> (According to [de Soto], "being" is always used as a participle of the verb "to be," as "existing" is used as a participle of the verb "to exist," and formally it signifies being, but materially it signifies what has being; then he clarifies his thesis by saying that "being" signifies not only what actually is, in the sense of existing, but what is in actuality or in potentiality, for, of a man who does not exist, it can be truthfully affirmed that he is a being, just as he is an animal or a substance, and yet he concludes that "being" is not said quidditatively of things, and especially of those that are created, since it signifies a relation to being that is external to the essence of the creature.)

(Suárez, *Disputationes metaphysicae*, 2.4)

Reaffirming the *habitudo ad esse* within the nominal meaning of being necessarily leads to opposing *ens* and *res*: the *res*, unlike the *ens*, can be predicated *in quid* of everything that is (that is, also of what is not actual), because it signifies nothing other than the quiddity itself, in its absolute truth ratified by the understanding, without the intervention of any further ordination to being or to existing. The same is not true of "being," which never signifies quiddity taken absolutely, but always "*sub ratione essendi,*" that is, insofar as it can be ("*id quod est potentia*"), in the sense of what can receive the *esse* ("*Et in hoc constituit differentiam inter ens et res, quod res quidditative praedicatur, quia significat quidditatem veram et ratam absolute, et sine ordine ad esse; ens autem non praedicatur quidditative, quia non significat absolute quidditatem, sed sub ratione essendi, seu quatenus potest habere esse,*" *Disputationes metaphysicae*, 2.4.2). Without following the logic of his argument to its final implications, which would lead him to make the *res* an instance (one does not dare to say an "entity") more vast than existence, because it includes both existence and quiddity—the *esse essentiae* of the (pseudo-)Avicennian tradition—and to break the convertibility of the transcendentals, in order to make the

"thing" a supertranscendental term, Suárez limits himself here to identifying *ens* and *res* simply and purely: the two terms differ only nominally, through their linguistic origin (*in etymologia nominum*):

> Unde obiter colligo, ens in vi nominis sumptum, et rem, idem omnino esse seu significare, solumque differre in etymologia nominum; nam res dicitur a quidditate, quatenus est aliquid firmum et ratum, id est non fictum, qua ratione dicitur quidditas realis; ens vero in praedicata significatione dicit id quod habet essentiam realem; eamdem ergo omnino rem seu rationem realem important.

> (Whence I also conclude that "being" [*ens*], taken as a noun, and "thing" [*res*] are absolutely identical or signify the same, and that the only difference is in the etymology of the two terms. For the *res* is used on the basis of the quiddity, insofar as it is something firm and ratified, that is, nonfictitious, and that is why it is called "real quiddity"; whereas being [*ens*] names, in the meaning under consideration, what has a real essence; they thus refer to the same *res* or to the same real reason.)

(Suárez, *Disputationes metaphysicae*, 2.4.2)

The true background of this continuing tendency—which has been called "essentialist" (Étienne Gilson)—to make the *ens* a transcendental term is once again Henry of Ghent's previously mentioned analysis that tends to make *res* an absolutely general term, identical to the *etwas*, to the "something," to the *aliquid* in the sense of the non-*nihil*. Clauberg in particular had seen this very clearly when he interpreted "*res in latissima acceptione*" as "*Intelligibile seu Cogitabile*" (*Exercitationes*, 45, in *Opera omnia philosophica*, 2:668), that is, as a supertranscendent term or as "supertranscendental," without there being any reason to distinguish here between the two adjectives (cf. Doyle, "Supertranscendental Nothing").

Thus the philosophical history of the word *res* clearly leads, as Kobusch has shown ("Das Seiende als transzendentaler oder super-transcendtaler Begriff"), to making the *ens rationis* the most general concept defining the sphere of the thinkable (*cogitabile*), within which is secondarily delimited the domain of the *ens reale*, which itself merges with the possible understood as noncontradictory (*potentiale obiectivum*). If philosophically the Latin *res* was initially used to translate the Greek *pragma* [πρᾶγμα], in late Scholasticism and in *Schulmetaphysik*, it is usually understood as a transposition of the indeterminate *ti* [τι]. That is why a few authors who were not content to classify *res* among the transcendentals or to make it the first among them imagined a new, still more general category, that of supertranscendental terms that are perfectly illustrated by French *chose*, Latin *aliquid*, or German *etwas*.

RÉVOLUTION

Révolution derives from Latin *revolvere* (turn back), and originally designated in particular the return by which a celestial body comes back to the starting point on its orbit: it is the basis of the cyclical conception of time, from Plato to Nietzsche's "eternal return," in contrast to linear time. See AIÔN, *CONTINUITY*, *ETERNITY*, MEMORY, MOMENT, PRESENT, *TIME,* WELT; cf. EPISTEMOLOGY, FORCE.

In political history, the word has come to designate a sudden change (cf. German *Umwälzung*, "upheaval") but does not imply a return to the point of departure. However, revolution is still contrasted with evolution, which has to do with continuity and the line. French hesitates between *révolution* and *évolution* to translate the kind of movement that is expressed by the Italian *mutazione*, notably in the work of Machiavelli: cf. VIRTÙ.

More generally, on the way of expressing progress, whether linear or cyclical, see CORSO, HISTORIA UNIVERSALIS, NEUZEIT, PERFECTIBILITY; cf. GLÜCK, HISTORY, *PROGRESS*. On the relation between the two conceptions of time and human practice, see PRAXIS; cf. AUFHEBEN, PLASTICITY.

Finally, on the revolutions that have marked European history and their singularity, see LIBERAL, PRAVDA, RULE OF LAW, WHIG. In a more metaphorical or more philosophical sense, see, for example, SUBJECT, LIGHT; cf. EUROPE, TO TRANSLATE.

➤ *DROIT*, POLITICS, *SOCIETY*

RIGHT / JUST / GOOD

FRENCH   *bien, juste, bon*
GERMAN   *gut, wohl, recht*

➤ *DROIT*, *GOOD/EVIL* [GUT], and FAIR, *JUSTICE*, LAW, PRUDENTIAL, TRUTH, UTILITY

The French translator of English terms for "good" is always in danger of being confronted by cases in which the contrast between "right" and "good" seems to be one between *bien* and *bien*. French does not make a sharp distinction between *le bien* and *le bon*, the imperative and the attractive, whereas English has two distinct series that correspond quite clearly to two aspects of the good. Moreover, where French clearly distinguishes between *le bon* and *le juste,* with the former emphasizing individual or collective interest and the latter universal moral law, English is less clear on the distinction between "right" and "just," since "rightness" can mean both *rectitudo* and *justitia.*

I. The Three Meanings of "Just"

First of all, "just" has a cognitive meaning, that of French *juste,* in the sense of "correct," "exact," or "true." Nonetheless, the English noun corresponding to French *justesse* is not "justice" but "rightness," whence the intervention of the Anglo-Saxon lexicon (*recht* / right, straight), which complicates matters. "Right" and "just" are, then, more or less interchangeable with each other and, except for a few nuances, with "good," which also has a cognitive sense (as in French, where a *bonne réponse* is *correcte* or *juste*). In this sense, the antonym of all three words—"good," "right," and "just"—is "wrong," in the sense of "erroneous."

The second sense of "just" is the moral sense, and here again, the distinction from "right" and "good" is imperceptible. The virtue of justice, Latin *rectitudo*, corresponds well to English "rightness," meaning "moral rectitude." "Right" is used chiefly to qualify "good" actions, while "good," like "just," is used more to describe the character of the virtuous agent. But this resemblance is misleading. "Right" has a much broader semantic field and comes to designate not only the conduct of the virtuous man, but also what is good, the moral criterion in general in contrast to the morally wrong. As for "good," it also has a nonmoral sense, the "good" in the sense of what satisfies appetites and natural desires, of happiness and well-being; and the passage from natural properties to moral properties has been, as we know, one of the thorniest debates in moral philosophy ever since Hume. It is at this point that the most serious translation problems arise, because there is no French equivalent for "right" (and especially no noun corresponding to "rightness") with this prescriptive sense. However, the meaning of this distinction as expressed by Henry Sidgwick, who was a disciple of both Kant and Mill, is entirely clear:

> We have regarded this term ["rightness"], and its equivalents in ordinary use, as implying the existence of a dictate or imperative of reason which prescribes certain actions either unconditionally, or with reference to some ulterior end. . . . It is, however, possible to take a view of virtuous action in which . . . the moral ideal [is] presented as attractive rather than imperative . . .

substituting the idea of "goodness" for that of "rightness" of conduct.

> (*Methods of Ethics*, bk. 1, chap. 9, §1)

Finally, the semantic fields of "right" and "just" differ completely from one another because a third sense of "just" is "fair," "equitable," a meaning absent in the case of "right." On the other hand, "right" has the meaning of "a just claim or title" (Fr., *droit*), as in the expression "rights and duties." One of the most important debates in English-language moral and political philosophy concerns the relations between right and good (in French, between *le juste* and *le bien*), whence the exemplary difficulties raised by this quotation from Michael Sandel:

> The priority of the right means, first, that individual rights cannot be sacrificed for the sake of the general good (in this it opposes utilitarianism), and, second, that the principles of justice that specify these rights cannot be premised on any particular vision of the good life.

> (*Liberalism and the Limits of Justice*)

This can be rendered in French as: "La priorité du juste veut dire, tout d'abord, que les droits individuels ne peuvent être sacrifiés au bien général (en ce sens elle s'oppose à l'utilitarisme) et, ensuite, que les principes de justice qui spécifient ces droits ne peuvent être déduits d'aucune vision particulière de la vie bonne."

II. The Relations between "Right" and "Good"

In the passage quoted above, Sidgwick contrasts the "attractive" meaning of the moral criterion, or "goodness," with its imperative meaning, or "rightness." This distinction seems quite clear. If "right" has to be translated into French as *bien*—for example, in the expression *le critère du bien et du mal*—and not by *juste* or *droit* or *correct*, and if its antonym is clearly "wrong" (Fr., *mal*), that is because it designates what must be done: it conveys the imperative, coercive, aspect of morality, the sense of duty and obligation. In contrast, "good" designates the attractive aspect of morality, what should be desired or wished, *le bon*. It is entirely inadequate to simply add, as one might be tempted to do in French, that "right" designates *le bien* (the "moral" good) and not *le bon*, because for Sidgwick and most other English philosophers, what French calls *bon* is just as moral as what French calls *bien*, but differently. On the other hand, such a distinction within morality is unacceptable if, like Kant, one thinks that "good" in the sense of "desirable" has no place in morality (see GUT):

> "Well-being" [*Wohl*] or "woe" [*Übel*] indicates only a relation to our condition of pleasantness or unpleasantness . . . . But good or evil always indicates a relation to the will so far as it is determined by the law or reason.

> (*Critique of Practical Reason*)

It is because the English tradition has always refused to practice this exclusion that it draws the line of demarcation not between *le bien* and *le bon*, but between *le juste* and *le bon*. English "rightness" is thus paradoxically closer to the

German *Gut* in this opposition, and in a French translation of Sidgwick's text, it should be rendered by *le bien.* From this we can conclude that "goodness" and "rightness" can be rendered only by *le bien* in these two cases, which seems to be a good example of untranslatability.

Another way of posing the problem is to say not that "good" designates the attractive, the desirable, but that it must be distinguished from "right" because it leads to a series of questions that are of a different order and are just as constitutive of morality: those that bear on ends in themselves, on what has intrinsic value, independently of the actions and desires of the human subject. The confusion of these two senses of "good" is avoidable if we distinguish between the adjective "good," which has this sense of intrinsic value, and the noun "good," which retains the ordinary sense of French *bon.* This kind of confusion is responsible, according to G. E. Moore, for the "naturalist sophism" that can be attributed to the Utilitarians, who make moral ends dependent on human desires and appetites. On this point, Kant would agree with Moore. Here is how Moore proposes to articulate "right" and "good," which can be translated here only by *bon* and *bien*, respectively, contrary to what Utilitarianism prescribes:

> The word "right" is very commonly appropriated to actions which lead to the attainment of what is "good" . . . . But Bentham's fundamental principle is that the greatest happiness of all concerned is the right and proper end of human action. He applies the word "right" to the end, not only to the means . . . which is a naturalistic fallacy.

(*Principia ethica,* §14)

III. "The Priority of the Right over the Good"

The most troublesome case is that of the expression "the priority of the right over the good," which is untranslatable into French, and not solely because French lacks an equivalent for "right," but also because of English's lack of rigor. This expression has acquired two meanings that are related to each other but are still distinct and that have never been clearly explained because of the shifts we have already noted between "right" and "just." The first meaning concerns Rawls's liberal critique of the Utilitarians and their refusal to derive the right from the good. It contrasts "teleological and deontological doctrines" (see Box 1). The other meaning concerns the critique of liberalism made by the "communitarians," the question of the independence of the norms of justice from common values and the "common good," to adopt Habermas's vocabulary. The expression "the priority of the right over the good" thus comes to mean the priority of justice over the good, as in the remarks by Michael Sandel quoted above.

A first meaning is, as we have indicated, that of the priority of duty, of what must be done, over the good or happiness. Above all, it marks the priority of the question of freedom and moral autonomy over submission to the realization of a summum bonum given in advance by human nature. In this sense, the priority of *le bien* over the *le bon* is the fundamental thesis of an individualistic morality for which the capacity for individual justification through a social contract is the sole criterion of the validity of norms. This is a position parallel to the definition of the true by consensus and no longer by correspondence to a state of affairs external to judgment. But in what does this priority consist? Is it a logical priority—do we need the concept of "right" to constitute that of the "good"? That would presuppose that if this priority is not respected, there exist behaviors, organizations, etc. that are "good" without being morally right—which is absurd, whereas what is meant is that the imperative sense of the right has priority over the attractive sense of the good.

▪ See Box 1.

IV. The Relations between "Right" and "Just"

The other source of confusion comes from the fact that English seems to slide, without much rigor, from "right" toward "just," from *rectitudo* toward *justitia.* New ambiguities are then created that are sources of confusion but also enrichments. This kind of slide can make it possible to leave the context of the moral analysis of the criterion of good and evil and to operate on a broader playing field, that of distributive

---

1

Teleological theories and deontological theories

Moral theories differ depending on how they articulate *right* and *good.* For teleological theories such as ancient moral theories of happiness (Epicureanism, Stoicism, etc.) or Utilitarianism, the right (the good in the sense of what must be done) is derived from the good that is supposed to be an end, a *telos* given in advance and independently of consciousness, such as pleasure or happiness, that one should seek to maximize. For deontological theories like those of Kant or Rawls, on the contrary, the right is posited independently of the good, since it is impossible to sacrifice the imperatives of duty to those of the individual or general welfare, and the autonomy of the right reflects the autonomy of the individual. However, we must qualify this analysis. According to deontological theories, the existence of a *telos*, a Sovereign Good, necessarily threatens individual freedom, whence this break between *good* and *right*. But this is certainly not the case. For Mill, for instance, it is clear that the right is a collective norm compatible with human freedom and happiness and that this independence of the one from the other is absurd. The *telos*, the good that is to be maximized, is itself dependent on an imperative: the duty to consider impartially the overall good of all the individuals concerned. The distinction between teleological and deontological theories is thus not found primarily in the priority, or not, of the right with respect to the good, as is often said, but rather in the break between moral imperatives and the hypothetical maxims of prudence and happiness, in the independence of the right—that is, of a certain idea of the person, of the person's freedom, in relation to the natural order.

justice, which includes politics and economics. That is the meaning of the well-known debate between liberals and communitarians, that is, between John Rawls, on the one hand, and Taylor, Sandel, and MacIntyre on the other. Contemporary liberal doctrine affirms, with Rawls, the independence of the principles of distributive justice with regard to the conceptions of a society's good. That is the meaning of the remarks by Michael Sandel quoted above.

What is demanded by the communitarian critique of the priority of the right over the good and of procedural ethics, as they are found in both Utilitarianism and Rawlsian theory, is a certain return to Aristotle against Kant, the possibility of restoring a substantial historical and social content to "right" by deriving it from the traditions, the conceptions of the good of a community, and no longer solely from the individual interest. Because of this slide from "right" to "just," the French reader may well not really perceive what is at stake here. The essential point at issue concerns a culturalist and historicist critique of procedural liberalism. The difference between the two senses of *bien* that we have seen above—senses that are conflated in French, but clearly distinguished in English—is that "good" refers to particular conceptions of individual or communal good. But are they good in a universal way, that is, "right" for humanity as a whole? That is why in reality the debate is about universalist justice and local justice, about what is good for me and my group, or about what might constitute a "human right." That is exactly what Rousseau means when he says that "the General Will is always right [*droite*], but it is not always good [*bonne*]" (*Du contrat social*, 2.3). He opposes *le droit* and *le bon*, which would be the best way to translate the conflict between the particularity and self-interest of the individual or the group, on the one hand, and the universality of the rule or the moral criterion, on the other.

ROMANTIC

FRENCH   *romantique*
GERMAN   *romantisch*

➤ BAROQUE, CLASSIC, DESCRIPTION, DICHTUNG, ERZÄHLEN, *IMAGINATION*, LOVE, MANIERA, MIMÊSIS, NEUZEIT, PERFECTIBILITY

The term "romantic" first appeared in England about 1650; in the form *romantisch* it first established itself in German around 1700 and came into wide use after 1760. *Romantique* entered French in 1776 and was soon adopted by Rousseau. The word owes its morphological homogeneity to a common Latin root. The terms "romantic"/*romantisch/romantique* all come from the old French *roman* (or *romanz*), which designated both a particular literary genre and a particular linguistic mode: a verse narrative in a Romance language, that is, in the vernacular, as opposed to Latin. But this homogeneity stops at the formal level. Each passage into a new language gave rise to important shifts in meaning. In its initial English form the term had an essentially aesthetic meaning. "Romantic" is very close to French *romanesque* or *pittoresque* and thereby involves a particular interpetation of the principle of *mimêsis*. In the course of its second wave of diffusion in late eighteenth-century Germany, it added a new historical and critical meaning. Not only is German *Romantisch* related to *romanhaft* and *malerisch*, but it also designated a cultural era, the Middle Ages and Renaissance, a specific intellectual exercise (*romantisieren*), and soon a literary school (*Romantik*). After these multiple European peregrinations the word seemed oddly elusive, which may explain why French writers of the early nineteenth century were reluctant to adopt it.

I. As in a Romance

From the medieval *roman courtois* and *roman de chevalerie*, nourished by the Arthurian legend, down to Honoré d'Urfé's pastoral romance *L'Astrée* (1607–24), the French word *roman* designated a fantastic genre close to the fable. From this semantic matrix the English word "romantic," which appeared about 1650, inherited its first meaning: *romanesque*, that is, invented, imaginary, fictive. Although in England the word rather quickly lost its explicit connection with the world of the *romanesque*, the German term *romantisch* retained it for a long time.

Already present during the first wave of the word's introduction into German, which was carried out especially from Switzerland by J. J. Bodmer and J. J. Breitinger, the synonymous doublet *romantisch/romanhaft* continued to be used until the end of the eighteenth century. C. M. Wieland, who played a central role in the spread of the term *romanhaft*, regularly used the two terms interchangeably. Connected with the fabulous genre of the romance, the word also reflects the latter's aleatory popularity. In the late seventeenth and early eighteenth centuries, when the romance was attacked for its excessive implausibility, the terms "romantic"/*romantisch* usually meant "chimerical, false, fabricated," a negative connotation that disappeared in the course of the eighteenth century with the rehabilitation of new novelistic forms.

Having thus issued from a strictly literary sphere, the word "romantic" was nonetheless soon applied metaphorically to other kinds of experience: the perception of a landscape presented as real, the expression of an intimate feeling (a romantic land, romantic love), all uses that, by

their disconcerting variety, seem to discourage any effort to give a precise definition. This astonishing diversity requires a shift in the definition from the sphere of the object to that of the subject. What is "romantic" is what is perceived by the subject as being like a romance. At the heart of the notion there is thus less an intrinsic quality of the object than a quality of the way the object is experienced. That is what C. Brentano says in his romance *Godwi* (1800–1802): "The romantic is thus a lens" (*Das Romantische ist also ein Perspectiv*) (2:258). If "romantic"/*romantisch* implies a relation to the subject, it presupposes in addition a specific relation to art and to nature, or more precisely, a strict reversal of the traditional principle of *mimêsis*. In romantic experience nature is perceived through the prism of art (literature or painting). In other words, for the romantic way of seeing things, it is no longer art that imitates nature, but nature that imitates art.

This is the mechanism that explains the precocious application of the term to a privileged domain: the landscape. When it appeared in England in the second half of the seventeenth century, "romantic" was frequently used to define landscapes that reminded the spectator of those in a novel or a picture. Very widely used by English theorists of the aesthetic (J. Addison, Shaftesbury) and in eighteenth-century travel narratives, this use soon became common in Germany, where it remained alive for a very long time. K. P. Moritz, F. Schiller, W. von Humboldt, and J. W. Goethe all deliberately resorted to it. For example, in Goethe's *Sufferings of Young Werther* we read:

> How glad we were when we discovered, at the beginning of our acquaintance, our mutual affection for this spot, which is in truth one of the most romantic that I have ever seen portrayed by an artist.

> (Wie freuten wir uns als wir im Anfang unserer Bekanntschaft die wechselseitige Neigung zu diesem Plätzchen entdeckten, das wahrhaftig eins von den romantischsten ist, die ich von der Kunst hervorgebracht gesehen habe.)

> (Goethe, Bk. I, letter of 10 September; Eng. trans. B. Q. Morgan, London: John Calder, 1957, 75)

From this connection with art, the adjective "romantic" drew a special relationship with painting. Still more than to literary reminiscences, it is to pictures that romantic experience refers. "Romantic"/*romantisch* very often means "picturesque"/*malerisch*. Claude Lorrain, Nicolas Poussin, G. Dughet, and especially S. Rosa are constantly cited as models underlying the perception of a real landscape. Thus a craggy region of New Zealand reminds G. Forster of a painting by Rosa, just as H. Walpole is reminded of this same painter by a tortuous Alpine landscape. It is not surprising, then, that the fortunes of this word, which constantly grew all through the eighteenth century, coincide with the fashion of the English garden. Like the term "romantic"/*romantisch*, the English garden is based on a reversal of the traditional concept of *mimêsis*: nature must be organized like a painting, pictorial or linear, but the intervention of art must be concealed as much as possible. Moreover, the great theorists of the English garden (U. Price, H. Walpole, T. Whately) made extensive use of the term "romantic." Following them, C.C.L.

Hirschfeld suggests that to make a garden "romantic," one should place rocks in it, imitating the paintings of S. Rosa, along with poetic inscriptions and paintings in the grottos that adorn it (*Theorie der Gartenkunst*, 1779–85). The experience of the romantic landscape cannot be understood without this explicit or implicit substratum of literary and pictorial references.

II. A Notion of Cultural History

From its matrix relation to the romance, "romantic"/*romantisch* took not only an aesthetic meaning but also a historical and cultural meaning. Since "romance" designated an ancient literary genre, the adjective derived from it was used to designate the chronological period that saw this genre's birth and development: the Middle Ages and Renaissance.

The appearance of this meaning in the 1760s was due to Thomas Warton, formulated in particular through the notion of romantic poetry, medieval poetry connected with peculiar cultural components (the Christian tradition, the gothic universe, etc.). Although this historical meaning appeared for the first time in England, it was in Germany that it truly took root and developed over the long term. It is as though, during the great wave of the diffusion of the word *romantisch* in the last third of the eighteenth century, German had drawn toward cultural history a notion that had up to that point been reserved in England chiefly for the literary and aesthetic domain. In this change J. G. Herder played, alongside C. M. Wieland, a central role. In the 1760s Herder frequently used the expressions *romantischer Taten* (romantic acts), *romantischer Charakter* (romantic character), and even *romantischer Fabelgeist* (the romantic spirit of the fable) to define the quintessence of the romantic period. One thing, however, is striking in the use of this word: its great imprecision. Under the category "romantic" Herder lumps together the Middle Ages and the Renaissance, along with the Scots, the Normans, the Arabs, and the Provençals. If the "romantic era" thus had very fluctuating chronological and geographical boundaries, it nonetheless had one constant: its opposition to antiquity and to modern neoclassicism. A distant avatar of the Quarrel of the Ancients and the Moderns, the antithesis *antik/romantisch* or *klassisch/romantisch* became structuring in late eighteenth-century Germany. In his essay "Der Ähnlichkeit der mittlern englischen und deutschen Dichtkunst" ("The resemblance of medieval poetry in English and German") (1777), Herder thus contrasts the freedom of medieval ballads and romances, romantic forms that have fallen into oblivion, with the regularity of ancient meter, caricatured in the modern period in French classical versification (9:522ff).

III. Critical Discipline

Used by Herder in an essentially aesthetic and historical sense, in the work of Novalis the term *romantisch* took on still another dimension. For Novalis and a whole generation of writers, it became a general concept designating a particular way of apphrehending the world, an intellectual exercise.

In addition to the traditional uses, which are very present in his writings, in 1797–98 Novalis coined a series of words that gave their root, *romantisch*, a new meaning. The first

of these, *romantisieren*, designates a process of poeticizing the world:

> The world must be romanticized. . . . This operation is still entirely unknown. By conferring on secret things an elevated meaning, on the everyday a mysterious prestige, on the known the dignity of the unknown, on the finite the appearance of the infinite, I romanticize them.
>
> (Die Welt muß romantisiert werden. . . . Diese Operation ist noch ganz unbekannt. Indem ich dem Geheimen einen hohen Sinn, dem Gewöhnlichen ein geheimnisvolles Ansehn, dem Bekannten die Würde des Unbekannten, dem Endlichen einen unendlichen Schein gebe, so romantisiere ich es.)

<div align="center">(Novalis, Philosophical Writings, vol. 2, §4, no. 105)</div>

Thus invested with a very general critical dimension, the word *romantisch* soon came to designate a discipline or science called *Romantik* by analogy with other fields of knowledge (*Physik, Mathematik, Grammatik,* etc.). Just as there is a *Physiker* or a *Grammatiker,* so there is a *Romantiker.* The subject of this new discipline is life, or rather, what amounts to the same thing, the romance, since "we live in a colossal romance" ("*Wir leben in einem kolossalen Roman*"):

> Life is something like colors, sounds, forces. The Romantic studies life as the painter, the musician, and the specialist in mechanics study color, sound, and forces.
>
> (Das Leben ist etwas, wie Farben, Töne und Kraft. Der Romantiker studiert das Leben, wie der Maler, Musiker und Mechaniker Farbe, Ton und Kraft.)

<div align="center">(Novalis, Philosophical Writings, vol. 3, §9,
nos. 853 and 1073)</div>

For Novalis the *Romantiker* is a person who succeeds in living his life like a romance, that is, poetically (*Fragmente und Studien*, 1797–98, no. 188, in *Philosophical Writings*). Disseminated through the publication of Novalis's works by F. Schlegel and L. Tieck (1802), these neologisms were soon being used by many writers.

IV. Overlapping Meanings

Far from excluding each other, these diverse historical and critical meanings never ceased to intersect, and around 1800 they conferred on the word *romantisch* an unusual density. At the confluence of these semantic traditions stood Friedrich Schlegel. Having started from Herder, but being a great reader of Novalis, he made a central contribution to the definition of the word. In his essay "*Über das Studium der griechischen Poesie*" ("On the study of Greek poetry"), written in 1795, he opposes, like Herder but in a way very favorable to the ancients, ancient poetry, which is beautiful, objective, natural, cyclical, and finite, to romantic poetry, which is infinite, subjective, artificial, progressive, and sometimes mixed with ugliness. However, though he is still very critical with regard to the romantic period, that is, the Middle Ages and the Renaissance, he reverses this judgment in his later writings. In the Athenäum fragments (1798), the infinite progressivity of romantic poetry is presented as a

privilege of modernity, and superior in this respect to that of antiquity, which remains ineluctably prisoner to a cycle of apotheosis and decline. In the tradition of Herder, then, Schlegel makes this term both a key notion in cultural history (*romantisch* designates the culture of the Middle Ages and the Renaissance) and a component of the antinomic pair "antiquity"/"modernity." But Schlegel soon gave it a much broader meaning. Although, of course, it was still connected with the literature of the twelfth to the sixteenth centuries, for him the concept of "romantic poetry" quickly came to include contemporary works (Goethe's *Wilhelm Meister's Apprenticeship*, L. Tieck's *Franz Sternbald's Wanderings*) and was also extended to include ancient authors (Homer, Aeschylus, Plato, Horace, and Virgil), and even included all the existing literary genres. At the end of this itinerary, the term *romantisch* designated neither more nor less than the essence itself of all poetic activity. It was endowed with a truly universal meaning in which all the earlier antinomies were dissolved: Herder's opposition between antiquity and modernity, and the oppositions between prose and verse, between romance and poetry. That is what is expressed in Athenäum fragment no. 116:

> Romantic poetry is a progressive, universal poetry. Its aim isn't merely to reunite all the separate species of poetry and put poetry in touch with philosophy and rhetoric. It tries to and should mix and fuse poetry and prose, inspiration and criticism, the poetry of art and the poetry of nature, and make poetry lively and sociable, and life and society poetical; poeticize art. . . . It embraces everything that is purely poetic, from the greatest systems of art, containing within themselves still further systems, to the sigh, the kiss that the poeticizing child breathes forth in artless song. . . . It alone can become, like the epic, a mirror of the whole circumambient world, an image of the age. . . . The romantic kind of poetry is the only one that is more than a kind, that is, as it were, poetry itself: for in a certain sense all poetry is or should be romantic.

<div align="center">(F. Schlegel, Athenäum fragment 116, in Friedrich
Schlegel's Lucinde, 175–76)</div>

It was in this sense, saturated with diverse meanings, that the word *romantisch* spread from 1800 onward. Jean Paul's *Vorschule der Ästhetik* (Preparatory course in aesthetics) (1804, §22) provides a surprising example of this overlapping of meanings. In the tradition stemming from Herder, Jean Paul tells us, *romantisch* applies chiefly to the medieval and Christian era, as opposed to antiquity, but it does not in any way exclude Greekness. Moreover, in the English tradition it designates a landscape with romantic or pictorial qualities but also defines a way of apprehending the world, in accord with the meaning that Novalis gives the word. Finally, in the tradition stemming from Schlegel, *romantisch* also refers to the very essence of poetry.

To these multiple meanings another was added in the first decades of the nineteenth century. *Romantisch*, having become a term commonly used by a whole generation of writers (the Schlegel brothers, Tieck, Novalis, Brentano, Eichendorff, et al.), ended up designating this group. It

must be emphasized that this use of the adjective, applied to a still quite recent school of writers, was actually very polemical. It was usually found in the adverse camp, that is, among the "classical writers" gathered around Goethe, or in F. Bouterwek and J. H. Voss, who began in 1800 a very virulent campaign against the Schlegel group. In terms of literary history, the word *romantisch* thus emerged from these multiple mutations as a strangely equivocal term. In the German of the early nineteenth century, it could refer, in a very broad sense, to the whole poetic production of humanity since antiquity, the literature of the Middle Ages and Renaissance, the literature of the modern period down to the nineteenth century, or, finally, a contemporary school that arose at the very end of the eighteenth century.

V. The Importation of the Term into France

It is probably these multiple senses that explain the reluctance of French writers to adopt the word. *Romantique* does not appear in French until 1776, in P. Letourneur's introduction to a translation of Shakespeare, and then in an essay by the Marquis de Girardin, "De la composition des paysages," dated 1777.

In both cases it is in direct reference to the English meaning of the term that the adjective is adopted. Rousseau endorses this borrowing in the fifth chapter of his *Reveries of a Solitary Walker* (*Les Rêveries d'un promeneur solitaire*, 1782) when he describes the shores of Lake Biel-Bienne as "more wild and romantic than those of Lake Geneva" (*plus sauvages et romantiques que celles du lac de Genève*). Despite what is said by Letourner, who was trying to justify the invention of the word by emphasizing its radical difference from *romanesque*, the adjective *romantique* had difficulty prevailing over its rival. In the 1792 *Encyclopédie méthodique* and the 1798 edition of the *Dictionnaire de l'Académie française*, it appears only as an anglicized doublet of *romanesque*, used especially in relation to landscapes, in the sense of "similar to a romance" or, by extension, "picturesque." Rousseau himself, a few pages after using the word, speaks of "*romanesques rivages*." If the word *romantique* certainly found supporters (Senancour, Stendhal, L. S. Mercier), it seems not to have been seen as really French until the early nineteenth century.

The first wave of the term's spread in English having met with a certain resistance, the second wave in German was far more defining, both by its breadth and by the shift in meaning that it carried out: the word "romantic" moved from an essentially aesthetic and literary meaning to one in the domain of cultural history. It was A. W. Schlegel's definition that established itself in France, as it did elsewhere in Europe, especially after his lectures on dramatic art and literature (delivered in Vienna in 1808; published 1809–11 as *Über dramatische Kunst und Literatur*), which were published in French translation in 1814. In a somewhat simplified paraphrase of his brother Friedrich's reflections, A. W. Schlegel attached the concept of *Romantik* to the modern cultural era inaugurated in the Middle Ages, marked by the Christian tradition, and characterized by an infinitely progressive literature that was open to a mixing of the genres. The romantic era can be understood only as the antithesis of the ancient era. Picked up by Madame de Staël, this historical-cultural meaning was also filled out by Charles de Villers, a great mediator between France and Germany, who connected the romantic era with both the late Latin that gave rise to the Romance languages and the medieval period. In the early nineteenth century, in the absence of an accepted adjective relating to the Middle Ages, *romantique* often meant "medieval." In 1810 Villers even tried to import a direct translation of the German noun *Romantik*, in the form of *la romantique*, to designate medieval poetry and its main characteristics. But this attempt failed, and the adjective long remained without a nominal form. The term *romanticisme*, proposed by Stendhal as a calque of the Italian *romanticismo* (see especially his *Racine et Shakespeare*, 2:113–21), was not adopted; by 1824 it had disappeared from his vocabulary. Paradoxically, it was the adversaries of this trend, and especially the members of the Académie française, who, in their determination to discredit this aesthetics, popularized the term *romantisme* in the 1820s. *Romantisme* signifies first of all a genre, based on the medieval model, and then, by extension, the contemporary movement that had made itself that genre's defender (a definition that was to be adopted by literary historians). In the preface to his play *Cromwell*, Hugo was able to use the noun without fearing that he would be misunderstood.

In England, Germany, and France the currently dominant sense of the word "romantic" bears hardly any trace of the three original meanings, aesthetic, historical, and critical. This rich multitude has been reduced to two main senses. For the most part "romantic" refers to a set of rather vague themes (melancholy, mystery, imagination, etc.) and, in a more precise sense that comes essentially from literary historians, to the group of writers who wrote about and exemplified these themes in the late eighteenth and early nineteenth centuries. But here again translation difficulties persist. Goethe, whom historians of German literature consider a virulent adversary of Romanticism, is commonly placed in France under the banner of the German Romantics.

| RULE

"Rule" derives from Latin *regula*. On the *regula*, a ruler serving to square things, and connected with "straight" (*directum*) and with the power of "ruling" (*rex*), see LEX (cf. *DROIT*), with LEX, Box 1 on the Greek network of equivalences, which opens not onto the problematics of law but onto that of the proper measure (see PHRONÊSIS and TRUTH, Box 1).

Règle is, along with *critère*, one of the accepted French translations of English "standard," designating what serves to evaluate and then to regulate experience in a more regional manner than law: see STANDARD, and cf. the constellation of the same family around STAND. The term is applied in all domains: as a rule of taste, of morality, or of production; the "standard" is a norm of evaluation or use that is determined by conformity (standardization). See ECONOMY, GOÛT, UTILITY; cf. ART, DUTY, LAW, MORALS, *OBLIGATION, VALUE*.

On the relation between "regular" and "secular," see SECULARIZATION; cf. BERUF, OIKONOMIA.

| RULE OF LAW

FRENCH   *État de droit*
GERMAN   *Rechtstaat*

➤ CIVIL SOCIETY, DUTY, HERRSCHAFT, LAW, LIBERAL, MACHT, POLIS, POLITICS, SOLLEN, *STATE*

The concept of the rule of law, long viewed with disdain by philosophers who saw it as a purely legal or even ideological notion, enjoys considerable prestige in contemporary thought, which corresponds to the recent developments in internal democratic politics and international law. The end of the twentieth century saw the fall of West European conservative regimes (Spain, Portugal, Greece), the rise of constitutional courts in most democracies, the collapse of communist regimes in central and eastern Europe, and, finally, the sometimes problematic emergence of an international law that is designed to limit the sovereignty of states by making it possible, under certain conditions, to impose sanctions against governments that are guilty of flagrant violations of fundamental rights. It is no doubt possible to consider all of these heterogeneous but convergent processes under the concept of the rule of law, insofar as they all yield a contrast between totalitarian, authoritarian, and arbitrary states and a superior model defined by its conformity with the law—although it is not clear whether this entails simply the existence of a duly agreed-upon hierarchy of norms or, more radically, the subordination of states to metalegal norms such as the Rights of Man. We may note that the agents of these transformations themselves often referred to the concept of the rule of law to legitimate their actions, whether they were governments of countries in transition to democracy, constitutional courts, or even the last communist leaders when they were attempting to save something of the regimes they had been in charge of (Mikhail Gorbachev wished to establish in the Soviet Union a "Socialist rule of law"). Contemporary political philosophy has for the most part gone along with this movement, presenting itself as a philosophy of law (A. Renaut and L. Sosoe, *Philosophie du droit*), attempting to show the irreducibility of the rule of law (a creation of Western Europe) to a "police state" (B. Kriegel, *L'État et les Esclaves*), or seeking a synthesis between a radical theory of democracy and the liberal tradition of the rule of law (J. Habermas, *Between Facts and Norms*). Nevertheless, even today the notion of the rule of law remains problematic in numerous ways. The main questions are those of the origins of the concept of a rule of law (which goes back to the Germanic doctrine of the *Rechtstaat*, which appears in a very different context from that of France), of its operational value (contested on grounds offered both by Carl Schmitt and Hans Kelsen), and its translatability into English (where the concept of the rule of law refers both to a different division between right and law and to constitutional agencies that are not reducible to the "continental" models).

I. The German Doctrine of the *Rechtstaat*

The French expression "état de droit" is a translation of the German *Rechtstaat*, which first occurs in the nineteenth century to describe the progressive process of the framing and limitation of the state by the law and which was believed to be at work in the German State. As noted by Jacques Chevallier, "[T]his common objective nevertheless covers rather different visions of the State and the law" (*L'État de droit*, 11), running from the simple functional requirement of a state acting by means of the law to subtantial requirements concerning the content of the law, as well as the formalist idea of a state subject to law. The formula is moreover put forward both by liberal legal thinkers like R. von Mohl, who seek to limit the sphere of action of the state and hence to protect individual liberty, and by others, less ambitious or more conservative, who simply wish to rationalize the domination of the state by normalizing the relations between it and the administration with those administered. In the end, the formalist conception won out, since it made it possible to subordinate the administration to the law by opening avenues of legal recourse against it, while at the same time presenting the subjection of the state to the law as a product of self-limitation (which requires no ultimate reference to legal norms superior to those posed by the State). On one hand, the rule of law is contrasted with the police

state (*Polizeistaat*), in which the law is only the instrument of an administration that may impose obligations upon those administered without being bound by higher norms. On the other hand, the rule of law is the fruit of a free (but rational) self-limitation of the state, the true subject of law, whose domination (*Herrschaft*) is at its origin a subjective law before which it is not possible to have public law, but whose immanent finality is to create law and rule by it (note here that the expression "self-limitation" translates several German words—*Selbstverpflichtung, Selbstbindung, Selbstbeschränkung*—which all contain the idea that the state imposes duties, obligations, or limits on itself; see R. Carré de Malberg, *Contribution à la théorie générale de l'État*, 231).

The *Rechtstaat* thus appears as an irreducibly liberal and statist concept, one that fits rather well in the German political philosophical tradition as developed from Kant to Hegel. The liberal aspect appears in the form of the demand that those administered be protected in their relationship to the state, but also, more radically, by the clear affirmation of principles of constitutionalism. The respect for higher norms is imposed not only on the administration and the executive power but also on the legislative power itself, which is subordinate to a nation's Constitution, according to a scheme that may easily be transposed from an empire to a liberal-democratic state (as is the case with current German basic law). The statist aspect is manifested by the absence of any superconstitutional norms (unlike what is supposed to happen today), by the rather emphatic claim of the originary power of the state (which goes along with the superiority of internal law over international law—which is also a product of the self-limitation of sovereign states), and more concretely by the autonomy of administrative law (which derives from the state's privilege of fixing its own rules that it follows in interactions with individuals). The theory of the *Rechtstaat* is also part of the general framework of the construction of public law centered on the state, which is inseparable from the development of the empire. We may note here that, by insisting on the state's originary power in respect of the nation, the theorists of self-limitation also dispute the claims of the Romantics and the historical school of law, while at the same time breaking with any patrimonial conception of the state and clearly distinguishing it from those doing the governing (cf. J. Chevallier, *L'État de droit*, 14–21). It would nevertheless be unfair to see here a uniquely German doctrine, since the theory of the rule of law is also pertinent to other nations of continental Europe, and more generally wherever the problem of the synthesis between affirmation of public law and the liberal limitation of state power is posed. This is illustrated by reception of the German doctrine in France, where it was eventually taken up by Raymond Carré de Malberg, despite the suspicion toward a theory that seemed to legitimate the imperial regime and that was opposed to the conception of the nation-state inherited from the French Revolution (*Contribution à la théorie générale de l'État*, 21–43).

French debates over the problem of the rule of law are not purely theoretical; they are, in fact, tightly set within the national and international political context of the beginning of the twentieth century. The authors who are most critical of the German doctrine, like Léon Duguit or, somewhat less so, Maurice Hauriou, are above all concerned to distinguish the state from the law, in order to guarantee the submission of the former to the latter. For Duguit, this is done by a twofold criticism of the doctrine of sovereignty and legal individualism, considered effects of subjectivism, against which he offers the rule of law as the only real foundation of an objective law, which is founded on social solidarity and opposed to both the state and to individuals. The state is thus not self-limiting, since it is not a legal subject, nor is its limitation based on the subjective laws dear to liberals (P. Raynaud, "Léon Duguit et le droit naturel"). For Hauriou, the law is also clearly distinct from the state, but the doctrine of self-limitation nevertheless retains some force for understanding the development of freedoms: "Logically, the self-limitation of the State appears to be an absurdity. Historically, it is the constitutional truth" (*Précis de droit constitutionnel*, 101). For its French defenders, most prominently Carré de Malberg, the rule of law appears both to be a contemporary expression of the ideals of the French Revolution (which makes it possible to contest the German priority on this point while also legitimating the French adoption of a German theory; see, for example, Carré de Malberg, *Contribution à la théorie générale de l'État*, 448n5) and as a powerful instrument for criticizing the constitutional mandate of the Third Republic. The French regime of the time, indeed, guaranteed the legality of the actions of the executive, or the administration, with more rigor than in Germany since it "subordinates to the laws even those administrative acts which do not pertain to the citizens as individuals." However, on the other hand, the French Constitution "has not reached the perfection of the rule of law" since it does not prohibit the legislator from "derogating the general rules consecrated by existing legislation" by particular laws, and because, above all, the legislator is not subordinate to the Constitution except by checks on the constitutionality of the laws, which makes it difficult to protect individual freedoms against the legislator (ibid., 492). At the same time, Carré de Malberg takes up the theory of self-limitation and translates it into the French language of sovereignty, giving what might be called a liberal version of legal positivism, while at the same time rejecting the German conception of the relations between the state and the nation. From the perspective of French constitutional law, the state cannot be the legal personification of the nation (cf. Raynaud, "Droit naturel et souveraineté national"). The debate between these views continued for a long time in the subsequent history of the doctrine, since they brought up fundamental questions, both theoretical and practical (J. Chevallier, *L'État de droit*; P. Raynaud, "Des droits de l'homme à l'État de droit"; M.-J. Redor, *De l'État légal à l'État de droit*). We may note, to conclude, that between the German version of the theory of *Rechtstaat* and the transposition made by Carré de Malberg, continuity wins out over discontinuity. In both cases, the synthesis between liberal concerns and public laws is effected by a legal positivism and the liberal theory of the self-limitation of the state, and the theory of the rule of law, which makes it possible to reinforce the guarantees of those subject to the law and to extend the actions of the courts, is used as a "solid support in the doctrinal construction of a fully flourishing administrative law" (J. Chevallier, *L'État de droit*, 32). Conversely, the main theoretical criticisms of the state bear, on the one hand, on its liberal component, and on the other, on the theory of self-limitation. In addition, the difficulty of translating the notion of the

rule of law into English is linked historically to the weakness of administrative law in England.

II. The Criticisms of the Rule of Law

As it originated in the project of providing a liberal rationalization of the state, the notion of the rule of law was the object of various criticisms, many of which are antiliberal or antidemocratic, but some of which are, on the contrary, democratic and anti-authoritarian in spirit.

On the antiliberal side, the most radical and developed criticism is doubtless to be found in the work of the German jurist Carl Schmitt (1888–1985), whose considerable writings cannot be separated from his activities against liberal democracy. This viewpoint led him to support the Third Reich for a time (after he had, during the Weimar Republic, demanded the prohibition of the Nazi Party, though in the service of an authoritarian transformation of the constitution in force at the time; see Beaud, *Les Derniers Jours de Weimar*). In Schmitt's major work *Constitutional Theory* (1928), the discussion of the principles of the "bourgeois rule of law" aims at revealing the implicitly polemical or partisan character of the notion of the rule of law, while at the same time uncovering its inability to account for what the modern liberal state retains of politics. If we were to take the expression of the rule of law literally, "we could call a rule of law any State which faultlessly respects the objective law in place and the existing subjective rights." This would lead to an application of this notion to the most powerless political forms and even the most archaic ones, forms in which the rights acquired would be scrupulously respected at the expense of the very conditions of the political existence and security of the state. "In this sense," Schmitt writes, "the old German Reich, the Roman Empire of the German Nation, was a perfect *Rechtstaat* at the time of its dissolution; its character as a *Rechtstaat* was the manifestation and the instrument of its political collapse" (*Constitutional Theory*). However, the contemporary meaning of the notion is in fact essentially polemical: the rule of law is opposed to the rule of might (*Machtstaat*), as well as to the police state and the welfare state and to "any other type of State which is not focused simply on maintaining the legal order" (ibid.). Finally, if we aim to give a more precise meaning to the notion, we find the principles of liberal constitutionalism, where the respect for fundamental (individual) rights is based on the division of power of the state (ibid.), which leads to various organizational criteria such as the principle of legality, the fixed division of political powers and the independence of the judiciary, which end in the general predominance of jurisdictional forms (*allgemeine Justizförmigkeit*) in the life of the state (ibid.). Schmitt's reservations about this conception of the state focus first on its unilateral character, which leads to misjudging the specifically political dimension of the legal order, which rests on sovereign choice and not simply on a "system of legal norms aimed at preserving the individual against the state" (ibid.). Schmitt suggests thus that the liberal state is either hypocritical or incapable of understanding itself, except by seeing that the rule of law itself presupposes a prior decision in its own favor—the liberal principle, which simply demands limitations on power, being silent on the question of the different forms of government (ibid.). In other texts, Schmitt refers to the institutionalist dimension of the law, equally misunderstood by the doctrine of the rule of law in his opinion, which is unilaterally attached to the simple normative idea of the law as a system of abstract rules (see, for example, *On the Three Types of Juristic Thought*, a summary of his lectures from 1934).

While Schmitt's theories may be seen as a reactivization of the authoritarian aspects of the German conception of the state against liberal tendencies at work in the rule of law, those of Hans Kelsen, who affirms the identity between the state and the law, may be, on the contrary, considered as an effort to emancipate the normative idea of the predemocratic notions retained by the idea of state self-limitation.

Kelsen is known as one of the major representatives of legal positivism and, as such, is often the subject of ritualized and misguided criticisms, which bear on the supposed inability of positivists to criticize positive law where it is manifestly unjust or oppressive, where instances of the latter simply indicate the impossibility of basing the necessity of obedience to the law in the law itself, as well as the ultimately nonlegal character (since it is moral and/or political) of the fundamental norm from which positive law is derived. Defining the law as a type of constraint, Kelsen is led to include extremely shocking facts (see, for example, *Pure Theory of Law*). However, this must be seen as the expression of an attempt to deconsecrate the legal order, which is also, for the democratic Kelsen, perhaps the prior condition of a definition of the effective conditions of the preservation of freedoms. As for the identity of the state and the law, it leads Kelsen to a vigorous critique of the theory of self-limitation (or rather of self-obligation, *Selbstverpflichtung*), which shows that it relies on circular reasoning, since the authority of the state presupposes a norm that makes it a subject of the law empowered to lay down further norms. In this sense, every state is a *Rechtstaat*, and "it is impossible to think of a State which is not subordinated to the law," since "the State only exists in state actions, that is, actions accomplished by human beings and which are attributed to the State as a legal norm" (H. Kelsen, *Pure Theory of Law*). Thus, "the term *Rechtstaat* is a pleonasm" (ibid.). Kelsen notes, however, that in fact the expression *Rechtstaat* is often used as a simple synonym for democratic states guaranteeing legal security, which he denies distinguishes them at all from authoritarian states. As a practicing jurist, Kelsen, who was also a major democratic theorist, was one of the promoters in continental Europe of constitutional oversight. This oversight, which makes it possible to subordinate the legislative power to the fundamental norm, is one of the most powerful loci of the development of what may be called the rule of law. The anti-imperial orientation of Kelsen's doctrine, which inspires his critique of self-obligation, is equally visible in another fundamental claim in favor of the "pure theory of law," that of the unity of international and internal law, which is obviously in contradiction with the claims of the jurists of the Empire. Kelsen's best readers did not miss the point of this doctrine: in his most virulent period, Carl Schmitt denounced normativism as being essentially liberal and antipolitical (*On the Three Types of Juristic Thought*). A thinker like Raymond Aron, who, while liberal, was also a realist thinker about international relations, confessed his preference for the theory of

self-limitation (even though it cannot provide a basis for the "obligatory force" of the law, this theory is "a formalization of historico-social reality"; see Aron's *Peace and War*).

III. "Rule of Law" in English

While the German notion of *Rechstaat* may be easily translated into most continental languages, its translation into English raises important problems that are not merely linguistic. The most common translation of *Rechtstaat* or *état de droit* is "rule of law," whose connotations are nonetheless rather different. From a linguistic point of view there is the problem of there being two meanings of "law," which corresponds to both the French *droit* and *loi*, whereas what would be called in French *droits subjectifs* are called "rights" in English. More importantly, the legal-political content of the concept of the "rule of law" is different from that of the *état de droit*. The notion of the "rule of law" refers more to substantial and procedural criteria of the legitimacy of governments and legal norms than to the formal coherence of a system of state norms. It means, on the one hand, that in the organization of the *government* the law must be placed above people (according to a classic idea going back to Greek thought), on the other, that legislation and legal processes must bear certain procedural qualities (cf. the American notion of "due process of law," usually translated into French as *procédure équitable*). Thus, where the *état de droit* urges above all a means (the hierarchy of norms) that are supposed to yield a certain result (freedom), the "rule of law" defines the result much more precisely, but does not indicate the means for achieving it (M. Troper, "Le concept d'État de droit," 63). The difficulty is, in fact, compounded by the English origins of the notion, given the degree to which the English Constitution is out of conformity with contemporary norms of constitutionality. The classic author in this regard is the great jurist A. V. Dicey (1835–1922), who showed that English rule rests on a subtle balance between the sovereignty of Parliament (which does not allow for constitutional oversight of the laws) and the "rule of law" (which demands that the administration derive from common law and that the functionaries shall be, like any other citizen, responsible before ordinary tribunals, which is incompatible with the continental and especially French idea of administrative law). The consequence of this doctrine is that, on one hand, the United Kingdom is not an *état de droit*, lacking oversight of the constitutionality of laws, and that on the other, France does not live under the rule of law, since it has an administrative law with a special jurisdiction (see D. Mockle, "L'État de droit et la théorie de la *Rule of Law*"). The practical repercussions are less serious today than at the beginning of the twentieth century, given the liberal evolution of administrative law and the importance of American constitutionalism in the culture of jurists and English-speaking philosophers of law. Nevertheless, it remains the case that British and American authors do not mean the same thing by "rule of law" that continental jurists or philosophers mean by *état de droit*. Indeed, this is why the most rigorous among them translate *Rechtstaat* by "constitutional government" and not by "rule of law" (Troper, "Le concept d'État de droit," 54).

| RUSE

In French, *ruse*, from Latin *recusare* (to reject, refuse, protest against), is first of all a hunting term that designates a trick used by game animals to throw dogs off the scent and escape hunters (RT: *DHLF*). Various elements come into play.

I. Human Ruse, Divine Ruse

The Greek *mêtis* [μῆτις], the strategy used by the octopus, by Odysseus, by the sophist, and by Zeus, is connected with practical intelligence in a complex system that includes measure (*metron* [μέτρον]; see LEX, Box 1) and premeditated planning (cf. *medomai* [μέδομαι]; see MÊTIS).

TALAṬṬUF [تلطف] designates Allah's ruse, whose subtlety combines grace and machination (see *GRACE*), and makes use of evil in order to do good, as Hegel's Spirit does in history (*die List der Vernunft*). See TALAṬṬUF. Cf. AUFHEBEN, *DESTINY*, HISTORY, OIKONOMIA, PLASTICITY.

II. Ruse, Skill, Wisdom

More broadly, "ruse" implies an inventiveness in means-ends relationships characteristic of artistic and mechanical skill; see ART, I, INGENIUM, Box 1 on Arabic *hads* [الحدس] and Greek *agchinoia* [ἀγχίνοια], ITALIAN, VI; cf. ARGUTEZZA, CONCETTO, GENIUS, MIMÊSIS.

This kind of know-how is connected with practical wisdom, see *PRUDENCE* [PHRONÊSIS, PRUDENTIAL], VIRTÙ, *WISDOM*; cf. MORALS.

RUSSIAN

Diglossic Opposition in Russian

➤ ASPECT, AUFHEBEN, BOGOČELOVEČESTVO, *GOOD/EVIL*, GREEK, MIR, POSTUPOK, PRAVDA, SVOBODA

Diglossic opposition characterizes philosophical discourse in Russian. Diglossia is the coexistence in a single society of two languages that have different values, as opposed to bilingualism, in which two languages are on the same level. "Good," "truth," "knowledge," "action," and "time," for instance, present themselves in the form of organized oppositions in accord with the linguistic model of diglossia. The semantics of this opposition is based on the representation of two "worlds," one "low" and the other "high," so that the concepts concerned are rendered by two terms, one referring to the low world and the other to the high world. The relation between the two worlds is a dynamic process of realizing and sublating one world in the other. Since it is the "person" (*ličnost'* [личность]) that carries out this process, Russian philosophy is often described as personalist. The conceptual schema of the two worlds is the basis on which Russian philosophy has developed an ontology that cannot be separated from either anthropology or ethics.

I. Diglossia and the Russian Language: Linguistic and Historical Elements

Modern Russian is not a homogeneous language. Today, it includes two different types of elements, Slavonic and Russian. When the East Slavs were Christianized at the end of the tenth century, two languages coexisted in this linguistic community. The first was Old Slavonic, an ecclesiastical language based on a Macedonian dialect that was used to translate the Greek texts of the Gospels. It was imported along with Christianity into the Kiev state of the East Slavs. From the outset, in addition to its initial function as an ecclesiastical idiom, this language had assumed, as was usually the case in the Middle Ages, the role of the language of theology, literature, and science—in short, the language of civilization. We are accustomed to giving this language the name of Russian Slavonic or simply Slavonic (Ungeaun, "Le russe littéraire," 44).

The second language, which was clearly opposed to Slavonic, was popular, everyday Russian. This was, first of all, the language that was spoken daily. But it was more than that. From the beginning there were two domains in which Russian alone was accepted as a written language: administrative and judicial documents and private correspondence. The spoken language was thus the one used, not only in legislation and legal proceedings, but also in every document that had anything to do with the legal or juridical aspect of things, so that the language of the laws had become a chancellery language in the broad sense of the expression.

The East Slavs, and particularly the Russians, thus made use of two different written languages: a so-called chancellery language, which was indigenous, Russian; and a literary language, Slavonic. This dualism, this distinction in principle between chancellery language and literary language, is a characteristic trait of Russian history and language (ibid.).

In modern Russian, which is a mixed language, there is a functional semantic and stylistic opposition between Slavonic and Russian elements. The Ouspensky-Hüttl-Folter theory of reference explains this mixed character of modern Russian in relation to the diglossia that characterized the linguistic situation of the Kiev state. It is on the basis of this situation of diglossia that we can try to understand the "two worlds" schema that constitutes an important theme in Russian philosophy. The two languages of different values in this case are, on the one hand, the language of everyday conversation, and on the other, a quite codified language that is learned through formal apprenticeship and serves as the vehicle for a body of written texts that are highly respected; this latter language is the written language par excellence, and it is considered to be superior by the speaker himself. It is called the "high language" (H), as opposed to the everyday, "low language" (L). According to C. Fergusson, to whom we owe this concept, the conditions of diglossia are as follows:

1. there is a large literary corpus close to the language of ordinary communication, and this corpus incorporates the community's fundamental values;
2. only a small elite of the community receives formal education and has access to this corpus;
3. a long period of time (from one to several centuries) separates the time when conditions (1) and (2) are met from that when the situation of diglossia is established.

In the Ouspensky-Hüttl-Folter theory Slavonic, the ecclesiastical language, is obviously the high language, and Russian, the everyday language and also the chancellery language, is the low language.

The interpenetration of Slavonic and Russian during this first period produced a third language, Russian Slavonic, an intermediary language from which modern Russian emerged.

Fergusson stresses that:

A striking characteristic of diglossia is the existence of a large number of lexical pairs composed of an item H and an item L, and which refer to common concepts in frequent use in both the H language and the L language; the semantic field of each term is about the same, but

the use of one or the other immediately marks the oral or written utterance as H or L.

(Fergusson, "Diglossia")

According to Ouspensky-Hüttl-Folter, the diglossia of the Russian language, in its initial state, explains the semantic and stylistic oppositions between Slavonic and Russian elements in modern Russian. As an example of this, let us take the concept of "face." The word that corresponds to it in Slavonic is *litse*, and in Russian *litso* [лицо]. During the first period (from the eleventh to the fourteenth century), the forms of Slavonic and Russian differed morphologically but were semantically equivalent. Both designated the face of God as well as the human face. Then came the emergence of diglossia as such, and the Russian word became a "marked" form designating solely the human face, while the Slavonic word continued to designate both the divine and the human face, so that in order to make a discourse "high," it sufficed to replace the Russian *litso*, which means only "human face," with its Slavonic equivalent, which means both "face of God" and "human face."

It was after the "second Bulgarian influence" in Russia (end of the fourteenth century and beginning of the fifteenth) that Slavonic and Russian forms ceased to be equivalent. Slavonic was henceforth distinct from Russian because the speaker did not use Russian forms to create Slavonic ones but learned Slavonic as an independent system. However, Slavonic words, with their peculiar physiognomy, became words in the Russian language, within which they were regarded as "high." Modern Russian emerged from this Russian Slavonic, which mixed the Slavonic forms with Old Russian.

The texts show that there was a close relationship between the subject dealt with and the linguistic key in which it was described. The linguistic difference between the Slavonic word and the Russian word corresponds to the difference between true ("high") reality and empirical ("low") reality, between objective and subjective knowledge. Analogies can be found in the opposition between Greek *gnôstês*/*histôr* [γνώστης/ἵστωρ] and the opposition between German *kennen*/*wissen.* In Russian these correspond to the two ways of saying "knowledge": *znati* [знати] (Slavonic), and *vedat'* [ведать] (Russian). Thus, Russians use Slavonic terms in speaking of angels and Russian terms in speaking of humans, but Slavonic terms are also used when speaking of man as the image of God. This correlation between the theme and the verbal key provides the linguistic model of the conceptual schema of the "two worlds" in Russian philosophical thought.

In late seventeenth-century Russia Slavonic words became autonomous to a certain extent, developing new meanings under the influence of other European languages, particularly French. These new meanings tended to be abstract, metaphorical, poetic, and sublime. Thus Slavonic forms differentiated themselves from Russian ones and became "marked" in turn: Slavonic *litse* no longer meant both "human face" and "face of God" but was now restricted, by direct opposition to Russian *litso* ("human face"), to the meaning "face of God." Modern Russian thus uses Slavonic forms to express abstract and poetic concepts.

Thanks to this diglossic play, when Russian seeks to develop its vocabulary, especially its intellectual vocabulary, it can do so in two ways. If it enriches its vocabulary by Europeanizing itself, it thereby affirms its autonomy with respect to Slavonic. But if it enriches its vocabulary by drawing on Slavonic, which has itself been enriched and modernized, then it presents Slavonic as autochthonous and asserts its identity with respect to other European languages. In general, diglossia, and the particular twist it gives to relations between Russian and European languages, is one of the roots of Russian untranslatables.

II. Dialectic Revised by Diglossic Thought: The "Two Worlds" Conceptual Schema

Because of the semantic and stylistic opposition of Slavonic and Russian elements, the Russian language gives rise to the "two worlds" conceptual schema. The objective situation of diglossia generates a diglossic thought that develops independently of the Slavonic or Russian origin of the terms it uses. It is appropriate to use this schema in analyzing Russian philosophical discourse. We will call thinking based on this kind of opposition "diglossic": it transposes the linguistic model of diglossia to the conceptual level.

The Russian philosophical language was constituted in the 1830s and 1840s, at the same time as modern Russian literature. Unlike the language of literature and journalism, whose development was shaped by the French model, the Russian philosophical language was shaped by German idealism (Schelling, Hegel). Our hypothesis is that Russian philosophy was constituted at that time on the basis of German dialectic interpreted in the framework of diglossic thinking.

The diffusion of Hegelian philosophy in Russia did not begin with the *Phenomenology* or the *Logic*. The first of Hegel's works to be translated into Russian were the *Philosophy of History*, the *Aesthetics*, and the *Philosophy of Religion*, which dealt with themes more directly connected with traditional Russian problems (Koyré, "Hegel en Russie," in *Études sur l'histoire*). Essentially, Russian thought takes two things from Hegel's philosophy: first, dialectical contradiction, and second, the idea of the rationality of the real.

1. Here, for example, is how diglossic thought interprets the concept of dialectical contradiction to make it conform to the "two worlds" schema. Consider the translation of the German word *aufheben*. Two words are used, *snimat'* [снимать] and *primirjat'* [примирять] (Hegel, *Complete Works*, vol. 9). *Snimat'* is a neologism whose literal meaning is "remove," "deduct," and even "disconnect" (a currently common meaning is "take a photograph"). *Primirjat'* corresponds to the German *versöhnen*, "to reconcile." "Reconciliation" is a transition from "conflict" to "peace": the root of the word *pri-mir-jat'* is the word *mir* [мир], which means "peace." Each of the Russian terms is an aspect of the polysemy of *aufheben*: the first is a word coined ad hoc, the second a word in ordinary, practical language. Hegel himself justified in advance this double translation by using *versöhnen* as a synonym of *aufheben*, but only with regard to human action (for example, in his *Philosophy of Religion*). In Russian the expression "the reconciliation [*primijat'*] of contradictories in unity" (ibid., vol. 3) thus

coexists with this other expression "the disconnection [*snimat'*] of contradictories in unity" (ibid.). But these two expressions are in fact distributed in accord with the diglossic schema of the high world and the low world. For example: "the concreteness of the thing is the unity of all its aspects and the reconciliation of all its oppositions" (Belinsky, *Complete Works*, vol. 11): this sentence refers to the high world; in fact, the notion of peace (*mir*), which is inseparable from that of *kosmos* [κόσμος], has religious connotations. Thus we see that a word in the ordinary language is used to express the high world.

2. Diglossic thought is also at work in the value hierarchy of the terms constitutive of any contradiction, for example, the opposition "individual"/"society," which plays a central role in the work of Vissarion Belinsky (1810–1847). It was in large measure because of the latter that Hegelianism ceased to be something discussed in salons and coteries and became a major event in intellectual history (oddly enough, Belinsky knew no German). Applying what the *Philosophy of Right* says about rational reality—"*Was wirklich ist, das ist vernünftig*" (Whatever is real is rational), Hegel, *Grundlinien der Philosophie*, 14)—he presents the individual/society dialectic as a process of reconciliation with reality ("*Versöhnung mit der Wirklichkeit*," Hegel, *Vorlesungen*, vol. 2).

Personality (*ličnost'* [личность]) is particular and contingent. Its mode of existence is the mirage and nothingness. Society is the highest reality. Compared with the universal, which alone is real, the individual is nothing. Personality is the negation of society, because society as a reality constitutes the positive; its negation is an anomaly, a "disease," as opposed to the healthy state. But as a rational being man is universal and necessary. That is why we must reconcile ourselves with rational reality. A man who has not been thus reconciled becomes a mirage and an "apparent nothingness" (Belinsky, *Complete Works*, 3: 341: "Reality . . . demands that man make complete peace with it, . . . or else it will crush him"). Belinsky always gives a positive sense to words like "real," "universal," and "rational," which have for him "an almost sacred coloring" (Tchizevskij, *Gegel*). Thus he contrasts "the domain of pure reason" with "common vulgar reason," and this contrast corresponds to the Hegelian opposition between reality and existence. Belinsky explains that the more one has universality, the more alive one is, and that a person who has no universality is a "living cadaver." For Hegel, reality is higher than existence ("*die Wirklichkeit steht auch höher als die Existenz*," *Wissenschaft der Logik*, 2: 169). But for Belinsky, this "higher" belongs to the high world and necessarily has the value of "better," to the point that the inequality of the terms of the opposition blocks the dialectical process itself. The fact that *ličnost'* belongs to the low world may explain its political use in the expression "personality cult." Khruschev was able to attack Stalin as a promoter of his "personality" because *ličnost'*, far from being a positive term, as "personality" is in English and French, has to "supersume" all the negative values of the individual. The critique of the personality cult is thus still a matter of Hegelian-Marxist orthodoxy, but it is anchored in diglossic thought.

3. However, diglossic thinking does not imply remaining in dualism. The third specifically Russian characteristic is the development of the dialectical contradiction into a "(re)conciliation of all oppositions," for example, in the work of Alexander Herzen (1812–1860).

According to Herzen, Kant's achievement was to have shown the existence of antinomies within reason. The Kantian heritage has penetrated the mind of modern man in the form of a permanent battle between consciousness and habit, logic and narrative, thought and action, philosophy and history (Herzen, *Works in Two Volumes*, vol. 1). The Hegelian dialectic sublimates "all" these oppositions by achieving the unity of things in a movement for which the organization of the Russian lexicon provides the model. However, this kind of opposition between thought and reality is only one type among others: the theoretical type. There still remains the deeper dualism between theory and practice. The latter finds its definitive resolution only in man's personal "action." Herzen's conception of action differed from the one that was common at the time of the Left Hegelians. It is not a directly political or social action; nor is it "practice." Personal action is the element of a "language," because it has a symbolic sense and refers to something other than itself. What is this language?

Herzen's model is nothing other than the "two worlds" schema. The "low" world is the one represented by science as a language of abstraction and generalization. The "high" world is that of a science that penetrates "into the brain and the blood" (ibid.) and is manifested only in free and rational "action" (Slavonic *dejanie* [деяние]); it is the world of life or of "living truth." These actions constitutive of *ličnost'*, of the "person," are the language of history. The will of the people as a historical subject is based on the personal freedom of the *ličnost'*. The person creates (Slavonic *tvorit'*) his actions as well as his morality ("The truly free man creates his morality," Herzen, *Works in Seven Volumes*, vol. 5). In the framework of history, free action, the scientific word, is the *odejstvotvorenie* [одействотворение] of science, that is, its "actualization-creation." *Odejstvotvorenie* is a neologism invented by Herzen, probably on the basis of the German *verwirklichen*, which does not exist in modern Russian (it is a neologism like *entelecheia* [ἐντελέχεια] in Aristotle).

The oppositions that exist in the "low" world "resolve-disconnect" themselves in the Hegelian sense, but the opposition between the low and the high worlds cannot be "dissolved." Rather, it is "reconciled" (*primirjat'*), because reconciliation is the disconnection of the high toward the high, and this reconciliation takes place in free and rational action or *odejstvotvorenie*.

A few explanations regarding the use of this term: "In the context of action [Slavonic *dejanie*], reason and the heart are integrated in *odejstvotvorenie*" (Herzen, *Works in Two Volumes*, vol. 1). The verb *odejstvotvorjat'* [одействотворять] is a word composed of *dejstvie* [действие] ("action") and *tvorit'* [творить] ("create"). The verb *tvorit'*, "create like God the Creator," refers to the high world. The verb *dejstvovat'*

[действовать] ("act") is an erudite equivalent of the authentically Russian verb *delat'* [делать] ("to do"), which refers to the low world. In Slavonic we find the verb *dejati* [деяати] ("act"), one of the derivatives of which is *dejanie* ("action"). Thus *dejanie* signifies action that is aimed at the high world, or high action.

The Slavic verb has two aspects, the perfective (which considers action from the point of view of its result) and the imperfective (which takes the process into account). *O-dejstvovat'* ("animate by action or for action," "make actual or efficacious," "realize") is the imperfective corresponding to the perfective *dejstvovat'*. The morphological structure of this verb thus reflects the transformation of the imperfective into the perfective, and then the transformation of this perfective base into a new imperfective by adding the form **tvorjat'*, from the verb *tvorit'* ("create") (in accord with the schema *o-dejstvovat'* [pf] > *o-dejstvotvorit'* [pf] > *o-dejstvo-tvorjat'* [impf]).

The imperfective obtained in this way clears the way for the process on the basis of what is already the result of an earlier process. The lexical means for obtaining this "imperfectivization" consists in making use of a verb from the high register: "create," which is added to "to make" from the first process. The total process thus includes both the first process and its completion (in other words, it is a "creation" that includes both the "making" and the product): this verbal form is in itself an eminently Hegelian actualization.

Thus the translation of the sentence considered in relation to the "two worlds" schema is presented in the following way: in the personal action of *ličnost'*, which is the "high" action as opposed to the actions of the reason and the heart, which are "low" actions, reason and the heart are integrated into the process that separated them from the low world in order to draw them, in a creative way, toward the high world.

This example is a good illustration of the general case. The reconciliation between the two worlds is the process that brings out what has already been achieved in the low world and carries it toward the high world. As a rule human action, which is at the same time language, carries out this reconciliation, which constitutes the reality of the high world. On this foundation alone all oppositions are reconciled in the framework of a synthetic unity. The "two worlds" schema provides the basis on which Russian philosophy develops an ontology that is separated from neither anthropology nor ethics. That is how diglossic thinking transforms the Hegelian dialectic, the relation between the perfective and the imperfective being itself subjected to this "supersumption" to the benefit of the imperfective.

III. The "Good" in the Two Worlds: The Diglossic Opposition between *Dobro* and *Blago*

The approximate French equivalent of the *dobro/blago* opposition is *bonté* (the quality of what is morally good)/ *bonheur* (happiness). French dictionaries translate both words as *bien*. The Greek *eu* [εὖ] has been translated as *blago* [благо] (Slavonic) or by *dobro* (Russian), whereas *agathos* [ἀγαθός] and *kalos* [καλός] have always been translated by *dobro* (RT: *Leksikologija i slovoobrazovanije drevnerusskogo jazyka* [Lexicology and word formation of the Old Russian language], 174).

The *dobro/blago* opposition was first applied in Russian philosophy by Vladimir Solovyov (1853–1900), in his fundamental work *Opravdanie dobra* (1897). The standard French translation of this title is *La Justification du bien*. Solovyov's starting point is the heritage of the dualism of Kantian ethics, namely the opposition between the motives of human action and the moral law, between the real world and the world of duty. Human action thus has two registers, that of the actual and empirical, and that of the normative. In this double register how is the distribution between the Slavonic term, *blago*, and the Russian term, *dobro*, carried out?

In our sublunary world *dobro* qualifies the ideal norm of the will, whereas *blago* designates the object that is the source of felicity. We seek to acquire this goodness that is called *dobro*, while *blago* is a grace that we enjoy or hope for. Insofar as it concerns human action, the actual accomplishment of duty, *dobro* belongs to the low world, even though the ideal to be attained (duty) concerns the high world. Thus the dialectical process aims at the realization of *dobro* and the unity of *blago* and *dobro*. To achieve this, Solovyov says, we have to show *dobro* as *pravda* (ibid.): therein consists *opravdanie dobra* [оправдание добра], the "justification" or "realization of the good." What does that mean?

The word *pravda*, from which *opravdanie* is constructed, is common to Slavonic and Russian. Its semantic field includes the promise, the oath, the rule, the command, the contract, the law. The starting point is the idea of a "divine order," a contract between God and man. Thus *pravda* corresponds to high reality, spiritual reality (Ouspensky, *Kratkij očerk*). In Russian the term has two meanings: "justice" and "truth." For Solovyov, who appeals to Russian linguistic intuition (ibid.), justice is nothing other than true reality.

The verb *opravdyvat'* [оправдывать] ("justify") is an imperfective of the perfective *opravdat'* [оправдать] (lit., "render justice"). The term *opravdanie* is the active noun drawn from the latter verb. The formula *opravdanie dobra* ("justification of good") can be interpreted in two ways, depending on whether the noun's genitive complement is understood as objective or subjective. Objective: the *dobro* is the object of a justification, a human realization in the low, sublunary world. Subjective: the good is the subject of the justification and takes an active part in the process that develops between the two worlds, the world in which *dobro* is distinct from *blago* and, on the other hand, the world in which they merge.

According to Solovyov, the expression "show the *dobro* as *pravda*," the literal meaning of *opravdanie dobra*, does not mean "show the *dobro* as justice" but rather "show the *dobro* as true reality." In this sense the *dobro* is the active *dobro* (subjective genitive) that unifies *dobro* and *blago*. As such, it is the state of God, "beatitude" (*blaženstvo* [блаженство]), the Russian word derived from *blago*.

Opravdanie dobra, that is, the accomplishment and realization of *dobro*, takes place only insofar as the divine Spirit really appears in humanity; and this realization merges with *blaženstvo* ("beatitude"). Humanity as "person" (*ličnost'*) is realized in history as the true bearer of the real ethical order, the perfect organization of the world, the universal

Church suitable for receiving the divine Spirit. The actions of this general person thus become a kind of language because they acquire a symbolic sense. Humanity, insofar as it performs this task, becomes "divino-humanity" (*bogočelovečestvo* [бого-человечество]).

In Solovyov's work the low world is the historical world, and the high world is that of beatitude and divino-humanity. The process of *opravdanie* accomplishes the transition from the former to the latter. The vehicle of this transition, the low agent, is humanity, but its true motor is *dobro* itself. *Dobro*, which first constitutes in the normative sphere in the low world, becomes actually real in the high world, through *opravdanie*. This process transforms the low agent (humanity) into a high agent (divino-humanity) and unites *dobro* and *blago* in the form of *blaženstvo* (beatitude). Thus the expression *opravdanie dobra* must be translated as "the (true) realization of the good," understanding "realization" in two senses: (1) the passage to the state of concrete reality, and (2) correct perception (cf. English "realize"). The "accomplishment of the good," beatitude, is the good realized. This dual conception of the good shows with the greatest force the irresistible propensity of Russian thought to formulate its notions in religious terms or, more exactly, in hierarchized dualities, thus taking advantage of the diglossia that characterizes the history of the Russian language.

SACHVERHALT, SACHLAGE, OBJEKTIV (GERMAN)

ENGLISH   state of things, state of affairs, positive fact
FRENCH   *état de chose, état-de-chose, contenu propositionnel*
GREEK   *pragma* [πρᾶγμα]
LATIN   *status rerum, status quaestionis, dispositio rei, complexe significabile*

➤ *STATE OF AFFAIRS* and DICTUM, ERLEBEN, *FACT*, GEGENSTAND, INTENTION, MATTER OF FACT, OBJECT, PROPOSITION, *PROPOSITIONAL CONTENT*, SEIN, SENSE, TATSACHE, *THING* [RES]

Although in German *Sache* is a generic term designating the thing (in the physical sense, or the thing in question during a debate or trial), philosophical language has extended this concept, which has since Husserl designated both physical things and values, things for use, mathematical idealities, and the correlates of complex propositional forms. The same holds for the derivative forms *Sachlage* and *Sachverhalt*, which in everyday German designate the circumstances but in the philosophical language designate how things behave (*wie die Sachen sich verhalten*), which is translated into French as *état de chose* or, more terminologically, *état-de-chose*, and into English as "state of things" or "state of affairs." This translation masks the difficulty of grasping what these terms mean because they seem to denote properties or relations peculiar to objects of experience, even though they actually refer to the object of the judgment or of the propositional formulation. Similarly, the concept of the *Objekt* introduced by Meinong designates not the correlate of an experience but that of an act of judgment. The problem thus proceeds from the fact that all these terms have to do, not with the general problematics of objectivity, but with the specific question of the intentional object of judgment.

I. The Juridical Origin of *Sachverhalt*: The *Status Rerum*

The concept *Sachverhalt* has its origin in the juridical lexicon: it is derived from the legal notion of *status*, understood in the expression *status rerum* as the state of affairs in question, as contrasted with the *status homini*, which designates a person's status (free or slave). More precisely, the expression *status rerum* is found in judicial rhetoric, where it is defined as the object of litigation (*Streitfrage*), which is moreover one of the original meanings of *Sache* in German. Thus we read in the *Lexicon totius latinitatis* ("Status," 478): "*status dicitur quaestio, quae ex prima causarum conflictione dicitur*" (the question arising from the primary conflict of legal cases is called the *status*). For example, if the conflict of cases is defined by the contradictory assertions "A killed B" and "A did not kill B," then the *status* is defined as the question of whether A killed B. This juridical origin of the term *Sachverhalt* on the basis of *status* understood as *quaestio* no doubt explains the formation of the German word: the substantive *Verhalt* is not common in German (the nominalized infinitive *das Verhalten,*

"behavior," is used instead), and *Sachverhalt* is probably an abbreviation of a question as to "how a thing behaves" (*wie die Sache sich verhält*).

In this context there is already a shift of the sense of *status* from the real things about which a judgment is made toward the object of judgment itself, since *status* is correlative to the *narratio* and the argumentation: the object of litigation can be determined only by the establishment of the facts (*Sacherzählung*), and the judgment handed down is the conclusion of a series of arguments bearing on the facts (*sachliche Argumentation*). That is the sense in which the term is used by Quintilian:

Quod nos statum, id quidam constitutionem vocant, alii quaestionem, alii quod ex quaestione appareat.

(That which I call the *basis* [*status*], some style the *constitution* [of the object of litigation], others the *question* [of the object of litigation], and others again *that which may be inferred from the question*.)

(Quintilian, *Institutio oratoria*, III, 6, 2, 409)

In detaching itself from the specifically juridical field, the term *status* underwent an extension that anticipates the modern meaning of *Sachverhalt* as "state of affairs"; initially reserved for the object of litigation, with which the pleas made by the prosecution and the defense were connected, it came to designate all the properties of a thing:

Translate ponitur frequentissime pro modo, quo quaeque res stat, condicione, qualitate fortunae, loco, ordine.

([The expression "status"] is very frequently used to translate how each thing stands, its condition, external circumstances, place, order.)

(RT: *Lexicon totius latinitatis,* 478)

In the German juridical lexicon the corresponding terms constitute a series of related concepts (*Rechtverhältnis, Sachstand, -lage, -verhalt, -verhältnis, Streitstand, Tatbestand,* that is, the state of affairs, the circumstances relevant to a case, a cause, a trial), in which *Sachverhalt*, whose meaning was initially close to that of *Tatbestand* (at first equivalent to the *corpus delicti*, but then restricted to the first part of the juridical *status*, which sets forth the conditions of the law's application), is gradually detached from this purely formal meaning and comes to designate all the concrete facts that make up the *Tatbestand*: "*der konkrete Lebensfall, der juristisch beurteilt werden soll*" (the concrete life-case that has to be decided by law) (E. Beling, *Grundzüge des Strafrechts* [Foundations of criminal law], 1930). On all this, see B. Smith. "Sachverhalt," in RT: *Historisches Wörterbuch der Philosophie*.

II. The Logical Origin of *Sachverhalt*: The *Complexe Significabile*

The second origin of the concepts of *Sachverhalt* and *Objektiv* is found in the way that Aristotle and medieval thinkers analyzed the relation between the proposition and its object, and especially in Gregory of Rimini's doctrine of the *complexe significabile*. The general issue at stake has to do with the determination of the object of the proposition: is it in the things themselves and their properties, or in the meanings that designate states of affairs? From this point of view, we can distinguish two stages: the first identifies the object of judgment no longer with the thing denoted but with the *complex* relationship between the thing and its properties; the second makes this complex no longer a real state residing in things but a complex *signification*.

a. In Aristotle's *Categories*, *pragma* [πρᾶγμα] designates not simply the thing, but the state of affairs described by a judgment that confirms the latter and gives it the status of truth (*Categories* 4b5–10, 12b5–15, and 14b19–23). This distinction is extended in some medieval theories of truth, which make the object of a proposition not the things themselves that are the denotation of nouns, but the *dispositio rerum*, that is, the relationship of things (substances, properties, accidents) to each other, in short, a state of affairs, a way of being, a "mode of behavior": the object of the judgment "A is B" is not "A" but the "being B of A." Thus we read in Thomas Aquinas that "*dispositio rei est causa veritatis in opinione et oratione*" (the state of affairs is the cause of truth in opinion and discourse) (*In duodecim libros*, IX, 11), and in Abelard's *Dialectica* we read that:

> non itaque propositiones res aliquas designant simpliciter, quemadmodum nomina, immo qualiter sese ad invicem habent, utrum scilicet sibi conveniant annon, proponunt. . . . Unde quasi quidam rerum modus habendi se per propositiones exprimitur, non res aliquae designantur.

> (Propositions do not designate simply random things, as names do, but set forth the way in which they behave with respect to each other, whether they are in accord with each other or not. . . . And thus what is expressed by propositions is, so to speak, the mode of things' behavior, the things themselves are not designated.)

(*Dial.* 160.23–36)

b. Gregory of Rimini's doctrine, set forth in his *Commentary on the Sentences*, gives the complex the status of a *signified complex* and no longer that of a real complex: knowledge bears not on the proposition stated, or simply on the real object to which it refers, but on the adequate signified of the proposition (*significatum*); it is not only the proposition (*veritas in dicto*) or the thing with its mode of being (*veritas in re*) that is true, but also the signified of the proposition (*veritas in essendo*): neither the statement "A is B" (man is white) nor the thing denoted "A" in its "being–B" (man, whiteness), but the stateable complex or what is signified by complex "A to be B" (man to be white). Thus the object of a

demonstration is neither the conclusion stated, nor the external thing it concerns, but the total and adequate signified of the conclusion.

In this way, the relation between a thing and a property, which is translated in German by *Sachverhalt*, acquired the status of "complex objective meaning": it is not simply a subjective act of the mind connecting the thing with its predicates but actually an object, and an object of another type than a simple denotation (the existent, the external thing) or a complex denotation (the real state of affairs). The essential consequence of this is the extension of the concepts of thing, being, or "something" (*res, ens, aliquid*), that is, the extension of the concept of "object in general" beyond that of "external thing," because the signified complex is indeed an "object" of a certain kind but one that is irreducible to an external thing, namely an ideal object distinct from any real object. "Man to be animal" is not something like the animal itself, but it is not nothing; it is not a being, but it is nonetheless an object.

III. A Series of Equivalents: *Satz an sich* (Bolzano), *Sachverhalt* (Stumpf-Husserl), *Objektiv* (Meinong)

The term *Objektiv* was introduced by Alexius Meinong in his book *Über Annahmen* to designate the correlate of a judgment. In section 14 he examines the genealogy of this concept as it had been traced by A. Marty and recognizes as antecedents of the *Objektiv* Bolzano's "proposition in itself," Carl Stumpf's "state-of-affairs," and Brentano and Marty's "content of judgment" (*Urteilsinhalt*). This genealogy allows us to clarify the double basis of *Objektiv* in the intentional analysis of significations as ideal objects and in the intentional analysis of judgment and its correlate, and to situate it in the tradition of the medieval *complexe significabile*.

A. *Objektiv* and *Satz an sich*: Meinong and Bolzano

In Bolzano's work the concept of a "proposition in itself" or "objective proposition" combines the properties of objectivity, complexity, and completeness: on the one hand, like all subjective thought, it is distinct from any real statement, and unlike external things, it has no real existence, no spatiotemporal individuation but only an ideal, omnitemporal objectivity; on the other hand, unlike "concepts in themselves" (*Vorstellungen an sich*), which are both its simple parts and elementary signifieds, it has the property of bivalency, that is, of truth and falsehood; it is an ideal signified, bivalent and complex, the objective correlate of the stated proposition or of the subjective thought. "A square is round" designates an objective proposition, even though no real or noncontradictory object corresponds to it (cf. *Wissenschaftslehre* [*Theory of Science*, 1837], §19, and introduction to the *Grössenlehre* [*Theory of Magnitudes*, 1833], II, §2). The concept of *Satz an sich* thus defines one of the dimensions of the *Objektiv*, that of the ideality of signification.

B. *Sachverhalt* and *Objektiv*: Stumpf, Brentano, Meinong

The other dimension, that of the correlation between judgment and its "object," hails from Stumpf and Brentano. In the 1906 treatise *Erscheinungen und psychische Funktionen* [*Phenomena and psychic functions*], Stumpf, having defined

"functions" as lived experiences other than the contents of sensation (acts of attention, unitary understanding, judgment, and also desire, will, etc.), seeks to define the correlates produced by these acts. Thus the act of unitary understanding has as its correlate a quality-of-form, the act of synthetic understanding as a whole, and the act of judgment a content-of-judgment to which Stumpf gives the name *Sachverhalt*. Brentano recognized, he tells us, that

> dem Urteil ein spezifischer Urteilsinhalt entspreche, der vom Vorstellungsinhalte (der Materie) zu scheiden sei und sprachlich in "Daß-Sätzen" oder in substantivierten Infinitiven ausgedrückt wird. . . . Ich brauche für diesen spezifischen Urteilsinhalt den Ausdruck *Sachverhalt*.

> (to the judgment corresponds a specific content-of-judgment that must be distinguished from the content-of-representation (matter) and that is expressed in language by subordinate clauses with "which" or by nominalized infinitives. . . . To designate this specific content of judgment, I use the expression "state-of-affairs.")

(Stumpf, *Erscheinungen*, 29–30)

Meinong denied the equivalence between Stumpf's *Sachverhalt* and Bolzano's *Satz an sich*, on the one hand, and his concept of *Objektiv*, on the other: such an assimilation would in fact reduce the *Objektiv* to "psychic constructs" (*psychische Gebilde*, in *Über Annahmen*, §14) and would thus situate itself on the side of the subjective or psychological; if the state-of-affairs is a construct produced by the creative synthesis (*einer "schöpferischen" Synthese*) of psychic functions, it is nonetheless not a content included in consciousness and is not identified with these subjective functions; on the contrary, it is a new object requiring a grasping that involves going outside consciousness (*ein Hinausgreifen*). This new object is strictly correlative to the function of judgment and does not exist in itself, independently of the latter; in Husserlian terms, it is the intentional correlate of the act of judgment:

> Aber der Sachverhalt kann nicht für sich allein, unabhängig von irgendeiner Funktion unmittelbar gegeben und damit auch real sein . . . die Gebilde aber sind Tatsachen überhaupt nur als Inhalte von Funktionen.

> (But states-of-affairs cannot be immediately given in isolation, independent of any function, and be thereby real . . . constructs are facts insofar as they are contents of functions.)

(Ibid., 32)

C. *Objektiv* and *Gegenstand*: Meinong

It is in Meinong's treatise *Über Annahmen* that the state-of-affairs designated by the term *Objektiv* finds its most systematic theoretical formulation and its most rigorous use in the framework of a generalized theory of objects (*Gegenstandstheorie*) that includes significations as ideal objects:

> In unserem Beispiele finden wir neben einem Gegenstande, über den geurteilt oder der beurteilt wird, noch einen anderen, der "geurteilt wird." . . . Objekt fällt also hier mit dem zusammen, was beurteilt, Objektiv mit

dem, was geurteilt wird. Insofern hat das Urteil also nicht einen Gegenstand, sondern deren zwei, von denen sonach jeder Anspruch hätte, "Urteilsgegenstand" zu heißen.

> (In our examples we find, alongside the object of a judgment or assessment, another object, which is "judged." . . . Thus here *Objekt* merges with that which is assessed and *Objektiv* with that which is judged. To this extent, the judgment has not a single objective correlate but two, both of which could lay claim to be called object-of-judgment.)

(Meinong, *Über Annahmen*, §8, 14)

Here, *Gegenstand* is the genus designating the correlate of an act or a lived experience of which *Vorstellungsgegenstand* and *Urteilsgegenstand* are the species, the correlates of representation and judgment respectively. Meinong's goal is to show the specificity of the latter with respect to the former, and he does so by calling the former *Objekt* (denotation, reference, or real object represented) and the latter *Objektiv* (the meaning or complex signification that is the aim of judgment). Thus in the statement "there is snow outside," the object is "snow" and the "objective" is "that there is snow."

Let us clarify the terminological question. If Meinong rejects the concept "content of judgment" (*Urteilsinhalt*) employed by Stumpf, Brentano, and Marty, that is because metaphorically the term *Inhalt* makes the *Objektiv* something contained within the subjective lived experience of judgment, whereas it is an object grasped by the judgment:

> Ganz unnatürlich scheine mir aber, dabei so weit zu gehen, daß man [das Objektiv] in einem Erlebnis deshalb wollte "enthalten" sein lassen, weil es durch dieses erfaßt wird. Das Erfaßte ist vielmehr der Gegenstand des erfassenden Erlebnisses. . . . Objektive können nicht Urteilsinhalte heißen, weil sie nicht Inhalte heißen können.

> (It seems to me very artificial to go so far as to try to see [*das Objektiv*] as "contained" within an experience because it is grasped by means of the latter. What is grasped is rather the object of the grasping experience. . . . The Objectives cannot be called contents-of-judgment because they cannot be called contents.)

(Ibid., §14)

The Objective is thus indeed an object, but far from being an object of an existing (*wirklich, daseiend*) representation, it is an ideal object, of a superior order, characterized not by existence but by pseudo-existence, a-temporality, or nontemporal persistence (*Persistenz*). Meinong expressed it by the term *Bestand*, which operates in a double register: on the one hand, it means "state of affairs," like *Sachverhalt*; on the other hand, it comes from the verb *bestehen* (to subsist) and designates what subsists outside of time, as opposed to *Gegenstand*, that is, the object that subsists in time. Although each of the two possible translations of *Bestand* ("state of affairs" and "subsistent") leaves out one of these two characteristics, the latter translation is preferable, not only because the context insists on the a-temporality common to the Objective

and to all ideal objects (*ideale Gegenstände*), but also in order to avoid the redundancy with *Sachverhalt*.

> Bestände unterscheiden sich von Existenzen . . . darin, daß sie an keine Zeitbestimmung gebunden, in diesem Sinne ewig oder zeitlos sind. Das gilt natürlich auch vom Objektiv.
>
> (Subsistents differ from existents in that they are not bound by any temporal determination, and in this sense they are eternal or a-temporal. That also holds, of course, for the Objective).
>
> (Ibid., §11)

Thus "3 > 2" is a subsistent, an omnitemporal object, and paradoxically judgments bearing on temporal existence ("this table exists now") concern a-temporal Objectives, because time belongs solely to judgment and not to its correlate.

Finally, the properties that classical logic attributed to statements belong to Objectives: the two formal paradigms of Objectives are being ("A is") and being such (*Sosein*, "A is B"). Objectives are positive or negative (ibid., §12), and they admit of modalities (ibid., §13). But the nominal identity of these properties must not mask the difference between those of the Objective and those of the subjective judgment: the truth of judgment (*Wahrheit*) is a grasping of the actuality of the Objective (*Tatsächlichkeit*), its possibility, that of the verisimilitude of the Objective (*Wahrscheinlichkeit*).

D. From *Sachverhalt* to *Wertverhalt*, *Wertsachverhalt*, etc.: Husserl

The concept of *Sachverhalt* was also adopted by Husserl and Adolf Reinach, further extending Meinong's problematics. In Husserl's work it is part of a universal theory of the objective correlates of judgment (formal ontology) *qua* species of categorial objects distinct both from acts of judgment and things experienced (*Dinge*):

> Das Objektive des urteilenden Vermeinens nennen wir den beurteilten Sachverhalt; wir unterscheiden ihn in der reflektierten Erkenntnis vom Urteilen selbst, als dem Akte, in dem uns dies oder jenes so oder anders zu sein erscheint.
>
> (What plays the part of object to judgment and opinion we call the *state of affairs judged*: we distinguish this in reflex knowledge from the *judging* itself, the *act* in which this or that appears thus or thus.)
>
> (Husserl, *Logische Untersuchungen,* V, § 28, Hua XIX/1)

From this point of view, the category of state-of-affairs undergoes an extension of meaning, for it can be the correlate of other kinds of acts (of nominalization as "the being-P of S," of wishing, of questioning, etc.) and designates all objects other than those of simple representation, hence the universal object of formal ontology as a doctrine of the modes of the "something."

It is on this basis that we can pose and resolve the problems of translation: namely, both the complex character of the *Sachverhalt* (insofar as it is the correlate of a complex intention, implying a judgment or a predicative structure that may be ramified) and its quasi-universal extension to all the objective correlates of judgments (insofar as it is a correlate of diverse types of acts, judgments that are axiological, aesthetic, eidetic, etc.). Thus the term *Sachverhalt* has been translated into English, with reference to the Latin locutions *status rerum sive quaestionis* and *dispositio rei* as "state of things" and "state of affairs," and the latter has become standard since its first use in the English translation of Husserl's *Logische Untersuchungen* in 1905—reappearing later in the translations of Wittgenstein (*Tractatus logico-philosophicus*, 1922) and in Russell's works on objectives, facts, and propositions (*The Philosophy of Logical Atomism*, 1918; *Analysis of Mind*, 1921), and then in G. Bergmann (*Logic and Reality*, 1964) and in R. M. Chisholm's work on the ontology of state-of-affairs (*Person and Object*, 1976). However, the expression "state of affairs" is equivocal in that it can designate both a simple positive state of fact and the complex correlate of a judgment, whereas the meaning of *Sachverhalt* refers exclusively to the latter. Thus Boyce Gibson adopted, in his much later translation of Husserl's *Ideen* (1931), the translation "positive fact," which, referring to the first sense, is unacceptable because by depriving *Sachverhalt* of its character of complex predicative formation (which makes it a "predicatively formed affair-complex"), it falls back on *Sachgehalt* (which designates everything that has a concrete content) or *Zustand* (that is, the momentary state of a thing or of an ego in general) and makes impossible its extension to all sorts of possible judgments.

Husserl's vocabulary includes several terms that testify both to the predicative origin and to the possibility of extending *Sachverhalt* to the various kinds of judgment: thus (cf. *Ideen*, I, §95; Hua III/1, 220–21) an axiological judgment has as its object a *Wertsachverhalt* or *Wertverhalt*, that is, not the simple state-of-affairs present in the act of evaluation as having a value (*der werte Sachverhalt*, e.g., the betrayal of Jesus by Judas considered as evil), but the value of the state-of-affairs (the evil character of this betrayal) *qua* specific correlate of an axiological judgment based on the awareness of a state-of-affairs (the betrayal of Jesus by Judas); thus again (*Ideen* I, §6, Hua III/1, 19) the act of judgment concerning a correlation between essences (and not between facts) has as its proper correlate the eidetic state-of-affairs (*eidetische Sachverhalt*) designating either the ideal relation between essences as a subsistent object (*das Bestehende*) of judgment or the truth of this relation, which suffices to show that the meaning of the *Sachverhalt* is not limited to the positive fact; finally, since the activity of predication can be complex (because it can qualify objects that are themselves already nominalized states-of-affairs, e.g., "the betrayal of Jesus by Judas is an evil action"), its proper object is a *Sachverhalt* of a higher level because it results from a stratification of acts of grasping, predication, and nominalization, and this *Sachverhalt* then bears the name of *Sachlage*, which, translated into French by *situation* (which has the same drawback as "positive fact" in the case of *Sachverhalt*, namely that it eludes the predicative origin of the object in question), corresponds to the affair-complex, that is, to the complex state-of-affairs.

E. *Sachverhalt* and *Tatbestand*: Adolf Reinach

Reinach refines the characterization of *Sachverhalt*, which he clearly contrasts with the relation between objects that provides its factual material (*der sachliche Tatbestand*, *der Dingtatbestand*, in which *Bestand* has an opposite meaning to that of the one it had in Meinong, where it designates an objective substrate that is singular and concrete and not an ideal subsistent), as well as the ideal meaning intended by judgment. Reinach specifies the set of characteristics that distinguish it from things or worldly objects: the state-of-affairs is "apprehended" by a grasp of reality rather than being intuited in a perceptive manner, as are singular things. It is situated in a "logical and ideal" relation of antecedent to consequent rather than in a real and prediscursive relation of cause and effect, like worldly realities. It admits modalities such as the possible, the necessary, the contingent, and so on and finally, it can be positive or negative, whereas concrete things are simple existent and do not admit of negativity ("Zur Theorie," §9).

This reaffirmation of the status of the *Sachverhalt* as ideality encourages us to be very prudent with regard to the French equivalent "*état-de-chose*" or "*état de chose*," which, while it stresses the relational character of *Sachverhalt*, nonetheless affirms neither its predicative origin (because an *état de chose*, e.g., the color of a rose, can be perceived, whereas the *état-de-chose* "the being-colored of the rose" is exclusively a correlate of judgment) nor its nonworldly status (since both a thing and a state can be worldly realities, whereas the *état-de-chose* is an ideality). Even so, we are not likely to find a more truly adequate translation.

SAMOST' [самость] (RUSSIAN)

ENGLISH	self, selfhood, ipseity
FRENCH	*soi, ipséité*
GERMAN	*Selbst, Selbstheit*
GREEK	*ousia* [οὐσία]

➤ *SELF* [SELBST], and ACTOR, BOGOČELOVEČESTVO, CONSCIOUSNESS, DRUGOJ, ES, ESSENCE, I/ME/MYSELF, ISTINA, LËV, *PERSON*, POSTUPOK, RUSSIAN, SOUL, STAND, SUBJECT, SVOBODA, UNCONSCIOUS

The Russian word *samost'* [самость], a nominalization of the reflexive pronoun *sam* [сам], "myself" ("yourself," "himself," etc.) is the literal equivalent of English "ipseity." In the fifteenth century, *samost'* was nonetheless used in the sense of "essence" (*ousia* [οὐσία]). In modern Russian *samost'* can mean "the base, the center of the individual" and serve as a translation of French *soi*, English "self," or German *Selbst*. However, there is a diglossic tension between an ascetic meaning of *samost'* as an obstacle to the deification of the human being and a meaning derived from Jungian psychoanalysis as "the true self," the goal of personal development. The current tendency to neutralize the opposition between the two meanings reflects a unified, "onto-practical" vision of personal selfhood.

I. *Samost'* as *Ousia* and as "Monad"

The first known occurrence of the word as a philosophical term goes back to the anonymous fifteenth-century treatise on logic known as *Logika iudejstvujuščix* [The logic of those who practice Judaism]. The manuscript is a translation from the Hebrew and is thought to be an exposition of the logical ideas of al-Fārābī (Neverov, *Logika iudejstvujuščix*, 6), but the Hebrew original has not been found. The exposition follows more or less the content of Aristotle's *De interpretatione*. The Aristotelian distinction between essence (*ousia* [οὐσία]) and accident (*sumbebêkos* [συμβεβηκός]) is rendered in Slavonic by a distinction between *samost'* and *priključenie* [приключение], which means "occurrence, accident": "When one says 'man is living and white,' there is a difference between the relation [*prikosanie* (прикосание)] of living to man and the relation of whiteness to man: whiteness [is related to man] by accident [*po priključeniju* (по приключению)], and living by essence [*po samosti* (по самости)]."

In modern Russian the term that renders *ousia* is *suščnost'* [сущность] (Ukrainian *sutnist'* [сутність]), the nominalization of *suščee* [сущее], "that which is" (Greek *to ontôs on* [τὸ ὄντως ὄν]) (see also ISTINA). Although today *samost'* is no

longer used in the latter sense, the term nonetheless retains the ontological connotations of *ousia*. Thus, to introduce the term *samost'* in his work *Nepostižimoe* [The inconceivable] (1939), Simeon Frank (1877–1950) leaves the field of subjectivity: "By *samost'*, we do not mean here the subject [*subjekt*] or the "self" [*ja*] . . . and still less the person [*ličnost'*]" (Под "самостью" мы разумеем здесь не "субъект" или "я" . . . и тем более не "личность"). (*Nepostižimoe*, 332). For Frank *samost'* is first of all "singular being" or "separate being": "The self [*samost'*] is *certain* uni-totality [*vseedinstvo*], one uni-totality among others [*odno iz vseedinstv*], but it is not uni-totality in general—uni-totality as such [*kak takovoe*]—and it is found precisely outside the latter "("Самостъ" есть некое всеединство, одно из всеединств, которое, однако, не есть всеединство вообще—всеединство как таковое—и имеет себя именно вне последнего) (ibid., 333–34). This reference to *vseedinstvo* [всеединство], "uni-totality," gives *samost'* the character of a monad: each singular being is separate and eo ipso reflects the totality of the Absolute (Frank speaks of "the monadic form of being," ibid., 334–35). Moreover, Frank does not relate *samost'* to German *Selbst*, but rather to *das Eigene*, "the proper, what is one's own" (ibid., 333, 338; see PROPERTY). We note that the Slavic term *sobstvo* [собство], "the person," a old synonym of *samost'* that designates both individuality and membership (see SVOBODA), is in fact the abstract nominalization of the adjective *sobtsvennyj* [собственный], "proper, own" (German *eigen*). On the other hand, starting in the eleventh century *sobstvo* was used as an equivalent of the Greek *hupostasis* [ὑπόστασις], which means both "essence" and "person" (*Kneževič*; see ESSENCE). All this still further reinforces the ontological connotations of *samost'*.

II. *Samost'* as Ipseity

Samost' is an exact translation of English "selfhood," French *ipséité*, and German *Selbstheit*. Thus Paul Ricoeur's preface to his book *Soi-même comme un autre*, entitled "La question de l'ipséité," is rendered in the Ukrainian translation as "Pytannia pro samist'" (Ukrainian translation, 7; cf. *Soi-même comme un autre*, 11). *Samist'* is also used in the Ukrainian translation of Emmanuel Levinas's *Entre nous*: "Tout savoir de l'ici est déjà savoir pour moi qui suis ici. Le savoir se fonde sur l'ipséité" becomes "Bud'-jake znannia 'tut' je vzhe znanniam dlia mene, perebuvajučogo tut. Znannia gruntujet'sia na samosti [Будь-яке знання "тут" Є вже знанням для мене, перебуваючого тут. Знання грунту Ється на самості] (Ukrainian translation, 31–32). Similarly, *samist'* translates "selfhood" in John Crosby: *The Selfhood of the Human Person* becomes in Ukrainian *Samist' liuds' koji osoby* (Ukrainian translation, 29 f.).

III. *Samost'* as "Self"

However, starting in the nineteenth century, the term *samost'* reappeared to render *Selbst* in Russian translations of classical German philosophy. This meaning has been preserved down to the present. Thus in Hegel's *Naturphilosophie* (to take an example that does not concern human subjectivity) we find the expression *das Selbst des Organismus*, "the organism's self" (Hegel, *Vorlesungen über die Naturphilosophie* [1842], 597), which is translated into Russian as *samost' organizma* [самость организма] (Russian translation, 499).

The same translation of *Selbst* appears with the more abstract meaning: "*Das Selbst ist in seinem Dasein, in seiner Gestalt in sich reflektiert*" (*Vorlesungen*, 597) and becomes "*Samost' v svoëm naličnom bytii, v svoëm obraze reflektirovana v samoe sebja*" [Самость в своём наличном бытии, в своём образе рефлектирована в самое себя] (Russian translation, 441). Similarly, we find *samost'* in the translations of Feuerbach (e.g., *Istorija filosofii* (History of philosophy), 1: 293, 318–20; 2: 31, 60, 68) and often in Heidegger (*Filosofskij*, 403–4; *Vremia i bytie* (Being and time), 442). As concerns the derivative terms in Heidegger, *Ich-selbst* is rendered by *ličnaja samost'* [личная самость], "the *samost'* of the person," and *Man-selbst* by *bezličnaja samost'* [безличная самость], where the prefix *bez-* designates the negation of the "I." However, *Selbstsein* is rendered by *bytie Ja* [бытие Я] or by *samobytie* [самобытие], but never by *bytie samosti* (*Filosofskij*, 403–4). On the other hand, outside the context of German philosophy, the French *Soi* and English "self" are usually translated into modern Russian by *Ja* [я] (the pronoun "I" as a philosophical term, often capitalized, in italics or between quotation marks). Because of the abstract character of *samost'*, Russian (like Ukrainian) avoids as much as possible its use to render "self" (*Selbst, Soi*). In the recent Russian edition of MacIntyre's *After Virtue*, we find *Ja* used as the equivalent of "self" (*èmotivistskoe Ja* [эмотивисцкое Я]: "the emotivist self"; *geroičeskoe Ja* [героическое Я], "the heroic self," and so on. (MacIntyre, *Posle dobrodeteli*, e.g., p. 48, 173). *Samist'* is missing in the list of equivalents of "self" offered by the *English-Ukrainian Philosophical Vocabulary* (RT: *Anglo-Ukrajins'kyj filosofs'kyj slovnyk*, 219). On the other hand, the list contains *Ja* (I); *ja sam* [я сам] (I myself); *sutnist'* (essence); *osoba* [особа] (the person), a term with the same root as *svoboda* [свобода] (see SVOBODA); *istota* [істота] (living being), from the same root as *istina* [истина] (see ISTINA). The *Soi* in Ricoeur's *Soi-même comme un autre* is rendered in Ukrainian by the reflexive pronoun *sam* [сам], "myself" (yourself, himself); since *soi* and *soi-même* are both rendered by *sam*, translators are sometimes forced to explain between parentheses which French term is involved: *(*e.g., Ricoeur, Ukrainian translation, *Soi-même*, 10–11). Let us note in passing that the Ukrainian and Russian grammars, which have too many indirect cases, are not well adapted to expressing the distinction between French *je* and *moi*, so that the translation of Ricoeur sometimes requires giving the French terms: "*ja* (*moi*)" or "*ja* (*je*)," or again "*ja* (*moi-même*)" (e.g., ibid., Ukrainian translation, 10, 17; see I/ME/MYSELF).

IV. The Translation of Jung: *Samost'* as Center of the Person

However—and this constitutes a genuine translation difficulty—in certain contexts "self" (*Selbst, Soi*) can be rendered only by *samost'* (or *samist'* in Ukrainian). Thus "self" used in the context of Carl Jung's analytical psychology is always translated by *samost'*. In two encyclopedias of psychology recently translated from English, *samost'* is the only term used to render Jung's *Selbst* (Frager and Fadiman, *Ličnost'*, 97–98; Hall and Lindzey, *Teorii ličnosti*, 88–89), whereas in other authors—particularly William James, Alfred Adler, Ludwig Binswanger, George Kelly, Carl Rogers, and Abraham Maslow—"self" is translated by *Ja* (Frager and Fadiman, *Ličnost'*; Hall and Lindzey, *Teorii*

ličnosti). Although "self-actualization" is rendered in Russian by *samoaktualizatsija* [самоактуализация] (Frager and Fadiman, *Ličnost’,* 447–48, 491–95), the equivalent of the "ideal self" is *ja-ideal’noe* [я-идеальное] or else *ideal’noe ja* [идеальное я] (ibid., 446–47; Ross and Nisbett, *Čelovek i situatsija,* 274). But in Jung, as in Adler, Binswanger, Rogers, and Maslow, "self" refers to the wholeness of the person and signifies "the base, the center of the individual." Why, then, is there this disparity in the translations? The reason may be linked to the ontological connotations of the self as a term in Jungian psychology: like Plato’s *ousia,* Jung’s "self" often signifies "the essence" of the human being, whereas to other modern psychologists and psychoanalysts, it signifies more the image, the idea, the idealization, than an ontological concept. On the other hand, if we understand therapy and analysis as participation in the creation of an authentic self at the deepest level (that of both the therapist and the patient)—that is, as "ontological practice" or "ontopractice," Russian *ontopraktika* [онтопрактика], a neologism introduced by Igor Vinov in the collection *Practical Psychology* (RT: *Praktyčna psyxologijav konteksti kul’tur,* 77ff.)—a whole psychological theory will become an ontology of the person. Whence perhaps this new tendency to use *samost’* systematically in the sense of "the heart of the person and the center of his individual nature," beyond the limits of the exclusively Jungian context (RT: *Psixologija ličnosti,* 42, 67, 81, 82, 88, 150, 163), particularly in Maslow’s and Rogers’s theories of self-actualization (ibid., 108, 160, 206).

V. Ascetic Discourse:
Samost’ as "Low" Self / *Serdtse* as "High" Self

However, in contemporary Russian thought there is a discourse that denies the importance of the realization of the self and uses *samost’* to signify the "low" self. Orthodox asceticism, both Byzantine and Russian, affirms the necessity of an "elimination of the self" (Rus. *preodolenie samogo sebja* [преодоление самого себя], Gr. *kinêsis huper phusis* [κίνησις ὑπὲρ φύσις]) as the condition of the transfiguration of the person in the act of the "deification" (Rus. *oboženie* [обожение], Gr. *theôsis* [θέωσις]) of man (Florovsky, *Izbrannye bogoslovskie stat’i* [Collected theological articles], 60 ; see BOGOČELOVEČESTVO). In ascetic discourse *samost’* refers to the self that is to be eliminated. Thus Sergei Averintsev, a contemporary representative of ascetic discourse, disapproves of *samoljubie* [самолюбие], "self-esteem": "The ill will [*zlaja volja*] of the ‘self’ [*samosti*] seeks to subjugate the Other, to engulf his person [*ličnost’*]. . . . That is bizarre and dreadful" (Злая воля "самости" стремится поработить ближнего, поглотить его личность. . . . Это странно и страшно) (*My prizvany v obščenie* [We are called upon to communicate], 406–7.). Similarly, in Sergei Zarin’s monumental work *Asceticism according to Christian Doctrine* (1907), we do not find the usual terms of analytic psychotherapy—*samorealizatsija* [самореализация] (self-realization) or *samoosuščestvlenie* [самоосуществление] (self-actualization); on the other hand, we find *samootverženie* [самоотвержение] (repudiation of the self), *samootrečenie* [самоотречение] (self-renunciation), *samoprotivlenie* [самопротивление] (resistance to the self),

samoprinuždenie [самопринуждение] (self-restraint), and so on (691).

To designate the center of human spiritual life, ascetic discourse uses the term *serdtse* [сердце] (neuter gender), "the heart," the equivalent of the Hebrew *lĕv* [לֵב] (see LĚV) and the Greek *kardia* [καρδία]. In addition, the influence of neo-Platonism and especially the practice of hesychast asceticism gave the term mystical and spiritual connotations. The Greek term *hêsuchia* [ἡσυχία], which initially meant "tranquility," acquires in Byzantine Orthodox literature the meaning of "ascetic contemplation, in retreat and renunciation" (Averintsev, *Poetika rannevizantiĭskoĭ literatury* [The poetics of the first Byzantine literature], 258).

The essence of hesychasm as a spiritual practice is the transformation of the soul toward a state that is "open and ready for grace" (Khoruzhy, *K fenomenologii askezy* [On the phenomenology of asceticism], 105). Hesychast asceticism sees the heart, *kardia,* as "the existential and energetic center of the human being, the seat in which all the energies of man come together: strengths, aspirations, feelings, intentions" (ibid.). But to obtain the integrity of the *kardia* (the "high" self), one must first renounce oneself (the *samost’,* the "low" self).

This Orthodox ascetic discourse was adopted in the modern age by the "philosophy of the heart" (Russian *filosofija serdtsa* [философия сердца]. From the etymological point of view, the Russian word *serdtse* (Czech *srdce,* Polish *serce,* Ukrainian *sertse* [серце]) has the connotations of its Biblical Greek equivalent, *kardia:* the root *serd/sred* refers to the position within or at the center of a space. The list of terms with the same root includes the Russian *seredina* [середина] (middle, interior), *sreda* [среда] ("Wednesday," day in the middle of the week), *sredotočie* [средоточие] (center, crucial point), the adjective *srednij* [средний] (middle), and the adverb *posredi* [посреди] (among, at the center of) (Florensky, *Pillar and Ground,* 269).

Gregory Skovoroda (1741–1796), the founder of the "philosophy of the heart," found his *hêsuchia* in the life of the "itinerant philosopher" (Ukrainian *mandrovanyj filosof* [мандрований філософ]). Pamfil Jurkevytch (1826–1874) and Pavel Florensky (1882–1937) rearticulated in modern Russian the theological conceptions of the Church Fathers regarding the central role of *serdtse* in human spiritual life (see in particular Jurkevytch, *Filosofskie proizvedenija* [Philosophical works], 69–103; Florensky, *Pillar and Ground,* 267–71). Finally, in the work of Boris Vycheslavtsev (1895–1967), the "philosophy of the heart" found its psychoanalytic interpretation.

VI. Boris Vycheslavtsev: *Samost’* as "the True Self"

Vycheslavtsev uses the notion of *samost’* to move beyond the dualism of the *homo noumenon* and the *homo phenomenon* (Vycheslavtsev, "Serdce v xristianskoj i indijskoj mistike" [The heart in Christian and Indian mysticism], 81). He quotes Pascal’s *Pensées:* "*Où est donc ce moi, s’il n’est ni dans le corps ni dans l’âme?*" (Where is this self, then, if it is neither in the body nor in the mind?) (Vycheslavtsev, *Ètika preobražĕnnogo èrosa* [The ethics of Eros transfigured], 259; cf. Pascal, *Pensées,* 141). According to Vycheslavtsev, "this self" of Pascal’s is only *Ja sam* (I myself) or *samost’* (Vycheslavtsev, *Ètika,* 119, 259).

The *samost'* is not the body [*telo* (тело)], it is not the mind [*duša* (душа)], nor consciousness [*soznanie* (сознание)], nor the unconscious [*bessoznatel'noe* (бессознательное)], nor the person [*ličnost'*], nor even the spirit [*dux* (дух)]. What is it then? It is not "something," not "the thing" [*predmet* (предмет)], not the object [*ob'ekt* (объект)] or the idea. It is the infinite passage beyond itself [*za predely samoj sebja* (за пределы самой себя)], transcendence [*transtsenzus* (трансцензус)] and freedom [*svoboda*].

(Ibid., 258)

Both knowledge and action are attributed to *samost'*; it is the bearer of wholeness and the center of personal freedom:

Freedom [*svoboda*] is a creation *ex nihilo*, a creation that emerges by itself. . . . It is in this "by itself" [αὐτὸ κινοῦν] that the essence (*suščnost'*) of the self [*samost'*] and the I [*Ja*] lies.

(Свобода есть творчество из ничего, оно возникает само собой [αὐτὸ κινοῦν]. . . . В этом "само собой" и заключается сущность самости, сущность Я.)

(Vycheslavtsev, *Serdce*, 83)

When Vycheslavtsev relates *samost'* to *svoboda*, "freedom," we have to remember that *sobstvo*, the synonym of *samost'* that expressed individuality and membership, is from the same root as *svoboda*: both derive from *svoj* [свой], "my (your, his, our, your, their) own" (see SVOBODA). We can articulate the linguistic intuition that makes Vycheslavtsev's synthesis possible: "I myself" (*ja sam*, the Self proper) is "my own" (*svoj*), and it is thereby that I am free (*svoboden* [свободен]).

VII. The Paradox of the Person: A Dialogue between Asceticism and Psychotherapy?

Vycheslavtsev was the conduit for Freud's psychoanalysis and for Jung's work (he was the first to publish Jung in Russia). In his main work, *Ètika preobražĕnnogo èrosa*, he criticizes Freud's "naturalism" and proposes a Platonic interpretation of the sublimation (Greek *anagôgê* [ἀναγωγή]) of Eros as an ascension toward the ontological "sublime"—to the "superior levels of being" (109–14; see SUBLIME, Box 3).

By introducing the concept of *samost'*, Vycheslavtsev refers directly to Jung's *Selbst* (ibid., 263–64). Vycheslavtsev's *samost'*, which "transgresses the opposition between the conscious and the unconscious (ibid., 264), clearly refers to the discourse of analytical therapy. Vycheslavtsev draws a distinction between "detached" *samost'* (*otrešĕnnaja* [отрешённая]) and "incarnated" *samost'* (*voploščĕnnaja* [воплощённая]). *Samost'* can thus be understood in two ways. First, it can be taken in itself, in its "essence" (Vycheslavtsev gives the Greek *ousia* and the German *Wesen* as synonyms); as such, it never acts and, as a result, is not capable of sinning (Vycheslavtsev, *Serdce*, 79). But it can also be considered "in the real world, the one in which each of us acts . . . referring to a singular way of living and behaving" (ibid., 79); in this second meaning, *samost'* is *serdtse*, "the heart" of the living human:

The Christian self, or the heart [*serdtse*], is not the detached self [*otrešĕnnaja samost'*], which is irresponsible; on the contrary, it is the incarnate self [*voploščĕnnaja samost'*], which is present everywhere, penetrates everything, and thus it is responsible [*otvetstvennaja*; see POSTUPOK] for everything.

(Христианская самость (сердце) ни есть отрешённая самость, ни за что не ответственная; нет, это воплощённая самость, всюду присутствующая, и потому за всё ответственная.)

(Ibid., 77)

This last sentence is a veritable program: by identifying "incarnate *samost'*" with the *serdtse*, Vycheslavtsev seeks to combine the discourse of psychotherapy with that of asceticism. At the same time, by distinguishing incarnate *samost'* from *samost'* as essence, *ousia*, and *Wesen*, he opposes the two practices—psychotherapy and asceticism—to abstract metaphysical discourse. Thus, it is the *serdtse* of the Church Fathers and not the *Selbst* of the philosophers that is "the true self."

In the first chapter of *Slavery and Freedom*, Berdyayev refers to the "fundamental paradox of the existence of the person":

The person [*ličnost'*] must create itself, enrich itself, acquire a universal content, achieve its unity and integrity in every aspect of its life. But to do so it must first exist [*byt'*]. . . . The person [*ličnost'*] is at the beginning of its path, and yet it is only at the end of the path.

(Личность должна себя созидать, обогащать, наполнять универсальным содержанием, достигать единства в цельности на протяжении всей своей жизни. Но для этого она должна уже быть. . . . Личность в начале пути, и она лишь в конце пути.)

(*Slavery and Freedom*, chap. 1)

If Berdyayev is right, the opposition between "low" *samost'* and "high" *samost'* is not so much diglossic as ontological; it refers to the real tension between the actual self and the possible self (see MacIntyre's analogous distinction between "human nature as it is" and "human nature as it could be" (Russian translation, 75). Both psychotherapeutic discourse and ascetic discourse accept the existence of this "vertical" dimension. But asceticism emphasizes the radical character of the transformation and one's inability to realize the latter without God's help, whereas the actualization of the self in analytical therapy is a natural (*estestvennyj* [естественный]) and terrestrial process. In the context of self-actualization, *samost'* can thus become the "high" term. On the contrary, in Orthodox ascetic discourse, which puts maximal emphasis on the ontological rupture between "the self" and "the true self," using *samost'*/*serdtse* to render this opposition, *samost'* plays the role of the "low" term. The question of the modern, unified meaning of *samost'* remains for the moment unresolved. Perhaps the diglossic tension can be surmounted without reducing the "vertical" dimension and falling into self-importance (*samodovol'stvo* [самодовольство]) and self-admiration (*samoljubovanie* [самолюбование]). One might think that the current tendency to neutralize diglossic tension does not

entail giving up the "vertical" dimension of the human being but rather creating, through a dialogue between asceticism and analytical therapy, a unified, "ontopractical" vision of personal selfhood.

SAUDADE (PORTUGUESE)

CATALAN	*anyoransa*
FRENCH	*nostalgie*
GERMAN	*Sehnsucht*
LATIN	*desiderium*
SPANISH	*soledad*

➤ *MALAISE, NOSTALGIA*, and ACEDIA, DASEIN, DESENGAÑO, DOR, ERLEBEN, INTENTION, LOVE, MELANCHOLY, PORTUGUESE, SEHNSUCHT, SPLEEN

Saudade is presented as the key feeling of the Portuguese soul. The word comes from the Latin plural *solitates*, "solitudes," but its derivation was influenced by the idea and sonority of the Latin *salvus*, "in good health," "safe." A long tradition that goes back to the origins of Lusophone language, to the thirteenth-century *cantiga d'amigo*, has repeatedly explored, in literature and philosophy, the special feeling of a people that has always looked beyond its transatlantic horizons. Drawn from a genuine suffering of the soul, *saudade* became, for philosophical speculation, particularly suitable for expressing the relationship of the human condition to temporality, finitude, and the infinite.

I. A "Matrix Expression"

In all languages, there are expressions that are "mothers," words that conceal and at the same time reveal a long and mysterious experience that is supra-individual and trans-temporal . . . *Saudade*, an untranslatable word of Galician-Portuguese origin . . . is precisely one of the "mother" expressions to which Goethe referred. . . . Starting out from the original experience of *soledade* or *soidade*, the [Portuguese] people arrived at the experience of *saudade*. Solitude is there found to be potentially transcendable through love. From another point of view, the present is found in it in the form of eternity, attached to the past by memory, to the future by desire.

(Quadros, *A idéia de Portugal*)

Saudade proceeds from a memory that wants to renew the present by means of the past in a loving soul that is restrained by the limits of its condition, whatever that might be. A concise definition of *saudade* appears in the treatise *The Origin of the Portuguese Language* (*Origem da língua portuguesa*, 1606) written by Duarte Nunes de Leão: "Memory of a thing with the desire for this same thing" (quoted in Botelho and Braz Teixeira, *Filosofia da saudade*). Endowed with a structural ambiguity, this feeling is located at the intersection of two affections that present absence: the memory of a cherished past that is no more and the desire for this happiness, which is lacking. Pleasure and anxiety: the result is a displaced, melancholic state that aspires to move beyond the finitude of the moment and the errancy of distance. "It is a suffering that we love, and a good that we suffer . . . " (Melo, *Epanáfora amorosa*).

But for all that, *saudade* is not so much a complex aspiration to the beyond, to the distant object of love, as it is a tender malaise of a body drawn out by the mind, corporal ecstasy itself. The tenderness of the common expression "to die of *saudades*" is explored in Tom Jobim's song "Samba do avião": "My soul sings / I see Rio de Janeiro / I am dying of *saudade*."

The song expresses the emotion felt regarding a return, a mix of anxiety and happiness that precedes the moment of arrival. *Saudade* is not something that is merely melancholy and solitary, felt at a distance from the beloved, but is also felt on meeting the beloved, as if all the accumulated pain were cathartically released in an instant of ecstasy, the instant of salvation. This may explain the very particular route taken in Portuguese by the Latin words *solutes/solitudes*.

II. Etymology, Myth, and History

In its archaic form, *soidade*, the word is found in the *cantigas d'amigo* sung by the thirteenth-century troubadours, which are the first texts in Portuguese literature. These are complaints, initially by women, deploring the absence of the beloved who has left to go to war or on crusades or on voyages of discovery and conquest beyond the seas. The origin of *soidades*, as well as of the Spanish word *soledades*, is the Latin plural *solitates* (solitudes), whose original signified is better preserved in Portuguese in the singular *solidão* (Lat., *solitas*) and in the poetic form *solitude* (Lat., *solitudo*). The abstract plural is used as a singular: *saudade* and *saudades* are used interchangeably.

The form *saudade* is found once in a fourteenth-century codex, but it began to spread, according to Carolina de Vasconcelos, only in the sixteenth century, in the years following the legendary Portuguese defeat at the battle of Alcácer Quibir. It was there that the Portuguese lost their king, Sebastian, who disappeared in the fighting, and since a successor could not be found, they subjected themselves to the Spanish crown. This battle produced a collective feeling of mourning and hope that has characterized the Portuguese soul ever since. Messianic legends developed that prophesied the king's return and the redemption of the Portuguese nation by *saudade*. The *History of the Future*, by the Jesuit António Vieira, which recounts the advent of a fifth universal empire ruled by a returned King Sebastian, is the best example of this. The figure of the *Encoberto* (the Veiled, the Hidden King) as a hypostasis of the feeling of *saudade* has been repeatedly discussed, notably by the existentialist philosopher Leonardo Coimbra.

The passage from *soidade* to the more melodious word *saudade* is explained, hypothetically, by the popular influence of the verb *saudar* (greet) and of the words *salvo* (safe) and *saúde* (health), which derive from the Latin *salvus/salutate*, as is shown by the still common habit of greeting people by sending *saudades*. A letter that is arbitrarily attributed to Camões but that probably dates from his period (sixteenth century), explores this ambiguity:

Por usar costume antigo
Saúde mandar quisera
E mandara se tivera . . .
Mas . . . amor dela é inimigo
Pois me deu em lugar dela
Saudade em que ando,
Saudades cem mil mando . . .
E não ficando sem ela.

(Out of an old habit
I'd like to have sent you my salutation
And I'd have sent it if I'd had it . . .

But . . . love is its enemy
For instead it gave me
Saudade that I am suffering,
Saudades a hundred thousand I send . . .
And still have more here with me.)

(Quoted in Vasconcelos, *A saudade portuguesa*)

However, the religious idea of salvation was not involved in *saudade* before the existentialist and mystical poets and philosophers of the Portuguese renaissance, the nationalist and messianic cultural movement of the early twentieth century that accompanied the establishment of the republic in Portugal. Leonardo Coimbra and Teixeira de Pascoaes, the founder of the review *A Águia*, made this feeling an existential foundation, indeed a goddess, with a special religion and form of worship.

Saudade is thus associated with the most important events in Portuguese history and with most of its myths of origin. Ulysses is presented as the mythical founder of Lisbon (*Olisipolis*—the city of Ulysses): he is supposed to have founded it in a dream, without ever going there. A hero marked by nostalgia, the suffering of the return, he is also supposed to be the mythical ancestor of the *saudade* felt by the navigators wandering the globe and their wives who waited for them. All the departures for the *Reconquista*, the Templars' quest for the Holy Grail, the Crusades, the great maritime discoveries, and twentieth-century migrations accumulated to produce a diaspora that separated the people from their beloved, their families, their villages, and their country. This desire for the beyond that leads the Portuguese to leave is experienced as the effect of *saudade* and produces an archetypal reminiscence and desire.

III. Universality and the Existential Approach

When the Portuguese needed to define the specific characteristics of their nation, the theme returned. Thus when Portugal's difference from Spain was to be affirmed and the autonomy of its territory assured; when the Roman Catholic Church exceeded, with the Jesuits and the Inquisition, the limits of a properly spiritual power; when the French Enlightenment attracted the intellectuals in Coimbra; when the English made their capitalist industrial expansion felt; or, more recently, when the question of joining the European Union came up, whether in order to assert a national character or to justify a more cosmopolitan position, *saudade* has always been central. From the most scholarly philological discussions to the most chauvinist nationalist messianisms, trends, positions, and opinions diversify and clash: "The Lusitanian soul is concentrated in a single word, where it exists and lives like the reflection of the immense sun in a tiny dewdrop" (Teixeira de Pascoaes, *O Espírito lusitano ou o saudosismo* [1912], in Botelho and Braz Teixeira, *Filosofia da saudade*). The untranslatability of *saudade*, both the word and the feeling, accompanies Portuguese history from Dom Duarte (King Edward) of Portugal's first reflection on the theme: "And yet this name *suidade* seems to me so appropriate that neither Latin nor any other language I know has anything similar for such a meaning" (*Leal Conselheiro* [The Loyal Counsellor], chap. 25; written in 1438). In French, the words *nostalgie, désir, manque*, and *mélancolie* are used; in Catalan, *anyoransa*; Latin

has *desiderium*, analyzed by Augustine and Spinoza, while German has *Sehnsucht*—but even the Spanish word *soledad*, whose origin is identical, does not really have the same meaning.

This singularity nonetheless indicates an existential approach to the human condition; it gives rise to a phenomenological analysis and thereby becomes capable of universality. *Saudade*, like anxiety, brings out human beings' relationships to the world. The medieval notion of *intentio* (see INTENTION) is thus reinvested by the phenomenology of *saudade*:

> [I]n the act of *saudade* [or the act that is *saudoso*] are given [*dão-se*] the existence of being for the subject and the existence of the subject for being, or, to put it in the Scholastic vocabulary, that for which there is *saudade* is, from a certain point of view, *esse in*, that is, an event that is given [*se dá*] in an individualized consciousness and, from another point of view, *esse ad*, that is, an intentional relation with the absent and desired object. Thus if *saudade*'s going-into-itself [*ensimesmar-se*] implies the categorial determination of existence as *saudade* (*vivência saudosa*) in psychological life as a whole, its going-out-of-itself [*exsimesmar-se*] implies the complex problem of the forms, nature, and ontological place of the objects that the person who feels *saudade* [*o saudoso*] would like to see actualized.
>
> (joaquim de carvalho, "Problemática da saudade" [1950], in Botelho and Braz Teixeira, *Filosofia da saudade*)

With the idea of intention, the whole human condition unfolds in the time and the manner in which they are related to their own finitude. Silvio Lima describes this tension, this tense folding-back in the dimensions of presence, which tends toward the past in the memory and toward the future by desire:

> Consciousness in *saudade* [the consciousness that is *saudosa*] suffers in the present from the privation of something past, but it suffers because it aspires to the return [*regresso*], to enjoy once again [*refruição*] the "lost paradise" and because it thus prefers it to the elimination of the obstacles that produce *saudade* [obstacles that are *saudozantes*]. Without this permanent flame of aspiration, *saudade-saudade* will not take place [*não se dará*]; the simultaneous *complexus* of three dimensions has to take place in the dimension of the present: the present inhales the past, and, in futurition, exhales it.
>
> ("Reflexões sobre a consciência saudosa," *Revista Filosófica* 44 [1955], in Botelho and Braz Teixeira, *Filosofia da saudade*)

The object that produces *saudade* determines in each case an existential, cultural, aesthetic, religious, metaphysical position (the *saudades* for a lover, a country, a time, this or that idea, etc.); inversely, everything, from literature to religion and politics, is capable of an interpretation modulated by *saudade*. This is the case for diverse philosophies, in their differences of period and language—from Plato's theory of the desire for the Beautiful through reminiscence of its idea to the transcendence of metaphysics by a return to the pre-Socratic origins of thought—the whole history of

philosophy can be woven and deconstructed in the shadow of this delectable melancholic passion.

SCHICKSAL / VERHÄNGNIS / BESTIMMUNG (GERMAN)

DUTCH	*schicksel*
ENGLISH	fate, destiny
FRENCH	*destin, fatalité, destination*

➤ *DESTINY,* [KÊR], and BERUF, ES GIBT, GESCHICHTLICH, GOD, HISTORY, LIBERTY, PROPERTY, STIMMUNG

Schicksal and *Verhängnis* refer to a "sending" or "destiny" over which we ultimately have no control, even if they are not the same as strict fatality. The addressee nonetheless assumes responsibility for the way in which he is to acknowledge their receipt in that which, from Kant to Fichte in particular, was involved in the essential concept of *Bestimmung*—a destination or vocation that is also determination proper.

In the German vocabulary of destiny, the concept of *Schicksal* (Kant, *Critique of Pure Reason*, A 84–B 117) owes its name, borrowed from the Dutch *schicksel*, to the verb *schicken*, "to send," "to destine," from which is also derived *Schickung*, "dispensation," as the action of dispensing, and *Geschick*, the result of this action. In spite of Kant's charge of usurpation, or groundlessness, the term *Schicksal* was nonetheless rehabilitated by German Idealism in the horizon of Greek tragedy (Hölderlin, Schelling) or Christianity (Hegel), where it was defined as "the consciousness of oneself, but as an enemy" (Nohl, *Hegels theologische Jugendschriften*, 283).

> To destine is first of all to attach solidly, as when a sailor secures (Latin *destinat*) to the mast the yards that hold the sail. Then it is to assign or attribute a share. Destiny is thus what its addressee (*destinataire*) receives as his share, without his playing any role in this process or being able to question the share he has been assigned.
>
> (Beaufret, *Dialogue*, 3:11)

The French terms *destin* and *destinée* suggest sending and reception, but the German verb *schicken* is related to *geschehen*, "to happen," whence *Geschichte*, "history," which Luther still called (in the neuter) *das Geschicht*. Here we still hear an echo of *das Geschick*, the thing that is sent to us, and even a *Schickung*, or the dispensation of which man is not the actor but the receiver. It is in this sense that Schelling distinguished, in a letter of 8 April 1850 to Maximilian II of Bavaria, between metaphysics, the awareness that humans can acquire by their own lights, and the metaphysical (*das Metaphysische*), which falls to the share of man in virtue of a "divine dispensation (*göttliche Schickung*), which alone remains" (quoted in David, *Schelling*, 9).

We must distinguish *Verhängnis* and *Bestimmung* from *Schicksal*. *Verhängnis*, "fatality," is understood as designating "that from which a human destiny is suspended (*hängen*, "hang")." Understood during the Reformation in the sense of divine providence (*göttliche Fügung*), during the Enlightenment *Verhängnis* is used as a synonym of *Schicksal*, but since then it has taken on an essentially negative meaning, sometimes synonymous with "disaster." Schelling seems to play on the proximity and difference between the two terms when he writes, at the beginning of the tenth of his *Philosophical Letters on Dogmatism and Criticism*, in a passage that is tricky to translate:

> Man hat oft gefragt, wie die griechische Vernunft die Widersprüche ihrer Tragödie ertragen konnte. Ein Sterblicher—vom Verhängniß zum Verbrecher bestimmt, selbst gegen das Verhängniß kämpfend, und doch fürchterlich bestraft für das Verbrechen, das ein Werk des Schicksals war!

> (It has often been asked how Greek reason was able to bear the contradictions of its tragedy. A mortal—destined by fate to become a criminal, struggling himself against such a fate, and yet dreadfully punished for a crime that was the product of destiny!)

> (Schelling, *Schellings Werke*, 1:336)

Here the three concepts of *Schicksal*, *Verhängnis*, and *Bestimmung* ("destination," in the sense of intention or determination, essentially a Kantian and Fichtean term) seem to converge. However, *Bestimmung* escapes the idea of destiny in two ways. First, in one sense, because it expresses the "determination" of every thing, of each thing that determines it to be what it is, thus linking "determinism," to action exercised on it from the outside, thereby connecting it with the whole universe. Second, in another sense, because it qualifies man's "destination," that is, his freedom par excellence, as the action he exercises on himself in the ethical-practical field, in response to the call of a "voice"—German hears in *Bestimmung* the word *Stimme*, "voice"—that Kant calls "the iron voice of the categorical imperative." In the first instance, *Bestimmung* can be said of everything and is similar to *Bestimmtheit*, the "determinacy" that, in Hegel's German, qualifies a property, a characteristic of the being concerned; in the second instance, it is said of man as a rational being. Always obliged to choose, French does not help us understand that the passage from one meaning to another constitutes, for example, the whole itinerary of Fichte's "popular" work

known in French as *La destination de l'homme* (*Die Bestimmung des Menschen*; [The vocation of man]), a *destination* that is also, in the first, "Spinozist" part of the text, a "determination"—even if, as has been noted, "Fichte's originality in relation to tradition has to do with the fact that for him complete determination is not a theoretical given but a practical imperative (in French as well, *être bien déterminé* is a synonym of *vouloir*)" (J.-F. Marquet, "Fichte et le problème de la *Bestimmung*," in *Restitutions*, 19). The problem grows when, still in French, we relate *Bestimmung* as *destination* to *Schicksal* as *destin*: with regard to the latter, destination always says either too much (universal determinism) or too little (individual freedom). Here the lexical relationship based on *destiner* conceals an abyss of meaning and perhaps even a paradigm change in German philosophy of the first decade of the nineteenth century, during the period separating criticism from idealism. This transformation is the one that, from Kant's and Fichte's *Bestimmung*, and perhaps in order to get rid of its ambiguity, leads to Hegel's *Schicksal*. Then we can better understand the emergence at this point of new objects for speculation that Kant would never have included in his idea of philosophy: Greek tragedy and the "spirit" of Christianity.

SECULARIZATION

FRENCH	*sécularisation*, *profanation*
GERMAN	*Säkularisation*, *Säkularisierung*, *Verweltlichung*
ITALIC	*secolarizzazione*

➤ BERUF, BILDUNG, BOGOČELOVEČESTVO, DESENGAÑO, GOD, NEUZEIT, PIETAS, PRAXIS, RELIGIO, ROMANTIC, SOBORNOST', STATO, WELT

The word "secularization," derived from ecclesiastical Latin *saecularis* (an epithet that stems from *saeculum* in the sense of "world" or "worldly life"), comes into use in French around 1567 as part of the lexicon of canon law. As an expression of an antinomy between the religious world and the profane world, it gradually comes to be understood as a general process governing the whole of culture as it is modernized. Such "rationalization" coincides with the "disenchantment of the world" (*Entzauberung der Welt*), a condition engendering multiple responses and attempts at redress: among them, "laicity" (a strict separation of religion and public affairs), political secularism, and desecularization. In each case the initial opposition

between sacred and profane remains in play and enriches the term's meaning.

I. Secularization According to Canon Law and *Verweltlichung*

The Justinian Code, which dates from around 533, mentions the opposition between *saeculum* (*a saeculari conversatione recedere* or *saeculo renuntiare*) and *vita sanctimonialis* (I.3.54). This general distinction between those who live "in the world" (*saeculum*) and those who live "in the clergy" is explained by another distinction within the ecclesiastical world between the status of those who belong to the ordinary clergy and that of monks and others who have taken monastic vows. This distinction is the one adopted for the most part by canon law when it distinguishes the regular clergy (the religious who are subject to a conventual rule) and the secular clergy. From another point of view, within the ecclesiastical sphere governed by canon law, the formal transfer of rights to monastic goods to a secular authority or the return of a monk or other religious to the secular clergy is distinguished from the act through which ecclesiastical goods in general are transferred to the strictly secular sphere, a transfer that is then designated by the term *profanatio*. The "profanation" of a sacred reality concerns first of all the Eucharastic host when it is made the object of a commercial transaction which, because it is inappropriate and confuses the registers of the sacred and the profane, amounts to "profaning" it.

The *Codex juris canonici* as it was promulgated in 1917 designates by the term "secularization" both the passage of a member of the regular clergy to the secular clergy—a simple exclaustration that does not break the vows taken by the religious—and, on the other hand, the return of a cleric, monastic or secular, to secular life—a complete secularization that releases him from his vows because he is leaving the clergy. In the sphere of canon law, secularization does not imply that the status of persons, privileges, or goods is modified to the point that they change in nature, becoming strictly profane. Such a transformation in nature implies the intervention of the pope, who alone, as the Vicar of Christ, *sicut Deus in terra*, has the capacity to make such a transformation.

The origin of the derivative use of the term "secularization" is the Treaty of Westphalia (1646). At the end of the Thirty Years' War, the question of the transfer of ecclesiastical goods to certain Protestant *Länder* had to be dealt with. In the first volume of his *Négociations secrètes touchant la paix de Münster et d'Osnabrück* (1725), Jean Le Clerc sums up the situation this way: "We have to make use of ecclesiastical goods to compensate those who will lose something for the love of peace, they [the goods] could not be more appropriately alienated." The French emissary, the Duke of Longueville, chose, for diplomatic reasons, to use the term "secularization" to qualify this transfer of property. In so doing he was responding to several simultaneous constraints. First, he sought to avoid offending Catholics by using a canon law expression that would create the illusion that the goods of which they would be deprived would not change in nature, even though that was in fact the case; thus it was not necessary to request papal intervention. Second, he tried to make it clear to Protestants that these goods were not only secularized but in fact "made profane" (*profanisés*). The use of the latter term, which did not imply a transformation in nature, implied that the Lutherans also represented a church—which the duke did not, however, recognize, contrary to the desires of the Evangelical *Länder*, who understood that in this case "secularization" meant simply "making profane."

The German terms *Säkularisation* (or *Säkularisierung*) and *Verweltlichung* (literally, "making worldly") have their origin in the terminological ambiguity characteristic of these negotiations in 1646, as well as in the many commentaries to which they later gave rise. In Germany, the term *Säkularisation* became synonymous with anti-Catholic measures that implied in particular the alienation of ecclesiastical goods to the benefit of the secular sphere. This use became more widespread under the reign of Frederick II, who wanted to "secularize," that is, to "render profane" (*profaniser*) certain convents (letter to Voltaire, 24 March 1767, and Voltaire's reply, 5 April 1767), and after the treaty of Lunéville and the cession of the left bank of the Rhine to France in 1801, and especially in 1803, with the great "secularizations" that put an end to the Holy Roman Empire. It is to this latter event and to the reactions that it aroused among the first German Romantics that the term owes its further extension and its entry into philosophical terminology: "secularization" implied opposition to the Christian conception of the world, to the Christian order governing earthly life—it being understood that Christianity was identified with Catholicism, whereas Lutheranism was perceived as one of the most perfidious agents of this secularization. The term thus became an essential one in the Romantic philosophy of history.

II. From the Romantic Reaction to Hegel and Marx: *Verweltlichung* and *Säkularisation*

Joseph Freiherr von Eichendorff's *On the Consequences of the Suppression of the Territorial Authority of Bishops and Convents in Germany*, published in 1818, along with Novalis's essay "Europe or Christianity," is one of the very first testimonies to a very strong reaction to the consequences of what the author imputes to the Enlightenment: the criticism of traditional understanding had destroyed the authority of faith, which was supposed to be founded on a temporal basis (real property and political power) to play, through ecclesiastical institutions, a pacifying and charitable role, realizing on earth a reconciliation that anticipated the Redemption. "The secularization of the states and of ecclesiastical goods," Eichendorff writes, "is a misfortune that has struck Germany." The Romantic reaction did not, however, see secularization as a process that would end in a complete dechristianization; on the contrary, those who, like Schlegel and Novalis, believed in the beneficial action of the secret Catholic societies to which they belonged, envisaged the future of Europe as an ascent toward a new spiritual era, a final synthesis of history punctuated by the ages of the Father (the Revelation), the Son (the Reformation), and the Holy Spirit (the Redemption). Secularization was thus not understood as a radical *Verweltlichung*.

In his *Lectures on the History of Philosophy* (*Vorlesungen über die Geschichte der Philosophie*, in *Sämtliche Werke*, 19:190, 207), Hegel introduced the notion of *Verweltlichung* as a qualification of the historical movement that extends from the end of the Middle Ages to the French Revolution by way of

Scholasticism and the Reformation: the (Catholic) church was brought into a critical situation by the work of the Scholastics, who applied rational and finite notions to an absolute content; the crisis took the form of an increasingly sharp dissociation between the spiritual and the temporal (or "earthly") spheres. And, through the critical slant of the Reformation that deprived the papacy of its spiritual authority—after kings had asserted against it their *potestas* in the form of political sovereignty (especially in England)—the modern era that began with the rational form of the state constitutes the reconciliation of the spiritual and the temporal in the concept of freedom: this concept realizes the spiritual content of Christianity and makes it consubstantial with actual reality. The truth of Christianity is realized in the modern state, which incarnates the principle of Christian freedom (*Lectures on the Philosophy of History* [*Vorlesungen über die Philosophie der Geschichte* in *Sämtliche Werke*, vol. 11]). The realization of Spirit in history is accompanied by the total *Verweltlichung* of the church.

In his letter to Hegel of 22 November 1828, Ludwig Feuerbach seeks to pursue further "the realization and *Verweltlichung* of the ideal," to the point of the total dissolution of any theological dimension in anthropology (*Principles of the Philosophy of the Future*, 1843). And, at the same time, Marx proceeded in the same way to seek to outdo Hegel in his "Introduction to the Critique of Hegel's Philosophy of Right" (1843) and in his famous "Theses on Feuerbach" (1844; theses IV, VI, VII, and VIII). In a letter to Ruge written in September 1843 Marx describes the current reform in philosophy this way: "Philosophy has been secularized [*verweltlicht*], and the most striking proof of this is that philosophical consciousness itself has entered into the painful struggle, not with respect to the outside, but within its own heart" (*Marx-Engels Werke* 1:344). However, we must note that the "Introduction to the Critique of Hegel's Philosophy of Right" concludes with an initial definition of the proletariat that is not based on a sociological analysis or a political economy, but solely on a "messianic" construction of the history to come in which the proletariat will be called upon to play a Christological and soteriological role: it is the redeemer of humanity at the end of history as we have known it, that is, the proletariat is the historical way that human beings emerge from their alienation and can be reconciled, here on earth, with there true nature.

Richard Rothe was the first writer in Germany to identify Hegelian *Verweltlichung* with *Säkularisation*. In his *Theologische Ethik* (Theological ethics), he conceives the notion in the framework of a universal salvation history, and, like Hegel, thinks that the Reformation contributed to the "secularization" of Christianity. But he also thinks that in freeing itself from the (Catholic) church, Christian life did not cease to be Christian as it entered into a (Protestant) political and moral era. This is because the movement of history is governed by a kind of constant rebalancing: as the church is secularized, it Christianizes the state and "desecularizes" it to the same degree. The church was thus cast as a provisional form of the Christian spirit; with the state being another one. The validity, then, of a Christian theodicy, conceived as underlying universal history (*Vorlesung über die Geschichte der Kirche und des christlichen Lebens* [Lecture on the history of the Church and the history of Christian life]), is preserved.

The term *Säkularisation* acquired an extension sufficiently vast to allow it to be identified, in the perspective of the progressive positivism of the late nineteenth century, with progress itself (for example, in J.-M. Guyau's *L'irréligion de l'avenir* [Irreligion of the future]). The separation of church and state is governed by the idea that the natural end of historical development, of which secularization is the corollary, is the secularization of public life, whereas religion is limited to the private domain governed and controlled by the principle of the freedom of opinion and belief.

It was in the twentieth century that debates around the problem of secularization became most intense, and not just in reaction to the gradual political and institutional separation of church and state. It was, of course, in Germany—where a general obligation to pay taxes to support the churches persisted—that this problem was and remains most acute, for it responds to central aspects of "modernity": the gradual disappearance of the religious framework of life, and the role of the churches, and religious culture more generally, in ways of life.

III. Secularization and the Disenchantment of the World According to Weber

Although he avoids extending his analysis to the whole of world history, Max Weber characterizes the evolution of Western culture by the notion of rationalization (*Rationalisierung*), coupled with that of generalization. The rationalization that began, particularly, in the monotheistic form of religion has as its corollary a disenchantment of the world (*Entzauberung*) that means, first of all, the abandonment of magical beliefs regulating behavior. But on the one hand, Weber does not consider rationalization and religion to be systematically antinomic, on the contrary; on the other hand, disenchantment is not a synonym of either rationalization or secularization:

There are essentially two complementary criteria that make it possible to evaluate the degree of rationalization achieved by a religion: first, to what extent it has rid itself of magic, second, what degree of systematic unity it has attained in the relations between God and the world, and correlatively, in its own ethical relations with the world.

(*Gesammelte Aufsätze zur Religionssoziologie*, 1:512)

Disenchantment and rationalization may even be opposed:

Action governed by magical representations often has a character that is subjectively far more rational in its goal than any non-magical "religious" behavior, precisely insofar as with the growing disenchantment of the world religiousness is forced to accept significations (for example, emotional or mystical ones) that are (subjectively) more irrational in their goals.

("Über einige Kategorien der verstehenden Soziologie," in *Gesammelte Aufsätze zur Wissenschaftslehre*, 433)

That is why Talcott Parsons's identification of *Entzauberung* and rationalization in his English translation of *The Protestant Ethic* is mistaken. Weber rarely uses the term "secularization," and it is rather Weber's readers who created amalgams, whereas Weber himself always remained very prudent in his handling of the term, which cannot be seen as an engine of universal history understood from a teleological point of view. His examination of the tendencies of modernity led him to observe that despite partial secularizations and a growing generalization, and despite a disenchantment that is often their corollary, religion (or religions) are not doomed to inevitable disappearance. At most we find a deep indifference to the essential contents of the sphere of religious worship, but not a twilight of the gods.

IV. Troeltsch's Corrective and Modern Theology

Ernst Troeltsch, who notes that the most decisive fact in modern history is the secularization of the state (whose engine is the secularization of religious individualism and whose philosophical foundations are utilitarianism and British skepticism), and who acknowledges that the belief in progress peculiar to the modern conception of history is a secularization of Christian eschatology, is nonetheless the first to oppose an excessive extension of the identification of modernity with secularization. He emphasizes, on the contrary, the fact that religious contents resist any secularization and that religion is not an economic ideal. There can be a secularization *lato sensu* only if the content thus "secularized" is itself governed by a genuine rejection of religion, parallel to the religious rejection of the world. Troeltsch does not begin, like Weber, from sociological and statistical considerations regarding the fact that capitalism is more widespread in regions where Calvinism was dominant, but from the content of the religious doctrines that determine the institutional forms (churches, sects, mysticisms) through which religion enters into direct relation with the world. A kind of internal secularization even began within the Catholic religion when Scholasticism took the Stoic theory of natural law as a basis for an attempt to synthesize natural ethics and revelation, suggesting that the decalogue might be identified with the *lex naturae*. Nonetheless, Troeltsch advocates an antagonistic vision of the relations between religion and world history, with the intention of preserving the critical potential contained in the religious institutional forms that have least compromised with the temporal sphere.

We find in Karl Barth the same prudence with regard to the generalized conception of secularization: "Where are the windows of the divine world that are supposed to open onto our social life?" ("Der Christ in der Gesellschaft," in *Gesammelte Vorträge*, 36), and especially in Friedrich Gogarten, who inverts the point of view: the condition for faith is precisely that the world be secular. Gogarten's concern is to distinguish faith from its proselytizing justification, which is always in danger of slipping into ideology. The radicality of disenchantment does not triumph over a faith that remains—to use an expression of Rudolf Bultmann's—a paradox, but it emphasizes its purity: it does not proceed from the world; even if it has to refuse to be a flight outside the world, it is irreducible to an anthropological conception of the opposition between the sacred and the profane. Secularization remains a necessary element of faith; but Gogarten introduces the notion of secularism (*Säkularismus*) to designate an immanentist perversion, the abusive ideologization of temporal powers that are supposed to provide salvation on earth (this notion is nonetheless very close to what is meant by *gnosis*).

V. The German Pair *Verweltlichung-Säkularisation* and the French Pair *Sécularisation-Laïcité*

The most recent discussion, Hans Blumenberg's critique of Karl Löwith's position, contributes nothing new to the definition of the term, but does clarify what it designates. Löwith is certainly right to show how Voltaire, for example, "secularized" Bossuet's conception of Providence by seeking to substitute a vision of strictly immanent progress; by doing so, he transferred into the secular sphere thought contents that were all borrowed from the Christian spiritual sphere; but it cannot be directly concluded from this that modern history is a history of secularization whose theological origin can finally emerge purified after beliefs in progress have revealed the ambiguity of their origin and that of their ideological applications. Blumenberg tries to bring out a different, more empirical genealogy of progress in the extension of reality that scientific theory enables us to master and in that of actual scientific method. Giving up the attempt to explain the totality of universal history makes it possible to avoid a conceptual formation that remains metaphorical.

German usage retains the *Verweltlichung-Säkularisation* pair, which has, for the time being, been stabilized, but must constantly be explained, depending on whether one understands the terms in the perspective of a philosophy of history or in the more limited framework of a sociology or a precise historical analysis. In French, the problem arises as soon as *sécularisation* is identified with *laïcisation*: *laïcité* can be understood as a consequence of secularization *lato sensu*, that is, as the normal outcome of a historical process that began with the Enlightenment and was actualized in the formation of the modern liberal state, or as an imperfect solution to the problem of secularization, since *laïcité*, if it remains "neutral," affects only one aspect of social life, but thus acknowledges the existence of a permanent cultural tension, since no religion can bear being reduced to the ranks of simple private opinion. On the other hand, if this *laïcité* is understood as "interventionist," that is, if the state seeks to make common cause with what it believes to be a just tendency of history, it will be in danger of infringing upon the fundamental freedoms enjoyed by the private sphere, thus changing the nature of a constitutional principle that is essential to any republic. It is this dilemma and this contradiction that are the deep moving force behind a constant renewal of the modern debate.

SECURITAS (LATIN)

ENGLISH	security, tranquility, carelessness
FRENCH	*sécurité*, *sûreté*, *incurie*
GERMAN	*Sicherheit*, *Sorglosigkeit*
GREEK	*asphaleia* [ἀσφάλεια], *ataraxia* [ἀταραξία], *akêdeia* [ἀκήδεια]
ITALIAN	*sicurezza*, *trascuratezza*

➤ CERTITUDE, DASEIN, SEIN, SORGE, *SOUCI* [CARE], *STATE*, STATO

The semantic career of *securitas* is as long as it is ambivalent. The word is constructed from the prefix *se-* (removal from), the common noun *cura* (concern, care, anxiety), and the suffix *–tas,* which denotes a state of being. Hence, the primary meaning of *securitas* is "the condition of being removed from care." Since *cura* is itself ambivalent—expressing either something troubling (anxious concern, nervous fear, burdensome worry) or something beneficial (careful attentiveness, loving diligence, well-intentioned administration)—*securitas*, precisely as the removal of *cura*, may designate a state that is either profitable or harmful. When *securitas* implies the elimination of a vexing problem, it clearly denotes a good; however, should the term entail the eradication of conscientious attention, it expresses a state of heedlessness. To be without care is to be protected or vulnerable, safe or negligent, carefree or careless.

I. Tranquility and Safety

In the mid-first century BCE, *securitas* emerges in the philosophical writings of Cicero. Here, the *cura* implicitly cancelled is generally negative; that is, *securitas* names the alleviation of psychological disturbances and therefore represents the Latin translation of any number of ideals promulgated in Hellenistic moral philosophy that also feature a negating prefix, such as Epicurean *ataraxia* [ἀταραξία] (being free of perturbations) or Stoic *apatheia* [ἀπάθεια] (being free of bothersome passions; see *De officiis* 1.69). Cicero also employs *securitas* as a synonym for the *euthumia* [εὐθυμία] (cheerfulness) celebrated by Democritus (*De finibus* 5.23). Seneca continues this trend by regularly equating *securitas* with the *beata vita* (blessed life) of the philosopher (*Epistles* 92.3). In both authors, *securitas* denotes the "peace of mind" (*tranquillitas animi*) associated with the private life, far from the oppressive concerns and worries of the political sphere. The removal of *curae* corresponds to the philosopher's withdrawal from the forum.

It is only with the collapse of the Roman Republic that the sense of *securitas* begins to be employed in a decidedly public fashion. Throughout the Imperial period, the word denotes military or governmental protection—not a condition to be enjoyed privately, away from the city, but rather within the city's sheltering walls. Previously, in republican usage, meanings of civil defense were instead expressed by *salus* (which yields the English "safety" and "salvation"). Following the accession of Augustus, *securitas* therefore suffers its first semantic split, between an inner, subjective sense of composure and an external, objective sense of shielded safety.

The latter, Imperial meaning should no longer be understood exclusively as a translation of Hellenistic *ataraxia* or *apatheia*, but rather as an extension of another privative term in Greek: *asphaleia* [ἀσφάλεια] (steadfastness, stability; literally, prevention [*a-*] from stumbling or falling [*sphallein*]). A term with clear conservative connotations, *asphaleia* is the guarantee that institutions will not crumble, that they will continue to persist like the "eternally steadfast [*asphales*] abode of the gods" described by Homer (*Odyssey* 6.42) or the "infallible [*asphalê*] statutes of the gods" invoked by Sophocles's Antigone (*Antigone* 454). Accordingly, Velleius Paterculus, writing nearly eight decades after Cicero's late works, uses *securitas* to describe the emperor's achievement in removing the threat of civil war (*Historiae romanae* 2.89).

II. Certainty, Conviction, and Negligence

With the post-Augustan conflation of *securitas* and *salus*, as well as the link to *asphaleia*, the concept of *securitas* moves well beyond issues of emotional tranquility and physical protection to include cognitive dispositions like "certainty" and "intellectual conviction," where the "concern" of falsehood no longer diminishes one's position. Yet, in addition to these positive senses, *securitas* can also be understood as the negation of *cura* as "attentiveness" or "diligence." Quintilian, for example, resorts to the term *securitas* to denote "carelessness" among his students (*Institutio oratoria* 2.2.6). Seneca, too, although he generally aligns *securitas* with Stoic "imperturbability" (*apatheia*), finds occasion to use the same

term to mean "idleness" and "negligence" (e.g., *De beneficiis* 5.12.2). Even already in Cicero, one can glimpse misgivings concerning an otherwise vaunted ideal. In *De amicitia*, "removal of care" (*securitas*) severs an individual from interpersonal relationships that define the best and most pleasing aspects of human life (*De amicitia* 47). The allure of a transcendent, philosophical position may on the surface promise a carefree, unbothered existence, but in the inescapably immanent reality of our lives, both in the world and among others, any such promise seduces us to a carelessness that renders virtue impossible.

Augustine introduces the term into Christian discourse by emphasizing a crucial point: "true security" (*firma securitas*) is only possible posthumously with God, that is, in the eternally blessed state in which the saved will at last be removed from the anxiety that constitutes the present realm of earthly existence (*Confessions* 2.6.13). To be utterly secure in this world would threaten our security insofar as it would offer a deceptive resting point, when the only valid resting point should be in divine grace. Augustine is cognizant of the political and social ramifications: for example, he observes how the Roman Republic degenerated into weakness and reckless complacency after its glorious triumph in the final war against Carthage (*City of God* 3.21). To fail to recognize one's vulnerability is to suffer from the carelessness of a security that leaves one more vulnerable than ever.

The pejorative sense of *securitas* as "negligence" persists throughout Christian usage, which tended to associate the word with a caricatured portrayal of Epicureanism, not necessarily aligned with *ataraxia*, but rather with *akêdeia* [ἀκήδεια] (indifference, torpor; literally, the negation of care [*kêdos*]). Following Gregory the Great, Christian theologians ultimately define *akêdeia* as "sloth," one of the seven mortal sins stemming from pride and invariably ending in "melancholy," where all occupation, spiritual as well as physical, is supplanted by detrimental boredom, lethargy, and complete insouciance. Hence, Robert Burton, in *The Anatomy of Melancholy*, warns that "many a carnal man is lulled asleep in perverse security" (Part 3.4, 2.6).

Positive connotations of *securitas* in the Christian era are missing from political and religious discourse but do persist in some legal contexts, where the term serves as an ideal of guarantee in oaths, pledges, and contracts. When *securitas* resurfaces in civil and theological thought during the Reformation, it again betrays the ambivalence that has always characterized its usage. Martin Luther distinguishes public security—a good provided by secular governments and their magistrates—from individual security, symptomatic of the slothful and the proud, who neglect careful examination of scripture or are wrongly confident of their state of grace.

Meanwhile, the positive sense of security as protection is established as a central topic in modern political philosophy, from Niccolò Machiavelli's readings of Livy to Thomas Hobbes's discussion of the sovereign's covenant and John Locke's securement of liberty through the "bonds of civil society." Later still, the eighteenth-century economic theories of the Physiocrats use a concept of security to maintain the profitability of open markets. With the rise of nineteenth-century nationalism, state security is elevated to prominence,

paving the way for the abuses of state apparatuses in the century that follows.

III. Allegories of Care

Philosophical approaches—loosely gathered under the rubric of existentialism—raise suspicions about the idealization of security and its implicit elimination of care: Søren Kierkegaard's reflections on anxiety, Friedrich Nietzsche's genealogies, and even Martin Heidegger's fundamental ontology criticize a purely theoretical position detached from the world—a metaphysical attitude that should be exposed as a defensive flight, as a strategy that seeks false tranquility in objectivity. The destructive—or deconstructive—impulse discernible in this work aims to deprive the substantial subject of any sure, noncontingent foundation, like the *fundamentum inconcussum* that René Descartes envisioned against radical doubt. In a similar spirit, philosophical anthropologists like Helmut Plessner define all human institutions as security projects that aim to remedy or compensate for mankind's essential lack of instinctual capabilities, and hence conceive philosophical critique as a mode of *Entsicherung*, a "desecuring" that vividly removes the "safety catch" (*Sicherung*) of conventional patterns of thought in order to prepare the ground for a more secure security.

In his famous analysis of "care" (*Sorge*) as the "Being of Being-There [*Dasein*]," Heidegger cites a fable recorded by the first-century Roman grammarian Hyginus (*Fabulae* 220; Heidegger, *Being and Time*, §42). The story relates the creation and naming of mankind. A personification of *cura* forms a figure from muddy clay, and Jupiter, upon request, animates it with his spirit. A debate over the creature's name ensues: Cura wants to name it after herself, but Jupiter insists that he should be so honored. After Earth (*Tellus*) herself appears to make her own case, the three contestants appeal to Saturn, who judges that after death, the spirit should return to Jupiter and the body should go back to Tellus, but as long as the creature lives, it should be possessed by Cura. As for the name, it should be called *homo* (mankind), since it was formed out of the *humus* (soil). Heidegger offers this fable as a "pre-ontological document" that illustrates *Dasein*'s self-interpretation within the horizon of temporality. Yet, he neglects to stress that the terms of the story further spell out mankind's relation to security. If mankind is consigned to the realm of Cura for the duration of life, then an absolutely secure state—a condition that is purely "removed from care" (*se-cura*)—is only possible posthumously, when the body rests in the fixity of the Tellurian grave and the spirit enjoys the freedom of Jupiter's heaven.

The promise of perfect security therefore rests on a negation of time, which includes the negation of human mortality, be it the lifelessness of physical death or the im-mortality of eternity. Political critics of security, in line with a Lockean tradition, frequently lament the well-known trade-off that purchases protection with the sacrifice of certain liberties. Yet, one could cite an even more insidious consequence: the dream of absolute security does not simply take away one's freedom but also threatens to remove the time-bound mortality that defines human existence. Hence, Jean Baudrillard characterizes the booming security industry as "state blackmail," which converts all manners of accidents, diseases, and

threats into "capitalist surplus profit"—"the worst repression, which consists in dispossessing you of your own death" (*Symbolic Exchange*, 177). For Baudrillard, an "immortal life" is a contradiction in terms, an ideologically driven oxymoron. To live is to be able to die; and security technologies, which forestall this potential end, end up defusing potentiality, foreclosing future contingencies, and therefore preventing life itself from living.

IV. Vigilance

It is not necessary to accept Baudrillard's radical judgment to recognize that the concern for security is always a concern for being without concern. The desire to protect oneself and others, the need according to the law of self-preservation to foresee and preempt danger, the commitment required to locate threats and remedy vulnerabilities, all ostensibly demand carefulness and caution, vigilance and ingenuity, usually by implementing a capacity to calculate risk and assess probability. One cannot be without care. Perhaps no one understood this better than Franz Kafka, the one-time officer and safety expert at the *Arbeiter-Unfall-Versicherungs-Anstalt* in Prague. In his short story "Der Bau" (The burrow), the tiny foraging animal knows that the protection of his day-to-day life requires constant awareness. His fortification is left vulnerable by design, which forces him to remain watchful. Paradoxically, it is the structure's lack of total impenetrability that ensures the inhabitant's capacity for self-defense. His mortality saves his life.

SEHNSUCHT, SEHNEN (GERMAN)

ENGLISH   nostalgia, yearning, longing
FRENCH   *nostalgie, aspiration*

➤ *MALAISE, NOSTALGIA,* and DOR, DRIVE, GEFÜHL, HEIMAT, I/ME/MYSELF, PATHOS, ROMANTIC, SAUDADE, SOUL, WUNSCH

German lexicographers like to emphasize that the verb *sich sehnen* and the corresponding noun, *Sehnsucht*, are words that have no equivalents in other European languages. Since these words—frequently used in everyday language and almost too common in

poetry after 1750—are not at first sight among the technical terms of philosophy, no one is offended by the fact that they may give rise to very diverse translations into French (*nostalgie, aspiration, désir ardent*, etc.). On closer inspection, however, these terms bear a philosophical freight to which we should pay attention. *Das Sehnen* (is this aspiration or nostalgia?) is one of the central terms in the first version of Fichte's *Wissenschaftslehre* (1794–95). *Sehnsucht* is also at the heart of the thinking of Friedrich von Schlegel, who notes in his *Philosophy of Life* (*Philosophie des Lebens*, 1827) that philosophy might be defined as a "doctrine or science of nostalgia" ("Lehre von der Sehnsucht, oder Wissenschaft der Sehnsucht," in *Kritische Friedrich von Schlegel Ausgabe*,10: 33).

I. The "Sentimental" Origin of *Sehnsucht*

The verb *sich sehnen*, whose etymology is obscure, appeared in Middle High German only after the eleventh century and means "languish, torment oneself, desire, sigh for something." In the middle of the seventeenth century, le lexicographer Justus Georg Schottel gave as its equivalent the Latin *cupidine ardere* (RT: *Deutsches Wörterbuch*, art. "Sehnen"). *Sich sehnen* was used extensively by courtly poets, especially in referring to the torments of love. This "sentimental" origin deeply influenced the verb and the noun *die Sehnsucht* (a compound with the suffix *–sucht*, which designates a sickly state): thus it referred to the suffering of a person consumed by desire.

A. The indeterminacy of the object of desire

The terms *sehnen* and *Sehnsucht* are centered on the desiring subject and on the pain that he feels (*ardere*) and not on the object of his desire, which remains relatively indeterminate. *Sehnen* and *Sehnsucht* designate a tension, a subject's aspiration to change his state. When the object of desire is specified, an abstract and immaterial term is generally used (*Sehnsucht nach Ruhe, nach der Heimat, nach Geborgenheit* [the desire for peace, for the homeland, for security]). In *Sehnsucht* the crude and even brutal aspect that lust (*das Begehren*, the desire to possess) may take on is in a way abolished or sublimated. From this point of view, we might say that it is an ennobled (spiritualized) form of desire, which probably also explains the inflation of *Sehnsucht* in German poetry between 1750 and 1850.

B. The difference between *Sehnsucht* and nostalgia

These characteristics of *Sehnsucht* allow us to compare it with "nostalgia"—which is one of the terms most frequently used by translators when they seek to render the German word. The accent put on the subject's suffering, along with the vague and immaterial aspect of that to which he aspires, seems to suggest that "nostalgia" and *Sehnsucht* are equivalent to each other. But nostalgia is, properly speaking, the longing for a return, the suffering connected with the desire to go back to what one has previously known (see Box 1). *Sehnsucht* is not connected with a return; the idea associated with it is primarily that of a departure ("Ah! To be able to leave as they do / Into that marvelous summer's night!" Eichendorff writes in his poem "Sehnsucht," vv. 7–8). Whereas *Sehnsucht* is turned toward a distant goal and often concerns the future rather than the past, nostalgia is an elegiac sentiment and manifests itself in the form of regret. Littré's French

dictionary does not list a meaning of *nostalgie* that is not turned toward the past: that is why *nostalgie* is a very imperfect translation of *Sehnsucht*. In fact, a use of the French word *nostalgie* that is more temporally open does not appear until the middle of the nineteenth century. In one of his prose poems, Baudelaire refers, for example, to cigars that "make the soul nostalgic for unknown countries and joys" (Baudelaire, "Le joueur généreux" [1864]). In French this use remains, however, marginal: the idea of a tendency toward the past remains closely connected with the word *nostalgie*, which thus remains faithful to its etymology.

■ See Box 1.

II. The Term's Philosophical Freight

A. Fichte: *Das Sehnen,* the aspiration of the self

It is in this lexical landscape that the reflections of Fichte and the Romantics about *Sehnsucht* developed in Germany, along with Hegel's rigorous critique of the notion. *Das Sehnen* played an important role in the first version of Fichte's *Wissenschaftslehre* (1794–95). The word is usually translated into French by *aspiration*, but the reference is to an aspiration that is a feeling, or else to a nostalgia that is an aspiration. For Fichte the constraints and limitations imposed on the Ego lead it to reflect on what impels it irresistibly toward objects external to itself.

We call such a determination in the Ego an aspiration (*Sehnen*); a tendency (*Trieb*) toward something absolutely unknown, which manifests itself only as a need (*Bedürfnis*), a disquiet (*Unbehagen*), a void (*Leere*) that seeks to fulfill itself and which does not indicate what

would allow this fulfillment. The Ego feels an aspiration; it feels a lack in itself.

(Fichte, *Gesamtausgabe.*)

In his *System of Ethics* (*System der Sittenlehre*, 1798), Fichte similarly defines *das Sehnen* as the indeterminate sensation (*Empfindung*) of a need (that is, one that is not determined by any concept of an object) or as a "feeling (*Gefühl*) of a need that we do not ourselves know. We lack something, but we don't know what."

Aspiration, nostalgia directed toward the future, is precisely what permits the Ego to feel within itself the existence of an outside. It is only through *das Sehnen*, Fichte writes, that "the Ego is pushed outside itself; it is only by *das Sehnen* that an outside world is revealed within the Ego" (ibid.). Whereas the feeling of constraint forces the Ego to perceive itself solely as a passive figure (it undergoes limitation), "in the feeling of aspiration it is also perceived as active" (ibid.). In this context *das Sehnen* is a powerful source of energy that drives the Ego to transform the outside world: "The object of *das Sehnen* is something other, something that opposes the existent. In *das Sehnen*, ideality and tendency toward reality are intimately connected" (ibid.). Here we should emphasize that it is the choice of the nominalized verb *das Sehnen* that allows Fichte to confer a dynamic and active value on a lexical field that originally stressed the subject's suffering.

B. The infinity of Romantic *Sehnsucht*

The idea that *das Sehnen* has a genuine creative power was adopted by the authors of the early Romantic period. The privilege that it acquired in Fichte's theory of knowledge was transferred to the more psychological or anthropological

---

1

Nostos and nostalgia

The English word "nostalgia," like the French *nostalgie*, was "borrowed by physicians (1759) from the modern scientific Latin *nostalgia*, coined in 1678 by the Swiss physician J. J. Harder." And this Latin term was invented to translate "the Alemannic *Heimweh*, the 'homesickness' [see HEIMAT] felt by the Swiss who were abroad, especially mercenaries" (RT: DHLF, s.v.). "Nostalgia" thus derives from Swiss Latin, coined on the basis of Greek—even if the compound term is not itself Greek—*nostos* [νόστος] ("return") and *algos* [ἄλγος] ("suffering, pain"), on the model of medical terms that describe diseases in terms of the organ affected, such as "neuralgia" and "lumbago."

Nostos is derived from *neomai* [νέομαι] ("to come back, return") and comes from a root whose active meaning is supposed to be "to save": this is shown in particular by the name *Nestor*, "one who comes safely home, who succeeds in bringing back his army" (see Chantraine's

comparisons with Germanic, Old High German, and Anglo-Saxon, and with the Sanskrit *násate*, "to approach, unite with" RT: *Dictionnaire étymologique de la langue grecque*).

Nostos appears, obviously, in Homer's *Odyssey*. A *nostimos* [νόστιμος] is "one who is capable of returning": the question is whether Odysseus—and then Telemachus who has gone in search of him—is a *nostimos* (IV, 806; XIX, 85), or whether he has been deprived (*apheileto* [ἀφείλετο]) of "the day of return" (*nostimon êmar* [νόστιμον ἦμαρ], I, 168, 354), whether he has lost it (*ôileto* [ᾤλετο], *apôlese* [ἀπώλεσε], I, 168, 354). In the first lines of Book I, the motif is already presented:

By now, all the survivors, all who avoided headlong death were safe at home [*oikoi* [οἴκοι]], escaped the wars and waves.

But one man alone . . . his heart set on his wife and his return [*nostou*

kechrêmenon êde gunaikos (νόστου κεχρημενον ἠδὲ γυναικός)]—Calypso, the bewitching nymph, the lustrous goddess, held him back.

(*Odyssey*, trans. R. Fagles, I, 13–18)

Calypso, the "enveloping, the covering," loves and cares for Odysseus, promises him that he will be "immortal and young forever"; but as Odysseus tells Alcinous, "she never won the heart inside me, never. / Seven endless years I remained there, always drenching / with my tears the immortal clothes Calypso gave me" (VII, 97–99).

Here we see the complex motif that links nostalgia not only with the desire for return and with the tedium of separation from home but also to the obstacle, to the desire of the other, and to the desire for immortality.

Barbara Cassin

term *Sehnsucht.* In one of his last writings, Friedrich von Schlegel makes the feeling of *Sehnsucht* the source of almost "everything that is grand and beautiful in the domain of the spirit" (Schlegel, *Kritische*, 10: 33; in addition to the texts cited here, cf. especially ibid., 11: 123; 12: 392, 430f.). In his work *Die Anweisung zum seligen Leben oder auch die Religionslehre* (*The Way towards the Blessed Life; or, the Doctrine of Religion*), Fichte himself had made "longing (*Sehnsucht*) for the eternal" a kind of vital principle, "the deepest root of all finite existence" (Fichte, *Gesamtausgabe*). Nothing can quench this inner thirst in man: "the object of true *Sehnsucht* can only be inaccessible," Goethe wrote (*Dichtung und Wahrheit*, 10: 54; see also *Hamburger Ausgabe*, 7: 240, and the poem *Selige Sehnsucht* [Blessed longing] in ibid., 2: 19, first stanza: "Don't tell anyone about it, except the wise / For the crowd is quick to mock: / I want to praise the Living / Who longs to die in the flame"—but we must emphasize that Goethe distances himself from all this praise of nostalgic longing).

Fichte, and then Schleiermacher and Friedrich von Schlegel, conferred on this principle a strong metaphysical and religious dimension: for Schlegel, *Sehnsucht* is "a vague feeling of the deepest longing" (*ein unbestimmtes Gefühl des tiefsten Verlangens*), which no truly terrestrial object, or even any ideal, could satisfy, since it is directed toward the eternal and more generally toward the divine" (Schlegel, *Kritische*, 10: 32). (In his famous *Dialogue on Poetry* [*Gespräch über die Poesie*, 1800], the young Schlegel had already emphasized that *Sehnsucht* constantly renews itself (ibid., 2: 284; cf. Lacoue-Labarthe and Nancy, *L'Absolu littéraire*, 290). True *Sehnsucht* knows no limits, but instead, "climbing step by step, never ceases to rise further" (*Philosophy of Language and the Word*, 1828–29, in Schlegel, *Kritische*, 10: 398). It is hardly surprising to learn that, by means of a circular movement entirely characteristic of Schlegel's thought, this engine that drives us toward the divine is itself of divine origin (ibid., 10: 33).

C. Hegel: *Sehnsucht* and the unhappy consciousness

By emphasizing the dynamic aspect of *Sehnsucht*, Romantic thought thus tends to erase somewhat the element of suffering and passivity. For Hegel this longing is, on the contrary, one of the chief manifestations of the unhappy consciousness. In the *Phenomenology of Mind*, the depreciation of *Sehnsucht* is part of the criticism of Fichte and the Romantic thinkers. When we consider the unhappy consciousness as pure consciousness,

> it takes up towards its object an attitude which is not that of thought; but rather (since it is indeed in itself pure thinking particularity and its object is just this pure thought, but pure thought is not their relation to one another as such), it, so to say, merely gives itself up to thought, devotes itself to thinking (*geht an das Denken hin*), and is the state of Devotion (*Andacht*). Its thinking as such is no more than the discordant clang of ringing bells, or a cloud of warm incense, a kind of thinking in terms of music, that does not get the length of notions, which would be the sole, immanent, objective mode of thought. This boundless pure inward feeling comes to have indeed its object; but this object does not make its appearance in conceptual form, and therefore comes

on the scene as something external and foreign. Hence we have here the inward movement of pure emotion [*Gemüth*] which feels itself, but feels itself in the bitterness of soul-redemption. It is the movement of infinite Yearning [*Sehnsucht*], which is assured that its nature is a pure emotion of this kind, a pure thought which thinks itself as particularity—a yearning that is certain of being known and recognized by this object, for the very reason that this object thinks itself as particularity. At the same time, however, this nature is the unattainable "beyond" which, in being seized, escapes or rather has already escaped.

(Hegel, *Phenomenology of Mind*, 257–58)

We find the same point of view and the same implicit criticism of Fichte, Schleiermacher, Schlegel, and Schelling not only in Hegel's analysis of the "beautiful soul" that "flees contact with actuality" and whose sole activity is "languishing" (*das Sehnen*) (ibid., 354), but also in his *Aesthetics*, where he citicizes the modern tendency to privilege the distant:

> The Greeks' divine, correct way of thinking did not consider going out toward the distant and indeterminate [*das Hinausgehen ins Weite und Unbestimmte*], in the manner of the modern sentiment of nostalgia [*Sehnsucht*], as the *nec plus ultra* for man, but rather as a kind of damnation, and relegated it to Tartarus.

(Hegel, *Sämtliche Werke*, 13: 55)

In the *Aesthetics* Hegel also condemns the "languorous nostalgia" (*Sehnsuchtigkeit*, a depreciative derivative coined by Hegel) of the Romantic authors who wanted to rediscover the naïveté of popular poetry (ibid., 14: 202) and of Novalis, a nostalgia "that does not consent to lower itself to actual action and actual production, because it fears being soiled by contact with finitude" (ibid., 12: 221).

SEIN / SOSEIN / AUSSERSEIN (GERMAN)

ENGLISH   being / being so / beyond being

➤ *TO BE*, and DASEIN, ES GIBT, *FICTION*, GEGENSTAND, INTENTION, *NOTHING*, OBJECT, REALITY, REPRÉSENTATION, RES, SACHVERHALT, WERT

In the post-Kantian era, the vocabulary of being was redistributed within the horizon of the object, in conformity with the Kantian injunction to substitute an "analytic of pure understanding" for the "pretentious name of ontology." The phenomenon, which was already present in neo-Kantianism, in Lotze, and in Nathorp, would know a development particularly rich in distinctions in the school of Franz Brentano, where the elucidation of the doctrine of intentionality (see INTENTION) would meet up with the Bolzanian problematic of "representations without object" (*gegenstandlose Vorstellungen*). As a consequence a significant sector of German and Austro-Hungarian philosophy would revisit the Hegelian division between *Realität* and *Wirklichkeit*, reality and effectivity (see REALITY), and introduce or redefine a new lexicon that, even as it harkened back to ancient tradition (Porphyry, Boethius, Latin Scholasticism of the thirteenth century), would impose on various European languages a difficult terminological innovation exemplified in Alexius Meinong's distinction between *Sein*, *Sosein*, and *Aussersein*.

I. Being and Object-Being:
From Ontology (the Science of *On Hê On*)
to the Theory of the Object (*Gegenstandslehre*)

In his *Metaphysics*, through generalization and universalization, Aristotle distinguished the mode of knowledge that focused universally on being as being, or rather, on the existent only insofar as it can be characterized as existent, from all other regional or specialized sciences, which envisage existents only *en merei* [ἐν μέρει], according to a determined perspective and by selecting a "sample." By 1888, against an explicitly neo-Kantian horizon, Paul Nathorp had already retranscribed Aristotle's ontological investigations in terms of objects:

That supreme (because most general and most abstract) object is, as we learn in the fundamental concept of the "object in general" (*Gegenstand überhaupt*), for it is thus

that we are able, so to speak, in Kantian terms, to restore the Aristotelian *on hê*.

(Natorp, "Thema und Disposition der aristotelischen Metaphysik," 39)

K. Twardowski, in his celebrated short work of 1894 (*Zur Lehre vom Inhalt und Gegenstand der Vorstellungen*, Vienna, 1894), similarly repeated Aristotle's gesture, retranslating it into a lexicon of object and objecthood, as it was opened up at the time by a consideration of representation (*Vorstellung*) in its complex intentional structure, oriented as it was toward a content (*Inhalt*) and an object (*Gegenstand*):

What particular sciences are concerned with, to be sure, are nothing but the objects of our representations (*die Gegenstände unserer Vorstellungen*). . . . On the other hand, a science which draws into the circle of its considerations all objects, those that are physical, organic and inorganic as well as those that are psychical, those that are real (*realen*) as well as those that are not real (*nicht realen*), those that exist as well as those that do not exist, and which searches for the laws obeyed by those objects in general—and not just a determinate group of them—, such is metaphysics. . . . Such is the meaning of the venerable definition according to which metaphysics is the science of the existent as such (*Wissenschaft vom Seienden als solchen*).

(Twardowski, *Zur Lehre*, 39)

The theory of the object would thus take over from metaphysics, or more precisely from ontology, even if the process as evoked here by Twardowski is plainly rudimentary as compared to the complex and subtle deployment of *Gegenstandtheorie* (1904), in which Meinong would attempt far more judiciously to distinguish between "theory of the object" and "ontology" and to situate ontology itself, in the Aristotelian tradition, as a restricted segment in a far more comprehensive consideration of the *Gegenstand* and its modalities.

A. Translating being into the lexicon of objecthood

If Twardowski did not resolutely move the theory of the object outside of metaphysics, constituting it as an extra-ontological doctrine, it was no doubt because he had retained the classical identification, dating from Thomas Aquinas, between (*On Truth*, 1, 1) *ens* and *aliquid*:

Der Gegenstand ist etwas anderes als das Existierende; manchen Gegenständen kommt neben ihrer Gegenständlichkeit, neben Beschaffenheit, vorgestellt zu werden (was der eigentliche Sinne des Wortes "essentia" ist), auch noch die Existenz zu, anderen nicht. Sowohl was existiert ist ein Gegenstand (*ens habens actualem existentiam*) als auch, was nur existieren könnte (*ens possibile*), ja selbst was niemals existieren, sondern nur vorgestellt werden kann (*ens rationis*), ist ein Gegenstand, kurz, alles was nicht nichts, sondern in irgend einem Sinne "etwas" ist, ist ein Gegenstand. Thatsächlich erklärt die Mehrzahl der Scholastike "*aliquid*" für gleichbedeutend mit "*ens*," und zwar im Gegensatz zu denjenigen, welche ersteres als ein Attribut des letzteren auffassen.

(The object is something other than an existent: to numerous objects, in addition to their objectity, to their capacity to be represented (which is the literal meaning of the word "essentia") there attaches existence as well, and to others, not. An object can be what exists (*ens habens actualem existentiam*) as what could exist (*ens possibile*), and even what could never exist, but only be conceived (*ens rationis*); an object, in sum, is everything that is not nothing, but is in any sense "something," an object. In point of fact, a majority of the scholastics regard "aliquid" as a synonym of "ens," and that in opposition to those who regard the former as an attribute of the latter.)

(Twardowski, *Zur Lehre*, 37–38)

B. Object and existence

Bertrand Russell, for his part (and the point is worth emphasizing), wrote in the *Principia Mathematica* in 1903:

Being is that which belongs to every conceivable term, to every possible object of thought—in short to everything that can possibly occur in any proposition true or false, and to all such propositions themselves. … "A is not" implies that there is a term: A, whose being is denied, and hence that A is. … Numbers, the Homeric gods, relations, chimeras and four-dimensional spaces, all have being, for if they were not entities of a kind, we could make no propositions about them. Thus being is a general attribute of everything, and to mention anything is to show that it is. Existence, on the contrary, is the prerogative of some only among beings.

(Russell, Allen & Unwin, 1937, 2nd ed., 136)

He rejoins in this passage the long tradition which, from Thomas Aquinas to Kant, distinguishes, in the critique of the ontological argument, being or entity (*aliquid*) and existence, which cannot be counted among the predicates of reality (see DASEIN).

II. Object and Something
(*Gegenstand, Etwas, Bestand*)

The reference to the doctrines of Scholasticism and the metaphysics of Aristotle was initially intended, within the economy of Kazimierz Twardowski's essay (*Zur Lehre*), to specify the meaning of the term "object" (*Gegenstand*), but ended up opening onto "something" (*etwas*) whose status and whether or not it depended on an intentional or constitutive subject were both unknown:

An object can be approximately described in the following manner: anything that can be represented by a representation, acknowledged or rejected by a judgment, desired or detested by an affective act we call an object. Objects are real or not real (*real oder nicht real*); they are possible or impossible; they exist or do not exist. They all have in common the fact of being able to be or not be an object (*Objekt*) (but *not* an intentional object), of psychical acts and are designated in language by a name …; considered as a family (*Gattung*), they form the *summum genus* that finds its customary expression in language

in "something" (*etwas*). All that is "something," in the broadest sense, is so called, first of all, in relation to a subject that thinks it, but, subsequently, independently of that object, an "object" (*Gegenstand*).

(Ibid., 40)

Alexius Meinong, more resolutely still than Twardowski in his essay of 1894, took up in his own terms the project of a theoretical treatment of the object as such, in a move that generalized and extended it beyond ontology, assumed to be too narrow because too linked to actuality (*Wirklichkeit*) (see REALITY).

For Meinong if one is to elaborate a general science of the object, it is consequently important to distinguish it from metaphysics, which is not universal enough to encompass the complete treatment of the *reiner Gegenstand* (pure object) (*Übergegendstandstheorie*, in *Gesamtausgabe*, vol. 2). Traditionally, metaphysics is undoubtedly concerned with everything that is, but that totality is confused with the set of all that exists, including what has existed or will exist; but that set is infinitely small compared with the totality of *Erkenntnisgegenstände* (objects of knowledge). Limited to the real, to what exists, has existed, or will exist, metaphysics is fundamentally always *Daseinsmetaphysik* (metaphysics of being-there, of existence). From this it follows that it is legitimate to distinguish a *daseinsfreie Metaphysik* (a metaphysics freed from existence), which it would be appropriate to rebaptize, in order to avoid all confusion, a "theory of the object." The theory of the object should include in particular ideal objects having a certain consistency (*Bestand*) and of which it can be said that they subsist (*bestehen*), but which nonetheless do not exist (*existieren*), which are nothing actual (*wirklich*), such as number, equality, difference, etc. Meinong thus eschews Twardowski's awkwardness in seeking to determine the *Gegenstand* as *summum genus*: the desire to define the object formally is without meaning, he notes, since both *genus* and *differentia* are lacking, if it is true that everything is object (*alles ist Gegenstand*).

It is thus important to proceed to a broadening of the sphere of the object beyond even that of being and nonbeing, a broadening intent on breaking with the ontology of Aristotelian tradition, in conformity with the provocative and paradoxical formula: "es gibt Gegenstände, von denen gilt, daß es dergleichen Gegenstände nicht gibt" (Meinong, *Gesamtausgabe*, 2: 490).

Before proposing a translation, let us attempt to unravel the paradox of the formula, whose backdrop is constituted by the distinction, at the heart of the vocabulary of being, among:

- *existieren*, which applies to objects said to be real or actual;
- *bestehen*, which is applied to "objectives" (*Objektive, Sachverhalt* [see SACHVERHALT]);
- *Sosein* (so-being), which applies to nonreal, but possible, entities, such as a "golden mountain," concerning which it is always permissible to determine the being-such or so-being, independently of being (*Sein*);
- *Außersein* (outside-being), which applies to contradictory entities such as a "square circle," entities that are not purely and simply nothing but retain in themselves an ultimate positional residue.

ال

Whereas metaphysics limited itself to what effectively exists, it befell the theory of the object to bring fully to light the independence of *Sosein* (so-being) in relation to its indifference in relation to being, beyond being, and nonbeing.

The neologism *Außersein* is thus intended first of all to resolve the paradox of the governing formula, as Meinong explains in *Über Annahmen*:

Our grasp (*Ergreifen*) finds in objects something pre-given (*etwas vorgegeben*), without its being necessary to take into account the matter of knowing how the question of their being or nonbeing is decided. In this sense, "there are" also objects that are not, which I attempted to designate by an expression that is a bit barbarous, but I could not find a better one: namely, the "outside-being" (*Außersein*) of the pure object. The term is a response to the effort to interpret the strange "*es gibt*," which can not, it appears, be denied even to the objects most foreign to being (*seinsfremdeste Gegenstände*), without it becoming necessary to resort to a third type of being, in addition to existence (*Existenz*) and subsistence (*Bestand*). But since then I have on more than one occasion had the very distinct sense that such an effort could not come to terms with the specific positivity (*eigentümliche Positivität*) that appears to be a function of the pre-given character (*Vorgegebenheit*) of any object available in theory to being grasped and conceived. It is upon consideration of this point that I am obliged to envisage expressly the eventuality of there possibly being, beyond existence and subsistence, a third mode, which can no longer be called being, and which, finally, must be characterized as something related to being (*etwas Seinsartiges*) in the broadest sense of the term. What remains to be decided is precisely the question of knowing whether this *Außersein* ("outside-being") itself is an ontological determination or if it indicates only that such a determination is lacking.

(Meinong, *Gesamtausgabe*, 2nd ed., 4:79–80)

The principle of the independence of so-being or suchness (*Sosein*) is to be understood first of all in this sense: the fact that an object has properties in no way implies that that object itself *is*, that is, that it exists *extra mentem* or *extra causas*. But that weak version of the principle of independence is insufficient to characterize the position defended by Meinong, since it simply brings us back to the Scholastic, pre-Kantian position of *realitas*. In the strong version of the thesis, independence is a property of the object in relation to mind and its intentions; the object, considered in what should no longer be termed its "being," unless in a sense that is too broad and inadequate, is indeed "apprehended," "but precisely not constituted": not being constituted, neither does the object have the classic status of objective being, which always ultimately turns on the extra-mental *res* and is distinguished from the *ens rationis*. If it is not possible to give a formal definition of the object, etymology can come to our aid: for the *Gegen-stehen* (standing against) of the *Gegen-stand* brings us back to the lived experience of apprehending the object (should we say the *ob-stant*?), an experience that cannot be envisaged as *constitutive* in any sense at all. Meinong insists

on the anteriority of the object as such (*objeto*, entity, Grossmann) independently of the question of knowing whether we are dealing with an object, which might trivially be called real, with an ideality, or with a being of reason, in its status a *fictum*, *figmentum* (see FICTION).

In relation to apprehension (*dem Erfassen gegenüber*), the *object* (*Gegenstand*) is what is in every case *logically anterior*, even when the object in question logically comes after apprehension. This is why apprehension can never create its object or even modify it, but can merely select it, so to speak, by extracting it from the multiplicity of what has been given in advance (at least as foreign to being).

(Meinong, *Personal Presentation*)

Thus the principle of the independence of so-being or suchness finds its true bearing only if applied not only to possible objects but also to *impossibilia*, once it is accepted that the suchness of an object is not affected by its nonbeing (*Nichtsein*); such nonbeingness (*Nichtseiendes*) suffices to procure for the judgment apprehending it its "nonbeing."

If I say "blue does not exist," I am thinking only of blue and not of a sample of blue or of the qualities and possibilities that it might present. It is as though blue should possess being *in the first place* (*erst einmal*), before any possibility of raising the question of its being or non-being. ... Blue or any other object is in some sense given prior to our decision concerning its being, and it is given in a way that does not prejudge its nonbeing. ... In order to be able to affirm that a given object is not, it appears that the object must be understood, in a sense, *in advance* (den Gegenstand ... erst einmal ergreifen) in order to speak of its nonbeing, or, more precisely, to defend or deny the attribution of nonbeing to that object.

(Meinong, "Theory of Objects")

Indeed, if, concerning any "given" object, I am to judge that it is not, it is necessary that I be able to apprehend the object in a first instance in order to attribute to it the predicate of nonbeing, or more precisely to impute or deny that predicate to it. It is thus necessary to introduce still another level or understanding of "being," in addition to those of existence or subsistence; one that was first named by Meinong "quasi-being" (*Quasisein*), then "beyond being and nonbeing" (*jenseits von Sein und Nichtsein*), which is appropriate to the pure object, or even exterior to being, outside-being (*Außersein*). Being is exterior to the pure object, as opposed to so-being or suchness: "What is in no way foreign to the object and constitutes, to the contrary, its true essence, resides in its suchness, which adheres to the object, whether it be or not be [Dasjenige, was dem Gegenstand in keiner Weise äußerlich ist, vielmehr sein eigentliches Wesen ausmacht, besteht in seinem Sosein, das dem Gegenstande anhaftet, mag er sein oder nicht sein]."

III. *Es Gibt, Es Gilt*

One must keep in mind the irreducible dimension of donation, of being given, even pre-given, if one is to interpret

rigorously Meinong's paradox: "Es gibt Gegenstände, von denen gilt, daß es dergleichen Gegenstände nicht gibt."

It is a paradox whose translation is only apparently obvious. We may say, with Findlay, that "there are objects concerning which it is the case that there are no such objects," while completely losing sight of the subtle interplay between the first *geben*, the *gelten*, and the second *geben*. Let us begin with the *gelten*, recalling, in the present context, the distinctions of H. Lotze:

> We shall call actual (*wirklich*) a thing that *is*, in opposition to another that *is* not; actual is also an event taking place (*ein Ereigniß welches geschieht*) or which has taken place, in opposition to another that fails to occur; actual a relation that subsists (*besteht*), as opposed to one that does not subsist; finally, we call actually true (*wirklich wahr*) a proposition of *value* (*ein Satz welcher gilt*) as opposed to one whose validity (*Geltung*) is still in doubt.
>
> (Lotze, *Logik vom Erkennen,* 511)

Gelten, in this case, understood as a kind of actuality, corresponds to a meaning of being (ὄν, εἶναι) said to be veracious but which applies here to propositions ("Wahrheiten *sind* nicht, sondern *gelten* nur [truths *are* not, but only bear value]," ibid., 578). The problematic horizon in which Meinong's terminological and doctrinal decision is situated is quite clear: *gelten* corresponds to the veritative sense of being: "it is true

that …"; "it is the case"; "it is thus." The last *es gibt*, in the articulation of the paradox, can be understood in the broadest and most common sense of being: "there are objects for which, it is the case: such objects are not, do not exist." Thus the truly problematic element in the formulation of Meinong's paradox is the first *es gibt*, which is very poorly rendered by the French *il y a* or the English "there is." In point of fact, with that *es gibt* we are in the presence of an elementary figure—as tenuous as might be liked, reduced to almost nothing, but precisely not to nothing at all—of the gift or of being given.

■ See Box 1.

IV. The Extra-Ontological

It remains, in the strict framework of the theory of the object, that the ultimate rule—imposing itself a priori as a final instance—is this singular "given": objects for which it is *valid* to claim that they are not, and of which, thus composed, in their being-so or suchness, *there are none*; such objects cannot *be*, or better, being (*das Sein*) cannot be attributed to them in a judgment, neither as a property, nor as an accident. And yet that irreducible given or pre-given—it "resists," and that characteristic might well be the final word concerning *Außersein*—must be understood in the strong sense: it imposes itself on us, offering itself a priori to every act of apprehension, it is that from which, in a quasi-empirical manner, we must necessarily take off. This is why Meinong can adopt for his

---

1

Heidegger's *es gibt*

➤ ES GIBT, *IL Y A*

Far be it from us, needless to say, to entertain the grotesque idea of linking *es gibt* in Meinong with the Heideggerian *es gibt*, as it appears, well before the final variations of *Zeit und Sein,* in *Sein und Zeit*, in order to indicate—in quotation marks that need be interpreted, moreover—that being "is" not, but that "there is" being.

It was not Meinong, but Emil Lask who engaged the young Heidegger on the path of *es gibt*; his first course at Freiburg (1919, in *Gesamtausgabe*, 56–57, *Zur Bestimmung der Philosophie*) proposes, in fact, a long analysis of *es gibt*, which begins with a variation on *gelten* (ibid., 50ff.), before opening onto the question: "Gibt es das 'es gibt'?" [Is there a "there is"?]. Emil Lask envisaged the category of *Es-geben* ("there being") as that of reflection (reflexive *Gegenständlichkeit*). Opening on to pure objectality prior to any determination of an object (Lask, *Logik der Philosophie*, 130, 142, 162), that is, as the elementary category of a "something" (*etwas*) that constitutes the minimum required for anything apt to be subsequently presented as a categorically defined object; thus the *il y a*, "there is," of

pure objectality, is opposed, "objected," to reflection so that the latter can be exercised. The "something" (*etwas*) or "it" (*es*) of *es gibt* thus furnishes a material still "logically bare," "a-logical," and prior to any possibility of applying formal categories.

But it may also be wondered to what extent the question elaborated by Heidegger in the 1919 course "Gibt es das 'es gibt'?" echoes the critique formulated by Paul Natorp in his revised edition—which was known to Heidegger—of Husserl's *Ideen I* (*Logos,* 7: 224–46, 1917–1918)—the original given or the final giving, which furnished Husserl with his "principle of principles" (*Ideen I*, 24):

> daß jede originär gebende Anschauung eine Rechtsquelle der Erkenntnis sei, daß alles, was sich uns in der "Intuition" originär … darbietet, einfach hinzunehmen sei, als was es sich gibt, aber auch nur in den Schranken, in denen es sich da gibt.
>
> ([The principle of principles affirms] that every originary presentive intuition is a legitimizing source of cognition, that everything originarily (so to speak, in its "personal" actuality) offered to us in

"intuition" is to be accepted simply as what it is presented as being, but also only within the limits in which it is presented there.)

Natorp opposed the very process of thought in its discursiveness:

> *Der Prozeß selbst ist das "Gebende"* für die … "Prinzipien"; nur so "gibt" es, "gibt" sich (wie andere Sprachen sagen) Gegebenes.
>
> (*The process itself is what "gives"*… in relation to principles; it is only thereby that there is, that the given (as is said in other languages) is given.)
>
> (In Husserl, Wege der Forschung, ed. H. Noack, Darmstadt: Wissenschaftliche Buchgesellschaft, 1973, 43)

There can thus be no "completed presentation or giving (*fertige Gegebenheit*)," which would be like a polar star for thought; such fixed stars, as Natorp emphasizes, are never more than planets of a higher order: "So ist nichts, sondern wird nur etwas 'gegeben' [thus nothing is 'given,' but all that is given is such only insofar as it becomes it]" (ibid., p. 42).

own purposes the idea of a philosophy that would begin from below, that is, from what is irreducibly given, even if foreign to being (*außerseiend*). There is thus given, but outside-being, this which is valid and is true: certain objects are not, and that in such manner that their "beyond being-and-non-being" is itself capable of being given. Meinong, in fact, strained to give a more easily acceptable formulation of his "paradox" by introducing the singular concept of *Außersein*, which was precisely intended to reduce the paradox: "He who is inclined to paradox might very well say that there are objects concerning which it can be affirmed that there are none."

The obvious solution for neutralizing the paradox—one against which the theory of the object was precisely elaborated—would consist in interpreting the first *es gibt* (there are objects) in the trivial sense of an existence in representation or of a pseudo-existence: certain objects are or are possible, for instance, in the divine intellect; others, which are not, have being only in and through representation, as *entia rationis* or *intentionalia*; their "being" is reduced to *objective esse* or pseudo-existence.

■ See Box 2.

But for Meinong the thesis of nonexistence never refers merely to representation or being-represented but indeed to an object, say, *x*, about whose being or non-being it is wondered: "if I am to be able, concerning an object, to judge that it is not, it would appear that I am under the necessity of initially apprehending the object in order to be able to assign to it the predicate of non-being." Or to state it in other terms, and more rigorously: to the objective (or to the state of things: *das Objektive*) that "A is not A" or to the nonbeing of A, a being must nonetheless be attributed, be it only through appeal to the analogy of the relation between the whole and the part (medieval thinkers, grounding themselves in the resources of the infinitive proposition, were able to paraphrase things economically: "objectum hujus 'Deus est Deus' est 'Deum esse Deus'; et hujus 'homo est albus' ... significatum est 'hominem esse album.' ... Hujus 'homo non est asinus' objectum est 'hominem non esse asinum'" (Adam Wodeham, in Perler, *Satztheorien*, 296–98). We translate, with emphasis: "the object of this, that is, the state-of-things described by the proposition 'God is God' is 'God-to-be-God'; and the complex signified of the proposition 'the man is white' is 'man-to-be-white'; the object or state-of-things of the proposition: 'man is not a donkey' is 'man-not-to-be-donkey.'"

Taking the objective (*das Objektive*) for the whole, if it be, it is necessary that the part, the objectity or *objectum*

2

Rābiṭa (رابطة)

For the word *rābiṭa*, coming from the verb *rabaṭa* (ربط), which means "to connect," the following meanings are listed in dictionaries: "nexus," "tie," "bond," "relation," "league." It has been used specifically in philosophy to translate the Latin word *copula* or the Greek *sumplokê*, which designated the verb "to be," which connects, in different conjugated forms, the subject and the predicate in a proposition under the canonical form "S is P." Aristotle considered such a form to be a logical canon, insisting that if a proposition, for example, "Socrates walks," does not appear under such a form it should be restored to its authentic logical structure (subject, copula, predicate) which is "Socrates is walking."

Why insist on transforming "Socrates walks" into "Socrates is walking"? To manifest the ontological import of what is affirmed, namely that of the individual substance Socrates has predicated the attribute "to be walking," which expresses his "posture." And we know that "posture" is precisely one of the ten categories of being, defined by Aristotle as the most fundamental ways in which being is said. The verb "to be" in its different forms is then a crucial element in Aristotle's logic which has been rightly characterized by Robert Blanché as an "onto-logic."

The first translators of Aristotle's *Analytics* into Arabic were fully aware of the profound connection between his logic and his ontology and therefore of the necessity to have a linguistic element indicating the relation between the subject and the predicate. As philosophers in the Muslim world, from Al-Fārābī to Averroës, have explained, in the apophantical assertion in which the subject is a noun and the predicate also a noun, there must be expressed a verb, or any linguistic element serving as a verb, to indicate the relation of the predicate to the subject. And as they well remarked, too, there does not exist in Arabic, unlike, for example, Indo-European languages, a word for that kind of (onto-logical) relation. In Arabic (as in Hebrew), the copula is not expressed in the present tense, and it is more natural to say "Socrates an animal" than "Socrates *is* an animal." In linguistic terms the language uses the zero copula form.

In order to maintain the formal equivalence between the canonical form of Aristotle's logical proposition and its Arabic rendition, the pronoun or a word meaning "existing" is considered as the *rābiṭa* playing the role of the verb "to be." Thus "Socrates *huwa* hayawān," literally meaning "Socrates, he, an animal," or "Socrates *mawjūdun* hayawānan," literally meaning "Socrates is existing as an animal," will be the translations of "Socrates is an animal."

To translate a philosophical tradition into a language unfamiliar with it leads to these sorts of accommodations. The Hellenizing philosophers from the world of Islam realized that in the case of the *rābiṭa*, as well as in other instances. An interesting paradox concerning the copula is found in the rendition of the apophantical assertion in the present tense. Islamic philosophers were concerned to preserve the ontological weight of the copula, in this instance, but their usage undermined it. To have the pronoun serve as a copula is to reduce the latter to a *formal* sign, to being the simple *indication* of a relation. And it is perfectly possible then to see that as a prefiguration of the modern disjunction that will occur in the history of logic between that discipline and ontology, when the copula became a simple sign of relation (represented by an algebraic symbol) defined by certain formal properties.

(*Gegenstand*), also be, in a certain manner. From the objective of nonbeing, if it be, there consequently flows the being of objictity. This, it will be agreed, is less to resolve than to deepen the paradox, leading one to posit, if not a third type, at least a third level of being, beyond existence and subsistence, the very one that Meinong himself had at one point called "quasi-being," were it not that such being ("quasi-being") could no longer be opposed to a nonbeing of the same type.

"Can we still," Meinong asks, "call being a being to which no nonbeing, in principle, would be opposed?" ("Theory of Objects"). Are we not rather obliged to give up the analogy between whole/part or even complex/constitutive element and objective/objictity, positing that if the objective of a nonbeing—by which we understand: the being of that objective—is not "assigned to the being of its object," it is because being and nonbeing are not situated at the level of the object. Or more appropriately phrased: that the pure object is beyond being and nonbeing, or that it is foreign to being (*außerseiend*). We are naturally dealing here with the pure object or the object as such—in the minimalism of its *gegenstehen*—a circumstance that in no way contradicts the fact that a specific absurd object (a round square or a goat-deer) bears within itself evidence of its nonbeing, even as ideality does that of its nonexistence. In transferring the full doctrinal difficulty onto the term *Außersein*—which, we have just seen, cannot be simply transcribed into a "beyond being and nonbeing"—Meinong would reduce the paradox with which his name is associated:

> What might be appropriately called the principle of beyond-being of the pure object (*Außersein des reinen Gegenstandes*) definitively dissipates the apparent paradox that furnished the initial motive for the establishment of that principle "the principle of the independence of *Sosein* in relation to *Sein*."

(Ibid.)

It thus follows from the principle of indifference that being or nonbeing do not belong to the nature of the object: the latter is beyond being and nonbeing; it is *außerseiend*, beyond being, outside-being. In truth, if one takes the expression literally, it must be understood that it is less the object that is outside the sphere of being, a sphere to which one is naturally inclined to accord special status, regarding it as primordial, than the couple being/nonbeing that is outside the object: "Sein wie Nichtsein dem Gegenstand gleich äußerlich ist."

Such is the price to be paid for a complete de-ontologization of the object as such.

> If someone, for example, judges that a *perpetuum mobile* does not exist, it is nonetheless quite clear that the object (*Gegenstand*) to which existence has been thus denied must necessarily have properties and even characteristic properties without which the conviction of its non-existence could not have either meaning or justification.

(Meinong, *Über Annahmen*, 12, in *Gasamtausgabe,* 4:79)

It is thus important not to retreat in the face of a conclusion directly opposed to the metaphysical tradition of Avicenna, Aquinas, and Duns Scotus:

> Being is thus precisely not the only condition that would allow the process of knowledge to find its first angle of attack. It is, on the contrary, itself just such an angle of attack. But nonbeing, it turns out, is just as good a one.

(Meinong, "Theory of Objects," 77)

SELBST (GERMAN)

ENGLISH	self
FRENCH	soi, soi-même

➤ *SELF*, and COMBINATION AND CONCEPTUALIZATION, CONSCIOUSNESS, GERMAN, I/ME/MYSELF, *PERSON*, SAMOST', SUBJECT

The root *Selbst* is found in the composition of a large number of philosophical concepts, particularly in Hegel's philosophy, where *Selbstbewusstsein* (self-consciousness) occupies a central and decisive position. Its status as a prefix, which is the most common case, leaves open the question of the relation between the various components of those concepts: is it, for example, a case of consciousness functioning, as it were, on its own, "with complete autonomy," or simply of consciousness having itself as its object? The translation of

selbst has frequently "oscillated" between those poles, and it would be hard for it to do otherwise.

German etymology sheds light, if any be needed, on the hesitations of translators. *Selb-* is an adjective that is declined (giving *derselbe, dieselbe, dasselbe:* the "same" in the sense of identity), stemming from a root that was undoubtedly a reflexive pronoun (from the family of French *se*), whose adverbial form *selbs* becomes *selbst* in Luther, whereas the transformation of the adverb into a noun (*das Selbst*) intervenes at the very beginning of the eighteenth century, on the model of "the self" in English.

It appears that the use of the concept (a noun) was originally religious: it designated the "odious self," sinful ego, agent of corruption. That negative echo was immediately audible in *selbstisch*, constructed by analogy with *selfish.*

Compounds with *selbst* as a prefix are numerous and common. In philosophy we find in particular *selbstständig, Selbstständigkeit* (autonomous, autonomy), *Selbstbestimmung* (self-determination), *Selbstbetrug* (self-deception), *Selbstbewegung* (spontaneous motion), *Selbsterhaltung* (self-conservation), *Selbsterkenntnis* (self-knowledge), *Selbstgefühl* (feeling of selfhood), *Selbstkritik* (self-criticism), *Selbstmord* (suicide), *Selbstsucht* (egotism), *selbsttätig* (automatic), *Selbstzweck* (containing its end within itself). Depending on the second part of the compound, *selbst* designates the autonomous nature of the operation (*selbstständig, selbsttätig*) or its reflexive object (*Selbstsucht*), or even both simultaneously (*Selbstmord*), which is the most frequent case.

A considerable number of these uses are found in French compounds beginning with *auto-*, with the undoubted exception of those cases in which the second component contains in sufficient measure the dimension of active or operative autonomy for *selbst* in its first sense to be plainly redundant and for the prefix to immediately imply its status as object. Such is the case for *Selbstgefühl* and *Selbstbewusstsein.* In Hegel in particular, in the *Phenomenology*, the transition from simple consciousness to self-consciousness occurs in the very notion of object of consciousness, which functions as subject from the outset but is finally discovered to be such in the chapter thus titled.

The conventional translation of *das Selbst* is "the Self" (Fr. *le Soi*). To be completely rigorous, we would be obliged, however, to indicate that on the one hand, this translation is redundant in relation to that of the reflexive forms of the personal pronoun (corresponding to *sich* in both the accusative and the dative), which the translator regularly needs in order to translate *sich, an sich, für sich, in sich*, etc. Finally, as both adjective and adverb, the root *selb* strongly connotes identity or, if one prefers, the identity of what is the "same" (*die Sache selbst*: the thing itself, *dieselbe Sache*: the same thing), or even what is not to be distinguished from its essence: in the sense of "properly speaking." In French one can thus envisage restoring the connections between self-sameness and identity by reinforcing the *Soi* with the adverb *même,* which presents the interest of leaving the bare reflexive forms available for translating *sich. Das Selbst* would thus be "*le Soi-même*"—(the) Oneself—in French, with a capital since "*soi-même*" would have to be retained for *sich selbst,* which is quite frequent!

This configuration is sustained in German by the possibility of using the nominative form of the personal pronoun as a noun (*das Ich*: "the I," as it has been translated in French since Rimbaud (*le Je*), although previously rendered as *Moi* or *Ego*), whereas French—generally unbothered by declensions—has specialized the form: *moi, toi,* and *soi* for such uses. In contrast, *das Selbst* thus becomes a kind of synonym for the concept of the subject: it is the impersonal subject (but not the "id") and thus also the essence. This concept has consequently become the special reserve of phenomenology. It will be noted that Kant makes scant use of it and prefers the classical paradigm derived from Greek— *die Autonomie*—to *Selbstständigkeit.* Current German usage has specialized the noun *das Selbst* in descriptions of behavior: "the *I* conscious of itself."

| SELF

At certain moments in its history, the term "self" has posed some interesting problems for translators of philosophy. In 1700 Pierre Coste, the French translator of Locke's *Essay on Human Understanding,* proposed the innovative *soi* in order to simultaneously insist on the reflexive dimension contained in the English *self* and take his distance, following Locke himself, from the *moi* (or ego) introduced by Descartes and Pascal: see CONSCIOUSNESS. Coste also used *soi-même*. That Anglo-French innovation, characteristic of the turn in classical metaphysics toward subjectivity, currently raises four sorts of problems:

1. its relation to the syntax and semantics of European languages
2. associations between *mêmeté* and *ipséité* (to invoke Paul Ricoeur's terminology) in the history of the problematic of identity since its formulations in Greek: see in particular I/ME/MYSELF, Box 2; *IDENTITY*
3. speculative elaborations of the "subject substance," particularly in German and Russian; see SELBST, SAMOST; cf. SUBJECT, SUPPOSITION
4. fluctuations in the topographical model of the psyche as renewed by psychoanalysis; see ES; cf. DRIVE, UNCONSCIOUS

➤ *IDENTITY, PERSON*

| SEMIOTICS, SEMIOLOGY

FRENCH	*sémiotique/sémiologie*
GERMAN	*Semiotik*
GREEK	*sêmeiôsis* [σημείωσις]

➤ LANGUAGE, and SENSE, SIGN, SIGNIFIER/SIGNIFIED, SPEECH ACT, THING

The existence of the doublet "semiotics/semiology" is derived from the difference in traditions from which each term stems. Semiotics

(*Semiotik*, cf. Lambert, "Semiotik") refers to the Stoic and medieval tradition upon which C. S. Peirce drew, influencing the entire pragmatist tradition (although Peirce himself preferred "pragmaticist" in order to distinguish his thought from James's pragmatism) invoked by C. Morris; whereas semiology derives from Saussure's RT: *Cours de linguistique générale* (1916). There is no established convention regarding the use of the terms, which vary according to schools. Hjelmslevians, for instance, use semiology for everything relating to language and semiotics for everything relating to the general study of signs, whereas Saussurians like J.-L. Prieto retain the broadest extension for the term "semiology." In 1969, however, the International Association of Semiotics recommended using the term "semiotics" for cases entailing a broader extension.

For Saussure, semiology is "a science that studies the life of signs within social life; it would be part of social psychology and, consequently, of general psychology. . . . It would teach us what signs consist in and what laws regulate them. . . . Linguistics is but a part of that general science" (RT: *Cours de linguistique générale*).

The term "semiotics" comes from Locke, who divides science into *Physica*, *Practica*, and *Semeiotike* (*Essay Concerning Human Understanding*, 4.21.1–4). He identifies semiotics in part with logic: "it is aptly enough termed also Logike, logic: the business whereof is to consider the nature of signs the mind makes use of for the understanding of things, or conveying its knowledge to others." In his "Semiotik" (1764), J. H. Lambert adopts Locke's term but grants "semiotics" a broader extension: it describes all sorts of signs, even if the orientation remains fundamentally cognitive. Peirce uses three terms: "semeiotics," "semeiotic," and "semiotic." Semiotics would be an extension of logic; it is "often identified with logic" ("Ideas, Stray or Stolen, about Scientific Writing [1904]," in *The Essential Peirce: Selected Philosophical Writings*, 2:327); "logic is the study of the essential nature of signs" (ibid., 2:311). The definition of semiotics is as broad as possible: "What I call, semiotic, namely, the doctrine of the essential nature and fundamental varieties of possible semiosis" (Peirce, *Collected Papers*, vol. 5, §488; from statements recorded in 1907). Semiosis (a term which he claims he has borrowed from the "Greek of the Roman period") is, according to him, "the action of practicing any sort of sign" ("Pragmatism [1907]," in *The Essential Peirce*, 2:411). According to Peirce, logic comprises three branches: speculative grammar (a term borrowed from modal logic), critic logic, and methodeutic (a word Peirce preferred to "methodology"). It was speculative grammar that included the general theory of signs. Morris ("Foundations of the Theory of Signs" in *Signs, Language and Behavior*) defines semiotics as a general theory of signs that includes syntax (sign / sign relations, the study of the formal conditions of meaning of combinations of signs), semantics (sign / object relations, the study of the conditions of interpretation), and pragmatics (sign / user relations). R. Carnap (*Meaning and Necessity*) adopted this trichotomy. In Peirce, semiotics tends to be identified with a general grammar of signs, whereas Morris distinguishes different components within semiotics, including the grammatical component.

Émile Benveniste ("Séméiologie de la langue") has interpreted the opposition between Saussurean semiology and Peircean semiotics as a paradigm reflecting the division intrinsic to language itself between a "semiotic mode" and a "semantic mode." The term "semiotics" is thus redefined: "Semiotics designates the signifying mode specific to the linguistic SIGN and constituting it as a unit."

SENS COMMUN / COMMON SENSE

I. Ambiguity of "Common Sense"

"Common sense" is an ambiguous notion, between a technical sense originating in Aristotle and referring to sensibility and the convergence of sensations, and a more common meaning referring to "good sense" and the community of men. In point of fact, the expression can be traced back to at least two Latin versions:

1. *Sensus communis*, which translates *koinê aisthêsis* [κοινὴ αἴσθησις] ("perception common" to several senses) comes from Aristotle and involves, on the one hand, the way in which the different senses communicate with each other and, on the other, the way in which one senses what one senses (*sunaisthesis* [συναίσθησις]): see SENSE, I.B, CONSCIOUSNESS, I. *Sensorium commune* is another translation of Aristotle's *koinê aesthêsis*, interpreting it as linked to its own organ, contrary to what Aristotle affirms. Concerning the Scholastic notion and its transition through Arabic, see SENSUS COMMUNIS; cf. IMAGINATION [PHANTASIA], INTENTION, PERCEPTION.

2. *Bona mens*, which can be found, for example, in Seneca, and designates correct judgment and even the wisdom that every member of the human community is apt to share. One is thus involved with the positive aspect of Greek *doxa* [δόξα] and, within the individual subject, with "good sense" (resulting in a veritable crisscross between French and Latin usage) and the "natural light" invoked by Descartes or the *gesunder Menschverstand* (healthy understanding): see DOXA, LIGHT, PHRONÊSIS, UNDERSTANDING, *WISDOM*.

Concerning the more directly political aspect of such community, see *COMMUNITY, CONSENSUS, SOCIETY* and cf. LOGOS, MENSCHHEIT, MORALS.

II. "Common Sense" and "Ordinary Life"

The Anglo-Scottish tradition, originating in Shaftesbury and Reid, tended toward a "philosophy of common sense" whose moral and epistemological aspects, converging toward an original analysis of sociability, it developed: see MORAL SENSE and COMMON SENSE; cf. UTILITY. On the link between sociability and "esprit," in the sense of wit, joke, and humor, see NONSENSE and INGENIUM, Box 2. The philosophy of common sense leads to a privileging of the "ordinary": ordinary language and ordinary life; see CLAIM, ENGLISH; cf. MATTER OF FACT, SENSE, V, and SPEECH ACT, IV.

➤ AESTHETICS, COMMONPLACE, GOÛT, PERCEPTION

▌ SENSE / MEANING

FRENCH   *sens*
GERMAN   *Sinn, Bedeutung, Gefühl, Empfindung*
GREEK   *aisthêsis* [αἴσθησις], *nous* [νοῦς], *dianoia* [διάνοια], *sêma* [σῆμα]

"Time is the meaning [*le sens*] of life—*sens* as one might say the direction or sense [*sens*] of a current of water, of a sentence, of a fabric, of the sense [*sens*] of smell." That sentence of Paul Claudel (quoted by Cuvillier, *Vocabulaire philosophique,* s.v. "Sens") suggests that the polysemy of *sens* is not random.

The polysemy of the Latin *sensus* lies at the origin of those to be found in the Romance and Anglo-Saxon languages (Fr. *sens,* It. *senso,* Sp. *sentido,* Eng. "sense," Ger. *Sinn*). The semantic field of *sensus,* toward the end of the classical age, articulated three major meanings: (1) sensation, sense perception; (2) understanding, intellectual perception; (3) signification. The articulation did not exist before then: in Greek, the register of *aisthenasthai* [αἰσθάνεσθαι], "to sense," "to perceive," "to notice" (1), is absolutely distinct from that of *semainein* [σημαίνειν], " to signify or mean" (3). And yet it was under the rubric of a Greek term, *nous* [νοῦς], emergent from the second meaning above, that of intellectual perception, that the church fathers, who rendered it as *sensus,* would unify the set.

Moreover, the polysemy did not necessarily evolve in the same fashion later on. One observes two sorts of phenomena. On the one hand there are cases of contamination between the various meanings of "sense," something like a potentially unified semantic flux; this is all the more palpable in French (and, later on, in Italian and German) in that "sense" takes on the additional valence of "direction," so much so that *le bon sens* in French simultaneously denotes "the right direction" and "common sense," which consequently end

up connoting each other (see COMMON SENSE). On the other hand, there are frequently, in any given language, one or several ways of saying one of the senses of "sense," which results in a distinction available to philosophical appropriation, such as between *Sinn* and *Bedeutung,* or "sense" and "meaning." Finally, the articulation between sensation and intellect produces an entire intermediate complex, from inner sense to moral sense, by way of sensitivity and sentiment, that is caught up in the constituted network of each language ("sense," "sentiment," "feeling" [see FEELING], or *Gefühl, Empfindung* [see GEFÜHL]).

I. Greek: Heterogeneity and Amplitude

When one departs from the polysemy of the French *sens,* and already from the Latin *sensus,* what is retrospectively striking in the Greek is, on the contrary, the heterogeneity, without any apparent transition in either language or classical doctrine, between, on the one hand, the register of sense or intellectual perception, or of the external or internal knowledge it might bring, and, on the other hand, the register of sign and signification. The unity that would be effected under the sign of *nous* between outer sense, inner sense, and literal sense was not envisaged, and was perhaps impossible to envisage, in Aristotelian terms at the time the semantic was being theorized as such.

A. The scope of *aisthêsis*

On the other hand, the term *aisthêsis* has an extremely large range of meanings, which makes it difficult to translate with a single term. It is a derivative of *aisthanomai* [αἰσθάνομαι], and the construction of that verb is already revealing: with the genitive, like verbs denoting a sensory act (with the exception of vision), it generally means "to perceive" something; with an object in the accusative, it means "to understand" (Thucydides, 5.26.5), and with the genitive of origin of the person from whom one has information, it means "learning something from someone"; in all cases it implies that one "perceives something" or "perceives that," that one "realizes" (Thucydides, ibid.: "being of an age to realize that," speaking of one's own experience of the war; see CONSCIOUSNESS, Box 1); so much so that when one employs it absolutely, it ends up meaning that one is in possession of one's faculties, of common sense (Thucydides, 1.71.5: *hoi aisthanomenoi* [οἱ αἰσθανόμενοι], "people of common sense [*gens de bon sens*]," Bailly [RT: *Dictionnaire grec français*] advises, whereas J. de Romilly's translation in 1958 gives us no less reasonably "men who will know [*les hommes qui sauront*]").

1. "Hearing" and "sensing"

According to Chantraine (RT: *Dictionnaire étymologique de la langue grecque*), *aisthanomai* comes from *aïô* [ἀΐω] (as witnessed above all in the participle in Homer), based on the Sanskrit *avih,* like the Latin *audio,* which means "to hear," "to perceive" (and less frequently, "to listen, "to obey"). We touch here on the "linguistic" privilege of one or another model of sensation. Thus it is that hearing, more than vision, is initially the determinant sense for Greek *aisthêsis* (Bailly takes the example of Thucydides, 6.17.6: *akoêi aisthanomai* [ἀκοῇ αἰσθάνομαι], "I perceive by hearing, I hear it said"). On the other hand, the French *sentir,* from the Latin *sentire,* is specialized as "perceiving by smell" and "exhaling an odor."

(The RT: *DHLF* mentions *senteur* [scent] and, in game hunting, *sentiment*, which designates the sense of smell of hunting dogs and the odor they detect.) To sum up, such examples make manifest the merger or fusion between subject and object in sensation, a link thematized by Aristotle in *aisthêsis* (see below, I.A.3). But the difference in paradigm between *aisthanomai*, which is initially "auditory," and *sentir* (to sense), which becomes "olfactory," can also shed light on the the displacement effected from *aisthêsis* to *nous* when we move on to the Latin *sensus*. Indeed, the Greek *nous*, which Bailly proposes to translate in French equivalents or cognates of "intelligence, mind [*esprit*], thought, sagacity, wisdom, common sense, intention, soul, heart, sentiment, will, desire" (I omit the rather frequent translation as "intuition," which takes us this time to the paradigm of vision—Latin, *intueri*, "to see"—which also informs Greek *theory* or *idea* [see SPECIES]), is essentially linked to the French word *flair*, the ability of dogs to smell; and it is precisely this "olfactory" sense that will give us *sensus.*

2. The system of hierarchies

That difference in model—ears or nose?—is complicated by a gnoseological hierarchy. The Aristotelian system gave us the lasting outline of the framework within which *aisthêsis* and *nous* could be differentiated, namely, a hierarchy of living beings and their faculties, which is deployed in *De anima.* Aristotle distinguishes three types of living beings: vegetables (*phuta* [φυτά], see NATURE, Box 1), which possess only the ability to nourish themselves (*to threptikon* [τὸ θρεπτικόν]); animals (*zôia* [ζαῷ], see ANIMAL), which possess the faculty of "sensing" (*to aisthêtikion* [τὸ αἰσθητικόν], which opens onto that of desiring, *to orektikon* [τὸ ὀρεκτικόν], see WILL and PHANTASIA); and men ("and"—he says—"any other similar or superior being"), who possess in addition the ability to think (*to dianoêtikon to kai nous* [τὸ διανοητικόν τε καὶ νοῦς]) (*De anima*, 2.3.414a 29-b 19). The distinction between the "dianoetic," discursive intelligence ("which moves through," *dia* [διά], while scenting), and the "noetic," intuitive intelligence ("which scents"), is not pertinent at this level of descriptive generality, but *nous* is plainly the term of maximal scope and complexity, at once the final instance, subsuming all the others, and a separate and sovereign instance, linked to what is divine in man ("the *nous* that becomes all things and the *nous* that produces them all" [ibid., 3.5.430a]; see INTELLECTUS). This is why *aisthêsis* and *nous* are structurally linked: "the soul is analogous to the hand; for as the hand is a tool of tools [*organon . . . organôn* (ὄργανον . . . ὀργάνων)], so the mind is the form of forms [*ho nous . . . eidos eidôn* (ὁ νοῦς . . . εἶδος εἰδῶν)] and sense the form of sensible things [*kai hê aisthêsis eidos aisthêton* (καὶ ἡ αἴσθησις εἶδος αἰσθητῶν)]" (ibid., 3.432a 1–3). But we touch here on a limit that calls into play the range not only of the notions of *nous* and *eidos* [εἶδος], but, more directly, that of the notions of *aisthêsis* and *aisthêton* [αἰσθητόν].

3. *Aisthêsis* as the joint act of the sentient and the sensed

The amplitude of the *aisthêsis* is deployed and thematized in *De anima.* For us it is a function of the fact that within it the subjective/objective alternative is always already transcended. In fact, *aisthêsis* designates simultaneously (a) the faculty of sensing or "sensitivity" characterizing certain living beings; (b) the exercise of that faculty, or "perception"; (c) its distribution, linked or not to the organs of the senses (each of the five "senses," then, which, insofar as they are located in an organ are said to be *aisthêtêrion* [αἰσθητήριον], but also the notorious "common sense"); (d) finally, the affections or pathemes produced by the objects of the senses, the "sensations." The synchrony of these uses—sensitivity, perception, sense, sensation—with the remarkable conjunction of the active and the passive is one of the effects of the definition of *aisthêsis* as a "single act [*mia . . . energeia* (μία . . . ἐνέργεια)] of the sentient-sensing [*tou aisthêtikou* (τοῦ αἰσθητικοῦ)] and of the sensible-sensed [*aisthêton*, cf. the "double sense" for us of the verbal adjective in *-tos*]" (*De anima*, 3.2.426a 16–17), and as the active coinciding of the organ of sense (*aisthêtêrion*) and the sensed (*aisthêton*), each of those two elements, like hearing and sound, which will become subject and object, being identical to the other, "though retaining their being" (ibid., and 3.2.425b 26–28; Cassin, *Aristote et le logos*; see SUBJECT, OBJECT, and PATHOS), in a "crossing over" that would not be lost on Merleau-Ponty.

■ See Box 1.

B. *Koinê aisthêsis* and common sense

Koinê aisthêsis [κοινὴ αἴσθηις], which is rendered as "common sense," designates in Aristotle not a sixth sense but rather the fact of feeling simultaneously at least two sensations (*aisthêseis* [αἰσθήσεις]) arriving through two distinct sensory channels (*aisthêseis* [αἰσθήσεις]). This results in two extremely important consequences:

a. On the one hand, a transversalization of the sensations specific to each sense, namely color, and this specific color, for sight; and odor, and this particular odor, for smell. We thus arrive at a perception of what is "commonly sensed" [*idia aisthêta* (ἴδια αἰσθητά)], which each of the senses has us sensing alone solely by accident: these include movement, rest, size, number, unity (*De anima*, 3.1.425a 14–16; cf.2.6.418a, 17–18). Above all, one arrives at a recognition of an object through a synthesis of impressions sensed in isolation by the individual senses, which are, for their part, always true: such synthesis makes it possible to name things, but it also enables errors—yellow and bitter: is it "bile"? (ibid., 3.1.425b 1–4; see TRUTH, Box 7 and Cassin, *Aristote et le logos*). Whence the dual meaning of *sentirei* in Latin, "to sense" (*percipere*) and "to judge" (*judicare*), which can be understood, for example, through Albertus Magnus's commentary on *De anima* ("odorare est sentire et judicare odorem," quoted in Spinosa, "Sensazione e percezione").

b. On the other hand, sensation of sensation (one "realizes"—in which we rediscover the Homeric sense of *aisthanesthai* [αἰσθάνεσθαι]—that one senses, one senses that one senses), an auto-affection or "consciousness of (sensing)," which can be called "aperception" (see, in addition to *De anima*, 3.2.425b 12 ["since we sense that we see and that we hear. . ."], *De somno*, 255a 15; cf. *sunaisthêsis* [συναίσθησις] in Alexander of Aphrodisia [Spinosa, "Sensazione e percezione"]; see PERCEPTION and CONSCIOUSNESS). It is to the extent that sensing is a

1

Aisthêton

It is not easy to render Greek philosophical texts dealing with sensation, despite the terminological equivalences that appear to be imperative: such is the case of *sensible* (in French) for *aisthêton*, [αἰσθητόν], of *visible* for *oraton* [ὁρατόν], etc. The reason for this is in fact less lexical than grammatical. Ancient Greek tends to transform verbal adjectives or participles into nouns with great ease and disposes of a singular or plural neutral for designating without any more precision than that which it is discussing. In addition the verbal adjective in -*tos* generally marks possibility, like Latin adjectives in -*bilis*, but it occasionally retains from its origin the meaning of a passive past participle (cf. Lat. *audi-tus*).

This yields particularly concise formulations, which lead translators to issue glosses in order to be clear, at the risk of philosophical anachronisms. They are frequently tempted to restore to *sensible* its adjectival status by having it modify the word "thing" or, worse yet, "object," thus introducing surreptitiously into ancient thought a distinction between subject and object that would not appear until our classical age. In Aristotle—and he would be widely followed in this—it is the *sensible* that acts on the senses and realizes them in imitation of itself. The "sensible" is thus defined through the sensation it affords and the sense through the "sensible" offered by it (sight by the visible, hearing by sound . . .), in keeping with a conceptual circularity that dispenses with opposing subject to object.

French extricates itself from such concision through a certain roughness of style and one or two additional elements. In *De sensu et sensibilibus* (440a 18–19), R. Mugnier renders "ὥστ᾽ εὐθὺς κρεῖττον φάναι τῷ κινεῖσθαι τὸ μεταξὺ τῆς αἰσθήσεως ὑπὸ τοῦ γίνεσθαι τὴν αἴσθησιν" as "par suite, il vaut mieux déclarer sur-le-champ que c'est l'intermédiaire indispensable à la sensation qui, par le mouvement reçu du sensible, produit la sensation." In English, translating appears to be more difficult. J. I. Beare feels obliged to abandon the term "sensible" and to resort to paraphrase: "So that it were better to say at once that visual perception is due to a process set up by the perceived object in the medium between this object and the sensory organ."

It appears that the difficulty in English is increased by the current meaning of "sensible," which ordinarily does not refer to an immediately sensory register. "Sensible" designates either a reasonable person (the French *sensé*) or even, with reference to clothes or shoes, to practical things in which one feels good. One has to force one's language if one is to translate the Greek word by word, or else be resigned to paraphrase. And such is also the case for French *sensible* in the sense of "what is given to be felt or sensed," which is hard to convey in English.

Gérard Simon

BIBLIOGRAPHY

Aristotle. *On Sense and the Sensible*. In *The Works of Aristotle*, translated by J. I. Beare. Oxford: Clarendon Press, 1931.

———. *De sensu et sensibilibus*. In *Petits traités d'histoire naturelle*, translated by René Mugnier. Paris: Les Belles Lettres, 1953.

matter of judging that common sense will be conceived (by Albertus Magnus, for instance) as the first of the "inner senses" (Spinosa, "Sensazione e percezione").

In Aristotle, what is "commonly sensed" forms a well-defined list and is the effect of a perception mediated by at least two simultaneous senses, and is, as a result, vulnerable to error. In Plato, where the phrase "common sense" does not appear, the possibility of comparing and "grasping what individual senses have in common" (*to koinon lambanein peri autôn* [τὸ κοινὸν λαμβάνειν περὶ αὐτῶν]; *Theaetetus*, 185b) is related directly to the soul, without the mediation of any sense organ, as a "faculty exercised through language" [*hê dia tês glôttês dunamis* (ἡ διὰ τῆς γλώττης δύναμις); ibid., 185c). In each case, there does not exist a "common sense" that can be isolated from the other senses and linked to its own organ (*sensorium commune*). But we can, without doubt, understand on that basis a *sensus communis* as a common manner of sensing and appreciating (Cicero, *De oratore*, 1.12; 2.68), which can be vulgar and in error or replete with "good sense" and a "sense of what is fitting" (Seneca, *De beneficiis*, 1.12.3) and linked to ordinary language as the expression of a *consensus* (see SENSUS COMMUNIS and COMMON SENSE).

C. An intersection with *semainein*?

Is there, in our journey, no point of contact between the register of sensitivity/sensibility and that of signification?

a. The semantic is touched on with the description of sensation as a relation, *logos* [λόγος], which is determined in each case by contrasting qualities. It is thus the breadth of the term *logos* that must be investigated (see LOGOS). Indeed, *aisthêsis*-sensation *legei* [λέγει] "speaks," in the sense of "adds up," "evaluates," to the extent that it is nothing other than a singular proportion, an assessing, between contraries: as in gray, which I sense as being nothing but a *logos* of black and white (*De anima*, 2.12.424a 17-b 3 and 3.2.426a 27-b 29); see Cassin, *Aristote et le logos*). Thanks to the *aisthêsis koinê*, one can recognize and name (*legein* [λέγειν]) an object one senses while running the risk of being in error (this yellow and that bitterness gives us "bile"). One thus obtains a descriptive statement (*logos*) that is close to a definition (*logos*) of the perceived object. But, to pursue our example, one does not for all that know what "bile" "means" (*sêmainei* [σημαίνει]). On the other hand, we are in a realm of "signals" in the Homeric and pre-Aristotelian sense: yellow signals bile, at the risk of a misinterpretation.

b. From another point of view, the relation between the "aisthêsis" in the sense of sensitivity/sensibility, and the discursive/semantic is constructed within the black box of the soul in *De interpretatione*, which brings into relation sounds of the voice, states of the soul, and things of the world (see SIGN, Box 1). Place is made for the intention and meaning of the *nous* as a *sensus* to be understood simultaneously as receptivity, intentionally directed at the object, and as emission, intending

to submit to the convention of meaning as it is put in place on the basis of the principle of noncontradiction in Book Γ of the *Metaphysics* (to speak is to say something that has a meaning and only one, for oneself and for others, see PRINCIPLE, I.C and HOMONYM, II.B.3; see also INTENTION).

But the entire complex is surely not constructed around a single term that we might translate as *sense*, given the present scope of that word for us.

II. The Unitary Polysemy of *Sensus*: Triple Sense and Semantic Flux

The polysemy of *sensus* is linked to the Greek terms *aisthêsis*, *dianoia*, *nous*, and the tendentially unitary semantic flux characterizing it is the expression of the philosophical debate over the relations between sensation and knowledge.

The three registers determining the senses of *sensus* are organized according to four levels of analysis that long remained implicit: the physiological level, the psychological level, the gnoseological level, and the logico-linguistic level. *Sensus,* as "sensation," "sense perception," thus includes at the physiological level the sense of "sensation" as the biological functioning of a sense organ, the passive motion of the organ under the impulse of external objects, and the sense of "sense organ." At the psychological level, *sensus* additionally includes the meaning of "faculty of the senses" (senses of sight, of hearing, etc.) (*aisthêsis*, see above, I. A; see as well PATHOS). *Sensus*, as "comprehension," "intellectual perception," participates in the gnoseological level and includes the meanings of "consciousness" (see CONSCIOUSNESS), "intention" (see INTENTION), "sentiment," "opinion" (Lat. *sentential*, which is also derived from *sentire*), and of "thought," "judgment," "mind," and "intellect," implying a second phase of mental elaboration of the data furnished by sensation. *Sensus*, as "signified," "signification," is situated at the logico-linguistic level and includes the senses of "idea," "concept," "mental concept," to the extent that every sense perception that involves the intellect entails an interpretation of sense data as well as the attribution of mental concepts to data furnished by sensation and expressed through the mediation of linguistic signs.

A. Sites of polysemy

Translations and commentaries of Greek texts of late antiquity and the Middle Ages are quite revealing as to the polysemy of *sensus.* In the Epistles of Saint Paul (New Testament, Latin translation, fourth–fifth centuries) and in the Latin *Asclepius* (ca. fourth century), the correspondence between *sensus* and *nous,* as "intention," "thought," "mind," "intellect," leads to the acknowledgment of an overall semantic similarity within the Greco-Latin couple. Thus Saint Paul, referring to the "reprehensible thoughts in which God has plunged the pagans," says "tradidit eos Deus in reprobum sensum" (*paredôken autous ho theos eis adokimon noun* [παρέδωκεν αὐτοὺς ὁ θεὸς εἰς ἀδόκιμον νοῦν]; Rom 1:28): then, referring to the "peace of God that surpasses all understanding": "et pax Dei quae exsuperat omnem sensum" (*kai hê eirênê tou theou hê huperechousa panta noun* [καὶ ἡ εἰρήνη τοῦ θεοῦ ἡ ὑπερέχουσα πάντα νοῦν]; Phil 4:7); or, further on, referring to the thought of God and his counsel: "Quis enim cognovit

sensum Domini aut consiliarius eius fuit?" (*Tis gar egnô noun Kuriou? Hê tis sumboulos autou egeneto?* [Τίς γὰρ ἔγνω νοῦν Κυρίου ; ἢ τίς σύμβουλος αὐτοῦ ἐγένετο]; Who has known the mind of the Lord or who has been his counselor?).

In *Asclepius*, the hermetic work, on the other hand, *sensus-nous* designates the intellect, the superior human faculty that allows humans to partake of the divine:

Sed de animalibus cunctis humanos tantum sensus (nous) ad divinae rationis intelligentiuam exornat, erigit atque sustollit.

(Of all living things, consciousness equips only the human, exalts it, raises it up to understand the divine plan.)

(Copenhaver, ed., *Hermetica*, chap. 6, ll. 8–10)

The text continues:

Unde efficitur ut, quoniam [homo] est ipsius una compago, parte, qua ex anima et sensu (nous), spiritu (pneuma) atque ratione divinus est velut ex eolementis superioribus inscendere posse videatur in caelum, parte vero mundane, quae constat ex igne (et terra), aqua et aere, mortalis resistat in terra.

(Whence, though mankind is an integral construction, it happens that in the part that makes him divine, he seems able to rise up to heaven, as if from higher elements—soul and consciousness, spirit and reason. But in his material part—consisting of fire (and earth) water and air—he remains fixed on the ground, a mortal.)

(Ibid., chap. 10, ll. 22–26)

We can similarly compare:

Gratias tibi summe, exsuperantissime . . . condonans nos sensu (nous), ratione, intelligentia: sensu ut te cognoverimus; ratione, ut te suspicionibus indegamus; cognitione, ut te cogniscentes gaudeamus.

(<ch>arin soi oidamen . . . charisamenos hêmin noun <log>on gnôsin; noun me<n>, hina se noêsômen, logon <de hin>a se epikalêsômen, gnôsin hina epignôsômen. [<χ>άριν σοὶ οἴδαμεν . . . χαρισάμενος ἡμῖν νοῦν <λόγ>ον γνῶσιν νοῦν μὲ<ν>, ἵνα σὲ νοήσωμεν, λόγον <δὲ ἵν>α σὲ ἐπικαλήσωμεν, γνῶσιν ἵνα ἐπιγνώσωμεν.])

(We thank you, supreme and most high god, by whose grace alone we have attained the light of your knowledge . . . by giving us the gift of consciousness, reason, and understanding: consciousness, by which we may know you; reason, by which we may seek you in our dim suppositions; knowledge, by which we may rejoice in knowing you.)

(Ibid., chap. 10, l. 41)

This usage would subsequently spread to the Greek and Latin church fathers: Saint Irenaeus (*Adverses haereses*, bk. 2, chap. 13, §3), Tertullian (*Adversus Praxean*, chap. 6), or Saint Jerome (*S. Hieronymus presbyteri opera*, chap. 3, l. 549).

On the basis of the *sensus-nous-intellect* correspondence, the overall affinity between the semantic fields of *sensus*

and *nous* can be observed. The two terms are, in fact, articulated according to the three senses of (1) sense perception, (2) intellectual perception, (3) signification, to the extent that they express in general the complex and articulated world of humans in relation to the world, a person endowed with body and mind facing a world both available to the senses and intelligible. *Sensus* and *nous* diverge according to a polarized semantic outcome, *sensus* coming to signify principally sensory perception and signification, and *nous*, intellectual perception and signification. The perceptual (and consequently "immediate") nature of cognitive understanding obtained through sensory as well as intellectual perception (which is thus distinguished from abstract and discursive—or nonintuitive—knowledge) remains the connotation common to both terms. The tripartite polysemy of *sensus* is indicated in the earliest Scholasticism: in an anonymous commentary on *Asclepius,* dating from the twelfth century (Vat. Ott lat. 811) (*sensus corporei, intellectus, significatio*) and in the alphabetical dictionary of the Bible of Alanus of Lille (twelfth century; *Dictiones dictionum theologicarum*, in RT: *PL*, vol. 210, col. 941B) (*intellectus, significatio*).

B. Semantic continuity via the cognitive value of the senses

The triple meaning of *sensus*—(1) sensation, (2) comprehension, (3) signification—is articulated in keeping with an essential semantic continuity, which is the expression of fundamental doctrines, both ancient and medieval, about the cognitive value of the senses. Those doctrines are in turn themselves conditioned by different conceptions of the nature of the human soul.

Sensus, as passive corporeal sensation (1a), entails a reduction of knowledge to sensation characteristic of the sensualist and materialist tendencies of antiquity (the atomism of Democritus, the Epicureans, the Stoics, and, in part, the Sophists), for which the corporeal nature of the soul, whatever its subtlety, reduces the cognitive process in its totality to a contact between bodies. *Sensus* as sensory perception (1b) but also as intellectual perception (2) names different ways of reducing sensation to an act of the soul, a reduction with differing connotations for Aristotle and Aristotelianism and for Plato and the Neoplatonists, according to the status of the human soul, which is at times the form of the body, at others a spiritual substance.

Medieval commentaries, translations, and texts offer clear evidence of this semantic differentiation, which, from the perspective of terminology, is articulated in two phases: (a) a rendering explicit of the polysemy of Aristotelian and Platonic *aisthêsis* along with *sensus communis*; and (b) the Neoplatonic notion of *dianoia* (with John Scotus Erigena, ninth century) and *sensus interior*, opening onto *sensus litteralis* and the third meaning of sense.

1. *Aisthêsis* and *sensus communis*

The commentary on Aristotle's *De anima* composed by Albertus Magnus (thirteenth century) underscores the simultaneously passive and active nature of Aristotelian *aisthêsis*: passive modification, but also an acquisition of potentiality, consciousness of sensing, sensory judgment (above all in the *koinê aisthêsis*, see above and SENSUS COMMUNIS):

Et ad hoc dicimus, quod odorare non est absolute pati a sensibili percepto, sed potius odorare est sentire et judicare odorem, quod est secunda sensus perfectio, et non est tantum pati, sed etiam operari aliquid.

(We say to this that apprehending an odor is not absolutely to suffer from what has been perceived by the senses, but more exactly that to apprehend an odor is to sense and judge the odor, which constitutes the second perfection of sense, and that it is not only to suffer but equally to effectuate something.)

(Albertus Magnus, *De anima*;
cf. Aristotle, *De anima*, 2.12.424b 18–20)

The soul as form of the body is what guarantees the sensory contribution to knowledge, according to Aristotle's moderate empiricism, within which Albertus Magnus articulates explicitly the notion of *sensus* as sensory perception (1b), which had remained implicit in the Aristotelian *aisthêsis.*

In the medieval version of Plato's *Phaedo*, Henry Aristippus of Calabria (twelfth century) translates *aisthanomai* not only as *sentire*, but also as *sensu percipere* and *sensu concipere* (perceive/conceive through the senses), with the intention of emphasizing the purely instrumental role of the corporal sphere in sensation. The translator thus contributes to making manifest the Platonic reduction of sensation to a sensory perception that, in this case and as opposed to Aristotle, is the prerogative of a purely spiritual soul, which is temporarily linked to a radically heterogeneous and inferior body through whose intervention the soul cannot be in any way altered. In keeping with the situation of sensation in Plato, the soul, on the one hand, makes use of the bodily organs as instruments for conserving the body and perceiving the sensory world; but, on the other hand, sensation is never anything but a stimulus that awakens in the soul the memory of intelligible realities that it has previously known:

Possibile enim hoc eciam apparuit, sensu percipientem quid [aisthomenon ti] vel videntem vel audientem vel aliquem alium sensum sumentem, diversum quid ab hoc animo concepisse, quod oblivione deletum erat, cui hoc assimilatum est simile existens vel cui dissimile.

(Here indeed is the possibility that has clearly appeared to us: when someone perceives through the senses, sees, hears, apprehends a thing through some other sense, he conceives, based on that thing, something else that had been erased by forgetting, and which is brought in contact with the first, whether it resembles it or not.)

(*Plato latinus: Phaedo*, 76a 1–4, p. 31)

2. *Dianoia, sensus interior,* and *sensus litteralis*

In the tripartite division of the faculties of the human soul in the image of the divine Trinity, John Scotus Erigena distinguishes two faculties in the *motus compositus* of sense as set forth by Maxim the Confessor. The first—*sensus exterior, aisthêsis*, sensation and sensory perception (or *sensus* 1)—is foreign to the divine image in man, since it is an intermediary between the soul and the body. The second—*sensus interior, dianoia*, intellectual perception (or *sensus* 2)—is nothing other than reason and intellect: it is the organ

of the "division of nature," since, in an Aristotelian manner, it divides and rejoins—and even distinguishes and reorganizes—images of natural specific objects, effects and signs of universal causes, channeling them to the unity of causes by way of reason and intellect:

> et si quis intentius graecae linguae proprietatem perspexerit, duorum sensuum in homine proprietatem reperiet. In ea enim NOUS intellectus dicitur, LOGOS ratio, DIANOIA sensus, non ille exterior sed interior; et in his tribus essentialis trinitas animae ad imaginem Dei constitutae subsistit. Est enim intellectus, et ratio, et sensus, qui dicitur interior et essentialis; exterior vero, quem corporis et animae copulam diximus, AISTHÊSIS vocatur.

> (But, if one examines more closely the semantics of the Greek language, one discovers that the word is not univocal and that it encompasses two distinct meanings. For in the Greek language, the intellect is called *nous*, reason *logos*, and sense *dianoia*, and this word does not at all designate external sense, but inner sense; and it is in those three components that the essential trinity of the soul, created in the image of God, subsists. The trinity of the soul is thus composed of intellect, reason, and sense, which is called the inner and essential sense, whereas the outer sense that we have defined as the conjunctive link between body and soul is called *aisthêsis*.)

(Erigena, *Periphyseon*, bk. 2, p. 98, ll. 20–26)

In Erigena, *sensus interior* is thus situated entirely in the higher sphere of the soul and is purely spiritual, and it is also *dianoia* by virtue of the semantic affinity with *nous* in the sense of "signification" (*sensus* 3). In the biblical hermeneutics of the Greek church fathers, *dianoia* is indeed the *sensus litteralis*, the sense of Scripture. It is thus the case that in Origen, the sense (*sensus*) of Scripture is the *nous tôn graphôn* [νοῦς τῶν γραφῶν], in conformity with the Christian doctrine with the four meanings of Scripture (cf. Origen, *De principiis*, 3, sub indice).

■ See Box 2.

III. The Exuberance of the Latin Lexicon of Signification

Against the backdrop of this unitary flux, the Latin lexicon of the third sense of "sense" would undergo exceptional diversification. When the question of meaning or signification became an object of specialized study, medieval thinkers would attempt to specify each of its aspects (primary and secondary sense, lexical and grammatical sense, etc.), and traditional terms were redefined by the place they occupied in a network in which new terms were being forged (e.g., *significatio* vs. *suppositio* or vs. *consignificatio*). This specialization was linked to problematics that would make a significant reappearance in analytic modernity.

A. *Sensus, sententia, vis, significatio, intellectus*

The term *sensus* is caught up as one in a set of nouns bearing the idea of signification (*sententia, vis, significatio, intellectus*), related as it is to a series of verbs (*sentire, valere, significare, intellegere*) that are frequently difficult to distinguish. That

set underwent constant reorganization, with predictable instances of interference between the third (gnoseological) and fourth (logico-linguistic) levels. It was only when networks were established that contrasting values attained a measure of precision.

The evolution of the two derivatives of *sentire* is delicate. The term *sensus* gradually came to supplant *sententia* during the Roman era, in the sense of "mental disposition," taking on a generic value, while the specialization of *sententia* in the lexicon of law ("sentencing") and politics ("advice" given to the Senate) explains its use as "authorized, profound, authentic signification" (see Box 2). In grammatical tradition, *sententia* was chosen to translate the Greek *dianoia*, and occasionally *lekton* [λεκτόν] as well, to denote a thought insofar as it can be expressed in a composite linguistic sequence, whence the extension of the term to the sequence itself. That choice contributed to the disappearance of the difference between Stoic and Aristotelian terminologies (Nuchelmans, *Theories of the Proposition*). The term was used systematically when it was a matter of the expression of a complete meaning (*sententia perfecta, plena*), whether to define a logical proposition (cf. Varro: "proloquium est sententia, in qua nihil desideratur"; quoted by Aulus Gellius, *Attic Nights*, 16.8) or a grammatical sentence (cf. Priscian's definition: "oratio est ordinatio dictionum congrua, sententiam perfectam demonstrans" [a sentence is a correct sequence of words, manifesting a complete meaning], *Grammatici latini*, vol. 2, p. 53, l. 28; see *lekton* in SIGNIFIER/SIGNIFIED, II and PROPOSITION, Box 2). In rhetoric, *sententia* was applied more broadly to ideas that constitute a speech, to an opinion expressed (in which it translates the Greek *doxa* [δόξα]), or to whatever constitutes the substance or deep meaning of a text (or of a sentence or a word—although this last use was less frequent as of the time of the Empire and rare in the Middle Ages), the sense, as well, to be probably attributed to a text in opposition to the one assigned to it by an adversary (cf. Cicero, *Rhetoric to Herennius*, 2.13). It is in this sense that it can be opposed to the letter of the text (*scriptum, littera*) and also to the *sensus* most immediately associated with it. A *sententia* thus being the reading to be retained of a passage or a text—Boethius, for example, speaks of *sententia Aristotelis* or Bérenger of *sententia catholice ecclesie*—the term designates by extension an authoritative text, resulting in those collections of systematically organized excerpts, anthologies of *sententiae* such as those of Peter Lombard in theology, which would elicit comment throughout the Middle Ages.

The different meanings of *significatio*—"the act of indicating," "indication or mark (of approval, above all)," "signification, meaning"—parallel those of the verb *significare*, from which it originated (a compound of *signum* and *facere*), "to indicate (through signs)," "to make known," "to announce or presage," and "to mean." Starting from what was originally an intransitive use, as in Plautus, for instance ("to make signs"), the verb became transitive, taking as its object the content intended by the signs ("to be a sign of"). If Latin possessed the verb *signare* in the first sense ("to make a mark"), it created a verb that was not modeled on any Greek term for the second sense, even if *significare* surely benefited from the

2

The different "meanings" of texts

The Latin vocabulary of exegesis was established gradually in Christian patristics, then in medieval Scholasticism, while borrowing from Hellenistic and Jewish exegeses (the bibliography is abundant, see Dahan, *Exégèse chrétienne*). Although the opposition between the letter and the spirit grounds a distinction between two moments of the reading of a text, the content of the distinction and the terms that express it are far from unambiguous. Already in the patristic era, *littera*, for example, could either refer to the explicit or manifest content of the expression (which might, moreover, not have any) or include the figurative or metaphorical sense, the *figura* (which can elsewhere form part of spiritual exegesis; see Bureau, "Littera"). *Litterae* thus designates for Saint Augustine both the letters of the alphabet and "letters," that is, the text to be read (*divinas litteras*), whence the analogy between the two apprenticeships of reading: "that which teaches how to understand Scripture is similar to that which teaches the letters [*similis est tradenti litteras*], that is, to the master who teaches how to read" (*De doctrina christiana*, prooemium 8).

In the beginning of the twelfth century, Hugh of Saint Victor presented in a precise and enduring manner the distinction between *littera*, which corresponds in the strict sense to the analysis of the text, *sensus*, which takes the historical context into account, and *sententia*, which derived the theological teaching of the passage; he explained that every text was to have at least two of those three "senses," and certain have three:

> Illa narratio litteram et sensum tantum habet, ubi per ipsam prolationem sic aperte aliquid significatur, ut nihil aliud relinquatur subintelligendum. Illa vero litteram et sententiam tantam habet, ubi per ex sola pronuntiatione nihil concipere potest auditor nisi addatur expositio. Illa sensum et sententiam habet, ubi et aperte aliquid significantur, et aliquid aliud subintelligendum relinquitur quod expositione aperitur.

> (Only the letter and the sense are possessed by the narrative in which, through its mere utterance, something is signified sufficiently clearly for nothing ambiguous to subsist. The narrative which has only letter and signification is one of which nothing can be understood when it is heard as merely articulated, unless an explanation is added to it. Finally, the narrative possessing sense and signification in which one thing is signified clearly and another left as an implication to be revealed after an explanation.)

(*Didascalicon*, 6.8)

The work of exegetes is situated at three levels: labor of comprehension, of exposition, and also of "criticism," since even as they render the text before their eyes explicit, they are obliged to judge and evaluate it in terms of correctness [*congruitas*], ultimately deciding whether to complete its letter, to rectify its apparent meaning, in order finally to declare its true meaning. In point of fact, the *littera* is not necessarily "complete or perfect [*perfecta*]"; it can also be superabundant or elliptical, and even incomprehensible or incorrect [*incongrua*] "if it is not resolved in another letter" (*Didascalicon*, 6.9). Moreover, even if the signification of its words is clear (*significatio aperta*), the *sensus* can be correct or incorrect (*congruus, incongruus*) or be revealed to be "unbelievable, impossible, absurd, false," for example, in Psalm 79:7, "They devoured Jacob." On the other hand, the *sententia divina* "is never absurd, never false, and contrary to the *sensus* containing many contradictions, does not admit any incompatibility [*repugnantia*]; it is always correct/coherent [*congrua*], always true" (ibid.).

The *littera*, or *sensus litteralis*, in the broad sense, comprises three levels of meaning (*littera, sensus, sententia*) and is massively opposed to "spiritual" interpretation (which is also called mystical, or allegorical, in the broad sense). In fact, Thomas Aquinas says, whereas scientific texts depend on men, who have at their disposition only words, God has the power to make use of a dual mode of signification; he can simultaneously call on words and realities (*duplex significatio, una per voces, alia per res quas voces significant*), and, for that reason, Scripture will have several senses (*plures sensus*): "The signification [*significatio*] through which words signify concerns the literal or historical sense [*sensus litteralis seu historicaus*]; the signification through which the realities designated by words designate still other realities concerns the mystical sense [*sensus mysticus*]" (*In Epistolam ad Galatas*, in *Opera omnia*, 21:230). Exegetes generally recognize in the latter three levels of meaning: the moral or anthropological sense, which transmits moral teachings; the allegorical sense (the term being taken here in the narrow sense), which refers to truths of faith relative to the church; and the anagogical or mystical sense, referring to future life. Those three levels of meaning, which determine the spiritual sense, thus constitute, along with the literal sense, what are called the four senses of Scripture.

The sacred text is thus characterized by this accretion or stratification of levels of meaning, the essential opposition being the distinction between the literal and the spiritual sense conveyed by numerous images (for example, the nut and its shell): the debates between exegetes deal with the domains covered by each, the primacy to be accorded to one or the other, the relations they entertain with each other (continuity or discontinuity), the nature of the "hermeneutical leap" allowing one to pass from the first to the second, to move beyond what the text says to attain a truth lying beyond words.

meanings of *semanein*: "to make a sign," "to reveal," "to manifest," "to denote," meanings that are found again in philosophical Latin, particularly when the subject is divination. In that perspective, the act of "mean-ing" can be as much that of the sign, to which intentionality, a predisposition to indicate, to point toward something, is attributed, as that of an individual seeking to manifest that intentionality by means of a sign (cf. Brachet, "Réflexions sur l'évolution"). In medieval Latin, that double valence, which is not found in the French verb *signifier*, was preserved, including in

treatises of semantics, a situation well expressed in an anonymous treatise of logic from the end of the twelfth century:

> "Significare" applied to an expression and to the person using it [*utens*] is not the same thing, as is habitually said. When one says that "such a person expresses a thing through an expression [*significant rem per vocem*], this means: "uses a sign and a mark of the thing with the intention of producing a sign concerning the thing" [*utitur signo et nota rei cum intentione faciendi signum de re*]. And *significare* predicated in this sense is in a way to act, considered in relation to the person forming the expressions. But when it is said of expressions, the word does not predicate an action, but rather a relation or a similarity, and a fitting of the sign, in so much as it is a sign, in relation to what it signifies [*relatio . . . signi ad signatum*]. . . . To say of an expression that it signifies the thing [*vocem significare rem*] is to say that the expression makes a sign of the thing [*vocem facere signum de re*]: here "to make" does not mean "to act" [*agere*], but "to make a sign" [*signum facere*], that is, "to be a mark" [*notam esse*]. As a result, "to signify" is not the same thing for the user as for the expression. Indeed "to signify," with reference to a speaker, announces the so-called action of expression, the relation or mutual fit of sign and signified.

> (*Tractatus de proprietatibus sermonum*, in De Rijk, *Logica modernorum*, 2:710–11)

Significatio is the term that appears to have been used in a technical way to address the intrinsic semantic properties of a word or an expression, more rarely of a sentence or speech (in which cases there is a preference for *sententia* or *sensus*), for example, of its polysemy (*significatio duplex*) or of the evolution in meaning it has undergone.

Vis served as a translation of the Greek *dunamis* [δύναμις] in speaking of the virtue of a plant, the effectiveness of a remedy, the value of a coin, and, by analogy, the meaning of a word or a sentence—it is a noun linked to the verb *valeo*, which renders as the Greek *dunamai* [δύναμαι]. Cicero frequently used the expressions *vis verborum* and *vis verbi* (for the value or meaning of words), which would be the subject of an extremely precise development in Augustine's *De dialectica*: the word is instituted as a function of a certain (immediate or mediate) relation to the thing; its pronunciation will thus provoke a sensory impression in the listener, which will induce an intellectual impression dependent either on the nature of the word (the "softness" or "harshness" of its sound, for instance), on the thing it signifies, or on both. Thus it is, according to Augustine, that the "force" proper (*vis*) of words is constituted (*De dialectica*, chap. 7, §14), a force that can be impeded as a result of obscurities or ambiguities that Augustine would describe in minute detail. A word's *vis* can be understood only to the extent that the word is a sign, the sign of something for someone; it is thus a function of its ability to move the listener: the *vis* thus retains its "dynamic" connotation, since it is not the *significatio* associated with the word that is important, but "its force" and consequently what it produces as meaning in the listener: "Vis verbi est qua cognoscitur quantum valeat autem tantum quantum movere audientem potest" [The *force* of a word is that whereby the extent of its efficacy is learned. It

has efficacy to the extent to which it is able to affect a hearer; *De dialectica*, chap. 7, §12]. In the thirteenth century, Henry of Ghent, in his reading of this passage, would further emphasize this connotation: "Vis verbi est qua agitur quantum valet." This nuance of efficacy would be quite marked in texts of the Middle Ages when, particularly in the context of sacramental theology, *vis* and *virtus* would be occasionally interchangeable, when the *vis* or *virtus significandi* of a word (its signifying value or force) would mesh with the *vis* or *virtus sacrificandi* of the sacramental sign (its sanctifying value or force), defined as "doing what it says" (see SIGN and SPEECH ACT). For the grammarians, the *vis* was the semantic force of a word—whether it is "signifier" or "consignifier" as in the case of conjunctions—which explains its constructive potentials, with different cases, for example.

Intelligere, originally meaning "to comprehend," appeared frequently in Cicero, then underwent a slippage in its passive form (*intelligetur*) toward "to understand," "to mean." What is "understood" by a term can be not only its obvious sense but also something that is connoted, implied, insinuated (see TERM, Box 1). It is always a matter of the sense received—or that one should receive if one follows the authorized interpreter. The passive *innuitur* was a further step toward the implicit, since the verb was often used in the Middle Ages in a theological context when a word applied to a divine reality was analyzed as the bearer of a supplementary value in relation to its ordinary sense (see CONNOTATION). The noun *intellectus* first took on the meaning of "sense," "signification" with Seneca (*Naturalis quaestiones*, 2.50.1). Boethius used *intellectus* as an equivalent of *passiones animae* the *pathêmata tês psuchês* [παθήματα τῆς ψυχῆς] of the first chapter of *Peri hermeneias*: "[V]oces quiden significant intellectum, ipsas autem voces litterae significant. Sunt autem intellectus passiones." (Sounds of the voice signify intellections, but the letters signify those sounds themselves. And the intellections are the passions of the soul), whence the triad: *voces, intellectus, res*. The term *intellectus* would thus designate simultaneously the intellection of a word and the concept (without any linguistic connotation) until the introduction of the term *conceptus* (see INTELLECTUS and CONCEPTUS), and also the intellectual faculty, the intellect. The polysemous nature of the word was well perceived in the Middle Ages. Intellections are never mechanically produced by words; they imply an activity indicated by the term *intelligere*.

B. The technicality of the medieval semantic lexicon

The developments of medieval semantics produced an entire range of technical terms, with precise meanings, arrayed in three different directions.

1. "Meaning"/"reference"

First, a distinction was established between meaning and reference, an opposition absent as such in antiquity, as is plain from the undifferentiated use of *significare*, *ostendere*, or *designare* or from the imprecision of the term *res* as the object of those verbs, at once "signified" and "referent" (see Roesch, "Res et verbum"). As of the end of the eleventh century, it was linked to a reflection on paronyms, which was pursued on the basis of Aristotle's *Categories*, and on the *nomen appellativum*, a designation for the "common noun"

by the grammarians, ending up (for the grammarians and for Anselm) in *De grammatico*, with the distinction between *significare* and *appellare*:

> Grammaticus non significat hominen et grammaticam ut unum, sed grammaticam per se et hominem per aliud significant. Et hoc nomen quamvis sit appellativum hominis, non tamen proprie dicitur ejus significativum; et licet sit significativum grammaticae non tamen est ejus appelativum.

> ("Grammarian" does not signify "man" and "grammar" in a single unit, but it signifies "grammar" by itself and "man" by something else." And that name, even though it is what a man is called, does not, however, properly speaking, signify him; and although it may signify grammar, it is not what grammar is called.)

(Anselm, *De grammatico*, 12.4.231–4.241)

The proper object of the *Categories*, Anselm concludes, is to show what terms "signifiy" and not what they "call" or "name" (ibid., 12.4.5122, 12.4.5144, 12.4.604). The grammarians and the logicians would use the doublet *significatio* and *nominatio*: the noun "man" "names" the substance and "signifies" the quality, whereas the pronoun has solely the function of "nomination," since it can be applied "to all referents" (*ad omne suppositum pertinet*). It names a substance in so far as it is determined by the quality of rationality and mortality. Similarly, *album* "names" the body by signifying whiteness; it signifies principally whiteness and secondarily the body. Such analyses vary according to whether one is a realist or a nominalist: depending on whether or not one admits the existence of the universal "whiteness," one will accept either the proposition that the name "names" such whiteness or that it merely signifies it (see De Rijk, *Logica Modernorum*, and Fredborg, "Speculative Grammar"). Toward the second half of the twelfth century, the distinction would be stabilized by logicians with the couple *significatio* and *suppositio*

on the basis of a consideration of polysemy: *significatio* is stable, fixed by imposition; *suppositio* is variable, dependent on contextual elements; *canis* ("sea dog"/"constellation") is an *ambiguous* term since different meanings are a function of different impositions, whereas *homo* (in the statements *homo est species* [man is a species], *homo est nomen* [man is a name], *homo currit* [a man is running]) is *univocal*, the semantic variations being contextually determined and with constant signification (see PARONYM; SUPPOSITION; WORD, Box 4; HOMONYM).

2. Primary meaning, proper sense vs. secondary sense

Second, a network of terms was introduced in order to think through the distinction between what a term signifies primarily and what it implies or connotes secondarily (see *translatio* in TO TRANSLATE and CONNOTATION).

3. Signification vs. modes of signifying

The distinction between signification and the way of signifying developed as part of speculative grammar and theology; it allowed for a new way of thinking about the relations between being, thought, and language, as well as the different questions they raise, in particular that of the arbitrary, conventional, or natural character of language.

In the semantics of the thirteenth century, the linguistic unit *homo* was analyzed as being constituted by (1) a lexical signified (*significatum speciale*); (2) a general signified (*significatum generale*) or essential general mode of signifying, which accounts for its categorization as a part of speech (a noun); (3) specific essential modes of signifying, which account for its categorization as a type (noun, a common name); and (4) accidental modes of signifying, establishing its accidents (masculine, nominative, etc.).

■ See Box 3.

The opposition between modes of signifying and signifieds is deployed in speculative grammar on four levels: (1) on the ontological level: the mode of signifying refers to

---

3
The sources of the notion of "mode of signification"

The notion of "mode of signification" has several distinct sources, which, before converging, combined to create several terminological confusions.

A. *Modus significandi* was initially the general characteristic of a part of discourse: the use has its origin in the *institutiones grammaticae*, in which Priscian explains that parts of discourse are not distinguished by formal properties (such as case), but by "properties of signification," that is: general semantic characteristics (e.g., a name or noun signifies substance and quality).

B. *Connotata*, then *modi significandi*, would later be used to designate what would

subsequently be designated more precisely as *modus significandi accidentalis*: on the basis of the Aristotelian notion that the verb "consignifies" time, grammarians very early on had the idea of defining most accidents as secondary significations to be added to the principal signification (e.g., person, mood, etc.) (see CONNOTATION).

C. In a different register, *modus significandi*—which would be better rendered as "manner of signifying"—is what distinguishes two terms with the same semantic root and different endings, and specifically paronyms (see PARONYM): thus "white" and "whiteness" signify the same "thing" (whatever the ontology

invoked) but differ in their manner of signifying, since they signify in an abstract or concrete mode.

In all these cases, and as is the case for consignification, the mode or manner of signifying refers to a signification that is not the principal or lexical signification but rather is either an additional signification (*significare cum*: *homo* signifies "man" and at the same time one or another property) or a manner of signifying (*significare sic*: "white" signifies whiteness insofar as it exists in a particular case). It will be noted that in cases (A) and (B), what are at stake are second-order or metalinguistic properties, but in case (C), first-order or semantic properties.

the property or mode of being of the thing, the signified to the thing; (2) on the semantic level: the modes of signifying ground the grammatical properties, the signifieds, the lexical properties—whence the idea of a double articulation, or institution, of language, the first, through which the *vox* becomes a signifying word (*dictio*; see WORD), and the second, through which it becomes a co-signifying part of speech, endowed with a mode of signifying; (3) on the epistemological level: grammar deals only with modes of signifying, logic with signifieds; (4) finally, it is the linguistic order that justifies (3): grammatical properties explain the construction and congruence of statements, the object of grammar; signifieds are the foundation of truth, the object of logic.

The Modists sought to justify the notion of *modus significandi* philosophically: every *modus significandi* corresponds to a property of things, or *modus essendi*, and to a conceived property, or *modus intelligendi*. The Aristotelian triad *voces/passiones/res* was duplicated in this system of three *modi*: *significandi, intelligendi, essendi.* This was true only for certain authors, for whom the modes of signifying were signs of *modi intelligendi*, which were signs of *modi essendi.* Others, inspired by Avicenna, supported the identity of modes: the same common nature (e.g., the property of movement) could exist in three different forms—as existing, as conceived, and as signified. In all cases, the modes of signifying, corresponding to modes of being, were quite distinct from the signifieds, which corresponded to things themselves. A single "thing" (pain) might exist in reality, might be conceived, and might be signified, being associated with either the property of movement (the verb: *doleo*) or the property of repose (the noun: *dolor*). The question of arbitrariness was thus thought through again: there was no relation of motivation or dependence between the grammatical category of a word (or of any of its accidents) and its lexical signified, since in theory any *thing* could be signified on any mode. The question of arbitrariness, moreover, underwent a kind of proliferation: it became imperative to simultaneously think about the relation between the various formal components of a linguistic unit (its modes of signifying); the relation of those components to the properties of the things on which they were grounded; and the relation of the grammatical components to the semantic components, etc. Whereas, in the Aristotelian tradition, *voces* represented the realm of convention and variation, and *intellectus* and *res* the realm of what was "identical for all," the Modists staged the coup of positing within language *modi significandi* that were substantially "identical for all," any difference being situated at the mere "accidental" level of "vocal" expression, thus affirming that a genuine "science of language," endowed with a universal subject, could exist. The nominalists of the fourteenth century would reproach them for that claim.

In theology, the notion of *modus significandi* was used as of the twelfth century to characterize simultaneously the semantic behavior of nouns and the mental operation corresponding to the use of nouns. Used for the analysis of speech about God, the notion of the signifying mode allowed one to think about the disparity between being and language, between what God *is* and what can be said of Him, a distinction already strikingly articulated at the end of the twelfth century by Alain de Lille when he distinguished

between *proprietas essendi* and *proprietas dicendi*: "Deus vere est, sed non vere esse dicitur" (God is in truth, but he cannot be said to be in truth). The principle of the correspondence between thought and language (*sicut intelligitur, sic significatur*) can be turned into a noncorrespondence grounding a negative theology: just as we cannot think God, we can not speak him either (*sicut non intelligitur, ita nec significatur*). That noncorrespondence, initially analyzed in terms of distinct connotations (for example, *just*, if said of God, connotes the cause; if said of man, it connotes the effect [see CONNOTATION]), was subsequently theorized in terms of signifying modes: we signify God, said Saint Bonaventure (to choose an example), not as he is, but as we conceive him, the modes of signifying corresponding to those modes of understanding and knowing. Starting with the reading of Pseudo-Dionysius and the idea that perfections, which are precontained in God, exist in him in a certain mode and are received by each creature commensurately with what it is, in keeping with its measure of "intellective receptivity," the notion will be inflected: Albertus Magnus, then Thomas Aquinas, could thus distinguish in the name designating perfection (e.g., *bonitas*) between the "thing signified" (*res significata*), which is perfection itself, and its mode of reception, on which the name's "signifying mode" is dependent. Nouns of perfection are thus improper at the level of signifying mode (*quantum ad modum significandi*), since, being invented by men, they correspond to their mode of thought and to things as they are able to conceive of them; at the level of the thing signified (*quantum ad rem significatam*), they are suited specifically to God, since justice is first of all, *per prius,* in God before existing, *per posterius*, in man (see TO TRANSLATE, IV and ANALOGY). For Thomas, as for other theologians, these "signifying modes" characterizing creatures are marked, inscribed in names themselves: verbs and participles, for instance, imply a temporality intrinsic to their signifying mode, but that temporality does not at all concern the thing signified as such.

IV. Modern Convergences between the Three Senses of "Sense"

Between the seventeenth and eighteenth centuries, three privileged witnesses allow us to understand how the three senses of "sense" have been articulated in the modern period.

A. Descartes and the degrees of "meaning"

In the middle of the seventeenth century, Descartes, in his *Replies to the Sixth Objections to the Meditations*, article 9, still felt the need to distinguish three degrees, three meanings of "sense," in order to be able to evaluate their degree of certitude with precision. In order to do so, he restricted the true and proper notion of meaning, and, consequently, its infallible character, to the first two degrees, namely: the first, the movement of the bodily sense organ under the pressure of external objects; and the second, the perception of sounds, odors, colors, pleasure, and pain, which stems from the union of body and soul in the mind. Descartes, on the other hand, reserved for the intellect alone the third degree, which was commonly attributed to the senses and included an evaluation, a cognitive judgment as to objects of the

senses expressed during sensory impressions, a judgment that could be true or false.

The Cartesian distinction refers implicitly to three of the four different levels of analysis (see above, II) that had long been superimposed and crisscrossed in the historical debate surrounding the nature and validity of sensations. With regard to those three levels, Descartes still felt a need for clarification, and he assigned them respectively to the realms of the physiology of sensation, to the psychology of sensation, and, finally, to the gnoseological aspect of the question.

B. Vico and the *sensus/sententia* link

There emerges from the texts a semantic flux revealing a continuity, in some respects unexpected, linking the principal meanings of *sensus*: sensation and sensory perception, intellectual perception, signification. Light is cast on this by linguistic analysis via the *sensus/sententia* nexus: *sensus* is successively a sense organ, a faculty, the act of feeling, consciousness of feeling and thus *sententia*, opinion, cognitive judgment bearing on what has been sensed.

In the modern period, at the beginning of the eighteenth century, Vico understood the full historical and philosophical import of philologico-linguistic analysis. Even as he attributed, in radical fashion, a fundamentally empiricist attitude to all the thinkers of antiquity (including the Platonists), Vico properly recognized in the *sensus/sententia* derivation the linguistic expression of a very precise school of thought bearing the sensualist stamp, in contrast to the occasionalism of Malebranche and deriving from the Platonic-Augustinianism to which Vico adhered. The Latins, Vico observed with implicit reference to the degrees of "sense" distinguished by Descartes, "understand by the term *sensus* not only external senses, such as sight, and inner senses, that is: those of the soul, such as pleasure, pain, and boredom; but they also name *sensus* judgments, deliberations, and desires" (*De antiquissima Italorum sapientia*). Proof of this is offered by certain linguistic expressions in which *sententia* is used for *judgment* or *opinion* (ibid. chap. 7, §1):

Latini sensus appellatione non solum externos, ut sensus videndi, ex. gr., et internum, qui *animi sensus* dicebatur, ut dolorem voluptatem, molestiam, sed judicia, deliberationes et vota quoque accipiebant: *ita sentio*, ita judico; *stat sententia*, certum est; *ex sententia evenit*, uti desiderabam; et in formulis illud: *ex animi tui sententia*.

(Under the term *sense*, the Latins included not only the external senses (for example, the sense of sight) and inner sense (such as pain, pleasure, and worry) which they called *animi sensus* (*sense of the soul*), but also judgments, deliberations, wishes; so in Latin, to say *ita sentio*, (*I sense that it is so*) means I judge that it is so; to say *stat sententia* (*my sentiment holds that*) means I am certain that; to say it turned out *ex sententia* (*it turned out in keeping with my sentiment*) means it turned out as I desired. And among their legal formulas is the expression *ex animi tui sententia* (*in keeping with your soul's sentiment*).)

And he linked the Platonists with the Stoics by virtue of their conception of reason as an ethereal and extremely pure sense, all the while recalling the materialism of the Epicureans, for whom thinking was sensing or feeling, and the empiricist psychology of the Aristotelians, who considered that the human mind perceives only by way of the senses (ibid.):

An igitur, quia antiqui Italiae philosophi opinati sint mentem humanum nihil percipere nisi per sensus, ut Aristotelaei; vel eam non nisi sensum esse, ut Epicuri asseclae; vel rationem sensum quendam aethereum ac purissimum, ut Platonici Stoicique existimarunt? Et vero Ethnicarum sectarum nulla, quae mentem humanam omni corpulentia puram agnorunt. Et ideo omne mentis opus sensum esse putarint; hoc est quicquid mens agat vel patiatur, corporum tactus sit.

(Accordingly, is this because the ancient philosophers of Italy were of the opinion that the human mind perceives nothing except through the senses (as was deemed the case by the *Aristotelians*); or that it is nothing but sense (as was deemed the case by the *followers of Epicurus*); or that reason is a kind of ethereal and most pure sense (as was deemed the case by the *Platonists* and the *Stoics*)? Indeed, there was no pagan sect which acknowledged the human mind to be pure of all corporeality. And the reason for this is that they regarded the operation of the mind to be entirely a function of sense.)

To this pagan metaphysic of sense, Vico opposed his own Christian metaphysic (ibid.):

Sed nostra religio eam prorsus incorpoream esse docet: et nostri metaphysici confirmant, dum a corporibus corporea sensus organa moventur, per eam occasionem moveri a deo.

(But our religion teaches that the mind is absolutely incorporeal, and our metaphysicians confirm that when the bodily sense organs are moved by bodies, through this occasion the mind is moved by God.)

C. Clauberg and the rereading of the *aisthêsis/dianoia* relation

It was during the modern period that the central importance of the relation between *aisthêsis* and *dianoia* would be confirmed, and it would occur, not at all by chance, in Cartesian circles, for the seventeenth century was also characterized by a renewed interest in the investigations of psychophysiology and the debate over the limits and conditions of human knowledge through an examination of the faculties of the soul. But the reconsideration of *aisthêsis* and *dianoia* occurred in this case through an interesting rereading.

In his systematic commentary concerning Cartesian doctrine on the three degrees of sense (for Descartes, see above, IV.A), Johannes Clauberg specified that the term *sensus* must be understood as the second of the three meanings indicated, namely, the perception of the soul united with the body:

Atque ego tibi assentior et addo, hanc mentis perceptionem, quae toto genere differt a corporis motu praecedente, proprie stricteque sensum nuncupari.

(I am in agreement with you and I add that such perception of the soul, which differs absolutely from the movement of the body preceding it, is properly and strictly termed *sense*.)

(*De cognitione Dei et nostri*)

"To sense" is thus, properly speaking, "to perceive" ("sensum proprie esse ac dici quam diximus perceptionem" [sense proper and properly speaking is what we have called "perception"]; ibid.), "to think" ("clarissime intelligo, quomodo recte philosophantibus sentire sit cogitare" [I understand as clearly as possible that for those who philosophize correctly to sense is to think]; ibid.); and, in support of this Cartesian thesis, he affirms that according to *Physicus* (Strato of Lampsacus), *aisthêsis* and *dianoia* coincide. Clauberg writes, "Idem esse dixerit [Strato Lampsacenus] *aisthêsin kai dianoian*, id est, sensum et cogitationem mentis" (Strato of Lampsacus has said that *aisthêsis* and *dianoia* are one and the same thing, that is, the sense and thought of the mind). Strato, Theophrastus's successor at the head of the Lyceum, interpreted Aristotelian thought in an empiricist and naturalist sense and cast himself as the theoretician of "sensory demonstration" (*apodeixis aisthêtikê* [ἀπόδειξις αἰσθητική]), developing a psychology of the reciprocal dependence of sensation and intellect (see Repellini, "Il Liceo e la cultura alessandrina").

Clauberg, for his part, tended to read Strato's affirmation in the Cartesian manner: as a reduction of sense to thought. The question of the Cartesians was, Are seeing and sensing the province of the eye or of the mind? (*Sitne mens quae videt, an oculus, an aliud quid?* [Is it the mind that sees or the eye, or something else?]; *De cognitione Dei et nostri*); and the reply was as follows: to sense is the domain of the mind in unity with the body, for to sense is to perceive, entailing attention, apprenticeship, on the part of the mind, in the movements provoked in the brain by the action of external bodies on the sense organs. Wherein we note the ascendancy of the Platonic-Augustinian doctrine: "Et maxime illud Aristotelis Probl. 33 sect. 11 . . . unde dictum Mens videt, mens audit" (This is above all what Aristotle says in the *Problems* . . . where it is said that the mind sees, the mind hears; ibid.); or further still: "Hunc [secundum gradum sensus] dico esse apprehensionem atque attentionem mentis, in ea cerebri parte, ad quam omnes externorum sensuum motus deveniunt, immediate residentis atque operantis" (I say that this [the second degree of sense] is the apprehension or attention of the mind, which resides and operates in immediate fashion in that part of the brain where all the movements of the external senses finally arrive; ibid.).

V. *Sinn/Bedeutung*, "Meaning," "Sense"

The rest of the story autonomously develops the lexicon of the third sense of "sense"—a complex story implicating analytic philosophy as well as phenomenology and hermeneutics. The contemporary break is owed to Frege and the "invention" of the *Sinn/Bedeutung* difference, in which the contest between German and English is joined.

We can, in fact, date the emergence of the concept of "sense," *Sinn*, which, from its inception, was distinguished from "reference," *Bedeutung* (or "denotation," as Claude Imbert translated it into French in 1971), to Frege and his fundamental article *Uber Sinn und Bedeutung* (1892). The *Sinn* of a sentence or word is a distinct public entity belonging to or associated with a statement, whereas the *Bedeutung* is the reality designated by the sentence or word.

Although Frege's doublet structures the whole of reflection on signification in the twentieth century, it does not allow easy translation. It is crucial to recall that analytic philosophy had its inception, from the beginning of the century, in a translation into English of a distinction formulated in German. The English word "meaning," like the French word *signification*, is ambiguous, at times meaning *Sinn*, at others *Bedeutung*, and the fraught nature of ordinary usage is such that the word endlessly overrides the distinction. The massive transfer (occurring, for historical reasons, during the years 1930–40) of the philosophy of language and theories of signification from German to Anglo-Saxon philosophy brought all the dimensions and discussions of "sense" and "reference" to bear on the notorious term "meaning" and thus transformed the linguistic question of signification in its double valence (sense and reference) into the central and single philosophical problem of analytic philosophy.

A. From empiricism to *Sinn/Bedeutung*

1. The vague sense of "meaning" before Frege

The problem of a distinction between sense and reference is not posed in a framework in which language is assumed to refer to mental objects or ideas: *meaning* is a relation between words and objects that can be either external or internal. It is of little consequence under such circumstances to know whether someone like Hobbes had a referential or ideationist theory of signification since, in a sense, he didn't have any at all, the sign-relation he evoked being a nonlinguistic relation (mental discourse produces verbal language, "put into words" [*Leviathan*, pt. 1, chap. 7]). "Meaning" is a vague term, mental in cast, that designates the relation between words and objects or ideas designated as much as those objects or ideas themselves, as in Locke, for whom "significations" are ideas (*An Essay concerning Human Understanding*, bk. 4, chap. 2, §4, §7). It is not surprising that all of the philosophy of language in the twentieth century, following what is known as the linguistic turn, sought to criticize this notion of "meaning" defined as idea in order to reconceive it in terms of language. More dubious are those readings that project a theory of signification (sense, reference) in the contemporary sense onto those classical thinkers or, worse yet, who discover in them arguments for rementalizing sense (see Hacking's justified critique, *Why Does Language Matter to Philosophy?*).

One should not, however, neglect the fact that there is a sense of "meaning" at the very heart of British empiricism that is not that far removed from contemporary usage—a properly linguistic—but also critical—sense. Hume thus envisaged in his *Enquiry concerning Human Understanding* (§2) a means for "discounting" the sense-laden use of a philosophical term. The term that would not have any would be impossible to derive from an impression. The link between the two senses of "sense"—"sensation" and "meaning"—may well have been forged here, not between (mental) idea and signification, but between impression (sensation) and signification (sense). It would seem that only a critique, which is central in Hume, of what Quine would call "the idea idea" (*From a Logical Point of*

View) could open the path to a clear concept of signification. One finds in this passage in Hume the outline of a critique of the statements and terms of metaphysics via the criterion of signification (to be charged with or stripped of meaning) that would be brought to completion by Carnap. Similarly, but by virtue of a different approach, Berkeley, in his introduction to *A Treatise concerning the Principles of Human Knowledge*, criticizes abstract general ideas by advancing this argument:

There is no such thing as one precise and definite signification annexed to any general name, they all *signifying* indifferently a great number of particular ideas.

There emerges here the critique of what Quine would call the "myth of meaning," the problem being not only to define meaning but also to isolate and fix it.

▪ See Box 4.

4

"Import"/"sense," "meaning," "signification"

English has at its disposal many more words than French for conveying what French calls *sens* and *signification*: "sense," "signification," "meaning," "appellation," and "import." Every sentence or proposition has a sense or meaning, which may vary from one individual to another, or from one community to another. "Sense" is dependent on "import," but cannot be confused with it, since "import" is more "objective" than sense. "Import, not discourse," as Bentham put it laconically (*Essay on Language*). As with the importation of a commodity or a service into an economic system, the "import" is at once the entry of a sign into a linguistic system and the drift that is initiated within it once that inaugural event occurs and that it is possible to retrace in a relatively objective manner. Entry and drift may be overlooked by "meaning" and "sense," which are entirely synchronic in orientation; on the other hand, "import" cannot be discussed without implying an awareness of the diachrony of meaning. What etymology seeks to reactivate is plainly the "import," a term that is almost untranslatable in French other than by the expression *sens etymologique*, which is an overtranslation.

I. The economic and dynamic sense of "import"

However original it may be, English, like all languages, is composed of borrowings from other languages:

In the stock of words of which the English language is composed, a very considerable, not to say the largest, portion, are borrowed from some one or other of several foreign languages; in some instances at a very early date, in others at different points of time from the remotest down to the most recent.

(Bentham, *Essay on Language*)

The import dynamic consists of a more or less forced entry into a system and the provoking of a perturbation—with the ongoing necessity of reequilibrating the system. The import is also the transmission of that initial shock, to the extent that it can be preserved. The import is what is conveyed within the language; it is, in a translation, what one seeks to transfer from one language to another, without, however, any hope of guaranteeing the absolute identity of what is being transferred.

II. The diachronic dimension of the "import"

One thus perceives the difference that exists between "import," on the one hand, and "sense" or "meaning," on the other: the philosophers, who speak in the language that they study and in which they conduct their analyses, strain to achieve awareness of the import, which is radically forgotten by those who, being mystified or hypnotized by the object, imagine they are grasping a meaning that they forge without knowing or mastering it. The import is what philosophers attempt to retrieve through their etymological labor, which reverses the historical order, since, in starting with a fiction, which always has sense and meaning, they aim at the actual entity from which it is derived. "Import" and "original" are constantly linked by Bentham: whatever the case for originality, the import can be grasped only indirectly, by questioning the immediate meaning.

In every language, words are found in clusters growing out of the same root. Whatsoever be the cluster to which the word in question belongs, the comprehension a man has of its import is comparatively imperfect, if it includes not a more or less general acquaintance with the whole cluster to which it belongs.

(*Essay on Language*)

It is that path, both logical and historical, that philosophers must be able to retrace if they are to fulfill the task that John Stuart Mill assigned to intellectuals, that of knowing the sources of the words with which they speak:

To common minds, only that portion of the meaning is in each generation suggested, of which that generation possesses the counterpart in its own habitual experience. But the words and propositions lie ready to suggest to any mind duly prepared the remainder of the meaning. Such individual minds are almost always to he found; and the lost meaning, revived by them, again by degrees works its way into the general mind.

(*A System of Logic*, bk. 4, chap. 4)

Bentham subtly distinguishes between what he calls "logical history," which ideally reconstructs the order in time as well as the logic of "removes," that is, the order of fictive entities in their degrees of distance from real entities, and "chronological history," which designates the far more chaotic course of time but which philosophers should also understand if they are intent on grasping the reality of the import rather than submitting to what fallaciously appears of it in meaning:

Language has its logical and its chronological history: its logical history shows what must have been the order of formation among the elements of language—shows it from the nature of man, shows it from the circumstances in which all men are placed, shows it from circumstantial evidence. The chronological history of language shows what has actually been.

(*Essay on Language*)

It may be said that the notion of import, as developed in these remarks, stems from "Benthamian," rather than from the English, language and derives its meaning only within a thematic specific to Bentham. In actuality, Mill mentions it as well (e.g., in *A System of Logic*, bk. 1, chap. 5, in order to deal with the meaning of propositions) and is familiar with the problematic, although

(continued)

he does not always articulate it with terminological distinctions as systematic as those found in Bentham. Curiously, like Hume, he utilizes it more often as a verb, in the logical sense of "entailing" or "implying." It should unfortunately be added that when Mill specifically retains the noun, the French translator of *A System of Logic*, Peisse, pays no attention to it and treats "import" as though he were dealing with "meaning"; on occasion, he even overlooks the term completely and leaves it out—but it is not easy to proceed differently.

2. Frege's invention

The distinction introduced by Frege created an objectivist break within a rather confused semantic field. Indeed, neither *Bedeutung* (denotation or reference, the object designated) nor *Sinn* (the meaning of the proposition, the thought it expresses) was defined by Frege in terms of ideas or mental content (see the text *Der Gedanke* [*Thought*], 1919). Frege was not content to transform or perfect the concept of sense: he invented it, breaking with the entire philosophical tradition of determining meaning in mental—or, in any event, prelinguistic—terms. He objectified *Sinn* (as he did thought, *Gedanke*, with whose definition he is associated) as absolutely independent from the thinking or speaking subject. The introduction of *Sinn* (along with that of *Bedeutung*) thus effected a depsychologization of questions relating to language—that may have been subsequently attenuated by translations of *Sinn* as "meaning"/"sense" or *sens/signification* (in French).

A further difficulty, of which Frege was aware, was then raised by the universality of sense and its independence of specific languages. *Sinn* ("original *Sinn*" in the pun much appreciated by English-language philosophers in the 1960s) was originally defined as the common endowment of languages and a cultural invariant, thus bearing the seeds of its own critique within itself, specifically by way of the problematics of translation and, more generally, of linguistic difference and relativity.

3. Wittgenstein's new distinctions and the confusion of the English translations

In the tradition initiated by Frege, the critique of "meaning" in the mental or psychological sense would continue. Wittgenstein, in *Tractatus logico-philosophicus*, would take up and modify the *Sinn/Bedeutung* distinction. According to the *Tractatus* (3.3), only a proposition (*Satz*) has a meaning (*Sinn*), a name or a primitive sign has a denotation (*Bedeutung*) and represents (*vertritt*) the object. The English translation of the *Tractatus* (1922) by C. K. Ogden employs "meaning" for *Bedeutung*, creating a lasting ambiguity. Bertrand Russell, in his introduction, thus has "meaning" serve for both the sense of the proposition (*Satz-Sinn*, 3.11) and the denotation of the component sign. All those translations would contribute to a standard interpretation of the *Tractatus*, which has only recently begun to be cast off in order to reestablish the bond between the first and second philosophies of Wittgenstein.

Another source of confusion and slippage is the Wittgensteinian distinction between *unsinnig* and *sinnlos* (4.461, 4.4611), which are translated respectively as "nonsensical" and "without sense." Tautology and contradiction are deprived of sense: they are *sinnlos*, but not nonsensical, *unsinnig*. They do not present a state of things but are nonetheless part of language. In various interpretations of Wittgenstein by the Vienna Circle, *sinnlos* became what was radically derived of sense and consequently to be excluded from language (see NONSENSE). In *Overcoming Metaphysics*, Carnap thus makes the transition from the absence of the *Bedeutung* of the term (no empirical content) to the absence of the sense of its statements (impossible linguistic constructs). In reducing the distinction between sense and denotation, thought and empirical content, one obtained a kind of hybrid for which the term "meaning" (which would become *signification* in philosophical French) worked rather well. "Meaning" thus became the criterion for distinguishing between statements deemed acceptable or not in the framework of a scientific philosophy. Every problem of knowledge became translatable as a problem of meaning.

The basis for such a criterion for distinguishing between statements endowed with meaning or not resides in what has been called a verificationist theory of meaning, which defines the meaning of a proposition (with Schlick) as the method of its verification. That concept of meaning was now in turn a (curious) retranslation of a proposition in the *Tractatus* (Ogden translation):

Einen Satz verstehen, heisst wissen was der Fall ist, wenn er wahr ist.

(To understand a proposition is to know what the case is when it is true.)

In point of fact, Wittgenstein, far from suggesting a method of verification, was affirming the effective bond between meaning and truth. For example (4.022):

Des Satz zeigt seinen Sinn. Der Satz zeigt, wie es sich verhält, wenn er wahr ist.

(The proposition shows its sense. The proposition shows how it is, when it is true.)

It is remarkable that this superimposition of meaning on truth (on the possibility of being true or false) should subsequently become a determination of meaning in terms of originary experiences, which is rather removed from the perspective of the *Tractatus.*

B. Indeterminacy of the translations

1. The ambiguities of "meaning" and "sense"

The contrast between the distinction proposed by Frege, which has become classic, indeed structural, in analytic philosophy, and ordinary English, which is characterized by the flexibility with which "meaning" is used, is considerable. *Sinn*, like *Bedeutung*, fell prey from the outset to a certain indetermination in translation, being rendered on some occasions as "sense" or on others as "meaning," or even as "denotation" or *significatum.* It may seem curious that "meaning" is utilized indifferently to translate *Sinn* and *Bedeutung* by philosophers (Russell is the most striking example) who elsewhere take up on their own (or at least are familiar with) Frege's distinction. It was only once "reference" and "denotation" were imposed as translations of *Bedeutung* that a first clarification of the status of "meaning" was achieved: "meaning" would partake rather of the realm of *Sinn* (as in Quine, see below, C.2).

C. Imbert translated *Bedeutung* in French as *dénotation* in order to bring into relief the full force of Frege's gesture. The translation did not really catch on in French, which, following the most frequent usage in English, prefers *référence* in as much as some would distinguish between "denoting" and "referring" (Bertrand Russell, Peter Strawson). In an edition of Frege's *Nachlass*, still other translators recently decided to translate *Bedeutung* as *signification* in French (and not as *référence*, which would be closer to standard English usage). As P. de Rouilhan has noted,

> To be sure, what Frege designated in his day as *Bedeutung* is what we French-speaking logician-philosophers today designate as "référence." But what logico-philosophical German designated in Frege's day as *Bedeutung* is what we today designate as "signification." It is not for us to rectify Frege's deviations (about which Husserl complained) in relation to his own language (by which we mean not a certain idiolect, but the language of a certain community). It befell us to transpose them into our own, and that is what we were able to do as simply as possible by translating *Bedeutung* as "signification."

> (Intro. to Frege, *Écrits posthumes*)

That choice, however, introduces a *sens/signification* doublet in French, which seems insufficiently clear and scarcely differential.

It was on the translation of *Sinn* by "sense" (in English) and *sens* (in French) that agreement was easiest to achieve. To be sure, the term itself was subject to an ambiguity, this time common to English and German, as well as to French, namely the "semantic" sense and the "sensory" sense of sense. (It is perhaps here, in the analytic field, that the origin of the verificationist definitions of meaning, particularly in the interpretation of the *Tractatus* by the Vienna Circle, is to be found.) Evidence is provided by Strawson's *The Bounds of Sense*, an influential work devoted to Kant's first *Critique*: Strawson introduced a "principle of significance" that transformed the problem of the limits of knowledge and sensibility into a semantic question: that of the limits of sense (of the domain in which our questions make sense). His position, extremely influential in analytic philosophy, was given clear and radical form in the last sentence of that work, in which he affirmed the impossibility of according meaning to a question beyond the limits of our language: "We lack the words to say how it would be without them."

The Bounds of Sense thus represents a turning point wherein the empiricist theme of the limits of our sensibility shades into the logico-linguistic theme of the limits of our language and thus of meaning, what Strawson and later Quine would call our "conceptual scheme." That history has recently been summarized by Hilary Putnam, who describes the transition effected by analytic philosophy from radical empiricism to semantic theories, followed by its more recent return to theories of perception and the senses in "Sense, Nonsense, and the Senses" (1995). In point of fact, the dual sense of "sense" reflects the dual heritage of analytic philosophy and all the ambiguity of its constitution: it lays claim to the heritage of British empiricism (for which, to borrow Quine's pun, "only sense makes sense" [*Theories and Things*]), even as it remains the Anglo-Saxon continuation of what Alberto Coffa has defined as "the semantic tradition" stemming from Frege and Carnap, whose investigations focused on sentences or statements as semantic units. The efforts of historians currently underway in the United States on the origins of analytic philosophy and logical empiricism will perhaps result in an understanding of how that dual (empiricist and semantic) tradition, when added to the specifically American tradition of pragmatism, succeeded in producing the multiplicity of theories of signification and in maintaining, in most cases, its twofold dimension.

Superimposed on the entire complex, finally, is "sense" in the sense of "good sense," "rationality." An illustration may be found in the title of Austin's *Sense and Sensibilia*, which refers to Jane Austen's *Sense and Sensibility* (translated into French as *Raison et Sentiments*).

2. Ogden and Richards and the "meaning of meaning"

Reflection on the "meaning of meaning" runs through the entirety of analytic philosophy, as evidenced by the celebrated book of Ogden and Richards, *The Meaning of Meaning*, which was published in 1923 and composed in stages, starting in 1910. It is a volume that is somewhat forgotten at present (or at least it was until a recent reedition with a preface by Umberto Eco) but that exerted considerable influence in its day. Putnam, for instance, would take up Ogden and Richards's title in his famous article "The Meaning of 'Meaning'" (with the extra quotation marks making all the difference), in which he sketches out—as a critique of Frege's *Sinn*—a causal theory of reference.

Ogden and Richards's book, even as it situates itself in the Frege-Wittgenstein line of ascent, plays on the diversity of senses ascribable to "meaning." For them, "meaning" designates both Frege's *Sinn* and his *Bedeutung.* The English translation of *Tractatus logico-philosophicus* (1922), which was Ogden's, uses "meaning" for *Bedeutung* and "sense" for *Sinn.*

The Ogden–Richards volume claims to be simultaneously a presentation of the different "meanings of meaning" and a critique. But the book does not always elude the objections it formulates against philosophical theories of meaning, notably in its elaboration of an "emotive" theory of signification, which was inspired by Wittgenstein and which would prevail in analytic—and particularly moral—philosophy during the 1940s.

In chapter 8 of their book, Ogden and Richards lodge an attack against the inflation within Anglo-Saxon thought of the different senses of "meaning," of which they list at least sixteen uses. This omnipresence of the word "meaning" is for them a sign of inadequate reflection with regard to the functions of symbols, a clarification of which would be imperative in keeping with their will to found a new semiotics (which would serve to inspire Charles Morris, one of the introducers of the Vienna Circle in the United States; see SEMIOTICS). Among the uses that are classified and criticized in *The Meaning of Meaning*, two (beside the well-known sense of "importance") are deserving of our attention. On the one hand, an "intentional" usage, which is facilitated by the English gerund (mean-ing) and which yields a noun-form of the verb "to mean"—as in "What I meant was . . . " (analyzed on p. 192), designates both the signification and the intention of a proposition; that dual dimension of "meaning" enables an easier assimilation of theories of intentionality by the philosophy of language. On the other hand, a "perceptual" usage, which was criticized by Ogden and Richards for its imprecision, particularly in Sellars (in an article in *Mind* and in his volume *Critical Realism*), for whom "meaning" is added to the content of perception or serves to structure it. It is in this connection that they note that

the one inevitable source of misunderstanding and disagreement, the omnipresence of the term Meaning, was allowed to pass unchallenged. It seems to have been accepted without question into the vocabulary of American philosophy, for use on all occasions of uncertainty.

(*The Meaning of Meaning*)

It was naturally in psychology that Ogden and Richards found the most misleading forms of that usage as well as of the meaning-perception association, but they also launched an attack on philosophers close to the analytic trend, such as Moore and Dewey, who "all have their own uses of the word, obvious yet undefined" (ibid.).

Finally, they advanced for the first time a dimension of meaning that might be called anthropological: the term "meaning" is omnipresent in Malinowski, whose texts on meaning in anthropology are included in an appendix to *The Meaning of Meaning*. "Meanings," in the plural, refers to cultural diversity (pluralities of signification, expression, and language). Everything thus becomes a search for meaning (in sociology and anthropology, Weber and Malinowski adopted an elaborated form of the concept of *Sinn*):

All this shows the wide and complex considerations into which we are led by an attempt to give an adequate analysis of meaning. Instead of translating, of inserting simply an English word for a native one, we are faced by a long and not altogether simple process of describing

wide fields of custom, of social psychology and of tribal organization which correspond to one term or another. We see that linguistic analysis inevitably leads us into the study of all the subjects covered by Ethnographic field-work.

(Malinowski, "The Problem of Meaning")

This anthropological dimension of meaning would be developed in the positions of Quine, positions based on a circumstance of radical translation (see TO TRANSLATE, Box 3).

Ogden and Richards thus proposed a recasting of the notion of meaning, which can be associated in their work with the emergence of pragmatics. Their principal references for such a renewal, enumerated and described successively, were, in order, Husserl, Russell, Frege, Gomperz, and, finally, Peirce. The London lectures (1922) delivered by Husserl, and particularly their abstracts in English, were cited to bring into relief his theory of "meaning." That was obviously the translation used by Ogden and Richards for *Bedeutung* when they presented several excerpts from *Logical Investigations*, a circumstance relevant to the extent that in those passages Husserl makes rather undifferentiated use of *Sinn* and *Bedeutung*. Here, too, it will be seen how the use of "meaning" allows one to associate, as though naturally, the two dimensions distinguished by Frege and which the English language had such trouble differentiating clearly.

C. The crossing of the Atlantic

1. The adaptation of the vocabulary of Viennese empiricism, or how "meaning" slipped from *Sinn* to *Bedeutung*

A crucial moment in the history of "meaning" in the twentieth century was the introduction in the 1930s in the United States, during the immigration of philosophers of the Vienna Circle expelled by Nazism, of an entire lexicon belonging to Viennese empiricism. It was through Carnap, brought to the United States by Quine, who had met him in Europe in 1933, that Frege's distinction in the transformed version just evoked would be introduced. Quine, who had *The Logical Syntax of Language* translated into English, played a crucial role. In *Logical Syntax*, *Bedeutung* and *Sinn* are both rendered by "meaning" ("sense [or meaning]," §14, theorem 14-4). In presenting Carnap's work and his project of "philosophy as syntax," Quine called "meaning" *Bedeutung* and, as of 1934, articulated the idea of a description of language that would have recourse to neither sense nor denotation (which, along with Carnap, he would subsequently propose to call "intension" and "extension" but which both thinkers would continue to reject). Thus it was that "meaning," from "sense," became in a way, through its Atlantic crossing and the beginnings of the critique of the notion of signification, "reference."

2. Quine and the "myth of meaning"

In a series of theses that would figure at the center of American philosophy for decades (1950–80), Quine waged an assault on the "myth of meaning." He was not aiming only at a certain confused use of "meaning," in the manner of Ogden and Richards, but also proposed a more radical critique directed first of all at the "meaning" of linguists ("The Problem of Meaning in Linguistics," in *From a Logical*

Point of View). Now despite the self-proclaimed fidelity of Quine to Frege, Quine's critique challenged the founding father of analytic philosophy by attacking what had been one of the achievements of Frege's semantics: the ideality of meaning.

The celebrated thesis of the indeterminacy of translation (is a *gavagi* a rabbit? see *Word and Object*, chap. 2; see also TO TRANSLATE, Box 3) was initially an attack against the *meanings* of the linguists, the significations of the mentalists, the semantics of Carnap, and even the *Sinn* of Frege: there is no more an empirical signification than there is analyticity, no more a mental meaning than there is a shared fixed point between languages. But—and this is a consequence that Quine himself calls "unexpected"—his thesis no less calls into question reference itself, the matter of knowing *what* I am speaking *about*, with the thesis of ontological relativity and inscrutability or, to use Quine's most recent expression, the indeterminacy of reference. The radicalism of this critique has not always been well received by post-Quinians, who have attempted to restore different ways of meaning (e.g., Davidson, who attempts to reconstruct meaning on the basis of the concept of truth as defined by Tarski) or to show that Quine's thesis would be tantamount to making all language impossible (Putnam).

The confusion of dualities—intension/extension, sense/reference—within "meaning" was thus paradoxically justified a posteriori or, at the very least, explained in the shared critique of those entities undertaken by the philosophy of language starting in the 1960s. The extent to which these skeptical theses are currently debated in America is well known. It is therefore a matter of some oddity that it was in France (and in French) that Quine first presented his thesis of the indeterminacy of translation (in 1958, at the Royaumont colloquium), under the title "Le mythe de la signification," in which the word *signification* could, in fact, accommodate all the senses (and also all the impasses) of "meaning." There remained a considerable difficulty: the relation between "to mean" and "meaning."

D. *"Must we mean what we say?"*

The absence of a standard translation of "meaning" in French, and more generally the dual character as noun and verb of "meaning," was highlighted in the following sentence by Quine: "One can perhaps talk of meaning without talking of meanings. An expression means; *meaning* is what it does" (*Theories and Things*).

Whereupon Quine made reference to French, which he deemed superior: *cela veut dire*. But it is clear that the verbal, or active, character of "meaning" confers a supplementary dimension on the English term (as in the untranslatable expression "to make sense" as well). Moreover, the verb "to mean" is untranslatable in French: *signifier* is too technical; *vouloir dire*, often inadequate, introduces an intentional aspect in certain contexts. Now all reflection on ordinary language in English-language philosophy of language after Wittgenstein is centered on this dual use of "mean" and the immediate relation between "mean" and "meaning," which is absent from French and German. To signify is to mean, but is every signification intentional? And is meaning—*vouloir dire*, wanting to say—always wanting to say *something*, expressing

an intention? The problem of such meaning (*meinen*) was already raised in the *Tractatus* (5.62) in relation to solipsism:

> Was des Solipsismus nämlich *meint* ist ganz richtig, nur lässt es sich nicht sagen.
>
> (What solipsism *means* is quite precise, only it cannot be uttered.)

Translated by Ogden: "what solipsism *means*." We are confronted here with a *meinen* that partakes of neither *Sinn* nor *Bedeutung* and that is well rendered by the French *veut dire*. Wittgenstein's meaning (or *vouloir dire*) is not an attempt to say otherwise than through language something that cannot be said clearly: for Wittgenstein, if an expression is without meaning, it has none "anywhere." As Diamond put it: "There is not a thought shorn of sense that would be expressed by a proposition shorn of sense" (*The Realistic Spirit*; see NONSENSE). It is a point that Wittgenstein would express in the *Philosophical Investigations*: "When one says that a phrase has no meaning, it is not, so to speak, that its meaning has no meaning." This brought him to determine the meaning of our ordinary statements, and such is the question that opens *The Blue Book*: "What is the meaning of a word?"

Therein lies the whole question of ordinary-language philosophy, which began with the second Wittgenstein, who proposed that meanings should no longer be sought elsewhere, outside language, but rather at our feet, as it were: in our daily usage. That emergence in the second Wittgenstein of a new concept of the verb "to mean" guided the choices of the French translators of the last edition of *The Blue Book*, in which, for meaning, the translators proposed *sens* and for the verbal form, *vouloir-dire* instead of *signifier*. Thus was laid out an entire line of translation of "meaning" altogether different from the previous semantic tradition and that would follow Wittgenstein's celebrated indication: "meaning = use." "Meaning," or *vouloir-dire* in French, would be determined by what I *do* with language. The whole of J. L. Austin's method, which was a radical critique of the traditional analytic notion of signification (first in his article, "The Meaning of a Word" [1940], then in his theory of the performative), was based on a new kind of inquiry into meaning as *vouloir-dire*; knowing what we mean is knowing "what we say when," what our relation to a statement is in the complete discursive situation.

In *Must We Mean What We Say?* Stanley Cavell has pressed the question of intentional (or unintentional) meaning furthest. He delves into the claim of the ordinary-language philosophers Wittgenstein and Austin to say and know what we say and what we mean. Cavell shows that such (intentional) meaning—*vouloir-dire*—can be determined only through a consideration of the language community and its judgments. "We" are those who say what we mean, but who is this *we*, and what is it that grounds *my* relation to it? Cavell's conclusion is radical: *I* am the only possible source of meaning, which emerges from our agreement ("to signify" or "to mean" is *übereinstimmen*, to harmonize or resonate together) and, in circular fashion, serves to found it and is founded on it alone. To accept to signify or mean is to accept that agreement and to be accepted by it. The question of meaning is thus transformed: it is no longer one of the boundary between sense and nonsense, of language's capacity to mean something, but, on the contrary, one of the refusal of

expression and meaning, which is precisely that of skepticism. "Why do we attach significance to *any* words and deeds, of others or of ourselves? . . . How can anything we say or do count as doodling, be some form of nonsense; and why is all the rest condemned to meaning?" (Cavell, *The Claim of Reason*; see COMMON SENSE, and also, for the Aristotelian background, which often goes unnoticed, HOMONYM, II.B.3 and above, I.A.3). For Cavell, it is the repression of this dimension of meaning that may well have been accomplished by the whole of contemporary thought about sense, the various definitions and critiques of signification being but the masks donned by our refusal of expression. "A fantasy of necessary inexpressiveness would solve a simultaneous set of metaphysical problems" (ibid.). For Cavell, what is thus repressed is plainly not the idea of intention or intentionality, whose past and present philosophical fortunes (see INTENTION) are well known, but the power of language itself to mean, making of me, so to speak, the bearer of its meaning. From this point of view, Cavell has pursued in his way the labor of depsychologizing meaning inaugurated by Frege and Wittgenstein, continued by Austin, and occasionally voided in various contemporary determinations (and even critiques) of signification.

Feeling

A vast complexity in aesthetics, philosophy, and psychology, "feeling" evokes everything from physical sensation to emotional affect. Henry Mackenzie's *The Man of Feeling* (1771) epitomized the eighteenth-century "cult of sensibility," an answer to scientific positivism, material economics, and military might. Romanticism gave "feeling" cognitive and philosophical heft. In a succinct essay "On Gusto" (1816), describing "power or passion defining any object," William Hazlitt argued for "truth in feeling"—this power and truth at once reorganizing rational epistemologies and purging for masculine aesthetics the stigma of feminine weakness and effeminate sensibility. The Hazlitt-admiring poet John Keats equated "feeling" with knowledge itself: "we read fine things but never feel them to the full until we have gone the same steps as the Author"; if he bristled at William Wordsworth's poetic didacticism, he admired his poetic power in making his reader "feel the 'burden of the Mystery'" in his "dark passages" (letter to John Hamilton Reynolds, 3 May 1818, quoting "Tintern Abbey"). As he lay dying, he wrote of his "feeling of my real life having passed" and, paradoxically, of his still keen "feeling for light and shade, all that information (primitive sense) necessary for a poem" (letter to Charles Brown, 30 November 1818).

Wordsworth blazoned a poetics of feeling in his preface to the second edition of *Lyrical Ballads* (1800), setting this as a principle opposite to narrative action, a value superior to rational understanding, a science in itself, and an antidote to the "degrading" popular appetite for works of "outrageous stimulation." Careful to say that the poet is one who has "thought long and deeply," he identified "All good poetry [as] the spontaneous overflow of powerful feelings," and his poetry as one in which "feeling . . . gives importance to the action and situation, and not the action and situation to the feeling."

This import and power are not uncontested. To Mary Wollstonecraft, women were degraded by "false sentiments and overstretched feelings" at the expense of salutary "natural emotions" and rational maturity (*A Vindication of the Rights of Woman*, 1792). Coleridge argued that feeling was but one element for poetic imagination—a "power" revealed "in the balance or reconciliation of opposite or discordant qualities": "a more than usual state of emotion, with more than usual order; judgement ever awake and steady self-possession, with enthusiasm and feeling profound or vehement." The "genius" of creating images "modified by a predominant passion," moreover, requires remoteness from "personal sensations and experiences"; Shakespeare's power entails "the alienation . . . the utter *aloofness* of the poet's own feelings, from those of which he is at once the painter and the analyst" (*Biographia Literaria*, 1817). This standard sustains T. S. Eliot's high modernist maxim that "Poetry is not a turning loose of emotion, but an escape from emotion"; he wasn't advocating emotional vacuity, only crucially "personal emotions" (*Tradition and the Individual Talent*, 1917). The question is never resolved. Beat poets would revivify the pulse of feeling, both in the extravagant shaping of poetry on the page and in energetic performances on the stage.

SENSUS COMMUNIS (LATIN)

FRENCH   *sens commun*

➤ *SENS COMMUN*, and COMMON SENSE, *IMAGINATION* [PHANTASIA], I/ME/MYSELF, INTELLECT, INTELLECTUS, INTENTION, MEMORY, PERCEPTION, SENSE, SOUL, TRUTH, UNDERSTANDING

The Scholastic notion of "common sense" was fixed in its principal directions with the medieval Latin translation of the section of Avicenna's *The Cure* dedicated to the treatise *De anima*. It thus presupposes Avicenna's classification of the inner senses into five instances, each situated in a different location in the brain, and designated respectively by the terms: (a) common sense, (b) imagination, (c) imaginative (in animals) or cogitative (in men), (d) estimative, (e) memory.

The inclusion of common sense, or of the function attributed to it, in a classification of internal senses is not totally an innovation of Avicenna (contrary to the assertion of Wolfson, "The Internal Senses in Latin, Arabic, and Hebrew Philosophic Texts). In point of fact, in the treatise *Ideas of the Citizens in the Virtuous City*, al-Farabi already distinguished a *principal sensory faculty*, "one in which the perceptions of the five senses are joined, as if the five senses were so many informants, each charged with a variety of information from a different region of the kingdom," and an *imaginative faculty*, "retaining sensations after their disappearance

from the senses, judging sensations, possessing total power over them, separating them from each other and combining them." Since that treatise was unknown in the West, it was Avicenna and he alone who introduced the so-called peripatetic division of the cognitive faculties among the Latins.

The distinction of the five inner cognitive faculties of *inner senses* is governed by a more fundamental distinction opposing *forma sensibilis* and *intentio sensibilium* (cf. Avicenna, *Liber de anima, seu Sextus de naturalibus*, 1.5). Inner and outer senses in fact have two objects of perception: (1) forms, such as the length of a thing, which is initially grasped by the outer senses, then transmitted to the inner sense; (2) what Avicenna calls the "intention of a sensory object," which is a content directly grasped by the inner sense without an external sense having perceived it—which is what happens, for example, when a lamb perceives the threat represented for it by a wolf. This threatening aspect, which is not directly perceived by the outer senses, is the wolf's *intentio* (*ma'na* [المعنى]), to be distinguished from its form, which normally provokes spontaneous avoidance or flight.

Common sense is the first of the inner senses. In book 1, chapter 4, Avicenna incidentally calls it the faculty of *bantasia* [بنطاسيا], that is, "common" sense, but he speaks only of "common sense" when dealing with it *ex professo* in chapter 1 of book 4. *Bantasia* translates the Greek *phantasia* [φαντασία]. That term may be disconcerting to the extent that [the] common sense in Avicenna is a receptive instance, "centralizing the data of different sensations," in Verbeke's felicitous phrase. In point of fact, as originally defined by Avicenna, the function of [the] common sense is, prima faciae, to "receive all the forms that the five senses transmit to—and imprint upon—it." But that is not its only function. Avicenna's common sense is not only the faculty capable of "simultaneously grasping the objects of the different sensory faculties" (a statement, it may be noted in passing, that transposes into the realm of faculties Aristotle's remark in *De anima*, 3.1.425b 1ff. on a "common sensation" produced when there is a *simultaneity of sensation relative to the same object*), but is also "the principle from which said sensory

faculties emanate" (3.8) and "to which they subsequently return with their booty" (5.8). Above all, (the) common sense plays a role in what, for lack of a better term, may be called the "transformation" of sensation into perception—a role quite distinct from that of the faculty that follows it, imagination (Lat. *imaginatio*, Ar. *Khayal* [الخيال]), which is to "retain what (the) common sense permanently receives from the five senses, after the disappearance of the sensory input in question (*post remotionem sensibilium*)." The "form" of the straight line traced by the fall of a raindrop: such is the product of the imagination, the effect of a retention of what has been grasped by (the) common sense and the outer sense, the effect of "endowing with form" or of a "formation" of the two series of data, one imaginary, in the sense of *bantasia,* and the other real. That is why the retensive imagination is also called *formans*, *vis formans*, and *virtus formalis* (*al-musawwira* [المصوّرة]). Common sense and "formative" imagination are anatomically distinct: (the) common sense is located in the first cavity of the brain, the imagination at the extremity of the anterior ventricle.

Imagination should not be confused with the "imaginative" faculty (*al-mutakhayyila* [المتخيّلة]), the third inner sense, called (*vis*) *cogitative* (*al-quwwat al-mufakkira* [القوة المفكرة]) in man. The role of this cogitative or imaginative faculty is to separate or combine the images retained by the imagination, to divide and compose images: it is itself located in the brain's central cavity, "ubi est vermisae" (where the worm lies). This is followed by the estimative faculty, situated in the extremity of the central cavity of the brain and whose object is *intentiones* unperceived through the intermediary of the outer senses. Memory, situated in the brain's posterior cavity, fulfills the same function of retention in relation to the estimative faculty as the imagination in relation to [the] common sense. It will be noted that the system of cognitive functions or inner senses does not account for the processes of *intellectual* knowledge.

1

"Common sense," "sensation," "perception" according to Avicenna

In his *Liber de anima*, 1.5, Avicenna explains the role of common sense in the transformation of sensation into perception. Take the case of a drop of water that falls while tracing a straight line. The external sense (sight) allows only the "form of what is "facing" it (literally, what is *ob-stant*, what *ob-jects*) to be imprinted in itself, but what faces it appears "as a point, not a line." The external sense thus does not perceive the straight line traced by the falling drop. At instant *T*, it grasps only the position occupied by the droplet at instant *t*: "He cannot see it twice at the same time, but he sees it only there where it is" (non videt eam bis, sed videt eam ubi est). This is where common sense intervenes:

At the precise moment [= *t*] at which the form of the drop (transmitted by sight) is imprinted in "common sense" and withdraws from it, but before the form (deposited in common sense) has entirely disappeared, two powers are exercised simultaneously: the external sense grasps the drop of water where it is (*ubi est*); the common sense perceives it as though it were (still) where it was (*quasi esset ubi fuit*) and as though it were (solely) where it is (*quasi esset ubi est*). What it perceives is thus a *distensio recta*, the trace of a straight line.

Two remarks: common sense does not perceive the thing where it is, which is the business of the external sense; what it grasps is not real, but on the order of *bantasia*. It grasps a movement, that is: it relates to the thing *as though* it were in two distinct locations—the one it occupied and the one it occupies. Given the fact that the forms of the external sense follow each other in the common sense and the forms of common sense in turn follow each other, an instance is required to apprehend both, retaining and conserving them, "when the thing (*res*) has passed (*abiit*)": this is the role of imagination, *imaginatio.*

SERENITY

"Serenity," and its adjectival form "serene," comes from the Latin *serenus*, "calm, without clouds" (with perhaps an evocation of the first meaning of "dry," as from Gr. *xeros* [ξερός]), used to describe skies as much as faces.

"Serenity" is the English translation generally adopted for the German *Gelassenheit*, a term belonging to the vocabulary of mysticism (where *Gelassenheit* signifies a sort of special, even ecstatic, abandon brought on in the proximity of God). Serenity, as a meditative quality by way of *Gelassenheit*, also relates to the notion of the historical in Heidegger's conception of *Seinsgeschichte*, or History of Being: see GESCHICHTLICH and HEIMAT; cf. *DISPOSITION, II,* SORGE.

More generally, "serenity" abuts the idea of felicity (see GLÜCK; cf. *HAPPINESS*) as well as being a related effect or corollary state of wisdom (see *WISDOM*).

SEX, GENDER, DIFFERENCE OF THE SEXES, SEXUAL DIFFERENCE

FRENCH	*sexe, genre, différence des sexes, différence sexuelle*
GERMAN	*Geschlecht, Gender, Geschlechterdifferenz, Differenz der Geschlechter*
GREEK	*genos* [γένος]
LATIN	*genus*
SWEDISH	*Kön, Genus*

➤ DRIVE, GENDER, *GENRE*, GESCHLECHT, MENSCHHEIT

Gender became a philosophical concept in Anglo-Saxon thought during the 1970s. Despite the analogy, to translate as *genre* (in French) or *genero* (in Spanish) proves to be ambiguous, whereas German adopts the English form *Gender*, which it allows to coexist as *Geschlecht*, which can be rendered by "sex" as well as by "gender." Raising as many problems as it attempts to solve, the concept of gender is balanced by the classic phrases *différence des sexes* (in French) and "sexual difference." The first is common in French, German, and Italian, but does not exist in English, which has at its disposal only "sexual difference" and "sex."

I. The Invention of the Concept of "Gender"

"Gender": the word is old, but the concept is new. The appearance in 1968 of Richard Stoller's book *Sex and Gender* marked the beginning of a terminological and philosophical debate that is far from over. The title seemed to say it all in its seemingly obvious distinction between biological sex and social gender. That heuristic scheme, with its opposition between the biological and the social, allows for multiple and contradictory interpretations, but presupposes an epistemological framework that should not be forgotten. Nature and culture designate an opposition, or rather a tension, in the analysis of the relation between the sexes—of the *différence des sexes*, as is said, for instance, in French. There are thus three terms in play: "sex," "gender," and "difference of the sexes." In a context that is both philosophical and political, the end of the twentieth century acknowledged that the physiology of the sexes, whose very reality is problematic, is no more than a support for the individual and collective identification of men and women, and that as a result a critique of sexual assignments imposes a new terminology. The beginning of the twentieth century had succeeded in disassociating sexual beings, "men" and "women," from their alleged attributes, both masculine and feminine, with an eye to a greater flexibility of identification. A century later, feminist thought is conceptualizing the critique of sexual duality. "Gender" is the key word, and it must be understood as a philosophical proposition. A decision has been reached to symbolize, by way of the concept of gender, the necessity of thinking the difference of the sexes. The delineation of that notion is thus a contemporary philosophical event.

That event is first of all a challenge, one born of a difficulty that is epistemological because it is terminological. The word "sex," despite its seemingly transnational character (with its links to Lat. *secare*, to cut), is a term whose interpretation spans from the extremely concrete to the extremely abstract. The English language denotes above all the biological and the physical with the word "sex"; French, on the other hand, understands the word as much in terms of sexual life as of the sexuated character of humanity. In brief, "sexual difference" (in English) refers to the material reality of the human condition, whereas *différence des sexes* (in French) includes an abstract and conceptual partition of the species. *Différence sexuelle* coexists in French with *différence des sexes* and thus allows for an understanding of the distinction between the two: *différence sexuelle* presupposes a difference between the sexes and thus gives a definition of the difference, whether in terms of biology (via the natural sciences) or philosophy (the object of speculation on the feminine); *différence des sexes*, on the contrary, implies an empirical recognition of the sexes independent of any definition of content. German offers other perspectives with the generic term *Geschlecht*, a word that covers the empirical and the conceptual. Unlike the situation in French, the single German word *Geschlecht* (see GESCHLECHT) designates both sex and gender. American feminist thought thus "invented" the concept of gender for lack of an adequate tool for thinking about the sexes, a thought of two in one, for lack of a formalizing thought about the sexes. The realism of the word "sex" entailed neither a theoretical elaboration nor a

subversive vision. But if "gender" was thus promoted to the rank of a theoretical concept, the word (from the Gr. *genos*, Lat. *genus*) was not new in the language, whence the question of determining how other languages received that terminological and conceptual proposition (see PEOPLE, III).

II. "Gender," *Genre Humain*, and Grammatical Gender

French was confronted with a multiplicity of terms and expressions. Contrary to the case in English, *genre* in French designates not only grammatical gender; it also serves to name the species, the *genre humain*, mankind. *Genre* thus designates both the sum total of human beings and the sexuation of the species into two categories. (It may be noted in passing that *genre humain* and *espèce humaine* are distinct but occasionally overlapping expressions, even if, as is the case for *Geschlecht* and *Gattung* in German, the former is more political and the latter more zoological.)

Given the polysemous relation between the human *genre* and grammatical *genres*, the importation of "gender" was met with a certain opaqueness. In short order, it appeared that "gender" was yielding to a translation in the plural (*genres*), as if returning to its origin in grammar. That situation calls for two remarks: the slippage toward grammatical gender reintroduced, at maximal distance from an abstract and neutral framework,

a strictly sexuated duality; simultaneously, grammar, with its two, and even three, genders—masculine, feminine, and neutral—might be the ideal medium for a fluid elaboration of thought about the sexes. The attempt at abstraction by way of "gender" in the singular would find its legitimacy in a return to the plural. Grammar would be the right way to find the balance between biological sexes and social sex, nature and culture. Nothing would be privileged, neither the fact of two different sexes nor the arbitrariness of individual attributions. But sex itself, like sexuality, would seem to disappear as a result. Might gender be an epistemological fig leaf?

■ See Box 1.

III. The Uses of Gender

All this does not suffice for the imposition of a new concept. It is plausible that the need for a doublet of the word "sex" proved more or less urgent depending on the language. If "genre" has been imposed in the common language, the terms to which it is opposed are not equivalent from one language to the next. English has solely "sexual difference," whereas French can use, with a variety of nuances, *différence sexuelle*, *différence des sexes*, and even *différence de sexe*. German as well makes use of the term *Geschlechterdifferenz* or *Differenz der Geschlechter*. To the extent,

---

1

Masculine, feminine, neuter

The existence of the category of grammatical gender is at the origin of a certain number of difficulties in translation that are experienced when an effort is made to translate a text from a language, such as English, in which most words do not enter into masculine/feminine categories, into another, such as French, in which, on the contrary, all words partake of one gender or the other. There are cases in which translating a "neutral" word (without gender assignment) by a word that necessarily has one adds to the text a connotation absent from the original. This difficulty is particularly perceptible when, for one reason or another, untranslated English words are introduced into French discourse. If, for example, one wants to spell out the difference in meaning between the words "soul" and "mind" (see SOUL), one is quite "naturally" led to write *la soul* and *le mind*, thus attributing to English words the grammatical gender of the words that commonly translate them into French (*âme* and *esprit*, in this case). But in so doing, one adds to the delineation of differences of meaning a difference of gender that does not exist in English and that is spontaneously interpreted as a supplementary difference in meaning. That addition is anything but trivial since, in French, categories of grammatical gender bear an implicit sexual connotation. This leads to complaints concerning the "sexism" of one language or

another (in fact, of all of them)—complaints that linguists categorically reject, arguing that languages do not obey semantic criteria.

This difficulty, linked to an unconscious sexualization of words in languages possessing masculine and feminine grammatical genders, may be linked to a remark by Aristotle (*On Sophistical Refutations*, 1.14.173 b 17–22) according to which, to the extent that the feeling of anger is a feature of heroes, and thus eminently virile, one commits a solecism in speaking in the feminine (the word *he menis* [ἡ μῆνις], which means "anger," is feminine). The *Iliad*, consequently, should have opened with reference to Achilles's wrath in the masculine. Aristotle here refers to the distinction proposed by Protagoras (Aristotle, *Rhetoric*, 3.5.1407b 6) between the genders of nouns (*tagene ton onomaton* [τὰ γένη τῶν ὀνομάτων]; concerning *genos* [γένος], see PEOPLE, III.A), which can be either "male" (*arrena* [ἄρρενα], which translates less literally as masculine) or "female" (*thelea* [θήλεα], feminine) or, finally, neither male nor female, as "things, useful objects" (*skeu* [σκεύη], also designated in Gr. as *ta metaxu onomata* [τὰ μεταξὺ ὑνόματα], names between the two, which yields neuters, from the Lat. *ne-uter*, neither one nor the other).

The determination of gender proposed by Protagoras is explicitly sexuated (as the words "male" and "female" bear witness). It is based

on the notion that the male/female division operates in the realm of words in the same way as in that of beings (living and inanimate "things"). "In the same way" should be understood in two different senses. First, in the sense that the operation of division into two classes no more exhausts the full set of words than it does that of "things": it always leaves a residue, a remainder of words and "things" that fail to enter into either of the two categories. Then, in the sense that the division of words into the three generic categories (one of which is defined as the residue of the other two) reproduces identically that of "things": female words designate female things; male words designate male things. Finding it strange and even scandalous that "anger" (*colère*) is feminine is conceivable only within the framework of that hypothesis, in which words, if they do not resemble the things they designate, are nonetheless marked with gender by the nature, male or female, virile or feminine, of those things: it suffices (theoretically) to know the meaning of a word to determine its grammatical gender, either directly (if it be masculine or feminine) or by default (for neuter nouns).

It is enough to utter this thesis to see that it does not have universal bearing. Even English, which also possesses three generic determinations, is removed from Protagoras's model. The masculine/feminine opposition

plays a secondary role in it since it intervenes only after the division between humans and nonhumans, among "things" themselves, has been effected, and is applied, in the realm of words, only to those designating humans, in the strictest sense: persons, to whom it is possible to ascribe a biological gender—in which case grammatical gender fuses (in theory) with biological gender. It is consequently unthinkable that the word designating in English the wrath of heroes might be of masculine gender: one cannot define the biological gender of wrath with which its grammatical gender might be confused. A word's sense helps in determining its grammatical gender only if its meaning reveals that one is dealing with a person: "queen," which designates a person, is necessarily feminine. Gender effects, whether masculine or feminine, are extremely discreet in English: the gender of the noun designating a person affects neither the adjective nor articles, whether definite or indefinite, associated with it; only pronouns in the singular ("he" or "she") indicate the (biological) gender of the person designated. It can be said that the English language takes almost no cognizance of grammatical gender: all words, except for a few exceptions ("man," "woman," "king," "queen"—and, to be sure, "ship"), are neuter, without gender. From that circumstance to the claim that it does not know of the difference of sexes the distance is considerable. But it will be understood that those speaking a language in which almost all nouns are without gender, and in which the (male/female) difference of sexes never affects any words other than those designating persons, have felt the need not to overlook the slightest occasion to emphasize that difference—be it at the price of artificiality, as in the case of the increasingly frequent use of "he or she" to designate human beings. It will also be appreciated that it is within the English (and/or American) language—a language in which biological and grammatical gender, for humans, coincides—that the concept of "gender" (see GENDER) emerged. One may wonder whether "gender," the social construction of sexual identities, is not intended to compensate for the absence of grammatical gender. For individuals speaking a language possessing genuine grammatical

genders live in a world in which the feminine/masculine distinction, even if it is not semantically determined (we shall see that this is not generally the case), is nonetheless omnipresent and contributes in part to the (broadly social) formation of masculine and feminine identities. Whether we like it or not, the fact that the word *fleur* (flower) is in the feminine in French influences the concept of the feminine gender (generally, not merely grammatically) entertained by those who express themselves in that language. In brief, the language establishes between gender and grammatical gender a series of cross-references that are unthinkable in English.

Linguistics opposes to such imprecise considerations—which amount to claiming that conceptions of the world forged by individuals cannot be the same depending on whether the language they speak and write does or does not dispose of genuine grammatical genders—the rigorous thesis according to which languages are formal systems whose construction does not depend on the meaning of words, and which thus do not obey any semantic determination (with grammatical gender not offering an exception to the rule, which is a version of the celebrated "arbitrary nature of the sign"). French and German are generally invoked in support of this argument. In German, a language of combinations par excellence, there exists an entire series of rules allowing one to know the gender of a noun from its morphology: the suffixes *-lein* and *–chen* are (in general) marked as neuter; the prefix *Ge-* renders neuter the noun in which it enters into combination—at least when one is dealing with a word produced by combination; nouns whose ending is in *-ung, -heit, -keit, -schaft,* and *-erei* are feminine, etc. Similarly, in French, a study by experts on the learning of French by English-language speakers (Tucker, Lambert, and Rigault, 1977) revealed that the attribution of gender was based—at a rate of 85 percent—on formal (and more precisely phonological) criteria. In such cases, it is the last phoneme of a noun that confers its grammatical gender (limited to two possibilities: masculine/feminine). If such correlations are indisputable, it remains nonetheless the case that they involve empirical rules, valid only 85 percent of the time, resulting more from

statistical findings than from genuine analysis (as is the case in German), which would alone allow for an understanding of how children who do not know where the end of a word is located determine the gender of nouns with great assurance. On the other hand, one understands quite easily the allures of this kind of result for linguists. It appears to be a confirmation of the thesis according to which languages are purely formal systems, and a weapon to be used against those who object, incorrectly to all appearances, that languages are not constructed rationally. Science analyzes that objection as the effect of a narcissistic wound (language, because it is a purely formal system, pays no heed to sexual difference, however important it be for the species), like those produced by the Copernican revolution, the theory of evolution, and psychoanalysis.

That being the case, the question raised at the outset (of how an individual expressing himself in French manages not to ascribe the feminine grammatical gender to the English word "soul" and thereby a feminine nature to what it designates) remains no less valid. It is indeed possible that grammatical gender is determined by formal considerations; nonetheless, once it is constructed it produces effects. How would one not infer, if only unconsciously, that what the English word "mind" designates is masculine in nature, since it is translated into French by a masculine word? One might also pose the question as follows: what conceptions of "soul" and "mind" are entertained by the Anglophone speaker? Does he perceive in the word "soul" the traditionally feminine characteristics that a Francophone speaker, albeit in spite of himself, senses in it? How can one translate from one language to another without taking into account the quasi-silent connotations induced by the existence or absence of grammatical gender?

however, that *Geschlecht* means simultaneously "sex" and "gender," German has been obliged to provide a double for *Geschlecht,* thus resorting to *Gender.* Swedish proceeds similarly with *Kön* and *Genus,* invoking the Latin word, as has long been the case in German, to serve as a concept. The question, then, is no longer one of translating "gender," which has become a transnational word, but of not being able to translate correctly into English *différence des sexes* or *Geschlechterdifferenz.* "Sexual difference" (in

English) implies reference to characteristics, qualities, and definitions of difference that go considerably beyond a conceptual use preceding any position regarding content.

■ See Box 2.

To this may be added, outside of any considerations related to research, the importance given to the use of "gender," notably during the Fourth World Conference on

2

"Sex" and "sexual difference"

An account of the way that "sex" is woven into the philosophical vocabularies of Europe needs to be more than an account of the theoretical and terminological innovations of the late twentieth and early twenty-first centuries. It needs to include what Fraisse calls the "extremely concrete" as well as the "extremely abstract" meanings of the word, not least because they may not be separable. In the routine employment of the concept of "sex" in the vernacular European philosophies, from the seventeenth century onward, we should note one initial peculiarity: even where the words are as linguistically incongruent as the English "sex" and the German *Geschlecht*, when the context is unambiguous the presumption in translation is that they refer to the same thing, precisely because that "thing" was *itself* taken for granted as a natural fact; neither the object of a philosophical analysis nor the site of a philosophical problem. When Kant compares "the fair sex," *das schöne Geschlecht*, with *das männliche Geschlecht*, (*Observations on the Feeling of the Beautiful and Sublime*), the apparent transparency of the presumption of the natural fact of sex difference (the distinction between male and female) is the abstract equivalent that facilitates the linguistic exchange between the particulars "sex" and *Geschlecht*, no questions asked.

However, Fraisse claims that the apparent equivalence between "sex" and *sexe* is false, for within the French *sexe* there is a distinction between sexual difference/*différence sexuelle* and *la différence des sexes,* where the former refers concretely—contentfully— to the "material reality of the human condition," the empirical domain of the biological and the physical, and the latter—a philosopheme—to an abstract conceptual division. The "realism" of the English "sex," it is said, refers only to the former. The sex/gender distinction is then the answer to the felt need for the distinction between sexual difference/ *différence sexuelle* and *la différence des sexes,* but in opposing cultural "gender" to natural "sex" the difficulty in thinking sex in English as *la différence des sexes* remains. In fact the English phrase "sexual difference," as opposed to balder talk of "sex," only began to appear in Anglophone feminist theory as a mark of the reception of the psychoanalytically influenced and literary feminist theory from France (notably that of Kristeva, Irigaray, and Cixous) that was often mistakenly identified as "French feminist theory" tout court. This terminological innovation in English was not always a result of critical reflection on the conceptual distinction between "sex" and "sexual difference"; as such it continues to sow

confusion. From this point of view the English "sex" is a plain and stodgy pudding, the just desert, perhaps, of an empiricist philosophical tradition. As empirical datum, sex is outside the philosophical arena, or it is an only illegitimate interloper there, as Kant's sexism seems to show. But this, in effect, protects "sex" from any critical, philosophical scrutiny by virtue of its naïve everydayness, or forecloses the possibility of an investigation into that everydayness itself. It presumes that the discrete biological meaning of the English "sex" makes it a word that is in itself politically and ideologically innocent, and that sex only loses this innocence in the uses to which it is put.

But "sex" is much more complicated than this, and part of its complexity is precisely its guise of simplicity. While apparently referring to a value-neutral, merely biological natural division in kind, it always in fact means more than this. The recognition that this semantic peculiarity is also a political problem is at the heart of Beauvoir's *The Second Sex*. In the first chapter Beauvoir attempted to disaggregate the existential concepts of man and woman from the biological, or better zoological, concepts of male and female, arguing that the latter—the terms of sex difference or sex in the English sense—were inadequate foundations for the explanation of the specificity of the latter. But she did so in the context of the recognition that this is indeed—even in French—how the terms of sex tend to function. Her attempt to determine the meaning of sex existentially was pitched against the assumption—common to both popular discourses and philosophy—that biological sex determines what it is to be a woman. This presumption is fully part of the meaning of sex (or *sexe*, or *Geschlecht*).

"Sex" is not so much the fact of the exclusive division of the human species into male and female as the *presumption* of this fact and, importantly, the presumption of the *efficacy* of this fact. That is, the popular concept of "sex"—casually employed by most modern European philosophers at one time or another (consider, for example, Rousseau's remark in *A Discourse on the Origin of Inequality*, "Aimables et vertueuses citoyennes, le sort de votre sexe sera toujours de gouverner le nôtre," or Locke in *Some Thoughts Concerning Education*, "The principal aim of my Discourse is, how a young Gentleman should be brought up from his Infancy . . . where the difference of Sex requires different treatment, 'twill be no hard matter to distinguish")—is constituted by the presumption that there just is a naturally determined sex duality (the exclusive division into male and female) and that this duality is also naturally determining.

It is becoming increasingly obvious that this presumed exclusive duality is empirically inadequate to the observable phenomena. Thus, for some, the very fact of sex difference is put in doubt. But this only reveals the persistence of the presumption relatively independently of the facts—whatever they may be—allowing us to see, according to both Christine Delphy and Monique Wittig, that "sex" is a *political* term that mandates a hierarchical social division.

For Fraisse, the range of meanings of "sex" ("from the extremely concrete to the extremely abstract") belies its apparently transnational character. But to the extent that "sex" refers to more than an innocent empirical datum it *is* a "transnational" term because it carries a transnational presumption. Now, "transnational" does not mean "transhistorical." But the transnational assumption of sex quickly leads us to presume, further, that it does—to presume that the modern concept of sex has always been with us. To take just one example, English translators and commentators, feminist and otherwise, have tended to assume that the (very broadly speaking) modern concept of sex is central to the discussion, in Plato's *Republic*, of whether females can or should be part of the ruling Guardian class. The translation of Plato's *genos* as "sex" is simultaneously both the symptom and the cause of this presumption: "Then if men or women as a sex [*to tōn andrōn kai to tōn gunaikōn genos*] appear to be qualified for different skills or occupations," I said, "we shall assign these to each accordingly; but if the only difference apparent between them is that the female bears [*to men thēlu tiktein*] and the male begets [*to de arren ocheuein*] we shall not admit that this is a difference relevant for our purpose, but shall maintain that our male and female Guardians [*tous te phulakas hēmin kai tas gunaikas*] ought to follow the same occupations" (454d–e). The word *genos*, which is sometimes translated as sex, means, primarily, race or stock or kin, and also offspring, tribe, generation, and kind. To the extent that "sex" is a general term, naming a specific kind of difference, a specific feature of both male and female or the principle of division between them, there is nothing like an equivalent term in classical Greek. Each time *genos* is used in the *Republic* in relation to men or women or male or female it is attached to one or the other in order to specify men or women or male or female as a class in distinction from this or that man or woman or male or female animal. There is no singular term like "sex" to refer to a distinction in kind between men and women or male and female. Indeed the very broad generality of the

concept of a *genos*, which may refer indifferently to any content (the *genos* of this, that, or the other—it does not matter), is most unlike the very narrow specificity of the concept of sex, which is identical with its limited content, designating what kind of categories "male" and "female" are. The considerable grammatical and semantic differences between the two terms *genos* and "sex" mean, therefore, that the translation of the former as the latter effects a conceptual transformation. The very basis of Socrates's argument concerning the possibility of female Guardians is the refusal to privilege any kind of difference, the distinction between any groups of *genē*—kinds of kinds—except that between Guardian, auxiliary and producer themselves. In translating *genos* as "sex" we introduce a special kind of kind, an emphasis on a special kind of difference, which is merely one difference among others in the text of the *Republic* itself. "Sex" cannot, strictly speaking, be translated backward into classical Greek. The fact that "sex" is nevertheless a standard translation

for *genos* in book 5 of the *Republic* is a symptom of the common presumption that underlies its translatability in modern thought.

Can sex, in this sense, be contained behind a semantic *cordon sanitaire*, separated off from associated words? If, as Fraisse says, the French *sexe* includes the meanings of both sexual difference/*différence sexuelle* (i.e., the English "sex") and *la différence des sexes*, can the philosopheme float freely in the refined air of extreme abstraction? No. To think *la différence des sexes* is to think its relation to, and not merely its distinction from, "sex."

Women (1995), which took place in Beijing under the aegis of the United Nations, and which allowed the internationally consecrated expression "women's rights" to be replaced by the notion of "gender." In Africa currently, including French-speaking countries, "gender and development" is a theme of discussion. The linguistic shift has thus occurred from "woman" to "gender" (and no longer only from "sex" to "gender"). The recourse to "gender" allows the noun "woman" to no longer serve as a general category in characterizing research and efforts on the subject or as a way to define a commitment. In French-speaking Africa, the term is offensive to the extent that it also means that the "woman" question is a relation between the sexes, men and women, as much as a demand for equality. Europe is also, as such, a laboratory. The use of "gender" has been generalized but not in a uniform way. The English word has been superimposed in phrases specific to each language as well as in the expressions "gender equality" (a synonym for "equality of the sexes") and "gender perspective" (translated in French as *dimension de genre*). "Gender" in English thus subsists within other languages, which is paradoxical, given the European desire for exhaustive translation. Yet "gender" persists in designating a social (as opposed to biological) dimension. Thus discrimination against a pregnant woman would not be categorized as "gender discrimination," but rather as "sexual discrimination." The words "man" and "woman" would be used to designate the "sex."

IV. Epistemology and Historicity

Feminist inquiry has become sharper with the refinement of its vocabulary. The first step was breaking with the dominant tradition subsumed in the aphorism Freud borrowed from Napoleon ("Anatomy is destiny"), and showing what it is, in the

relation between the sexes, that distinguishes the "natural" biological fact from the "cultural" social construction. In a second phase, it became possible to dissociate the two realities completely and to affirm that gender no longer had anything to do with sex, that each of them was produced and not given, and that maintaining the link, however contradictory it might be, between the two, was a residue of prejudicial essentialism. The objective was to liberate individual and collective identities from all norms. But if "sex" entailed a reference to "sexuality," could "gender" encompass the dimension of sexual life? Some would claim that "gender" conjures away the provocation entailed by the fact that sex is still present, while others, on the contrary, would see in it the basis for a possible liberation. Doing away with the word "sex" is not, to be sure, a trivial matter.

The fact is that the hierarchical distinction between "sex" and "gender" is more similar to the link between fact and concept than to the dualism opposing nature and culture. The political problem is thus compounded by an epistemological problem: is the heuristic scheme between two contradictory terms pitted against each other still pertinent? Is not the critique that makes use of that schema held hostage to it to the extent that it validates it? The opposition between nature and culture is a conceptual framework specific to the modern era: does compounding it with a tension between reality and concept change anything? Should not thinking nourished by feminist inquiry and action invent a new framework, a new problematic for the question of the difference of the sexes? Should we not respond differently to the opposition between the biological and the social (and to that between "sex" confronting "gender" as much as "gender" confronting "sex") than through a dualism, however roughed up it might be? The difficulty of the debate over sex and gender is a function of the fact that it remains imprisoned in a problematic of identity:

the quest for (or the critique of) identity appears to be the fundamental question. Yet a different question might modify the perspective—that of otherness. For in excessively debating the identity of sexuated beings too little is said of their relation, of the relation to the other and to others. Yet that relation—the sexual relation, social relations, relations of domination or emancipation—is historical. The historicity of the difference of the sexes might serve as a guiding thread—historicity construed as a critique of atemporal representations of the sexes as well as a situating of the sexes in the factory of history.

In conclusion, we return to the distinction between "sexual difference" and French *différence des sexes*, those two formulations enjoyed by the French language and with which philosophy has not refrained from playing. With the expression "sexual difference," the duality of the sexes is endowed with a content, multiple—but always distinct—representations of the masculine and the feminine. With *différence des sexes*, the duality entails neither affirmation of meaning nor proposition of value: it is an empty determination. Therein lies its essential value.

SHAME

Shame is one of the accepted translations for the Spanish *vergüenza*, a moral and social feeling related to the look of the other, and that corresponds to some extent to the Greek *aidôs* [αἰδώς]: see VERGÜENZA. Cf. SPREZZATURA.

More generally, on moral philosophy in general, see MORALS, and DUTY, *HAPPINESS* [GLÜCK], *VALUE, VIRTUE* [PHRONÊSIS, VIRTÙ].

On the relationship to the fear inspired by God or the gods, see in particular *ALLIANCE* [BERÎT], RELIGIO, PIETAS, SECULARIZATION, THEMIS; cf. *DROIT*, LAW.

On the relationship to decency and to sex, see GENDER, PLEASURE, SEX.

SIGN, SYMBOL

➤ ANALOGY, COMPARISON, *IMAGE*, IMPLICATION, LOGOS, MERKMAL, MIMÊSIS, NONSENSE, SEMIOTICS, SENSE, SIGNIFIER/SIGNIFIED, SPEECH ACT, TERM, UNIVERSALS, WORD

"Sign," as a being or thing, encompasses a great diversity of fields. If, in an Augustinian perspective, every sign is first of all a thing, a thing is not necessarily a sign, even if it can always, to an extent, become one (*De doctrina Christiana*, 1.2.2); thus, for example, for Christians the events recorded in the Old Testament, *res gestae*, are "signs" of the New Testament (*De doctrina Christiana*, 3.22–23). Sign thus partakes of an elaborate setup, which inscribes it as part of a network with realities that, in a way, proceed from it. Signification, variously interpreted. Grounded or motivated in the course of history. The delimiting of the respective fields of "sign" and "symbol" is one of the most problematic of the networks deployed in various languages, from the inaugural distinction of *semeion* [σημεῖον] and *symbolon* [σύμβολον] in Greek to the German formation *Sinnbild* (literally, meaning [*Sinn*]-image[*Bild*], in which *Sinn* betrays in addition a sensory dimension), used, for example, by E. Cassirer to designate the "symbol" as what ensures the transition from image to meaning. Such diverse networks, however, can be identified only by detecting certain mutations from the Latin, and even neo-Latin, *signum*, which allows the "sign" to communicate with the "term," in accordance, for example, with the "categoreme" vs. "syncategoreme" axis, and have the word *signum* designate—at a certain stage of the development of medieval logic—what are today called "quantifiers." From the medieval "sign [of quality]" to the modern "quantifiable symbol," there are transitions, but they count less than delineating the sets that they link. In what follows, we will present the essential, starting with the Aristotelian send-off, joining up, by way of the Stoic moment and the distortion it induced, with the major oppositions constructed in the Middle Ages around several polarities, whether regarding sources—Aristotle vs. Augustine—or the conceptual structures they convey or propose to recast in their entirety, such as the distinction between natural signs and conventional signs, and, more discretely, and affecting the "sign" itself, that between "sign of" and "sign for," in which the intersubjective dimension of the sign is explicitly thematized.

I. Greek Vocabulary of the Sign: Several Problematic Nodes

A. *Sêma* and *sumbolon*

Homer and Hesiod do not use *semeion*, but two words, *sêma* [σῆμα] and *sumbolon* [σύμβολον], which can also be translated by "sign," but whose concrete meaning and social usage are quite pronounced.

Sêma, from which would develop *semeion* [σημεῖον], to "signify or mean" (see SENSE), says sign in the sense of "signal" (to begin a battle, *Odyssey*, 21.231; as a presage sent by the gods, 20.3, for instance), as a "landmark" (sign on a trail allowing one to rediscover one's way, *Iliad*, 10.466; points of demarcation, *Odyssey*, 8.192), and more generally, a "sign of recognition" guaranteeing the trustworthiness of an identity or a message (such as the mark made by each warrior on

lots to be drawn [*Iliad*, 7.189], what is conveyed by Bellerophon's tablet—first traces of writing [6.176ff.] and above all the secret, shared by husband and wife alone, of the conjugal bed carved from an olive tree whose roots were still in the ground [*Odyssey*, 23.202]). It is eminently the sign by which one recognizes a grave: the "tomb" (*Odyssey*, 2 or 11.75) and such is the meaning with the pun on *soma* [σῶμα]/*sêma,* "body/tomb," which can be found from Orpheus (B3 DK) to Philolaos (B14 DK). It was undoubtedly in Parmenides's *Poem* that the relation between signal and signification made its appearance, at the time of the constitution of the identity of the existent, with the description of the *semata* [σήματα] (8.2) which, "landmarks" on the road to the verb "to be," are nothing other than the predicates of the beings to be found within it, semantemes as much as semes (unengendered, imperishable, whole, one, continuous, etc.) (see ESTI). *Sêma* refers us to something other than itself, which it signals in a more or less constant or natural manner, thus leaving room for interpretation.

Sumbolon, from *sum-ballo* [συμ-βάλλω], "to throw together" (in which it is "together" that is to be emphasized), has a far more precise meaning. It too is a "sign of recognition," but it originally designated quite materially the parts of an astragal or of any other object divided in two and whose readjustment would bear witness to an old relation between guests (Euripides, *Medea*, 613), between an exposed child and his parents (Euripides, *Ion*, 1386), then between all sorts of parties to a contract. *Sumbolon* will also be used for a token (tesserae of a citizen who votes and receives remuneration, seats at the theater), a passport, a receipt, a guarantee, a contract, or a treaty. The relation between the whole and the material parts of a *sumbolon* is thus the visible sign of a convention between parties to a contract.

B. *Semeion*

1. The Aristotelian send-off

There are, in the corpus of Greek philosophy, two nodes of problems concerning the notion of the sign and the relation of signification, a circumstance that accounts for the variation in translations of terminology as well as the incompatibility between definitions subsequently.

The first pertains to the meaning to be given to the first sentences of chapter 1 of Aristotle's *De interpretatione,* a canonical text that structures for the entire tradition the relation between language (both written and spoken), affections of the soul, and things, and entails in particular that the status of the variation *semeion/sumbolon* be determined. The second relates to the incompatibility of the terminology introduced by the Stoics, whose highly elaborate theory of the sign is from the time of the very first commentaries a source of unending contamination for that of Aristotle, opening, to all appearances, onto concepts of a more immediate modernity (*semeion*, "sign," but also *semainon* [σημαίνον], "signifier," *semainomenon* [σημαινόμενον], "signified," *lekton* [λεκτόν], "expressible," *tugchanon* [τυγχάνον], "referent") (see SIGNIFIER/ SIGNIFIED, II).

■ See Box 1.

A characteristic of the *semeion* should be noted: the "variable geometry" of its nature. A *semeion* is as much an empirically observable thing, a "symptom" of an illness in an investigation, as a premise, apt to appear in a demonstration. In both cases, the *semeion* allows one to move to (or to deduce), with more or less certainty, something (a phenomenon or a proposition) other than itself.

We can thus understand the definition of the *semeion* in the *Prior Analytics*, 2.27: "A sign means a demonstrative proposition necessary or generally approved: for anything such that when it is another thing is, or when it has come into being the other has come into being before or after, is a sign of the other's being or having come into being," (trans. A. J. Jenkinson), in relation to the rhetorical difference that is probable (*semeion*)/demonstrative (*tekmerion* [τεκμήριον]), and the use of *semeion* ("here is an index of it") in the remainder of chapter 1 of *De interpretatione* (in 16a, 16). This is a corroboration of the possible (but not necessary) "naturalness" of the *semeion.*

This is particularly clear in Stoicism, linked to the transformation of the "subject" of signification, which is no longer the word, as in Aristotle, but only the complete *logos* (see WORD). Milk as a "sign" of giving birth is thus simultaneously the nourishing liquid present in the mother's breast (one of Aristotle's examples) and the proposition: "that woman has milk" is the premise of the valid conclusion in the *sunêmmenon* [συνημμένον]: "that woman gave birth" (which is the adaptation of the Aristotelian example by Sextus).

2. The Stoic definition of the *semeion* and the taxonomy of signs according to the "demonstrability" of the object

The sign may be said in two manners (*legetai dichôs* [λέγεται διχῶς]), in the general and the specific sense (*koinôs te kai idiôs* [κοινῶς τε καὶ ἰδίως]); in the general sense: this is what seems to show something (*ti dêloun* [τι δηλοῦν]), to the extent that we are accustomed to name a sign what serves to renew the object that has been observed in conjunction with it (*pros ananeôsin tou sumparatêrêthentos autôi pragmatos* [πρὸς ἀνανέωσιν τοῦ συμπαρατηρηθέντος αὐτῷ πράγματος]); in the specific sense: it is what is indicative (*endeiktikon* [ἐνδεικτικόν] of an object that is not apparent ("unshown," *tou adêloumenou pragmatos* [τοῦ ἀδηλουμένου πράγματος]).

(Sextus Empiricus, *Adversus mathematicos*, 8, chap. [*pros Logikou*, 143–44])

From this definition flows the fundamental distinction between two kinds of signs, which structures the Skeptics' presentation and critique of dogmatic Stoic semiology, as proposed in chapter 3 of book 8 of *Adversos mathematicos.* We shall leave aside things that are manifest (*enargê* [ἐναργῆ]), which are in need of no more than their own evidence, and thus do not partake of the realm of signs. There can be signs only of things that are not apparent (*adêla* [ἄδηλα]), on the condition, however, that they not be "absolutely not evident" (*kathapax adêla* [καθάπαξ ἄδηλα], for instance, the number of grains of sand in the Libyan desert) since in that case they escape by definition all apprehension whatsoever. There will thus be a sign of things that are "occasionally not evident" (*pros kairon adêla* [πρὸς καιρὸν ἄδηλα], such as Athens when I am in Libya), or rather "naturally not evident" (*phusêi adêla* [φύσει ἄδηλα],

1

Sign/symbol/image

The major options in translating *De interpretatione*, 1.16a 3–8

Ἔστι μὲν οὖν τὰ ἐν τῇ φωνῇ τῶν ἐν τῇ ψυχῇ παθημάτων σύμβολα, καὶ τὰ γραφόμενα τῶν ἐν τῇ φωνῇ. Καὶ ὥσπερ οὐδὲ γράμματα πᾶσι τὰ αὐτά, οὐδὲ φωναὶ αἱ αὐταί· ὧν μέντοι ταῦτα σημεῖα πρώτων [πρώτων: Minio-Paluello, generally followed / πρώτως: all manuscripts expect one; Ammonius], ταὐτὰ πᾶσι παθήματα τῆς ψυχῆς, καὶ ὧν ταῦτα ὁμοιώματα πράγματα ἤδη ταὐτά (Aristotle, *De interpretatione,* 16a 3–8).

Translations have had to administer two series of differences: that between *ta en têi phônêi* (literally, what there is in the voice), *ta graphomena* (what is written), on the one hand, and *phônai* (the sounds of the voice), *grammata* (letters), on the other hand; that, above all, between *sumbolon* (symbol), *semeion* (sign), *homoiôma* (image, representation). Two major interpretive options can be distinguished, depending on the thrust of *prôton* or *prôtôs*. According to the first option, shared with virtual unanimity by Greek, Latin, Arabic, and modern translators and commentators, written and spoken words are signs "in the first instance" (*hôn, prôtôn,* or *prôtôs*) of affections of the soul, and, in the second instance, of the things themselves that those affections represent. Tricot follows the English translator Ackrill, in adopting the first option:

Sounds emitted by the voice are symbols of states of the soul, and written words the symbols of words emitted by the voice. And just as writing is not the same for all men, neither are spoken words the same, even though the moods of which those expressions are the immediate signs (*hôn . . . prôtôn*. Ackrill maintains the reading but instead translates the adverb *prôtôs*: "but what these are in the first place signs of—affections of the soul" - identical for all, regardless of editorial choices) as are identical the things of which those moods are the images.

Words are the direct signs of affects and the indirect signs, precisely via those affects, of things. The significant difference, as Ammonius emphasizes, occurs between, on the one hand, things and affects, which are the same for all since they are linked by a natural relation of resemblance that we are unable to change, and, on the other hand, sounds and letters, which are not the same for all, as is proven by the difference between languages, and which are linked to each other,

as with affects and things, by a conventional relation of signification. From which it follows that there can be no fundamental difference between *semeion* and *sumbolon* (vocal sounds, says Ammonius in 1934, are *sumbola kai sêmeia*, "symbols and [or: that is] signs" of thoughts): one can understand that tradition would follow Boethius into the abyss in his proposal to translate each case as *notae*, and that Pierre Aubenque, would deplore the lack of rigor in Aristotle's terminology (*Le problème de l'être chez Aristote*).

The second option, quite recently elaborated, even though it draws on certain commentaries of Ammonius and Boethius (see Kretzmann and Pépin) understands that one is dealing in these sentences with two interlocking or nesting descriptions of language: sounds of the human—but also animal—voice (*tauta*, 6) are first of all natural signs (the adverb *prôtôs* modifies *sêmeia*) of affections of the soul and only subsequently, in the case of articulated speech specific to humans and thus in the context of differences between languages, become conventional symbols (*sumbola*) of those affections, just as letters are conventional symbols of articulated sounds. The translation then becomes something like:

But it should be known that sounds emitted by the voice are symbols, affections that are in the soul, and the traces of them that are written are symbols of the sounds emitted by the voice. And just as written letters are not the same for all men, emanations of voice are not the same either; on the other hand, what those sounds emitted by the voice are first of all signs of, that is, affections of the soul, are the same for all, just as the things those affections resemble are the same.

This second option presents the obvious interest of working the terminological differences rather than crushing them.

Whatever, however, the version retained, the overall movement from *logos* to soul, and from soul to things, remains, in all cases, unchanging and paradigmatic: *De interpretatione* deploys in its very first lines the classic structure informing phenomenology and remains a founding document of language:

things	phenomeno
soul	---
words	logy

The soul's mediation effects the transition from things to words; phenomenology appears clearly as a question of transitivity:

the phenomenon reveals itself in language, allows itself to be spoken and written, on two conditions: that it "pass" into the soul, and that the soul "pass" into the *logos*.

It is true that this dual condition also constitutes a dual problem: is it certain that the mediation of the soul does not partially conceal things, and that in turn that of the *logos* does not in some way skew the affections of the soul? In order to render the "phenomenological method" of his investigation perceptible, Heidegger, in paragraph 7 of *Sein und Zeit*, proposes an exploration of the concept of phenomenon, then of the concept of *logos,* resulting in a "provisional concept of phenomenology" such that the reader is gradually stripped of his classical prejudices and arrives at a more Hellenic and Aristotelian understanding of the term. But such a guiding thread can also be followed in reverse (see TRUTH, SENSE); one is obliged to admit that this phenomenological structure is, always already and already in Aristotle, covered over and layered in the constitution of objectivity. In other words, transitivity is ultimately guaranteed only by making of showing a sign, of *logos* a judgment, of unveiling an adequation, and of the phenomenon an object. Might a Greek phenomenology, however much the paradigm of phenomenology, be undiscoverable?

for example, the idea of intelligible pores or an infinite void outside the cosmos).

In the first case, the sign is "commemorative," *hupomnêstikon* [ὑπομνηστικόν], since it merely links two perceived items whose connection (*sumparatêrêsis* [συμπαρατήρησις]) has already been frequently observed, and one of which, that is then recalled, is temporarily absent, according, moreover, to any temporal modality whatsoever: a scar, sign of the past, recalls a wound; smoke, sign of the present, evokes fire; a blow to the heart, sign of the future, announces death. It will be understood that the study of signs can concern simultaneously what we call a sign, the thing that serves as a sign (smoke in relation to fire), and the *sunêmmenon*, the reasoning in the form of "if . . . then," characteristic of Stoic logic ("if there is smoke, there is fire"; see IMPLICATION). In the second case, the sign is said to be "indicative," *endeiktikon*: it contains in itself the entire demonstration since what is signified is by its nature not observable in itself, so that "it is directly on the basis of its specific nature and constitution, almost by emitting a vocal sound (*monon ouchi phônên aphien* [μόνον οὐχὶ φωνὴν ἀφιέν]). That it is said to signify what it is indicative of." Thus the movements of the body are signs indicative of the existence of the soul, which by its nature is not available to the senses. One part of Sextus's anti-dogmatic effort consisted in radically separating the two kinds of signs, maintaining the commemorative sign whose dependability we experience and live every day, but dismissing the pretentions of the indicative sign, by exposing the aporia of its concept. In so doing, the Skeptic first revealed the Stoic systematic, and transmitted a corpus of examples or cases that would continue to be commented on and developed by an Aristotelian semantics against which they were, nonetheless, elaborated.

3. The Aristotle/Stoic distortion and its reading by Heidegger

Heidegger's judgment here is interesting in more than one respect. (1) It establishes two eras of the sign: Aristotle, during the great age of the Greeks, understood the *Zeichen* as a *Zeigen*: as a self-display and a license to appear against a backdrop of *alêtheia* [ἀλήθεια]. The Stoics understood the sign as a designation (*Bezeichen*) according to a structure of reference. On one hand, phenomenology; on the other, linguistics. (2) In *De interpretatione, sumbola, sêmeia*, and *homoiômata* are to be—provisionally, but essentially—considered as synonyms since they are first of all three modes of self-revelation, saying how the phenomenon "unshelters itself" in the soul, the soul in the voice, and the voice in letters.

But that strong interpretation should no doubt be resisted. In point of fact, the difference between *dêloun,* "showing," and *sêmainenen,* "signifying," as thematized by Aristotle, already implies a mutation in the notion of the sign: "Nothing is by nature a word, but only when it becomes a symbol (*sumbolon*); in point of fact, unarticulated sounds (*agrammatoi psophoi* [ἀγράμματοι ψόφοι], which are not written) like those of beasts, do indeed show something (*dêlousi ge ti* [δηλοῦσί γέ τι]), "but not one is a word" (*De interpretatione*, 16a 16–19). One moves with Aristotle from *sêmainein* [σημαίνειν], an action verb with ontological transitivity (Heraclitus, B93: the Delphic oracle "neither says nor conceals, but makes a sign [*oute legei oute kruptei alla sêmainei* (οὔτε λέγει οὔτε κρύπτει ἀλλὰ

σημαίνει)]"), to *sêmainein* having as its subject a word: "the word signifies the fact of being or not being that (*to einai ê mê einai todi* [τὸ εἶναι ἢ μὴ εἶναι τοδί]") (*Metaphysics*, 4.1006a 28–30). To the extent that signification is a natural indicator referring to the impressions of the soul, it cannot distinguish man from animal (*Politics*, 1.1253q 1–18). But it can do so as soon as it is *kata sunthêkên* [κατὰ συνθήκην], by convention, constituted as a human *logos*. At that point, it is no longer man, but the word "man," which means something, namely, the *logos* [λόγος] that makes it explicit, provides its definition (cf. Cassin, *La décision du sens*).

It will be seen how it all holds together—the *semeion/sumbolon* difference, the *dêloun/sêmainein* difference, the transition to words as the subjects of meaning: the "linguistic" is there in Aristotle as much as in the Stoics. It is thus not so much in the phenomenological opening or closure that the difference between Aristotle and the Stoics will be situated as in the very definition of what is a phenomenon and of what it is that means. On the one hand, with Aristotle, the analysis, oriented by the substance-subject (see SUBJECT, I), into word-units (*onomata* [ὄνοματα]) bearing meaning and combination via the "with" (the *sun* [σύν] of syntax and syllogism); on the other, with the Stoics, analysis into units of action rather than substances, into complete statements rather than into words, and into hypothetical arguments rather than syllogisms (the *sun* of the *sunêmmenon*, which links an "if" with a "then"): it is no longer the *onoma* but the *logos* that constitutes the signifying unit. Two types of phenomena and two types of linguistics, but one is no less linguistic than the other. Once again, the *sêmeinon* is variable in its geometry.

II. *Signum* and the Intersubjective Dimension

A. Greek tradition and Roman innovation

Beyond its assumption of the *semeion/sumbolon* doublet and its numerous versions up to Boethius's translation of *De interpretatione*, Roman civilization loaded the *signum* with semantic charges that were at times directly adapted from Greek and at others more adjusted to the resources of Latin. Among the numerous meanings of *signum* that interfere, in classical Latin tradition, with the logico-linguistic uses in the broader field of the "semiotic," to the point of recurring as examples of "signs" in medieval typologies more or less directly inspired by Augustine (see Roger Bacon on this point), one finds those of the "insignia" and the (painted or sculpted) "image." *Signa*, in point of fact, designates the insignia "that distinguish the divisions of an army" (whence *signifer*, found in the medieval astrological notion of "sign-bearing heavens," prolonging the equivalence of *signa* and *sidera*, typical of Roman civilization, attested to by [among other sources] Varron's *De lingua Latina*, 7.14: "Signa dicuntur eadem et sidera. Signa* quod aliquid significant" [stars are also called signs—*signs* because they signify something]). That specifically military sense presides—at the limits of "miracle," "presage," and annunciatory sign— over the presentation of the Cross as a "sign" in the story of Emperor Constantine ("in hoc signo vinces"). But we also find *signum* at the heart of *sigillum* (small image or

statuette; seal, signature), in a register in which properties of different rank are combined, going from the material level of branding (the "mark" imposed on the herd as a sign of possession—*pecora signis notare*) to the ideal level of iterability (the *sigillum* and the operation it authorizes, the *sigillatio*, representing par excellence the iterability of the sign). It is not by chance that "sigillation" (no doubt borrowed from *Timaeus*, 50c–d, extends through an Aristotelian casting of Plato's doctrines, in *Metaphysics*, 1.6.987b–988a, in which the term *ekmageion* [ἐκμαγεῖον] has gone directly into Latin in the form of *etymagium, echmagium*) plays, in Ammonius, the role of a paradigm or explanatory model of the production of the various types of "forms," implied by the theory of "universals":

> Imagine a ring, with an imprint (*tis ektupôma* [τις ἐκτύπωμα]) [representing], for example, Achilles, along with numerous slabs of wax; suppose that the ring imprints its seal on the slabs of wax; suppose now that someone comes along later and looks at the slabs of wax, observing that all [the imprints] come from a single seal; he will have the imprint in himself, that is, in his discursive faculty [ἐχέτω παρ' αὐτῷ τὸν τύπον ὅ ἐστι τὸ ἐκτύπωμα ἐν τῇ διανοίᾳ]; it can thus be said that the seal on the ring is "prior to the multiples" [ἡ τοίνυν σφραγὶς ἡ ἐν τῷ δακτυλιδίῳ λέγεται πρὸ τῶν πολλῶν εἶναι]; that the imprint in the slabs of wax is "in the multiples" [ἡ δὲ ἐν τοῖς κηρίοις ἐν τοῖς πολλοῖς], whereas the one that is in the discursive faculty of the person who has imprinted is "posterior to the multiples" and "posterior in the order of being" [ἡ δὲ ἐν τῇ διανοίᾳ τοῦ ἀπομαξαμένου ἐπὶ τοῖς πολλοῖς καὶ ὑστερογενής]. Well, such is what must be understood in the case of types and species.

(Ammonius, *In Porphyrium Isagoge*; see UNIVERSALS)

Everything in this complex is taken up somewhat helter skelter in medieval tradition, meshing with deep associative networks serving as vehicles for Aristotelico-Boethian semantics. It is those networks that need to be analyzed in order to gauge the phenomena induced by the polysemous nature—including in its (theological, medical, astrological) transdisciplinary aspects—of the Greco-Latin doublet *semeion/signum*, in the languages of philosophy.

B. The stakes of the *signum* in medieval tradition

The stakes entailed by the introduction of the term *signum* were considerable since it was a matter, under Augustine's influence, of introducing the intersubjective dimension of the relation to the other, whereas the Aristotelian tradition was interested above all in the relation between words, things, and thoughts, as was well expressed by the word *nota*, "mark," used by Boethius in his translation of Aristotle (as well as his commentary on his thought), *De interpretatione* 1.16a.3–8.

Signum, in medieval semantics, has three fields of meaning. First, it retains the old sense of "proposition" playing a specific role in an argument. In its second (and most common) sense of "sign," it should be related with the word *nota*. The third sense is that of "logical sign."

A contamination between the Augustinian tradition of *signum*, which was dominant in theological texts, specifically in sacramental theology, and the peripatetic tradition of the *nota* can be observed on several occasions, notably in Albertus Magnus. Taking up various developments pursued in the context of sacramental theology, Roger Bacon attempted an integration of the two traditions, resulting in a general semiological system, unified by the notion of *signum*, attempting to integrate all types of signs, linguistic and non-linguistic, inferential and iconic, conventional and natural, and adding to the array of reflections on the relation to the signified, derived from Aristotle, others on the relation to the speaker/interpreter, inspired by Augustine.

1. *Signum* and inference

The first meaning of *signum* has no linguistic connotations and refers to the grounds of an inference. In such cases the medieval reference is first of all to Aristotle's *Prior Analytics* (2.27), then to the first book of his *Rhetoric*. Peter of Spain thus defines the *signum* as *propositio inferens*, that is, as the antecedent of a conditional. The *signum* thus serves as a necessary inference between the antecedent and its consequence, as opposed to the plausible or *ycos* (from Gr. *eikos* [εἰκός], copied, but not translated, into Latin; see EIDÔLON), which refers to the probable character of the proposition in itself (*Tractatus*, 5.3). Albertus Magnus, in his commentary on the *Prior Analytics*, adapts the classical Augustinian definition of the sign (see infra), and injects into it the idea of inference, which it did not contain: the *signum* is that which, on the basis of the image that it offers to the senses by itself, brings forth something other than itself to knowledge, that is, supplies something else, that can be inferred from it (*Liber priorum analyticorum* 2.7, 8). A *signum* is thus a demonstrative proposition from which one can infer a necessary or probable conclusion (see Marmo, "Bacon, Aristotle (and Others)").

2. *Signum* and *nota*: The translation of *Peri hermeneias*

Boethius, translating the first chapter of Aristotle's *Peri hermeneias*, uses the term *nota*:

> Sunt ergo ea quae sunt in voce earum quae sunt in anima passionum notae et ea quae scribuntur eorum quae sunt in voce. Et quemadmodum nec litterae omnibus eaedem, sic nec voces; quorum autem hae primorum notae, eaedem omnibus passiones animae sunt, et quorum hae similitudines, res etiam eaedem.

(16a 2–7; *Aristoteles Latinus*, 1–2)

There is thus a relation of *nota* simultaneously between vocal expressions (or rather "ea quae sunt in voce," what is in a vocal expression) and *passiones animae* (the marks or impressions that things leave in the mind) and between written expressions and vocal expressions; and a relation of *similitude* between *passiones animae* and things. It will be noticed that at the end of this first chapter, the Latin translation uses the term *signum* in an argumentative sense that is often found in Boethius: a statement can be based on an example or on a fact that constitutes a (supplementary) sign of its acceptability, an "index" (cf. Aristotle, *De interpretatione*, 16a 16, cited supra).

William of Moerbeke restored the original Aristotelian opposition by opposing *symbola* and *signa*, thus leaving aside

the term *nota.* He did so both in his translation of the *Peri hermeneias,* "Sunt quidem igitur que in voce earum que in anima passionum *symbola* et que scribuntur eorum que in voce. Et sicut neque littere omnibus eedem, sic neque voces eedem; quorum tamen hec signa primum, eedem omnibus passiones anime, et quarum hee similitudines, res iam eedem" (Aristotle *Latinus,* 2.1–2), and in that of Ammonius's commentary on that text, which was completed in 1268. Thomas Aquinas would make abundant use of the latter text in his own commentary, but would continue to comment on Boethius's translation, even as he preferred to use the term *signa* (*Expositio Libri Peri hermeneias*), which serves as a gloss for *nota* in its two meanings: "sunt note, id est signa." That gloss, which could already be found in other Parisian authors of the middle of the thirteenth century, such as Nicholas of Paris, was by no means a given.

The opposition between the Augustinian and Aristotelian perspectives is apparent in the commentary proposed by Robert Kilwardby, and adopted by Albertus Magnus, concerning the first chapter of *Peri hermeneias,* with the distinction between *signum* and *nota*:

> Postea queritur propter quia dicitur ea que sunt in voce sunt NOTE et non signa, et hoc ut iuxta hoc pateat differentia inter notam et signum. Et dicendum quod differunt nota et signum, quia nota est in quantum est in ore proferentis, set signum est in quantum est in aure audientis: quod patet per hoc quod signum est quod se offert sensui, aliud derelinquens intellectui. Quia igitur species intelligibilis in anima in quantum significanda est alteri dicitur "passio" in anima eius qui loquitur, melius dicit, sunt note quam signa.

> (It will then be wondered why he said that what is in the expression is a *mark* [*nota*] and not a *sign* [*signum*], and consequently what is the difference between *nota* and *signum.* It will be answered that *nota* and *signum differ*, since *nota* is used for what is in the mouth of the speaker, but *signum* for what is in the ear of the listener: this appears clearly when it is said that the sign is that which is offered to the senses, while depositing something for the intellect [a modified version of the definition of *De doctrina Christiana,* see below]. Since, then, the intelligible species in the soul, insofar as it is to be signified to another, is called "passion" in the soul of the one who speaks, the author was well advised to say that these are *marks* rather than *signs.*)

> (Robert Kilwardby, *Super Peri hermeneias* [ca. 1240], quoted by Rosier, *La parole comme acte*)

The distinction is important: *nota* is situated on the side of the speaker, and takes into account the production of signs based on the intelligible species that it forms in the mind and that constitutes its "marks," which corresponds, according to the author, to the meaning of the passage. Moreover, this is Thomas Aquinas's understanding, when he insists, on the basis of Ammonius and the *Politics,* on the fact that *voces* are made so that man, a "political and social animal," can express to others the knowledge (*notita*) that he has acquired of things. On the other hand, *signum* conveys the reception of the expression by the listener. The introduction of

an intersubjective dimension appears clearly influenced by Augustine, and is explicitly based on his definition of the sign. Whereas *nota* is situated in the series that includes the verbs *notare, connotare,* whence its meaning of "mark," *signum* is placed among terms indicating signification.

Augustine's definitions of the signs were broadly known and commented on in the Middle Ages in chapters devoted to sacramental theology. The best known was certainly that of *Doctrina Christiana* (2.1.1: "signum est res praeter speciem quam ingerit sensibus, aliud aliquid ex se faciens in cogitationem venire" [the sign is a thing which, in addition to the impression that it leaves on the senses, brings forth, therefrom, something more to thought]), which is taken up in the *Sententiae* of the theologian Peter Lombard in the middle of the twelfth century, with the division between *signa data* and *signa naturalia* (*Sententiae,* 4.1.5–6; see infra). If we occasionally find this definition in the thirteenth century, or that of the *De dialectica* (5: "signum est quod et se ipsum sensui et praeter se aliquid animo ostendit" [the sign is that which simultaneously presents itself to the senses and something other than itself to the mind]), cited in various texts, it appears in distorted form, attributed to different authors.

3. "Sign of" and "sign for"

It was with Roger Bacon that the Aristotelian and Augustinian traditions would be articulated in a new manner. Roger Bacon did indeed base his reflections on the thought of theologians such as Richard Fishacre and Bonaventure, even as he incorporated the contributions of commentaries on *Peri hermeneias,* but also examples borrowed from the *Analytics.*

Starting from the definition in *De doctrina Christiana,* the Dominican Richard Fishacre (ca. 1240), followed by Bonaventure, then by Roger Bacon in his astonishing treatise *On Signs* (1268), would introduce the idea that the sign (or more precisely the term "sign") is characterized by a dual relation—a relation to what it means (termed the "accusative relation") and a relation to the individual for whom it means (termed the "dative relation"). For the theologians, the first was essential: in the context of sacramental theology, it was important to say that the relation of the sacramental sign to its signified (grace) was inscribed in the institution of the sign by Christ, and could not be modified, independently of the way in which it was received. Bacon, on the contrary, would regard the dative relation as having priority: even if the sign possesses a given meaning at the moment of its institution, if it is not received as a sign, the sign remains a sign only in its substance, but is not a sign in act. This implies that the relation to the signified is entirely dependent on the will of the speaker and the interpreter, who freely define and redefine it with every utterance.

■ See Box 2.

4. Natural signs and signs that are *ordinata*

Bacon then proposes a general typology of signs that integrates linguistic and non-linguistic signs. He distinguishes natural signs (comprising three types: through inference, similarity, and relation of cause to effect) and signs that are *ordinata* or *data,* following Augustine; then he divides the latter, following Aristotle this time, into instituted

2

Fishacre/Bacon: The doubly relational nature of the sign

Drawing on Augustine, Richard Fishacre elaborated the notion that the sign is by nature a relative entity, and that two relations are implied, the relation to the signified and the relation to the interpreter. Roger Bacon would adopt that idea. The opposition between the two authors bore on the primacy of the two relations, Roger Bacon viewing the relation to the interpreter (producer/receiver) of the sign as essential since it befalls him to determine what the signified of the sign will be.

Richard Fishacre, *Commentary on the First Distinction of the Fourth Book of Sentences*:

> It will be said that the noun *sign* is a relative. Among the names of relatives, some signify a single relation, others a dual relation. Single, as in *is placed*, dual as in *given*, since the word says simultaneously a relation to the person who gives and to who receives. In the same way *gleam* signifies a single relation, to what gleams, and *illuminate* a dual relation. Consequently, in my opinion, *sign*—if the word is understood in the strict sense—signifies a first relation to the signified (*ad significatum*) and a second relation to the person for whom it signifies (*ad eum cui significat*), and that dual relation is contained in the definition that has been posited (that of *De doctrina Christiana*): the relation to the signified through the clause *something else* (*aliud*), namely: the signified, and the relation to someone for whom it signifies (*ad aliquem cui significat*), through the clause *coming to knowledge* (*in cognitionem venire*). Just as *given* signifies what is through someone and for someone (*ab aliquo et alicui*), just so is the sign a sign of something and for someone (*alicujus et alicui*). The relation to the signified is the one that is most essential to the sign. Thus, since that relation depends on a relation that is either nature or will, the sign is split into a natural sign, such as smoke, which is a sign of fire, and a given or instituted sign, such as the noun *man,* which is the sign of such a thing. The relation to him for whom the sign signifies is occasionally permanent, which is manifest for instituted signs: it is by virtue of the will of whoever realizes the institution that the word *man* always signifies that specific thing. Occasionally that relation is not permanent: such is the case for smoke, which can be considered as a thing in itself and not insofar as a fire is its cause, in which case it is not at all a sign, since one of the two relations is lacking; but if it is considered insofar as fire is its cause, from that point of view it is entirely a sign. Now, it should be seen that the two relations are permanent for instituted signs, and this by virtue of their institution, but neither of those relations is essential to the sign. But on the contrary, for natural signs, the relation to the signified is essential, and thus perpetual, since it is of the essence of every creature to be caused by God, and thus to be a sign of Him.. . . But the relation of natural signs to the person for whom they signify is neither essential nor perpetual, but accidental. Created things are, in fact, not only made to signify the Creator. Consequently, when a word is understood or apprehended, it is immediately apprehended as a sign for the individual who apprehends it, since words are made solely in order to signify, whereas when I apprehend a created thing, it is not immediately apprehended as a sign for whoever apprehends it, but frequently as a thing.

Roger Bacon, *De signis* (1268):

> The sign is in the predicament of relation and is spoken of essentially in reference *to the one for whom it signifies* (*ad illud cui significat*). For it posits that thing in act when the sign itself is in act and in potency when the sign itself is in potency. But unless some were able to conceive by means of this sign, it would be void and vain. Indeed, it would not be a sign, but would have remained a sign only according to the substance of a sign. But it would not be a definition of the sign, just as the substance of the father remains when the son is dead, but the relation of paternity is lost. And even if the sound of a voice, a circular indication, or any other thing is imposed in act on a thing with which it is in relation, and instituted in such manner that it can represent it and signify it for others, nonetheless if that for which it signifies is not in act, it is not a sign in act but a sign in potency only. It is, in fact, different being imposed in act, which permits signifying for whomever it be, from being a sign in act. The verb *signify* is essentially and principally related to what acquires something, namely a thing signified by a dative, rather than a thing signified by an accusative. And for that reason, it refers only accidentally to the thing to be signified, that is, an object of knowledge for knowledge. One can indeed not conclude: "The sign is in act, and thus the thing signified exists," since non-beings can be signified by words as much as beings can, unless we intend that the being necessarily demanded by the signified is solely in the intellect and the imagination.

> The sign is that which, offered to *the senses or to the intellect,* represents itself to that intellect, since not every sign is offered to the senses as the common definition of sign supposes. However, on the testimony of Aristotle, another kind is offered only to the intellect. He states that the *passiones anime* (concepts/species) are signs of things (*signa rerum*), and such *passions* are a habit of the soul and species (representations/intentions) of the thing (*species rerum*) existing for the soul, and therefore they are offered only to the intellect so that they represent external things to that intellect.

signs resulting from a deliberation (signifying in a conceptual mode), whether linguistic or non-linguistic, and signs that signify naturally (signifying in an affective mode). The phrase "natural sign" is ambiguous and covers quite different relations of meaning. In a first sense, it characterizes a kind of relation between sign and signified based on a natural link, which may be causal, mimetic, or iconic in nature. In a second sense, the reference is to a "type of production" of the sign, which is "natural" when it occurs in a non-deliberate manner, as is the case for screams, moans, and manifestations by animals, which escape the control of reason. The confusion between the two uses is facilitated by

the fact that, in both cases, the sign signifies without the intervention of a prior will by the "institutor of speech" or the intention of a specific speaker. In *De signis*, Bacon renders this distinction explicit by placing the first case under the rubric of "natural signs" and the second under that of "signs signifying naturally."

■ See Box 3.

3

Natural signs: Conventional and voluntary

This distinction is used to translate two oppositions that do not, in fact, coincide. The first is drawn from Augustine's *De doctrina Christiana* (2.1, 2): "signorum alia sunt naturalia, alia data" (among signs, some are natural, others are "given"). The second is constructed on the basis of Aristotle's *De interpretatione,* as interpreted in the Middle Ages, for example, by Petrus Hispanus (*Tractatus*): "vocum significativarum alia significativa ad placitum, alia naturaliter" (among vocal expressions some are intentionally meaningful, others naturally so). In Augustine, it is a matter of an opposition between, on the one hand, signs that "without intention or desire to signify, allow to be known, by themselves, something more than what they are in themselves," and, on the other hand, those that "all living beings address to each other to reveal, as much as they can, the motions of their soul, that is: all that they feel and all that they think." Augustine gives as examples, for the first case, smoke signaling fire, the pawprint indicating the passage of an animal, or even the irritated face of a man that conveys his feelings: each of these signs reveals what it means "without wanting to," and because we are accustomed, says Augustine, to associate "from experience" the two things being related. Roger Bacon would specify that in this first case the sign-relation is based on a natural relation between two things, a relation that might be, for him, one of interference, of similarity, of effect to cause. Augustine's *signa data* were produced in order to generate a thought or intellection, "to transfuse into the mind of an other what the individual producing the sign bears in his mind," thus Scripture, which was revealed in order to be interpreted, or the sound emitted by a cock in order to let his chicks know he has found food. These are signs that are not necessarily conventional, but were produced intentionally, or at least in order to be acknowledged. They are the result, according to Roger Bacon, of a deliberation and a choice. On the other hand, the opposition between words signifying *naturaliter* and *ad placitum* rests essentially on the criterion of *institution* and Boethius, and the Middle Ages following his lead, made use, for *ad placitum,* of the expressions *positione* or *ad positionem* (by [im]position) or even *voluntaria, ex institutione*; these expressions signify by virtue of an institution, and are thus not "the same for all" (*eadem apud omnes*), unlike signs signifying naturally. This distinction allows, on the one hand, for a distinction between nouns, verbs, sentences, that signify by virtue of such a process of institution, from other expressions (*voces*) that signify "by nature" (*natura*), without institution, such as the moans of the sick or the barking of a dog. But it is also used to distinguish written and oral expressions, intellections and things, and in this case it is not a matter solely of signification. Written and oral expressions are *secundum positionem* because they depend on an institution (*secundum hominum positionem*), and as a result they are not identical for different populations and are subject to variation. Conversely, intellections and things are by nature since they are identical for all and cannot be modified. It is because things are identical for all, and intellections are similar to things that the latter are equally identical for all. It will be perceived that the expression "by nature" is in fact applied by Boethius to two types of very different things, moans and barks, on the one hand, and intellections and things, on the other. Those two sets are deserving of the negative characteristic of not being the work of an institution. But the first covers vocal productions which, for Augustine, might partake of *signa data* (e.g., barking, insofar as it is intentional), the second realities that are not as such signs; were one to consider the relation of similitude of intellections to things, intellections would then be classified among the *signa naturalia*.

Roger Bacon articulates the two distinctions jointly, and proposes an overall schema in which it appears clearly that the Augustinian distinction trumps the Aristotelian distinction:

1. *signa naturalia* (e.g., smoke-fire; intellections-things, etc.) (= natural 1)
2. *signa data*
   2.1 *significativa ad placitum* (e.g., words, signs, etc.)
   2.2 *significativa naturaliter* (e.g., moans, barking of dog) (= natural 2).

A sign being a relational entity, it is not its substance that gains it entry into one or another of these categories, but the type of relations it entertains with the thing that it signifies, it being understood that it may entertain several such relations. A sign that is identical in substance can thus be considered in two different ways, in accordance with the nature of its relation with the thing it signifies. Consider the case of the dog's bark: it can be considered as either natural 1: I hear a dog and infer that there is an animal barking (the signification is produced because one is accustomed to associating an effect with a cause, or recognizing a relation of "concomitance" between the two events; but the bark was not produced in order to generate that thought; or as natural 2: the bark is a sign produced by a dog in order to manifest its anger (as Abelard puts it, it is, so to speak, the sign God gave dogs in order to do so, just as he gave men conventional language). This is exactly Augustine's position regarding facial expressions, which can involuntarily convey a movement of the soul or be produced "truly in order to be a sign," and thus intentionally (*De doctrina Christiana*, 1.2.2, 3). This is also how we may distinguish, along with Roger Bacon, the fact that the cock crows (*gallum cantare*), a natural sign (in the first sense) of dawn, and the crowing of the cock (*cantus gallli*), used to indicate that nourishment has been found.

The confusion between the two senses of "natural" is manifest in numerous discussions and obscures several classifications.

The term "conventional" is used erroneously to render the Latin *signa data* (Roger Bacon also uses *ordinata*): these are signs that living beings give each other (or are given) and that they employ intentionally. Augustine, moreover, uses other terms to designate the voluntary act that allows men to agree on the signification of signs (*consensio, placitum*; cf. *De doctrina Christiana*, 1.2.34, 37; 35, 38). *Ad placitum* can be translated as "conventional" only for certain authors; if the expression always refers to a deliberate decision to attribute a value to words or signs, that decision can be seen as a primal instituting process (*institutio, impositio*), occurring once and for all, and "counting as a law" for a given linguistic community, but also as a tacit—daily and thus perpetually renewed—act dependent on the "good will" of each interlocutor, an act which, for Roger Bacon, amounts to effectuating a new imposition of the sign, allowing a renewal of its meaning.

Bacon thus reinterprets the first chapter of *Peri hermeneias* in a rather personal manner, criticizing traditional interpretations, which he deems reductive (*De signis*, 166): thoughts are the natural signs (*signa*) of things and vocal sounds are the conventional signs of thoughts even as written words are the conventional signs of vocal sounds. In addition, vocal sounds are also the natural signs of their own images in the mind of the speaker, simultaneously by inference (one sees the sign, one infers from it that there exists an image of the sign in the mind), by similitude (the oral word is in conformity with its mental image), by relation of cause and effect (the vocal sound is the effect of its mental image). The vocal sounds are in a relation of natural sign to the image of the thing (one infers from the existence of the vocal sign that there has been a knowledge of the thing, and thus an image of it), and not, as Aristotle and Boethius seemed to maintain, in a relation of conventional sign, since the vocal sign signifies conventionally only the thing—Bacon here is taking a stand against those who thought that the word signifies first the concept and secondarily the thing in the "great controversy" (to use Duns Scotus's subsequent expression) that divided medieval thought. Finally, there exists a relation of natural sign from the image of the thing to the thing. That last relation may be at the origin of the idea later elaborated by Ockham that concepts are the natural signs of things.

5. *Signum* and logical function

Signum in a third sense designates terms that have a logical function, notably quantifiers. Boethius, commenting on *Peri hermeneias* (chap. 7), speaks of determinations (*determinationes*) or additions indicating particularity or universality (*adjectiones particularitatis/universalitatis*), which determine the quantity of a proposition, that is, which arrange for the universal thing signified by the determinate noun to be taken in its universality, with *omnis* (all), or, on the contrary, in a partial manner (*in partem*), with *quidam* (a certain, indefinite). Insofar as the quality of the proposition is concerned, Boethius uses the expression "particle of negation" (*particula negationis*). At the beginning of the twelfth century, Abelard and Garlandus Compotista commonly speak of *signa* as much for quantity (*signa universalitatis, particularitatis, quantitatis*) as for quality (*signa negationis*) (Abelard, *Glossae Super Peri Hermeneias*: "The signs of quantity, that is, of universality and particularity, like the signs of quality, that is, of affirmation and negation like 'est' and 'non est' are such that they allow one to know and to manifest respectively the universality and particularity of propositions and the property of affirmation or negation since such signs render the proposition universal and particular, and in the latter case, affirmative or negative"). Abelard also speaks of *signum consecutionis* for conjunction. He discusses whether such *signa*, which are "determinations" for Boethius, merit the name of "parts of discourse" (*partes orationis*), even if they cannot be called *termini*, an expression appropriate solely to subject and predicate (*Dialectica*).

During the same period, the grammarian Guillaume de Conches distinguished four varieties of names, and included in the last category those names that signify "ways of speaking about things" (*modi loquendi de rebus*), like *omnis, quidam, aliquis, nullus* (all, a certain, some, none), which the

dialecticians, he says, call *signa propositionum* (in De Rijk, *Logica, modernorum*, vol. II/I). In terminist logic, this use of *signum* would be maintained, with *signa* thus constituting a subset of syncategoremes. The author of the *Summe metenses* (middle of the thirteenth century) justifies this term by saying that the *signa* are thus called because they signify the mode of signifying or supposing possessed by the *terminus* to which they are adjoined, grounding that affirmation on the Augustinian definition of the sign. Although every word is a sign, according to Aristotle, who says that words are signs of intellections ("voces sunt signa intellectuum"), such words can be called signs by antonomasia because they are "signs of signs" (*signa signorum*). The author thus emphasizes the particular character of such words, which refer not to things, but to other words (see INTENTION). He thus distinguishes signs that signify things, whether substance or accident, from those that signify other signs, by signifying either a mode of signifying terms of substance or a mode of supposing terms of accidents (De Rijk, *Logica modernorum*, vol. II/I).

III. The Place of the Symbol: From *Symbolum* to *Sinnbild*

The "symbol," by definition, implies simultaneously a difference—there are two distinct partners in a convention—and a bond—the two elements of the symbol must be able to be joined together. The connection, in turn, can be arbitrary (a mathematical symbol) or motivated according to different modalities (similitude, analogy, a "natural" relation, water as the symbol of purity) and its interpretation can be conventional and coded (scales as a symbol of justice) or more open to individual choice (Todorov, *Théories du symbole*). This initial complexity, illustrated, for example, by the confused and inconclusive discussion of the word's definition in Lalande's classic dictionary (RT: *Vocabulaire technique et critique de la philosophie*), and leading to the suggestion, in Umberto Eco's words (*Semiotics and the Philosophy of Language*), that the "symbol is simultaneously everything and nothing," has had considerable impact on the way in which its opposition to the sign has been described. But from negative theology to the theories of art of the first German Romanticism, what has always been at stake in the symbol has been the articulation of the finite and the infinite.

A. The Neoplatonic heritage

1. Dissimilarity and negative theology

During the Latin Middle Ages, the *symbolum* was felt to derive from the Dionysian tradition: it was indeed transmitted by way of the first chapters of Pseudo-Dionysius's *Celestial Hierarchy*, and various commentaries on that text, including primarily those of John Scottus Eurigena and Hugh of Saint Victor.

Symbols are first of all sensorial realities in the material world that constitute intermediaries allowing men to ascend toward the supernatural (cf. Hugh of Saint Victor: "symbolum est collatio formarum visibilium ad invisibilium demonstrationem" [the symbol is the conjoining of visible forms of reality in order to demonstrate invisible realities]"; RT: *PL*, vol. 175, col. 941B). It is because materials available to the senses are resemblances, copies of such realities (cf. John Scottus: "per symbola, hoc est per signa sensibilibus rebus similia" [through the intermediary of symbols,

that is, signs available to the senses and similar to things],"in which the glossing of *symbola* as *signa* will be noted) that they can lead an individual to hidden *mysteria*, as though "taking him by the hand," following a *materialis manuductio*. Symbols are veils (*velamina*) that conceal the mysteries they signify and, as a result, John Scottus specifies, constitute "exercises" for the human soul, which attempts to accede to them thereby. "Symbols" thus include the images in the Bible as well as the types of the Old Testament or the sacraments of the New, but additionally, for John Scottus, all the realities of the created world, natural realities and even artistic creations.

It will thus no longer be said that symbols are at once similar, insofar as they are copies, and dissimilar, insofar as they are of an inferior level, to the thing signified: there are indeed two kinds of symbols, the similar and the dissimilar, of which the latter are less deceptive than the former, then two kinds of utterance, the affirmative and the negative, of which the latter are less false than the former (cf. John Scottus, *Expositions,* 3.3.156BC: "just as negation is prior to affirmation in meaning, so dissimilar and absurd images are prior to images and manifestations of divine things"). Privilege is thus accorded in a single swoop to dissimilar images and negative theology. Subsequent reflection on divine names would clearly distinguish, starting with Pseudo-Dionysius (*Celestial Hierarchy*, 2.3.140Cff.), "symbolic names, such as *leo, lapis* (lion, stone), from "mystical" names, such as *sapientia, bonitas, essentia* (wisdom, goodness, essence).

The former, designating realities of the sensory world, are never "appropriate" for God, and can be applied to him only metaphorically, according to a process of *translatio*, established by way of an intermediate term (it is because of the lion's *strength*, also attributed to God, that he is called a *lion*; see *translatio* under TO TRANSLATE, IV). It is solely concerning the latter, whose purpose is the expression of essential properties, that the question will be raised of determining whether they are equivocal, univocal, or analogous to those same names when used for creatures. If the latter, through their semantic content, seem to approach divine truth more closely, the former are nonetheless more true *as signs*, being posited from the outset, through the dissimilarity that characterizes them, as pure signs, without risk of passing for true and adequate expressions. Albertus Magnus and Thomas Aquinas would clearly contrast those two types of names, explaining that the thing meant was suited, for the former, *per prius* to creatures, and, for the latter, *per prius* to God, with the former being called *metaphoricie* and the latter *proprie* as a function of analogy, even though, at the level of their modes of signifying, all names are equally improper since instituted at the outset to signify the realities of the world of creation (see ANALOGY, HOMONYM).

2. "Sign" or "symbol" in Augustine: The arbitrariness of translations

The Dionysian use of the *symbolum* can be related with certain affirmations of Augustine, for example, when he considers created realities as *vestigia trinitatis*, a set of signs "referring to the sole *res* that cannot subsequently become a *signum*, which is God" (*De Trinitate*, 6.10.12; cf. Maieru,

"*Signum* dans la culture médiévale"). But we would do well to insist on the fact that Augustine made massive use of the term *signum:* numerous studies of "medieval universal symbolism" are absolutely incoherent in the use they make of the term "symbol" to read Augustine, translating *signum* capriciously as "sign" or "symbol," and the verb *significare* as "to signify" or "to symbolize," introducing arbitrary divisions within the different types of *signa* in order to distinguish a subset corresponding to "symbols." Thus Chydenius, in a frequently cited article, declares without giving justification that intentional signs given by men and by God can be called "symbols," but natural signs or intentional signs produced by animals cannot. Similarly, he introduces a distinction between *interpretative* and *descriptive* symbols, a distinction which, despite the efforts of the author to superimpose them, does not overlap with any of the Augustinian distinctions, such as those between *signa naturalia* and *data* or between *signa propria* and *translata*. Augustine's definition of *signum*, so often cited and explicated in the Middle Ages, is invoked by certain commentators as that of the "symbol," or even of the "sign-symbol." Although it is frequently said that Augustine's *signum* "absorbed the values of the symbol" (Ladner, "Medieval and Modern Understanding of Symbolism"), there has never been an inquiry into the philosophical or theological consequences of the fact that in Augustine's text, we are dealing at this juncture with only one term, namely, *signum.*

Signum is the signifier associated, either naturally or conventionally, with a precise, determinable, and identifiable signified, even if it is invisible or inaccessible, like God or grace, and even if that signified may be polymorphous or ambiguous. There is an intended order in the world, with things referring to each other according to a pre-established "plan"; things are made to be interpreted so that man can rediscover the meaning that they have been associated with or that he has associated with them in the case of voluntarily instituted signs, like the kiss exchanged to seal a peace or the wreath of foliage (*circulus vini*) to indicate wine in a tavern. This is the case for all signs, whether they be words or things referring to other things (thus "ox" signifies the animal, which itself signifies Christ). The criteria according to which one attempts to define the "symbol" in reality function, in the case of medieval authors, as so many criteria allowing one to discriminate between different types of signs—for instance, the criterion of similarity for natural signs; the same holds for functions judged characteristic of the "symbol," such as "recognition within a community," which is a function of the "sign."

In the context of sacraments, and thus contrary to the translating habits of the moderns, the term *symbolum* is never used, and use is made exclusively of the Latin *signum*, grounded in Augustine's definitions, whereas as of the sixteenth century the term "symbol" would be employed for the external form of the sacrament. Modern commentators of medieval texts, however, frequently render the Latin *signum* as "symbol," which inflects the thought of the era markedly; whereas the Augustinian *signum*, developed and extended in medieval definitions, situated the sacrament in its dual function of knowledge (providing access to invisible realities) and operativity (producing what it allows one to know, grace; see

SPEECH ACT, III) along with intersubjectivity (a sign produced by someone for someone), the use of the term "symbol," in this context, places the accent on the sacrament as a "password," an instrument of recognition and identification (cf. in this sense Chauvet, *Symbol and Sacrament*).

■ See Box 4.

B. "Symbol," *Sinnbild*, "allegory" in German idealism and early Romanticism

From Kant to Hegel, the major area for reflection on the symbol is the philosophy of art. During that period, the concept of the symbol appears as a metaphysical solution to the problem of the unification of the finite and the infinite—the

Symbolum: A rereading of *Metaphysics* on the basis of Augustine and Averroës

The exceptional use of *symbolum* to speak of language in its simultaneously intersubjective and conventional dimensions in the Middle Ages is linked to the quite remarkable convergence of three different sources, resulting in the affirmation: "sermo omnis symbolum est" (all speech is symbolic). The first of these sources is a passage from Aristotle's *De sensu et sensato* (1.437a 12–15), notably used by Albertus Magnus in the *De voce* question of *Summa de creaturis*, written in Paris around 1246. Albertus inquires whether intelligible form is necessarily in the word and draws on our passage in order to argue in the affirmative: what passes (*transit*) from master to pupil-listener are not words without meaning, but meaningful words, since, as Aristotle claims, "hearing plays an accidental role in knowledge: meaningful discourse (*sermo*) is the cause of knowledge, not by itself, but in an accidental manner, by virtue of the fact that it is composed of words: and every noun is a symbol" (nominum unumquodque symbolum est).

Henri de Gand inquires in several articles of his *Summa questionum ordinarium,* written in 1292–93, as to the possibility of knowing, signifying, and naming God. His investigation is no longer merely one of the truth or of the property of signification or nomination, but far more one of the possibility of *transmitting to others* such knowledge, in the event it should prove possible, of signifying to others something by means of signs that might manifest it, which is an altogether novel question, clearly inspired by the Augustinian perspective in which the author situates himself. Signs, explains Henri de Gand, are established by convention to signify something and can transmit only what they have been imposed on. But in order to function as "symbols" between speaker and listener, the thing signified must be known to both and they must have something intelligible in common, which is problematic in the case of speech about God. The entire argument can be summarized as the affirmation that every noun (or vocal verb; or discourse [*sermo*]) is a symbol. Henri draws, on the one hand, on the passage from *De sensu et sensato* already mentioned. He associates it explicitly, on the

one hand, with *De doctrina Christiana* (2.24, 37; 25, 38), passages in which Augustine insists on the fact that signs signify "non natura, sed placito et consentione significandi," and, on the other hand, with a famous passage of Aristotle's *Metaphysics* (4.1006a 28ff.), on the principle of contradiction (see HOMONYM and PRINCIPLE). The reference to this passage cannot be understood if one reads the first Latin translations (cf. *translatio anonyma, Aristotes Latinus*), but only if one consults the Arabo-Latin version:

> Primum igitur omnium istorum est concedere quod sermo aut negat aliquid, aut affirmat ali-quid, et dignum est existimare quod hoc primum solum manifestum. *Et necesse est ut sermo loquentis fit signum de aliquo apud ipsum, et apud alium, si aliquid dicit.* Quoniam, si hoc non fuerit, non poterit disputare neque secum, neque cum alio.

> (In the first place, we should begin by considering, among all things, that speech either denies something or affirms something, and it should be estimated that only the first opinion is manifest. *And it is necessary that the speech of the one speaking become a sign of something, simultaneously for him and for others, if he wants to say something.* Indeed, were this not the case, he could debate neither with himself nor with others.)

Averroës comments on this passage, explaining that the discourse of the speaker must signify something that is simultaneously in his mind and in that of his listener, and which must be intelligible for both interlocutors, failing which there can be no discussion:

> Dicamus igitur quod necesse est homini concedere quod sermo dicentis, idest quod sua loquela, significat illud, quod est in ejus anima apud ipsum, et apud ipsum cum quo loquitur, sed ille qui loquitur dicit aliquod intelligibile, quod si illud, quod dicit, non fuerit intelligibile apud ipsum et apud audientem, non fit disputatio, neque ad ipsum, neque ad alterum.

(We shall thus say that it is necessary to concede that the speaker's discourse, that is: what he says, signifies precisely what is in his soul for himself, and for the one with whom he is speaking, and that he who speaks utters something that is (an) intelligible, because, if what he said were not intelligible, both for himself and for his listener, there could be no discussion, neither with himself nor with others.)

Henri de Gand paraphrases the passage from the *Metaphysics* by glossing *signum* as *symbolum*, adapting the formula from *De sensu et sensato*, and insisting on the fact that for there to be transmission of meaning it is necessary for the thing signified to be known both to the speaker and to the listener, so that hearing the sign might provoke in the listener a rememoration of the thing that the noun signified for the speaker and with which it had been associated by imposition:

> Quia nomen sive verbum vocis universaliter debet esse symbolum inter duo, scilicet (inter add. l) loquentem et illum cui loquitur, sic ut res significata modo quo imponuntur nomina ad significandum, sit in se nota utrique, et quod nomen ad significandum ipsam rem ut talis est, sit institutum.

(Because the noun or verb should be universally a symbol between two individuals, namely, between the one who speaks and the one who is spoken to, so that the thing signified, in the mode according to which nouns were imposed to signify, be known by both, and the noun instituted to signify the thing as it is.)

(*Summa quaestionum ordinarium*, art. 73, q. 9, ll. 34–35; cf. also art. 20, q. 1)

Duns Scotus would recall this opinion while himself reflecting on the divine names (*Reportata Pariensia*, I, d. 22).

humanly knowable form of the absolute. In a general manner, that union is understood, in opposition to the idea of convention or the arbitrary, as manifesting a secret affinity between the essence of the finite and that of the infinite—the former revealing itself capable of sheltering, in its very finitude, the divine, the latter able to reveal fully the life that animates it only by becoming embodied in finite reality.

1. A *Versinnlichung* (transition into the sensorial) of the Idea

The conditions of the idealist and Romantic comprehension of the symbol are posited by Kant in §59 of the *Critique of Judgment* (1790). On the one hand, indeed, he presents the symbol (*Symbol*) as a *form of intuition*: just as schematization is a "hypotoposis" or presentation (*Darstellung*) of concepts of understanding, "symbolism" "places before us," although in a manner that is only *analogical*, the concepts of reason or Ideas—and to that extent, it allows, if only indirectly, a "transition onto the sensorial" (*Versinnlichung*) of the Idea. Kant thereby intentionally took his distance from the Leibnizian use of the notion of the symbol, insofar as the latter assimilated *cognitio symbolica* to knowledge through signs and opposed it to intuitive knowledge (cf. Leibniz, *Meditationes de cognitione, veritate et ideis*, 1684). In addition, the intuition that we have of the Idea in the symbol is, according to Kant, *merely* indirect and analogical (in the strict sense of an identity of relations): an organism can symbolize a free polity to the extent that I judge the kind of relation between the parts of an organism to be identical to the kind of relation between the citizens of a free polity. But there is no resemblance or community of being between the freedom of a polity and organicity: the latter allows me to *think* the former, but not to *know* its essence. Symbolism thus partakes of an activity of judgment by a subject concerning an Idea which, by definition in Kant, remains a regulating horizon, not a constitutive force of reality.

On the basis of the Kantian definition, two tendencies emerge in the use of the notion: one that insists on the *presence* of the Idea in its symbolic embodiment, or even on the fusion of the universal and the particular in the symbol, the other that insists more on the *inadequacy* of the symbol to the Idea that it presents, thus bringing it closer to a mere sign. Those two tendencies, both emerging from the problem of the "presentation" (*Darstellung*) of the absolute in the finite, are opposed to each other, but can, on occasion, fuse in a paradoxical manner.

2. *Sinnbild* and *Andeutung*

The correspondence between Schiller and Goethe, between 1794 and 1797, was the site of an interpretation of the *Symbol* no longer merely as an analogical intuition of the Idea, but rather as a way of knowing the Idea insofar as it is present in a living manner in the sensorial reality that it organizes. According to Goethe, the symbol manifests the Idea on its own, but indirectly: symbolic objects "appear to be there solely for themselves (*bloß für sich*) and are, however, meaningful (*bedeutund*) to their very depths" (*On the Objects of the Plastic Arts,* 1797). On the other hand, allegory refers to the idea as something external to itself, destroying the interest taken in the sensorial presentation itself, which is no more than a simple intermediary allowing for the direct comprehension of the idea. Allegory is but the translation into

images of the concepts of understanding, whereas the symbol has the Ideal as its inner organic principle. The intellectual proximity between Goethe and Schiller was undoubtedly an essential factor in the formation of the Schellingian concept of the symbol (cf. Goethe's letter to Schelling of 29 November 1803), defined in his *Lecture on the Philosophy of Art* (1802). Schelling insists there, in a rather Goethean spirit, on the identification of being and meaning in the symbol: "the finite [here] is at the same time the infinite itself, and does not merely mean it (*nicht bloß es bedeutend*)" (*Sämmtliche Werke*, V). Given that circumstance, the German word *Sinnbild* seems particularly suited to designate the compenetration or identity of the Idea and its presentation in the symbol since the latter, which presents the absolute in art, must be as concrete as the image (*Bild*) and yet as universal and charged with meaning (*Sinn*) as the concept. In allegory, on the other hand, the particular does no more than signify (*bedeuten*) the general. In a general way, the classical aesthetic of Goethe and Schelling thus has a tendency to bring the allegory closer to the sign (*Zeichen*).

Parallel to that organic understanding of the symbol, which tends to assimilate the presentation of the Idea to a real presence, there developed a conception in which the symbolic unity of the finite and the infinite appears like a goal situated at infinity rather than an actually realized embodiment. It appeared notably in what Friedrich von Schlegel called both "symbol" (*Symbol*) and "allegory of the infinite" (*Allegorie des Unendlichen*). All beauty is allegorical, and allegory for Schlegel is the tendency toward the absolute in the finite itself: "Every allegory signifies God (*bedeutet Gott*), and one can speak of God in no other than in an allegorical way" (*KFSA*, XVIII, 347, no. 315). Beyond what it actually presents, and which is always insufficient from the perspective of infinity, art makes a sign (*andeutet*) toward the absolute, which it can never truly render present: the symbol is understood here as an indication (*Andeutung*) or allusion. Creuzer, in his *Symbolism and Mythology of the Ancient Peoples* (1810–12) similarly insists on the inadequacy of the finite symbolic form to the essence of the idea that it manifests, "the incongruity of the essence with the form" (*Incongruenz des Wesens mit der Form*). He delineates, moreover, in an original manner the distinction between symbol and allegory with the help of the category of time: the former gives us instantaneously the intuition of the idea, whereas the latter reveals its meaning to us over the course of a gradual intellectual process. Hegel, finally, despite his opposition to Romanticism and to Friedrich von Schlegel on a number of points, nonetheless characterized symbolic presentation, in his *Lectures on Aesthetics* (1820), in terms of its inadequacy (*Unangemessenheit*) to the very essence of the Idea. The symbolic is in fact the first form of the artistic manifestation of the absolute, that is, the Idea would thereafter yield itself in a form available to the senses; but because the content of the idea itself was as yet indeterminate, symbolic figures, for instance, in Egyptian art, allow us to anticipate or intuit the absolute, instead of rendering it truly present: "the symbol (*Symbol*), although it ought not—like the merely external and formal sign (*wie das bloß aüßerliche und formelle Zeichen*)—be entirely inadequate to its meaning, ought nonetheless, inversely, in order to remain a symbol, not render itself totally suited (*angemessen*)

to it either" (*Werke*). Plenitude of sensory presence is the privilege of classical Greek art (i.e., what Schelling called . . . symbolic art). But in the final analysis, the presentation of the Idea in art, and thus in the immediacy of a sensory figure, can never be fully adequate to its essence, which is perfectly revealed only in its concept rendered explicit by philosophy.

Karl Wilhelm Ferdinand Solger (1780–1819), a philosopher close to the first wave of Romanticism, whose thought, drawing its inspiration largely from Schelling, simultaneously presented a certain proximity to the thought of Hegel, developed, in his dialogue *Erwin* (1815), a conception of the symbol in which the two tendencies evoked come together. On the one hand, the symbol is indeed the full and entire presence (*Gegenwart*) of the idea in a finite reality; on the other hand, the intimate link between the symbol and *irony* manifests to a similar degree the persistence of an infinite distance or inadequation between the idea and its symbolic embodiment. Irony is indeed the state of mind of the spectator of a work of art (but also the moment of the life of the idea itself) in which he (or it) recognizes that the realization of the idea in a finite figure, the only means of its embodiment, can only and simultaneously coincide with its denaturation.

IV. Neologisms and Redefinitions

In semiotics, the meaning given to the "symbol" by Peirce is generally retained: that of a purely conventional relation, dependent on neither a relation of contiguity (as opposed to the index) nor a relation of resemblance (as opposed to the icon), whereas Saussure inversely uses the term "sign" to indicate a conventional, arbitrary, and necessary relation between signifier and signified which, in the symbol, are for him, to the contrary, linked by a "rudimentary natural bond." For Wittgenstein, finally, the accent placed on the symbol, "use without meaning," at the expense of the sign, which is no more than its perceptible face, constituted an essential element of his critique of metaphysics, opening onto a philosophy of ordinary language.

A. Peirce's taxonomies

In Baldwin's *Dictionary of Philosophy and Psychology*, C. S. Peirce, under the entries "sign," "index," and "symbol," provides convenient definitions. A "sign" is "anything that determines anything else (its interpretant) to refer to an object to which it refers itself (its object) in the same fashion, the interpretant becoming in turn a sign, and so forth until infinity." "Index" and "symbol" are types of "signs." An "index" is a sign that does not refer to an object so much because of an analogy or a similarity as because of a "dynamical (including spatial) connection both with the individual object, on the one hand, and with the senses or memory of the person for whom it serves as a sign, on the other hand." A "symbol" is "a sign that is constituted as a sign purely by the fact that it is used and understood as such, whether the habit be natural or conventional, without consideration for the motives that have governed its choice." In the manuscript on trichotomies of signs (ca. 1903), Peirce situates this distinction of three types of signs within a more general classification. If every symbolic situation has a triadic structure, by virtue of the ontological principle of differentiation of Firstness, Secondness, and Thirdness, one ought to distinguish in a ternary manner not only signs, but

also the divisions of signs themselves. Peirce thus distinguishes the following divisions: (1) depending on the sign in itself (*qualisign, sinsign, legisign*); (2) depending on the sign and its object (*icone, index, symbol*); (3) depending on the relation of the sign to its interpretant (*rheme, dicisign, dicent sign*). For example, the *qualisign* is determined as a type of sign manifesting a firstness (whose quality is the paradigm). In this perspective, which is the only correct one and which consists of deriving Peirce's semiotics from his metaphysics and not the reverse (cf. Tiercelin, *La pensée-signe*), the icon is a dual category (it considers the sign-object relation) of Firstness. An icon is a sign that refers to its object by virtue of a similarity to that object. The index is a dual category of Secondness and the symbol a dual category of Thirdness.

In his manuscript, Peirce defines the symbol more precisely:

> A symbol is a sign which refers to the object that it denotes by virtue of a law, usually an association of general ideas, which operates to cause the symbol to be interpreted as referring to that object.

The symbol, to the extent that the law is human, is conventional. The symbol, by virtue of the legal causality of its denotation, is a legisign, that is, a sign that is a law (cf. "Every conventional sign is a legisign"). The symbol is simultaneously open to an extension and a limitation in comparison with icons and indices. The extension is the symbol's capacity to specify the qualities of the objects denoted (an icon resembles its object by virtue of a community of quality, but without specifying it, and an index does not include a descriptive element necessary for that specification—an example: a footprint denotes a presence, but does not specify its qualities; for that, recourse would be needed to natural language, which is an assemblage of symbols, with the possible exception of deictics, which can be considered as indices and metaphors taking the place of icons). The symbol plays an indispensable role in major operations of thought: abduction, deduction, demonstration. In that sense, the symbol is the very life of reality and of science:

> A symbol is an embryonic reality endowed with power of growth into the very truth, the very entelechy of reality.

> (*New Elements,* ca. 1904)

The limitation is that the symbol can only denote types of objects and not occurrences. A footprint denotes an individual event, but the symbol "donkey" denotes the donkey in general and not Balthazar or Fanchon; "red" denotes the property "red" in general. In his semiotics, Peirce thus carefully distinguished the "sign," the general concept of all signifying relations, declined according to the ontological categories of the real world, from the "symbol," which is a kind of sign denoting, by virtue of its legal character, the universal and the general (see SEMIOTICS).

B. Wittgenstein: On the symbol as use endowed with meaning

It is altogether remarkable to discover a distinction parallel to the one introduced by Peirce, but independently, in Wittgenstein. Wittgenstein cautions us (*Tractatus*, 3.324) against "confusions of which philosophy is full." The philosopher frequently allows himself to be mesmerized by

the existence of a single sign (*Zeichen*) for two objects. Yet a shared sign cannot be regarded as a characteristic of the objects themselves (3.322), and, what is important is not the sign itself but that of which it is the perceptible aspect (3.32), namely, the symbol (*Symbol*). A symbol is thus any part of the proposition that characterizes and determines its sense (3.31).

How are we to conceive of the possibility of an access to the symbol? Wittgenstein's answer is crucial for all of his later philosophy:

> In order to recognize the symbol in the sign we must consider the significant use.
>
> (3.326)

It is the "significant use" that constitutes the symbol. The error of philosophy and metaphysics, allowing themselves to be taken in by the play of signs, is to believe frequently that where there is a common sign, there is a common symbol, thus neglecting essential distinctions inscribed in language use and the "perceptible" reality of the symbol. Thus already in the *Tractatus*, the limit between sense and nonsense is determined neither by "empirical content," nor by a kind of transcendent instance that would trace the limit of thought, nor by a reality with which our speech would be obliged to enter into conformity through its structure. It is determined by use:

> In the language of everyday life it very often happens that the same word signifies in two different ways—and

therefore belongs to two different symbols—or that two words, which signify in different ways, are apparently applied in the same way in the proposition.

Thus the word "is" appears as the copula, as the sign of equality, and as the expression of existence; "to exist" as an intransitive verb like "to go"; "identical" as an adjective; we speak of *something* but also of the fact of *something* happening.

(In the proposition "Green is green"—where the first word is a proper name and the last an adjective—these words have not merely different meanings but they are *different symbols*.)

(3.323)

Far from the "realist metaphysics" currently attributed to the early Wittgenstein, it would be negligence regarding the sign/symbol distinction that would constitute the fundamental reason for metaphysical errors.

The symbolic in psychoanalysis

1. *Symbol, Symbolik,* and *Symbolbildungen* in Freud

The use of the notions of *symbol/symbolic* dates back to the origins of Freudianism. In the text *Project for a Scientific Psychology* (*Entwurf einer Psychologie*, 1895), Freud already uses the term *Symbol* (*das Symbol*) to describe the (normal or pathological) phenomenon in which an element takes the place of another, the association between the two not always being manifest. Among the examples given by Freud, one finds that of the soldier who "sacrifices himself for a piece of colored cloth on a pole because it has become the symbol of his native country," or of "the knight who fights for a lady's glove" (*The Origins of Psychoanalysis*). What is at stake in such cases are "symbol formations" (*Symbolbildungen*) that belong to normal life. In the hysterical symbol, the phenomenon is realized in a different manner. "The hysteric whom A causes to cry does not know that it is only because of an association between A and B in which he himself does not play any role in her psychic life. In such a case, the symbol has completely replaced the object."

In chapter 6 of *The Interpretation of Dreams* (*Die Traumdeutung*, 1900), in the section titled "Representation by Symbols in Dreams" (Die Darstellung durch Symbol im Traume). Freud develops the idea according to which dreams use "the symbolic" (*die Symbolik*) in order to conceal representations of latent dream thoughts, most often sexual in origin. He adds that

> This symbolism (*diese Symbolik*) does not belong to the dream itself, but to the activity of unconscious representation—particularly among commonfolk, and it can be found in folklore, myths, legends, colloquial phrases, the wisdom of maxims and in jokes circulating among the people more completely than in dreams.

Freud thus used the term "symbol" to designate a kind of constant signification appearing in formations of the unconscious, notably in dreams: for example, "a hat as a symbol of a man (or of male genitals)" (*des männliches Genitales*) or the "genitals represented by buildings, stairs, and shafts" (*Darstellung des Genitales durch Gebäude, Stiegen, Schachte*),

etc. (see the index of symbols at the end of the work). Freud adds:

> We characterize a constant relation of this kind between an element of the dream and its translation as symbolic, the dream element itself as the symbol of the unconscious thought in the dream.
>
> ("Die Symbolik im Traum," in *Vorlesungen zur Einführung in die Psychoanalyse* (1917), in *Gesammelte Werke*, vol. XI)

Nonetheless, Freud's use of the notions of "symbol" and "symbolic" is not precisely stable. In the text cited above, Freud affirms:

> It should also be granted that the boundaries of the concept of symbol are currently difficult to define with precision in relation to substitution, representation, etc. The limits are unclear, since it even is related to allusion.. . . It will thus be seen that a symbolic relation is a comparative connection of a very particular sort, and

(continued)

whose bases we have not yet clearly apprehended. Perhaps in the future we will find clues leading to this unknown.

In essence, the symbol is thus one thing put in the place of another. The fact that there is a hidden connection between the symbol as such and the thing signified implies that this relation can also be deciphered, as happens in unconscious formations (dreams, symptoms, parapraxes, and jokes). It should be noted, however, that Freud himself has reservations concerning the symbolics of "invariant translations": "Interpretation depending on a knowledge of symbols is not a technique that can replace the associative technique or measure up to it." Jacques Lacan emphasizes that this constitutes a break with Jung and the idea of an archetype established from the beginning:

> This exteriority of the symbolic in relation to man is the very notion of the unconscious. And Freud constantly demonstrated that he was faithful to it as to the very principle of his experience. As is shown by the point on which he broke outright with Jung, that is, when the latter published his "Metamorphoses of the Libido." For an archetype is tantamount to making of the symbol a flowering of the soul, and that is crucial. . . . But what should be said, in conformity with Aristotle, is that it is not the soul that speaks, but man who speaks with his soul."
>
> ("Situation de la psychanalyse en 1956," *Écrits*)

2. The Symbolic in the Teaching of Jacques Lacan

For Jacques Lacan, the nominal form "the symbolic" takes on more precise contours, borrowing from linguistics (the arbitrary nature of the sign and the articulation of signifier and signified from Saussure, metaphor and metonymy from Jakobson) and, initially, from structural anthropology (Lévi-Strauss). From structural anthropology Lacan has taken in particular the notion of a "symbolic system":

> Every culture can be considered as a set of symbolic systems, of which language, rules of marriage, economic relations, art, science, and religion are of the first rank.
>
> (Lévi-Strauss, "Introduction à l'œuvre de Marcel Mauss")

It is with that grid that Jacques Lacan undertook a return to the Freudian roots of psychoanalysis, formulating the axiom that he would argue until the end of his teaching: "The unconscious is structured like a language." That axiom lies at the basis of his elaboration of the "symbolic" register, with its equivalence between symptom and metaphor, desire and metonymy.

From the outset of his teaching, Lacan constructed his notion of the symbolic in relation with two other "registers" from which it could not be dissociated, the imaginary and the real. Although he had already used the word "symbolic" in his text "The Mirror Stage" in 1949, it was not until 1953, in the lecture "Le symbolique, l'imaginaire, et le réel" and in "Fonction et champ de la parole et du langage en psychanalyse," that he elaborated it in all its complexity. In "Le symbolique," Lacan writes:

> It is indeed in this manner that the symbolic at play in the analytic exchange is to be understood, to wit: what we discover, and what we speak about over and again, and which Freud manifested as its essential reality, whether it be a matter of actual symptoms, parapraxes, and whatever be inscribed; it is still and always a matter of symbols and even of symbols specifically organized in language, and thus functioning on the basis of equivalents of signifier and signified: the very structure of language.

The "symbolic" thus becomes the very center of the analytic experience, inseparable from other elaborations, such as the "Name-of-the-Father," "phallic signification," "paternal metaphor," "foreclosure." The Oedipus complex constitutes the fundamental operation determining the subject's insertion in the symbolic order.

Lacan reinterprets the Freudian Oedipus complex, dividing it into three logical phases: in the first phase, "the subject identifies in the mirror with the object of the mother's desire"; in the second phase, "the father intervenes fully as the agent of privation of the mother"; and in the third phase, "the father can give the mother what she desires (the phallus), and is able to give it to her because he has it" (*Les formations de l'inconscient*). "What is the symbolic path? It is the path of metaphor," writes Lacan. It is the "paternal metaphor," the result of the Oedipus complex, that establishes for the subject any possibility of signification ("phallic signification"): in the paternal metaphor, it is a matter of "the substitution of the father as symbol, or signifier, in place of the mother."

The phallus is thus the psychoanalytic symbol par excellence—"the pivot of the entire subjective dialectic." It is the "signifier of a lack," which regulates for the subject the realm of the dialectic of demand and desire.

Insofar as it is a symbol, it cannot be confused with the biological organ.

The non-inscription of the "Name-of-the-Father" (foreclosure, *Verwerfung*) characterizes psychosis: "What is rejected in the symbolic order, in the sense of *Verwerfung,* reappears in the real (*Les psychoses*).

Throughout his teaching, Lacan gave different emphasis to the three registers. In the beginning, he devoted his efforts to the elaboration of the register of the imaginary. As of 1953, he concentrated on bringing the symbolic into greater relief, until the early 1970s, when he began to deepen his elaboration of the real, which, contrary to the symbolic, "emerges as excluding meaning" (1977).

Although Lacan modified his theory of the symbolic as he developed that of the "real," and the notions linked to that register—such as that of *jouissance* (bliss)/*jouis-sens*—he never abandoned the tripartite conception of psychic structure. In the seminar "R.S.I." (1974–75), he presented the three registers in terms of the topological figure of the Borromean knot: "The definition of the Borromean knot starts at three; you break one of the rings and they are free, all three of them, that is: the two other rings are set free" (unpublished seminar, session of 10 December 1974).

That a sign is composed of a signifier and a signified is something that we moderns believe we owe to Saussure, but that Jakobson, for instance, attributes to the Stoics. The Stoics, however, latch their doublet to a terminological and doctrinal innovation, that of the *lekton* [λεκτόν] (expressable, utterable), which no longer is present as such in modernity. The use of the term "signifier," as of the doublet *"signifier/signified,"* eminently anti-Aristotelian (see SENSE and WORD) up to and through its adaptation by Lacan, derives from ontological presuppositions and linguistic conceptions so heterogeneous that it has produced no end of slippages and generated countless misinterpretations.

What is the meaning, what are the major reinterpretations of *"signifier/signified"* (are "signifier" and "signified" dissociable or not, of the same nature or not, implying or not a third term and according to what relation?), and how is this readable in the way in which they are said and in the definitions they receive?

I. History of the Couple? Mythic Precursors

The couple seems so obvious that it is recurrently projected as deriving from the authority of a host of precursors: Aristotle/the Stoics, Augustine, Port-Royal. The idea that the couple "signifier/signified" comes from Port-Royal has its origin in Michel Foucault's presentation of the classical theory of the sign (*The Order of Things*). It was then, according to the author, that a "binary disposition of the sign" was substituted for "an organization which, in different modes, had been ternary from the time of the Stoics and even the first Greek grammarians" according to different modalities: first, the tripartite Stoic division, "signifier, signified, 'conjuncture' (*tugchanon* [τυγχάνον])" (see below); and second, the one put in place during the Renaissance and based on the notion of similitude ("similarities linking the marks to the things designated"). In Foucault's presentation of the classical notion of the sign, however, only representation will be at stake, and not the reorganization of the allegedly Stoic couplet, as confirmed by quotations from Port-Royal, and notably the definition of the sign as containing "two

ideas, one of the thing that represents, the other of the thing represented" (I, chap. 4). In concluding, Foucault adopts the idea that the "binary theory of the sign" is based on the "link between a signifier and a signified," even as he notes that that link "can only be established within the general medium of representation." That binary disposition presupposes that "the sign is a representation doubled and redoubled on itself," since "the signifier has as its sole content, function, and determination what it is that it represents . . . [and that] that content is indicated solely in a representation that is given as such," as is well illustrated by the example of the tableau. Thus is revealed the homogeneous nature of the sign and the signified, excluding "the possibility of a theory of signification." The connection between a theory of signs and a theory of ideas, which is determinant in Saussure, is similarly evoked by Foucault concerning the debate between Destutt de Tracy and Gerando. The relation to Saussure is ultimately spelled out in the conclusion only because of the "psychologistic" definition he gives of the sign, and of the "rediscovery" of its binary nature.

The same precursors are to be found in Lacan, who gets them from Jakobson (see below). And the novelty of Lacan himself is thus serialized in terms of its exceptionality by Jean-Claude Milner:

> From a strictly morphological point of view, Saussure could have sought inspiration in the *semainonta/ semainomena* doublet found in Aristotle and the Stoics, or in the *signans/signatum* doublet found in Saint Augustine. But in French, he does indeed appear not to have had a predecessor. The fact that the signifier is on the active side and the signified on the passive side does not appear to have been thematized before Lacan.

(*Le périple structural*, 42 n. 13)

The mythic precursors are indeed both precursors and mythical: we will analyze the Greek terminology of the Stoics, in its innovation in relation to Aristotle, then the Latin doublet found in Augustine, not in itself since the doublet is foreign to his theories of meaning, but in the posterity based on his theories, the semiology of the sacraments.

II. "Signifier"/"Signified" in the Stoics: The Invention of the *Lekton*

The Stoics, unlike Aristotle, innovated a terminological use of the doublet *sêmainon* [σημαῖνον] / *sêmainomenon* [σημαινόμενον] (signifier/signified). This is why they are often perceived as the first precursors of Saussurean linguistics. From the point of view of the theory of language, the difference between Aristotle and the Stoics was pinpointed with greatest precision by Ammonius, who commented on Aristotle in the fifth century CE: "Nouns and verbs signify thoughts," says Ammonius, corroborating the traditional interpretation of the beginning of *De interpretatione* [see SIGN], "and one need invent nothing other between thought and thing, as is posited by the men of the Portico and that they choose to call the 'sayable' (or the 'expressable,' *lekton* [λεκτόν])" (17, 25-18).

A. The constitutive relation of signification: "signifier" (*sêmainon*) / "signified" (*sêmainomenon, lekton*) / "referent" (*tugchanon*)

"The Stoics [claimed] that there are three things linked together (*tria suzugein allêlois* [τρία συζυγεῖν ἀλλήλοις]): the signified, the signifier, and the referent (*to te sêmainomenon kai to sêmainon kai to tugchanon* [τό τε σημαινόμενον καὶ τὸ σημαῖνον καὶ τὸ τυγχάνον])" (Sextus Empiricus, *Adversus mathematicos*, 8.11–12, SVF [Stoicorum Veterum Fragmenta] 2.166).

It was initially the very word *sêmainon* (signifier) that the Stoics were the first to press into terminological service: "The signifier is the vocal sound, for instance, 'Dion' (*tên phônên, hoion tên Diôn* [τὴν φωνήν, οἷον τὴν Δίων]) (ibid.)." A. A. Long and D. N. Sedley (*The Hellenistic Philosophers*) propose "utterance," and J. Brunschwig and P. Pellegrin (*Les philosophes hellénistiques*) opt for "émission vocale" (on the meaning of *phônê*, see WORD). The signifier, or *phônê*, which is emitted and heard, in its bodily materiality, shows or manifests (*dêloô* [δηλόω]) a signified.

> The signified (*sêmainomenon*) is *auto to pragma* [αὐτὸ τὸ πρᾶγμα], the thing in question manifested by the vocal sound, and which we understand, for our part, when it is presented to our thought by the vocal sound, whereas those who do not speak our language do not understand it even though they hear the vocal sound.
>
> ([σημαινόμενον δὲ αὐτὸ τὸ πρᾶγμα τὸ ὑπ' αὐτῆς δηλούμενον καὶ οὗ ἡμεῖς μὲν ἀντιλαμβανόμεθα τῇ ἡμετέρᾳ παρυφισταμένου διανοίᾳ, οἱ δὲ βάρβαροι οὐκ ἐπαΐουσι καίπερ τῆς φωνῆς ἀκούοντες.])

(Sextus Empiricus, *Adversus mathematicos*)

Auto to pragma ("the thing in question"; see RES) is rendered by M. Baratin and F. Desbordes (*L'Analyse linguistique dans l'Antiquité Classique*) as "contenu de pensée" (thought content); A. A. Long and D. N. Sedley (*The Hellenistic Philosophers*) opt for "the actual state of affairs." What is essential, whatever the tension between subjectivization and objectivization, is to avoid the confusion between objects of the world and the referent, *tugchanon* (see SACHVERHALT). "As for the *tugchanon*, it is the corresponding external object—Dion itself in this case (*tugchanon de to ektos hupokeimenon, hôsper ho Diôn* [τυγχάνον δὲ τὸ ἐκτὸς ὑποκείμενον, ὥσπερ ὁ Δίων])." *To tugchanon*, literally "what is found there" (whence Foucault's translation as *conjoncture* [*The Order of Things*]), is also subject to interpretative nuances: *référent* (Baratin and Desbordes, *L'Analyse linguistique*), "name-bearer" (with an *onomatos* as direct object elided [Long and Sedley, *Hellenistic Philosophers*, 2:197, cf. 1:201]), *porteur du nom* ("bearer of the name" [Brunschwig and Pellegrin, *Les philosophes hellénistiques*]). The link with Gottlob Frege's *Bedeutung* comes from Benson Mates, then from A. A. Long, quoted by J.-B. Gourinat (*La dialectique des stoïciens*, 114 [see SENSE]): the *tugchanon* designates, in any event, the external substrate (*hupo keimenon* ["extended below"], which is correctly translated as "object," but which designates no less clearly the substrate subject; see OBJECT, SUBJECT), which is corporeal, physical, and corresponds to what is emitted by the voice: "Dion"/Dion.

Of those three components, Sextus continues, "[T]wo are corporeal, the vocal sound and the referent (*toutôn de duo men einai sômata, kaithaper tên phônên kai to tugchanon* [τούτων δὲ δύο μέν εἶναι σώματα, καθάπερ τὴν φωνὴν καὶ τὸ τυγχάνον]), but the third is incorporeal, the signified of 'utterable' thought content (*hen de asômaton, hôsper to sêmainemenon pragma, kai lekton* [ἓν δὲ ἀσώματον, ὥσπερ τὸ σημαινόμενον πρᾶγμα, καὶ λεκτόν]."

The Stoic invention of the "signifier/signified" doublet thus presents two characteristics: (a) the doublet cannot work without a third term, on the order of the referent; (b) the signified is not called only *sêmainemenon* ("signified"), since the Stoics invent another name for it as well, *lekton*, as if to mark their own invention. The *lekton*, which is "incorporeal" (and that also designates it as a Stoic innovation), manifests the anti-Aristotelianism of the Stoic theory of language, which otherwise, with signifier and referent assimilated to word and thing, might pass for Aristotelian.

B. *Logos* and *lekton*

The neologism *lekton* is a nominalization of the verbal adjective from the verb *lego* [λέγω] (to say). The impossibility of translating *logos* [λόγος] unambiguously encounters, in Stoic logic, the difficulty of understanding and translating *lekton* (see LOGOS). The *lekton* is defined as "what subsists according to" or "in conformity with a logical representation" (*to kata phantasian logiken huphistamenon* [τὸ κατὰ φαντασίαν λογικὴν ὑφιστάμενον]) (Diogenes Laertius, *The Lives and Opinions of Eminent Philosophers*, VII.63). This definition is given greater precision by Sextus (*Adversus mathematicos*, 8.70), and one understands, after reading current translations unable to convey the meaning of terms with the common root *leg-* (in this case, that of Gourinat, *La dialectique des stoïciens*), why matters are difficult to understand: the Stoics "say that what is utterable [*lekton*, i.e, 'available to discourse'] is what has reality in a rational representation [*logiken*, 'discursive representation']; and that a rational representation is one in which what is represented can be manifested by language [*logôi parastêsai* [λόγῳ παραστῆσαι], 'manifested by discourse']."

What is designated by this concept, for which we dispose of a large variety of ancient and modern translations? The difficulty for recent translators of *lekton* lies less in their choice of verb—there is general agreement, with Baratin and Desbordes, who render *lekton* as *énonçable* (cf. *L'Analyse linguistique*, 72–73), on using the verb *énoncer* in French for *legein* [λέγειν]—than in the question of knowing whether or not the concept entails a nuance of virtuality. Is it a matter of *dicible, exprimable, énonçable* (ibid.)—Long and Sedley translate *lekton* as "sayable"; Brunschwig and Pellegrin as *dicible*—or of *dit* (Long, *Language and Thought in Stoicism,* 77; C. Imbert, "Théorie de la représentation et doctrine logique dans le stoïcisme ancien," 247)?

The *lekton* appears as a correlate of the verb *legein,* in the sense in which Aristotle speaks of a correlate (*antikeimenon* [ἀντικείμενον]) for a relative term: the slave is thus slave of the master and the master master of the slave; knowledge is knowledge of the knowable and the knowable is knowable by knowledge; sensation is sensation of what can be sensed and what can be sensed can be sensed by sensation. In point

of fact, as Claude Imbert (ibid.) indicates, the *lekton* must be understood within the series relating to the act of uttering, *legein, lexis* [λέξις] / *lekton*, parallel to the series of representation, *phainomai* [φαίνομαι], phantasia [φαντασία] / *phantaston* [φανταστόν], of intellection, *noein* [νοεῖν], (*noeisthai* [νοεῖσθαι]), *noêsis* [νόησις] / *noêton* [νοητόν], of sensation, *aisthanesthai* [αἰσθάνεσθαι], *aesthêsis* [αἴσθησις] / *aisthêton* [αἰσθητόν]. Such series allow one to indicate the role of the object of knowledge within the very movement of knowing. Concerning all these cognitive acts and for all sensory activities, one may note the same division within the word "action" as it pertains to the actor and as it pertains to the result of the action, that is, its accomplishment in the object.

Lekton is thus to be understood as *aisthêton* (see SENSE, I and Box 1), *noêton, phantaston.* What remains to be understood is the difference between *lekton, lexis,* and *logos*. It appears that *logos* is distributed into a couplet in two different ways:

1. First in relation to *lexis*, within the part of the dialectic concerned with *phônê*, understood within the division of the signifier: the *lexis* is *phônê eggrammatos* [φωνὴ ἐγγράμματος], "a voice articulated in letters," without for all that being necessarily endowed with meaning, whereas the *logos*, for its part, as utterance or discourse, is simultaneously voice, articulation, and bearer of meaning (see WORD, II.B.2).

2. Secondly in relation to *lekton*, involving the relation between the study of *phônê* and the study of "signifieds." In this second doublet, the distinction between *logos* and *lekton* advances neither by way of articulation, nor by the relation to *phônê*, nor by the distribution of the signifier. If *logos*, as opposed to *lexis*, is necessarily a bearer of meaning, it is because of the *lekton*. Whereas the *lexis* concerns the articulation of the signifier, the *lekton* conceptualizes the discursive situation productive of meaning in the framework of the utterance: the Stoics would distinguish between the meaning that is thought of a given situation (the *nooumenon pragma* [νοούμενον πρᾶγμα]) and the meaning of what is said that exposes it discursively, its *lekton,* which exists in the reality of the act of utterance.

As Gilles Deleuze proposes in *The Logic of Sense*, the *lekton* is nothing other than the sense or the meaning. However, it is not a matter of meaning in general, or of the meaning of a term, but always of the meaning of a statement or a sentence (it can be the meaning of a term only to the extent that a term is always understood by the Stoics as that of an incomplete sentence). That it is a matter of the meaning of a sentence is attested to by the distinction specific to the field of signifieds (cf. Diogenes Laertius, *The Lives and Opinions of Eminent Philosophers,* VII.63), between the "sayable" or "complete saying" (*lekton autoteles* [λεκτὸν αὐτοτελές])—and the "sayable" or "incomplete saying" (*lekton ellipes* [λεκτὸν ἐλλιπές])—for example, one "written," concerning which we ask: "Who?" It is indeed the reference to the meaning of the complete sentence (*lekton autoteles*) that determines the completeness or incompleteness of a linguistic sequence. The distinction between such completeness and incompleteness is part of logic, the study of signifieds. Logical analysis in terms of *lekta*, like the distinction between complete

"sayables" (*lekta autotelê* [λεκτὰ αὐτοτελῆ]) and incomplete "sayables" (*lekta ellipê* [λεκτὰ ἐλλιπῆ]), brings the dimension of the sentence into relief by making explicit the constructability of the complete sentence, separating considerations of syntax properly speaking from the analysis of truth values (true or false).

The distinction between truth and falsity nonetheless intersects with the distinction between complete and incomplete *lekta* in the following way: "it is the 'sayable' that is true or false, but not any 'sayable' at random, since there exist cases that are complete and others that are incomplete" (Sextus Empiricus, *Adversus mathematicos*, M.7.12). What is called an assertion (*axiôma* [ἀξίωμα], see PROPOSITION) partakes of the complete variety of the "sayable," and it is precisely the assertion that Sextus characterizes in these terms: "What is true or false is an assertion (*axiôma estin ho estin alêthês hê pseudos* [ἀξίωμά ἐστιν ὅ ἐστιν ἀληθὲς ἢ ψεῦδος])" (ibid.). The incomplete "sayable," on the other hand, is neither true nor false. Syntactical rules governing the construction of a sentence allow one to add to it what it lacks in order to achieve completeness and, if among the different varieties of the sayable that are complete, an assertion is generated to situate it simultaneously as true or false.

The difference between *logos* and *lekton* is justified by way of the separation between the two parts of the Stoic dialectic: the study of signifiers, on the one hand, the study of signifieds, on the other. *Logos*, however much it partakes of language, is not without a body. The *lekton*, on the other hand, is incorporeal: without the specific *logos* whose "meaning effect" it is, the *lekton* does not exist; it "subsists." How are we to understand the production of an effect of meaning during a speech act? How not to exist before existing without being a potentiality or virtuality? Therein lies precisely what the Stoics call "subsisting" (*huphistanai* [ὑφιστάναι]) for the *lekton*, which exists (*huparchein* [ὑπάρχειν]) only at the moment that the sentence is uttered. The *lekton* would thus be understandable as the sayable/said.

■ See Box 1.

C. Latin (non)translations of *lekton*

A passage from Letter 117 of Seneca (117.13; K. Hülser, *Die Fragmente zur Dialektik der Stoiker,* 892) lists the different Latin translations that have been proposed to designate the "what I am talking about" corresponding to the sentence "Cato is walking," which is not a body, but a "declarative fact concerning a body": *effatum, enuntiatum, dictum*. When he explains that "what is said (*quod nunc loquor*) is not a body," Seneca is certainly thinking of the *lekton*, a particular case of which he is considering, the one that is *enuntiativum*, the *axiôma*; this corresponds to other usages in Latin, in which *effatum* and *enuntiatum* explicitly rendered the Greek *axiôma* (see PROPOSITION); compare to this passage cited by Gabriel Nuchelmans:

"Sunt," inquit, "naturae corporum, tamquam hic homo est, hic equus"; has deinde sequuntur motus animorum enuntiativi corporum. Hi habent proprium quiddam et a corporibus seductum tamquam "video Catonem ambulantem": hoc sensus ostendit, animus credidit. Corpus

1

The Stoic incorporeal

According to the testimony of Diogenes Laertius (*The Lives and Opinions of Eminent Philosophers*, 7.140), "what is capable of being occupied by bodies, without it actually being the case" may be defined as incorporeal. The Stoics recognized four incorporeals: time, place, emptiness, and the *lekton*.

The distinction between body and incorporeal (*asômaton* [ἀσώματον]) partakes of the Stoic theory of causality and its originality. Whereas the body, in keeping with the Platonic definition of being as potency (*dunamis* [δύναμις]; Plato, *The Sophist*, 247e), may be defined as what is able to act or to suffer, the incorporeal is defined by inactivity and impassiveness: "The incorporeal, in their view, by nature does not act or undergo anything" (Sextus Empiricus, *Adversus mathematicos*, 8.263). More precisely, "No incorporeal interacts with a body, nor a body with an incorporeal, but a body with another body" (Nemesius, SVF [Stoicorum Veterum Fragmenta] 1.117; Long and Sedley, *The Hellenistic* *Philosophers*, 45.C). Now, a body is a cause for another cause of an incorporeal effect: "Every cause is a body and is a cause for a body of an incorporeal [effect], for example: a scalpel, which is a body, is a cause for the body that is wood of an incorporeal [effect], the predicate 'to be burned'" (Sextus Empiricus, *Adversus mathematicos*, 9.211). Émile Bréhier's analysis of this passage is worth retaining:

When the scalpel slices the flesh, the first body produces on the second not a new property, but new attribute, that of being cut. The attribute does not designate any real quality. . . . [It] is always, on the contrary, expressed by a verb, which means that it is not a being but a manner of being. . . . This manner of being is located, in some sense, at the limit, at the surface of the being and it cannot change its nature; it is, in truth, neither active nor passive, since passivity would presuppose a corporeal nature undergoing an action. It is purely and simply a result, an effect not to be classified among beings.

[The Stoics distinguish] radically, something that no one had done before them, two levels of being: on the one hand, deep and real being, which is force; on the other hand, the level of facts, which are played out at the surface of being and constitute an endless multiplicity of incorporeal beings.

(*La théorie des incorporels dans l'ancien stoïcisme*, 1–2)

The originality of the Stoic theory of causality lies in this "rupture of the causal relation" (G. Deleuze, *The Logic of Sense*), which joins causes with each other and effects with each other; it also lies in the fact that principle and cause are not incorporeals; they are active and productive, and thus corporeal. The incorporeal is not the higher degree of reality, and corporeal reality is in no way its degradation.

est quod video, cui et oculos intendi et animum. Dico deinde: "Cato ambulat. Non corpus," inquit, "est quod nunc loquor, sed enuntiativum quiddam de corpore, quod alii effatum vocant, alii enuntiatum, alii dictum."

("There are," it is said, "certain natural classes of bodies; we say: 'This is a man,' 'this is a horse.'" Then there attend on the bodily natures certain movements of the mind which declare something about the body. And these have a certain essential quality which is sundered from the body; for example: "I see Cato walking." The senses indicate this, and the mind believes it. What I see, is a *body*, and upon this I concentrate my eyes and my mind. Again, I say: "Cato walks." "What I say," they continue, "is not a body; it is a certain declarative fact concerning a body—called variously an 'utterance,' a 'declaration,' a 'statement.'")

(*Theories of the Proposition,* 108)

These terms cannot translate precisely the Greek *lekton*, the terms *effatum, enuntiatum,* and *dictum*, indicating solely the content of a *complex* linguistic sequence. The perspective, in point of fact, has changed. The Stoic focus on the notion of predicate, and the distinction between complete (*autoteles*) and incomplete (*ellipes*) *lekton* has disappeared and given way to an opposition between simple and complex: thus does Augustine, in *De dialectica*, contrast *verba sumplicia* with *verba conjuncta,* while distinguishing among the latter those that have a complete meaning. Whereas for the Stoics the incomplete *lekton* was a predicate, for Augustine one arrives at an incomplete sequence of words (*verba conjuncta*) by excising, for example, from the complete sequence *homo festinans in* *montem ambulat* (a man in a hurry walks toward the mountain) the verb *ambulat* (M. Baratin, *La naissance de la syntaxe à Rome*, 408–13).

Because of this opposition between the simple and the complex, it appears that "the sayable," which is to be found only in Augustine's *De dialectica*, cannot be regarded as a translation of *lekton*: it is, in fact, introduced as a pendant of *dictio* in the remarkable series *verbum, dicibile, dixtio, res* (see WORD, Box 3); it thus corresponds to the mental content of a simple word, which is occasionally said by Augustine to be prior to the utterance of the word (*dictio*), occasionally simply contained in the word, and at still other times to be understood by it in the mind of the listener. Here too the perspective has changed: meaning is no longer realized, as with the Stoics, solely in the *lekton autoteles.* There can be meaning, and thus a junction between form and content, at the level of the simple word. The *dicibile*, despite the suffix –*ibile*, which normally indicates potentiality, is thus capable of existing either as a potential or an act. It is perhaps on the basis of this term that the term *enuntiabile* would be forged, a term that would be used in the Middle Ages, along with *dictum*, to designate that content, but insofar as it belongs to the *enuntiatio* or the proposition (see DICTUM).

The term *sententia*, on the other hand, designates the content expressed in a linguistic sequence, which can be either simple or complex; in most cases, it is a rendering of the Greek *dianoia* [διάνοια], particularly for the grammarians, but it is clear that it can also render the Greek *lekton*—that dimension of thought insofar as it is expressed by words being so strong for the Romans that they occasionally use the term for expression itself. As evidence of all these difficulties, we shall adduce in conclusion Aulus-Gellius, who,

giving the Greek definition of *axiôma—lekton autoteles apophanton hoson eph' hautôi* [λεκτὸν αὐτοτελὲς ἀπόφαντον ὅσον ἐφ᾽ αὑτῷ] ("an intrinsically declarative complete statement")—specifies that "I have foresworn translating, since I would have had to use new and unknown words, which would have shocked our ears." And he continues by giving Varro's "excellent definition": *proloquium est sententia in qua nihil desideratur* ("an assertion is a statement in which nothing is lacking"), in which *sententia* has taken the place of *lekton* (Aulus-Gellius, *Attic nights,* XVI.8; cf. G. Nuchelmans, *Theories of the Proposition*, chap. 7, and A. Garcea, "Gellio e la dialettica," 125–35).

III. *Signans/Signatum*

In medieval Latin, the term *signum* is often ambiguous and designates either the sign in its entirety or only the signifier, for which we also find *signans*, in opposition to the signified *signatum.* The elaboration of Augustine's *De dialectica*, which distinguishes *dictio* and *dicibile*, but within a system of four

terms including as well *res* and *verbum* (see WORD, Box 3), would remain virtually unknown subsequently. As far as complex entities are concerned, the terminology is occasionally unstable: even though, at the time the terminology was created in the twelfth century, the *dictum* ("what the proposition says") was distinguished from its "name," the *appellatio dicti* (for example, *Socratem currere* is the name of the corresponding *dictum*), the terms *dictum* and *enuntiabile* at times designate the signifier and at others the signified of the proposition, such imprecision compounding the one frequently observed in the term *propositio* itself (see DICTUM and SACHVERHALT).

The *signans*/*signatum* doublet and the theory of sacrament

The *signans*/*signatum* (signifier/signified) doublet appears in the very precise context of the definition of "sacraments" in the twelfth century. Peter Lombard, whose *Sentences* would remain the basis of the teaching of theology as of the second half of the twelfth century, begins his treatise of sacraments as follows:

> What is a sacrament? Augustine, in Book 10 of *The City of God* [CCIm 47, 277]: "A sacrament is a sign of a sacred thing (*sacrae rei signum*)." It is also said that a sacrament is a "sacred secret" . . . in such manner that the sacrament is a sacred signifier and a sacred signified (*sacrum signans et sacrum signatum*). But at present we shall deal with the sacrament insofar as it is a sign.

(*Sentences*, Book 4.1.c.2, p. 232)

The definition of the sacrament as a "sign," understood here as a signifier ([*signans*), is the result of a long history. The first Christian rites, such as the laying on of hands, unction for the ill, were initially perceived as distinct rites, which were first called *mustêria* [μυστήρια], this term designating as well, as in all initiatic practices, the hidden mysteries or designs of God. Until Augustine, the terms *mysterium* and *sacramentum* would be used in both senses. Under the influence of the Greeks and Origen, the symbolic value of the rite was accorded prime importance, but this opened on to "symbolic" exegetical reading more than to a redefinition of the sacrament. It was by developing this allegorical reading that Augustine made of the *sacramentum* a

synonym of *signum*. The facts and episodes of the Old Testament were not simply to be known, but to be interpreted in their value as signs, that is, as granting to be known something *other* than what they were in themselves. Christian sacraments are signs referring to a signified, the *res sacramenti*, which was, for Augustine, essentially the commemoration of Christ, and they were in addition bearers of multiple symbolic values, such as the purification associated with baptismal immersion. For him, the sacramental effect, grace, was the *virtus* or *vis sacramenti*, but was not its signified, whereas subsequently, when the sacrament would be defined as "effectuating what it means," signified and effect would coincide (see SPEECH ACT). The distinction between *signum* and *res* was at the heart of Augustine's analysis: every teaching bears either on signs or on things, and things can be said only by signs. Certain things are only things, others are simultaneously things and signs, and signs can be such only if they are used to signify something other than themselves (see SIGN). Christian sacraments are thus indeed signs, and "sacred signs," visible or sensory forms providing access to invisible realities; and, like all signs, they refer to a *res*, which is in this case *res sacra*, with which they entertain a situation idiosyncratic to them, a relation of "similitude" (concerning the distinction between *dicibile* and *res,* see WORD, Box 3).

Despite Augustine, it was the definition of sacrament as "mystery" that would

endure for several centuries. The stakes in the redefinition of the sacrament as "sign" were associated with a very precise debate on the nature of the Eucharistic conversion. Berenger of Tours, in the eleventh century, argued that the bread and wine continued to be such after consecration, but were transformed from pure things (*res*) into signs, signs of the body and blood of Christ. Bread and wine changed their status but were not annihilated. Whereas, when Moses's staff was changed into a serpent, there was the new presence of a serpent that had not existed before, in this case there was not, Berenger maintained, a new thing that began to be, since Christ exists for all eternity. He emphasized the relational nature of the sign: what acts as a sign is necessarily *ad aliquid*, and consequently in relation with a signified. I can thus not be accused, Berenger protested, of saying that the bread and wine would be *only* sacraments; indeed, since I posit that they become signs, I am necessarily positing at the same time the *res sacramenti*. The body of Christ could not be that *res* if the sign were totally annihilated. The sign (*signum*) and the signified (*signatum, res*) must be distinct, and it can thus not be said that the sacrament *is* the body of Christ. Despite the condemnation of Berenger, this discussion would have a great influence. It was with reference to it that theologians of the following generation would speculate as to whether the sacrament was a "signifier" (*signum, signans, significans*) or a "signified" (*res significata,*

signatum, *significatum*), and, in the case of the Eucharist, a "figure" (*figura*) or "truth" (*veritas*). It was in this context that *signans/signatum* or *significans/significatum* first appeared as a pair. The difference between the two pairs is impossible to determine with precision: in manuscripts, in fact, and varying with historical periods, a common abbreviation can be used ambiguously and interpreted, in keeping with the habits of the publisher, as *sign-* or *signific-*. To be sure, the two possibilities existed, but the pertinence of their difference was not necessarily reflected by the very different conditions of the manuscripts currently available to us. It should be emphasized that these terminological pairings were virtually never applied to the linguistic sign: if *significatum* or *res significata* were frequently used for the signified, it was most commonly done for the signified of a word (*dictio*, *vox*), more rarely of a sign (*nota*, *signum*). It will be understood that the pairing appeared in a context in which it was a matter of resolving an essential point: Was the sacrament *signans*, *signatum*, or both simultaneously?

Despite the assignment, drawing upon Peter Lombard, and in a durable manner, of the sacrament to the category of signs, the question would continue to be raised, with certain authors accepting, against Augustine, the notion that a sign can be a sign or form of itself, and there is not necessarily a difference between a sign and a signified (cf., for example, Innocent III, *De sacramento altaris*, RT: *PL*, vol. 217, col. 881D: "Sacramentum autem actem active et passive dicitur, quasi sacrum signans et sacrum signatum . . . Corpus Domini, cum utroque modo dicitur sacramentum, est scarum signum et sacrum signatum" [The sacrament may be said in both active and passive manner, as sacred signifier and sacred signified. . . . The body of the Lord, since the sacrament may be said according to those two modes, is sacred signifier and sacred signified].). Augustinian terminology would result in a new distinction, allowing one to oppose what is *sacramentum tantum* (for example, bread and wine, or the water of baptism), *sacramentum et res* (the body of Christ, *res* in relation to the sign, *sacramentum* in relation to the mystical body that it signifies, or the character imprinted by baptism), and *res tantum* (the mystical body).

publication based on notes of his students who attended the courses given by the linguist between 1907 and 1911 at the University of Geneva. Saussure's metalanguage was based on stipulative definitions. In certain cases he gives a new technical definition of a term or expression with established usage—and even "takes up a traditional word and makes it serve reverse ends" (Milner, *Le périple structural*, 31)—and, in other cases, he forges terminological innovations in order to avoid ambiguities linked to terms used in ordinary language.

First of all, "the linguistic sign unites not a thing and a word but a concept and an acoustic image" (Saussure, CLG [1966]): the relation of designation between language and the world, or, less crudely, between the sign and its referent, must not be confused with the relation of signification intrinsic to the sign. This refusal of the principle of nomenclature, which presupposes a prior reserve of things designated by a label and implies that the meaning of a word corresponds to a fragment of reality, is as perfectly compatible, contrary to what is frequently affirmed, with Aristotle as with the Stoics: each did indeed carefully distinguish between the indication of an outside, or referentiality, and the signification required by the internal functioning of the sign as such (see SIGN). On this point there is a line of transmission that goes from Aristotle to the Stoics to Saussure, even if the articulation between those two relations is not identical.

It was only at the end of his third course, in 1913, that Saussure forged the terms "signified" and "signifier" to replace, respectively, those of "concept" and "acoustic image." That terminological choice was felicitous, since it brought into relief the dependence of that couple in relation to the totality of the sign:

> We propose to . . . replace *concept* and *acoustic image* respectively with *signified* and *signifier*; those latter terms have the advantage of marking the opposition which separates them either from each other or from the totality of which they form a part.
>
> (CLG)

Here the Aristotelian legacy has been abandoned. For Aristotle, in point of fact, to signify was to signify something, and the sign taken as a whole was to be analyzed only in its relation to what it signified, not as an internal duality signaling a pair of participles (*signifiant, signifié*) that are, moreover, if not unfindable in his thought, at least not terminological in intent (*sêmainonta* [σημαίνοντα] / *sêminomena* [σημαινόμενα]) (see *De interpretatione*, I, commented on in SIGN, Box 1). On the other hand, the pair of terms *semainon/semainomenon* is indeed Stoic, and that is why Stoicism, in its very anti-Aristotelianism, is frequently said to be a precursor of Saussurean linguistics. In point of fact, the pair of terms is Stoic, but their coupling is already less so. For the first Stoic observation is that one can have a signifier without a signified (for those who don't "understand" the language), whereas the linguistic entity considered by Saussure exists solely as two-in-one (the "chemical compound" of the signifier and the signified, on the model of water composed of oxygen and hydrogen [CLG], one side for thought, the reverse side for sound to be segmented and cut apart on the sheet of paper that language

is [ibid.]). Which brings us to another difference: the Saussurean signifier and signified are homogeneous, both being "psychical"—Saussure specifying carefully that with the signifier we are not dealing with the "material sound, something purely physical," but with the "psychical imprint of that sound," which is present as well in the inner conversation that we hold with ourselves "without moving either our lips or our tongue" (ibid.); so much so, moreover, that Saussure will be able to characterize the signifier (understood, it is true, as value and difference, opening consequently onto a comparative systematic foreign to simple signification) as an incorporeal: "In its essence, the linguistic signifier is not at all phonic; it is incorporeal, constituted, not by its material substance but solely by the differences that separate its acoustic image from all the others" (ibid.). The Stoic signifier and signified, on the contrary, are heterogeneous: the first, contrary to Saussure's signifier, is a body, whereas the second is a thought-content, which, depending on one's perspective, may be more or less incorporeal or embodied (the *sêmainomenon* properly speaking designates the thought-content embodied in a signifier, but it is an incorporeal *lekton* insofar as it is only virtually uttered, and a *pragma* independently of all embodiment [Baratin, *La naissance de la syntaxe à Rome*). The Stoic connection between signifier and signified is thus thoroughly dynamic, linked not to an "abstract conception of language" (Imbert, "Théorie de la représentation"), but to the event of speech acts that incorporate and embody what is sayable, such that each of the two series, signifiers and signifieds, has its degrees and its autonomy.

"Those who have been formed by Saussure literally no longer understand texts from before Saussure. Saussure rendered the Stoics opaque . . . he rendered Saint Augustine opaque . . . he rendered Arnauld and Nicole opaque and, with them, if Foucault is right, all of classical philosophy by instituting a symmetrical and reciprocal model of the sign" (Milner, *Le périple structural*). In Saussure, in point of fact, one does not begin with two separate entities (sign/thing, signifier/signified) arbitrarily joined, but from a single one, the sign, which is divided by analysis into "two faces." It is the absence of all relation between those two faces ("suppose that one designs a figure on the front side, it is clear that it entertains no 'relation' with the figure one might eventually design on the reverse side" [Milner, *Le périple structural*]) that is encapsulated in the word "arbitrary": as Milner notes, "one should not confuse the arbitrariness characterizing a certain type of relation and the arbitrariness characterizing the absence of all relation" (ibid.).

This is why the concept of *value* appears to be central in Saussure's theoretical edifice. Given that signs are not delimited in advance, how is one to end up with an association of a signifier and a signified? One must begin with a solidary totality, the system, in order to grasp the linguistic units. That association can occur only through speech, which is, in a sense, the external document of language (CLG). The segmentation of elements into signs implies a comparison of different manifestations of the alleged element in different surroundings. For instance, the phonic sequences *donne-moi ton porte-plume* (give me your pen-holder) and *cet animal porte plume et bec* (that animal has feathers and a beak) constitute different units as a function of their difference in value. With this method, one arrives as much at signs shorter than the word, such as suffixes and inflexions, as at signs longer than the word, namely: syntagms. It is value that effects the delimitation of signs and the association of signifier and signified. Value is characterized as relative, differential, and negative: a linguistic unit exists only in relation to other units, and by virtue of what surrounds it (cf. CLG). It is important not to confuse the conceptual aspect of value with *signification*, which is the counterpart of the auditory image and which, consequently, is equivalent to the concept or the signified (ibid.). In the contrary case, one regresses back into the principle of nomenclature, which takes the "word as an isolated and absolute whole" (ibid.). Value is above all determined by signs that belong simultaneously to a system.

B. How to translate Saussure?

Should translators attempt to inject French terminology onto a preexisting terminology in the target-language, or should they attempt to forge a vocabulary even as they obey the linguistic system of the language concerned? To translate the words *signifiant* (signifier) and *signifié* (signified), they can follow Saussure's logic and begin with the (French) word *signifier* in the target-language, from which they will derive the signifiers for the terms *signifiant* and *signifié*. This can be explained by the principle of motivated arbitrariness: in this case there is partial agreement of the associative series concerning the signifier and the signified, in function of a systematic solidarity.

Here are various translations of Saussure's lexicon, as well as subsequent commentaries that translators have offered on the subject. Consider the chart below:

Key words concerning the Saussurean linguistic sign with their principal European translations.

At present, there is only one translation of the *Cours de linguistique générale* into German, dating from 1931. Herman Lommel was the first to reconstitute Saussurean terminology in a European language. In the German linguistic tradition, the established notions of *Lautbild* and *Vorstellung* preceded the Saussurean notions of "acoustic image" and "concept," which was propitious for the translation of the latter pair (cf., for example, Hermann Paul, *Prinzipen der Sprachgeschichte*, 1880). The equivalents of the terms "signifier" and "signified" were molded from the verb *bezeichnen* following the French model. One thus arrived, on the one hand, at *Bezeichnetes*, the neutral form of the past participle, and, on the other, at *Bezeichnendes*, the neutral form of the present participle, or indeed at *Bezeichnung*, through nominalization of a verbal form, those two last terms being used with a certain looseness insofar as the designation of the signifier is concerned. In the postscript of the second edition of Lommel's version (1967), Peter von Pohlenz judged that a new translation of the *Cours* was needed, which might take into account the evolution of linguistic terminology. He alternately used the gallicized forms of *Signifikant* and *Signifikat* to designate *signifiant* and *signifié.* One also encounters the terms *Zeichenausdruck* (expression of the sign) and *Zeicheninhalt* (sign content).

W. Baskin (*Course in General Linguistics*, 1959), the first translator of the *Cours de linguistique générale* into English, appears not to have encountered any problems with regard to terminology concerning the sign. It is true that in his day, translations of the Saussurean terms had already been established in Anglophone linguistics. Nonetheless, in his translation of the *Cours* in 1983, R. Harris effected a considerable renewal of Saussure's terminology. He claimed that translators and commentators had done a disservice to Saussure's thought because of their poor translations (*Course in General Linguistics*, 1983, xiii). According to Harris (ibid., xv), the term "sound image" proposed by Baskin to render "image acoustique" suggests the combination of a written word and a spoken word, as though the words had been stored in the brain in quasi-graphic form. In its place, Harris prefers "sound pattern," an expression that, according to him, better translates the auditory impression constructed by the mind. As far as the translation of *signifié* and *signifiant* are concerned, Harris renounces the terms "signified" and "signifier," opting respectively for "signification" and "signal." The term "signification" can be easily confused with the term "meaning," which in turn is an equivalent of the French term *signification.* As for the use of the term "signal" to designate the *signifiant*, it is not particularly successful, since in suggesting that the sound is the bearer of a message, the word omits the psychical nature of the signifier. These idiosyncratic choices do not appear to have met with much favor from linguists, with the result that in his translation of Saussure's third course, on the basis of manuscript sources, Harris (*Saussure's Third Course*, 1993) reformulated the terms under the labels "signified element" and "signifying element." The translator justified this terminological fluctuation in terms of the difference of the two audiences to whom the two translations were addressed: that the translation of the published *Cours de linguistique générale* was intended for students wishing to become acquainted with a classic text of linguistics, whereas that prepared from manuscript sources was addressed to specialists apt to understand a more elaborate metalanguage (*Saussure's Third Course*, xvii). The infidelities of Harris's translation compared with Baskin's should be attributed to Harris's concept of translation. For according to him, translation is an analysis and an interpretation rather than a rendering (ibid., *Saussure's Third Course*, xx).

In as much as it is a Germanic language, Swedish functions in a manner identical to German. In the Swedish linguistic literature, there now appears to be a pedagogical tendency

to substitute ordinary terms for technical terms. To translate the terms *signifié* and *signifiant*, A. Löfqvist, the translator of the *Cours de linguistique générale* into Swedish, opted for a translation offering the reader a fallaciously facile access to the text. In ordinary language, the term *uttryck* used to designate the *signifiant* has the sense of "expression, form." The dictionary defines *uttryck* as "audible sign" along with other meanings. The word thus has the same shortcoming as the term "signal" in English. *Signifié* is translated by a term as dubious as its counterpart, namely the word *innehall*, which in English would give "content." Yet that usage, which follows the model of the German terms *Zeichenausdruck* and *Zeicheninhalt*, is currently sacrosanct in Swedish. Bertil Malmberg implicitly voiced disapproval of that terminology by substituting the terms *betecknat* (signified) and *beteckning* (signifier), derived from the verb *beteckna*, which better obeys Saussure's logic. In the literature, one also encounters the pair *signalerade* and *signalerande*.

The Romance languages accommodated the French terminology without difficulty. The translator of the *Cours de linguistique generale* into Spanish, Amado Alonso, does not discuss any difficulties translation might raise in relation to the theory of the sign. The Italian translator, on the other hand, is more murky on the subject. In the preface to his Italian translation, Tullio De Mauro claims to have respected the structure of the sentences and the vocabulary of the original (cf. *Corso di linguistica generale*, xxi). The use of the words *significant* and *signifié* as nominal participles did not have a precedent in French before Saussure. It was, above all, with the translation of the term *signifié* from the verb *significare* that the Italian translator encountered difficulties. The notion of *significato* already existed in the language, but was the equivalent of the French *signification*, a term that the Italian translator did not hesitate to render as *significazione*, a rather rarely used word that referred rather to the act or the effect of the verb *significare*. In his commentary on the *Cours*, moreover, De Mauro concludes that "it is not clear that Italian, possessing as it does a familiar word like *significato* to render without difficulty Saussure's *signifié*, derives any advantage from it." The Spanish translator was also confronted with this terminological problem since the word *significado* is synonymous with *significación*. This allowed De Mauro to conclude that given "the facile linguistic equivalence, the Saussurean notion [of the *signifié*] would be subject to all the 'vagueness and indefiniteness' . . . connoted by the familiar word *significato* and, in other languages, by words like *Sinn, Bedeutung,* 'meaning,' *signification*, etc." (*Corso di linguistica generale*).

V. Psychoanalytic Terminology

A. "What is the signifier?"

What is the signifier? Jacques Lacan offers this explanation:

> The signifier—as promoted by the rites of a linguistic tradition that is not specifically Saussurian, but goes back as far as the Stoics and is reflected in Saint Augustine's work—must be structured in topological terms. Indeed, the signifier is first of all that which has a meaning effect (*effet de signifié*), and it is important not to elide the fact that between signifier and meaning

effect there is something barred that must be crossed over.

> ("To Jakobson," in *Encore.
> The Seminar of Jacques Lacan*, trans. B. Fink)

Lacan, who inherited the precursors discovered by Jakobson, reconceived the signifier outside of linguistics, as part of his psychoanalytic *linguisterie*: he inverted the Saussurean schema of signified/signifier (Saussure: signified/signifier [*Cours de linguistique générale*]; Lacan: S/s, "which is read: signifier over signified" ["The Instance of the Letter in the Unconscious, or Reason Since Freud," in *Écrits*, trans. B. Fink]). In thus placing the signifier above the bar, he promoted the autonomy of the signifier, which he understood "in the active sense" (Milner, *Le périple structural*) as a "signifying" or *signifiance"* and not as signification ("what has the effect of being signified" would not be able to be linked to a signified that it would express). Lacan is thus able to insist on the bar: if "the unconscious is structured like a language" (see *Encore*, trans. B. Fink, 15), it is in the sense that the bar strikes the speaking subject who does not know what he or she is saying ("the fact that the *S* and the *s* of Saussure's algorithm are not in the same plane, and man was deluding himself in believing he was situated in their common axis, which is nowhere" ["The Instance of the Letter in the Unconscious, or Reason since Freud," in *Écrits*, trans. B. Fink, 430–31]). The Lacanian rereading of Freud thus works as a recentering on the signifier, linked to dreams ("from the first chapter of the *Traumdeutung*, [Freud] brings to the forefront that *the dream is a rebus*, and no one notices it" [*Le séminaire*, Livre 4: *La relation d'objet*, 294]), to jokes ("it does not appear to have been noticed that the analysis of jokes begins with the diagram of the analysis of a phenomenon of condensation, the word *famillionaire*, a fabrication based on the signifier, via the superimposition of *familiar* and *millionaire*" [ibid.]). The signifier or, more precisely, "signifying activity" (*du signifiant*), which insists on the symptom, characterizes a subject in the manner of a symbolic nominalization ("determining the acts, words, and destiny of a subject unbeknownst to him," in the radical formulation of E. Roudinesco and M. Plon [RT: *Dictionnaire de la psychanalyse*, s.v. "Signifiant"]). "My definition of the signifier (there is no other) is as follows: a signifier is what represents the subject to another signifier. This latter signifier is therefore the signifier to which all the other signifiers represent the subject—which means that if this signifier is missing, all the other signifiers represent nothing. For something is only represented to ("The Subversion of the Subject and the Dialectic of Desire in the Freudian Unconscious," in *Écrits*, trans. B. Fink, 693–94]): this definition manifests the manner in which active and passive, subject and signifier, have switched their traditional places.

B. The play of the signifier and the existence of the real

The place occupied by the signifier in psychoanalysis opens onto a perception of language that is completely different from that of (classically Aristotelian) philosophy. "The giant of language recovers its stature at being suddenly delivered from the Gulliverian bonds of meaning" ("Situation de la psychanalyse en 1956," in Lacan, *Écrits*, 470). This is intrinscally linked to the analyst's way of listening to the

punctuation of therapy: "We repeat to our students: 'Beware of understanding!' . . . Let one of your ears grow as deaf as the other should be acute. And that's the one you should focus on listening to sounds or phonemes, words, locutions, maxims, without omitting pauses, scansions, interruptions, periodic expansions and parallelisms, for there is where the word-to-word of translation is prepared, without which analytic intuition has neither basis nor object" (ibid., 471).

It is, however, not so easy to take leave of Aristotle. Thus in the seminar on object relations (*Le séminaire*, Livre 4: *La relation d'objet*), which was held in 1956–57, Lacan hesitates, as Freud himself did in *Jokes and Their Relation to the Unconscious*, between according privileged status to the signifier's relation to sense or to *non*sense. The signifier is linked to sense or meaning insofar as it is vulnerable to effects of homonymy, that is, multiple meanings (see HOMONYM): as Lacan emphasizes with regard to Little Hans and his horse, "the symptomatic signifier is so constituted that its nature is to cover in the course of development multiple signifieds, and as different as can be. Not only is it its nature to do so, but that is its function" (*Le séminaire*, Livre 4: *La relation d'objet*, 288). Analyzed in these terms, the signifier promotes the invention and creation of meaning: "Man, because he is man, is confronted with problems which are as such problems of signifiers. The signifier, in fact, is introduced into the real by its very existence as a signifier, because there are words which are spoken, sentences which are articulated and follow each other, joined by a medium, a copula on the order of *why* or *because.* Thus it is that the existence of the signifier introduces into the world of man a new meaning" (ibid., 293).

But occasionally Lacan insists instead on the manner in which the signifier, far from creating meaning, annihilates it:

All that Freud would subsequently elaborate consisted in demonstrating the effect of annihilation, the

veritably destructive, disruptive character of the play of the signifier in relation to what can be called the existence of the real. In playing with the signifier, man persistently calls into question his world, unto its very roots. The value of the joke, and what distinguishes it from the comic, is its capacity to play on the fundamental meaninglessness of every use of meaning. At any moment, it is possible to call into question every meaning insofar as it is based on a use of the signifier. In point of fact, that use is in itself deeply paradoxical in relation to all possible signification, since it is that very use which creates what it is intended to sustain.

(*Le séminaire,* Livre 4: *La relation d'objet*, 294)

From Freud's *Jokes and Their Relation to the Unconscious*, read as a new version of Gorgias's *Treatise of Non-Being*, Lacan gleans the destruction and disruption of the existence of the real (and for reasons similar to those of Gorgias). It is necessary and sufficient to show that meaning, or the sphere of being, ontology, and so forth, rests on a *husteron proteron* [ὕστερον πρότερον], a "latter before," that can be called "paradoxical": only the use of the signifier creates meaning, or further still, being is an effect of speech. "It is that very use which creates what it is intended to sustain," and that is why everything is subject to collapse: "it becomes quite *funny*, with all that that word *drôle* may contain in the way of strange resonances" (*Le séminaire,* Livre 4: *La relation d'objet*, 295; see INGENIUM, NONSENSE, and SPEECH ACT).

"Signifier," *lekton*, and *point de capiton* (quilting point)

We need to grow accustomed to handling schemata scientifically adapted from an ethic— in this case that of the Stoics—of the signifer and the *lekton*. And one sees immediately that *lekton* does not afford a good translation. One keeps it in reserve and plays a bit with the signified, more accessible and more hospitable to those who find themselves in it, in the illusion that their thoughts on the subject might be worth anything more than garbage.

I say to whomever is prepared to hear it, since such an articulation presupposes a discourse having already registered its effects, effects of the *lekton* precisely. For it is from the practice of a doctrine in which it is demonstrated that the insistence of what is uttered is not to be held as secondary in the essence of speech that my term

the *point de capiton* or quilting point takes shape. Wherein *lekton* comes to be translated in a way agreeable to me, without my boasting about it, being far more than an expert on Stoicism a stoic from the get-go when it is a matter of determining what might be taken up anew of it.

(Lacan, preface to the French paperback edition of *Écrits* [1969])

The Stoic signifier, considered as *lekton*, would be translated as *point de capiton* or "quilting point." This is because the *lekton* effectively blocks the "incessant sliding of the signified beneath the signifier" characterizing Saussure's linguistics:

All experience argues against it, which had me speaking, at a certain moment

of my seminar on psychoses, of "quilting points" required by that schema to account for the dominance of the letter in the dramatic transformation that dialogue can effect in the subject.

(Lacan, "L'Instance de la lettre dans l'inconscient," in *Écrits*, 502–3)

This understanding of the signifier as *lekton* makes in particular for the difference between the meanings of metaphor and metonymy for Jakobson and Lacan. Jakobson situates metaphor and metonymy "of the signifying chain," Lacan specifies, as "the substitution of one signifier for another for the one, and the selection of a signifier in its sequence for the other. From which it follows (but only for Jakobson: for me

(continued)

(*continued*)

the result is different) that the substitution is by way of similarities, the selection by way of contiguities" ("Radiophonie," Question 3, in *Autres écrits*, 415–16). For Lacan, what counts is rather the manner in which, within the chain, a signifier is knotted or stitched to the signified in order to produce signification: and there lies the *lekton*, "which renders legible a signified . . . ; it is what I termed the 'quilting point' [or *point de capiton*] in order to illustrate what I will call the Saussure effect of disruption of the signified by the signifier, specifying that it corresponded quite precisely to my esteem for the mattress-audience reserved for me, since I was, of course, at Sainte-Anne, albeit composed of analysts" (ibid.).

The rest of the signifying operation would later become the object *a*, the unassignable cause of desire, which disables the causal relation at the very moment in which it brings it into play. Defined in terms of the nonbiological object of the Freudian drive, which finds its bodily contingency in the erogenous zones (interruptions finding "favor in the anatomical trait of a margin or an edge" [*subversion du sujet et dialectique du désir dans l'inconscient freudien*] in *Écrits*, 817), it is outside of language but gives it its overall consistency. The object *a*, condition of the unconscious, is characterized as being "incorporeal," a term attributed explicitly by Lacan to the Stoics: "Let us render their due to the Stoics for having managed with this term—incorporeal—sign wherein the signifier exercises its hold on the body" ("Radiophonie," in *Autres écrits*, 409). Or more clearly still, and exactly at the same time: "Where to situate it, this object *a*, the principal incorporeal of the Stoics? In the unconscious or is it elsewhere? Who is to know?" (*Autres écrits*, 402).

The *point de capiton* is an operator, and *a* is what remains afterward, on the model of a catalyst. It would appear that the topological model of the cross cap, which allowed Lacan to transcribe what clinical practice taught him, authorized him after the fact to read in the Stoics, no doubt thanks to his discussions with Jakobson, what the Stoic *lekton* anticipated of his own theory.

| SILENT

"Silent" is, along with "motionless," one of the possible translations of the German *still*, a topos of classical aesthetics: see STILL, and AESTHETICS, CLASSIC, SUBLIME. Cf. *SERENITY, WISDOM.*

➤ *NOTHING*, WORD IV.A

| SOBORNOST' [соборность] (RUSSIAN)

ENGLISH   conciliarity, conciliation
FRENCH   *conciliarité, collégialité, communauté, solidarité*

➤ *CONCILIARITY,* and BOGOČELOVEČESTVO, MIR, NAROD, OIKONOMIA, PRAVDA, RELIGIO, RUSSIAN, SAMOST', SECULARIZATION

Sobornost' [соборность], since Khomiakov, has designated the collegial nature of the Church, its capacity to surmount the individual even as it respects the freedom of each person. A Slavophile concept par excellence, it quickly exceeded the limits of theology and currently refers to a fundamental quality of Russian life, Russian thought, and even Russian culture.

I. The Church: Place of Assembly and Not of Dogma

The translation of the word might be "conciliarity" or even "synodality" to the extent that the councils of the Church are called in Russian *sobor* [собор], from the root *bor-*, which means "to take," and from the prefix *so-*, which means "with." The *sobor* is the assembling of the entire Church. It also designated in Russian the assembly of the land of Russia in the person of its representatives elected by the different estates of the Old Regime, boyars, merchants, clerics, peasants, and that assembly was called *Zemskij Sobor* [земский собор]. Ecumenical councils were called *vselenskie sobory* [вселенские соборы]. Finally, since the cathedral in which the bishop officiates is not considered primarily in Orthodoxy as a place of teaching, a *cathedra,* but as a place of assembly for the people of believers, it too is designated by the word *sobor*, which might in such circumstances be translated as a church or "college of clerics." But in Russian *sobor* can be immediately supplemented with *kafedral'nyi* [кафедральный], which comes from *cathedra* and refers to the notion of the place where dogma is proclaimed.

II. A Lay Theologian and Soldier, Alexis Khomiakov

The term *sobornost'* [соборность], destined to undergo a great extension, was used for the first time—in order to define the nature of orthodoxy—by a lay theologian of the nineteenth century, Alexis Khomiakov (1804–60), who was also an officer, a poet, and a dramatist. The term thus comes from the expanded lexicon of religion. It quickly became a key word in Russian Slavophile thought, before being broadened to political, philosophical, and literary thought. It can be translated as "free and unanimous collegiality." In 1989 a current theoretician of semiology, Viatcheslav Vsevolodovich Ivanov, a member of the last Supreme Soviet of the U.S.S.R., issued an appeal to the spirit of *sobornost'* so that Russia might move

harmoniously from one political regime to another. Works on *sobornost'* in Russian literature and thought appear daily.

Sobornost', along with *pravda* [правда] (justice-truth) and *narodnost'* [народность], is thus one of the major concepts through which Russia would differentiate itself from the Occident, which is regularly accused of rationalism and individualism. *Narodnost'* designates the national popular spirit, while *sobornost'* is the spirit of unity through the freedom of individuals.

■ See Box 1.

In German the distinction forged by Tönnies in 1887 between *Gesellschaft* and *Gemeinschaft* partakes of the same typology, essentially distinguishing between the abstract categories of social science and concrete, living categories, in brief, between a written contract and the living union that needs no contract. (Yuri Lotman expresses astonishment that even as mystical a saint as Francis of Assisi needed to sign a contract with his wolf [Lotman, " 'Dogovor' i 'vručenie sebja' kak arxetipičeskie modeli kult'tury," 3: 345]). Between the Western state and the family, which the collective life of the Slavic community resembles according to Slavophiles, there lies all the difference between *Gesellschaft* and *Gemeinschaft* (see CIVIL SOCIETY, Box 1).

III. *Sobornost'* and Catholicity

It is thus in a text in French by Khomiakov that the first more or less complete elaboration of the notion of *sobornost'* (in the broad and abstract sense of "unanimous and free collegiality through the spirit") is to be found. The text is *Quelques mots par un chrétien orthodoxe sur les communions occidentales à l'occasion d'une brochure de M. Laurentie* (Paris, 1853). The author signs with the name Ignotus. He announces that he is taking up his pen to defend the "orthodox Catholic church" from unjust accusations, *catholique* in this case being the French translation of the word *sobornost'* [соборность]. In another article, a letter to the editor of *Union chrétienne* "on the meaning of the words *catholique* and *sobornyj* with reference to a speech by Father Gagarin, a Jesuit," Khomiakov returns to the definition of the word. Gagarin had reproached the Orthodox for translating the word *katholikos* [ϰαθολιϰός] in the Nicene Symbol with a dull term, lacking in energy, *sobornyj*, which has many other uses, meaning additionally what partakes of the "kathedra," the synod, or even the social. In the Nicene Symbol, the word is *katholikos*; the Russians translate *sobornyj*, with the term *catholique* being reduced to designating the Roman Church and thus restricting the concept to a kind of space or territoriality. Khomiakov thus takes up the term, tears it away from the Roman Church, and deliberately creates the category "Catholic Orthodox." Shortly thereafter Khomiakov took up his pen anew in French to write to the editor of the *Union chrétienne* in a polemic against one of his compatriots who had become a Jesuit, Father Gagarin. The latter had criticized the Russian term *sobornyj* for its murkiness and imprecision. Gagarin had observed that the Russian term designated a reality that invoked simultaneously synod, *cathedra*, and society itself. Catholicism was a merely geographical universality, Khomiakov responded, whereas *sobornost'* is a universality of the spirit, he continued, resorting to an argument customarily addressed to Protestants.

It was thus in the context of a polemic with a fugitive from Orthodoxy that the broadening of the word occurred: individualistic Western thought could not achieve a complete grasp of being; only *sobornost'* managed that, since it is not the mere addition of components of the synod, but "organically surmounts their exclusion and their enclosure in a gnoseological limitation" (Skobtsova, *Khomiakov*, 41). Even *yourodstvo* [юродство] or "folly in Christ"—a form of asceticism quite characteristic of Russian piety: the fool for Christ simulates madness, renounces his property and hygiene, denounces the hypocrisy of the powerful (the best known was the Blessed Vassily, in the sixteenth century, buried in Red Square in Moscow)—is, in the East, part of the gnoseological process. In the West the participation of madness and disorder in the creation of order is strictly impossible and forbidden. For love participates in it in the Slavic East, it possesses a force and a gift, whereas in the West it is reduced to a law. The constraining principles of law and dogma are part of Western religious and philosophical thought, whereas freedom is integrated into *sobornost'*. It is a matter of a unity-freedom that is not imposed, but experienced by all in the act of *sobornost'*.

IV. The Divine Humanity of Solovyov

Vladimir Solovyov, the son of a great historian of Russia and a disciple of Khomiakov but destined to become a more eminent philosopher, developed this notion in that of "pan-humanity" or "humano-divinity." Through that concept Solovyov wanted to reintegrate harmony into the whole of humanity. In his view it was a matter of establishing a "total interpenetration of the individual and collective principles, the inner coincidence between maximal development of the personality and social unity at its most complete" (Solovyov, *Lectures*). There would thus be born a free collectivity whose thinking would be one, but not forced.

Solovyov spoke of the principle of *obscinnost'* [общинность], which is the social principle of the life of the *mir* [мир] in economic solidarity, without the imposition of collectivism. It is well known that the *mir*, or village collective, which proved as solidary when confronted with taxes or conscription as it had confronting landlords, was the object of an intense polemic in Russia, with some seeing in it the promise of a future communism, linked to primitive communism and organically bound to Russian rural life, and others seeing in it the dictatorship of the strongest over the weakest within a village assembly held by the kulaks.

■ See Box 2.

V. Toward an "Ecclesialization" of the World

The theologian Sergei Bulgakov reminds us that, from the etymological point of view, *peasant* in Russian does not mean pagan, as in French, but (on the contrary) Christian (*krest'janin* [крестьянин]). This is not random. The new Russian thought of the Silver Age at the beginning of the twentieth century, influenced by the thinking of Marxists converted to idealism, then to Christianity, like Father Sergei Bulgakov himself, insisted on the cosmic character of man, on the necessity of promoting a Christian socialism, a reconciliation of man and nature through a flourishing of the economic energy of man by way of Christianity and even the Church, the world being called on to become increasingly church-like or ecclesiastical (a translation of the Bulgakovian neologism *otserkovlenie* [оцерковление]), even in the sphere of the economy. Orthodoxy, bereft of a monarchical principle and even of any strictly ecclesiastic spirit, is called on to promote economic democracy. *Sobornost'* or the collegial spirit (such is C. Andronnikof's translation of the word in Bulgakov's *Orthodoxy*) is not a democracy, but it includes a democratic spirit within it, and particularly in the economic domain. Bulgakov was plainly influenced by Dostoyevsky, who said that Orthodoxy was "our Russian socialism." Long before the *Esprit* movement, thinkers of the Silver Age thus indicated the path to a Christian economics integrating communism and marrying it to the freedom of the individual. The inspiration of the Church of *sobornost'* gathering the faithful in the free union of the Church was destined to exercise its influence throughout the world. Nicolas Berdyayev interpreted the idea for the French Catholics of the Franco-Russian Rencontres group and later for Emmanuel Mounier's *Esprit* movement.

Another Orthodox thinker, Father Pavel Florensky, who perished in the gulag, declared in his very singular book, titled *The Pillar and Ground of the Truth*, that Orthodoxy had invented a sacrament of fraternization that issued in a specific rite, the ritual of "adelphopoeisis," a half-ecclesiastical, half-popular rite consisting in the exchange of crosses and the taking of an oath of loving friendship. The rite confirmed that there was to be nothing in the Orthodox Church that was not general, nor anything that was to be private. Neither

Obscinnost'

➤ MIR

Obscinnost' marks the predestination of Russia to primitive communism—based on mutual assistance and a refusal of property—to be found in the old social institution of *mir* or the peasant collectivity that administers lands, distributes them, and represents the community in the face of political power. This ancient Slavic institution is considered as what differentiates Russian society, which is collectivist, from that of the individualist West. The *mir* in the strict sense subsisted for a few years at the beginning of the Soviet era and was then replaced by the *kolkhoz* and its principle of constraint.

Privatsache nor impersonal law, which corresponds to the spirit of *sobornost'*.

VI. Nicolas Berdyayev between *Sobornost'* and Personalist Socialism

Berdyayev, in his book on Khomiakov's thought, insists on the gnoseology of the founder of Slavophile thought: "Being is given solely to ecclesiastic awareness of universal communion. Individual consciousness is unequipped to grasp the Truth" (Berdyayev, *Aleksei Stepanovich Khomiakov*, 2:127). But Berdyayev reproached the theologian for not having succeeded in connecting that "great idea of universal communion [*sobornost'*]" with cosmology and with the "soul of the world" (ibid.), as Solovyov did. A philosophy of integral spirit, a quest for concrete being, such are the original paths of Russian philosophy, according to Berdyayev, that derive from the theological concept of *sobornost'*.

Berdyayev's thought passed through quite contradictory phases, going from an aristocratic stance advocating inequality to a Khomiakovian conception of familial communion, in a society that was above all land-based, that is, linked to the *zemščina* [земщина], which might be translated as the "voice of the land," a concept quite different from the voice of the people: "the Russian *zemščina* is organic; it is not divided into classes that struggle with antagonistic wills" (ibid., 201). The land must be the czar's councilor and allow the consensus of the land to ascend to him; the *zemskaja duma* [земская дума] is the representative of the land, and not of the social classes in conflict. A strange and brief reappearance of this conception was seen in the last Supreme Soviet, that of *perestroika*, to which a certain number of Slavophile thinkers (or thinkers taken with that tendency) (Sergei Averintsev and Viatcheslav S. Ivanov) had been elected. For them political decisions became the fruit of a consensus. Berdyayev writes that the entire history of Russia is dependent on a relation of the land (*zemlja* [земля]) to power. The Saint Petersburg interlude, which inserted the bureaucracy between the czar and the land, was a catastrophe. Peter the Great ordered that writing was to be done with the door open: writing was not to be an isolated and seditious act, but an act before all and sundry—familial, transparent, and public.

VII. Current Broadening of the Concept

Sobornost' is without contest one of those imprecise concepts in which the originality, attractiveness and—for others—the repulsiveness of Russian thought lie. The word is untranslatable in its polysemy—in theology and politics throughout Russian history, where it always functions as a mark of the originality of Russian or Orthodox "togetherness."

It is currently to be found applied to such fields as literature, as in the book of a Moscow scholar, Ivan Esaulov, on "the category of *sobornost'* in Russian literature." The author analyzes the principle of *sobornost'* in the work of Pushkin, and particularly by way of the theme of the paradoxical solidarity between men, for example, between the brigand and future insurgent and the young nobleman in "The Captain's Daughter." The criterion has long been applied to the work of Tolstoy. The encounter between Pierre Bezukhov and the simple moujik Platon Karataev in *War and Peace* is a sample of *sobornost'*. The world perceived by Pierre at that juncture is a round, cosmic world, in which everything is linked by a paradoxical organic bond that is not beholden to reason. Petya Rostov feels in the depth of his being the *sobornost'* that unites all soldiers, even the crudest of them, and which is revealed with the emperor's arrival in Moscow, when Petya hurls himself forward shouting "Hurrah," while a service of thanksgiving is held in the cathedral. The sacristan who saves Petya from the tumult on that occasion, and mounts him on King-Cannon, which can still be seen in the Kremlin, describes what is happening in the cathedral and uses the term *soborne* [соборне] on several occasions, meaning "solemnly, all together, pontifically," but whose "meaning remained obscure for Petya." Petya does not understand the word's meaning, but he lives it intensely since he throws himself into the colorful crowd and shares all its emotions; and his enthusiasm will be even greater when he subsequently joins the army, that great family in which his brother Nicolas already feels as good as in his father's house. Petya's death—one of the most forceful episodes in all of Tolstoy's work—is also a high point of intense connection of all with all, of lived *sobornost'*. But the episode is treated musically, as though one were hearing a fugue, in which each instrument played its own motif. "And without finishing it, melded with another that initiated almost the same motif, then with a third, and a fourth; then they all fused into a single motif, separated out again, only to fuse anew, at times in a solemn religious chant, at others in a song of victory that was dazzling in its luminosity" (Tolstoy, *War and Peace*).

VIII. Immersion in the Living

Tolstoy's fugue accompanying the death of the youngest hero of *War and Peace* is the secular transposition of an old Russian Orthodox church chorale, the *sobornost'*:

It is only by immersing ourselves in ourselves, by seeking our own mystical roots in the total organism, that we experience our own *sobornost'*, that we know our self as non-self. In the atmosphere of ecclesiastic love, in the experience of the sacramental mysteries, our particularity is surmounted and collectivism fails to occlude *sobornost'*.

(Bulgakov, *Light without Decline*)

SOCIETY

"Society" is borrowed from the Latin *societas* (association, meeting, community, society), which can designate participation in a commercial enterprise as well as an alliance or political union: a *socius* is a partner and, no doubt, according to the etymology, a comrade in war. Latin *societas* was used to render the Greek *koinônia* [κοινωνία], from *koinos* [κοινός] (common, public); on the relation between "community" and "society," see POLIS, *COMMUNITY, II.*

The term "society" acquired precise meaning rather late, through a series of oppositions whose development scans the history of political and social thought since the end of the eighteenth century and which generally tend to relativize the position conferred by philosophy to politics in the human sphere: "civil society" forms spontaneously and is distinguished from the state; social relations are distinguished from political ties, and, for sociology, are their cause rather than their effect; the "individual" is at once cause and effect of society; the "social" or the "societal" cannot be reduced to the "economic": we have explored, under the rubric "civil society," the set of networks at play, both ancient (*koinônia politike* [κοινωνία πολιτική], *societas civilis*) and modern (in particular the distinction *Gemeinschaft/Gesellschaft*, in CIVIL SOCIETY, Box 1). See also CIVIL RIGHTS, ECONOMY, OIKONOMIA, PEOPLE, POLITICS, SOBORNOST', *STATE.*

SOLLEN (GERMAN)

FRENCH   *devoir, obligation*

➤ *OBLIGATION,* and BERUF, *DESTINY*, DUTY, LAW, *LIBERTY*, MORALS, PIETAS, TATSACHE, *TO BE*, *VALUE*, WERT, WILLKÜR

Etymology traces the "modal auxiliary" *sollen* to the noun *Schuld* (debt, guilt) and the Latin *debere*, *solvere*; on the other hand, *Pflicht*—a noun formed from the verb *pflegen*, "to take care of something," and, by extension, "to have the habit of"—is traced back to the idea contained in the Latin *colere*, "to take care of, to cultivate." Whereas *Pflicht* translates as *officium* or *obligatio*, always referring to a content of what is to be accomplished, *sollen* refers from the outset to a fundamental level, at once an obligation to be and to do, posing the problem of its relation to being, with a resultant insistence on either ethical function or logical (and even ontological) status. This ambiguity has been noted as underlying the expression "naturalist paralogism" ("from what is one cannot deduce what ought to be"), which is said to be grounded in Hume (*Treatise on Human Nature*, III, I, 1, conclusion). But it is rather starting with Kant, and up until his critique by Lask and Rickert, as well as by Scheler, that this dual usage has been deployed in all its acuity.

Translating Exodus 20:13, Luther renders the Hebrew *lo' tireṣāḥ* [לֹא תִּרְצָח] as "Du sollst nicht töten (Thou shalt not kill)." The commandment is not formulated according to the order of objective necessity that would be expressed through the modal auxiliary *müssen*, but according to the register of what is assumed to be, the behavior one is assumed to adhere to without necessarily succeeding in doing so. Similarly, in Galatians, 3:19, *ti oun ho nomos* [τί οὖν ὁ νόμος] is rendered as "Was soll nun das Gesetz?" The nuance introduced by *sollen* is halfway between necessity and recommendation, between imperative command and advice.

I. *Sollen* before *Pflict*: Duty and Duty-to-Be in Kant and Fichte

It is in this semantic tradition that Kant's use of the nominal verb *das sollen* is inscribed: practical philosophy is a discipline in which "it is not a matter for us of proceeding to the subsumption of the principles of what effectively takes place, but of the laws of what is supposed (*soll*) to happen, even if it never does" (*Foundations of the Metaphysics of Morals*). The understanding latches exclusively onto the principles of the structure of being *sive natura*, of being as it is, as it is by necessity; now the *Sollen* depends on "its own order which heeds only ideas," so that what ought to happen thus has no empirical cause (cf. *Prolegomena to Any Future Metaphysics*, 53). The *Critique of Pure Reason* (B 576) explains it without ambiguity: "[Reason] creates for itself, with perfect spontaneity, its own order following the ideas to which it adapts empirical conditions and according to which it goes as far as to proclaim as necessary actions which never occurred," since natural conditions (including the senses) "cannot produce

obligation (*Sollen*), but only a will that is far from being necessary, is always conditioned, and to which, on the contrary, the obligation (*Sollen*) proclaimed by Reason opposes a rule and a measure, and even an interdiction and an authority." It comes as no surprise that the practical and speculative interest of reason is summarized in three questions (*Critique of Pure Reason*, B 833): "What can I know? What should I do? [Was soll Ich tun? What am I supposed to do?] and "What do I have a right to hope?" The presence of *Sollen* is at once the sign of human finitude and the awareness of that finitude, an awareness that seeks to remedy it: "For a being in whom Reason is not the sole principle determining will, the [practical] rule constitutes an imperative, that is, a rule defined by an obligation (*Sollen*) expressing the objective constraint that dictates action, and it signifies that if Reason determined will completely, the action would occur without fail according to that rule" (*Critique of Practical Reason*). In the intelligible sphere, *Sollen* and *Tun* would not be distinct, any more than the will would need to determine itself as a function of categorical imperatives or skill in terms of hypothetical imperatives. *Sollen* thus makes sense only for beings equally determined by their senses, and the limits of our capacities will not dispense us from obeying that *Sollen*, since "we are supposed (*sollen*) to become better" (*Religion Within the Limits of Reason Alone*).

The transcendental critique thus opens onto a primacy of the duty-to-be, which it presupposed in a way since the critique made sense only against the backdrop of a finitude that it explores systematically; in addition it is that duty-to-be as duty-to-do that determines the general regimen of action and subtends the conception of duty (*Pflicht*) as *officium* or *obligatio,* a task or concrete obligation. Since a duty (*Pflicht*) performed by inclination, compassion, etc., has no moral value, and the only duty worthy of such value is one that forces us "to become better"—that is, to act against all our penchants, contrary to every search for benefit or interest, without at all taking into consideration the happiness or effects produced by our action—the duty-to-do (*Sollen*) is indeed the organizing axis on which duty (*Pflicht*) is inscribed, even as it is subordinated to it. To the extent that Kant refuses the possibility of there actually being a "conflict of duties" (*Metaphysics of Morals*) ("A collision of duties and obligations is not at all thinkable"), the details of the practical prescriptions constituting the content of an obligation are, from the logical point of view, fully as subordinate as the action necessary to fulfill them is to the general register of *Sollen* (both duty-to-be and duty-to-do, simultaneously). The difference between duties of virtue (*Tugendpflichten*)—in which an end and a duty coincide—and juridical duties (*Rechtspflichten*)—which are to submit to the maxim according to which neither the self nor another can be means for the other—as well as the distinction between morality and legality (and consequently the distinction between internal and external obligation) remain under the aegis of the promulgation by pure Reason of ends partaking exclusively of the duty-to-be.

Fichte adopted for the most part this use and value of Kant's *Sollen* while radicalizing its importance with regard to the pure self and freedom: "Free being ought (to be/do) (*soll*); for obligation (*Sollen*) is precisely the expression of the determination of freedom" (*System der Sittenlehre* [1798], in

Werke, ed. De Gruyter, 4:60). As in Kant, the *Sollen* is the characteristic of the self as finite Reason, but the fact that man is equally a pure ego implies that "he ought (*soll*) to be what he is simply because he is. . . . He ought to be what he is because he is a pure ego" (*Lectures on the Vocation of the Scholar* [1794]). Fichte thus insists on the process-like nature of the *Sollen*, "an 'ought' (*soll*) is itself in its deepest being a genesis, and it demands a genesis. . . . It is the absolute postulate of a genesis" (*Wissenschaftslehre* [1804], 22nd lecture), even if it is not exclusively a matter of the moral approximation of the good in the practical realm; the meaning of *Sollen* is broadened to the whole of action, whatever it be:

> I ought [to do] (*ich soll etwas*) something signifies that I ought to produce it from myself or—since it imposes on me an undoubtedly infinite aim to the extent that *is* not ever and, on the contrary, can never ever but ought to be—if I could not realize it fully, I would, however, always do in such matter as to find myself in the approximation of that aim.
>
> (Fichte, *System des Sittenlehre*, 4:66)

II. *Pflicht* and *Sollen*:
Contradictions and Reversals from Hegel to Nietzsche

Beyond Schelling's critique, which is obviously opposed to the idea that there would be a possible passage between the finite ego and the infinite (the absolute ego), it is above all Hegel who refuses this conception of *Sollen*: "What universally holds value is also universally valid; what ought to be *is* in fact also, and what is only supposed to be without being has no truth" (*Phenomenology of the Spirit*). Further still, the "inadequation of being to what ought to be" is the origin of evil (*Encyclopedia*, 472), and "the substance that knows itself to be free, at the core of which the absolute duty-to-be is as well and just as much being, finds its reality in the form of the spirit of a people" (ibid., 514).

Schopenhauer breaks with the dignity of meaning conferred on *Sollen* and, in his eyes, *Pflicht* and *Sollen* are almost synonymous in their shared status as *relative notions:* the only difference between the two terms is a function of the juridical status of each individual (cf. *Über die Grundlage der Moral*, 4). Thus the slave knows only *Sollen*, to the extent that he has no rights and thus has no duty (*Pflicht*) incumbent on him. Nietzsche would take up this analogy between *Sollen* and *Pflicht*, but by introducing a decisive stylistic inflection: the first chapter of the first book of *Thus Spake Zarathustra* opens with the well known text on the "Three Metamorphoses," in which the dragon baptized "Thou-shalt," blocking the path of the lion who says "I want," is opposed to the creation of new values; he thus embodies the values of the past, lays claim to the everlasting, whereas the lion incarnates the strength needed to "create itself freedom, and give a holy Nay even to duty (*Pflicht*)." The lion has strength only in negation and refusal, and one needs the innocence and absence of memory of the child to affirm a new beginning. The refusal of "thou-shalt" tends to the affirmation of new values, to the conversion of all values; now that last imperative again implies the entire series of *du sollst,* that will continually punctuate the text of *Zarathustra*. Nietzsche quite plainly

takes up the Lutheran rhetoric of the translation of the Decalogue to apply it to a new tablet of values, so that what was on the order of duty (*Pflicht*) belongs resolutely to the past, whereas what was on the order of duty-to-be is concealed by *Sollen*, allows it to escape that past and open itself up to the future of transformed values, which are just as (and, in fact, altogether more) demanding.

III. *Sein, Sollen, Gelten*: Problems of the Ontology of Duty from Franz Brentano to Heinrich Rickert

But that exclusively ethical use of *Sollen*, in fact, merely emphasizes the ambiguity concealed by its meaning from the outset, since it signifies the duty-to-be as well as the duty-to-do. It was more or less at the same time that Brentano attempted to establish the idea of moral knowledge, and reflected, in a logical perspective, on the values that govern action: thus the commandment "thou shalt not kill" can quite well be interpreted, on the one hand, as an interdiction on murder, that is, as partaking of a judgment that disqualifies murder universally and in general, and, on the other hand, as a corollary interdiction, but one that is no longer universal, on killing. The judgment disqualifying murder in general also disqualifies the act of killing but without, however, banning it in certain circumstances. To the judgment "killing is bad" is added another, "all murder is forbidden," which no longer exactly partakes of the duty-to-do or the duty-to-be, but of a judgment concerning the absolute value of life (cf. F. Brentano, "Zur Lehre von der Relativität der abgeleiteten Sittengesetze" [2 September 1893]). That same ambiguity is found in the *Ethik des reinen Willens* (1904) by Hermann Cohen to the extent that, concerned with emphasizing the difference between being and the duty-to-be, and grounding ethics on *Sollen*, he could not avoid granting a value of being to the duty–to-do: "It is in the duty-to-be (*Sollen*) that the value of being of the ethical resides. . . . Without *Sollen*, there would be no will, but only desires. Through *Sollen*, the will achieves and conquers true being" (*Ethik*, 7:27).

It was precisely against the insistence on distinguishing duty-to-be and being that Emil Lask undertook to redefine the relations between *Sollen* and value: "It appears to be a simple explanation of the concept of value to affirm that value is what *ought* absolutely *to be* although it *is* not always ("Hegel in seinem Verhältnis zur Weltanschauung der Aufklärung" [1905], in *Gesammelte Schriften*, vol. 1). The *Sollen* or normative characteristic is a predicate of value; it designates but an aspect of it and is in no way identical to it. *Sollen* (or the norm) does, in fact, not only designate the essence of value but also its relation to reality, its realization. Lask would establish a distinction as a more subtle relation between duty-to-be and being: being is identical to the *logical content* of validity, "being is a 'being worth' (*Gelten*)" (*The Logic of the Philosophy and Doctrine of Categories,* in *Gesammelte Schriften*, 2:118). More precisely, "the logical form is identical only to the being of the existent, just as a theoretical content of worth (*geltend*), participant in value and duty-to-be, coincides with it" (ibid., 273). The distance is thus less between being (of the existent) and duty-to-be than between pure duty-to-be and impure duty-to-be, that is, between a value (*Gelten*) partaking of duty-to-be and the category of being, which is altogether determined and partakes equally

of duty-to-be. The objectivity of being coincides with *Sollen* as a *category*, which is also quite determined. Lask refuses to ascribe *Gelten* to a subject endowed with a will to know, since "from the point of view of its adherence to a value, *all* subjectivity would appear as 'practical,' 'autonomous' behavior, as a will devoted to value for value's sake, as the subordination of a *Sollen* in the name of *Sollen* itself" (*System des Logik*, in *Gesammelte Schriften*, 3:95).

In his intervention at the international philosophy colloquium of 1908 ("Is there a primacy of practical Reason in logic?" in *Gesammelte Schriften*, 1:347–56), Lask quite naturally criticized the thesis until then defended by Rickert, according to which a duty-to-be would precede being by maintaining a Kantian division between pure and practical Reason. That critique would bring Heinrich Rickert to undertake a profound revision of his *Der Gegenstand der Erkenntnis* (as he acknowledged in his preface to the third edition, 1915). He did not hesitate to describe as a Copernican revolution at the heart of the concept of judgment (*Der Gegenstand der Erkenntnis*, 1927) the fact that henceforth it would no longer be the effective real that would be the Archimedean point of a judgment on reality, but the duty-to-be harbored by the necessity of bearing a judgment. In a judgment of the "that is (quite) real" sort, the *that*, the content, is the subject of the judgment to which the form reality should (*soll*) be ascribed as predicate:

> It is not around *reality* that the knowing ego-subject "gravitates" . . . , but around theoretical *value* that he must gravitate if he is to recognize that *reality*. Thus the concept of the effective real enters, concerning the form "reality," into a necessary relation with the concept of duty-to-be and evaluating subject . . . for "real" quite properly signifies or simply *is* the content that ought (*soll*) effectively to be affirmed or admitted.
>
> (Ibid.)

IV. *Werturteil* and *Pflichturteil, Sollen* and *Pflichtsollen*: Max Scheler and the Material Ethics of Values

In his "Material Ethic of Values," Scheler rejects the idea that value judgments would express "instead of a bond of being a bond of duty-to-be . . . or that, more generally, every value judgment must necessarily be based on the lived experience of a 'duty-to-do' (*Sollen*), whatever it be. In point of fact, the moral meaning of propositions such as 'this image is beautiful' or 'that man is good' is not at all that this image or that man *ought* (*sollen*) to be something" (*Formalism in Ethics*). Otherwise put, value judgments of the type simply describe a state of things that, in certain cases only, present themselves with a dimension of obligation ("That man ought [*soll*] to be good"), which then signifies that an "idealization" preceded the judgment. The value judgment is not reducible to a "judgment of obligation" (*Sollurteil*) for the simple reason that the domain of the former is far more vast than that of the latter. One can thus not reduce being to a duty-to-be, and even less to a duty-to-do. This is all the more the case in that Scheler posits as a principle that every duty-to-do (*Sollen*) ought to be grounded in values that alone ought to be (*sollen*), but also *ought not to be* (ibid.).

Since there exists no duty-to-do whose matter would simply be existence, there is always, pitted against the "duty-to-be," a "duty not to be," that should be characterized as a quality different from obligation itself and distinguished strenuously from the "duty-to-be of a non-being." . . . Duty-to-be is applied to positive values, non-duty-to-be to negative values.

<div align="right">(Ibid.)</div>

On its own, *Sollen* cannot determine what positive values are; it affirms them by opposing them to negative values: "Every *Sollen* . . . is oriented toward the exclusion of non-values, and not toward the position of positive values" (ibid.) From this, Scheler deduces that every proposition that expresses a *Sollen*

rests on a positive value, but does not itself contain that value. What "ought to be" is never originally the existence of the good, but simply the non-existence of evil. It is thus impossible for any duty-to-be whatsoever to contradict the judgment of what is positively good or might depend on that judgment. If I know, for example, what it is good for me to do, "what I ought to do" is of little concern to me. For me to *ought,* I must first know what is good. But if I know immediately and fully what is good, that effective knowledge equally determines (and in an immediate way) my will without my having to pass through the intermediary of an "I ought."

<div align="right">(Ibid.)</div>

This is the perspective on which Scheler bases his resumption of Hegel's critique of the Kantian and Fichtean conception of *Sollen*:

The attitude of an ethic of this sort is such that it can attain positive values only *through reference* to negative values. . . . But if one adds to it a tendency to conflate ideal duty-to-be with the duty-to-be of obligation (*Pflichtsollen*), or to derive ideal duty-to-be itself from the duty-to-be of obligation, one arrives at a peculiar species of negativism and simultaneously at a fear of seeing all existent moral values enter into contact with reality, a fear of every effective realization of the good in action and in history.

<div align="right">(Ibid.)</div>

| SOPHISM, SOPHIST

"Sophism" is a borrowing from Latin *sophisma*, itself the transliteration of Greek *sophisma* [σόφισμα]. The Greek term designates first of all an ingenious invention, a skillful expedient such as that of Prometheus stealing fire to help mortals, Ulysses playing on words to escape the Cyclops (see MÊTIS, Box 1), or even Thales monopolizing the presses (see PHRONÊSIS, Box 1). It thus has a connection to know-how (*technê* [τέχνη]) and ruse: see ART, I, MÊTIS, and it refers to qualities of inventiveness denoted by the Latin *ingenium* and that the Renaissance, particularly in Italy, would rediscover in the form of ingenious subtlety (see ARGUTEZZA, CONCETTO). The connotations of the term may vary from wisdom (*sophisma* and *sophistês* [σοφιστής] and "sophist" have the same root as *sophia* [σοφία], meaning "wisdom, knowledge," and *sophos* [σοφός], meaning "sage") to trickery (see TRUTH, Box 7, which specifies the kind of "deception" produced by a sophism), to insolent pretention (*hubris* [ὕβρις], "insolence, excess": see VERGUENZA, II; *apaideusia* [ἀπαιδευσία], "bad upbringing": see PRINCIPLE, Box 1).

I. Sophism and Logic: "Sophism," *Sophisma*, "Fallacy"

Sophistical discourse implies a privileging of the powers of language, an awareness of its efficacy and performativity, linked to what will constitute rhetoric: see SPEECH ACT, I, LOGOS, II.A. That awareness implies critique of the pretentions of ontology to speak the truth by conforming to what is: see TRUTH, I; cf. ESTI, *IL Y A*.

But starting with Plato and then with Aristotle, sophistical thought would be devoted to sophistry, in the sense of fallacious reasoning, in other words, reasoning that is not only false but also intentionally deceptive: see HOMONYM; and, more generally, it is linked, at all levels, with deceptive appearances: see DOXA, EIDÔLON, MIMÊSIS (cf. *APPEARANCE, IMAGE*).

In the Middle Ages, a *sophisma* is a proposition intended to test the validity of a rule or a distinction, and *sophismata* [σοφίσματα] are disputes organized around a proposition, making use at the level of literary form and Scholastic practice of certain of the gains of Aristotle's *On Sophistical Refutations*: in addition to HOMONYM, see TROPE, and cf. CONNOTATION, SUPPOSITION.

In English, note should be made of the distinction between "fallacy," which designates an error in reasoning that has all the appearances of truth, and "sophism," which denotes additionally an intention to deceive, with the difficulty that "fallacy" is the received translation for medieval *sophisma*, which is more ambiguous (cf. French *fallacieux* and Latin *fallax*, TRUTH, IV.B.2); see, for example, RIGHT for use of the syntagm "naturalistic fallacy," rendered in French as *sophisme naturaliste*; see the bibliography of TROPE for the use of *fallacy* in the titles of medieval works; see also SOLLEN.

II. Sophism and Politics

Hegel says of the Sophists that they were "the masters of Greece," in the sense of pedagogues and teachers, but also in the sense of being politically powerful, dominating through the power of language and the establishment of the political per se; see, in addition to LOGOS, II.A and RES, Box 1, SPEECH ACT, I, TRUTH, Box 2, and *CONSENSUS,* PRAXIS, VIRTÙ.

SORGE (GERMAN)

FRENCH	*souci*
GREEK	*phrontis* [φροντίς]
	merisma [μέρισμα]
LATIN	*sollicitudo*

➤ CARE [*SOUCI*], DASEIN, *IL Y A*, *MALAISE*, PATHOS, PHRONÊSIS, *TO BE*

Although there is, prior to Heidegger, an entire—and, to be frank, rather problematic—"prehistory" of the concept of care (Plato, Aristotle, Seneca, Saint Paul, Hyginus, Saint Augustine), an identification of sources does not suffice to illuminate the ontological structure elaborated by Heidegger under this rubric. The question of the rooting of the concept in tradition—but in which tradition, precisely?—is currently a matter of debate.

A key term in Heidegger's thought, at the center of which it designates nothing less than the being of *Dasein* (according to the title of §41 in *Being and Time*), and indeed its "arch-structure" (*Urstruktur*), *Sorge* speaks the being of *Dasein* to the extent that "it is a matter" (es geht um). The "care" in question here should thus be separated from our ordinary understanding of the term (as in the Fr. *avoir des soucis,* to have worries; note, moreover, that *souci* comes from the Lat. *sollicitare*, to agitate, shake forcefully, trouble, whereas *Sorge* is related to Lat. *servare*, to preserve, keep, like Eng. "sorrow," from Old Eng. *sorg*, Middle Eng., *sorge*, but which took on the meaning of "chagrin," "affliction"). Insouciance (*Sorglosigkeit*) is itself a deficient mode of *souci,* far more than its opposite. It partakes no less of *souci*, "care," understood as an ontological structure, than of anxious care.

The existential-ontological interpretation of *Dasein* as care finds its "pre-ontological" basis in fable 220 of Hyginus, on which Goethe, by way of Herder, drew in elaborating part 2 of his *Faust* (cf. *Being and Time*, 42). Emphasizing that the orientation of his analysis of care is related to a study of Augustinian anthropology, on a basis furnished by Aristotelian ontology, Heidegger specifies: "Already in Stoicism, *merisma* [μέρισμα] was a stable term, which is found in the New Testament, and which the Vulgate translates as *sollicitudo*."

According to Rémi Brague, however:

> This is an error: Bultmann notes (art. "Merimnao," etc. of the *TWNT*, IV, 594) that "it is remarkable that the term is absent from Stoicism, where it is replaced, among others, by *phrontis*." The latter term is, in fact, found in the doctrine of the passions (cf. *SVF*, III, p. 100 sq.). But it is scarcely elsewhere than in two passages of Seneca [*Letters to Lucilius*, 121, 17 and 124, 14] that it becomes a concept. For more details on the historic origin of the concept of *Sorge*, cf. Heidegger, *Prolegomena zur Geschichte des Zeitbegriffs* (*GA*, 20), 418–20. Heidegger's error appears to come from an article by K. Burdach, which he cites in a note on p. 47.
>
> Brague, *Aristote et la question du monde*

The question of determining whether "Heidegger sought, with the concept of 'care,' to bring to light a hidden source of Aristotle's thought" (Brague, *Aristote et la question du monde*), specifically, deepening *phronêsis* [φρόνησις] in the direction of *phrontis* [φροντίς], or rather, on the contrary, whether

Being and Time was connected in this regard to "the philosophical tradition of 'care for the self,' a tradition whose origin is Platonic" (Larivée and Leduc, "Saint Paul") remains a subject of debate, even if the former hypothesis strikes us as plainly more convincing. One should also undoubtedly add to the discussion a sentence from Aristotle's *Rhetoric* (in which *Being and Time*, 29, sees "the first systematic hermeneutic of the everyday with being-with-others"), which articulates *phrontizein* [φροντίζειν] (caring for) with the manner specific to "everydayness" of relating to death:

> ἴσασι γὰρ πάντες ὅτι ἀποθανοῦνται, ἀλλ' ὅτι οὐκ ἐγγύς, οὐδὲν φροντίζουσιν.
>
> (All men know that they are going to die, but since it is not imminent, they are not concerned by it.)
>
> *Rhetoric*, 2.5.1382a 26–27

SOUCI

Souci comes from Latin *sollicitare* (to agitate strongly), which is composed of *sollus* (whole) and *citus*, from *cieo* (to put into motion); after designating above all "amorous preoccupation," the term became in its contemporary use a quasi-synonym of "problem." In philosophy, it refers not merely to a passing preoccupation, or a difficulty, but to what Heidegger took to be the very characteristic of *Dasein*, of human being-there: see ANXIETY, DASEIN, and cf. *MALAISE*.

1. To the extent that *Dasein* is that being for which its very being is to be in question, this preoccupation with its very being, which is not the Platonic "care for the self," becomes a fundamental ontological structure, rendered in French by *souci*: see SORGE; cf. *IL Y A, TO BE*.

2. The translation of *Sorge* into English as "care" (from the Gothic *Kara* [chagrin, whence sorrow] and not from the Latin *cura* [care, particularly the administration of public affairs]), aside from being as unsatisfactory as the French version, underscores the difficulty for the Francophone reader of grasping the nuance present in the English doublet "care"/"solicitude";

see CARE, in which one will find reflections on the "ethics of care," the "feminine" deconstruction of a morality of justice (cf. *JUSTICE,* MORALS).

3. For the relationship between "care" and "security," both internal and external, and particularly with reference to classical philosophy, see SECURITAS.

Philosophers' use of terms in the various European languages that designate "mental reality" and refer its manifestations to a substrate or unitary field of experience seems at first to pose only problems of translation that are connected with partially divergent etymologies or with conflicts between doctrines (mentalism, physicalism, reductionism, and so forth). This is, however, a prejudice established by textbook presentations of a philosophical "psychology" still dominated by a dualism that is manifested at least methodologically and has been widely accepted since the beginning of the nineteenth century. But this prejudice dissolves as soon as we become aware of the irreducible contradictions concealed by the nonequivalence of the paradigms of the "mental" in the classical philosophical languages. The first symptom of this is the lack in French of a simple equivalent of the Latin *mens*. The great philosophers do not treat these contradictions negatively, as obstacles to pure "thinking about thinking," but positively, as a means of gaining access to the complexity of the mind's relationship to itself (often through multilingual philosophers' efforts to translate such terms, as in the case of Descartes, Leibniz, or Kant).

Rather than seek to reconstitute here a complete genealogy of these concurrent paradigms, we will carry out two reductions (two successive theoretical "zooms," as it were). On the one hand, we will concentrate on the translation problems and the tensions characteristic of the classical metaphysics inaugurated by Cartesianism, which continues to shape the horizon of the doctrines of Hume, Kant, and Hegel, and even of phenomenology. We will emphasize their historical originality between two types of naturalism: the naturalism of ancient doctrines of the *psuchê* [ψυχή] and the *anima*, which has been preserved despite medieval onto-theology's transformation of its meaning, and the naturalism of experimental psychologies or of contemporary "philosophy of mind." On the other hand, we will reduce the examination of this metaphysical period of transition to the clarification—on the basis of their terminology itself—of a major opposition between Descartes's and Locke's points of view, in relation to a persistent tradition (unfortunately perpetuated by many contemporary presentations of the origins of

the mind-body problem) that sees in them the founders of the same theoretical trend.

The presentation of classical metaphysics will stress first the centrality of a problematic of a self-presence immediately given in thought (or in its own immanence, for which Locke and Kant recast the notion of experience or *Erfahrung*), which is denoted by the term *mens*, rendered in French as *esprit*, or by the term "mind" rendered in German as *Gemüt* or *Seele*. But this problematic struggles with the limitations of its own intellectualism or mentalism, which is sometimes discernible in the order of the sign and communication, and sometimes in the order of affectivity; it reappears in the form of a "remainder of soul" in contradiction with the general movement of the desubstantialization of mental reality that is reflected in fluctuations in language and that anticipates revolutions in contemporary thought (notably in psychoanalysis, which is paradoxically closer to the way the Greeks problematized the insistence of the bodily in the psychic than metaphysical thought ever was).

There is a clear opposition between the language of Descartes and that of Locke on this subject. Descartes's use of both *âme* and *esprit* to render in French his concept of the Latin *mens* surrounds, so to speak, the central ideal of a self in the first person (*ego sum res cogitans*) radically deprived of interiority (except in the form of an "image of the body" internal to thought itself). For Locke, by contrast, this interiority (or "fold" of reflection) is the object of the system of correlations that he establishes among the three fundamental (and founding) concepts of philosophical "psychologism": mind, consciousness, and self, all of them *stricto senso* untranslatable.

Around this central opposition, we will study the relationships between linguistic divergences and the philosophical aporia of "thinking about thinking" through the study of the particularly significant cases of Spinoza, Leibniz, and Berkeley, which illustrate the opposed ways in which the seventeenth- and eighteenth-century philosophers tried to combine reflection on the power of representation with reflection on the autonomy of the individual willing subject, whether with respect to immanence or with respect to transcendence, thus making the terminology of *esprit* irreducibly polysemous.

Finally, having thus arrived at the threshold of modernity, we will situate in counterpoint the debates surrounding the idea of a philosophy of mind aroused by contemporary Anglo-American thought. These debates are inseparable from terms with novel meanings that are difficult to translate into languages other than the very idiomatic English of the analytical tradition. But there, too, we will show that there are tensions, in particular the one that contrasts the great return of the psychologizing point of view (which has become inseparable from the debate on the various degrees of "physicalism" or "reductionism" authorized by cognitive psychology based on neurophysiology) with Wittgensteinian criticism and its logico-anthropological interpretations, which carry into the language of the philosophy of mind a Fregean problematic of the *Geist* in the sense of a "thought of content" and arrive at a paradoxical de-psychologization of psychology. It might seem that here we are dealing with a repetition of the opposition between Cartesianism and Lockean psychologism, with the qualification that in the "philosophy of mind" the interiority of the mind has basically been turned into an observable exteriority, and that in Wittgenstein the dimension of experience has moved toward a kind of praxis [πρᾶξις]: that of the uses of language, on which the description of the manifestations of mind is itself dependent. Thus we

are confronted not so much by a repetition as by a revival whose formulations are henceforth inscribed within the framework of a single dominant idiom and its more or less approximate national translations.

I. The "Mental": A Catchall?

In modern languages, the notion of the "mental" (derived from Vulgar Latin *mentalis*, which itself derives from *mens*, designating the superior part or, for Christian theology, the immortal part, of the soul, *anima*) has come to cover a vast domain of experiences or phenomena that our spontaneous dualism opposes to the field of the physical or the biological. Apart from its use as a substantive in French, it is more or less rigorously identified with the technical term "psychic," which competes with it (particularly in psychoanalytic discourse, but Freud himself used the expressions *seelischer Apparat* and *psychischer Apparat* more or less interchangeably, both of them being rendered in French translations by *appareil psychique* [psychic apparatus] and occasionally by *appareil mental* [mental apparatus]). It has certainly benefited from the support provided by its association in English with the word "mind," which also derives etymologically from *mens* (*memini* [to remember, to cause to come to mind]; see MEMORY), and which frequently recurs in the discussion of the mind-body problem, that is, in the problematic of the psycho-physical or psycho-physiological correspondences that form the horizon of contemporary cognitivism.

■ See Box 1.

This tendency toward standardization should not prevent us from seeing that the term "mental" is a catchall from both the logical and the philological points of view. It has gradually absorbed semantic chains that have been distinct from one another since antiquity, some of them concerning the parts of the living organism and its behavior, others the structure, hierarchy, and destiny of souls, and still others the phenomena of consciousness and their relationship to intellectual processes and the perception of personal identity. The grouping of the meanings of the mental that is characteristic of what might be called modern psychologism in European culture (including a transcendental psychologism) has not, however, taken place in the same way in all languages, in particular because each language has its own terms for the powers of thought and imagination, or for the interiority of the self (in Italian, *ingenio*, or in German, *Gemüt*: see INGENIUM, GEMÜT).

However, *Geist*, *Gemüt*, and *Witz* are obviously no more subdivisions of the more general meaning designated by French *esprit* (even if Kant sometimes refers to French uses of this term) than the meaning of *âme* is distributed over *Seele* and *Gemüt*.

Similarly, French is led to translate by the single word *âme* the Latin terms *animus*, *anima*, and *mens*, but it also translates *mens* as *esprit*, thus creating an ambiguous relation with *spiritus* (whereas English has "the mind," and Italian and Spanish *mente*). German *Geist* is rendered in English by either "spirit" or "mind" (not to mention "ghost"), whence the two successive translations of Hegel's title: one psychologizing (*The Phenomenology of Mind*), which in the body of the text (at the beginning of chapter 4) couples the term with the adjective "spiritual" ("With this we already have before us the notion of *Mind* or *Spirit*"); the other theologizing (*Phenomenology of Spirit*). Finally, there are two terms in French (*âme*, *esprit*), whereas English has three ("mind," "soul," "spirit") or even four, with the archaic "wit" (see Box 1 in this entry), and this results in certain difficulties such as the ambiguity of the notion of *philosophie de l'esprit*, which is used in French to render the new "philosophy of mind."

■ See Box 2.

It can be suggested that these discrepancies themselves express different conceptions or perceptions of the mental that are both rooted in the culture and conceptualized by the history of philosophy. This idea, which may be combined with a precise philology, is nonetheless debatable in several respects.

First of all, it presupposes what is to be proved: the relative autonomy, uniform horizon, and permanence of the mental or psychic domain that the Greek, Latin, German, French, English, and other European-language words are said to designate and describe and among which a network of approximate translations is established. One of the fundamental contributions made by R. B. Onians (in his great book *The Origins of European Thought* [1951]) is to have challenged these postulates while at the same time illuminating in exciting ways the anthropological and cosmological notions originally covered by certain words (*phrēn* [φρήν], *thumos* [θυμός], *anima*, *genius*, and so forth). In other words, different corporal schemas, even if breath is privileged, can lead to the notion of mind (see Boxes 3, 4 in this entry).

Second, this idea can designate the referential signified or the general horizon of complementarities and substitutions only by means of expressions that themselves belong to this field and that reflect a certain, historically dated way of conceiving its organization. The same goes, obviously, for modern expressions such as "life" or "mental reality," "psyche," "psychical life," and so on.

Finally, this idea neglects or marginalizes the paradox to which all dictionaries attest, namely the fact that over time a given term in one language, for example, *Gemüt* in German, can be given virtually all the equivalents in each of the others: *âme*, *caractère*, *esprit*, *pensée*, *humeur*, and so forth (an amazing example that can be considered emblematic here is provided by the Basque *gogo*—see GEMÜT, GOGO), and the fact that the paradigmatic oppositions constantly reverse their value (for example, *âme* and *esprit* in relation to immanence and transcendence, materiality and immateriality).

This is not the place to discuss the whole development of the terminology of the "soul" and "spirit" in various European languages to how it has been sedimented and renewed from antiquity to the present time, as well as the problems of transfer and equivalence that have resulted from it (see UNDERSTANDING and INTELLECT, INTELLECTUS). But we will examine two major successive moments that crucially shaped the terminology of the "mental," even though they are very heterogeneous: Descartes's awkward position between several languages and several "souls" and Locke's invention of the "mind"—the first great attempt to define the "interiority" of thought, immediately accessible to itself, which antiquity had situated only as a divine ideal of wisdom or beyond death, and

1

"Mind," "soul," "body": The example of Hume

English has three words, "mind," "soul," and "spirit," where French has only two (*âme*, *esprit*). Modern, nonreligious works on what the French call *esprit* clearly prefer the term "mind." But it has to be recognized that the three terms are to a large extent interchangeable, since some expressions have become almost phrasal (as when Hume refers to the "passions of the soul" [*A Treatise of Human Nature*, 395] and not of "passions on the mind," just as in French one speaks of *passions de l'âme*, that is, without thinking of the religious sense or the moral value of soul). Here we will be concerned chiefly with the example of Hume, which is both representative of the classical problem and particularly helpful in understanding its repercussions in contemporary philosophy.

If we try to discern Hume's intentions, we see the meanings distributed rather insistently as follows:

"Mind" is opposed to "spirit" by its different relationship to "body." There are in Hume countless uses of the phrase "mind or body" (*Treatise*, 439) or "mind and body" (ibid., 453, 489) that imply, if not an identity of mind and body, at least the possibility of a similar theoretical treatment of them corresponding to a certain resemblance between the objects. It would be harder to say "spirit and body" or "spirit or body" precisely because "spirit" indicates a nonphysical principle in humans or participation in a nonmaterial or even immaterial reality.

"Mind" and "body" are associated through a certain resemblance, if not a community, of "frame and constitution" (ibid., 488, 583). Just as the body is a system of organs, the mind is an integrated set of perceptual laws, or of impressions and ideas, whose limits are no more fixed than the ectoderm fixes the precise limits of a body in its environment or designates the surface that provides access to what is external to this body. When Hume asserts that "mankind [is] nothing but a bundle or collection of different perceptions, which succeed each other with an inconceivable rapidity, and are in a perpetual flux and movement" (ibid., *Treatise*, 252), he is returning—through Indo-European *men*, included in "mankind"—to a very old sense of the word "mind," and this allows him to problematize the limits of this "bundle or collection," its self and its incorporeal nature. In any case, etymological dictionaries emphasize the possibility that English "mind" may have its origin in Indo-European *men* or

man, which means "make use of one's mind," "think" (see MEMORY). Consider, for instance, the article "mind" in RT: *The Oxford Dictionary of English Etymology* (577) and also in *Origins: An Etymological Dictionary of Modern English* (Routledge [1966], 404). The latter, while emphasizing that the derivation of "man" from *man* (think) has been discredited, nonetheless adds that it can be proven to be correct. The second edition of the *Oxford English Dictionary* (11:284) adopts a closely related position. *The Barnhart Dictionary of Etymology* (H. W. Wilson [1988]) says the same thing. It is the functioning of laws that produces the true limits of the mind, which is in itself limitless.

In order for "spirit" to recover its original material meaning—in his *Chrestomathia*, Jeremy Bentham reminds us of its proximity to "breath," *spiritus*—it has to be plural; then, in the form of "spirits" (Hume, *Treatise*, 420–23, 427) it frequently confuses translators who are led astray by the expressions "in high spirits" and "in low spirits," forgetting the material sense of the "animal spirits" that in the eighteenth century were still thought to circulate in our nervous system.

"Mind" is the term that privileges the psyche least and allows us to adhere more strictly to the descriptive and explanatory. On the other hand, "spirit" is primarily a term of valorization, against materiality, against dependency on the laws, against spatiality and temporality. It is easier to say "in the mind" or "into the mind" (Hume, *Treatise*, 420–21, 426, 441, 446, 453), "out of the mind," or even "on the mind" or "upon the mind" (ibid., 410, 422, 473, 527) than "in the spirit," or "out of the spirit," expressions that become completely absurd insofar as the notion of "spirit" implies a real separation from the body. The abstract tendency of "spirit" is seen particularly in the difficulty of using "human spirit" to refer to the human mind, whereas French forces the speaker to use the expression *esprit humain* in this context. On the other hand, in English it is easy to speak of the "human mind" (ibid., 423), even if it involves redundancy, as the previously mentioned Indo-European root suggests. Human beings share "spirit" with the angels, whether the term is used seriously or ironically.

The metaphysical tendency of "soul" is different from that of "spirit," in that it plays a role less in an opposition between different kinds of substance than in a reflection on destiny, with a much more marked religious connotation (even though Hume speaks of

"supreme spirit or deity"). We never speak of the immortality or immateriality of the mind, but only of the immortality or immateriality of the soul (Hume, *Treatise*, I.4.§5). The nature of the "soul" is the explicit object of "metaphysical disputes" (ibid., 236); this is not exactly the case for "mind" or even for "spirit." It is "human souls" that correspond (592) and have a "simple essence." On the other hand, the "mind" evolves only by stages, configurations, and situations for which a dynamics can account. "[The] mind runs along a certain train of ideas" (406); "the mind naturally runs on with any train of action, which it has begun" (565). "Mind" is opposed topically to "spirit," dynamically to "soul."

Finally, far from opposing itself to its objects, the mind is supposed to have a tendency to subject them to the laws that govern itself. Thus the mind, in its theoretical activity, "balances contrary experiments" (Hume, *Treatise*, 403); we would hardly see "soul" or "spirit" engaged in a similar process of imitating their objects.

The greater value accorded "soul" or "spirit" at the expense of "mind" can also be seen in the way spiritual force is described. No matter how physical it is, the word "strength," which is used to qualify the vigor of a body, is nonetheless more often applied to "spirit" and "soul" than to "mind" (Hume, *Treatise,* 433–35), because of its relative archaism in comparison with the term "force," which is felt to belong to a modern dynamics more likely to be applied to "mind" and to the discovery of its laws. The word "force" is less valorized, less loaded with affectivity than "strength" or "vigor," just as "mind" is less valorized than "spirit" or "soul," which remain inseparable from a philosophy dominated by affectivity and moral values. It is for "soul" to have the old aristocratic virtues of vigor, "courage and magnanimity" (ibid., 434) and to seek out suitable adversaries in the quest for a grandeur which the philosopher of mind, who has read Cervantes, hardly believes in anymore (435).

The ambiguity of the expression *philosophie de l'esprit*

The French expression *philosophie de l'esprit* refers to two theoretical orientations that are foreign to each other (P. Engel, *Introduction à la philosophie de l'esprit*). The first refers to the doctrine of philosophers attached to mind-body dualism, such as Louis Lavelle and René Le Senne. From this point of view, a materialist philosophy of mind would be a contradiction in terms. The second refers to a thematic field rather than to a doctrine—the mental, and not the spiritual. The philosophy of mind understood in this sense is interested in the nature of mental phenomena and in their relations with behavior; recently, it has also examined their relations with cerebral phenomena. So conceived, the philosophy of mind has always constituted a domain of philosophical interest—the analysis of the faculties of the mind (sense perception, memory, imagination) or relations between the body and the mind. However, a domain was not constituted explicitly under this name until the second half of the twentieth century, in the wake of the philosophy of language.

The term *philosophie de l'esprit* nonetheless remains subject to ambiguity insofar as it is applied to two different types of reflection (these two types corresponding, as might be expected, to very different styles of argumentation). The first, inspired by the so-called ordinary language tradition or by Husserl's phenomenology, conceives the philosophy of mind as a purely conceptual analysis based on the common experience and understanding of states of consciousness (Ryle, *The Concept of Mind*; Hornsby, *Simple Mindedness*). The second holds that the philosophy of mind can develop fruitfully only by including in its reflection scientific knowledge regarding the mind and the brain (Engel, *Introduction à la philosophie de l'esprit*). Willard Van Orman Quine's rejection (in his "Two Dogmas of Empiricism") of the distinction between analytical propositions, which are true by virtue of their meaning, and synthetic propositions, which are true by virtue of experience, has led many analytical philosophers to turn to the cognitive sciences to raise the classical problems of philosophy (such as the nature of self-knowledge or of representation) in a way that is enriched by, and compatible with, the contributions of these sciences. Today, some phenomenologists challenge Husserl's antipsychologism by seeking to naturalize the concept of consciousness (Petitot, Varela, and Pachoud, *Naturalizing Phenomenology*).

The development of the cognitive sciences has certainly favored the development of a naturalistic philosophy of mind by making available to philosophy information that stimulates its reflection on the nature of the mental. But we must not confuse naturalistic philosophy of mind with the philosophy of psychology or with cognitive philosophy. The former produces original arguments intended to naturalize traditional philosophical concepts (Rey, *Contemporary Philosophy of Mind*), whereas the philosophy of psychology offers a critical evaluation of the analyses and methods applied in psychology (Grünbaum, *Validation in the Critical Theory of Psychoanalysis*). Cognitive philosophy, on the other hand, participates directly in scientific activity by contributing to the development of concepts or by proposing experimental schemas (Dennett, *Consciousness Explained*).

that contemporary philosophy, psychology, and neurophysiology have, it seems, lost again, either in the depths of the unconscious or in the objectivity of behavior and brain processes.

■ See Boxes 3 and 4.

Our hypothesis is that "translation problems" are characteristic of a "threshold" of modernity that extends, roughly speaking, from Descartes to Hegel, and whose Lockean, Humean, and Kantian stages must be considered decisive. The "psychology" or "noology" of antiquity was either transmitted from Greek and Latin in accord with a terminology that is now part of history, or it arose from a more general problem whose importance we are only beginning to see (cf. once again Onians and Box 3 in this entry): that of the conceptions of the human animal peculiar to a civilization whose experiences, and hence modes of thought, are now very distant from us (which does not mean that they are not capable of being rethought and brought up-to-date). So far as contemporary disciplines are concerned, we can acknowledge that the translation of their terminology is largely a matter of convention (at least within the European or Western sphere), even if it may be enlightening to understand the connotations of certain terms in their original languages (see Box 6 on Wittgenstein and the "philosophy of mind").

On the other hand, so far as the metaphysics of *âme* and *esprit*, of *mens* and "mind," *ingenium,* and *Gemüt* and *Geist* in the early modern period is concerned, what is untranslatable or imperfectly translatable clearly manifests the confrontation of the strategies deployed to "think thought" in the context of a revolutionary anthropology. "Homo cogitat," Spinoza posits as an axiom at the beginning of the second part (*De mente*) of his *Ethics*, but what does "think" mean? And precisely what thinks in "man"? These questions, to be sure, are no longer the ones we ask. But we cannot claim that they have disappeared from our horizon. It is no accident that they were asked—in this diversity—at a time when philosophy was emerging from an apparent linguistic uniformity, passing into vernaculars and seeking a new universality that would include them (so that Latin itself became, in Descartes and Spinoza, one idiom among others).

3

Onians's Greeks: *Thumos, âme-sang* and *psuchê, âme-souffle*

One of the effects of Onians's work is to force us to retranslate ancient texts, particularly those of Homer and the tragedians: we can no longer accept, for example, the translation of the cry repeated by the Furies in Aeschylus's *Eumenides, thumon aie, mater Nux* [θυμὸν ἄιε, μᾶτερ Νύξ], literally "inspire me with breath, Mother Night," as "Hear me, Mother Night" (*The Oresteia*, trans. I. C. Johnston). Onians's whole method (unlike that of Bruno Snell, for instance) consists in interpreting in a radically nonmetaphysical way words and expressions referring to the body, that is—and this is the order followed in his work and emphasized in the title—"spirit," "soul," "world," "time," and "fate." This brings out two ancillary characteristics: on the one hand, thoughts and emotions are rooted in the body, or in modern terms, there is no separation between *res cogitans* and *res extensa*; on the other hand, the body is not entirely the same as our own, we no longer have the same organs as Homeric heroes. As a result, not only must translations be revised, but some translations are impossible.

Using etymology and cross-references like a detective, Onians sets out to find "the seat of consciousness." The spiritual part of our being, thought, intelligence, or mind, is designated primarily by the word *thumos* [θυμός], "which appears to be something vaporous," a "breath," a "vapor" fed by the ferment of the blood, a "blood-soul" (cf. Onians, *Origins of European Thought*, I.2, esp. 39–40). Onians connects *thumos* with *thumaio* [θυμιάω], "to smoke" (Chantraine [RT: *Dictionnaire étymologique de la langue grecque*] mentions instead *thuô* [θύω], with a long *u*, "rush furiously forward," like the wind, for instance, and distinguishes it from *thuô* [θύω], "to sacrifice," which is used chiefly to refer to offerings that are burned and that smoke). *Thumos* denotes the heart, ardor, courage, the hero's combative enthusiasm; hot, it is contained in the *phrenes* [φρενές] and the *prapides* [πραπίδες], which designate not the "diaphragm," as the word is commonly translated, nor the "pericardium" (for *phrên*, RT: LSJ gives "midriff, heart, mind" and "will, purpose"; for *prapides* it gives "midriff, diaphragm," and "understanding, mind"), but rather the "lungs," thick, dense, spongy (Onians, *Origins of European Thought*, I.3, esp. 55, 68); death destroys and breaks the *thumos*. Close to the *thumos*, the *êtor* [ἦτορ], situated in the *phrenes* but also in an organ that can be either the heart or the stomach (called *kardia* [καρδία], *kradiê* [κραδίη]) and is responsible for respiration, the heartbeat, and the pulse. Stimulated by the emotions, it laughs, and when one speaks to oneself, one is speaking to it as one does to the *thumos* (ibid., 105; see CONSCIOUSNESS, Box 1).

Both words, *thumos* and *êtor*, differ from the *psuchê* [ψυχή], another way of referring to the breath, this time in the sense of respiration, breathing (the Indo-European root **bhes-*, "to breathe," as for *phêmi* [φημί], "say"): this "breath-soul" in contradistinction to the "blood-soul" constituted by the *thumos*, is cold and situated in the head; in Homer it designates particularly the separated soul of the dead that escapes the body like a puff of smoke (*Iliad*, XXI.100), flies away like a moth or bat (*Odyssey*, XXIV.6), or a dream (*Odyssey*, XI.222), to live in Hades in the form of an *eidôlon* (εἴδωλον], "phantom," that preserves the form or "image" (see EIDÔLON and MIMÊSIS), and as a *skia* [σκιά], shade (Onians, *Origins of European Thought*, II.1, 119–23; cf. the *nekuia* [journey to the underworld], *Odyssey*, XI, where translator V. Bérard regularly renders both *psuchê* and *skia* as "shade" [*ombre*], and *thumos* by "soul" [*âme*], for example, pp. 204–24).

Finally, *noos* [νόος] or *nous* [νοῦς] (which Onians associates with *neomai* [νέομαι], "I go," *neô* [νέω], "I swim"), described as "in" the *thumos*, defines it "as in a sense a current consists of but defines air or water" (Onians, *Origins of European Thought*, 107); with the result that it is valorized as "intelligence, intellect," while remaining less manifestly material than the *phrenes*. Basically it is something like a "current of consciousness" that perceives through the senses ("It is the *nous* that sees and it is the *nous* that hears; all the rest is deaf and blind" (see Onians, ibid., 108; see UNDERSTANDING, Box 1).

Conflations of organs, "mental" distinctions that remain indiscernible for us: Homer's world can explain our own (it allows us, Onians emphasizes, to understand what we are saying, the beliefs that persist in our traditional expressions and acts—we "swallow" what someone says, a poet is "inspired," the last kiss given a dying person always collects only the *psuchê* that escapes, etc.), but it cannot coincide with our world.

This distance between Homer's world and ours is connected in particular with the fact that we have inherited a whole philosophical reworking that, as early as Plato and Aristotle, hierarchizes and unifies complementary powers in terms of *dunameis* [δύναμεις], all of these powers belonging to the *psuchê*, in other words, to "faculties of the mind." *Psuchê* becomes a generic term covering *nous* and *thumos*, and takes on new distinctions like the one between *dianoia* [διάνοια] (literally, "what crosses the *nous*," translated as "intelligence, thought, project") or *epithumia* (literally, "what is on the *thumos*," translated as "desire" or "the desiring faculty"). In the course of the *Republic* and the *Timaeus*, a tripartite analogy is constructed that holds both for each individual's *psuchê*, for his body, and for the social body—or should we say the social soul?—constituted by the city-state (*politeia* [πολιτεία], see POLIS). At the top is *logistic*, which "decides" (*ho logos* [ὁλόγος], *to logistikon* [τὸ λογιστικόν], *to bouleutikon* [τὸ βουλευτικόν], see LOGOS), that is, the head, and thus the guardians or the philosopher-king, everything that has to do with *logos, nous, dianoia*, rational decision, destined to be immortal; in the middle, the humors, ardor, or the thymic part (*to thumoeidês* [τὸ θυμοειδής]), that is, the chest and thorax, with the heart, lungs, diaphragm, and thus the warriors or guardians who "provide help" (*to epikourêtikon* [τὸ ἐπικουρητικόν]); at the bottom, the desiring faculty (*to epithumêtikon* [τὸ ἐπιθυμητικόν]), or the lower abdomen, between the diaphragm and the navel, and thus producers and merchants who nourish and create wealth (*to chrêmatistikon* [τὸ χρηματιστικόν]). Each person has his own virtue: the top is "wise" (*sophos* [σοφός]); the middle "courageous" or "virile" (*andreios* [ἀνδρεῖος]), and the bottom "tempering" (*sôphron* [σώφρων]); as for the structure itself, it is "just" insofar as each faculty, like each entity, remains in its place (cf. *Republic,* IV.434c–444e; IX.580d–581e; see also the anatomy lesson in the *Timaeus*, 69d–76e, and the myth in the *Phaedrus*, 256a–b, 253c–254e). The organic has thus become an ethical-political diagram.

With Aristotle and the natural sciences, the hierarchy internal to the soul, which also creates a hierarchy among souls, becomes the theme of a hierarchy of species: the soul, Aristotle says very simply, is "not a body, but something bodily (*sôma men gar ouk esti, somatos de ti* [σῶμα μὲν γὰρ οὐκ ἔστι, σώματος δέ τι]), *De anima*, II.2.414a.20–21). To a given body belonging to a genus and species corresponds a soul endowed with a given faculty or potentiality, and not necessarily all of them. Thus plants (*ta phuta* [τὰ φυτά], "what grows") have only the "nutritive faculty" (*to threptikon* [τὸ θρεπτικόν]). Some living beings (*ta zôia* [τὰ ζῷα], see ANIMAL) also have the "sensitive faculty" (*tò aisthêtikon* [τὸ αἰσθητικόν]) and at the same time, through the sense of touch, the "appetitive faculty" (*to orektikon* [τὸ ὀρεκτικόν]), which includes *epithumia* [ἐπιθυμία], *thumos,* and *boulêsis* [βούλησις], desire, ardor,

(continued)

and will, that is, very precisely the Platonic tripartite division, thus forcibly concentrated under the appetite that flows from sensation. Some animals have in addition the "faculty of moving in accord with the place (*to kata topon kinêtikon* [τὸ κατὰ τόπον κινητικόν]). Finally a very small number, humans in any case, also have the "thinking faculty" (*dianoê-tikon, logismon kai dianoìan* [διανοητικόν, λογισμὸν καὶ διάνοιαν])—"as for the theoretical faculty (*peri de tou theôretikou* [περὶ δὲ τοῦ θεωρητικοῦ], intelligence or speculative

intellect, that is another question" (*De anima,* ll.3.414a.29–41b.14).

These terminological reinvestments testify to the fact that the distance among Greeks, between the heroic body and the rational animal, is no smaller than that between the Greeks and us.

"Soul" and Hebrew *nèphèš* [נֶפֶשׁ], *rûah* [רוּחַ], and *nešāmā* [נְשָׁמָה]

The word designating the soul, *nèphèš* [נֶפֶשׁ], is often derived from the idea of "breath," and more precisely from the respiration, the vital breath whose presence signals life, and which leaves the body at the moment that one dies or "expires." In that regard, Semitic languages do not differ from Greek. In its first written occurrence (*Iliad,* I.3), Greek *psuchê* [ψυχή] is already specialized in the sense of "soul." On the other hand, the Hebrew *nèphèš* is still attested in concrete senses: "gullet" (Is 5:14b; Pr 27:7) or "breath" (Job 41:13). The word is employed chiefly in reference to humans; the *nèphèš* of God is almost never mentioned. This soul is the seat of all mental, intellectual, and emotive activities (cf. Maimonides, *Guide for the Perplexed*, I.41). Whatever has a soul is therefore "animate," alive; the word is used to designate life, as when one says "don't leave a soul alive." It is frequently used, as the word *èsèm* [עֶצֶם], "bone" is also used, as a reflexive pronoun (e.g., 1 Sm 18:1). To do something to one's soul is to do it to oneself, to one's self.

The Hebrew word for "spirit," *rûah* [רוּחַ], has a multitude of meanings, and efforts have been made to distinguish among them in the exegetes and also in the philosophers (cf. Maimonides, *Guide*, 1.40; Hobbes, *Leviathan*, III.34; Spinoza, *Tractatus theologico-politicus*, 1). The etymology allows us to clarify matters somewhat: originally, *rûah* meant "wind." It still has this meaning in the Gospel of John, which says (in Greek, however), that the *pneuma* [πνεῦμα] blows wherever it wishes. Moreover, an old image sees the wind as God's breath (Ps. 18:16b). It is this meteorological rooting that makes it possible, in certain contexts, to distinguish *rûah* from *nèphèš*: the former is a breath exterior to the organism. But as a result, the word can be used to designate what comes from outside, invading and filling the organism. The outside can be the absolute Other; thus we often speak of God's "spirit," and almost never of his "soul." To be filled with the spirit is reserved for certain exceptional individuals: it descends upon the "judge" and makes him go completely berserk, usually in order to help him play his political role as the

dictator who saves the people (Jgs 3:10, 6:34, 11:29), sometimes in a private matter (Jgs 14:6, 9). The spirit is laid upon the prophet (1 Sm 10:6). The king represents a kind of institutionalization of *rûah*: in him, the effects of the spirit are permanent (Jgs 16:13). The idea of artistic inspiration is discreetly anticipated. It is attributed, not to an inspiration coming from the Muses, as in Greece (Hesiod, *Theogony*, 1.31), but from the divine spirit, given to Betsalel, the artisan of the temple (Ex 31:3).

Nešāmāh [נְשָׁמָה], derived from a verb probably meaning "to pant" (Isaiah 42:14), also designates the vital breath. Thus God breathes into the human form that he has just shaped the breath (*nešāmāh*) of life, and man becomes a living "soul" (*nèphèš*) (Gn 2:7). However, *nešāmāh* is used only with reference to humans, whereas *nèphèš* is also used for animals. It is also as well in the sense of "to be alive" (e.g., Dt 20:16). The Septuagint usually renders it by *pnoê* [πνοή], "breath."

II. Descartes and the Problem of Multiple *Âmes*

A. Latin-French reciprocity

With Descartes, we might hope to find a simple situation. At the center of his metaphysics there is a formula he uses in the *Discourse on Method* and repeats in the French translation of the *Meditations:* "this self, that is, my soul (*âme*) through which I am what I am." But how can we understand this strange equivalence literally? The textual evidence may be complicated by the fact that Descartes writes in two

languages between which there is a notorious terminological discrepancy in the area of psychology.

It is important to understand that Descartes' relationship to these two idioms is not unilateral but rather circular or reciprocal. The philosopher who sometimes calls himself René and sometimes Renatus did not write (and think) first in Latin and then translate himself into French, but neither did he write first in French and then seek, in order to communicate his thoughts, a Latin equivalent. It is easy to see that while Descartes's French retains Latin rhetorical

patterns and transposes a terminology taken from the ancients and from Scholasticism (for example, "subject" [*sujet*] for *subjectum*, which is moreover rare), his very classical Latin (more that of the Jesuit schools than that of the universities) sometimes coins expressions that have a French background. Some of his texts were written first in Latin, others in French. There is no hierarchy between them. Translations were made in both directions, usually under the author's supervision. The discrepancy between the two idioms overdetermines the expression of a doctrine that evolves over time as it coheres into a system and is confronted by unanticipated questions and objections.

Should we conclude, then, that the relationship between *mens*, *esprit*, and *âme* poses a problem of translation? If that is the case, Descartes provides an explicit solution, but the question is whether he is able to maintain it throughout. In Latin, he rejects the word *anima* and chooses the word *mens*, to which he gives the meaning of *res* (i.e., *substantia*) *cogitans*. When he writes in French, he uses *âme* in the same sense, despite the etymology, but has to explain it. But in the translations from Latin to French, he authorized the use of *esprit* (particularly in the *Meditations*, translated by the Duke of Luynes), even though in the end it was the equivalence *mens = âme* that was finally made official, as it were (*Replies to Objections, Principles of Philosophy*). However, the difficulties, which were not to be inconsequential for later Cartesianism, arose from four facts: (1) the word *anima* is not totally proscribed, it is found in the "paratext" of the *Meditations*; (2) the term *mens* itself gives rise to ambiguities, because the meaning Descartes gives it is contrary to the traditional one (especially in the Augustinian and Thomist tradition); (3) the fluctuation of the "authorized" translations of *mens* between *âme* and *esprit* is not purely a matter of convention: each of these terms has connotations that affect the core of the theory, and this also means that in a way neither of the two terms is quite right; (4) *anima* reappears in the Latin translation of Descartes's last work, the *Passiones animae*: a translation that is, admittedly, posthumous, but whose basis has to be sought in the work itself.

B. The ever-immortal *anima*

An examination of the titles under which Descartes's *Meditations* were published is intriguing. In Latin (first edition 1641): *Renati Descartes Meditationes de prima philosophia in qua* [sic] *Dei exsistentia et animae immortalitas demonstratur*; (second edition 1642): *R. D. Meditationes de prima philosophia, in quibus Dei exsistencia et animae humanae a corpore distinctio demonstrantur*; in French (1647): *Les méditations philosophiques de René Descartes touchant la première philosophie dans lesquelles l'existence de Dieu et la distinction réelle entre l'âme et le corps de l'homme sont démontrées.* In the rest of the text, including the intermediary subtitles, Descartes systemically uses *mens* (*Meditatio Secunda: De natura mentis humanae. Quod ipsa sit notior quam corpus*; *Meditatio Sexta: De rerum materialium exsistentia, et reali mentis a corpore distinctione*); the French translation systematically renders *mens* by *esprit*, except in this last subtitle (*Méditation sixième: De l'existence des choses matérielles, et de la réelle distinction entre l'âme et le corps de l'homme*). The dedicatory epistle to "Messieurs le Doyen et Docteurs de la Sacrée Faculté de Théologie de Paris" also uses *anima/âme*, whereas

the abridged edition of the *Meditationes* alternates between *animae immortalitas* and *mentis immortalitas.*

From this we might conclude that the use of *anima* is a *captatio benevolentiae* directed toward theologians imbued with Scholasticism. Without ignoring this reference to the conditions of "the art of writing" in the French classical age, we can complement it with an intrinsic interpretation. The formula closest to the doctrinal content of the *Meditations* is obviously the one that refers to the "real distinction" (that is, the distinction in substance) between the soul/mind and the body, for which only the appropriate term is *mens*, in the Cartesian sense. The text suggests that this thesis is a logical presupposition of the thesis regarding immortality (which is not demonstrated). But from one to the other there is a leap that Descartes is not able to evade or reduce. Only the expression *animae immortalitas* really has an accepted theological meaning, and it connotes "first philosophy" (as was indicated by the first Latin title). Descartes can dispense with it only by abandoning not only the hope of being understood by orthodox thinkers but also a whole part of his doctrine (in particular the claim in the Third and Fourth Meditations that there is a resemblance between human nature and the Divine, and perhaps also the claim that there are "innate ideas" that God has placed within us as "seeds of truth").

C. *Mens*, "soul/mind," and the act of *ego cogitans*

What then is the problem raised by the meaning of the word *mens*, and what indirect light could the translations of this term by "soul" and "mind" shed on it? In the same year, 1644, the Latin translation of Descartes's *Discourse of Method* appeared, in which *âme* (soul) is translated by *mens*, as well as the French versions of the *Meditationes* produced by Luynes (who renders *mens* by *esprit*) and by Clerselier (who renders *mens* by *âme*), and finally the Latin *Principia*, in which Descartes gives his system a "definitive" expression. He clearly settles his choice on the *mens/âme* couple, objecting as early as 1641, in a letter to Mersenne, to the "ambiguity" of *anima* (which confuses the vegetative or motor principle with a faculty of thought, bringing *res cogitans* back into the sphere of "animation" and "organization," as in Aristotle, where the soul is the "form of the body"—an objection that is repeated and explained in the *Responses to the Second and Third Objections*). However, since the eighth and ninth principles of the first part of the *Principia* collect under the rubric of the *âme* (*mens*) the totality of the modes of thought (*cogitatio*), including sensation, as "actions" separate from the body, one might wonder why in the French *Meditations* he accepts without correction the translation by *esprit* (which also includes paradoxical echoes of the body: consider "animal spirits" and the alchemical use of the term in the sense of "subtle matter").

We see two reasons for this. The first, which is stylistic and philosophical, is that in this way Descartes is able to establish a connection between the characteristic expressions of his metadiscourse that reflect the nature of the activity or mental exercise called "meditation" (in particular *mente concipere* [conceive in (my) mind], *inspectio mentis* [inspection of the mind], *in ipsa mente* [(ideas found) in the mind itself], *in meipsum mentis aciem converto* [I reflect on myself], etc.) and the expressions of the doctrinal discourse regarding

the nature of thinking thing (*res cogitans*). Paradoxically, in seventeenth-century French only the word *esprit* makes it possible to refer to the subject of meditation, that is, to the reality or actuality (or even the performativity) of thought thinking itself, which Descartes also calls the understanding, and which in his first, unfinished essay, the *Rules for the Direction of the Mind*, he had called in Latin *ingenium*). Here the term *âme* paradoxically seems to have a spiritual and even mystical meaning, as it later did in the work of Malebranche.

But this leads us to a deeper reason that we can try to approach by the *via negativa*. In fact, neither *âme* nor *esprit* is really suitable, because in Descartes *mens* designates not only the "substance" whose whole essence consists in thinking (or whose essence merges with its "principal attribute," *cogitatio*), but also connotes the presence of the subject in his thought, or the fact that thought grasps its own essence only in the first person. Thus one would have to be able to designate immediately by *mens*, or by one of its translations, not only the subject of thought as a "thing," but also the fact or "act" itself of the *cogito*, or better yet, the *ego sum cogitans*. This is, strictly speaking, impossible, but Descartes never ceased to seek to approximate it through a series of formulas in Latin and French, two of the most remarkable of which are the one in the *Discourse*, part 4, already cited (see I/ME/MYSELF): "This self, that is, the soul, through which I am what I am," which in the Latin version becomes *Adeo ut ego, hoc est mens*, and the one in the Second Meditation, *Quid autem dicam de hac ipsa mente, sive de me ipso?* rendered as "What shall I say about this mind, that is, about myself?" We see that Descartes, at the precise moment when this ipseity is recognized, formulated in order to name "the thing that thinks" a generalized equivalence that also proves that none of the necessary terms is sufficient, and that singularly qualifies the importance of the fact that from one language to the other, their correspondence cannot be exact (if Luynes had accepted *âme*, he would have had four terms out of four, not three out of four):

> sum igitur praecise tantum res cogitans, id est, mens, sive animus, sive animus, sive intellectus, sive ratio, voces mihi prius significationis ignotae.

> (Thus I am, strictly speaking, only a thing that thinks, that is, a mind, an understanding, or a reason, which are terms whose meaning was previously unknown to me.)

> (Descartes, Second Meditation; trans. Lunes)

What the oscillation between *âme* and *esprit*—the first term more theological, the second more epistemological—ultimately shows is that they no more translate an original Latin *mens* than the latter truly renders their signifieds, which is impossible as such and in any case is irreducible to the form of a "substantive," since it refers to an action: the act of thinking (oneself) in the first person, inevitably implying a short circuit between the utterance and the act of enunciation. The French and Latin names circle around the sought-after signification.

D. "The passions": An eclipse of the mind

There remains the problem raised by the translation of Descartes's last work: *The Passions of the Soul* (*Les passions de l'âme*, 1649). In Latin, the book becomes *Passiones animae, per Renatum Descartes, gallice ab ipso conscriptae, nunc autem in exterorum gratiam latina civitate donatae. Ab H. D. M. j. u. l.* It is true that this translation (made by Henri Desmarets, and brought out a few months later by the same publisher as the original Latin version, Elzevier) was not reviewed by Descartes, who had just died. Once again a contextual explanation offers itself, this time with reference to the tradition of philosophical and medical works on the passions, a tradition to which Descartes belongs and that goes back to antiquity (*pathê* [πάθη] or *pathêmata tês psuchês* [παθήματα τῆς ψυχῆς], a Platonic and Aristotelian expression transmitted through Stoicism; see PATHOS). But this explanation merely deepens the paradox. At the heart of the treatise we find one of the theses that justified the privilege accorded to the word *mens*: the "indivisibility" of the soul into parts that are distinct, and a fortiori hierarchical, which is reaffirmed in principle 47 ("For there is in us only one soul, and this soul has in itself no diversity of parts: it is the same that is sensitive and rational, and all its appetites are wills"). Which means that in the *Discourse*, the *Meditations*, and the *Principles* the soul that is affected by the passions is always, in principle, the "thing" or *res* that "thinks." It is just that here a new, "passive" modality of cogitare is explored in detail. But beneath this doctrinal continuity, a shift has taken place. On the one hand, the renewed criticism of the physical representation of the soul as a system of organic parts or functions has as its correlate a singular insistence on their qualitative diversity or on the ethical inequality of the individuals with whom the souls are identified: there are "great souls" and "low or vulgar souls," as Descartes's correspondence with Princess Elizabeth explains in counterpoint. Once again, a stylistic feature encounters a theoretical question. On the other hand, and above all, the self-certainty that is at the heart of the Cartesian doctrine assumes here an unforeseen form that practically inverts the preceding one. As in the Sixth Meditation, it is the paradox of the "union" of two absolutely distinct substances that is the object of analysis. But whereas the Sixth Meditation concentrated its attention on the intellectual clarity of the "distinction" (even in perceptual illusions), *The Passions of the Soul* is devoted to the moral properties of the confused experience we have of the substantial union. This human body that we "are" not, is nonetheless not foreign to us: an idea that is intellectually obscure but indubitable as a sensation or feeling. Therefore if we try to imagine a translation such as *passiones mentis* we can see its insufficiency and even its impossibility.

This does not mean that the translation by *anima* is satisfactory. Descartes has not returned to an Aristotelian conception of the soul as the "form of the body." Nor has he returned to the theological tradition (on the contrary, the ethics of the *Passions* is clearly antitheological, and the underlying metaphysics includes blasphemous aspects, in particular in its too-human reconstitution of the mysteries of the Incarnation). He has defined a new field of experience in which there is still "thought" but not, strictly speaking, "understanding." The real question is why he did not use the language of the "heart," which is that of the tragedians and moralists, and which intersects with some of the key notions in his ethics ("generosity"), especially when they concern the analogy of the relation to oneself and the relation to

others (which Descartes subsumes under the single notion of "esteem"). The answer is probably that this term is too closely connected with the discourse of the mystics. Nonetheless, it is difficult to avoid the impression that there is a correspondence between the enigma (the conjunction of the body and the soul) subsisting at the heart of the system and the impossibility of unambiguously designating the subject of thought. For this strange proximity of spiritualism and materialism, which will persist in Descartes's posterity, no learned or ordinary language, no system of translation, can offer any more than an approximation.

III. Fluctuations in the Seventeenth and Eighteenth Centuries

A description of the place of the terms *âme* (soul) and *esprit* (mind) in French philosophers and essayists of the seventeenth century would probably be very revealing of the configurations or "points of heresy" (as Foucault would say) that characterized the philosophical discourse of that time. In large measure, it either proceeds from Descartes or expresses a position with regard to his work, but in accord with strategies that are always overdetermined. In particular, nothing would be more erroneous than to assign once and for all either of the two terms to the camps that were henceforth to confront each other: materialists and spiritualists, rationalists and empiricists.

A. Resolving the irreducible contradictions of Cartesianism

It is the "Augustinians" who want to push dualism to the extreme and who privilege the word *esprit* (La Forge, who published Descartes's work and continued it with his *Traité de l'esprit de l'homme* [1666]). For his part, Malebranche uses the word *âme* to refer both to the "foundation of the soul" and the "foundation of being" (which is God himself), while at the same time reversing the Cartesian *cogito* (for him, the soul is essentially obscure to itself, and the "inner feeling" through which it becomes conscious of its existence is practically described in the terms that in Descartes characterized as the union of mind and body). Because he wants to overthrow the religious doctrine of the Creation and the Fall, La Mettrie coins, in the spirit of Locke, the expression "natural history of the soul (*âme*)" (1745), which in Rousseau's *Confessions* becomes the "history of my soul," in the sense of the history of "my life." But Helvétius gives the title *De l'esprit* (1758) to a work in which he seeks to base the enterprise of Enlightenment on a generalized sensualism.

Most astonishingly of all, perhaps, Condillac (*Essai sur l'origine des connaissances humaines*, 1746; *Traité des sensations*, 1754) systematically uses the language of the "soul" (*âme*) and its "operations." Here he is probably following Coste's classical translation of Locke (1700), which renders "mind" sometimes by *âme* and sometimes by *esprit*, but—contrary to what we would do today—with a prevalence of the former term (the article "*Âme*" in the *Encyclopédie*, which refers to Voltaire's commentary on Locke, tends to do the same). It would also be worthwhile to explore another hypothesis, that of the Cartesian heritage, since Condillac pursues his analysis by moving back toward a pure sensation that represents the original conflation of body and thought before the understanding is constituted.

Thus we would have an essential link in the continuity of a "French" doctrine of the union of the soul and the body as an irreducible mode of perception, a doctrine that extends from Descartes to Merleau-Ponty, passing through Malebranche, Maine de Biran, and Bergson, and that remains profoundly foreign to the psychophysical issues of the "mind-body problem."

But still more important is the question of the adjustments made to the terminology of the soul and mind in the context of opposing attempts to resolve the contradictions of Cartesianism: in Latin, by Spinoza, from an anthropological point of view determined by his politics of freedom; in French, by Leibniz, from a metaphysical point of view oriented toward a new theology of salvation.

Spinoza radically desubstantializes the mind/soul, which becomes a "finite mode" of the attribute "thought" (one of those that characterizes, on equal terms, the intelligibility of substance) and in the course of his work this leads him to definitively reject *anima* in favor of *mens* (cf. E. Giancotti-Boscherini, "Sul concetto spinoziano di Mens"). But his primordial interest in the question of "individuation" at all levels of nature and life, and especially the degree of the individual's autonomy with respect to the parts that compose him and to the collectivities that include him, leads Spinoza also to retain the "old" term *ingenium*, which is applicable to human individualities as well as to "historical" individualities (states, cities, social classes). In the unfinished *Tractatus politicus*, he makes this the equivalent of a *quasi-mens*, which is not so much a "collective soul" or a "spirit of the people" as an institutional "unanimity" indissociable from the power of the people and its political resistance to dissolution.

Leibniz also puts the question of the individual or unity at the center of his philosophy, but he does so in order to invent a new ontology of substantial individuality. Writing his systematic treatises in French (in particular, the *Monadologie* of 1714), he institutes a relation between *âme* and *esprit* that is both inclusive and hierarchical. The old adage *omnia sunt animata*, whose meaning had been enriched by contemporary Neoplatonism (Thomas More, Ralph Cudworth) allows him to maintain that to every "monadic" individual corresponds an *âme,* that is, a perception of itself and an "appetition," that is, a tendency to act or develop. However, only certain souls (especially human souls, but also others that are of equal of superior status) have a "clear" perception, in various degrees, of themselves and of their volitions (In his *Nouveaux essais sur l'entendement humain*, written in 1703 but not published until 1765, Leibniz, coining an astonishing neologism to translate Locke's "consciousness," calls this a *consciosité*, or, in his definitive terminology, an *apperception*). It is these souls that deserve to be called *esprits* and that, in the preestablished harmony of creation, subordinate all others to themselves in order to realize the immanent goal.

■ See Box 5.

B. "Mind" or "Spirit": The case of Berkeley

In his *Essay Concerning Human Understanding* (1690), Locke made consciousness the essential characteristic of the mind, and self-consciousness the new name for the human subject (see CONSCIOUSNESS). On the contrary, Berkeley (like Leibniz)

5

The mind-body problem

What is the place of the mind and consciousness in the natural order? The problem of the relations between the mind and the body is traditionally conceived as the question of the substance that composes each of them. If we adopt a dualism of substances, the difficulty consists in understanding how two distinct substances—the mind, whose essence is thought, and matter, whose essence is extension—could have a distinct causal relationship, for instance, in the case of action. The hypothesis of a possible interaction between substances, defended by Descartes, seems difficult to maintain given the autonomy of substances. Leibniz's solution is psycho-physical parallelism, according to which there are no direct causal relations between physical and mental events. The two series of events develop in parallel. The synchronization of the two series requires recourse to a mediating principle such as divine Providence. Leibniz's theory is not dualistic because according to him there are no material substances.

Another monist solution of the problem is provided by Spinoza: there is only one substance, of which mind and matter are "two aspects" or attributes. Psycho-physical parallelism derives from the fact that the events of each attribute express one and the same essence of the same substance.

Contemporary authors have explored the Spinozist solution using new means: Bertrand Russell (*The Analysis of Mind*) and Michael Lockwood (*Mind, Brain, and the Quantum*) set out to defend a "neutral monism," whereas other authors favor a "property dualism" that is compatible with a materialist monism (B. O'Shaughnessy, *The Will: A Dual Aspect Theory*) or not (D. Chalmers, *The Conscious Mind*). What is

specific to the contemporary way of working out the problem is the introduction of concepts that seek to define the nature (psycho-biological or logical) and modal force of the dependency linking the mental and the physical. The difficulties of translation proceed from the abundance of specialized neologisms as well as from the adoption, in various senses, of notions that are simply homonymous, such as "reduction," "materialism," or "physicalism." Mental phenomena are said to "supervene on"—depend systematically on—physical nature in the sense that any mental difference assumes the existence of a corresponding physical difference. Donald Davidson ("Mental Events") has reintroduced into the contemporary debate on the mind-body problem the emergentist conception of the mental. The interest of the concept of "supervenience" is that it allows us to conceive the relationship between mind and brain as a dependency *without reduction*. It has been the object of numerous technical distinctions (strong, weak, or global supervenience; see J. Kim, *Supervenience and Mind*).

"Physicalism" is the general term that designates the idea that mental phenomena supervene upon physical-biological nature. There are several ways of understanding physicalism, depending on the form given to the dependency between the mind and physical nature. "Type physicalism," also called "psycho-physical reductionism," is the strongest form of physicalism, and was defended as late as the 1970s (D. Armstrong, *A Materialist Theory of the Mind*). "Token physicalism" was adopted by functionalists attached to the multi-realizability of mental states (N. Block, "Antireductionism Slaps Back"). Davidson supports a related position, with the thesis

of "anomal monism": every mental event is identical with an occurring physical event, but does not give rise to any psycho-physical law; in other words, the identity of brain and mind is not invariant relative to the type of mental event in question.

Philosophers continue to seek a solution to the problem that is compatible with physicalism but makes it possible to escape the threat of making mental phenomena, and especially representations, simple epiphenomena without any causal role (Engel, "Actions, raisons et causes mentales").

defends a rigorous theocentrism. We should therefore not be surprised that Berkeley challenges the primacy of consciousness. What in Leibniz leads to a broadening of the concept of the mind to include unconscious thought, which underlies and explains consciousness (see PERCEPTION), in Berkeley leads to a tendency to dissolve the idea of consciousness in favor of that of representation or phenomenon. He avoids the very term "consciousness," but sometimes uses the adjective "conscious," and constantly uses "perception" and "reflection." Why is there this reversal with respect to the usage then prevalent?

We can propose the following hypothesis. In Berkeley's thought, there is no need for a self-identical consciousness to give unity to experience by operating on simple ideas and forging complex ideas of relations: the relations are

already given with the phenomena themselves, they are part of the perceptive complex, in the form of habitual connections or associations between thing-ideas. We can even go so far as to suggest, as Husserl does in his lectures on *Philosophie première*, that "things refer to each other by associative-inductive means," that is, they are structured as signs and form, as it were, a language immanent to things (not a mental language, but rather a language-object). Thus the field of phenomena indicates its own meaning, or is given along with it.

This kind of immanence of meaning or of the unity of phenomena, which is inherent in the perception of their connections, does not in any way eliminate the function of the *subject* or *ego*: on the contrary, it affirms the latter *qua* activity. The subject is both the receiver of all perceptions

and the spiritual actor in all decisions or volitions, and consequently of all projects ("[M]an is a project of himself rather than a memory of himself," writes Geneviève Brykman, adding, "there is no doubt that Berkeley sought at the same time to move beyond Locke's point of view, from which personal identity is an identity of consciousness" [*Berkeley et le voile des mots*, 100]).

To this characteristic of the subject Berkeley attaches once again the name of "spirit." Brykman (*Berkeley*, 94f.) shows that in Berkeley there is a fundamental tension between "mind" and "spirit" (terms that are both translated into French as *esprit*), which is connected with the (re)discovery of "spiritual reality" as the unity of existence, thought, and will ("So long as I exist or have any idea, I am eternally willing: to acquiesce in my present state is to will," Berkeley writes in one of his manuscripts):

> The spirit is then designated, no longer as *mind*, but as *spirit* and image of God as pure act. But this is not to say that one conception of the spirit is abandoned for another; it is to say that to a dangerously skeptical conception Berkeley adds a thesis that is very bold, but more acceptable for a churchman. And if we suppose that that there is a dualism in Berkeley, the dividing line does not run between the spirit and ideas, but within the spirit itself, between a set of perceptions (mind) and an act (spirit): on the one hand the human mind tends to be a simple set of visible minima more or less regularly related to other sensible minima; on the other hand, the human spirit is a series of acts or volitions that accompany the given. Is there any more relation between these two statuses and denominations of the finite mind than there is between the mind and the body in other philosophies? Yes, at first sight, and yes, in a sense. But in the end, Berkeley posits the theoretical interdependence of active and passive things. And whereas in the most widespread conception of the relations between the mind and the body, the immortality of the soul is posited on the basis of the independence of the soul with regard to bodily phenomena, Berkeley makes "perceived things" conditions of possibility for the implementation of acts of the mind.

> (G. Brykman, *Berkeley*, 94–95)

Just as the perceiving subject is not fundamentally a "consciousness"—at least in the sense that Locke had just given this term—personal identity, the "ego," or "I" that is caught in this tension, cannot be considered a "self-consciousness." Does that mean that we must go so far as to consider the subject or personal identity (the sense of the word "I") as a "fiction," as Hume was to propose not long afterward in his *Treatise on Human Nature* (1740, I.IV.§Vi, 342f., and Appendix, 758f.; see Box 1 of this entry)? Even though Berkeley referred to the role of imagination in the cohesion of experience, his system's extreme propositions, as well as his theological orientation, were to lead him to another outcome. "The immanence of the perceiving subject in the field of perceptions," or of "idea-things" (a formulation much more satisfactory than the immanence of perceptions and thus of things to the subject's field of consciousness

maintained by Husserl), leads to a permanent difficulty in extracting the subject from the world and from his sensations. Inversely, the identification of "I think" with an "I want" leads to a tendency to consider the subject as the creator of his own world, or a tendency to solipsism—despite the reflection that shows me, by analogy, the existence of other minds. "Apart from the imagination, there is no way of distinguishing the mind from the whole of things perceived, nor the spirit from the undifferentiated power of God" (G. Brykman, *Berkeley*, 96).

IV. Locke and the Isolation of the "Mental"

But of all the questions that arise at the intersection of language and theory, the most fundamental is that raised by Locke's attempt to isolate the "mental" (representations, operations, faculties) as an autonomous field of subjectivity that is observable or objectifiable. Here we will focus on the aspects of the terminology that reflect Locke's effort to inaugurate, after Descartes but in a completely different way, a problematics of the activity of thought disengaged from traditional substantialism, while at the same time remaining irreducible to materialist reductionism. These aspects are all the more interesting because having put them at the heart of a new theoretical idiom, as distant from Latin as from the French of the "Republic of Letters," Locke used them to achieve an amazingly coherent semantics that set its stamp on the modern philosophy of the subject and has remained essentially recognizable over the centuries (see CONSCIOUSNESS and I/ME/MYSELF).

A. "Mental"/"verbal"

Locke founded psychologism in philosophy (and set it on the road toward the transcendental attitude) by carrying out in advance a kind of "anti-linguistic turn" based on the isolation of meanings that are "anterior" to linguistic signs and depend solely on the association of ideas and the relationships of agreement or disagreement that they entertain with them or with their objects—in the final analysis, the objects of sense perception reflected in the "ideas of sensation" that form the matter of all intellectual activity. He systematically opposes "mental propositions" to "verbal propositions," and "mental Truths" or "Truths of Thought" to "verbal Truths" or "Truths of words," the former element in these oppositions providing the criterion of the latter. From the outset, the concept of "mind" refers to the whole of the operations of the "mental" faculties internal to thought, in contrast to verbal expressions, which are secondary and external because they are conventional. The opposition between the mental and the verbal (Vulgar Latin *mentalis* versus *verbalis*) is just as common in Arnauld and Nicole's *Logique de Port-Royal* (1662).

This parallel brings out an irremediable lacuna in French, which has no substantive corresponding to "mind," making the English concept untranslatable. Naturally, Locke is aware of the etymological link between "mind" and Latin *mens*, which facilitates the immediate expression of his conceptions of mind as the seat of consciousness and of memory and recollection as the criterion of personal identity, leading him to attempt modernity's most complete "secularization" of Augustinian interiority.

B. "Mind"/"understanding"

On this basis we can try to clarify the complex relations between the terms "mind" and "understanding" in Locke's work. The title of the *Essay Concerning Human Understanding* refers to the latter term; in this respect it can be compared to Spinoza's unfinished treatise *De intellectus emendatione*, and it inaugurates a tradition that will also include Hume (*An Enquiry Concerning Human Understanding*). But on reading Locke's work, we may feel that the respective ranges of the two terms fluctuate. The field of "intellectual" operations obviously exceeds the purely "mental" to include all the acquisitions of knowledge and reason that have as their condition the verbal expression and communication of ideas. Inversely, when Locke presents mental functioning as divided into a passive side that is characterized by the acquisition of ideas ("perception," in the broad sense) and involves the understanding, and an active side that is characterized by acts of will—the understanding becomes only one part of the mind.

In reality, the two terms are fundamentally coextensive, and this reflects Locke's profound "intellectualism" and "cognitivism," but it also allows him to couple all associations of ideas with a virtual double in the form of an affective process. On the one hand it is mind itself that develops by incorporating into its functioning the instruments of language, whose use and meaning it determines. On the other hand—as the analysis of the relations among will, uneasiness, and desire discussed in chapter 21 ("Of Power") in Book II of *Essay Concerning Human Understanding* shows—the will is not so much an autonomous faculty as the resultant of the mind's intrinsic activity, which is already reflected in the constant succession of its thoughts, and which is subsumed under the notion of uneasiness.

Unlike other seventeenth- and eighteenth-century conceptions of the "understanding," in Locke "mind" refers, not to a receptacle of ideas or a system of faculties, but to a logico-psychological "machine" in movement. The differential between passivity (sensation, perception) and activity (operations, reflection, desire) is constitutive from the outset, which also makes it possible to understand how it is transformed throughout human existence in a constant process of acquisition and appropriation, while at the same time preserving an essential identity.

C. "Mind," "consciousness," "self"

The heart of Locke's conceptualization is constituted by the relations of mutual presupposition that are established among mind, consciousness, and the self, three notions that Locke either invented as concepts or completely reworked. They are already combined in a formula in the *Essay* (II.1.19) that has remained canonical as a definition of consciousness: "Consciousness is the perception of what passes in a Man's own Mind."

Mind and consciousness, notions that are developed in terms of operations, faculties, and "powers," on the one hand, and perception and the "internal sense" on the other, are only the two sides of a single process of *reflection*, which constitutes the basis of the intellectual operations carried out on ideas to produce new ideas and the essence of

thought's "self-presence." This reciprocity allows Locke to transform the Cartesian metaphysical proposition according to which the "mind always thinks" into a phenomenological axiom: the mind cannot think without knowing what it thinks (without being conscious of its thoughts: "as *thinking* consists in being conscious that one thinks," *Essay*, II.1.19), thus opening the way toward a radical critique of substantialism in both its animist and spiritualist forms (the mind is neither soul nor spirit) and in its materialist form (the mind is not the body, or at least their connection is merely hypothetical).

Consciousness and self are just as indissociable (so that in Locke "consciousness" is always already "self-consciousness," a term that he introduced into philosophy: in 1700, his French translator Coste still found it untranslatable). Consciousness has as its foundation a reflexive identity of thought or a logico-psychological principle of identity (every perception is also a perception of perception), but the self (conceived by Locke in terms of the individual's continual *appropriation* of his own ideas, and through them, of his actions) is nothing other than the continuity of consciousness. This unity of self and consciousness (which Leibniz immediately declares to be unacceptable, in view of the obscure or unconscious nature of most of the ideas that enter into the "complete notion" of each of them) essentially founds not only the separation of individual consciousnesses, each of which has its own, irreducible identity (and consequently the necessity of tolerance, or of freedom of conscience), but also each person's responsibility (within the limits of his or her self-consciousness, whose "pathologies," such as the phenomena of double personalities, Locke begins to explore). Thus it is the basis for a theory of the "identity of a person" that is as important for morality, religion, and politics as it is for the metaphysics and "psychology" it makes possible. The term itself is introduced, in this sense, by Wolff in 1732 (*Psychologia empirica*) and 1734 (*Psychologia rationalis*).

Finally, self and mind are also reciprocal concepts. Their equivalence with the notion of consciousness would suffice to show this formally, but the meaning of this fact can be seen when we understand that it covers the coincidence of the time of the mind's operations ("the train of ideas," the mind's inability to remain durably focused on a single idea, and especially the "logical time" of associations) and the time of retention or memory, in which these operations are summed up at every moment (except for those lost to memory) and which enables every mind to perceive itself as identical to itself over time. This phenomenological coincidence is ultimately what Locke calls *experience*, which is essentially an "experience of consciousness," that is, an internal experience that replicates external experience and makes possible its progressive development or its "appropriation of the world." The concept of experience, of the "operations of our own Mind" that involve "observing in our selves" (*Essay*, II.1.4), thus contains the permanent possibility of a subjectification *and* an objectification of ideas, which are like the two folds of a single interiority. That is the way interiority presents itself to itself, raised to the level of a concept, which sums up the mutual relations of mind, self, and consciousness.

V. The Remainder of the *Âme* on the Threshold of Modernity

The questions that arise at the intersection of these readings converge on the localization of a "remainder"—but not, strictly speaking, something inexpressible, since it is precisely through words that we can approach it. If we start once again from Locke's constitution, under the name of "mind," of a field of "inner experience" where the operations of thought are dominated by consciousness, we will discover among our principal authors striking discrepancies and term-for-term oppositions whose radicalness shows that they are situated within a common "moment," or rather that they constitute that moment by their very conflict.

A. From psychological positivity to the transcendental illusion: The "internal sense," *das Innere*

Both Locke and Kant refer to "self-consciousness" (*Selbstbewusstsein*) and the problematics of experience (*Erfahrung*), but what is in Locke a kind of self-deployment of a positivity becomes in Kant the site of a transcendental illusion, and thus also the reason for the shift in philosophy toward a critical register that seeks to define limits for reflective activity. Whereas in Locke consciousness as the "internal sense" is that which gives the subject to itself immediately, in Kant it is instead that which makes the subject inaccessible to itself. This does not mean that this field of experience ceases to be the site of truth. On the contrary, this is why what might be called the Lockean "thing in itself" (the substance of soul, whether material or immaterial, repressed into the realm of the unknowable by the theorizing of the conscious mind) haunts Kant's discourse more than ever. Following the example of Wolff, who had used the word "soul" (*Seele*) to translate "mind" into German, Kant restores to the idea of the soul part of the phenomenality of thought, which allows it to attribute to itself both permanence and identity (hence "personality"). And Kant makes interiority itself (*das Innere*: a notion that, in a crucial passage of *The Critique of Pure Reason*, he declares to be "amphibological" because it seeks to represent as a "space" something that contradicts exteriority, and thus spatiality) an *explicandum* and not an explanation. Therefore it is not the natural dimension of psychic processes but rather consciousness's "self-image," a structural or superficial effect produced by the "internal sense," whose deep origins remain "hidden" as Kant says in the chapter of the "transcendental schematism." One of the consequences of this is that Kant, though he provided an ample stimulus for "scientific" psychology and psychologism (from Herbart to Piaget), did not contribute to them, directing his attention instead toward a moral ("pragmatic") constitution of anthropology.

B. "Uneasiness" and interiority effect in the union of soul and body

The common view of Descartes as the father of all modern philosophies of consciousness results from a misunderstanding (partly encouraged by Kantian readings) that imputes to him Lockean theorems that were in fact developed against him (see CONSCIOUSNESS). But what remains fascinating when we read Descartes after Locke is that even though both thinkers insist on the "irreducibility" of acts of thought and the possibility of describing intellectual operations in an autonomous way (the question as to whether their "matter" comes solely from sensation or in part from "innate" ideas being in this respect secondary), they hold entirely different views regarding the question of "interiority." We cannot help being struck by Descartes's "nonpsychologism," that is, the care with which he avoids referring to an interiority of thought corresponding to the constitutive exteriority of bodies (whose "principal attribute" is extension). That is to say, in Descartes, immanence and interiority are not the same. His position was radicalized by Spinoza. The question thus raised has fed into all of modern and contemporary philosophy: that of Hegel (whose *Geist* is the perfect example of the internalization into itself of all experience, and the plane of the immanence of all cultural productions), but also that of Husserl and William James, and finally, through Sartre's great essay on "The Transcendence of the Ego," Deleuze, who constantly refers to the latter. Up to our own day, post-Cartesian and post-Lockean philosophies have offered different answers to the question of how the "interiority" of reflection and the subject's "immanence" in thought are connected.

But this statement must be immediately qualified. In Descartes there is an effect of interiority in thought, but this effect is not a matter of pure thought; it corresponds to the experience of "union" (where, as we have seen, the idea of the *anima* returns parasitically on *mens*), in which Descartes himself says that the soul thinks "as if it were the body," that is, through sensation it projects itself within its envelope and its form. An extreme, paradoxical experience that is, nonetheless, simply human experience if, as Descartes's letters to Princess Elizabeth and his *Passions of the Soul* suggest, its principal and permanent modality is so-called substantial union.

This is a typical example of what might be called "the remainder of the soul" in its Cartesian form. But one could also say that the concept of "uneasiness" is the name of this remainder in Locke's philosophy, especially if we note that "uneasiness" connotes all the "borders" of interiority, where pure mental reality proves to be at least virtually dependent on what is outside it: pure or originary sensation, which Kant was to designate as a limit of representation, and the linguistic sign, which is social in essence. Perhaps it is even dependent on its "repressed" (individual corporeal or spiritual substance, "body and soul," from which proceed affects that exceed, even with consciousness, the intellectuality of its "ideas").

These questions draw attention to the semantic uncertainties internal to each system as well as to the problems of untranslatability between theoretical traditions, which are inseparable from the idioms in which philosophers work and which they work on. We believe them to be ultimately indissociable.

C. The threshold of modernity and the contemporary configuration

With great caution, we could thus suggest that the "remainder" circulating among philosophers of the seventeenth and eighteenth centuries, even though it did not correspond to any unambiguous signified, nonetheless designated the problematic unity of a series of "questions at the limits"

that are constitutive of mental or intellectual reality. For example: the questions of the relation between activity and passivity (or, in the language of the time, "will" and "understanding," and also "concept" and "intuition"), questions of the relationship between intellectuality (representation, perception, idea) and affectivity (desire, feelings, passions) that in the seventeenth and eighteenth centuries put understanding outside itself, if they did not provide access to its vital sources (*conatus*), and finally questions about the sign and symbol, at the intersection of reflection on language, nature, and artifice ("civility," "sociability"), the products of artistic "genius," which constantly challenge the individualism dominant in seventeenth- and eighteenth-century thought by causing to rise up once more within the soul or mind a determination that is both preindividual and transindividual.

The threshold of modernity is this singular moment marked by the gradual decline of the influence of ancient schemas (philosophical, but also religious or medical) of the division and hierarchization of the "parts of the soul," with their social and cosmological implications, which Christianity continually tried to appropriate in order to give them a supernatural meaning. The attempt to conceive the *mens* as the totality of the soul, not as the name of its indivisibility, against the tradition that made it (in competition with *intellectus*; see INTELLECTUS) one of the equivalents of the Platonic and Aristotelian *nous* [νοῦς], is particularly representative in this respect.

At this point, the objective of a "thought of thought" changes radically in meaning. In Aristotle the *noēsis noēseôs* [νόησις νοήσεως] had essentially the meaning of a *reflexivity* whose perfect or exhaustive figure could be conceived by philosophy only as an ideal situated "outside itself" in the totality of the world and the divine. Among the moderns, starting with Descartes and especially Locke and Kant, it corresponds to a "subjectivization" of thought that brings thought back "to itself," but at the cost of the imperfection or finitude of reflection, and thus the existence of a "remainder" situated in the depths of the mind or on its margins. And even Hegel, who thinks he can reconstitute an absolute ("absolute spirit," *absoluter Geist*; "absolute knowledge," *absolutes Wissen*) by making logic and history converge in a single "dialectic" or union of contraries, and who is thus able to quote literally (in the conclusion to the *Encyclopedia of the Philosophical Sciences*, §577) Aristotle's formula (*Metaphysics,* XII.1072b.18–30) that identifies the divine with "the pure act," precisely insofar as it is a "thought of thought," while at the same time conferring on it a radically new meaning (that of the culmination of a historical *Bildung* of the spirit, of an education or transindividual culture), does not really escape this configuration. In particular, we could try to show this by interpreting the persistent discrepancy in his thought between the notions of "consciousness" (*Bewußtsein*) and "spirit" (*Geist*): for while consciousness undeniably provides the phenomenological model of the "self" (*Selbst*) that is essentially the spirit (which makes it a "subject"), the latter, through its "objectivity" and its "substantial" depth, remains irreducible to consciousness. In this respect Hegel is still part of what we call here the "threshold."

But neither is the threshold of modernity continuous with our contemporary configuration. The latter is itself certainly constituted in accord with a plurality of trends, the most extreme seeming to be represented:

1. by an objectivist, naturalistic isolation of the "mental," whether within a psycho-physiological perspective or not. Dependent on Locke's formulation, with the "cognitive sciences" and the new "philosophy of mind" it seeks to move beyond the limits Locke assigned to the observation of mind;

2. in the area of Freudian psychoanalysis and its various "topics," by an apparent return to the multiplicity of structures (or "partial souls") characteristic of the ancient point of view, but in radically new conditions that have emerged from the combination of the clinical hypothesis of the unconscious and a modern problematics of the subject, which obliges us to inquire anew into the continuity of the notions of *psychè* and the psyche. As if each of the old terms now prescribed its own path (see ES);

3. by a critique of individualism and the autonomy of the subject, which is oriented either toward a sociology or anthropology of the "institutions of meaning" (Descombes) or toward post-phenomenological hermeneutics, and which seems in these ways to explore the various connotations of *Geist* in the sense of "culture" (see BILDUNG and GEISTESWISSENSCHAFTEN).

Wittgenstein's critique of the mental or, once again, on a few difficulties in translating the expression "philosophy of mind": "Philosophy of mind" and psychology

I. The "mind"? With what is the "philosophy of mind" concerned?

In contemporary philosophy, the term "mind" raises a problem of translation, as is shown by the difficulty of delimiting a French domain of the *philosophie de l'esprit* that would be the equivalent of the English philosophy of mind. Advocates of the current *philosophie de l'esprit* in France (Joëlle Proust, Pierre Jacob, Pascal Engel) have implicitly decided that *philosophie de l'esprit* is the same thing as the "philosophy of mind": all one has to do—referring to a few well-chosen ordinary usages (*état d'esprit, l'esprit de...*)—is to get used to the expression, so that it ceases to be a neologism and becomes natural as a result of being heard and institutionalized. This is supposed to provide

a way out of the transitional period in which the use of the word *esprit* is problematic because it is still associated, sometimes (like the German term *Geist*) with a spiritualist and metaphysical tradition, and sometimes with the new mentalist tradition.

The philosophy of mind concerns first of all what might be called "mental phenomena" or phenomena of the mental. The French word *mental* might in fact provide a better translation of "mind" than *esprit* does, if nominalizing the adjective *mental* did not raise certain doubts (and were not, in French, associated with moral connotations, notably in sports vocabulary, where it thrives: *un mental d'acier*). Speaking of mental phenomena, or simply of *le mental*, allows us to evade the question of the status of the mind: the mind is to be conceived not as a metaphysical or psychological entity, but as what the philosophy of mind is concerned with, namely a set of phenomena to be examined without preconceptions, using the tools at our disposal: "the field of philosophy that concerns the nature of mental phenomena and its manifestations," to adopt the expression with which a recent presentation of the *philosophie de l'esprit* begins (D. Fisette and P. Poirier, *Philosophie de l'esprit, état des lieux*, 11).

This apparently neutral starting point conceals several preconceptions, as the words "nature" and "manifestations" indicate. Samuel Guttenplan's recent and already classic *Companion to the Philosophy of Mind* (1994) also takes a project of description as its point of departure: "What things or phenomena count as mental, as showing the presence of minds?" (6).

There follows a list of phenomena considered common and ordinary: the ability to learn, perceiving, acting intentionally, understanding language, etc. Thus, the philosophy of mind is concerned with everything that is a manifestation of the mind, without prejudging the nature of this mind, but prejudging that all kinds of things (a large part, indeed the totality, of our activities and capacities) are "manifestations" of this mind or "show its presence." Such a thesis draws part of its strength from the fact that only "mind" (and not "spirit") is concerned, and everything becomes more natural because of the vagueness of the term in the English-language philosophical tradition.

The uncritical use of the term "mind" thus leads us to accept the idea that we commonly attribute beliefs, intentions, and mental states, and the next step is to define the status, contents, nature (physical, mental, both, or other), and so forth, which are now the classic objects of the *philosophie de l'esprit*. The problem of defining the mind, as Wittgenstein emphasizes, is thus the point of departure, "the first step":

How does the philosophical problem about mental processes and states and about behaviourism arise? —The first step is the one that altogether escapes notice. We talk of processes and states and leave their nature undecided. Sometime perhaps we shall know more about them—we think. But that is just what commits us to a particular way of looking at the matter. For we have a definite concept of what it means to learn to know a process better. (The decisive movement in the conjuring trick has been made, and it was the very one that we thought quite innocent.)—And now the analogy which was to make us understand our thoughts falls to pieces. So we have to deny the yet uncomprehended process in the yet unexplored medium. And now it looks as if we had denied mental processes. And naturally we don't want to deny them.

(trans. G.E.M. Anscombe, Philosophical Investigations, §308)

II. The "linguistic turn" and philosophy of mind

Regarding the philosophy of mind, there is much talk of a new paradigm and a turning point in contemporary philosophy that is supposed to succeed the "linguistic turn" that took place at the beginning of the twentieth century. The philosophy of mind is to replace, as it were, the philosophy of language and move beyond it, drawing on the advances in the cognitive sciences during the same period. Here again we encounter certain difficulties; the philosophy of mind has been constructed, over the past thirty years, "on" the achievements of the philosophy of language, even if it has rejected some of its elements. After the linguistic turn and the mentalist turn, the "mind" is no longer what it was in the nineteenth century, and the renewed interest in mental phenomena cannot be detached from the linguistic and psychological dimensions of such phenomena.

The work of an author like Wittgenstein belongs as much to the philosophy of mind as to the philosophy of language (see D. Stern, *Wittgenstein on Mind and Language*). For Wittgenstein, it is the idea itself of something of which these phenomena would be the "manifestation," or whose existence is shown by these phenomena (an idea that founds the very definition of the philosophy of mind) that is problematic and misleading. Whence the importance of an examination of language, which cannot be rendered obsolete by the progress of the sciences of the mind. What counts for him is the investigation of *the ways we use language* (grammatical investigation), the ways we use words like "think,"

"remember," "see," "attend to," etc., which are obscured by images—common to psychology and philosophy—of internal processes, of belief, of *esprit* that block our access to the usage of the word the way it is, to the description of its uses. Wittgenstein does philosophy of mind through philosophy of language.

III. Folk psychology, scientific psychology, psychology without psychology

A particularly important dimension of contemporary philosophy of language is its critical relation, from the outset, to psychology. That is why in order to delimit a domain of the philosophy of mind it does not suffice to advocate a simple rehabilitation of psychology, as has recently been done in France (P. Engel, *Philosophie et Psychologie*).

The material common to the philosophy of language and psychology (what we usually call our "states of mind") might accredit the notion, greatly favored by contemporary mentalists, that there is a "folk psychology" (often called "popular psychology") that might serve at least as a database for scientific psychology. According to these authors, our vocabulary and psychological propositions have not yet attained the level of elaboration characteristic of scientific theories, and hence are part of a "naive psychology." This naive psychology consists in describing, explaining, and predicting human behavior in terms of interactions among beliefs, desires, and intentions. Psychologists think that folk psychology functions, for example, by attributing beliefs—since *ordinarily* we say: "X believes that Y has the intention to . . . ," and so forth. However, one might ask in what way "X believes that" involves attributing a mental entity, namely a belief (see BELIEF), to Y. The passage—an elementary stage in the philosophy of mind—from our ordinary expressions ("X believes that") to the claim of an attribution of beliefs to a mind is part of a clever strategy, as Vincent Descombes has shown in *La denrée mentale*:

First, the mentalist dogma is presented to us as being extremely commonplace: as if it were equivalent to a simple recognition of the existence of a psychological dimension in human affairs. Who would deny that people have opinions and desires, except the old-fashioned, narrow-minded behaviorist whom everyone mocks? What obscurantist would deny that neurological research is of interest for psychology? . . . Who would deny the platitude: people act on the basis of what they think they know and what they want to obtain? But in the final analysis, the reader is surprised to

(continued)

learn that by accepting these not very contestable truths he has accepted, one after the other, the elements of a metaphysics of the mind.

We can discern in Wittgenstein a project of speaking about the mind in "nonpsychological" terms. His interest is always, almost obsessively, in the "phenomena of the mental," which he calls *geistig* or *seelisch* (it matters little which, he says). "And now it looks as if we had denied mental processes (*geistige Vorgänge*). And naturally we don't want to deny them" (*Philosophical Investigations*, §308). To deny the existence of the mental is already to lend it *more credit* than would a procedure that—to borrow an expression from his *Tractatus logico-philosophicus*— would speak of the self, of psychology, "in a non-psychological (*nicht-psychologisch*) manner." Wittgenstein's approach is a philosophical one that involves psychology (of mind) without accepting the philosophy of spirit. As Cavell has shown in *The Claim of Reason*, Wittgenstein's perspective is not a simple negation of the existence of mental states, but a reinvention of psychological problems, their reformulation as questions of linguistic usage, their membership in a community of language. In *Must We Mean What We Say?* Cavell describes this specificity of Wittgenstein's approach (70):

The implication is not that I cannot know myself, but that knowing oneself—though radically different from the way we know others—is not a matter of "*cognizing*" (classically, "intuiting") mental acts and particular sensations." (emphasis added)

Wittgenstein's later philosophy is a radicalization of the *logical* project of the *Tractatus*: to bring out the necessity that presides over our utterances in ordinary language regarding psychology, which has nothing to do with the necessity of positing entities of which these utterances are supposed to be the manifestation. This leads Cavell to a famous formulation:

We know about the efforts of philosophers such as Frege and Husserl to undo the "psychologizing" of logic (like Kant's undoing of Hume's psychologizing of knowledge): the shortest way I might describe a book such as the *Philosophical Investigations* is to say that it attempts to undo the psychologizing of psychology, to show the necessity controlling our application of psychological and behavioral categories; even, one could say, show the necessities in

human action and passion themselves. And at the same time it seems to turn all of philosophy into psychology—matters of what we call things, how we treat them, what their role is in our lives.

(Ibid., 91)

The project of Wittgenstein's *Investigations* pursues in another way that of the *Tractatus*: the exploration of the mind. A psychological investigation that can be accomplished only in a nonpsychological way. In this sense, paradoxically, the whole of Wittgenstein's work can be conceived as belonging to the context of the philosophy of mind, but a philosophy of mind in which mind is defined nonpsychologically. The origin of such a conception (as Cora Diamond shows in *The Realistic Spirit*) is found in Frege, in a remarkable expression in his article "Der Gedanke":

Not everything is an idea. Otherwise psychology would include within itself all the sciences, or at least it would have supreme authority over all the sciences. Otherwise, psychology would also reign over logic and mathematics. But it would be impossible to more seriously misunderstand mathematics than by subordinating it to psychology. Neither logic nor mathematics has as its task to study souls (*Seelen*) or the contents of consciousness of which the individual is the bearer (*Träger*). Instead, we could assign them the task of studying the mind (*Geist*): the mind, not minds.

("Der Gedanke: Eine logische Untersuchung" [Thought: A logical investigation])

If logic is not concerned with individual minds, it is not because it denies psychology: it is because thought or mind—*Geist*—is wholly defined by the laws of logic. It is logic that defines what a mind is. Wittgenstein borrowed this point from Frege to define a depsychologized philosophy of mind.

Thus the problematic passage from *Geist* to "mind" is an interesting nodal point in the history of analytical philosophy: its rementalization, which has been largely achieved in English-language philosophy over the past few decades, neglects this Fregean-Wittgensteinian definition of the mind to base itself in an unexploited way on another tradition, the mentalist tradition of mind. Whence all the recent work by English-speaking philosophers inspired by Wittgenstein (Cavell, then Diamond) who suggest a nonmentalist concept of mind. Thus Diamond borrows from Frege the idea that there is no more a thought without meaning than there is an illogical mind:

But *the* mind has no fuzzes and no logically confused thoughts . . . and so far as philosophy deals with *the* mind, it will not have, internal to its subject matter, any distinction between the fuzzy and the sharply defined, or between the nonsensical and what makes sense.

(*The Realistic Spirit*, 2)

The propositions of logic, even if they say nothing, deal with the mind, and it is *nowhere else*.

[T]he *Tractatus* does not break the connection in Frege between *the* mind and logic-and-mathematics. The connection emerges this way: the propositions of logic and the equations of mathematics show what Wittgenstein calls "the logic of the world," and that *is* for them to show the possibilities that belong to the mind or the self considered in a nonpsychological way.

(Ibid., 2)

Philosophy will speak (in a nonpsychological manner) of the mind in its analysis of ordinary propositions or in its presentation of the general form of the proposition (Wittgenstein, *Tractatus*, 5.47). For Wittgenstein, we learn more about the mind through these analyses than through psychology— but this implies a transformation of philosophy that will lead to a definition of the mind by usage:

Everything is already there in . . ." How does it come about that this arrow → *points*? Doesn't it seem to carry in it something besides itself? "No, not the dead line on paper; only the psychical thing, the meaning, can do that." –That is both true and false. The arrow points only in the application that a living being makes of it. This pointing is *not* a hocus-pocus which can be performed only by the soul.

(*Investigations*, §484)

To give up the mythology of the mind is to seek what one expected from these entities (the mind, the soul, the mental, whatever) in language itself. Examining usage means this: seeing nothing in usage that isn't already there, and not explaining it by the mind. This sums up the "depsychologization of psychology" carried out by Wittgenstein, which might thus be extended to the mind: the immanent definition of the mind by our (its) usage. Parodying the well-known Wittgensteinian slogan "meaning as use," we might say "mind as use."

SPANISH

The Spanish Singularity: The Pair of *Ser* and *Estar*

➤ DASEIN, ESSENCE, FICAR, *IL Y A* [ES GIBT, ESTI, HÁ], NEIGHBOR, PREDICATION, SEIN, *TO BE,* VORHANDEN, WORD ORDER

Spanish has two different, non-synonymous words—*ser* and *estar*—to express the semantic complex that other languages group under the verbs "to be," *sein*, and *être*. This pair (which allows for a distinction, more or less, between the stable and the circumstantial at the level of predication) is in the first instance a feature of everyday language. Its philosophical importance is nonetheless evident. On one hand, its existence implies considerable linguistic and conceptual difficulties for the appropriation, in Spanish, of the traditional ontological vocabulary. Discussions originating in the Spanish-speaking community about the translation of the

Heideggerian vocabulary are a good example. On the other hand, the expressive possibilities of the pair are also a source of difficulty when it comes to translating them into other languages. This aspect of the question is illustrated by the constitution of a conceptual network expressed by etymologically related terms (*estar, bienestar*, and Ortega y Gasset's *circun-stancia*), the reworking of the primary sense of a common phrase for theoretical reasons (Zubiri's *estar siendo*), and, finally, the suggestion of *estar* by certain Latin American thinkers as the expression of a more basic and fundamental vision of the world than that associated with being.

I. *Ser/Estar* in Everyday Spanish

In Spanish, most of the semantic contents and functions of the Latin verb *esse* are executed by two different verbs: *ser* (whose conjugation derives directly from *esse* but also from *sedere*, "to be seated") and *estar* (from Lat. *stare*, "to be standing"). Originally meaning "to stand up," "to remain in place," or "to remain immobile," *stare* thus gave rise to one of the verbs that may serve as a copula in Castilian attributive constructions. Portuguese and Catalan had a similar evolution to that of Spanish. Italian also adopted *stare* as an independent form and uses it in certain constructions that it shares with Castilian, but not as a copula. Finally, the conjugation of the French verb *être* integrated a part of that of the Latin *stare* (for the imperfect, for example) but did not develop it as an independent form.

In contemporary Spanish, it is possible to separate at least two different uses of the pair. *Ser* and *estar* in effect have both an absolute usage, which treats them as predicates on their own, modified or unmodified by an adverb or an adverbial expression, and a copulative usage, according to which, on the contrary, they serve as a link between a subject and its predicate.

In its absolute use, the verb *ser* can make for the expression of the existence of an object or a person, though it rarely does (*ella es y eso me basta* [she is and that is enough for me]). Along the same lines, but very commonly used, it is a synonym for the verbs "to arrive," "to take place," or "to happen" (*el crimen fue de noche* [the crime took place at night]). The verb *estar*, for its part, has above all a locative value and is used to note the position or the place where the subject is, physically or in a figurative sense. Thus, phrases such as "he is not there," "the apple is on his head," or "you are in my heart" will always be constructed with *estar*. Similarly, a construction with an adverb of state or an equivalent expression ("we are fine," "the neighbors are in perfect harmony," etc.) will necessarily use this verb (*estamos bien, los vecinos están en perfecta armonía*, etc.).

These absolute uses, however, pose no special problems for translation. They are fixed values that are rather well determined, which may be taken up in any language without any loss of major nuance. The same cannot be said of the copulative use of *ser* and *estar*. In effect, the inherent economy and precision of this use are not easily transposed into languages that do not have the pair. Insofar as they are verbs that relate a subject and a predicate, *ser* and *estar*, far from being simple syntactic auxiliaries, presuppose important changes in the content of the sentence. They effectively determine the mode of belonging of the predicate to the subject by

opposing, respectively, the habitual with the occasional, the classificatory with the singular, the regular with the sporadic, and/or the abstract with the concrete. One may say, for example, of a fruit that it is green, using *ser* to indicate that its surface presents that color in a *permanent* way. On the other hand, *las uvas están verdes* (the grapes are green)—with *estar*—refers immediately to the transitory and complete state of the maturation of the fruit, that is, to a group of properties that result from and are part of a process, and that, as such, are liable to change.

■ See Box 1.

The possibility of distinguishing between these different modes of belonging is open, in theory, to any predicate. Common usage, however, is much more restricted. Normally, if the predicate is expressed by a noun, the attribution is made with *ser*. On the other hand, if the predicate is an adjective, Spanish-speakers will habitually use both verbs. Often, they will knowingly try to distinguish between what they consider to be an indelible or constant trait of the subject and one that presents itself as changeable. Sometimes, however, usage is less rigorous. Both *eso es permitido* and *eso está permitido* (that is permitted) are used, but normally only *ser* will be used to say "that is obligatory."

II. *Ser/Estar* and Heideggerian Terminology

The existence of this pair naturally had consequences for the appropriation of traditional philosophical vocabulary. The problem can be laid out in simple terms: how should we translate the occurrences and the cognates of a word as philosophically rich as *être* (or its "equivalents" in other Western languages) into a language that, like Spanish, usually spreads its meanings and functions out over two different terms? One way to approach the problem is to ignore the existence of the pair and its possibilities by reducing it to one of its members. For etymological reasons, the term chosen for such a reduction is traditionally *ser*. In fact, Spanish (just like other Romance languages) already has a panoply of terms (*ente, entidad, esencia*, etc.) that are etymologically related to forms of the Latin *esse*, which allows it to express a large part of the ontological vocabulary.

With regard to the Heideggerian vocabulary, this route was taken by José Gaos, the first translator of *Sein und Zeit* into Spanish. To render the vast series of expressions, verbal or nominal, taken on by *sein* (for example, *Sein, Seinsfrage, Dasein, Zu-sein, Seinsart*), he effectively created a network of equivalences where, practically, only the word *ser* is present (*ser, pregunta que interroga por el ser, ser-ahí, ser relativamente a, forma del ser*, respectively). In his *Introducción a "El ser y el tiempo" de Martin Heidegger* (1971), Gaos justifies some of his choices, notably that of *ser ahí*:

> Since we must distinguish between *Dasein* and its *Existenz*, and the latter has all the rights to the translation *existencia*, we must give another to *Dasein*. Which? Only the "literal" translation, the "calque" "*ser ahí*" is capable of reproducing the chief ideas according to which the *being there* is its *there*, and the latter is, as such, place, since it possesses the "existential constitution" contained by "*to find oneself*" and "*to comprehend,*" which, in turn, is constituted as a "projection," etc.

1

Ser/estar—essential/accidental

One of the traditional ways of defining the copulative usage of this pair of words consists of referring it to the opposition between essential and accidental (see, among other works, RT: *Diccionario de construcción*, 3:1076, and Vañó-Cerda, *Ser y estar + adjetivos*). With *ser*, one would express the essential attributes of the subject; with *estar*, by contrast, it would be a matter of simple accidents. However, if one takes it in a strict sense, this opposition turns out to be of quite a different order.

First of all, the copulative usage of *ser/estar* concerns every type of attribute expressed by an adjective. Thus, for example, it

is perfectly possible to say of a man that he is pale (and therefore to predicate an accidental condition) using either *ser* or *estar*. Next, the opposition essential/accidental constitutes, in its ordinary usage, a dichotomy of mutual exclusion. The same attribute belonging to the same subject therefore cannot be an accident and be part of its essence. This strict antithesis does not apply to the current usage of the pair of verbs. Nothing prevents Maria from receiving both predicates: *estar bella* and *ser bella* at the same time.

In reality, rather than establishing some sort of classification of attributes or

properties, the current usage of the pair obliges us to distinguish two perspectives arising from different locutions. In using *ser*, the speaker seeks to articulate a fact he habitually encounters or supposes he may habitually encounter; with *estar*, on the contrary, he places the accent on the singular or transitory character of this same fact.

BIBLIOGRAPHY

Vañó-Cerdá, Antonio. *Ser y estar + adjetivos: Un estudio sincrónico y diacrónico*. Tübingen: G. Narr, 1982.

(Puesto que hay que distinguir entre el *Dasein* y su *Existenz*, y ésta tiene todos los derechos a la traducción *existencia*, hay que dar a aquél otra. ¿Cuál?. . . Sólo la "literal," el "calco" "ser ahí" resulta capaz de reproducir las capitales *ideas* de que el *ser ahí* y de que éste es como tal *lugar* como tiene la "constitución existenciaria" integrada por el "encontrarse" y "el comprender," éste constituido a su vez como "proyección," etc.)

(Gaos, *Introducción*)

All of these reasons internal to the Heideggerian text cannot hide the genuine problem, however. In Spanish, as just mentioned, the verb used for expressing the position of a given subject, the fact for someone of "existing in a certain place" (RT: *Diccionario del uso del español*), is not *ser* but *estar*. A second possibility then opens up: instead of ignoring and reducing the pair, we could use each of the members as Spanish syntax demands. To translate *Dasein*, for example, we find in RT: *Vocabulario filosófico* a synthesis of various propositions using *estar* and a justification of these choices.

Although José Gaos . . . used the verb *ser* to translate *Dasein* (inventing the expression *ser ahí*), other philosophers have suggested expressions based on *estar* to translate it. Thus *estar en algo* [*estar* in something] (Xavier Zubiri), *el humano estar* [the human *estar*] (Pedro Laín-Entralgo), *estar en el ahí* [*estar* in the there], or simply *el estar* (Manuel Sacristán). Gaos's reasons for using *ser* to translate *Dasein* are well-founded, since they relate to a system of assignments and equivalents constructed for translating *Sein und Zeit*. . . . But we can understand why other authors chose *estar* to translate *Dasein*: the presence of the demonstrative *da* implies that *estar* is the appropriate Spanish term, since it immediately and without violence evokes the spatiotemporal character given to *Sein* by the *da*.

Although the solution for *Dasein* adopted by Jorge Eduardo Rivera—the most recent translator of *Sein und Zeit* into Spanish—consists in preserving the German term, his version is nonetheless a good example of this approach. To

give a few examples, *Mitsein* is rendered by *coestar*, *In-sein* by *estar-en*, or again, *In-der-Welt-sein* by *estar-en-el-mundo*. Even while aiming to preserve the technical character of the Heideggerian vocabulary, the translator thus chose to respect the habitual usage of the pair in Spanish. Sometimes, however, his choices are also inspired by considerations that go beyond grammar. This is the case with the translation offered for *Vorhandenheit* or *Vorhandensein*: *estar-ahí*. The expression had already been used by the Spanish translators of H.-G. Gadamer's *Wahrheit und Methode* (*Verdad y método*, 319n29), who used it to render *Dasein* in presenting Gadamer's Heideggerian project. According to Rivera, however, if *estar-ahí* can effectively translate *Dasein*, it is not in the sense introduced and discussed by Heidegger, but rather in the sense that the term already had in classical German and that corresponded to the Latin *existentia* (Heidegger, *Sein und Zeit*). Given that, since *Vorhandenheit* is used by Heidegger to clarify this traditional sense of *Dasein* (*Sein und Zeit*, §9), it should be translated by the phrase *estar-ahí*.

It is in this same, nonreductive spirit that we may understand the commentaries, halfway between translation and interpretation, by the Spanish philosopher and essayist Julián Marías. In his essay "Estar a la muerte" (*Obras completas*, 3:172–73), he effectively examines two different examples taken from Heideggerian terminology: the concepts of *Sein zum Tode* and of *In-der-Welt-sein*. The existing translations of the first copied, artificially, the German syntax. A suggested alternative was therefore "ser para la muerte" (to be for death)—which, according to Marías, "despite its literary deficiency, unduly forces the original, emphasizing the 'mortalism' . . . often attributed to Heidegger" more than necessary—but also "ser a muerte" ("to be to the death," as in "fight to the death") or "ser relativamente a la muerte" (to be relative to death). However, no suggestion takes into account the existence of a common phrase in Spanish that, according to the author, captures the sense of the Heideggerian word with inflicting "any linguistic or conceptual violence" upon it. This phrase is *estar a la muerte*, as in the title of the article. The expression normally refers to the fact of finding oneself in imminent danger of death. Yet, with *Sein zum*

Tode, it is precisely a matter of "taking this condition of man of which he is only aware when this imminence makes itself particularly salient and raising it up to a category of human life, to an 'existential' as Heidegger himself says" (se trata de elevar a categoría de la vida humana, a "existencial," como dice el propio Heidegger, esa condición del hombre, de la que éste no se da cuenta más que en caso en que la inminencia es especialmente acusada; Marías).

With *In-der-Welt-sein*, the problems of translation are even more flagrant, simply because in Spanish, "with or without the hyphens," the literal version, *ser en el mundo*, does not make sense. *Estar* is used instead, in order to indicate "without equivocation the inclusion . . . in everything which is a place, a space," which would yield, very naturally, *estar en el mundo*. What is more, the use of the verb *estar* presupposes, again according to Marías, a sort of engagement with the real that fits perfectly with the concept of German philosophy. In effect, "while *ser* may refer to a simple way of being, not necessarily real . . . , *estar* necessarily refers to reality: no doubt Ophelia 'is' [*es*] pale, but only a woman who 'is' [*está*] pale can be real" (mientras el "ser" puede apuntar a un mero modo de ser, posiblemente irreal . . . , el "estar" remite necesariamente a la realidad: quizá Ofelia "es" pálida, pero no puede ser sino real la mujer que "está" pálida; ibid.).

III. *Estar, Bienestar,* and *Circun-stancia*

The problems of translation related to the pair also work in the other direction: what should a translator do with an occurrence of *estar* when a Spanish-speaking author takes advantage of its specificity with regard to *ser*? In Ortega y Gasset, for example, we find at least two passages where the locative value of *estar* (practically absent from the verb *ser*) is highlighted. Both passages develop and make precise a notion that is central to the philosopher's thought: "circum-stance."

The first passage is found in the author's fourth lesson on metaphysics (*Unas lecciones de metafísica*). The analysis of the concept of life leads him to posit as a sine qua non condition of any act of self-consciousness the idea that man, necessarily and essentially, "finds himself surrounded by what is not himself, finds himself in an outline, in a circum-stance, in a landscape" (se encuentra rodeado de lo que no es él, se encuentra en un contorno, en una circun-stancia, en un paisaje). Our relations with this Other consist first in the fact, for us, of being (*estar*) in it. But what does *estar* mean in this instance? It is not, as for an object, a matter of a relationship of part to whole, since there is no homogeneity between the I and the spatio-temporal and social envelope of its circumstances. Rather, the radically unique character of each I (an "I who lives his life, and this life which the I lives is lived by no other, *even if all the contents of the two lives had been identical*") imposes a profound heterogeneity. *Estar*, thus, in this very precise case, "is for me to exist in this other than me, it is therefore to exist outside of me, in an unknown land, it is to be [*ser*] fundamentally foreign, since I am not a part of that where I am [*estoy*, from the verb *estar*], I have nothing to do with it" (es existir yo en lo otro que yo, por tanto, es existir fuera de mí, en tierra extraña, es ser constitutivamente forastero, puesto que no formo parte de aquello donde estoy, no tengo nada que ver con ello; ibid.).

These reports of total alienation between the I and its circumstance do not remove the possibility of an interaction, or more precisely, an intervention of the former with regard to the latter. This is in effect what comes out of the *Meditacíon de la técnica y otros ensayos sobre ciencia y filosofía.* Here the philosopher, seeking to clarify the concept of human need, contrasts *estar* with *bienestar*, "well-being." The first, proper to the animal, corresponds to an atechnical adaptation to the world, to an appropriation of the latter that limits itself to providing for the objective needs of life. The second, on the other hand, "implies the adaptation of the environment to the will of the subject," the transformation into a subjective need of what, objectively, may present itself as superfluous. In effect,

> objective biological needs are not, by themselves, needs for him [sc. man]. When he finds himself limited to these, he refuses to satisfy them and prefers to extinguish himself. They only transform themselves into needs for him when they present themselves as conditions of "*estar* in the world," The latter, in turn, is only necessary under a subjective form, that is, because it makes "*bienestar* in the world" and the superfluous possible.
>
> (las necesidades biológicamente objetivas no son, por sí, necesidades para él. Cuando se encuentra atenido a ellas se niega a satisfacerlas y prefiere sucumbir. Sólo se convierten en necesidades cuando aparecen como condiciones del "estar en el mundo," que, a su vez, sólo es necesario en forma subjetiva, a saber, porque hace posible el "bienestar en el mundo" y la superfluidad.)

> (*Meditación de la técnica*)

The occurrences of *estar* in these two passages may be translated in French by the verb *être* (which has a clear locative value) or by more punctual and plastic expressions like *se trouver* and *se placer*. In doing so, however, we would erase certain nuances of the original, notably the etymological affiliation that *estar* and *circonstance* have in the first case (a relation emphasized from time to time by Ortega y Gasset by separating the two components of the latter word by a hyphen) or between those terms and *bienestar*, in the second. Nevertheless, this loss is not too serious, since it is situated at the level of the signifier: the central idea (the ineluctable and problematic belonging of the individual to his context) would be preserved regardless. The situation, however, is different when the author, besides taking advantage of the materials of his language, manages to reshape the meaning from the possibilities it offers. The following example may illustrate this.

IV. *Estar Siendo*

In his treatise *Sobre la esencia*, the Spanish philosopher Xavier Zubiri uses an expression constituted by both members of the pair, one in the infinitive and one in the gerundive. It is *estar siendo*, a nominalized verbal phrase, that enables him to express duration (*duración*), one of three "dimensions according to which the real presents itself to us [*está plasmado*] from its interiority into the intrinsic exteriority of its characteristics

[*notas*]"; the two other dimensions being richness—the abundance of characteristics—and their solidity or stability.

From a linguistic point of view, the phrase does not entail any transgression of Spanish syntax. *Estar*, in effect, is playing the rather banal role of auxiliary. Added to any gerundive verb, it enables the expression of the durational aspect of an action. We could therefore translate it, literally, by "being in the course of being." However, in reality, the interpretation that Zubiri himself offers of this *estar* blocks this kind of analysis from the start. The role of auxiliary is in effect completely left behind, mixing inextricably with values that depend, rather, on the copulative usage.

As a statement of the real character of things, the features [*notas*] actualize it in a well-determined formal relationship, a relationship which we could call the "*estar siendo*," putting the accent on "*estar*." Let us recall that *stare*, "*estar*," sometimes had the meaning of *esse* in Classical Latin, "*ser*," but in a "strong" sense. It thus entered some Romance languages as an expression for being, not in any particular sense, but "physical" reality as "physical." In this manner *esse*, "*ser*," became restricted exclusively to its sense as a grammatical tool: the copula. It is only on rare occasions that "*ser*" allows us to distinguish the profound and the permanent from the circumstantial, which will then be expressed with "*estar*"; to say of someone that "he is" a sick person ["*es*" *un enfermo*] or that he "is" sick ["*está*" *enfermo*]—these are two different things. However, this is no exception to what we just said, as the original nuance is perfectly perceptible. For the circumstantial, precisely because it is circumstantial, envelopes the "physical" moment in its realization, whereas the "is" ["*es*" of *ser*], profound and permanent, denotes rather the "mode of being" ["*modo de ser*"] and not the "physical" character. This is why the expression "*estar siendo*" is, perhaps, that which best expresses the character of "physical" reality which belongs to every real thing and which, from an intellective point of view, is approved in the statement.

(En cuanto constatación de la índole real de la cosa, las notas actualizan a ésta en un respecto formal precisamente determinado, un respecto que podríamos llamar el "*estar siendo*," cargando el acento sobre el "*estar*." Recordemos que stare, estar, tenía a veces en latín clásico la acepción de esse, "*ser*," pero en un sentido "fuerte." Pasó así algunas lenguas románicas para expresar el ser no de una manera cualquiera, sino la realidad "física" en cuanto "física." Con lo cual el esse, ser, quedó adscrito casi exclusivamente a su sentido de útil gramatical, la cópula. Sólo raras veces expresa el "*ser*" lo hondo y permanente a diferencia de lo circunstancial, que se expresa entonces en el "*estar*"; así cuando se dice de fulano que "es" un enfermo, cosa muy distinta de decir de él que "está" enfermo. Pero esto quizá tampoco hace excepción a lo que acabamos de decir, sino que el matiz primitivo es perfectamente perceptible. Porque lo circunstancial, precisamente por serlo, envuelve el momento "físico" de su realización, al paso que el "es" hondo y permanente denota más bien el "modo de ser,"

no su carácter "físico." Por esto la expresión "estar siendo" es, tal vez, la que mejor expresa el carácter de realidad "física" de que está dotada toda cosa real, y que intelectivamente se ratifica en la constatación.)

(*Sobre la esencia*)

Estar siendo thus does not only express something like the act of existing *in general* in duration. In effect, as Zubiri says immediately afterward, this dimension does not concern "'*mera*' *realidad*," "pure and simple" reality, the indeterminate abstraction of being. Rather, *estar siendo* aims to express the flow of a very concrete mode of existence, that of belonging to what the author calls "physical reality," that is, to the real character of *that which*, continually and presently actualizing itself in rich and stable features (*notas*), presents itself to us as a fully determined "such." Yet, if the phrase constitutes for the author the most appropriate expression of this "tality" (*talidad*, a neologism made from *tal*, "such"), this is because it is possible for him to give back to the *estar* that composes it a strong and peculiar sense by using the resources of his language. This sense belongs to it by right, but a purely grammatical analysis would be incapable of bringing it out. Zubiri's *estar siendo* is, beside, a clear example of an untranslatable in the wide sense of "that which one is never done translating." The literal version, "to be currently being," though not incorrect properly speaking, nevertheless loses the connotation that the author wishes to use it to express. A paraphrastic version—"to be currently being here and now," for example—might capture it, but we would then lose the plasticity and simplicity of the original. The idea that the phrase expresses is, in fact, already deeply anchored, materially and semantically, in a peculiarity of its source language. Sometimes, however, taking advantage of these peculiarities leads to another type of untranslatable and generates expressions that, purely and simply, are not to be translated. The use that some Latin-American thinkers have for the verb *estar* can illustrate this possibility.

V. *Ser* versus *Estar* in Latin-American Philosophy

One can sometimes perceive a certain pride in texts by Spanish speakers about the pair of terms—sometimes colored with irony, sometimes clearly serious—in their combined expressive possibilities. Julián Marías, for example, in "Estar a la muerte," remarks, not without humor: "I believe that the Germans would exchange one of the provinces we left them for the verb *estar*" (the paper was written in 1953), adding that "if their language had this verb, in addition to *ser*, German philosophy and hence all of modern philosophy would be different." For others, the pair comes from the "interior form of the language," in the sense that Wilhelm von Humboldt gave that expression. It would thus constitute a specific feature of Spanish, contributing to the creation of a vision of the world that was proper and almost exclusive to the Spanish-speaking community (Navas-Ruíz, *Ser y estar*).

However, this sentiment of "pride," fruit of the impression of possessing something unique that may yield unanticipated possibilities, probably finds its most systematic expression among certain representatives of self-styled

"Latin American philosophy" (a branch of Catholic thought, politically engaged and inspired by diverse philosophical sources). Carlos Cullen's article "Ser y estar: Dos horizontes para definir la cultura" illustrates this point of view well.

In it the author distinguishes, in relatively simplistic fashion, two different approaches to the notion of culture. The first, derived from modernity but strongly anchored in Greek thought, is a "code of interpretation of human activity in all its manifestations, which is structured on the basis of a core of meaning furnished by 'the effort of being' [*esfuerzo de ser*]" (ibid.). This is the ontological perspective, or the perspective of *ser*. Cullen distinguishes two moments in its constitution. The first, structured around notions of the transcendental subject and experience, leads to a concept of culture based on progress and accumulation. Action, freed of all "immediacy," is thus identified with the necessary and the universal. We must wait for the "masters of suspicion" (Marx, Nietzsche, and Freud) in order for this model to reach a crisis. In a second moment, in effect, human activity is no longer conceived of as being the inevitable and always purified product of the consciousness of a transcendental subject. It constitutes, rather, the very foundation of all consciousness and any notion of subjecthood.

This crisis, however, does not indicate a decisive break, according to Cullen. It does not presuppose a change in paradigm and gives rise instead to a sort of extension of the modern approach. If, on one hand, "culture is no longer a code," it remains, however, only "the very possibility of structuring codes"; if, on the other hand, the "heroes, sages, and geniuses" who illustrate modernity have disappeared, it is only to be replaced by their "immense creative power" (ibid.). The true crossing of the boundary of *ser* (an approach to culture that, according to Cullen, is no longer proto-ontological but pre-ontological) can only come from a new boundary, that of *estar*. This is a matter of "the meaning acquired for man and his activity from a vital core which imposes itself 'as pure and simple *estar*, nothing more' [*como mero* estar*, no más*]" (ibid.). Over and against a historical and temporal conception of culture, this boundary offers the soil (*suelo*) as the principal referent. It thus gives rise to a "geo-culture," an expression of the rootedness (*arraigo*) in this soil, founded on "great history"—that of the provisional and the immediate—whose "subject" is none other than the people. It is also a matter of a culture characterized by its *negativity*, since it must reject the Western codification of human actions, hitherto dominant.

This boundary of *estar* is not a simple theoretical construction for Cullen. It is in fact the very one "which is alive in 'deepest America,' the America which falls just shy of any effort to be Western, which is in the process of slowly engulfing the effort of being, that is, which teaches us to read events starting with the soil, to write history into *estar*, to wait while already being its fruit" (es el vigente en la "América profunda," la que está más acá de todo esfuerzo por ser occidentales, la que lentamente va fagocitando el esfuerzo por ser, es decir, nos va enseñando a leer los acontecimientos desde el suelo, inscribir la historia en el estar, esperar estando el fruto; ibid.).

Several years later, J. C. Scannone published the article "Un nuevo punto de partida en la filosofía latinoamericana." Here again it is a matter of distinguishing a way of looking at the world characterized by strong notions such as identity and necessity—the territory of *ser*—with a perspective able to integrate the provisional and the indeterminate—the territory of *estar*. This antagonism, which claims to be, above all, the expression of an experience, is nevertheless already present, according to the author, in "the philosophical potentialities of the Spanish language (and languages like Portuguese)," in which "*estar* has a more local and circumstantial sense, where it signifies being firm (upright), but ready to begin moving, and does not express the essence in itself of things as does, by itself, the verb *ser*."

In the end, both Cullen and Scannone refer, as to their developments concerning the notion of *estar*, to the work of the Argentine Rodolfo Kusch. A genuine inspiration behind Latin-American philosophy, this thinker was, in his vast œuvre, most interested in the problems concerning culture and identity of Native Americans. He would admit, however, at the end of his life, that it was the concept of *estar* "which haunted [him] all through [his] work. It is a matter of *estar* being something prior to *ser* and which has the deep meaning of becoming" (De ahí el concepto de estar. Me ha obsediado durante toda mi producción. Se trata del estar como algo anterior al ser y que tiene como significación profunda el acontecer; quoted in Cullen, "Ser y estar," 44n5). It is thus in the work of Kusch that we find, for the first time (in *América profunda*, 1962), the doctrine of the priority of *estar* in relation to *ser*. It is also Kusch who creates a large number of the dichotomies (uncultured/cultured, stench/purity, deepest America/the West, etc.) that provide him with content and allow him to express its consequences. As with his descendents, this domain of *estar* (supposedly older and more authentic) is rooted for Kusch in a conception of the world that is peculiar to Latin America, whose main features are already to be found in pre-Columbian civilizations.

With this type of treatment, a step is taken with regard to what we have seen for Zubiri. Here, there are no longer translation problems, simply because the expression *estar* (replete with connotations, near or far from the original sense) becomes itself irreplaceable. This peculiarity of Spanish is not just a resource for expressing an idea. It is simultaneously both the starting point and the heart of reflection. From that point on, paradoxically, *estar* is transformed from its verbal form into a sort of a proper noun. Its sense becomes fixed, and despite its earlier possibilities, however rich, it comes to denote only a specific doctrine. It is to be hoped that the feeling of "pride" that seems to have given it momentum will be modified slightly. One may be "proud" or not of *being called* Juán or María, but that has little to do with the fact of *being* Juán or Mariá.

SPECIES, FORMA, EXEMPLAR, EXEMPLUM

FRENCH   *aspect, apparence, exemple, forme, idée, modèle*
GREEK   *eidos* [εἶδος], *idea* [ἰδέα]

➤ IDEA, FORM and ART, ESSENCE, *IMAGE*, MIMÊSIS, REPRÉSENTATION, SOUL, *TO BE*

The Latin translations of the terms *eidos* [εἶδος] and *idea* [ἰδέα]—as used in the specific context of Plato's writings—should be appreciated in terms of the full panoply of choices available to interpreters given that, in effecting transfers from one language to another, what is sought is not literal translation, unanimously scorned in classical Rome, but a global restitution of meaning. In the precise case of these two words, choices in translation indicate first of all different stages in the reception of Platonic doctrine, and bear witness in particular to a plainly "artificialist" inflection of the Platonic doctrine of ideas, under the crucial influence of the *Timaeus*. But what is at stake here is not a linear history proceeding by successive additions and rectifications: the translation proposed by Cicero, which privileges the Latin *species*, was maintained by neither Seneca nor Apuleius. Inversely, starting from Latin, it is surprising to observe that *species*, whose first meaning is "sight" or "vision" (cf. Lucretius, 4.236, 242), far from being always situated on the side of the *eidos* or model, refers no less frequently to image, spectre, and simulacrum, the *eidolon* [εἴδωλον], with Epicureanism having obliged it to reinterpret the cleavage (RT: *Dictionnaire étymologique de la langue latine: Histoire des mots* s.v. 2; cf. Lucretius, 1.125; see EIDÔLON). The choices in translation—beyond the contamination of different lexicons (Platonic, Aristotelian, Stoic, Epicurean . . .)—thus illustrate a characteristic feature of classical Latin philosophical translations: the superimposition of terms and the recourse to the Old Latin reserve, all the more "untranslatable" in the orbit of Romania as it will have been widely disseminated (see ESSENCE).

I. *Eidos*, *Species*: The Essential and the Apparent

In classical prephilosophical usage, *eidos* [εἶδος] and *idea* [ἰδέα] are polysemous terms ("form," "appearance," "structure," "category," "class"), from which Plato gave priority to certain meanings pressed into the service of his philosophical endeavors; thus the functions of intelligible forms in their various relations, given greater precision, are more easily graspable thanks to the semantic richness of the terms εἶδος-ἰδέα—structure and form: that which allows one to form categories and that which is given to be seen, that is, both the essential and the apparent, the most

profound and the most superficial (*Republic*, 5.479–80, and 10.132–35).

■ See Box 1.

The Latin *species* offers the same possibilities of articulating distinct levels and exploits equally the root of vision (the root-word *spex* is used as a second term in compounds conserved by the language of religion [*auspex-haruspex-exstipex*]); and yet Cicero alone imposed *species* coherently as a translation for *eidos*—at least in all of his works written after 46 BCE. Neither the Stoic Seneca nor, more strikingly, the Platonist Apuleius would retain that use of *species*, which for them had largely the meaning of "species" (in English), and they used instead *forma* and *exemplar*. Calcidius, finally, restricted the applications of *species* and resorted most frequently to *exemplum*. This can be observed in the limited corpus in which the doctrine of intelligible forms is exposed: Cicero's *De oratore*, Seneca's *Letters to Lucilius* 58 and 65, Apuleius's *Plato and His Doctrine*, and *Question 46* of Augustine's *Ideas*. One can draw as well on the two Latin translations of the *Timaeus*, that of Cicero and that of Calcidius.

In accounting for the diversity of the translations, one cannot neglect the history of philosophy, which is crucial on two distinct levels: that of the interpretation itself of Platonic doctrine and that of the dissemination accorded Aristotelian terminology by the Stoics. Nonetheless, a more attentive consideration of translation procedures and the semantic configurations implemented by them allows for a refinement of the observations one might make solely on the basis of the evolution of doctrines and the history of the language.

II. Cicero: The Distinction between *Forma* and *Species*

We shall first examine how Cicero constructed the equivalence *eidos-species*, then which configurations were exploited by his successors, thus better evaluating the coherence of the uses of *species* in the Ciceronian translation of *Timaeus*. We shall thus see that the choice of *species* entailed a polysemy so charged with philosophical problematics and was inscribed so much against the grain of certain uses dictated by the history of philosophy that, despite the authority of Cicero, it was not retained by those who, after Cicero, were to use and enrich the Latin philosophical lexicon.

A. Translating Plato: *Species*, model, and intelligible referent

It is in the text of *De oratore* (2.8–3.10) that one finds the first evidence of the use of *species* to evoke intelligible forms. *Species* (from the same family as Gr. *skeptomai* [σκέπτομαι], to look at) is used with the precise meaning of "model," or "vision" perceptible only by thought, *cogitata species*, which we see with our mind, *speciem animo videmus*. It is the context that gives it its meaning: *species* is the Form of the beautiful that inhabits Phidias. With *species*, repeated three times, Cicero is no doubt preparing, by means of a more expressive Latin term, the technical translation of the Platonic *idea* by *forma*. Associated with *forma*, the word *species* ultimately designates that which allows one to underwrite dialectical procedure, the intelligible referent. Two of the principal functions of intelligible form are thus expressed by a single Latin word that would subsequently, in the *Academics* and the *Tusculan Disputations*, be used alone, without *forma*:

1

The *eidos* from Homer to Aristotle

➤ CONCETTO, Box 1, EIDÔLON, FORCE, PRAXIS, PRINCIPLE

Eidos is connected to the root *weid-*, which expresses the notion of seeing (*idein* [ἰδεῖν]) and in the perfect tense that of knowing (*oida* [οἶδα]; cf. the Sanskrit *Vedas*, "possession, acquisition" [RT: *Dictionnaire étymologique de la langue grecque*, s.v.]). It is found in Homer with the sense of "aspect, form" (*Iliad*, 2.58; *Odyssey*, 17.308; 454), where it already refers to a conformity between the outer and the inner (see BEAUTY, Box 1), Empedocles, and Democritus. It commonly designates, in the prose of the historians, for instance, the "characteristic" of something, its type (e.g., Herodotus, 1.203; Thucydides, 2.50), in medical vocabulary, the "constitution" (Hippocrates, *De natura hominis,* 9), in geometry, the "figure" (cf. Euclid, *Data*, 53, "duo eidê tôi eidei dedomena [δύο εἴδη τῷ εἴδει δεδομένα]," rendered in RT: LSJ as "two figures given in species").

It was Plato, then Aristotle, in a concerted displacement, who gave the word its philosophical configuration. The terminological meaning of *eidos* that emerges and predominates with Plato—"idea" or "Idea"—is to be understood first of all in opposition to *eidôlon* [εἴδωλον] (image, phantom), following the problematic of *mimêsis* [μίμησις], with the implementation of the three *eidê* of "beds" effected in *The Republic*, 10 (*trisin eidesi klinôn* [τρισὶν εἴδεσι κλινῶν], 597b 14; see MIMÊSIS). The god fabricates from what must indeed be termed the three "species" of beds the one that alone deserves, in Plato's words, the name of *eidos* or "idea": he makes "what the bed is (*ho esti klinê* [ὃ ἔστι κλίνη])," the bed-essence, unique and by nature (597c–d), a bed étantiquement [ontically] a bed (*ontôs* [ὄντως], 597d 1; see ESTI, III). The carpenter, for his part, makes not "the bed," but "a bed" among others (*klinên tina* [κλίνην τινά], 597a 2), which is only "as" *eidos* (*toulouton hoion* [τοιοῦτον οἶον], 597a 6). The painter, finally, an "imitator" of the carpenter, paints a carpenter's bed as it appears, a "third" bed (597a 3) in relation to the truth of the *eidos*: "it is that, the *eidôlon*" (598b 8). In a general manner, words are on the side of the *eidôlon*—the *nomothete* never works as anything but a carpenter, his eyes fixed on

the *eidos* (*Cratylus*, 389a, 390e); but it is the *eidos* that is known: the dialectic that rises unto the idea of the good ("tên tou agathou idean [τὴν τοῦ ἀγαθοῦ ἰδέαν]"; *The Republic*, 6.508e), moves from idea to idea ("eidesin autois di' autôn eis auta kai teleutai eis eidê [εἴδεσιν αὐτοῖς δι' αὐτῶν εἰς αὐτά, καὶ τελευτᾷ εἰς εἴδη]"; 511c).

The Platonic *eidos* never ceased governing the idea, but remodeled (and this is what renders the "idea" so complex) by its Aristotelian reappropriation, which can be made perceptible by making explicit the new oppositions and new translations that it induces. The Aristotelian critique bears on the "separation" introduced by Plato: "Socrates did not produce either universals or definitions as separate (ta katholou ou chôrista epoiei oude tous horismous [τὰ καθόλου οὐ χωριστὰ ἐποίει οὐδὲ τοὺς ὁρισμούς]), but they (*hoi de* [οἱ δέ], i.e., the philosophers after Socrates), they separated them (*echôrisan* [ἐχώρισαν]), and called ideas (*ideas* [ἰδέας]) this type of entity" (*Metaphysics*, M.4.1078b 30–32; see HOMONYM, Box 1, and UNIVERSALS). To situate the *eidos* in its place, one has to render it simultaneously operative on different levels of intelligibility.

Physically, it becomes one of the four causes: it is as coupled with matter (*to ex hou* [τό ἐξ οὗ], what a thing is made of, for example, bronze for the statue) that the *eidos* intervenes ("cause in another sense is the form and the model" [allon de to eidos kai to paradeigma (ἄλλον δὲ τὸ εἶδος καὶ τὸ παράδειγμα)]; *Physics*, 2.3.194b 26); to those two first causes there come to be articulated the motor cause, first principle of movement and rest ("hê archê tês metabolês hê prôtê ê tês êremêseôs [ἡ ἀρχὴ τῆς μεταβολῆς ἡ πχώτη ἢ τῆς ἠρεμήσεως]," the father for the child, Polycletes for the statue—what we moderns designate customarily as "cause"), and the final cause (*to telos* [τὸ τέλος], *to hou heneka* [τὸ οὗ ἕνεκα], the reason for the sculpture; see PRINCIPLE). One thus moves from *eidos/eidôlon* (intelligible "idea"/perceptible copy) to *eidos/hulê* [ὕλη] ("form"/matter) as causes necessary for the description and existence of a single

and identical physical entity. *Eidos* and *hulê* are, in fact, analyzable as components: the *suntheton* [σύνθετον] (composite) or *sunolon* [σύνολον], an individuated and unique composite—for example, a bronze sphere—is a composite of *eidos*, designated as *morphê* [μοφή], "figure, configuration," namely: a sphere, and *hulê*, brass (*Metaphysics* Z.3.1029a 1–7; cf. 8.1033b 5–10); the *eidos* is then more essential or substantial than the matter since it is act, activity, entelechy, *energeia* [ἐνέργεια] and *entelecheia* [ἐντελέχεια], whereas it is potency, *dunamis* [δύναμις] (cf. 8.1050b 2: "the essence, that is, the form, is an act" [hê ousia kai to eidos energeia estin (ἡ οὐσία καὶ τὸ εἶδος ἐνέργεια ἐστιν)]).

The *eidos*, Aristotle specifies in the same passage of his *Physics*, is identical to the "affirmation which is that of the quiddity and its types" (ho logos ho tou ti ên einai kai ta toutou genê [ὁ λόγος ὁ τοῦ τί ἦν εἶναι καὶ τὰ τούτου γένη] (194b 27; see LOGOS, TO TI ÊN EINAI): as with Plato, we are here at the heart of ontology, but the pairing has been twice displaced, not only physically, but also logically. Indeed, at the same time as it plays physically the role of "form," the *eidos* plays logically the role of "species," differentiating itself this time not from "matter," but from "genus," genre, *genos* [γένος]. The *eidos* articulates what is essential in the essence; it allows a far closer approach to what is singular than *genos*; this specific sphere is more a sphere than a shape or figure, Socrates is more a man than a living being: in other words, by virtue of the well-named "specific" difference, the *toionde* [τοιόνδε], the "such," is closer to the *tode ti* [τόδε τι], the "this," closer to the essence or the primal substance that it contributes to defining (1033b 21–26; cf. *Categories*, 5.2b 22: "the species is more essence than the genus" [to eidos tou genous mallon ousia (τὸ εἶδος τοῦ γένους μᾶλλον οὐσία)]; see ESSENCE). Thus it is that in Aristotle's terms, the *eidos* can function as an ontological necessity, more essential and substantial than matter or genus, without having a separate existence.

Barbara Cassin

My opinion, then, is,—that there is no human production of any kind, so compleatly beautiful, than which there is not a "something" still more beautiful, from which the other is copied like a portrait from real life [*ut ex ore aliquo quasi imago exprimatur*], and which can be discerned neither by our eyes nor ears, nor any of

our bodily senses, but is visible only to thought and imagination [*cogitatione et mente*]. Though the statues, therefore, of Phidias, and the other images abovementioned, are all so wonderfully charming, that nothing can be found which is more excellent of the kind; we may still, however, suppose a something which is

more exquisite, and more compleat. For it must not be thought that the ingenious artist, when he was sketching out the form of a Jupiter [*Jovis formam*], or a Minerva, borrowed the likeness from any particular object;—but a certain admirable semblance of beauty was present to his mind [*ipsius in mente insidebat* species *pulchritudinis eximia quaedem*], which he viewed and dwelt upon, and by which his skill and his hand were guided [*quam intuens in eaque defixus ad illius similitudinem artem et manum dirigebat*]. As, therefore, in mere bodily shape and figure [*in formis et figuris*] there is a kind of perfection, to whose ideal appearance every production which falls under the notice of the eye [*aliquid perfectum et excellens, cujus ad cogitatem* speciem *imitando referentur ea quae sub oculos ipsa cadunt*], is referred by imitation; so the semblance of what is perfect [*sic perfectae eloquentiae speciem animo uidemus*]. Oratory may become visible to the mind, and the ear may labour to catch a Likeness [*effigiem*]. These primary forms of things are by Plato [the father of science and good language] called "Ideas" [*has rerum formas appellat ideas ille*]; and he tells us they have neither beginning nor end, but are co-eval with reason and intelligence; while every thing besides has a derived, and a transitory existence, and passes away and decays, so as to cease in a short time to be the thing it was. Whatever, therefore, may be discussed by reason and method, should be constantly reduced to the primary form [*quicquid est igitur de quo ratione et via disputetur, id est ad ultimam sui generis formam speciemque redigendum*] or semblance of its respective genus.

(*De oratore*, 2.8–3.10)

The same *forma-species* connection would be rediscovered much later in Saint Augustine in the form of a strict equivalence: "Ideas igitur latine possumus vel formas vel species dicere, ut verbum e verbo transferre videamur" (We can thus render *ideas* in Latin either by *forms* or by *visions*, translating literally). Augustine continues in this famous passage, proposing a definition of the idea, inscribed in the divine intellect, which would remain classic at least until Malebranche:

Ideas are in fact principal forms or essential reasons [*sunt namque ideae principales formae quaedam vel rationes rerum*], fixed and immutable, not informed themselves, and thus eternal and permanent in their mode of being, subjectivated as they are in the divine intelligence [*stabiles atque incommutabiles, quae ipsae formatae non sunt, ac per hoc aeternae ac semper eodem modo sese habentes, quae in divina intelligentia continentur*]. And admitting in themselves neither origin nor extinction, one nonetheless defines as formed in accordance with them all that admits of origin and extinction, and all that is born and expires [*secundum eas tamen formari dicitur omne quod oriri et interire potest, et omne quod oritur et interit*].

(*Quaestio 46*, 2)

B. Translating Aristotle and the Stoics: *Forma*

The difficulty of distinguishing between *forma* and *species* at work in this text of the *Orator* can be read as an echo of a passage in the *Topics* (dating from 44 BCE), which allows

one to understand at the same time what is at stake in the choice of *species*. Cicero, in point of fact, uses the pretext that the flexion of *species* in the oblique cases—and in the plural—is a bit awkward to refuse to use that word to translate the *eide* [εἴδη], which designate, in the *Topics*, elements of the analysis of definitions: that meaning is the one retained by Aristotle and the Stoics. Cicero proposes to use for this meaning not *species* but *forma*:

In division there are forms which the Greeks call *ideai*; our countrymen who treat of such subjects call them species [*formae sunt, quas Graeci* [εἴδη] *vocant, nostri, si qui haec forte tractant, species appellant*]. And it is not a bad name, though it is an inconvenient one if we want to use it in different cases. For even if it were Latin to use such words, I should not like to say *specierum* and *speciebus*. And we have often occasion to use these cases. But I have no such objection to saying *formarum* and *formis*; and as the meaning of each word is the same, I do not think that convenience of sound is wholly to be neglected [*Cum autem utroque verbo idemque significetur, commoditatem in dicendo non arbitror neglegendam*].

(*Topics*, 30)

The argument from euphony or usage may not be without weight, but it is remarkable that Cicero should reject the use of *species* in a context marked by the Aristotelian and Stoic dialectic. In other words, Cicero rejects the evolution of the uses of *eidos* to impose the meaning given it by Plato. This movement in reverse, which committed Cicero to restore all the semantic possibilities offered by *species*, is particularly palpable in the translation of *Timaeus*; the extent of the phenomenon will be best gauged, however, once one examines the specific lexical system put in place by Seneca in an analogous context.

III. Seneca: *Exemplar,* the Model in Art

In *Letter* 58, devoted to Platonic ontology, Seneca recalls the definition of *genus* and *species* by invoking Aristotle (58.9; on *genos*, see PEOPLE*,* in particular, III.A); it is thus not surprising that he does not use *species* to translate *idea*. Seneca thus rejects Cicero's linkage between *forma* and *species* to make the *eidos* explicit, whereas he draws on Cicero's authority at the beginning of the same letter (6) in using *essentia* as a translation for *ousia* [οὐσία]. Now the term he chose would commit the entire interpretation of his thought. Whereas in Cicero the role of Forms is present starting with the example of the artist, but is not reducible to that of a model, in Seneca, on the contrary, the use of *exemplar* to render Form privileges that sole function of the model. Thus the translation of *idea* as *exemplar* is immediately illustrated by the example of the painter:

And this "idea," or rather, Plato's conception of it, is as follows: "The 'idea' is the everlasting pattern of those things which are created by nature (*idea est eorum quae natura fiunt exemplar aeternum*). I shall explain this definition, in order to set the subject before you in a clearer light: Suppose that I wish to make a likeness of you (*imaginem tuam*); I possess in your own person the pattern of this picture (*exemplar picturae te habeo*),

wherefrom my mind receives a certain outline, which it is to embody in its own handiwork. That outward appearance, then, which gives me instruction and guidance, this pattern for me to imitate, is the "idea" (*ita illa quae me docet et instruit facies, a qua petitur imitatio, idea est*).

(58.6)

It will be observed, from the elaboration of this example, that Seneca uses *exemplar* for the sensory model, whereas *facies* and *habitus* render that toward which the imitation tends, namely, intelligible form. Moreover, when he distinguishes a fourth ontological level, that of the form of the work executed by the artist, Seneca reserves *exemplar* for the model and *forma* for its copy:

The "idea" was Vergil's outward appearance, and this was the pattern of the intended work. That which the artist draws from this "idea" and has embodied in his own work, is the "form." Do you ask me where the difference lies? The former is the pattern; while the latter is the shape taken from the pattern and embodied in the work. Our artist follows the one, but the other he creates.

(Idea erat Vergilii facies, futuri operis exemplar: ex hac quod artifex trahit et operi suo imposuit, idos est. Quid intersit, quaeris ? Alterum exemplar est, alterum forma ab exemplari sumpta et operi inposita : alteram artifex imitatur, alteram facit.)

Not without difficulty, since a gloss continues to be necessary: *exemplar* is thus to designate at once the intelligible model, the *eidos,* and the sensory model, the *idea.* Exemplarity at the level of the intelligible is illustrated at the sensory level by a mimetic duplication, in Seneca as in Plato (cf., in particular, the example of the "beds" developed at the beginning of book 10 of *The Republic*, 596b–597e; see Box 1). It is striking that Seneca is constrained to render *exemplar* more precise by way of *facies*, thus massively reintroducing the visible: "A statue has a certain external appearance; this external appearance of the statue is the '*eidos.*' And the model or pattern itself has a certain external appearance, by gazing upon which the sculptor has fashioned his statue; this is the 'idea'" (Habet aliquam faciem statua: haec est idos. Habet aliquam faciem exemplar ipsum, quod intuens opifex statuam figuravit: haec idea est). Thus *facies*, in turn, has a double—indeed, a triple—function, applicable to the sensory *exemplar* (Virgil's *facies*), as well as to the completed work, the statue, and the intelligible model: the *idos* has its aspect, its "physiognomy" or "face," and the *idea* has its aspect, its visibility. In using *facies* in this manner, not to translate, but to explain, Seneca reinforces the artificialist schema subtending the doctrine of ideas: it mobilizes as the most general of terms a word that refers to *facere*, the *making* of the artist, understood as an *imponere faciem*, to give form or shape (cf. Marcus Terentius Varro: "proprio nomine dicitur facere a facie, qui rei quam facit imponit faciem. Ut fictor cum dicit 'fingo', figuram imponit . . . , sic cum dicit 'facio' faciem imponit" [One says, properly speaking, to make (*facere*) from *facies* (fashion), for someone who imposes a form on the thing he

is doing. Just as the modeler, when he says, 'I am modeling,' imposes a shape, . . . so, when he says, "I am making," does he impose a fashion]; *De lingua Latina*, 6.78).

If the *exemplar* is not adequate to designate on its own an intelligible form, the term does nonetheless bring into relief the imitation in demiurgical creation, no doubt at the cost of an abusive reading of the myth presented in *Timaeus*. This emerges clearly in *Letter 65*, where Form is presented as a fifth sort of cause: "[To Aristotle's four causes] Plato adds a fifth cause, the pattern or model which he himself calls the 'idea'; for it is this that the artist-demiurge gazed upon when he created the work which he had decided to carry out" (His quintam Plato adicit exemplar, quam ipse idean vocat: hoc est enim, ad quod respiciens artifex id, quod destinabat, effect) (7).

In situating the artist and the god on the same level, Seneca gave priority to an "instrumental" conception of Form, which is defined in the process of an active imitation following the topical comparison of the creation of a statue (8). It is this interpretative perspective that gives its full pertinence to Seneca's choice of *exemplar*:

Neither is the pattern a cause, but an indispensable tool of the cause. His pattern is as indispensable to the artist as the chisel or the file; without these, art can make no progress.

(Exemplar quoque non est causa, sed instrumentum causae necessarium. Sic necessarium est exemplar artifici, quomodo scalprum, quomodo lima : sine his procedere ars non potest.)

(*Letter*, 65.13)

On the basis of the use of *exemplar,* a semantic configuration was initiated that was determined by the model of artistic activity.

■ See Box 2.

IV. Cicero and the Translation of *Timaeus*: The *Species/Exemplar* Distinction

This was the pitfall Cicero managed to avoid in his translation of the *Timaeus*: to that end, he uses *species* whenever there is a need to render what can be grasped by intellection alone. That coherent effort is palpable on three levels: on the one hand, the occurrences of *species* are not mechanically dictated by those of *eidos-idea*; on the other hand, sequences in which *species* figures contribute to produce an augmented nominal sense that brings into greater relief the intellection at work; finally, the distinction between *species* and *exemplar* favors the precision of the meaning of *species*.

The fact that *species* is not a word-to-word equivalent is evident from the first occurrence of the word: Plato's text (28a) distinguishes two phases, the time of the gaze that the artist-demiurge directs at what is conserved as identical and the time in which he achieves the form (*idea*) in his work; in his translation, Cicero condenses the time of the gaze and the apprehension of the form thanks to the use of *species* and thus anticipates the role of Forms in intellection.

ὅτου μὲν οὖν ἂν ὁ δημιουργὸς πρὸς τὸ κατὰ ταὐτὰ ἔχον βλέπων ἀεί, τοιούτῳ τινὶ προσχρώμενος παραδείγματι,

2

Apuleius: *Forma/exemplum/exemplar*

The model of art also inflected the vocabulary use of a Platonist like Apuleius in the succinct introduction of his brief work *Plato and His Doctrine*:

> Ideas, that is, the forms of all things, are simple and eternal, without, however, being corporeal; it is among them that the models of things present and future chosen by god are to be found; in these models, one cannot find more than a single image of each species and everything that is born has, like wax, its form and shape traced in accordance with the imprint of the models.

(Ideas vero, id est formas omnium, simplices et aeternas esse nec corporales tamen; esse autem ex his, quae deus sumpserit, exempla rerum quae sunt eruntve; nec posse amplius quam singularum specierum singulas imagines in examplaribus inveniri gignentiumque omnium, ad instar cerae, formas et figurationes ex illa exemplorum inpressione signari.)

(1.6)

As in Seneca, *species* is used in its common meaning, whereas *forma-exemplum-exemplar* designate Form following a progression determined in this case by the quite concrete image of a slab of wax on which the model is imprinted. This convergence might suggest that the interpretation of Platonic doctrine, which was certainly not the same for the Stoic Seneca—however influenced he may have been by middle Platonism—as for Apuleius, was inflected in a manner indicated by choices in translation: the translations of Seneca and Apuleius make use of a vocabulary intent on being explicit, but the explicitation of *eidos* [εἶδος] as *exemplum* inflects the meaning, or, more precisely, reduces it. In wanting to transmit, one congeals; by giving priority to the example, one impoverishes the thought.

τὴν ἰδέαν καὶ δύναμιν αὐτοῦ ἀπεργάζηται, καλὸν ἐξ ἀνάγκης οὕτως ἀποτελεῖσθαι πᾶν.

(Thus each time that a creator fabricates something by resting his eyes on what remains always the same and taking as a model an object of this sort in order to reproduce its form and properties, all that he achieves by proceeding in this manner is necessarily beautiful.)

Quo circa si is, qui aliquod munus efficere molitur, eam speciem, quae semper eadem est, intuebitur atque id sibi proponet exemplar, praeclarum opus efficiat necesse est.

(When he who undertakes to achieve a work contemplates the form that remains always the same and takes it as a model, he necessarily accomplishes a masterpiece.)

In 39a–40a, one can observe the same type of displacement: the Forms comprised by the Living, "enousas ideas tôi ho estin zôion [ἐνούσας ἰδέας τῷ ὃ ἔστιν ζῷον]," become *formae,* whereas the Living is clearly rendered in its function as model by the group *species rerum*. It is equally remarkable that the use of *formae*, with a meaning close to *genera*, anticipates the description of the Forms contained by this world, namely, the four species.

ἧπερ οὖν νοῦς ἐνούσας ἰδέας τῷ ὃ ἔστιν ζῷον, οἷαί τε ἔνεισι καὶ ὅσαι, καθορᾷ, τοιαύτας καὶ τοσαύτας διενοήθη δεῖν καὶ τόδε σχεῖν. εἰσὶν δὴ τέτταρες, μία μὲν οὐράνιον θεῶν γένος, ἄλλη δὲ πτηνὸν καὶ ἀεροπόρον, τρίτη δὲ ἔνυδρον εἶος, πεζὸν δὲ καὶ χερσαῖον τέταρτον.

(Now as in the ideal animal the mind perceives ideas or species of a certain nature and number, he thought that this created animal ought to have species of a like nature and number.)

Quot igitur et quales animalium formas mens in speciem rerum intuens poterat cernere, totidem et tales in hoc

mundo secumcogitavit effingere. Erant autem animantium genera quattuor.

(The number and the nature of the forms that the mind could discern by contemplating the Form [of all that exists], he decided to reproduce it in this world. There were four species of the living.)

If one now focuses on sequences containing *species*, one observes that the use of a (genitive) determiner renders more precise the role of *species*, which allows one to see mentally the object specified by the determiner. In 29a, the creator fixes his eyes on the eternal model, *to aidion* (*paradeigma*) [τὸ ἀίδιον (παράδειγμα)]; Cicero translates "speciem aeternitatis imitari":

εἰ μὲν δὴ καλός ἐστιν ὅδε ὁ κόσμος ὅ τε δημιουργὸς ἀγαθός, δῆλον ὡς πρὸς τὸ ἀίδιον ἔβλεπεν.

(If our world is beautiful and its creator is good, it is clear that the creator has fixed his eyes on what is eternal.)

(Atqui si pulcher est hic mundus et si probus ejus artifex, profecto speciem aeternitatis imitari maluit.)

This is confirmed by the fact that *aeternitas* by itself is sufficient, in the following sentence, to render the "eternal model," once the process of intellection has been put in place by *species*: "It is clear to everyone that the creator fixed his eyes on what is eternal [παντὶ δὴ σαφὲς ὅτι πρὸς τὸ ἀίδιον. Nonigitur dubium quin aeternitatem maluerit exsequi]."

These uses appear more characteristic still if they are situated parallel to "speciem optimi," which translates, while turning the adjective into a noun, "tou aristou idean [τοῦ ἀρίστου ἰδέαν]" in 46c (the best there is), and to "speciem rerum," which translates "tôi ho estin zôion [τῷ ὃ ἔστιν ζῷον]" (the Living) in 39e.

The gesture favoring the determining noun is a choice in translation that was not retained by Calcidius, as may easily be seen by comparing Cicero's text with his own in the

four following passages, which were previously quoted and translated:

28: [Q]uocirca si is, qui aliquod munus efficere molitur, eam speciem quae semper eadem est, intuebitur atque id sibi proponet exemplar, praeclarum opus efficiat necesse est; quippe ad immortalis quidem et in statu genuino persistentis exempli similitudinem atque aemulationem formans operis effigiem honestum efficiat simulacrum necesse est. [In fashioning a representation of the work resembling and imitating an immortal model and conserving its original state, he necessarily achieves a work of beauty.]

29: Atqui si pulcher est hic mundus et si probus ejus artifex, profecto speciem aeternitatis imitari maluit. Namsi est—ut quidemest—pulchritudine incomparabili mundus, opifexque et fabricator ejus optimus perspicuum est, quod juxta sincerae atque immutabilis proprietatis exemplum mundi sit instituta molitio. [The construction of the world took place following the model of what is unaltered and unchangeable.]

39: Quot igitur et quale animalium formas mens in speciem rerum intuens poterat cernere, totidem et tales in hoc mundo secum cogitavit effingere atque ut mens, cujus visus contemplatioque intellectus est, idearum genera contemplatur in intelligibili mundo, quae ideae sunt illic animalia, sic deus in hoc opere suo sensili diversa animalium genera statuit esse debere constituitque quattuor. [when the mind . . . contemplates the kinds of ideas in the intelligible world]

46: deus, cum optimi speciem, quoad fieri potest, efficit . . . dei summam optimamque et primariam speciem molientis. [god implementing the first Form]

Whereas Cicero uses nouns to tighten the articulations governing the specific mode of intellection of the creator, Calcidius calls on adjectives and groups of qualifiers to specify what a model is. It is perhaps not a matter of indifference that in such passages, the term used three out of four times is *exemplum*, whereas the term *species* appears only once, qualified by the adjective *primaria*: systematic examination of Calcidius's translation and commentary reveals that the word *species* is reserved for what is apprehended by the intellect, whereas *exemplum* appears whenever, in intelligible form, it is the function of model that is being advanced. If that distinction, however, seems more or less to adhere to the one established by Cicero, it is not maintained with the same rigor. And yet it is in the distinction between uses of *exemplum* and *species* that the specificity of the Platonic reading of the myth of the Demiurge-Creator would appear to reside.

Thus, in the previously quoted translation from 28, Cicero designates as *species* that toward which the gaze of the creator tends, but uses *exemplar* to evoke the role played by the *species* in the process of imitation; similarly, in the following paragraph:

Rursus igitur videndum ille fabricator hujus tanti operis utrumsit imitatus exemplar, idne, quod semper

unumidem et sui simile, an id, quod generatum ortumque dicimus. Atqui si pulcher est hic mundus et si probus ejus artifex, profecto speciem aeternitatis imitari maluit.

(But one should further ask whether the artificer of such a work achieved it by imitating a pattern, that is, according to what is always identical and resembling itself, or according to what we call changing and created. If the world be indeed fair and the artificer good, it is manifest that he must have looked to that which is eternal.)

(29a)

The *exemplar* is what is imitated by the *fabricatoir* (*tektainomenos* [τεκταινόμενος]), whereas *species aeternitatis* is what is imitated by the *artifex probus* (*dêmiurgos* [δημιουργός]). Finally *species aeternitatis* is opposed to *generatum exemplum*.

This rigorously maintained distinction thus allows one to preserve on two distinct levels the description of the intelligible and the elaboration of its role in the sensory world: Calcidius made partial use of this distinction, but Seneca and Apuleius were unaware of it. Now, instead of invoking incomprehension or doctrinal inflection in their case, one might focus on the difficulties entailed by the choice of *species*. To do so it suffices to consider what the other uses of *species* were in philosophical discourse during Cicero's era. Cicero himself also employed the term to designate all that could not be an object of certainty, an appearance constraining one to be satisfied with the probable while the Stoics were intent on founding their theory of knowledge on true representations bearing their distinctive mark. But he also used it to designate the image of the gods, whose mental vision, according to the Epicureans, provides us, with certainty, proof that the gods are beatific and eternal. Although the *species dei* is a little explored aspect of Epicurean theology, it cannot be contested that the use of *species* in an Epicurean context is quite pertinent. This can be observed in the occurrences of the term in Lucretius, where *species* is used above all to designate appearance in as much as it gives to be seen, that is, in conformity with the Epicurean theory of knowledge insofar as it is the necessary condition of knowledge: the syntagm "naturae species ratioque," utilized on several occasions by Lucretius (*De rerum natura*, 1.148: "sight and the explanation of nature") provides a gripping encapsulation of it.

The fact that *species* is used, in the Ciceronian corpus, to reject the certainties of the Stoics, but also to evoke the very conditions of intellection—and to do so in a context not only of Platonism, but also of Epicureanism—suggests the formulation of the following hypothesis in the way of a conclusion: if *species* does indeed refer us back, in its Epicurean and anti-Stoic uses, to Hellenistic philosophy on the conditions of possibility of knowledge, Cicero's exploitation of it to translate Platonic Form can be explained by the frequently articulated wish to restore Plato's method to its true place, which would entail leaving inscribed in the language a question that would remain open. Like Plato, Cicero exploited in *species* all the heuristic potential contained in the term *eidos*. In so doing, he challenged the evolution of the uses of the Greek word fixed by the history of philosophy. His successors

preferred to take that evolution into account in their choice as translators, which does not derive from the authority of Cicero.

SPEECH ACT, PERFORMANCE

FRENCH	*acte de langage*
GERMAN	*Vollziehung*
GREEK	*epideixis* [ἐπίδειξις]
LATIN	*actus exercitus*

➤ *ACT*, ACTOR, AGENCY, DICHTUNG, ENGLISH, INTENTION, LOGOS, NONSENSE, PRAXIS, PROPOSITION, SACHVERHALT, SENSE, *SOPHISM*, TRUTH

The notion of a speech act is inseparable from J. L. Austin's work and his invention of the performative. The attention given to a category of utterances that undoes the true/false dichotomy (the "true/false fetish," as Austin calls it) in favor of a problematics of success and failure (felicity/infelicity) outlines a new field in which language, action, and intention compose a system, and invents a new vocabulary that sometimes leads to misunderstandings. No matter how contemporary it is, this invention, connected with the "linguistic turn," has led us to reconsider the movements or moments that, in the Greek and Latin traditions, are attached to language insofar as it acts and not insofar as it expresses. The problem to be solved is not, as in the Anglo-Saxon world, that of ethical utterances, but rather, in the context of Sophist *epideixis* [ἐπίδειξις], that of rhetorical

effectiveness, of culture as distinct from nature and the creation of the political. Then, in the Middle Ages, comes on the one hand the notion of *actus exercitus*—the revelation of a level of linguistic completeness in which the speech act, and no longer simply the combination of the parts of speech, intervenes; and on the other hand, the location of a remarkable attribute of sacramental utterances as "operative" utterances that "do what they signify."

I. *Epideixis*, Performance, and Performativity of the *Logos*

A. *Epideixis*, performance, and praise

Epideixis [ἐπίδειξις] is the word traditionally used, from Plato's dialogues to Philostratus's *Lives of the Sophists*, to characterize Sophistic discourse. The term is established by Plato, for example in *Hippias maior*, 282c and 286a, and *Hippias minor*, 363c, where it designates the continuous discourse of Prodicus, Hippias, and Gorgias in contrast to heuristic question-and-answer dialogue, seeking the truth about the object and grappling with the difficulties of the interlocutor, that characterizes Socratic dialectic. *Epideixis* is a long, continuous discourse whose effects are so calculated, even when improvised, that its author can only repeat it in the same form (*Gorgias*, 447c2–3). As Aristotle noted, the epidictic style is *graphikôtatê* [γραφικωτάτη], "the most specific to writing," because "its proper actualization is reading" (*Rhetoric*, 3.12; 1414a18–19). The best translation would therefore be "performance," "speech," or even "lecture," since the Sophists, who often came from Sicily or Magna Graecia, went on tour in foreign lands—that is, in the great Greek cities, Athens and Sparta.

With Aristotle (*Rhetoric*, 1.3), *epideixis* becomes more specific and is codified in a system of strict opposition: the epidictic genre, or "eulogy," is one of the three major genres in which all discourses are classified. "Deliberative" (*sumbouleutikon* [συμβουλευτικόν]) discourse is addressed to the assembly, in order to advise for or against something that concerns the future; "forensic" (*dikanikon* [δικανικόν]) discourse is addressed to the tribunal, to accuse or defend, and concerns the past. Epidictic, praise and blame, is addressed, Aristotle says, neither to a citizen nor to a judge, but to the spectator (*theôros* [θεωρός]); it concerns neither the future nor the past, but the present, and it is only "by following the present" ("kata ta huparchonta [κατὰ τὰ ὑπάρχοντα]," 1358b) that one can argue in it about the past or the future; it involves neither a decision nor a verdict, but simply the *dunamis* [δύναμις] (potentiality, power, talent) of the orator himself, regarding which the spectator is expected to express an opinion (1358b6). Finally, instead of referring everything to the useful and the harmful, as in the case of counsel, or to the just and the unjust, as in the case of the legal plea, the eulogy's only concern is "the beautiful and the shameful" ("to kalon kai to aischron [τὸ καλὸν καὶ τὸ αἰσχρόν]," 1358b28)—where the link between the aesthetic and the ethical is assumed (see BEAUTY, Box 1).

To understand the relation between the two senses of performance and eulogy better, we can start with etymology. *Deixis* [δεῖξις], from *deiknumi* [δείκνυμι], "show," is the act of designating without speech, pointing with one's index finger (see THEMIS). *Epideixis* refers to the art of "showing" (*deiknumi*) "before" (*epi* [ἐπί]): *epi* indicates first that one

must be speaking before an audience, Aristotle's "spectators." Moreover, that is why *epideixis* can occur without speaking: thus Thales, the founding hero of philosophy (*archêgos* [ἀρχηγός], Aristotle, *Metaphysics,* A.3, 983b20), also founds chrematistics: avenging himself for a Thracian servant's scornful laughter, Thales, by taking monopoly control of the oil presses before a particularly abundant olive harvest, shows everyone that when he wishes, the philosopher can use his meteorological knowledge for economic ends, and thus performs an "*epideixis heautou sophias* [ἐπίδειξις ἑαυτοῦ σοφίας]"—a demonstration, proof, display of his wisdom, or rather of his competence (*Politics,* 1259a9–19, probably the only nonrhetorical use of the term in Aristotle's works). Thus *epideixis* is an opportunity to show what one can do by taking advantage of the propitious moments that only the present can offer (see MOMENT). Rhetorical *epideixis* is also an opportunity for such a demonstration. The epideictic orator uses what he exhibits as an example or a paradigm: by praising it, he "overrates" it, and shows "even more" (*epi*) thanks to it; simultaneously, he shows what he can do with regard to an object of any kind (Helen or Palamedes, Athens or Rome, a hair or a fly); he demonstrates himself and his talent "in addition" (*epi*). The eulogy thus constitutes the rhetorical performance par excellence—a performance in the athletic sense of the term.

B. The performativity of *epideixis*

It is the status of rhetoric itself that *epideixis* forces us to reconsider. It does not suffice to say that rhetoric, instead of "speaking of," undertakes to "speak to," nor to define it, as Plato would, as empirical or routine, "a worker for persuasion" ("*peithous dêmiourgos* [πειθοῦς δημιουργός],*" Gorgias,* 453a), or even, like Aristotle, who grants it the status of an art and science, as the "faculty of observing in any given case the available means of persuasion" ("*peri hekaston tou theôrêsai to endechomenon pithanon* [περὶ ἕκαστον τοῦ θεωρῆσαι τὸ ἐνδεχόμενον πιθανόν],*" Rhetoric,* 1.1355b25, trans. Roberts). We must reconsider the ontological status of persuasion or, as Jean-François Lyotard puts it, "extend the idea of seduction": "It is not the addressee who is seduced by the speaker. The latter, the referent, the meaning, are no less affected than the addressee by the

seduction exercised" (*Le différend*, 148.128, trans. Van Den Abbeele). And we have to understand that here we have a characteristic of the Greeks and a peculiarity of their discursive tradition that was obliterated by the great school of Platonic-Aristotelian philosophy. This power of language is explicit in the very paradigm of the eulogy, the most ancient that has come down to us, Gorgias's *Encomium of Helen.* In the latter, epidictic power is fully revealed: Helen is the most guilty of women because she has set the whole of Greece to war and violence, and yet Gorgias convinces us that Helen is innocence itself. The supplement to *deixis* constituted by *epideixis* succeeds in changing the object into its contrary: the phenomenon becomes the effect of the omnipotence of the *logos* [λόγος]. In so doing, Gorgias also provides the theory of his practice: "Speech is a great sovereign [*logos dunastês megas estin* (λόγος δυνάστης μέγας ἐστιν)] that with the smallest and most imperceptible of bodies achieves the most divine acts [*theiotata erga apotelei* (θειότατα ἔργα ἀποτελεῖ)]" (RT: DK 82B11 [8]; see LOGOS). The inverse model of Aristotle's *De interpretatione* (which establishes in opposition to Sophistic the "normal" system of our discourse; see SIGN) is thus located de facto: discourse, not phenomenon, causes the soul to suffer, or, as Gorgias puts it, "under the effect of discourse the soul undergoes a passion that is peculiar to it [idion ti pathêma dia tôn logôn epathen hê psuchê (ἴδιόν τι πάθημα διὰ τῶν λόγων ἔπαθεν ἡ ψυχή)]" (RT: DK 82B11 [9]). For instead of having to express the phenomenon adequately and convey it, discourse, in complete autonomy, produces it: "It is not speech that indicates the outside, but the outside that comes to reveal speech [ouch ho logos tou ektos parastatikos estin, alla to ektos tou logou mênutikon ginetai (οὐχ ὁ λόγος τοῦ ἐντὸς παραστατικός ἐστιν, ἀλλὰ τὸ ἐκτὸς τοῦ λόγου μηνυτικὸν γίνεται)]" (*Treatise on Non-Being*, RT: DK 82B3, 85). Gorgias, in his "game" of recreating a Helen who is now innocent, makes it clear that *epideixis* involves moving, not from being to speaking about being, as in ontology, but rather, in a logological mode, from speech to its effect. It is in this respect that the performance of rhetorical-sophistical discourse, of which *epideixis* is the emblem, is (to adopt Austin's expression) the art of "doing things with words."

■ See Box 1.

1

Gorgias's *Encomium of Helen*: From orthodoxy to the creation of values

➤ COMMONPLACE, DESCRIPTION, *WORLD*

Epideixis is all the more spectacular when it transforms, or even performs, the world, by producing new objects and new values. The whole art consists in making use of accepted values to propose new ones: Gorgias's *Encomium of Helen* (RT: DK 82B11) shows us, in its opening sentences, this passage from communion to invention, from liturgy to "happening."

The first vector is orthodoxy:

kosmos polei men euandria, sômati de kallos, psuchêi de sophia, pragmati de aretê, logôi de alêtheia; ta de enantia toutôn akosmia. andra de kai gunaika kai logon kai ergon kai polin kai pragma xhrê to men axion epainou epainôi timan, tôi de anaxiôi mômon epitithenai; isê gar hamartia kai amathia memphesthai te ta epaineta kai epainein ta mômêta. [κόσμος

πόλει μὲν εὐανδρία, σώματι δὲ κάλλος, ψυχῆι δὲ σοφία, πράγματι δὲ ἀρετή, λόγωι δὲ ἀλήθεια· τὰ δὲ ἐναντία τούτων ἀκοσμία. ἄνδρα δὲ καὶ γυναῖκα καὶ λόγον καὶ ἔργον καὶ πόλιν καὶ πρᾶγμα χρὴ τὸ μὲν ἄξιον ἐπαίνου ἐπαίνωι τιμᾶν, τῶι δὲ ἀναξίωι μῶμον ἐπιτιθέναι· ἴση γὰρ ἁμαρτία καὶ ἀμαθία μέμφεσθαί τε τὰ ἐπαινετὰ καὶ ἐπαινεῖν τὰ μωμητά.]

1. For the city-state, order is the excellence of its men; for the body, it is beauty; for the soul, wisdom; for something one makes, value; for speech, truth. Their contrary is disorder. Someone or something that is worthy of praise—a man, woman, discourse, work, city-state, thing—has to be honored by a eulogy, and someone who is unworthy of it has to be blamed, for blaming the praiseworthy and praising the blamable are equally wrong and equally ignorant.

The key words that today still define for us poetic and philosophical Greece are all there, distributed among two values, positive and negative, *kosmos* [κόσμος] and *akosmia* [ἀκοσμία], order and disorder, well-structured beauty—ornament, colors—and its absence, its lack, its defeat by chaos. The auditor-spectator is led to the point where words take on their meaning, exist together as a conventional system of meaning. The sense of truth is rooted in this communion, constituted by the continual creation of the values necessary for the very existence of the social bond. Here we are at the heart of the most efficacious, the most performative, because also the most economical, of orthodoxies: the common practice of language.

The second vector, in the sentences immediately following, is heterodoxy:

tou d' autou andros lexai te to deon orthôs kai elegxai . . . tous memphomenous Helenên, gunaika peri ês homophônos kai homopsuchos gegonen hê te tôn poiêtôn akousantôn pistis hê te tou onomatos phêmê, ho tôn sumphorôn mnêmê gegonen. egô de boulomai logismon tina tôilogôi dous tên men kakôs akouousan pausai tês aitias, tous de memphomenous pseudomenous epideixas kai deixas kai deixas talêthes pausai tês amathias. [τοῦ δ' αὐτοῦ ἀνδρὸς λέξαι τε τὸ δέον ὀρθῶς καὶ ἐλέγξαι . . . τοὺς μεμφομένους Ἑλένην, γυναῖκα περὶ ἧς ὁμόφωνος καὶ ὁμόψυχος γέγονεν ἥ τε τῶν ποιητῶν ἀκουσάντων πίστις ἥ τε τοῦ ὀνόματος φήμη, ὃ τῶν συμφορῶν μνήμη γέγονεν. ἐγὼ δὲ βούλομαι λογισμόν τινα τῶι λόγωι δοὺς τὴν μὲν κακῶς ἀκούουσαν παῦσαι τῆς αἰτίας, τοὺς δὲ μεμφομένους ψευδομένους ἐπιδείξας καὶ δείξας καὶ δείξας τἀληθὲς παῦσαι τῆς ἀμαθίας.]

2. It is for the same man to say with rectitude what needs to be said, and to contradict those who blame Helen, a woman who combines in a single voice and a single soul the belief of the poets' audience and the sound of a name that reminds us of misfortunes. I want, giving logic to speech to put an end to accusations against a woman about whom we have heard so much calumny, to show that her detractors are wrong, to show the truth and end ignorance.

Gorgias—"I," all alone—is challenging a consensus that includes, "in a single voice and a single soul [*homophônos kai homopsuchos* (ὁμόφωνος καὶ ὁμόψυχος)]," all the poets and their audiences, and even the testimony deposited in language itself with the eponymy of Helen's name, constantly emphasized from Aeschylus (*helenas*, *helandros*, *heleptolis* [ἑλένας, ἕλανδρος, ἑλέπτολις], "destroyer of ships," "destroyer of men," "destroyer of cities," *Agamemnon,* 687–90) to Ronsard ("Her Greek name comes from ravish, kill, pillage, carry off," *Sonnets pour Hélène*, 2.9). The orator restores order in the *kosmos*, he restores *logismon* [λογισμόν] in the *logos*, and he is going to prove that Helen is an object to be praised, and not, as she has been since Homer, one to be blamed. The eulogy is thus based on the consensus implied in the first lines in order to recreate a new and, so to speak, contra-consensual consensus in the following lines. And that is exactly what happened: Gorgias launched into the world a new Helen who, through Isocrates and Euripides and on to Hofmannsthal, Offenbach, Claudel, and Giraudoux, is innocent and praiseworthy.

The *Encomium of Helen* thus illuminates two characteristics of eulogy in general. The first characteristic is that every eulogy that moves within the *doxa*, that manipulates the latter and the commonplace, is nonetheless, either virtually or in actuality, as here, paradoxical. It is the whole plan of the *Encomium of Helen*, codified as a norm in rhetorical manuals, that leads to this contradiction: the speaker praises her family line, her beauty, her qualities, and tells what she has done—or rather, since she is a woman, what she suffered: Helen is not guilty because she has nothing to do with the misfortunes and disasters, all of which were the result of divine decrees, men's violence, and the power of the discourses that forced her to do what she did—as if developing culpability sufficed to produce innocence.

The second specific characteristic, whose connection with the first is clear, is that every eulogy is at the same time a eulogy of the *logos*, that is, it is ultimately a eulogy of the eulogy. Gorgias's *Encomium of Helen* is once again the first and supreme illustration of this. It is in fact on the very power of the *logos* that Helen's innocence finally depends: Helen seduced by Paris's words is not guilty, for words are, literally, irresistible. This time we have to cite the whole passage:

(8) If what persuaded [Helen], deluded her mind, was speech, it is not difficult . . . to defend her against this accusation and to destroy the charge in this way: speech is a great sovereign which, by means of the smallest and most inconspicuous of bodies, achieves the most divine acts, for it has the power to end fear, produce joy, increase pity. I am going to show that this is in fact how it is. (9) And I shall have to show this to those who listen to me by also appealing to common opinion.

Then Gorgias analyzes the effects, in different areas of speech, and the deep causes of discursive tyranny, which are anchored in human temporality. In this way, he plays eulogy's game (*emon de paignion* [ἐμὸν δὲ παίγνιον], "my plaything," as the final words of the *Eulogy of Helen* bluntly put it), the game of this spectacle that is both codified and inventive, delivered by an orator who is playing with the consensus. "Appealing to opinion," taking banalities and accepted themes as his point of departure, Gorgias plays the *logos* to make them exist in a slightly different way, to produce them as different, to produce different ones. Or again: there is a moment in every eulogy where language overwhelms the object, where language performs a new object, where description and the commonplace open up. That is the moment of creation and, among other things, of the creation of values. It is also the moment of convergence between the criticism of ontology and the political institution.

C. *Apodeixis* and *epideixis*, language
   that shows and language that works

Epideixis differs essentially from *apodeixis* [ἀπόδειξις]. *Apodeixis* is showing "on the basis of" what is shown, drawing on the object to show, drawing the object from the object itself: demonstration that is logical, mathematical, but also, and primarily, philosophical, including first philosophy. "Apodictic" involves saying what is, what is there, what manifests itself, or making it appear, unveiling it, making it visible by means of the discursive medium. Martin Heidegger rightly emphasizes the sequence of Aristotle's use of apo-: *apo*-dictic (the "de-monstrative") is based on *apo*-phantic (the "declarative"), which in Aristotle designates the very essence of language. For Aristotle, as Heidegger stresses, referring particularly to chapters 1 to 6 in *De interpretatione*, "to say, *legein*, is *apophainesthai*, 'to make visible' [*phainesthai*] on the basis of the very thing spoken of [*apo*]": "In discourse [*apophansis*], so far as it is genuine, *what* is said is drawn *from* what the talk is about"; that is why "phenomenology means *apophainesthai ta phainomena*—to let that which shows itself be seen from itself in the very way in which it shows itself from itself" (*Sein und Zeit*, §7, pp. 32, 34, trans. McQuarrie, 56, 58).

■ See Box 2.

In the system of Aristotelian discourse, it is by opposition to *apodeixis*, which defines the "natural" relationship between word and thing, that we can understand the philosophically disturbing force of *epideixis*. Not only two discursive modalities but even two models of the world are opposed to each other: a physical model, in which it is a question of determining the principles of nature in accordance with demonstrations of truth (see TRUTH); and a cultural and political model, in which it is a question of performing, on occasion after occasion, the values in common that permit a city-state's constitution and ongoing consensus.

II. *Actus exercitus / actus significatus*

In the thirteenth century, the Latin expression *actus exercitus* (the act performed) was introduced into medieval Latin terminology in opposition to *actus significatus* (the act signified), in grammar as well as in logic. In both cases, the distinction made it possible to contrast, within language, simple or complex expressions that *signify* things, and those that make it possible to do something by means of language. In grammar, the initial question is that of completeness, since some utterances may be grammatically incomplete, and in particular lack a verb, the expression

Apodeixis in Aristotle

➤ ERSCHEINUNG

Apodeixis [ἀπόδειξις] is situated in two places in the Aristotelian corpus: within the *Analytics* and within the *Rhetoric*.

Apodeixis and apodictic science constitute the very object of the *Analytics*, as is shown by its very first lines (*Prior Analytics,* 1.1, 24a11). Unlike the dialectical syllogism, which starts from accepted ideas (see DOXA), thus operating with probable premises, and the rhetorical enthymeme, which is never more than an abbreviated rhetorical syllogism, the domain of *apodeixis* is truth: it starts from true premises that are self-evident or already demonstrated, and "shows the cause and the why" (*Posterior Analytics,* 1.24, 85b23–24). There could in fact be no science of the sensible particular as such, any more than of definition (*Metaphysics,* Z.15, 1039b28). But *apodeixis*, following induction (*epagôgê* [ἐπαγωγή]), see *Posterior Analytics,* 1.18, 81a40–b2), is precisely the procedure that makes the particular known qua universal, and makes it possible, for example, to deduce that because Socrates is a man, Socrates is mortal (ibid., esp. 86a5–10; cf. 1.11, 77a5–9). Aristotle's demonstration and his procedure of moving analytically from sensation to induction and then to deduction thus provide the schema for philosophical science,

in the perennial nature of its tradition, down to Hegelian phenomenology, which, like philosophical science, draws the contingent toward the necessary and extracts universal truth from the particular.

But *apodeixis* is not merely a procedure of transforming the phenomenon into a scientific object; it is also a technique of adhesion, and, in fact, the very heart of Aristotelian rhetoric.

Rhetoric deals essentially with three objects: the parts of the discourse and their order, proofs and their sources, and style properly so called. With regard to the parts of the discourse and their order, Aristotle opposes the ridiculous practice of proliferating divisions, retaining only two of them: "It is necessary to say the thing you are talking about, and to demonstrate it [*eipein . . . kai tout' apodeixai* (εἰπεῖν . . . καὶ τοῦτ' ἀποδεῖξαι)]" (*Rhetoric,* 3.13, 1414a31–32). The first part, which corresponds to the dialectical "problem" (*problêma* [πρόβλημα], "what is put forward," 36), Aristotle proposes to call *prothesis* [πρόθεσις], "proposition"; the second is *apodeixis* proper, which he proposes to call also *pistis* [πίστις], from a term that means indissolubly, on the subjective side, "faith," "belief," "adhesion," and, on

the objective side, "proof," "confirmation." Thus the analysis rejoins the main object of rhetoric: the classification of proofs, *pisteis* [πίστεις]. The great dividing line passes, we recall, between "extra-technical" proofs, which come from outside and which one has to know how to "use," such as testimonies, and "technical" proofs, which are provided by the rhetorical method and by the orator himself, and which he has to "discover" (*Rhetoric,* 1.2, 1355b35–39). The latter are themselves of three kinds: they are to be sought in the character of the orator (on the side of the sender, we might say), in the listener's dispositions (on the side of the receiver), or, finally, in the *logos* itself (thus in the message), "since it shows or seems to show" (1356a4). Thus *apodeixis* corresponds to proof par excellence, that which constitutes the very body of the *logos* qua rhetoric.

Art imitates nature and "partly completes what nature cannot bring to a finish" (Aristotle, *Physics,* 2.8, 199a17–18). Scientific demonstration and the system of rhetorical proof imitate nature and complete it insofar as they help the phenomenon to manifest itself, beyond its immediate apprehension, as true, universal, persuasive: they help us understand it and believe in it.

of the act, because they do not signify the act, but perform it. In logic, reflection bears on quantifiers and other logical terms that do not have a referent, that is, they do not refer to a thing or a concept, but have a function in the utterance by "acting" on the full terms. The notion of *actus exercitus* thus enabled thinkers to analyze, as in modern theories of speech acts, utterances that serve to act (counting, blessing, etc., in the examples below), in the framework of a theory of syntactical-grammatical completeness that is not based simply on formal criteria (grammaticality), but also on taking into account the speaker's intention to signify. Moreover (and this point is just as interesting in relation to contemporary thought), it enabled thinkers to include the emotive dimension of language in a new way, since it never converged, in the Middle Ages, with what had been said about it in the rhetorical tradition. It is interesting that the same notion enables us to analyze both utterances that are not assertive but performative, characterizing expressions that serve to carry out logical or linguistic operations (quantification, ostension, *deixis*, etc.), and utterances that, like interjections or verbal moods, are used to express non-conceptual mental states or affects, such as pain, hope, desire, and so on.

A. *Actus exercitus* and speech acts

The distinction between *actus exercitus* and *actus significatus* was introduced in the context of thirteenth-century grammarians' discussions of the completeness of utterances, more precisely in the commentaries on Priscian's *Institutiones*. Priscian says (*Institutiones grammaticae,* 17.10) that an adverb, *bene*, can have the value of a complete utterance if it is understood as "joined" either to an act previously carried out or to a previously made statement. Some authors glossed this passage by saying that the adverb can be referred either to an "act carried out"—for example, when one says "good," on seeing a master strike a pupil, the adverb would be the determinant of the act being carried out—or to an act signified by a verb. But in addition, we find, on the basis of the same example, a much more interesting use, which should be compared with the modern notion of a speech act. In the case of the master striking the pupil, the adverb not only helps to determine an unexpressed act (on the order of an ellipsis that could be constituted as the utterance "I think you are striking well," or "What you are doing is good," etc.), it can itself have the value of performing an act, because the utterance is tantamount to an encouragement to the person who is performing the act to continue to do so. Thus these two meanings of the expression *actus exercitus* are very different. Where the second is concerned, we can analyze many utterances that are considered to be complete even without a verb: they do not need an expressed verb that would express an act signified (*actus significatus*) because they constitute an "act performed" (*actus exercitus*); they are said to be "complete in relation to the act performed." Among these, we find examples of liturgical utterances such as "In the name of the Father, the Son, and the Holy Ghost," through which, says an anonymous grammarian, "I perform benediction": thus the act that is performed does not need to be signified.

There are two types of utterance. Through the first, we state something about another thing, such as "Socrates runs"; this type requires a verb to be complete. Through the second kind of utterance, something is done [*per quam aliquid exercetur*], as when one says "One, two, three" (an utterance, as is said elsewhere, that does not serve to signify the act of counting, but that enables the speaker to perform it); this utterance does not need an expressed verb, and it is made complete in the act performed: one does not need to say "I count one."

(Marbais, *Tractatus de constructione*)

The person counting does not intend to say something about numbers, or to designate himself as counting, but only to act by counting, says another author, with regard to the same example. The grammarians seek to provide a typology of the different kinds of act performed by distinguishing their formal properties. We will note here only two points.

First, utterances that are "complete in accord with the act performed" are not elliptical utterances: the latter are incomplete formally, but what is missing can always be expressed vocally (thus, if to the question "What is the supreme good in life?" we respond, "Dignity," the latter expression is a complete utterance in which, by anaphora, what is missing can be restored). This is not the case when an act is performed, as is indicated very clearly by the rule: "No word that performs an act of any kind is constructed with it, in fact *ecce* [behold] is not constructed with the act of designation, nor is the copulative or disjunctive conjunction constructed with the act of coordination or disjunction, nor *omnis* [everything] with the act of distribution. This would amount to a useless [*nugatio*] repetition and would not be comprehensible": it is a useless repetition because the same act would be both signified and performed.

Second, an important distinction that is very close to the one made by modern thinkers is introduced to distinguish between what might be called conventional and unconventional speech acts. In the first case, the acts "performed" are possible by virtue of the syntactical-semantic properties of expressions (*ex vi sermonis*); this is notably the case of vocative adverbs (*o!* to call someone), demonstratives (*ecce!* [here!] to show something), and interjections (*vae!* [woe!] to deplore something). In the second case, an act is performed by means of a given expression, solely because the speaker (*proferens*) intends to use the expression for that purpose, without it being particularly meant to have that function. A common and especially significant example is the expression *Aqua!* This noun, by itself, can be considered a complete utterance only because someone, in a particular situation where a fire has broken out, decides to use it to ask that someone get water. The notion of the speaker's intention to signify (*intentio proferentis*) is essential here: not only is such an utterance, even if it is not canonical (because it does not include a subject and a verb), totally acceptable, complete, and interpretable, but above all, it is much more adequate to expressing the intended sense (*intellectus intentus*) because through its very form it renders so clearly the urgency of the situation and the speaker's emotion or panic. Some authors qualify these utterances as "enclitic," perhaps because, like the particles designated by the same term that are not autonomous but require

attachment to a principal word, such utterances can exist only when uttered and interpreted in a particular situation. This theory of the *actus exercitus* was developed chiefly among grammarians who accorded an essential place to the notion of intending to signify in the analysis of the formal properties of utterances. Among the Modists (second half of the twelfth century), who refused to take the speaker or the situation into account in order to arrive at a system of description that would be universal and thus scientific, the notion of *actus exercitus* was adopted only in the case of the vocative, which is the "term of the act performed" (e.g., *O Henrice!*—the noun is the end of the act of vocation carried out by the interjection), by opposition to the accusative, which is the "end of the act signified" (e.g., "I see a book": the noun is the end of the act of seeing).

B. *Actus exercitus* and logical operations

In logic, in the analysis of logical operators or signs of function, we find the same idea: that some constituents of language do not signify something but do something. Just as we say that the adverb *ecce* serves to perform *deixis*, we can say that "not" serves to perform negation, or *omnis* distribution, and not that they *signify* these operations (which the corresponding verbs or nouns--respectively, *negatio, negare*, or *distributio, distribuere*—are supposed to do). Logicians who adopt this analysis can thus distinguish very clearly between two types of expression: categorematic expressions, which are signs of things, and syncategorematic expressions, which are signs of mental operations. Other schools, seeking to attribute a type of signification to the latter (for example, by saying that they signify "relations between things"), obscure the distinction.

The distinction between *actus exercitus* and *actus significatus* should be compared with another distinction, used by grammarians and logicians, between expressions that signify in the way of a feeling (*per modum affectus*) and those that signify in the way of a concept (*per modum conceptus*) (see CONCEPTUS). The Parisian tradition of medieval logic tends to maintain that logical operations are "performed" by terms such as *non* or *omnis*, whereas the Oxford tradition opposes this view, emphasizing the idea that it is the speaker who performs these operations qua "principal agent," these signs being no more than the "instruments" of acts:

> Just as man or the soul is the principal agent in the operation of negation [est principale agens in operatione negandi] and the word "non" the instrument, in the same way a person who is beating someone with a stick is the principal agent of the act of beating, and the stick is the instrument; similarly, man or the soul is the principal agent in the distribution of the subject, and "all" is the instrument.
>
> (Bacon, *Summa de sophismatibus et distinctionibus*, 153–54)

Logical operations are "acts of the reason" that correspond to affects: for example, if I take two simple expressions that are mutually incompatible, I am affected by their disagreement, and I use the word "not" to express this disagreement ("This table is not square"). There are other

affects that are also rendered by signifying expressions "in the mode of affect." Thus a disagreeable event that causes pain might be signified either in the mode of the concept ("I am suffering") or in the mode of pure affect ("Ow!"), or in an intermediary fashion, which is that of the interjection. (Authors differ in an interesting way concerning whether interjections signify a concept in the mode of affect, or an affect in the mode of the concept, the latter position being based on the conventional nature of interjections and their variability from language to language, which distinguishes them from exclamations, whereas the former seems to flow from their imperfect form, notably with respect to their pronunciation, which allows individual variations.) The relations between this "signification in the mode of affect" and expressions that allow us to perform an act are complex and theorized in different ways; the question is in particular whether these speech acts belong, qua "acts," to the sensitive faculty (which controls the emotions, the will, and thus action), or on the contrary to the rational faculty, insofar as they are realized by means of "language."

Furthermore, in logic, the distinction between a "signified act" and a "performed act" takes on a somewhat different but related value. Thus for William of Ockham, the copula is the sign of an act of the mind, the act that consists in predicating the concept of the subject with the concept of the predicate. The verb "predicate," and other verbs of the same kind ("verify," etc.), serve to "signify" the act that is "performed" by the copula. In "homo est animal," the predication is an *actus exercitus* and concerns particulars denoted by the subject and the predicate (taken in personal *suppositio*), whereas in "animal praedicatur de homine," the predication is an *actus significatus*, and concerns concepts (the terms being taken in simple *suppositio*). Ockham uses this distinction to explain the true sense of ambiguous or philosophically dubious propositions. Propositions whose terms seem to refer to universals (e.g., "homo est risibilis," "man is capable of laughter") are reformulated as predications of a superior type that can then be connected with the corresponding predication or predications "performed," whose terms denote only individuals (see PREDICATION and UNIVERSALS).

The distinction between *actus significatus* and *actus exercitus* was also used in the analysis of the paradoxes of self-reference, notably the liar paradox. In a proposition like "What I say is false" ("ego dico falsum"), there is a tension between what is "signified" and what is "performed," because the assertive content of the action is determined by the attribute "false" at the same time that the action is actually realized by uttering the proposition.

III. Speech Acts and Sacramental Theology

In the Middle Ages, reflections on speech acts are particularly developed in the area of sacramental theology. The very definition of a sacrament, "sacramentum id efficit quod significat/figurat" (the sacrament does what it signifies), is particularly explicit. The sacrament is a sign that has a twofold value, "cognitive" and "operative" or "factive," because it simultaneously signifies grace and confers it. Since it is composed of a matter (e.g., baptismal water) and a form (the formula "I baptize you," etc.), the question was what in

this formula allows it to be efficacious—a question that is not independent of those raised in relation to magic formulas. The operativity of sacramental formulas was perceived by medieval theologicans as being dependent on a set of intrinsically connected factors: the formula itself (reflections on its constituents, the modes of the verbs, the enunciative markers), its meaning and its institution, the speaker (discussions of the role of the priest, the utterer of the formula, the agent in relation to the conferral of the sacrament, but not in relation to its effect), the intention to signify on the part of the priest and of those who receive the sacrament, and the situation (other elements of the sacramental rite). These reflections led to a clear perception of the distinction between constative utterances, called "cognitive" (*cognitiva, significativa*) and "operative" (*factiva, operativa*) utterances. Theologians were led to inquire into the characteristics of the latter, noting that they were not necessarily different in their form (we see the importance of the first person in some formulas, such as that of baptism, but "This is my body" is assertive in form), reflecting on the relative role played, in order to confer on them this operative character, the intention of the person who established these formulas, the intention of the person who utters them (the priest), and the intention of the person who receives them. The assertive form of the Eucharistic formula aroused discussions regarding the different truth-values of cognitive and operative utterances. Cognitive utterances are, as Thomas Aquinas says so well, true in relation to a state of affairs that preexists them, unlike operative utterances, which, by being pronounced, create this state of affairs. Duns Scotus, against the tradition of the thirteenth century, refused to think that the Eucharistic formula needed to be true in order to be operative, maintaining instead that it must first act before it becomes true through the transformation of the bread into the body of Christ. The distinction between "signified" and "performed," which is used to describe either the acts carried out by means of language, or linguistic or logical operations like quantification, is used in this context and applied to the *deixis* that is realized by the subject pronoun *hoc* (this) in the formula of Eucharistic consecration, "hoc est corpus meum" (This is my body). There are in fact numerous discussions of the interpretation of the deictic: according to some thinkers, it is reported speech, so that the priest is merely repeating Christ's words, and the *deixis* (*demonstratio*) is said *ut concepta* or *ut significata*; according to others, the priest actually shows the bread while uttering the formula (leading to difficulties in understanding how the proposition can at that point be true, since it is false that "this bread is the body of Christ"), and the *deixis* is said *ut exercita*.

There are other domains in medieval theology in which reflections on speech acts are carried on, but sacramental theology is peculiar in that there analyses take an eminently technical form, using the tools provided by the logic and grammar of the time. In different contexts, it is acknowledged that certain utterances make it possible to act on the world, to transform it, even to create it ("fiat lux"), or again, to act on others (e.g., prayers, praise, making vows, insults, and so on). Reflections on promises and oaths are particularly interesting: on the basis of the idea of "obligation," which is of juridical origin, the difference between,

for example, a promise and an ordinary utterance is clearly perceived. Duns Scotus emphasizes the distinction between "assertatory judgments" and the "promissory judgments" that oblige them to "make the truth be," that is, to act so that what they say becomes real. In the case of promises and oaths, as in that of sacramental formulas, opinions differ regarding whether the operativity of such utterances and their obligatory value have to do more with the speaker's intention or with the conventional content of the expressions actually uttered, a distinction that corresponds to that made by modern thinkers between "speaker's meaning" and "conventional meaning." We see that here, the moral dimension of the speech act is foreshadowed, as is shown, moreover, by treatises on the "sins of the tongue" (see TRUTH, IV).

IV. "Speech Acts," "Perform"

To properly understand the novelty constituted by the "speech act," we have to resituate it in its context: the invention of this new vocabulary enables us to account for unperceived linguistic phenomena and to mount a definitive challenge to the propositional model.

A. Language turn / linguistic turn

The contemporary problematics of speech acts has its origin, curiously, in the distinction between sense and nonsense, which is constitutive of the paradigm of analytic philosophy and was challenged by Austin (see NONSENSE). At first, analytical philosophy excluded certain judgments (such as moral judgments) from the field of language. According to either the criteria of Ludwig Wittgenstein's *Tractatus Logico-Philosophicus* (the proposition as a state of affairs) or those Moritz Schlick and Rudolf Carnap derived from it (empirical meaning), ethical or normative utterances are without meaning, and thus say nothing. Ethical propositions, for example, are nonsense, Wittgenstein says in the *Tractatus* (6.42, 67.421–22), insofar as one cannot draw factual descriptions from value utterances (6.41). Thus ethics is outside the world; this is what Wittgenstein calls its transcendental character, in a derivation from the Kantian term that became influential in contemporary Anglo-Saxon philosophy. The dichotomy between fact and value, world and morality, which determines the nonsense of ethical propositions, is a central element in early analytical philosophy. It is this dichtomy that defines the first "linguistic turn"—here we will call it a "language turn" rather than a "linguistic turn" because the point is to determine (by *The Bounds of Sense*, to borrow P. F. Strawson's famous title) the limits of language and thus to outline those of philosophy.

Ethics and value are excluded from the domain of facts, and thus from the domain of language—of language that has meaning, and is thus verifiable. Only a second "turn"—this time not in language but in linguistics—could reintroduce questions of value into questions of language, and reopen the field of language. The first turn did not in fact alter the Aristotelian criterion of truth: sentences are either true or false (in conformity with the reality of things or denying it), or they are nonsensical (outside language). Meaning is thus inseparable from truth understood in the classic sense of "correspondence." Philosophy has only to clarify ordinary language by eliminating the nonsense (metaphysical,

normative, semantically deviant, paradoxical) that its unverified use can elicit. Starting in the 1920s, analytical philosophy gradually tried to "legitimate" nonsense, first maintaining the framework of the first analysis, and then simply exploding it: this is the "second analysis," that of the second linguistic turn.

B. The invention of speech acts

In a book published in 1923, *The Meaning of Meaning*, C. K. Ogden and I. A. Richards took the first step toward the second turn. They proposed an "emotive theory of ethics," adopted notably by A. J. Ayer: the concept of "good," if we consider that it is not the sum of its empirical determinations or of the various uses of the word, is "unique and unanalyzable." The specifically ethical use of the word "good" is thus supposed to be "purely emotive" (125), that is, it refers to no empirical datum and expresses only our emotive attitude toward the object we say is "good." This theory, though vague, has a twofold interest: it allows us to discern two rival functions in language, the symbolic function and the emotive function. The symbolic function is descriptive (statement), the emotive function is "the use of words to express and induce feelings or attitudes." Language is no longer envisaged in its cognitive dimension, but in its meaning: Ogden and Richards explicitly play on the multiple uses of the word "meaning"—linguistic signification and the intention of discourse (see SENSE, V.B.2).

Ogden and Richards, in their emotivist theory, also called noncognitivist, in fact remained close to the positivist project, whose divisions (cognitive/metaphysical) they replicated. There are similarities between their theory and Rudolf Carnap's description of the *Lebensgefühl* in "The Elimination of Metaphysics," where he asserts that the metaphysician is a musician or a poet without artistic talent (176–77). To be sure, as François Recanati says, "with the emotive theory of ethics, the domain of the non-cognitive recovered all the dignity it had lost" (Austin, *How to Do Things with Words*, postface). But this is still on the condition of being excluded from language (because it is nondiscursive). There remains another possibility: extending the boundaries of language, so as to make language itself an act. It is in this perspective that we must situate Austin's invention of performatives. His first texts deal with meaning, or rather, with the right way of raising the question of meaning. The question, "What is the meaning of a word?" was asked by Wittgenstein in the first words of the *Blue Book*. The meaning of an utterance, according to Wittgenstein, is its use ("meaning is use"). But Austin carried this idea to its logical conclusion. The use of language being founded—like any institutionalized human activity—on rules, and thus being normative in essence, it is language itself, in all its functions, that will be invested by what was, in early analytical philosophy, the order of nonsense.

Austin is the inventor of the theory of speech acts, even if the expression "speech act" is John Searle's. To understand his point of view, we have to see, for example, that moral judgments are speech acts: "It is not good to lie" and "It's cold" (said to someone who has left a window open) are each, in one way or another, utterances of blame, that is, moral acts, and not merely utterances that describe something—neither an empirical state of affairs, nor the taking of an "emotive" or psychological position regarding a state of affairs. Austin's most remarkable discovery is that speech acts are part of language and even represent the essence of language. His theory does not limit itself to inverting (as Ogden and Richards did) logical empiricism's act of drawing a dividing line between the sayable and the nonsayable, between sense and nonsense: it radicalizes it by extending the field of language and thus redefining what we mean by "language."

Let us recall Austin's point of departure, in the first lecture of *How to Do Things with Words*, the definition of performative utterances. Austin says he is beginning from a commonplace observation, but one to which attention has not yet been specifically been given. "It was for too long the assumption of philosophers that the business of a 'statement' can only be to 'describe' some state of affairs, or to 'state some fact,' which it must do either truly or falsely." Then, he goes on, philosophers showed (not without a certain dogmatism, unfortunately) that many statements were only pseudo-statements. Moreover, he suggests, one might classify more subtly the various types of nonsense. (That is practically what Carnap does in "The Elimination of Metaphysics.") But one must ask, "as a second stage," whether what has been taken for nonsense might be in some way a statement and thus reintegrated into the analysis of language.

We see that in the modern period, it is ultimately only with Austin that there is a break with the Aristotelian schema of language as apophantic, having as its primary task to describe the world as it is, and thus also with the model of the statement as description and with the concept of truth associated with it. There can be not only an act of uttering, but also an utterance (something said), without a state of affairs being described, and—this is the main discovery of ordinary language philosophy, and the center of the theory of performatives—without moving beyond the limits of language and the domain of truth. Thus not only the schema of description, but also that of signification and of the proposition, is put in question: the very idea of semantics.

However, Edmund Husserl, at the end of his sixth *Logical Investigation*, had already intuited the problem: he raises the question of the

> seemingly trivial, but, correctly regarded, most important and difficult point at issue whether the familiar grammatical forms used in our speech for wishes, questions, voluntary intentions—acts, generally speaking, we do not class as "objectifying" [*objektivierende Akten*]—are to be regarded as *judgments* concerning our acts, or whether these acts themselves, and not merely such as are "objectifying," can function as "expressed" [*ausgedrückte Akten*], whether in a sense-giving or sense-fulfilling fashion.

> (*Logical Investigations*, 2:9 §68)

In fact, sentences like "May Heaven help us!" and "Frank should take care of himself" (examples given by Husserl), being neither true nor false, should not even be statements, because, Husserl says, citing Bolzano, they say nothing *about their subject*, "but nonetheless they say something."

Here, Husserl is raising the philosophical problem specific to the very idea of a speech act, for since these utterances

constituted by questions, expressions of desire, or commands—and blame—cannot be qualified as true or false, there must be a different way of qualifying them, and this forces us to abandon truth for veracity (or verdictiveness—*Wahrhaftigkeit: Logical Investigations*), if one wants these utterances to be part of language—and that other way of qualifying them is just what a theory of "speech acts" seeks to provide.

C. Performativity and approval

But how can an act be true or false? Austin proposes to replace the true/false opposition with an opposition between felicity and infelicity: a performative (e.g., a promise) is infelicitous, failed, if it is not accomplished under the right conditions, which Austin describes and classifies (for example, if I do not intend to keep my promise, or I am not entitled to perform the act). To be sure, one of Austin's ideas is to destroy what he calls "(1) the true-false fetish and (2) the fact-value fetish." But destroying them does not imply abandoning the concept of truth, only transforming it, enlarging it in order to be able to apply it to the new types of expression thus discovered:

> [My] doctrine is quite different from much that the pragmatists have said, to the effect that the true is what works, &c. The truth or falsity of a statement depends not merely on the meanings of words but on what act you were performing in what circumstances.

> (Austin, *How to Do Things with Words*, 145)

"False is not necessarily used of statements only," Austin says at the end of his first lecture. And in his twelfth and last lecture, he describes the status of illocutionary acts, of which "state" is one:

> The following morals are among those I wanted to suggest:
>
> a. The total speech act in the total speech situation is the *only actual* phenomenon which, in the last resort, we are engaged in elucidating.
> b. Stating, describing, &c., are *just two* names among a very great many others for illocutionary acts; they have no unique position.
> c. In particular, they have no unique position over the matter of being related to facts in a unique way called being true or false, because truth and falsity are (except by an artificial abstraction which is always possible and legitimate for certain purposes) not names for relations, qualities, or what not, but for a dimension of assessment.

> (Austin, *How to Do Things with Words*, 148–49)

In short, it is language as a whole that is in question: if, as Austin has shown in his series of lectures, there exist speech acts, language is no longer merely descriptive ("objectivizing," to adopt Husserl's expression), it is action: "*By* saying, *in* saying something, we are doing something" (*How to Do Things with Words*, 12). But then truth is no longer adequation (between the description and the state of affairs), it is also an *act*, and an *approval*. That is what Austin has in mind when, cleverly parodying logicians, he replaces "truth" with "satisfaction" (see Quine, *Philosophy of Logic*: "Truth is the limiting case of satisfaction"; for example, chap. 3). Approval and blame are thus speech acts "with moral bearing" among others: they represent and sum up the normative or ethical dimension of language. The very use of language and learning it are based on blame (the rejection of what I say as inadequate) and approval (the acceptance of what I say as satisfying the norms of the linguistic community). That is what Wittgenstein meant when he defined, in the *Philosophical Investigations*, language learning as a search for the approval of elders: "Here the teaching of language is not explanation, but training" ("Das Lehren der Sprache ist hier kein Erklären, sondern ein Abrichten," §5).

D. "Performative [utterance]," "intention," "speech act"

We might be tempted to say that a performative (for example, a promise) expresses an *intention* that could be defined or explained outside the field of language (what has been called, following Grice and Searle, a "communicative act") as if to accomplish a speech act were ultimately to express an intention. Austin himself guarded against any "intentionalist" interpretation of his theory of speech acts, because for him such an interpretation would be not only erroneous but also immoral. To say that the performative expresses an intention is to reduce it to the descriptive, and thus to destroy all of Austin's work; but it is also the end of all morality, for if in promising, for example, my promise does not commit me to anything (it is simply mistaken description of an internal action), then

> it is but a short step to go on to believe or to assume without realizing that for many purposes the outward utterance is a description, *true or false*, of the occurrence of the inward performance. The classic expression of this idea is to be found in the *Hippolytus* (l. 612), where Hippolytus says . . . "My tongue swore to, but my heart (or mind or other backstage artiste) did not." . . . It is gratifying to observe in this very example how an excess of profundity, or rather solemnity, at once paves the way for immorality. For one who says "promising is not merely a matter of uttering words! It is an inward and spiritual act!" is apt to appear as a solid moralist standing out against a generation of superficial theorizers. . . . Yet he provides Hippolytus with a let-out, the bigamist with an excuse for his "I do" and the welsher with a defence for his "I bet." Accuracy and morality alike are on the side of plain saying that *our word is our bond*.

> (Austin, *How to Do Things with Words*, 9–10)

Despite Austin's warning, the intentionalist interpretation of speech acts has gained great influence. Its fecundity is connected with the generalization of the theory of speech acts and with the transition made by Searle from the performative utterance to the speech act (which French translators, thus reinforcing Searle's generalization, have chosen to render as "acte de langage" rather than "acte de parole").

■ See Box 3.

E. "Perform," "performance"

Austin's invention of performatives has brought out certain characteristics of the verb "perform" (which has no equivalent in French). The specific and philosophically interesting characteristics of performatives are in fact inseparable from

3

"Speech act": *Acte de langage / acte de parole*?

Unlike Austin, Searle refers to the Saussurean distinction between *langue* and *parole*, emphasizing the idea that speech acts are fully part of language: "An adequate study of speech acts is a study of *langue*" (*Speech Acts*, 17).

Searle uses the French term *langue*, which he thus considers untranslatable. It is remarkable that here Searle returns to the Saussurean distinction to extend Austin's theory, and it is no less remarkable that French translators of *Speech Acts* use this distinction to justify their translation of "speech acts" by *actes de langage* (notably in Ducrot's introduction to the French edition of Searle's work), long before the passage in which Searle mentions Saussure. However, we may wonder about the translation of some passages—such as the one in which Searle says: "Speaking a language is performing speech acts" (16).

The French translation, "Parler une langue, c'est réaliser des actes de langage," erases the obvious connection between "speaking" and "speech," and transfers the parallel to "language" (*langue*) and "speech" (*langage*). For Ducrot, "speech acts" would thus have been just as well translated *actes de langue*, this translation being impossible only because it is ridiculous. But it might also seem unwise to appeal to Saussure in introducing the word *langage*, even if the latter is understood as *langue*, in a context in which there is much discussion of "language" in a sense that is not necessarily Saussurean.

It is clear that the translation *actes de langage* is partly justified by Searle's theory, which extends the speech act to the statement, to reference, and to predication: "Speaking a language is performing speech acts, acts such as making statements, giving commands, asking questions, making promises, and so on; and more abstractly, acts such as referring and predicating" (16).

But why immediately choose this translation, when Searle, in the same passage, speaks of "linguistic acts," which, in the French translation, thus seem oddly differentiated from *actes de langage* (speech acts), a more specific category? It is true that in French, "linguistic" is often translated by *linguistique*, whereas a more precise translation would be *langagier* (see IV.A here, on "the linguistic turn"). Moreover, in his book, Searle repeatedly stresses his "theory of language," which is thus artificially associated by the translation with "speech acts": to be sure, his philosophy of language is in fact a theory of speech acts, but that is what the book is to demonstrate, and the translation by *actes de langage* "begs the question," as Hume would say.

This translation, though justified in theory, is inadequate in practice and forced in the details of the text. However, theoretical validity wins out here, as is shown by the generalization, in linguistics and philosophy of language in France, of the expression *actes de langage*, which is certainly more easily assimilated by the French tradition. But doesn't this obvious fact rest on a misunderstanding?

BIBLIOGRAPHY

Searle, John. *Speech Acts*. London: Cambridge University Press, 1969. French translation by Hélène Pauchard: *Les actes de langage: Essai de philosophie du langage*. Paris: Hermann, 1972. 2nd ed. published in 2009.

this verb, which, Austin says, is "the usual verb with the noun 'action'" (*How to Do Things with Words*, 6). The performative utterance is used, not to describe an action, but to carry it out. The verb "perform" indicates an act. But this act is inseparable from the action itself; it is a "function" of the action, not one of its consequences (as would be, for instance, hurting someone by doing something). In this sense, "perform" is associated more with the notion of "act" than with that of "action" (and Austin's terminology recognizes this) and is particularly well adapted to the speech act. The difference between "perform" and *effectuer* or *accomplir*, its usual French translations, has to do with the pair *perform/performance*, performance being the act itself considered from a triple point of view: (1) its temporal development (cf. the progressive "the performing of an action"); (2) its achievement, its completion (see German *vollziehen*, which often translates "perform"); and (3) its success: if Austinian performatives may be felicitous or infelicitous, it is by reference to this aspect of every "performance." This triple dimension, which we also find, in a slightly different combination, in the word "achievement," sometimes makes the word particularly difficult to translate, as in this concluding passage in Cavell's "An Audience for Philosophy": "There is an audience of philosophy; but there also, while it lasts, is its performance" (*Must We Mean What We Say?* xxix)—performance being conceived simultaneously as activity, duration, accomplishment, and success.

SPANISH   *esplín*

➤ *MALAISE*, and ACEDIA, ANXIETY, DOR, FEELING, GEFÜHL, GENIUS, INGENIUM, MADNESS, MELANCHOLY, *NOSTALGIA*, PATHOS, SAUDADE, SEHNSUCHT

Among the terms in European languages that have their origin in Greek *splên* [σπλήν], the English word "spleen" designates a moral sentiment and almost a style, the modern offspring of *acedia* and "melancholy." Its history takes one from the narrowly physical level to a psychological and moral semiology, opening on to a "malaise," the veritable symptom of a pathology of the culture, the spleen that accompanies modernization.

Splên [σπλήν] designates in Greek the organ of that name that is the seat of the humors necessary for the equilibrium of the body as a whole and, in the plural (*splenes* [σπλῆνες]), suffering of the spleen, hypochondria (RT: *Dictionnaire grec français*, s.v.; cf. the verb *spleniao* [σπληνιάω]). Its lexical neighbor *splagchna* [σπλάγχνα] designates entrails (of victims that one eats and examines in order to prophesy), the essential viscera of human survival (heart, liver, kidneys, lungs), thus also the heart or soul as seat of the affections and of character, and even the maternal breast (RT: *Dictionnaire grec français*, s.v.). In the Greek of the New Testament, *splagchna*, "heart," gave birth to *splagchna* (exceptionally *splagchnon* [σπλάγχνον]), "pity" (RT: *Dictionnaire étymologique de la langue grecque*, s.v. *splên*). In Spanish, the Academy of that language recognizes the claim of the form *esplín*, a rarity allowing one to connect with the English "spleen" and, above all, to underscore the Greco-Latin origin of this lexical field: thus did there surface, around 1740 (according to RT: *Diccionario de autoridades*) the term *splénico*, which, along with the use of *esplenetic* in Catalan and *esplenético* in Castillian, allows one to link this usage to the *esplén* of the Middle Ages.

The humor of the ancients, that produced by the spleen, is one of those "liquors nourished, maintained, and belonging to the physical condition, such as, in humans, blood, choler, phlegm, and bile, as well as excremental elements like urine,

sweat, etc." (RT: *Diccionario de autoridades*). These humors are the product of the initial transformation of the meal (according to Avicenna, "[they are] a humid and liquid substance into which food is first converted"; RT: *Diccionario de autoridades*). An abundance of one of these humors governs the external manifestations of what becomes *genius*, a "condition" or "nature," that is, the basic temperament of each individual that can and should only be controlled: "Buen humor por vida mia /se purga todos los años [a good humor, in faith, should be purged every year]" (Moreto, *El lego del Carmen*, first day).

I. Shakespearean "Spleen" and Power over Others

The properly psychological sense of "spleen" appears in the English baroque, where, by way of Shakespeare's genius, the notion receives its status as a sign of the soul as well as of a virtue or quality linked to the nobleman or warrior. Shakespeare plainly takes into account the physical sense, which stems from the ancient theory of humors: "spleen," in fact, designates not only the flow of tears or other external humors already evoked, but also the bodily seat of feelings that turn around "spleen." "Spleen" is a quality of young bodies ("Quicken'd with youthful spleen and warlike rage"; *Henry VI*, part I, act IV, scene 6) that clash with the nobility of the sages ("You charge not in your spleen a noble person"; *Henry VIII*, act I, scene 2). Its dependence in relation to the realm of nature (which can be said to be external, but which is metaphorical of the discovery of a dangerous inner nature) makes of the feeling called spleen something not human, but primitive and legendary that dominates the soul and its strength ("Inspire us with the spleen of fiery dragons!"; *Richard III*, act V, scene 3).

Shakespeare bases himself on the physical and pathological ground of the humors ("unto a mad-brain rudesby full of spleen"; *The Taming of the Shrew*, act III, scene 2), but he above all bears witness to a specific psychopathology of the era, which perceived its own struggles over power in the mirror of the classics, as in the case of Julius Caesar, who dies a victim of the play of "political secretions" ("You shall digest the venom of your spleen"; *Julius Caesar*, act IV, scene 3). The connection between the physical and the moral is represented by the difficult balance of the mythical figure of Eros ("conceived of spleen, and born of madness; that blind rascally boy that abuses every one's eyes because his own are out, let him be judge how deep I am in love"; *As You Like It*, act IV, scene 1). Its effects are also abhorred ("That in this spleen ridiculous, appears, / To check their folly, passions solemn tears"; *Love's Labor's Lost*, act V, scene 2).

But the idiosyncrasy of Shakespeare is above all a function of the moral and social stature that he accords to spleen: it is a source of power over others. Cardinal Wolsey declares to his lady, "Madam, you do me wrong; / I have no spleen against you, / nor injustice for you or any" (*Henry VIII*, act II, scene 4), in order to emphasize that respect for the law is the logical limit of spleen, whose injustice may be inevitable ("the unruly spleen"; *Romeo and Juliet*, act III, scene 1). And all the more so in that spleen is accompanied by arrogance and pride: "You sign your place and calling, in full seeming, / With meekness and humility; but your heart / Is cramm'd with arrogancy, spleen, and pride" (*Henry VIII*, act II, scene 4).

Spleen is the trump card of the conqueror: "spleen and fury" compose Alcibiades's self-portrait (*Timon of Athens*, act III, scene 5). And it is modern warfare—as in the wars of religion evoked by Montaigne in his *Journal du voyage en Italie*—that amplifies the excess of its anger: "with swifter spleen than powder can enforce" (*King John*, act II, scene 1). This kind of offense, which inevitably incites to revenge, appears, in *Henry VI*, as a formidable quality of soldiers ("That robb'd my soldiers of their heated spleen"; *Henry VI*, part III, act II, scene 1), but also, in *Henry VI*, as a fatal inclination ("A weasel hath not such a deal of spleen / As you are tossed with"; *Henry VI*, part I, act II, scene 3), dangerous because it can govern "a hair-brain'd Hotspur" (act V, scene 2). That force becomes accursed in *Richard III* (act II, scene 4): "and frantic pitrage, end thy damned spleen." But it is always endowed by an ambivalence perceived by those in spleen's possession (thus valorous Achilles sulking in his tent, who writhes with laughter when Patrocles imitates the aged Nestor: "Give me ribs of steel! I shall split all / In pleasure of my spleen"; *Troilus and Cressida*, act I, scene 3). This is why spleen can ultimately be an object of desire (*Twelfth Night*, act III, scene 2) and exploration (*Troilus and Cressida*, act II, scene 2).

II. Baudelairean "Spleen" and Modern Sentiment

"Spleen" would make a return in a sense that—like *esplín* in Spanish—the Academy would describe as "tragic humor" (Breton de Los Herreros) and which characterizes the heart of proto-consumerist urban sensibility. The meaning of "spleen" as a modern feeling, that is, as a relation to society and the epoch, a sentiment composed of indefinite distance and pain, is the work of Baudelaire. *Les Fleurs du Mal* and *Le Spleen de Paris* constitute, in fact, the necesssary points of bearing for understanding this pathology of the century. Furor and anger would henceforth be oriented toward a nonlogical order, aberrant in relation to the sentiments and projects of individuals, which constitutes at the same time—underscoring its ambivalence—the occasion for all the new experiences of an age that defined itself through the instant and the ephemeral. "Spleen" then became a lifestyle rather than a moral or esthetic sensation. It manifested itself as extravagance (*Verschrobenheit*), and modern activity, "spleening"—an activity to be cultivated and not a fate to be undergone—had the value of a slight case of madness (*leicht Verrückt*). It was a matter then of neither an isolated (or nocturnal) event nor an "extraordinary state," but of a genuine and generalized style of life dominated by overexcitement (in current German: *Überspanntheit*).

It is precisely that irritation or complaint without object that gives its coloration to Baudelairean "spleen" (*Les Fleurs du Mal*, LXXV, "Spleen") and which appears on the scene as "Pluviôse, irritated with the entire city," where the melancholy of pure loss is given substance. The state is, in fact, not elaborated in joy—as in Bataille, for whom laughter will overflow "spleen" in a maniacal skidding off course—but undergone in a fall or vertigo of the new time whose instantaneity overwhelms categories and careers alike. The "spleen" of the period of the arcades of the new commerce (Benjamin's *Passagen-werk*) and the Commune is a dialogue in which the ancien régime offers a plaint at being lost forever

("The handsome jack of hearts and the queen of spades / chat, sinister, about their defunct loves").

The internalization of the cultural crisis opens onto a representation of intimacy as a desolate space impossible to contemplate, except in distress or an indulgence clinically designated by the rubric masochism: "I am a cemetery abhorred by the moon / . . . I'm an old boudoir full of wilted roses" (*Les Fleurs du Mal*, LXXVI, "Spleen"). From this topology there comes knowledge of a new suspension of time—an eternal present that affords no possibility of creative life: "Ennui, fruit of a mournful lack of curiosity, / Takes on the proportions of immortality." Such is the profile of the new stroller in the showcase-city, endlessly searching for signs in order to fill the awareness he has of his inner emptiness and to attain some pretext for enthusiasm. This king who walks about without anyone realizing it, this new consumer-citizen bears within him the paradoxes of the changed style of production and of life: "I am like the king of a rainy country, Rich, but impotent, young and yet quite old." The new phantasmagoria that we are told about by the Marx of merchandise-fetishism allows us access to hidden, repressed presences. The subject of "spleening" sees himself invaded by these signs that he must learn to decipher.

SPRECHGESANG (GERMAN)

ENGLISH	spoken song
FRENCH	*mélodie parlée, parler-chanter*

➤ VOICE, and AESTHETICS, DICHTUNG, LOGOS, STIMMUNG, TO TRANSLATE

Arnold Schoenberg created the neologism *Sprechgesang* in 1912 for compositional and aesthetic purposes and to signify a new manner of writing for the voice. *Sprechgesang* opposes two verbs: *sprechen*, "to speak," and *singen*, "to sing," and designates a vocal technique as well as a way of conceptualizing the vocal in the twentieth century. It was in *Pierrot lunaire* (1912), a melodrama for instrumental ensemble and voice, that the compound term, which would pose considerable difficulties for interpreters as well as for theorists and composers, would be found for the first time. It should be noted that although *Sprechgesang* is used only in the field of music, it has contaminated the entirety of studies and research in the realm of aesthetics, particularly with regard to literature and poetry.

Several abortive attempts at transposition reveal that *Sprechgesang*, invented by Schoenberg to put a halt once and for all to the vocal aesthetic of *bel canto* prevalent between the

eighteenth and the end of the nineteenth centuries, constitutes a perfect case of untranslatability to the extent that the conjunction of speaking/singing in German has as a corollary that of vocalizing and vocality. Schoenberg's concern was not so much to fuse two categories of the *phônê* [φωνή] but to proceed in such manner that their fusion be representative of the transversal operations between questions of voice and variable forms of textuality and prosody. For Schoenberg the operation that consists in having a text sung is not necessarily dependent on a melodic musical structure. Voice calls for song, as though it were apostrophizing it, but the former is not necessarily dependent on the latter. Schoenberg regarded as trivial the reproach addressed to the composer of not doing justice to a text and "betraying" it vocally.

> When one has perceived this, it is also easy to understand that the outward correspondence between music and text, as exhibited in declamation, tempo, and dynamics, has but little to do with the inward correspondence, and belongs to the same stage of primitive imitation of nature as the copying of a model. Apparent superficial divergences can be necessary because of parallelism on a higher level. Therefore, the judgment on the basis of the text is just as reliable as the judgment of albumen according to the characteristics of carbon.

("The Relationship to the Text," in *Style and Idea*, 145)

Schoenberg sustained an atectonic ideal of the ambivalent relations between voice, song, and what he called in his *Berlin Diary*, 22 January 1912, "obligatory recitative." This is why *Pierrot lunaire* is the experimental site of an "unsayable" that, in the composer's mind, is to be, if possible, noted and interpreted by female speakers and not singers. The fusion of the inflections of the speaking and the singing voice is rooted in the theoretical premise that the voice is not a timbred entity with clearly defined contours. In *Sprechgesang* Schoenberg heard above all the irregularity of the vocal phenomenon, a skidding of one category over the other and, as a result, an abrupt aesthetic strangeness, the basis of a new harmony in which the sound of the voice is meaningful in itself. At the outset, Schoenberg noted in his preface to *Pierrot lunaire*, the task of the performer is "Maintaining the rhythm as accurately as if one were singing, i.e., with no more freedom than would be allowed with a singing melody; Becoming acutely aware of the difference between *singing tone* and *speaking tone* [emphasis in original]: singing tone unalterably stays on the pitch, whereas speaking tone gives the pitch but immediately leaves it again by falling or rising."

The expression *Sprechgesang* became a concept in its own right, affecting questions of declamation and textuality, beyond varieties of vocality put to work to declaim, say, speak, and sing the music of words. Such a matrix of musical writing, which renders intelligible not the words, assumed to undergo, vocally, mutations in diction, but the music itself, dislocates the homogeneity of the singing voice and pulverizes its lyric surface, the better to bring into relief the intermediary zones and limits of vocality. Schoenberg's project belongs to the hermeneutics of translation: in 1949, he himself, in a text titled "This Is My Fault" (*Style and Idea,* 145–47),

introduced the notion of translation to evoke the adventure of *Sprechgesang* at the time of *Pierrot lunaire*:

> In the preface to *Pierrot lunaire,* I had demanded that performers ought not to add illustrations and moods of their own derived from the text. In the epoch after the First World War, it was customary for composers to surpass me radically, even if they did not like my music. Thus when I had asked not to add external expression and illustration, they understood that expression and illustration were out, and that there should be no relation whatsoever to the text.

It is in the opposition between what Schoenberg designates by, on the one hand, the aesthetic and, on the other, the issue of craft that the question of translation inherent in the spoken and sung voice is to be understood.

SPREZZATURA

LATIN   *negligentia*

➤ *DÉSINVOLTURE*, and ART, BEAUTY, CIVILTÀ, GOÛT, *GRACE*, INGENIUM, LEGGIADRIA

The Italian word *sprezzatura*, which Baldassare Castiglione uses in his *Book of the Courtier* (1528), considering it as "new," characterizes a quality of the behavior required of the "courtier," that is, of man in his perfection according to the criteria defined by Castiglione, and falls under the rubric of the "je ne sais quoi." It has not, in fact, been absorbed into common usage and always refers to its specific literary origin.

> But having before now often considered whence this grace (*grazia*) springs, laying aside those men who have it by nature, I find one universal rule concerning it, which seems to me worth more in this matter than any other in all things human that are done and said: and that is to avoid affectation (*affettazione*) to the uttermost and as it were a very sharp and dangerous rock; and, to use possibly a new word, to practice in everything a certain *sprezzatura* that shall conceal design and show that what is done and said is done without effort and almost without thought.

(trans. Leonard Eckstein, *Opdycke*)

This sentence, which can be read in chapter 26 of the *Book of the Courtier*, introduced into world literature a word that is untranslatable par excellence. To understand the reasons for that impossibility, one must analyze the richness of the meanings included in the term, and the value that it has in

the work. The subject of the book is the joint quest, by certain members of the Court of Urbino at the beginning of the sixteenth century, for a definition of the "perfect courtier," the figure of the courtier being regarded as the very type of the ideal man. Now before even speaking in detail about the qualities that the courtier ought to know how to demonstrate in the various spheres of his existence, Castiglione posits from the outset a requirement that may seem a matter of mere form, but that nonetheless determines, in an absolute manner, the value of all the endeavors of the courtier, namely "grace" (*grazia*):

> The courtier must accompany his actions, gestures, habits, in short his every movement, with grace; and this you seem to regard as an universal seasoning, without which all other properties and good qualities are of little worth.

<div align="right">(ibid., chap. 24)</div>

The domain in which grace is exercised is immense, and it partakes of theology, metaphysics, and aesthetics; Castiglione extends the exercise of grace to the domain of manners. After acknowledging the "gratuity" of grace when it is a gift of nature, he endeavors to define the art through which it may be acquired, the "very universal rule" one must follow in order to give "to what one does or what one says" the "seasoning of grace" (*condimento de la grazia*). This attempt is paradoxical: it consists in attempting to obtain through art, through obedience to rules, what is given by nature. Grace thus results from a difficult labor, a "suffering," "a constant preoccupation, which must never appear to be such, but which effaces itself, conceals design, and shows that what is done and said is done without effort and almost without thought" (ibid.): to do so is to demonstrate what Castiglione calls "a certain *sprezzatura*." In the contrary case, when art, as a reflective and voluntary activity, allows itself to be too visible, the result is not attained, grace fails one, and one is dealing with "affectation," affectation being at once the opposite of *sprezzatura* and what is closest to it, what it risks lapsing into at every moment.

Ancient rhetoric had opened the way in this case for Castiglione, which should come as no surprise, since *The Book of the Courtier* can be considered as a treatise on rhetoric extending from the realm of discourse to that of social behavior in general. Cicero, in *On the Orator*, speaking of the "simple" or "Attic style," characterized by *quaedam neglegentia diligens* (a certain diligent negligence), compares it to the elegance of certain women "without affectation," and he adds that "in both cases one does something to have more grace (*gratia*), but without it appearing to be the case" (*On the Orator*, XXIII, 76–78).

The word *neglegentia* puts us on the track of *sprezzatura*, a term that, we should note, Castiglione presents in the definitive version of his work as "possibly a new word," whereas in a prior version he said that "it was, however, already accepted by us with this meaning." Whatever the case, the composition of the word and its literal meaning are clear. The noun comes from the verb *sprezzare* (in Latin, *expretiare*, from *pretium*, with the negative *es*) and denotes the attitude of one who "scorns," that is, who assigns "little price" or even "no price at all" to someone or something. The good

courtier is thus one who seems to accord no value, no importance to what he says and does, and never betrays the slightest effort. He feigns natural ease, spontaneity, and conceals work, effort expended, art. "Art is to conceal art" ("Ars est celare artem").

What word in French is capable of rendering all the nuances of *sprezzatura* (the difficulty, moreover, being the same in other languages)? Chappuis, one of the first translators, at the end of the sixteenth century, speaks of *mépris* (scorn) or *nonchalance*, but those terms, in modern French, have taken on a range that makes their use unsatisfactory. The first has too harsh a meaning, and the second (to be compared with *nonchaloir* [to take minimally into account]) is currently too marked by a pejorative nuance implying a lack of energy and softness. The same holds for *négligence*, from the Latin *neglegere* (not to be concerned with), which carries the excessive connotations of its first meaning in French of "forgetting one's duties, a failing or error, especially in the religious sphere" (RT: *DHLF*). One might propose, in current French, *désinvolture* (A. Pons). Castiglione does indeed speak at a certain point of *sprezzata desinvoltura*, but it should be acknowledged that the word *desinvoltura* does not transmit the "deprecatory" nuance of the etymology, and refers rather to the "disenvelopping" of manners, to their "disengaged" character.

The term *sprezzatura* has occasionally served, after Castiglione, to characterize within the aesthetic realm of mannerism, and particularly with regard to singing, a certain manner of taking one's distance in relation to the rules governing melody ("una certa sprezzatura di canto"). But if it continues to be used at present, it is always with explicit or implicit reference to Castiglione's book, with the result that the linguistic failure of the neologism is largely compensated for by the literary tribute paid to its "inventor."

STAND (TO), STANCE, STANDING

FRENCH	*se tenir, position, standing*
GERMAN	*stehen*

➤ *IDENTITY*, and ACTOR, BERUF, CONSCIOUSNESS, ENGLISH, I/ME/MYSELF, PERSON, STANDARD

English distinguishes clearly between qualitative identity, "sameness," which opts to identify several distinct entities as one and the same according to a given description, and an identificatory identity

based on a "map" or network of questions. This identificatory discourse is currently witnessing the development, around Charles Taylor's fundamental work *Sources of the Self* (1989), of an interrelated series of powerful and privileged terms linked to personal responsibility: with "to stand," "stance," and "standing," we are witnessing a repositioning of selfhood and, simultaneously, an elaboration of terms that the play of adverbs, prepositions, idioms, and metaphors in English makes particularly difficult to translate.

I. An Untranslatable in the Nascent State

At the beginning of *Sources of the Self*, Charles Taylor writes,

> To know who I am is a species of knowing where I stand. My identity is defined by the commitments and identifications which provide the frame or horizon within which I can try to determine from case to case what is good or valuable, or what ought to be done, or what I endorse or oppose. In other words it is the horizon within which I am capable of taking a stand.

In considering this view of self-identity one might well take the crucial question to be whether "the ground where I stand is given to me. . . . [Or whether] I am free to choose where to take my stand." At first sight, no doubt, neither of these passages would appear to present any major problem of translation in moving from the English to, say, French. "To take a stand" would seem to go easily enough into *prendre position*; "to know where I stand" might be rendered as *savoir où je me tiens* or *où je me situe*; and, in the context, the sense of the expression "the ground where I stand" is perhaps best conveyed by *le terrain sur lequel je me trouve* or *le terrain que j'occupe*. On second thought, however, one may be struck by the way in which the unity that, in English, the terms "standing" and "stance" give to these different expressions is dispersed and redistributed by the French. (In this way French is more or less typical of all the modern Latin languages, whereas the German *stehen* provides roughly the same range of cognates as the English "to stand.")

In his discussion of the concepts of "the self" and "self-identity" Taylor lays great emphasis on the ways in which the modern world provides for many previously unknown possibilities of social mobility and exchange of one role for another and thus allows much more room for individual development and self-determination. Secondly, and not altogether unconnectedly no doubt, we can see developing from about the time of the Reformation onward, a growing insistence on the role of the individual in taking responsibility for his or her own actions and the values that he or she may stand for or represent. This concern with individual or "personal" responsibility for what an agent does as the author of his or her own actions lies (together, of course, with continuity of consciousness) at the heart of John Locke's attempt in his *Essay on Human Understanding* (bk. 3, chap. 27) to work out a systematic distinction between the identity of a man, qua human animal, and that of a person. "Person" for Locke is a "forensic term," that is to say that it is to human agents qua persons that we impute responsibility. And before Locke, of course, none other than Martin Luther himself proclaimed his

own responsibility for his own unmediated relationship to God in the words *Hier stehe Ich* (Here I stand) (*Verhandlungen mit D. Martin Luther auf dem Reichstage zu Worms*; see CONSCIOUSNESS, Box 3). It is true, no doubt, that Luther would not have used that language of identity with which Taylor is concerned and which, as he rightly says, has become common currency only over roughly the past fifty years (but a currency now so common, indeed, that it may risk a serious devaluation). But it is easy to imagine contexts in which, if anyone had asked Luther who he was, he might well have answered "I am he who stands here and can do no other."

II. Idiomatic Expressions and Metaphorical Networks

It may be, indeed, that the metaphor of standing (itself an expression not obviously transposable into French) carries with it something of a peculiarly Protestant flavor. To stand (on one's own feet) is to not lean upon anyone or anything; it is to be not propped up by someone or something else. To take a stand is to resist pressure to move (retreat) any further, it is to be independently or autonomously upright—"upright" itself being a term, whose particular manner of juxtaposing the notions of "being erect" (not "bowed down," "bent," or "blown over"; "'undefeated'") and of "moral probity" does not go straight over into French. "An upright man" might plausibly reappear as *un homme droit*, a man of whom, translating back into English, it would be natural to say that he was "straight" (cf. "He is as straight as an arrow"). However, one can, of course, be straight in a horizontal position, and to say of someone (or, indeed, of something) that he, she, or it is straight is to imply nothing whatsoever as to whether the person or thing is either literally or metaphorically standing on his/its own feet or not. But, it is important to note, he who "stands foursquare," as it is said, and upon his own autonomous feet, does not necessarily "stand alone"; he may, on the contrary, "stand firm with" all those others who together are prepared to "stand up and be counted" as representatives of the values that they "stand for" and that they are ready to defend as they "take their stand" against the attacks of those who would discard them. In short, then, the English term "stand" is one that, together with a whole army of prepositional auxiliaries "standing ready" in the wings, as it were, is able to bring together a set of mutually supporting images of self-determination, autonomy, readiness to provide resistance or defense, uprightness, potential solidarity with others ("united we stand," "I stand with you/them"), and so on and so on.

Against the background of his own working out of a theme proposed by Harry Frankfurt in the latter's well-known "hierarchical account of identity," Taylor himself has been concerned to present a distinction between what might be called the ordinary or normal evaluative assessments that we all regularly make of one thing, one course of action, in relation to others and what he characterizes as deep or radical evaluation, that is to say the evaluative assessment by which one may pass in review one's existing range of first-order evaluations and, comparing them to other possible constellations of values, make a deep existential choice between them and in so doing determine or

redetermine one's own self-identity. Taylor may be understood as seeking both to articulate and to understand the origins of a sense of identity according to which people—both individuals and, indeed, groups—have to be seen as having a large share of more or less autonomous responsibility for the acceptance or remaking of their own identity. Also, no doubt, in presenting identity understood in this way as constituting the proper basis of respect of both self and others, I do not in the least wish to suggest that this project cannot be set out in a language such as French. But when Taylor, who is himself bilingual, tries to do this, metaphors of standing and stance tend to be replaced by metaphors of frameworks of reference (*points de repère*) and of horizons, metaphors that, it is true, do occur in the English version, but that are not so immediately at home there. It may well be, of course, that both sets of metaphors are needed to give the full flavor of the concept of identity that Taylor is trying to articulate in the passage quoted at the beginning of this entry. It remains difficult not to lose the entire associative network serving to sustain that concept in translation.

STANDARD

FRENCH   *règle, norme*
SPANISH   *norma*

➤ RULE, *VALUE*, and ART, BEAUTY, CIVILTÀ, GOÛT, LAW [LEX, THEMIS], PRINCIPLE, SPREZZATURA, STAND, UTILITY, *VIRTUE*, WERT

Until the eighteenth century, the word "standard" allowed one to account for an elevated level of living in society or of good taste. Its translation into French was then *règle* (rule) or *critère*. But the concept's meaning increasingly shifted to designate a norm or principle allowing for a rectification of experience. "Standard" serves to define an experience regulated on the basis of an excellence or to measure deviations in relation to that excellence. Evaluation is of various aspects of social life, such as the multiplicity of modes of human conduct or the variety of tastes. "Standard" refers to a possible but tacit regulation of such experiences, far less rigorous and more regional than the prescription of the law.

"Standard" is first of all linked to an apprenticeship of civil life. It allows for a definition of forms of behavior ruled by politeness and for the admission of a sociability comprising habits, customs, and social solicitations. Shaftesbury, in *The Characteristics of Men, Manners, Opinions, Times* (3:179) of 1711, focuses on the acquisition by the young of a "standard of manners, breeding, gentility." This use of "standard" to improve the taste of individuals in the affairs of everyday life rediscovers the spirit of the term *norma* in Baltasar Gracián, generally translated in French as *règle*: proper taste presupposes a knowledge of the "rule for knowing what is worthy of esteem [*la norma de la verdadera satisfacion*]" (*Oraculo manual y arte de prudencia*, 157).

"Standard of taste" in Hume extends reflection of the norm or criterion of human conduct to the domain of the fine arts, whose evaluation is perpetually confronted with the radical diversity of sentiments at the very moment one is obliged to establish a rule of taste (*Selected Essays*, 136). Well-regulated taste presupposes the delicacy of critics or connoisseurs, which is a discernment of the actual qualities of the object by a mind that is attentive, without prejudice, and practiced. "Standard" expresses the possibility of an experience of art that is well read.

When "standard" designates the possibility of a well-regulated experience in domains that are as subject to the instability of human behavior as are styles of living and the fine arts, terms such as "rule" or "canon" can help to refine the most local dispositions of the standard: the affirmation of rules of politeness, of aesthetic canons. But "standard" also posits a unit of measurement. "Standard" is close to "measure" and can be translated in French as *norme*. In *The Theory of Moral Sentiments* (25, 247–49), Adam Smith develops a parallel between art and morality concerning standard. One can define two different types of norm for human conduct. An ideal norm, an idea of the perfection of an object or a conduct, is a spur to construe every evaluation on its imperfections. A usage-based norm, the common degree of excellence habitually attained in art or morality, allows one to actually consider the rank of a work or an action among others of the same type. A standard serves to evaluate a degree of proximity or distance, a lesser or greater deviation in relation to the posited norm.

The word "standard" serves to rectify experience and, to be effective, ought to be as forceful and readable as possible. The use of "standard" in John Stuart Mill's *Utilitarianism* satisfies that requirement: in order to ameliorate behavior, utilitarian philosophy takes cognizance of what constituted the major defect of all moral experience, "the absence of any distinct recognition of an ultimate standard" (3). The word "standard" is deployed against the horizon of the foundation defined by the utilitarian doctrine. It comes close to "principle."

STATE

State comes from the Latin *status*, which refers to the action of standing and one's manner of standing, posture, position, from *sto, stare* (to remain standing, immobile, firm), and from which we derive *statuo* (to establish, to reckon, to decide); we find the same root in the Greek *istêmi* [ἵστημι] (to stand, to place) and in the intransitive sense (for example, in the aorist *estên* [ἔστην], meaning "to stand up"), in the Spanish *estar* (to be; see SPANISH and *TO BE*), and of course the English "stand," the German *stehen*, and so on. The Greek *stasis* [στάσις] can thus refer both to political and moral stability, the state of a person, a city, a question (cf. Lat. *status quaestionis, status causae*, see *THING*), as well as sedition, uprising, and civil war when one part of the city "stands up" again another. "Stela," "statue," and "statute" are also related to "state," which we see can refer to a physical or moral way of being, and to the institution of institutions that is the state.

1. On state as a disposition and way of being, see *DISPOSITION, II,* STAND, SUBJECT.
2. The concept of state strictly speaking refers to a mode of organization of political power presupposing a specialized government that is separate from society and institutionalized. This is the dominant tradition in political philosophy, which, in agreement with the major theorists of public law, tends to reserve the word "state" for political forms created with the development of the modern doctrine of sovereignty. However, sometimes we speak of the state simply as what holds together a political community, regardless of the empirical elements that compose it: see POLIS, the "city" that is a state, society, nation, and none of these all at once; cf. *FATHERLAND,* POLITICS, *SOCIETY*.
3. On the relation between the state and the law, see RULE OF LAW; cf. LAW, RIGHT/JUST/GOOD.
4. We have opted to study here the modulation of the senses of "state" as it is carried in languages and national histories. Thus, the Italian *stato* and the English "state" do not articulate the relation between territory, power, political regime, and government in the same way. See DEMOS/ETHNOS/LAOS, STATE/GOVERNMENT, STATO; cf. *AUTHORITY, GOVERNMENT,* HERRSCHAFT, MACHT.
5. On the "welfare state," see ECONOMY, LIBERAL.

➤ *COMMUNITY*, NAROD, PEOPLE, *POWER*

STATE OF AFFAIRS

"State of affairs" is one of the possible translations of the German *Sachverhalt*, which refers in everyday language to "circumstances." But this translation focuses attention on the properties of the objects of experience at the expense of the propositional content of the object of judgment. The other translation of *Sachverhalt*, and just as common, is "propositional content," which obviously suffers from the reverse problem. See SACHVERHALT.

We are in the presence here of logical terminology related to the most general questions (object-word-mind and the definition of truth) that effects the shift from medieval Latin (DICTUM), coming out of Stoicism and its competition with Aristotelianism (see *lekton* under SIGNIFIER/SIGNIFIED, II), to nineteenth- and twentieth-century German terminology, and then to contemporary analytic English terminology, and for which French produces descriptive translations that make the problems clear.

See, on one hand, DICTUM, INTENTION, PROPOSITION, SENSE; on the other ERSCHEINUNG, *FACT,* GEGENSTAND, *IL Y A,* MATTER OF FACT, OBJECT, TATSACHE, *THING* [RES], *TO BE*, and finally TRUTH.

STATE / GOVERNMENT

FRENCH	*état, gouvernement*
GERMAN	*Staat*
ITALIAN	*stato*

➤ *GOVERNMENT*, *STATE*, and DEMOS/ETHNOS/LAOS, LAW, POLIS, POLITICS, RULE OF LAW, STATO

If the English "state" is indeed the equivalent of *état* in French, of *Staat* in German, and of *stato* in Italian, the term "government," in English, is of a far broader use than *gouvernement* in French. "Government" refers simultaneously to the following: (1) the level at which the state is directed; (2) the political system in force in a state; (3) the whole constituted by the legislative, executive, and judiciary powers, and by the administration; and (4) the set of agents contributing to the action of the public powers that be. In the two last senses, the word will tend to be rendered by *état*.

The two primary meanings of "government" are close to the French use, for which *gouvernement* designates both officials in the executive branch and the regime, that is, the specific mode of organization under which a community (be it a republic, a democracy, or a monarchy) lives. The two additional meanings, however, are much closer to the notion of the state in the European sense: "the American government" would no doubt be *l'état américain* in French, and if one sought to translate into French what American conservatives mean when they denounce "big government," it may be said that undoubtedly their objection is to *trop d'état.* The preference in English for "government" to designate certain aspects of what the French call *état* has its source in the traditions of English law, which, despite Hobbes, never accorded the sovereign state the majesty granted it by the major authors of the Continent; in addition, the American use is all the more understandable in that, within the federal system of the American republic, the state is, in fact, a state in the federation: the United States do indeed have a government, but it is not clear that they constitute a state. Such nuances, however, are less clearcut at present than in the past, to the extent that political developments have imposed a uniform vocabulary to designate the different states that coexist in the international system.

"Corporation"

In English, "corporation" has different connotations from those of French *corporation*, a function of the manner in which "public law" and "private law" are articulated in British juridical culture. A "corporation" is an artificial person or juridical entity distinct from the individuals composing it, and that can plainly survive them. The distinction between "public" and "private" corporations does not stem from the identity of the owners (a "public enterprise" in the French sense is not a corporation) but from the purposes for which they are constituted: a corporation will be public if it has political missions concerning the government, but inversely a private corporation can have a certain normative power in the creation of law. In this sense, the "states" of a federation can be seen as public corporations without being sovereign "states." The importance of corporations thus stems from the fact that they allow a relativization of the role of the state in the production of law.

STATO (ITALIAN), RAGION DI STATO (ITALIAN), REASON OF STATE

ENGLISH   state, Reason of State
FRENCH   *état, Raison d'État*
GERMAN   *Staat*
LATIN   *status*
SPANISH   *estado*

➤ *STATE,* and MACHT, PEOPLE, POLIS, POLITICS, *POWER*, STATE/GOVERNMENT, VIRTÙ

The political lexicon reveals the historic emergence of the modern state, also known as the nation-state. The word for that new political reality in the principal languages of Europe (*stato*, *état*, *estado*, "state," *Staat*), a vague and general term, gradually, starting in the sixteenth century, takes on a meaning that is itself new, supplanting rival terms. Was Machiavelli the first to use the Italian word *stato* in the politico-juridical sense that it has since retained, and was he the first theoretician of the modern state? The matter can be debated, but one cannot deny the interest—which is not only linguistic, but also political and philosophical—in examining the evolution of the word *stato* in the political writings of the Italian Renaissance, and of its transition from being a polysemous configuration to embodying a relative unity of meaning, with all the problems of translation flowing from it.

I. *Stato*: Power and Territory

In classical Latin, the word *status* expresses the fact of "holding oneself," posture, and is used metaphorically to mean the situation, the state of something or someone, in particular the "state of public affairs" at a given time, whence the formula *status rei publicae*—the word *res publica* designating, for the Romans, their idiosyncratic political institutions. But Cicero also uses the formula in a more general sense, that of a form of government, *res publica* designating in such cases a *regnum* as much as a *res publica* properly speaking.

Medieval Latin for the most part inherited this usage. *Status* means the good state, good order, prosperity of a specific community. In this sense, it is never employed alone, but as *status Ecclesiae, status regni*, or even *status rei publicae*, even if it is a matter of *regnum*.

In fifteenth-century Italy, the words *status* and *stato* pass from this vague sense of political situation to the more precise one of exclusive possession of a territory with the power to command its inhabitants. They refer to those who hold such possession and power, but the words also begin to be employed absolutely, to designate possession and power themselves, without specific reference to those who hold them. This core of meaning is shaded with all sorts of nuances, as may be seen from the political literature, particularly in Florence, in the fifteenth and early sixteenth centuries. This suppleness of meaning and diversity of use are particularly visible in Machiavelli.

In order to shed light on the analysis of these nuances, it can be said that, for Machiavelli as for his contemporaries (Guicciardini, for example), the word *stato* oscillates between two poles of meaning, with slippages from one to the other. On the one hand, it designates the political power exercised by a single person or group over a fixed set of people. It is then synonymous with a dominant position, and inseparable from the active subject of a command clearly separate from its object, which is passive. The word thus refers to the specific interest of those who govern: the *stato de Medici* is the power exercised over the city of Florence by members of the Medici family, and *stato* in this case has a meaning close to *governo.* Thus understood, the *stato* partakes of an *ars dominandi,* an art whose treatise par excellence is Machiavelli's *The Prince*, since the question it raises is that of knowing how to secure and preserve nonhereditary power. In chapter 2 of *The Prince*, for example, one reads: "se tale principe è di ordinaria industria, sempre si manterrà nel suo stato, se non è una estraordinaria et eccessiva forza che ne lo privi" (a prince of average powers will always maintain himself in his state, unless he be deprived of it by some extraordinary and excessive force). Or further still, in chapter 24: "E se si considerrà quelli signori che in Italia hanno perduto lo stato a'nostri tempi" (And if those seigniors are considered who have lost their states in Italy in our times). In both examples, *stato* clearly signifies "power."

Stato can also have a more material frame of reference as a term for the domain, territory, or population over which power is exercised: "Ma quando si acquista stati in una provincia" (But when *stati* are acquired in a province) (ibid., chap. 3). In chapter 4, one reads that the *baroni,* the feudal lords, "hanno stati sudditi proprii" (have their own *stati* and subjects). These *stati* are territories. The same holds in chapter 7, when Machiavelli speaks of Pope Alexander VI, who, wanting to satisfy the ambitions of his son Cesare Borgia, "non vedeva via di poterlo fare signore di alcuno stato che non fussi stato di Chiesa" (did not see his way to make him

master of any *stato* that was not a *stato* of the Church). When one speaks in French of *États de l'Église*, the word *état* retains this older sense of territorial estate or realm.

In *The Prince* the two meanings of power and territory often come together. In the examples given in the preceding paragraphs, the prince *se manterrà nel suo stato* can translate as not only "will conserve his power" but also "will maintain himself on his lands." Sovereigns who have lost power have simultaneously lost their realm. One is inseparable from the other, but a translator is obliged to choose, unless she extricates herself by using indiscriminately the word "state." But one finds additional semantic difficulties when it is a matter of specifying the meaning, as in the aforementioned examples, of the word *stato*, namely, that of political power exercised over a human community. For *stato* can also mean "political regime" in the sense of "a type of organization of power." Thus the *stato popolare* is that in which the people, or a portion of the people, participates in the government of the city through different councils in which authority has not been confiscated by an individual or an oligarchy. In this case one speaks of a *stato stretto,* that is, one that is "tightened."

II. Machiavelli and the Notion of "State"

The thorniest question is whether there is a transition in Machiavelli from the meaning of "political power" or "concrete domain over which power is exercised" to that of an abstract and impersonal political and juridical structure in the modern sense of the word "state." In this case, the different powers constitutive of state structure are clearly distinguished from the person of those exercising them. In other words, the state is not identified with the government and its different modes of exercise but subsists even as regimes change, whether they be monarchical, aristocratic, or republican. The state preserves its own substance and exigencies, independently of the manner in which those exigencies are satisfied. In this regard, the first sentence of *The Prince* is frequently cited as marking the lexical birth of the modern state:

> Tutti li stati, tutti e'dominii che hanno avuto et hanno imperio sopra gli uomini, sono stati e sono o republiche o principati.

> (All states, all powers, that have held and hold rule over men have been and are either republics or principalities.)

Here Machiavelli seems to distinguish the notion of state, in the general sense of political structure of power, from that of regime or type of (republican or monarchical) constitution. But can it not be claimed that for Machiavelli, in this case, the *stati*, identified with *dominii*, are mere "facts," facts of power exercised over people in a given territory, and do not correspond to an "idea," which would be that of the "State" written with a capital "S"? One discovers the same ambiguity, the same occasion for interrogation, in numerous occurrences of the word *stato* in *The Prince* and in the *Discourses on the First Decade of Titus-Livius.* Two examples will suffice. When, in chapter 3 of *The Prince,* Machiavelli writes that the French *non si intendevano dello stato*, does he mean

that they did not have a sense of the State, or rather, more simply, that they did not know the art of conserving what was conquered, since the remark refers to Louis XII, who "lost Lombardy by not having followed any of the conditions observed by those who took possession of countries and wished to retain them"? Similarly, when he says, in a letter of 10 December 1513, to Francesco Vettori, concerning *The Prince*, that the "quindici anni, che io sono stato a studio all'arte dello stato, non gl'ho dormiti ne'giuocati" (the fifteen years that I devoted to the study of the art of the *stato* were not spent sleeping or amusing myself), is it a question of the art or science of the State, or rather of the art of winning and maintaining personal domination?

All these lexical uncertainties have been commented on abundantly, and it can be concluded that in his use of the word *stato*, Machiavelli did not greatly differ from his contemporaries. At most one can attribute to him an intuition (rather than a clear vision) of what the modern state would be. Nowhere does he define it, nor does he analyze its constitutive elements, as Bodin and Hobbes later would. He was interested in the phenomenon of pure political power; the conditions of its acquisition, exercise, and conservation, and rather than religious, moral, or juridical delimitation and structures of legitimation. This orientation explains his apparent indifference (at least in *The Prince*) to the institutional and juridical structure of the community subject to political power, with its attributions and limitations.

It is possible, however, to understand why Machiavelli has been turned into, if not the founder, then at least the forerunner of the conception of the nation-state. It is not by chance that republicans as well as partisans of absolute monarchy have invoked his authority. The idea of "the people," who, in *The Prince,* seem not to have an autonomous existence but to be mere objects submissive to power, makes its first appearance as a nation in the final chapter, which is a vibrant appeal to Italian unity. Moreover, when Machiavelli insists on the necessity of a national army and denounces the tutelary authority exercised by the Catholic Church, he reveals a lively sense of certain fundamental demands of the modern State: territorial unity, independence of the nation in relation to foreign powers ensured by a national army, and a refusal to submit political power to powers foreign or transcendent to it, specifically of a religious order. But if he undeniably has a sense of the general interest of the political community, he does not truly dissociate that interest from the personal interest of the individual or individuals exercising power: in the final analysis, what must be done for the prince to conserve his power is identified with what must be done for power itself—in its impersonal, "impartial" form, what we call the State—to be conserved. It is with the notion of *ragion di stato*, Reason of State*, that this new sense of *stato* would clearly emerge.

III. *Ragion di Stato*

If, in the Italian political writings of the sixteenth century, *stato* long continued to be used with the diverse meanings encountered in Machiavelli, a clear distinction began to emerge between *stato* in the sense of *governo* and *stato* in a more abstract sense, designating everything concerning relations between individuals and social groups within a

politically organized community. One speaks then of *subversione di tutto lo stato,* which is not reducible to that of the *governo.* When, in 1547, Giovanni Della Casa wrote of the *ragion di stato* (Francesco Guicciardini, in his *Dialogo del reggimento di Firenze* [1526], already had spoken of *ragione e uso degli stati*), one might wonder whether it was not still the interest of the *governo,* those who governed, that was in play in the political "argument." With the appearance of Giovanni Botero's book *Della ragion di Stato* (1589), the most representative of the abundant texts on "Reason of State" proliferating in Italy (and later throughout Europe in the late sixteenth and early seventeenth centuries), things become clear. For Botero the *stato* is "un dominio fermo sopra popoli, e agion di stato è notizia di mezzi atti a fondare, conservare ed ampliare un dominio cosi fatto" (a stable power over peoples, and Reason of State is the knowledge of the means suited to found, conserve, and augment such power), and he adds that *ragion di stato* (Reason of State) "suppone il prencipe e lo stato (quello quasi come artefice, questo come materia)" (presupposes the prince and the *stato* [the former being a kind of artisan and the latter his material substance) (Book I, chap. 1). The *stato* as *dominio* takes on a certain autonomy in relation to

the *governo* of the prince; it acts in its own interest when the political interest of governing officials is acted upon. What becomes an object of interest is no longer the *stato* of one prince or another, but the *stato* in and of itself; the State in its conditions of existence, in its proper functioning, and in its well-being. The concept of the impersonal, abstract, absolute state, unbound by any laws other than those it gives itself, is born. The paradox here is that the two authors who would definitively elaborate the political, juridical, and philosophical foundations of the modern state, Bodin and Hobbes, would not use or only rarely used words of the same family as *stato* in their lexicon, Bodin's work is called *The Six Books of the Commonwealth,* and Hobbes, in the introduction to *Leviathan*, speaks of "that great LEVIATHAN called a COMMON-WEALTH, or STATE (*in latine CIVITAS*)" and prefers the term "Common-Wealth," which is the English translation of the Latin *res publica*, and which Locke would use as well. One would have to wait a while for *État* and "State" to impose themselves.

■ See Boxes 1 and 2.

Alain Pons

1

Colonia and *imperium*

"Colony" and "empire" are words whose meanings have transformed over time as they have been translated between languages and therefore from one culture and its political system to another. The underlying shift in the twentieth century was from a positive to a negative connotation, reflecting the degree to which colonies are now regarded as negating the rights of indigenous peoples, and empires are seen as despotic systems in an age of democracy.

It was not always so. The Greek term for colony was originally *apoikía* [ἀποικία], or "settlement" (literally "people far from home"). Greek *apoikiai* [ἀποικίαι] were city-states established all over the Mediterranean of emigrants who retained their cultural ties with the *mêtropolis* [μητρόπολις], or home city. Each colony, however, was politically autonomous and functioned as an independent *polis* [πόλις]. The Romans, for their part, used the Latin term *colonia* in two related ways: drawing upon the meaning of *colonus* as farmer, it designated a settlement, or farm estate, often granted to veteran soldiers in conquered territories, initially in regions relatively close to Rome intended to act as outposts to defend Roman territory. These settlements, however, could also include towns, which were assigned a comparably favored rank on the basis of their population of Roman citizens: Roman *coloniae* included Ostia (the first), London, Bath, York, Arles,

Köln, Narbonne, and Jerusalem, cities established at the farthest reaches of the empire (in various periods) to act in some degree as imperial garrisons. For this reason, Roman authors also used the term *colonia* to translate the Greek *apoikia* [ἀποικία]. However, the function of the *coloniae* as strategic outposts of the Roman Empire meant that later Greeks did not translate the word back the other way, rather employing the Latin *colonia* as an untranslatable term: *kolônia* [κολωνία]. It was this untranslatable Roman word with its particular political and strategic resonance that then entered French (fourteenth century) and English (sixteenth century) to designate plantations and settlements abroad. Modern European colonies were formed on the Roman political model, consisting of the founding of a settlement in a separate, usually overseas, locality that sought to expand the territory and duplicate or renew the culture of the parent country ("New" Amsterdam, England, Spain, York, etc.) while retaining allegiance to it and submitting to its overall political control. The model of sovereignty in this period meant that, in contrast to ancient Greece, individuals remained subjects of the crown wherever they might happen to be in the world. Although many early European colonies were colonies of settlement, these were generally restricted to temperate regions where Europeans could establish themselves more easily. Elsewhere,

other colonies were founded as trading posts (the Greeks, by contrast, distinguished between the *apoikiai* [ἀποικίαι] and their trading posts, which they called *emporiai* [ἐμπορίαι]), which gradually took on territorial scope: a primary example would be that of the East India Company, which expanded from the original outpost that became the city of Calcutta to control the whole of India. Such colonies, where trade, resource extraction, or port facilities were primary, are distinguished from settlement colonies by modern historians as "exploitation" colonies. However heterogeneous in form, they were all called colonies, with the Roman word consistently repeated across the various languages of the European empires (*kolonie* [Dutch], *colonie* [French], *Kolonie* [German], *colonia* [Italian], *colônia* [Portuguese], колония [Russian], *colonia* [Spanish]). After the American and Latin American revolutions of the eighteenth and early nineteenth centuries, the system, practice, and administration of colonies, "colonialism" (introduced into English in the mid-nineteenth century, into French at the beginning of the twentieth) increasingly lost the positive aura that had been retained from the Roman *coloniae* and by 1919 came to be used as a derogatory term by its opponents, with the implication that all colonialism represented a form of exploitation of subaltern peoples by too-powerful nations. "Colonialism" was soon used as a negative word in

the discourse of the widespread opposition to colonial rule by the indigenous people of the colonies. This resistance is all generally termed "anticolonial" even if in practice the path of liberation tended to divide between relatively peaceful negotiation for exploitation colonies and violent warfare for settlement colonies, such as Algeria, where a significant presence of colonial settlers (*pieds noirs*) produced often apparently intractable situations. The old, more neutral sense of "colonial" survives today only in certain contexts, such as in the period designations "colonial architecture" or "colonial furniture."

In semantic terms, the Greek practice of autonomous colonies did not survive the creation of the Roman Empire: colony and empire ever since have retained an unbroken connection, even if it has often been one of tension and conflict. If colony comprises the individual settlement, empire involves the totality of settlements from the point of view of the metropolis, which is the center of imperial administration. There have been many empires throughout human history, but it is the Roman Empire, developed from the concept of the *imperium*, the supreme power of the ruler, that functions as the fundamental basis for the conceptualization of empire. What is significant here is that the idea of empire is the product of the supreme power of its ruler, and the language of command, *imperare*: the rule of the emperor and the territory over which that rule extends (cf. *translatio imperium*, the chronological succession of transfers of supreme power that form the basis of medieval and imperial histories). The first British Empire was simply that realm of dominion exercised after 1603 by James I over the British Isles, which he named Great Britain. The conventional land empire of contiguous or proximate territories, of which the Mongol was the largest historically, was supplemented in the colonial period by empires that were geographically dispersed, an aggregate of separate colonies held together by the new technology of ocean-going ships or, later, undersea telegraph cables. While the first British Empire was well established by the eighteenth century despite the loss of the American colonies, the defeat of the French in India (1757) and then Canada (1763) produced Napoleon's later attempt to compensate for their loss by reinstituting an empire through conquest of the European landmass. A new word was subsequently introduced to distinguish this "third way" of Napoleon's form of government between monarchy and republicanism: *impérialisme* (1832). It was not until the Second Empire of Napoleon III, however, that the word traveled into English as "imperialism" (1858) as a way of describing the French political system of an autocratic emperor creating an empire not through trade or emigration, but by the forcible appropriation of foreign territory through conquest (in the French case, consolidation of power in Algeria and invasions of or military missions to China, Cochinchina, Japan, the Levant, and Mexico).

Imperialism, which named the Napoleonic model of the French political system, was at this point actively rejected by British politicians and intellectuals (as well as by Karl Marx) as a form of despotism utterly alien to British traditions. Within twenty years, however, the allegedly untranslatable French concept of imperialism was to be shamelessly translated into British policy by Benjamin Disraeli, whose second (but first substantial) term of office began in 1874. Though the negative marker always endured for some, in public discourse it was gradually abandoned, together with the commitment to free trade, in favor of an imperialist policy of extending commerce through an actively acquisitive empire. In France "imperialism" was duly imported in its English form (1880) and initially referred to as *l'impérialisme anglais* (1900). These imports, exports, and insistence on the untranslatable difference of the French and English words for imperialism were markers of what continued to be regarded as a significant variation in the political organization of empire. Toward the end of the nineteenth century, British imperialism was conceived as a way of holding together an empire that was commonly seen as verging on the point of dissolution. The experience of the American War of Independence had encouraged the organization of the empire into units of semi-autonomous dominions: the British concept of a "Greater Britain," founded on a large number of settler colonies, including some that were entirely independent such as the United States, was distinct from most other European imperial powers in which imperialism involved the development of expansive concepts of "Greater France," "Greater Germany," and "Greater Italy"—and in the East, "Greater Japan"—in which the colonial territories were integrated administratively into the metropolitan mainland and considered as an integral part of the sovereign state. Such differences aside, at this point imperialism became the dominant world political system, an era best symbolized by the 1884 Berlin Conference in which the remaining territory of Africa was divided by agreement among Austria-Hungary, Belgium, Denmark, France, the United Kingdom, Italy, the Netherlands, Portugal, Russia, Spain, Sweden-Norway, and the Ottoman Empire (the United States was invited, but did not attend). While empire can describe a merely administrative arrangement for the government of diverse and diversely acquired territories, imperialism came to designate an ideology of empire that forged the identity of the originating imperial state, and whose interests lay in trade (importing raw commodities from their imperial possessions and reexporting them as manufactured goods), territorial control, and autonomy from the threat of other empires. (Some historians would argue that these were the underlying reasons for the First World War, and certainly increase of colonial territory was one war aim of all the main protagonists). Ideological justifications for empire were generally added to these material objectives—*la mission civilisatrice* (France), the rule of law (Britain), and conversion to Christianity (all European empires).

At the height of European imperial power, however, imperialism came under attack not only through resistance across the empire itself, but also from liberal and left-wing thinkers within Europe. Along with J. A. Hobson's *Imperialism* (1902), Henri Brunschwig's *Mythes et réalités de l'impérialisme colonial français* (1906), Rosa Luxemburg and Nikolai Bukharin's *Imperialism and the Accumulation of Capital* (1913), the most famous of these was Lenin's *Imperialism: The Highest Stage of Capitalism* (1916), which decisively transformed the public meaning of imperialism from positive back to negative once more, even in France. Ever since, even with the development of new forms of imperialism (such as the "economic imperialism" of the United States from the end of the nineteenth century, which in 1965 Kwame Nkrumah claimed continued among former European colonies after formal independence as "neocolonialism"), "imperialism" and "imperialist" have functioned as words of critique. With the exception of fascist ideologues in Germany, Italy, and Japan until the end of the Second World War, empire has been generally disavowed by states or politicians, and for the most part discussed in terms of something to be resisted and overcome (cf. Mao Tse Tung's "U.S. Imperialism Is a Paper Tiger," 14 July 1956, in *Selected Works*). It was Lenin who, following Hobson, made the connection between imperialism and finance capitalism so that imperialism and capitalism have since become almost synonymous in left discourse, and analyses of empire always establish their ground in economic critique. Lenin's argument was that the conjunction of the two represented a particular form of imperialism and that modern imperialism was therefore not to be usefully compared to, or translated into, the boundaries of the territorial expansion through conquest of historical empires in general Imperialism, he argued, was not translatable out of capitalism.

Although there were theories of colonization, colonialism can be defined largely as a practice Imperialism manifested itself as a

practice, but its meaning was grounded in a political concept of expansive power, seeking to turn heterogeneous colonies into a single political and economic system. Imperialism necessarily involves empires, therefore, but all empires do not necessarily invoke imperialism. As with "colony" and "colonialism," the meaning of "empire" and "imperialism" has shifted according to the political hegemony of their advocates or opponents.

"Postcolonial," "Postcolonialism"

Few notions in recent theoretical parlance have aroused as much criticism as "postcolonial" and "postcolonialism." From the start their ambiguity, awkwardness and insufficiency as political concepts have been subject to critique. More than other terms conceived with and through specific movements and schools of thought, "postcolonialism" and "postcolonial" solicit a new definition with each and every iteration. Both terms have been sites of epistemological and ideological confrontation.

A mid-twentieth-century construct, the qualifier "postcolonial" was first used to mean "post-independence," with explicit historical reference to the aftermath of decolonization. But even in this chronological ascription "postcolonial" remains problematic, since the nature and reality of political "independence" can always be debated. If used indiscriminately, "postcolonial" risks homogenizing very different colonial histories and modes of accession to independence. In the shift from its use as a historical term to its use in critical, theoretical, and literary discourses, the adjective produced the noun "postcolonialism." It became untethered from specific moments in history, and began to circulate in discourses that moved more fluidly between colonial and postcolonial histories, and their complex cultural and social ramifications.

Robert J. C. Young has argued that tricontinentalism, a form of Third World activism brought to the fore by the 1966 Tricontinental Conference in Havana, is the direct antecedent of postcolonialism as a political concept): "In many ways the Bandung conference marks the origin of postcolonialism as a self-conscious political philosophy." (*Postcolonialism: A Very Short Introduction*, 17).

"Postcolonial" studies gained currency in the 1970s, at a moment when literary studies (especially in English) were confronted with the inability of nation-centered disciplines such as "English literature" (or "French literature," etc.), to address the important body of writing from former colonies, produced in European languages. The inadequacy of a simple equation of nation and language underlined the political and social insufficiencies of academic institutions, and drew attention to the multiple legacies of the colonial situation. The problem of naming literary fields and world literatures in light of the impact of colonization on culture, education, and the conditions of knowledge-production was foregrounded in postcolonial criticism. In France, the question of how to mark the postcolonial in academic fields remains particularly rife with controversy. The term *Francophonie*, which was adopted to designate extrahexagonal literatures of French expression, is often rejected on the grounds that it contains condescending undertones (cf. the writers' manifesto "Pour une littérature-monde en français," *Le Monde*, 16 March 2007). In Anglophone studies, where the designation of "Commonwealth literatures" gave way to "new literatures" that were in turn supplanted by "world literatures in English," an awareness of diverse writings in "English(es)" from formerly colonized nations and territories helped effect a shift in emphasis in the way the term "postcolonialism" was adduced—a shift from a strictly chronological and historical application to what might be described as a broadly critical and discursive usage. As the term was taken up in different fields it gave rise to an increasing number of debates and questions: How "post" was colonialism? Was there a difference in how the term signified depending on whether or not it was hyphenated? Was postcolonialism a historically circumscribed phenomenon or was it coextensive with ongoing forms of neo-imperialism? To what extent was it identified with the critique of Europe-centered epistemological assumptions? Had it become a disciplinary/theoretical locus with a momentum all its own, and whose dehistoricized adjectival usage required infinite linguistic and cultural translation?

Interestingly enough, the critics whose contributions to the analysis of colonial discourse

were among the most notable—Edward W. Said, Gayatri Chakravorty Spivak, and Homi K. Bhabha—hardly used the term "postcolonial" in their seminal work of the late 1970s and early 1980s. And yet it was their articulations of Orientalism, the silencing of the subaltern, and colonial mimicry that gave substance to what came to be known as postcolonial theory, enabling it to challenge preexisting disciplinary boundaries. Arguably, the enduring force of postcolonial thought may be a product of the *non*existence of its disciplinary boundaries. Since "it" doesn't really exist as a discipline in and of itself, it works from without to split and suture discursive fields. It sutures, for example, "high theory" to the critique of colonial legacies; it carries an implicit endorsement of activist research and writing; and it fosters work that vigilantly attends to the way in which contemporary knowledge-systems are configured in specific geopolitical zones. This is perforce an anxiety-fraught exercise, for in requiring constant attention to manifestations of noninstitutional thought and systems, postcolonial theory sometimes assists (in politically problematic ways) in professionally institutionalizing them.

At their most effective, "postcolonial" and postcolonialism" can be identified with the politically engaged questioning of the primary historical meaning of "post" and with an enhanced understanding of what it means to colonize or to be colonized beyond the chronological definitions compounded by historians. From a postcolonial perspective, colonization is understood as an ongoing process that subsumes the exploitation of labor and resources; the history of social and political repression; and the imposition of values and systems of knowledge.

"Postcolonial" and "postcolonialism" represent something more like a critical tendency than a disciplinary category or distinct school of thought. The terms may be associated with heuristic practices; with readings that cut across literature, history, cultural studies, area studies, and economics. Because disciplinary categories themselves vary so much from one language and institutional context to another, postcolonial theory may be said to irrigate certain fields and to disappear in others. The difficulty that arises when translating "postcolonial" or "postcolonialism" is symptomatic of the terms' ability to unsettle the organization of academic disciplines. Equally symptomatic is the way in which the terms themselves have remained subject to political contestation. Given their sway in American and British academic contexts, they are suspected of becoming just another hegemonic form of thought, and as such, worthy of resistance. They have also come under attack for being used in conceptually unrigorous ways in a mainstream liberal arts education, which is to say used as loose synonyms for dominant social relations in almost any historical situation; for the subaltern status of certain minority groups within a nation, or for transnational cultural or religious practices as modes of resistance to the hegemonic pressures of the globalized economy. This expansion of intellectual, institutional, political, and ideological purview has, it is often thought, weakened the terms.

The untranslatability of "postcolonial" and "postcolonialism" may, paradoxically enough, be their greatest strength, for in becoming untranslatable they illuminate divergent concepts of the nation and national community; expose fault-lines in the modern nation-state; reveal the inherent violence of hegemonic intellectual and social practices; delegitimate assimilationism (and more specifically, the idea of a social contract based on the "integration" of all into one national model and language); and critique normalization in ways that have yet to be articulated in existing political and social idioms.

STILL, STILLE (GERMAN)

FRENCH   *calme, serein, silencieux; immobilité, sérénité, calme, silence*

➤ *MOTIONLESS*, *SILENT*, and AESTHETICS, CLASSIC, LEGGIADRIA,
   SECULARIZATION, *SERENITY*, SUBLIME

Because it unites three different semantic registers (spatial immobility, silence, and mystery) German *still* is privileged turf for untranslatability. Johann J. Winckelmann, who made it into the foundation of a central *topos* of classical aesthetics when he spoke of "*edle Einfalt und stille Größe* [noble simplicity and serene grandeur]," deliberatedly played on this ambiguity. In translating the notion of calm and serenity borrowed from French classicism as *Stille*, he created in German an aesthetic concept that is similarly untranslatable. *Stille*, the central characteristic of Greek beauty, refers for him not only to the physical motionlessness of the body but also to silence: Laocoön does not shout. This polysemy entails an entire theory of the sublime in art.

I. Initial Polysemy

The adjective *still* as well as the noun *Stille* have existed since Old High German. Already in that period their meaning was tripartite, referring at times to the realm of physical immobility (*still* means "without movement"), at others to the register of silence (without noise, without a word), or finally, by metaphorical extension, to that of secrecy and mystery (what is hidden, contained, concealed). Of those three senses it appears that the second is the most frequent. To those various meanings a mystical sense was already added in the medieval era. *Still* designates a state of serenity confident in the divine presence, a kind of *unio mystica*. Popularized by Luther through the expression "*die Stillen im Lande* [them that are quiet in the land]" (Ps. 35:20), the word *still* became a traditional motif of religious discourse, more specifically used, at the beginning of the eighteenth century, in Pietist circles and in the milieu of the Moravian Brothers. Ludwig von Zinzendorf frequently resorted to it. Nonetheless, the border between the various meanings remains hazy, which makes *Still* and its derivative terms difficult to translate.

II. A Central Concept of the German Classical Aesthetic

Winckelmann marks a major phase in the history of the word. In playing on the superimposition of meanings, on a fundamental untranslatability, he made of *still* a central aesthetic concept.

> The last and most eminent characteristic of the Greek works is a noble simplicity and serene grandeur (*eine edle Einfalt und eine stille Größe*) in gesture and expression. As the bottom of the sea lies peaceful (*ruhig*) beneath a foaming surface, a great soul lies sedate (*eine große und gesetzte Seele*) beneath the strife of passions in Greek figures.
>
> (Winckelmann, "Gedanken")

Stille becomes a major attribute of beauty. Its *locus* is ancient Greek art, but it can also be found in a rare few modern artists, such as Raffaello. In his use of the word, Winckelmann has recourse to two complementary strategies. He first of all plays with the ambiguities of German, effecting a slight displacement of meaning from the religious register of Pietistic *Stille* to the pagan space of ancient beauty. Even in greatest physical pain, Laocoön remains *still*, that is, at once serene, silent, and immobile, oscillating between sanctity and sublimity. In this way Winckelmann effects a secularization of the Pietistic notion of *Stille* while simultaneously imbuing Greek beauty with a strong spiritual dimension. This usage was taken up by a long tradition of writers: Herder, Hölderlin, Goethe. *Stille* became the attribute par excellence of classical man, the quintessence of Greekness—and did so until relatively recently, since the German philologist W. Rehm placed it in the very title of his great work on classicism, *Götterstille und Göttertrauer* (1951).

But *Stille* in Winckelmann was also nourished by a foreign linguistic source. A great reader of treatises of aesthetics of the seventeenth and eighteenth centuries, Winckelmann undertook to methodically forge a German lexicon of classicism by drawing on his European (and particularly French) library. His famous phrase "edle Einfalt, stille Größe" is, in fact, but the transcription of a commonplace of aesthetic literature, amply developed before him by C. A. Dufresnoy, R. de Piles, J.-B. Dubos, etc. In his manuscript collection, for example, he consigns such as it is the phrase *noble simplicité* in the French translation of a work by the son of Samuel Richardson. But Winckelmann was not satisfied with faithfully transcribing his sources. In translating the expression *grandeur sereine* as *stille Größe*, he confers on it a new density. In German *still* signifies not only "calm," "serene," "motionless," in the spatial realm, but also "silent" and "mute" in the vocal register. Winckelmannian calm invests the full range of speech. It designates fixity of muscles and suspension of voice. Whereas French is obliged to choose between *serein* and *silencieux*, Winckelmann knowingly plays on ambiguities in German that fuse the two registers. In rendering *sérénité* as *Stille*, he proliferates the semantic potentialities of calm and opens, in so doing, an extremely fruitful pathway to the theory of the sublime. It is, in fact, on the intrinsic ambiguity of the word *Stille* that his interpretation of the *Laocoön* is based: not only does Laocoön remain static in his effort, but he does not scream ("Gedanken"). This interpretation of the sublime is at the origin of a long debate on the role of the scream in art (Lessing, Hirt, etc.).

This deeply considered choice in translation, in fact, constitutes a foundational speech act. By making semantic potentialities that are separate in French converge in the concept of *Stille*, Winckelmann deliberately and genuinely created an untranslatable. It suffices, to be convinced of this, to read the French translations that, starting in 1756, sought to retranscribe *Stille*. Some choose immobility, others silence, and still others serenity. None renders all three. Winckelmann borrowed from French a concept that that language is incapable of translating back into French. The offshoot exceeds the matrix; the copy, the original. This irreversibility of translation should be seen as a forceful theoretical project. For Winckelmann it was a matter of bolting shut the German language, making it the depository of an original lexicon for classicism and, beyond that, of an inalienable aesthetic notion. Upon closer examination the *topos* "edle Einfalt, stille Größe" may owe its good fortune to a circumstance more profound than it appears to be: the

invention, from a traditional theme of European classicism, of an autonomous concept that resists all translation.

STIMMUNG (GERMAN)

DANISH *stemning*

FRENCH *accord, ambiance, atmosphère, humeur, disposition, tonalité affective*

➤ *DISPOSITION*, and CLAIM, DASEIN, GEFÜHL, GEMÜT, PATHOS, SUBLIME, *VOICE*

The multiplicity of possible French translations for *Stimmung* is in itself evidence of the resistance to translation offered by the term, which is quite properly regarded as a crux for translators. The principal difficulty is a function of the fact that the German term (or the Swedish *stemming* in Kierkegaard), in the sense that it has enjoyed since the eighteenth century, rests on an analogy between the musical (tuning of instruments) and the psychological (a person's way of being in agreement, his or her mood), for which neither English nor the Romance languages have any real equivalent.

Stimmung is a noun stemming from the verb *stimmen*, "to express out loud," "to have one's say on a subject" (whence *Stimme*, "voice," also in the sense of a vote: *vox populi / Stimme des Volks*), "to tune," "to be on pitch," "to be in tune." Applied to musical instruments starting in the sixteenth century, *Stimmung* was also used for humans by the beginning of the eighteenth century.

It is, in fact, from the tuning of instruments, their being on pitch, that *Stimmung* comes, particularly for the violin and the organ:

> das stimmen oder die stimmung der instrumente betrifft … hauptsächlich die geigen.
>
> (the tuning or the being-in-tune of instruments concerns … principally violins.)
>
> (Mattheson, *Der Volkommen Capellmeister*)

> Nichts ist schwerer, als die reine stimmung einer orgel.
>
> (Nothing is more difficult that the pure tuning of an organ.)
>
> (Schubart, *Ideen zur einer Asthetik der Tonkunst*)

From there *Stimmung* was transposed to humans, with, for example, Goethe's *Stimmung des Nervensystems* (toning of the nervous system) and Diderot's *Le Rêve de d'Alembert*, where the *ton* signifies "tension" (*tonus,* from the Greek *tonos*

[τόνος]). In Herder, moreover, it will be observed that the metaphorical sense of *Stimmung* is not yet a matter of course, in a consideration of the Stoic idea of idiosyncrasy:

> Jeder Mensch hat ein eigenes Maas, gleichsam eine eigene Stimmung aller sinnlichen Gefühle zueinander.
>
> (Every individual has a measure that is his own, a certain harmony, so to speak, that is his own, of all his sensory [as opposed to intellectual] feelings.)
>
> (Herder cited in Grimm, RT: *Deutsches Wörterbuch*)

This passage is precious in that it allows us to attend "live," as it were, the transposition of the musical sense to the aesthesiological—and even affective—sense. It is not without interest, moreover, to note that it was in the context of an analytics of the sublime that the term *Stimmung* seems to have made its true entry into the vocabulary of German philosophy, in Kant's *Critique of Judgement*:

> Die Stimmung des Gemüts zum Gefühl des Erhabenen erfordert eine Empfänglichkeit desselben für Ideen.
>
> (The proper mental mood for a feeling of the sublime postulates the mind's susceptibility to ideas.)
>
> (trans. J. C. Meredith)

As was previously the case with J. Gibelin, A. Philonenko translates *Stimmung* into French as *disposition*, a possible, but debatable, translation, that does not allow one to draw a distinction in French between *Stimmung* and *Anlage* (whose apposite terms in English include "aptitude," "tendency," and "predisposition").

It is occasionally the case that the musical background, which is most often implicit, is explicitly evoked, as in Ernst Jünger's *Die abenteuerliche Herz*:

> Es gibt ganz unvergleichliche Stunden, in denen der Mensch … sein Wesen wie ein Instrument in Stimmung bringt.
>
> (There are truly incomparable hours, in the course of which man … is able to tune his very being as if it were an instrument.)
>
> (in *Sämtliche Werke*, 9:173)

But it was only in the analyses of Heidegger (preceded by those of Max Scheler on sympathy) that the term *Stimmung*—notably in *Being and Time* (§29)—would become a key term in philosophical thought. On this question, consult F. Vezin's note in his French translation of *Sein und Zeit* (558ff.). "No sooner was it introduced than the word *Befindlichkeit* ["sensitivity to the situation" (R. Boehm and A. de Waelhens), "affection" (E. Martineau), "disposability" (F. Vezin)] was associated with *Stimmung* (disposition, mood) and the whole range of words in the *Stimmung* family" (*Sein und Zeit*, §29).

■ See Box 1.

In his Cerisy lecture, *Was ist das—die Philosophie?* (*What Is Philosophy?*), Heidegger relates *Stimmung* to the Greek *pathos* [πάθος], which he renders in French as *disposition*:

> Nur wenn wir pathos [πάθος] als Stimmung (disposition) verstehen, können wir auch das thaumazein, das Erstaunen näher kennzeichnen.

1

Words of the *Stimmung* family according to M. Heidegger

In paragraph 29 of *Sein und Zeit,* Heidegger writes,

> Was wir ontologisch mit dem Titel Befindlichkeit anzeigen, ist ontisch das Bekannteste und Alltäglichste : die Stimmung, das Gestimmtsein. … Dass Stimmungen verdorben werden und umschlagen können, sagt nur, dass das Dasein je schon immer gestimmt ist. Die oft anhaltende, ebenmässige und fahle Ungestimmtheit, die nicht mit Verstimmung verwechselt werden darf, ist so wenig nichts, dass gerade in ihr das Dasein ihm selbst überdrüssig wird. … Die Stimmung macht offenbar, "wie einem ist und wird." In diesem "wie einem ist" bringt das Gesimmtsein das Sein in sein "Da."

> (What we indicate *ontologically* by the term "state-of-mind" is *ontically* the most familiar and everyday sort of thing: our mood, our Being-attuned. … The fact that moods can deteriorate and change over means simply that in every case *Dasein* always has some mood. The pallid, even balanced lack of mood, which is often persistent and which is not to be mistaken for a bad mood, is far from nothing at all. Rather, it is in this that *Dasein* becomes satiated with itself. … A mood makes manifest "how one is, and how one is faring." In this "how one is," having a mood brings Being to its "there.")

(trans. J. Macquarrie and E. Robinson)

And now two French versions:

Ce que nous indiquons ontologiquement sous le titre d'affection est la chose du monde la mieux connue et la plus quotidienne ontiquement: c'est la tonalité, le fait d'être disposé. … Que des tonalités puissent s'altérer et virer du tout au tout, cela indique simplement que le *Dasein* est chaque fois toujours déjà intoné. L'atonie, c'est-à-dire l'indifférence persistante, plate et terne, que rien n'autorise à confondre avec de l'aigreur, est si peu insignifiante que c'est en elle justement que le *Dasein* devient à charge pour lui-même. … La tonalité manifeste "où l'on en est et où l'on en viendra." Dans cet "où", l'être-intoné transporte l'être en son "Là."

(trans. E. Martineau, 113)

Ce que nous dénotons ontologiquement sous le terme technique de disponibilité est du point de vue ontique on ne peut plus connu et on ne peut plus quotidien: la disposition, l'état d'humeur. … Or que veut dire que des dispositions de l'humeur puissent s'altérer et connaître des reviremenents, sinon qu'on chercherait en vain un cas où le *Dasein* ne soit déjà disposé? La morosité souvent persistante dans sa monotonie et sa grisaille, mais qui ne saurait se confondre avec la mauvaise humeur, est si peu rune que c'est justement en elle que le *Dasein* en arrive à n'en plus pouvoir de lui-même. … La disposition révèle "comment on se sent," "comment on va." En ce "comment on va"» l'être disposé place l'être en son "là."

(trans. F. Vezin)

There appears here the "entire register of words belonging to the *Stimmung* family": *Gestimmtsein, stimmen, Ungestimmtheit, Verstimmung*, rendered respectively in French as: *tonalité, fait d'être disposé, (être) intoné, atonie, aigreur/disposition, état d'humeur, (être) disposé, morosité, mauvaise humeur*. That neither of the two French translations manages to capture the paronomasia of the German text shows the resistances offered by the term *Stimmung* to any attempt at translation.

The lapidary sentence in paragraph 31 of *Sein und Zeit*: *Verstehen ist immer gestimmtes* (Understanding always has its mood), has been translated into French either in a way quite unintelligible in its platitude as *Le comprendre est toujours déjà in-toné* (E. Martineau) or more expressively as *Entendre est inséparable de vibrer* (F. Vezin), a translation whose success one feels obliged to salute. However insurmountable the difficulties specific to the translation of *Stimmung* and its related terms may appear, the resources of French occasionally manage to escape the trap of woodenness.

(It is only if we understand *pathos* as *Stimmung* (disposition) that we can also characterize in a more precise way *thaumazein* (θαυμάζειν), astonishment.)

(trans. Jean T. Wilde and William Kluback)

One should, however, in this specific context, understand the *pathos* discussed by Plato and Aristotle with regard to astonishment as something other than "passion," and not decree as a rule that the French translation of *Stimmung* is "*disposition*," since the result would be to sacrifice the musical resonance of the German term. The expression *tonalité affective* (affective tone), to which French translators of Nietzsche and Heidegger occasionally resort, attempts to reconcile the two dimensions brought into contact by the term *Stimmung*.

Stockhausen and *Stimmung* in music

In music, the word *Stimmung* takes on a double meaning: as a practical term and as a distant analogy with the philosophical scheme subtending the question of *Stimmung*. Historically, Karlheinz Stockhausen was the first composer to have treated the voice according to an environment no longer partaking of a single vocal technique or aesthetic conception, but of a state characterized by the composer as atmospheric, by virtue of the terminological ambiguity of *Stimmung*. In 1968 he composed a work titled, precisely, *Stimmung* for six voices, a work that would become a kind of philosophical manifesto for musical production in the second half of the twentieth century.

In evoking the complex climate in which a musical work written for one or several voices evolves, composers use the German word *Stimmung*. The use of *Stimmung* as an expression capable of representing a notion exceeding the framework distributing voices by register is recent. It is owed to Stockhausen (born in Cologne in 1928), who, in 1968, voluntarily cast aside the traditional labels used to designate the full range of sound-based activities and phenomena. Stockhausen indicated explicitly that *Stimmung* owed nothing to *Stimme*, the voice. *Stimmung*, on the model of *Stimme*, is far removed from a logic of heights. It occupies a place that can be qualified as spectral by virtue of its radiating and molecular function in the musical realm—spectral music, which emerged at the end of the 1970s, explored the vibratory and acoustic dimensions of sound-phenomena in particular. It should for this reason be regarded as the very paradigm of the musical in the sense that it figures simultaneously the divagations of composition, its dual notations, and the injunction of the subject that it causes to resonate beyond the procedures involved in prior elaborations.

The paths of music for Stockhausen are consigned to the voice, insofar as it is an ambiguous drive, a site capable of simultaneously representing transversal categories of the musical. To give form to voice would amount to treating it as a raw material. By modifying the contours of a sound, note, or spectrum, one thus modifies the vocal envelope and, as a result, both timbre and perception. This is why Stockhausen speaks of a "composition of timbres" (cf. Cott, *Stockhausen: Conversations with the Composer*). Each sound is endowed with its own inner life, a fortiori the timbres of voices conceived as arrangements of spatial and temporal textures. This is why the composer takes delight in specifying that the word *Stimmung* conveys a significant and, no doubt, contradictory

ambivalence. It signifies, in point of fact, a chord, resonance, vocal form, and, a fortiori, a form of meaning of all vocal manifestations. It can in no way be reduced to voice as designated according to the barometer of registers and tessituras. In the beginning, the composer had wanted to "experiment on himself certain sets of sounds; I would see what happens each time I concentrate on a different part of my body" (ibid.). Stockhausen opted to shatter the concept of *Stimme*, deemed to be too reductive with regard to the deployment of timbres and spaces of the vocal phenomenon in its interiority. The piece was written to last one hour. It is entirely articulated on the founding principle of a single chord. The latter, conceived and composed as the harmonic spectrum of one sound (B-flat) never sung and never heard, is assumed to "timbrify" harmonic verticality, giving it an expansion beyond its frame, its voice, or any recognizable attack of pitch and rhythm. The procedure at work consists in an accumulation of compositional and formal analogies. Singers agree on that inaugural chord in search of a symbolic order. In German the verb "to agree" is *stimmen*. For Stockhausen, *Stimmung* will become "the action of coming to agreement"—as though the natural resonance of B-flat were in a situation allowing it to engender the form of the piece, following a generative procedure specific to the voice and its capacity to go beyond the question of intelligibility. *Stimmung* is not the art of the signifier or of signification. Every vocal timbre (two sopranos, a tenor, a baritone, a bass) stems from a polyphony of attacks and durations obliging the voice-material to organize a discourse without recognizable narrativity, no more than the syllabic substrate needed to maintain an assemblage of individuated voices. There are two *Stimmungen*, one of an acoustical nature, in order to cause the *Klang* (sound) to resonate and convey a series of onomatopoeic utterances, that are in turn subjected to the sovereignty of the harmonic deployment; the other of a temporal nature, in order to give that chain of nonsignifying onomatopoeic utterances the value of a petrification of the chronology of events. The *Stimmung* petrifies the place from which it springs. It casts it in a situation of entropy. The voice disappears behind this phenomenon of molecular atmospheric suspension transmuting the aerial materiality of voice into a quasi-aquatic—and even plasmatic—texture. Whence Stockhausen's quest for an original and originary *Stimmung*, prior to the speaking and singing voice. Each chord latches on to another as though it were the very texture into which

the time of the work was woven—or its form. Stockhausen insists that every *Stimmung* is organized around a single chord (or spectrum). Technically, the singers decline the first second, third, fourth, sixth, and eighth harmonics of a fundamental sound, which is itself treated spectrally since it is absent. Each chord "timbres" another, even as it retains its architectonic singularity. The word *Stimmung* is untranslatable because of the prolixity of the parameters it implements to designate a set of perceptible but nonrecognizable processes. Stockhausen seeks what he calls "an experiment without finality," a transition from what can be designated to what acts without our knowledge. In that sense, one might say that the musical *Stimmung* is a composition of pure voices, which is not addressed to meaning, which rather attempts to suspend it, or even to interrupt it. *Stimmung* unbinds voice. In harkening to its origin, in this case its fundamental sound (B-flat), it resists the discursive temptation. "If you listen to *Stimmung*," Stockhausen writes, "you will see that there is nothing but a chord, and a single one, during the seventy-five minutes of the work's duration" (Cott, *Stockhausen: Conversations with the Composer*). On the other hand, and as though he wished to conjure away the risk of a fusion of voices or the magma, Stockhausen is careful to interpret the notion of *Stimmung* in his most precise (and even obsessional) writing configurations. Timbres and rhetorical figures of chordal setting—or, as one might say, "a vocal setting"—are scrupulously decrypted: "I noted them quite precisely, using the signs of international phonetics and assigning them numbers" (ibid.). One observed a reversal of functions. *Stimmung* slips ostensibly from the protean to a coded cartography, a grammar of timbres and their specific temporalities applicable to all instruments, but whose initial model remains the voice.

STRADANIE [страдание] (RUSSIAN)

ENGLISH	suffering
FRENCH	souffrance
GREEK	pathos [πάθος]
LATIN	passio

➤ *SUFFERING*, and *LIBERTY*, *MALAISE*, PATHOS, RUSSIAN, SAMOST', SOBORNOST', SVOBODA, WORK

The Russian noun *stradanie* [страдание] stems from the common Slavic root *strad-*, which means principally suffering and passion; and yet *strada* [страда], from which Slavonic *stradati* [страдати] (suffering) is derived, signifies first of all, "effort, painful labor." Activity and intensity are thus linked to passion in *stradanie*—whence perhaps the preeminence of suffering, its moral and cognitive value, and its accent, in Russian, on spirituality.

I. *Stradanie*: An Active Passion

The root *strad-*, from which *stradanie* [страдание] comes, establishes a connection between suffering and passion: in Russian, Serbian, and Croatian, *strast'* [страсть] signifies "passion," whereas in Czech the word has retained its initial sense of suffering and affliction (RT: Herman, *A Dictionary of Slavic Word Families*, 493–94; Vasmer, *Ètimologicheskiĭ slovar' russkogo iazyka* [Etymological dictionary of the Russian language], 770–71). The idea that passion is essentially a form of suffering is present in both Greek *pathos* [πάθος] and Latin *passio* (RT: Herman, *Dictionary of Slavic Word Families*, 494). A. Kenny proposes that the Latin word, derived from the verb *pati* (to undergo, to suffer), initially designated suffering as submission (to an action or influence) and that it was only subsequently that the notion of submission to a particular kind of influence—in the sense of an intense affect—acquired the modern meaning of *passion* (Kenny, *Aristotle's Theory*, 28). The connotation of passivity has thus remained quite present in the French words *passif, patient, patience*, etc.

Similarly, the Latin verb *sufferre* possesses the passive sense of undergoing, which has been largely conserved in the modern verbs *souffrir* in French and "to suffer" in English, as well as in the nouns *souffrance* and "suffering." In contrast Slavonic *stradati* [страдати] (to suffer) is derived from *strada*, which first meant effort, then painful labor, before taking on the sense of torment (RT: Tsyganenko, *Ètimologiceskij slovar' russkogo jazyka* [Etymological dictionary of the Russian language], 456). In Slavonic *stradati* also has the meaning of "working painfully" and "seeking to obtain" (Vasmer, *Ètimologicheskiĭ slovar'*, 770). In modern Russian *strada* [страда] still signifies "painful labor during harvest." Thus *stradati* corresponds to the Latin *actio* (action) rather than *passio* (submission): this is similarly the case for the modern term *stradat'* [страдать], which means "to suffer" in contemporary Russian.

II. The Value of *Stradanie* in Russian Tradition

Another notable characteristic of *stradanie* resides in the elevated moral value that the Russian spiritual tradition attributes to suffering. As we are reminded by Fedotov, the first saints canonized by the Russian Orthodox Church, Boris and Gleb, died as victims of a political conflict in a feudal context, and precisely for that they are considered to be the greatest of the Russian Orthodox saints (Fedotov, *Russian Religious Mind*); they thus acquired the status of a particular kind of saint marked by the state of debasement and destitution that Paul called *kenosis*. Such saints are sufferers (*stradal'tsy* [страдальцы]): they are not martyrs of the faith, but "only men," just martyrs. Nonetheless, through their suffering itself, they deserve to be canonized:

> It is noteworthy that the Russian Church which loves the sufferers so much gives no outstanding place among her national saints to the martyrs who in the Greek, as well as in the Roman Church, always occupy first place both in the liturgical and popular cult.
>
> (Fedotov, *Russian Religious Mind*, 1:105)

In other words, the Russian spiritual tradition suggests that suffering "in itself," in its most extreme form—as nonresistance to death—is itself worthy of particular veneration.

The active character of *stradanie* and its moral value take on great importance in the novels of Dostoyevsky:

> Perhaps it is not only prosperity or well-being that man loves. Perhaps he passionately loves (*do strasti* [до страсти]) suffering (*stradanie*) as much as prosperity. I am sure that man never refuses genuine suffering (*stradanie*), that is, destruction and chaos.
>
> (Dostoyevsky, *A Writer's Diary*, quoted in Berdyayev, *Dostoyevsky*, 51)

Suffering, in all its meanings, typifies Dostoyevskian "man," characterized by his contradictory and painful passions, internal conflicts, and rich inner life catalyzed by the "ultimate questions" of life. It is suffering that allows Dostoyevsky to maintain a meliorist moral position.

In his book on Dostoyevsky, Berdyayev evokes both his moral and cognitive sense of *stradanie*:

> Dostoyevsky put his trust in the expiatory and revivifying force of suffering (*stradanie*). For him, life is essentially redemption, expiation of an individual's errors through suffering.
>
> (Berdyayev, *Dostoevsky*, 94)

From this point of view, *stradanie* represents a necessary aspect of the *svoboda* [свобода] (freedom) of the person (*ličnost* [личность]):

> Man is a responsible creature. His suffering is not innocent. . . . The road to freedom [*svoboda*] is that of suffering. There is always a temptation to liberate man from suffering by stripping him of his freedom. Dostoyevsky is an apologist of freedom. That is why he proposes that man accept suffering [*stradanie*] as an inevitable consequence of his freedom.
>
> (Ibid., 109)

The difficulties experienced in translating the Russian term *stradanie* are linked, on the one hand, to its meaning as active intensity and, on the other, to the exalted moral and cognitive value of suffering in Russian spirituality.

STRENGTH, FORCE

FRENCH *force*

➤ DYNAMIC, FORCE, and ACT, AGENCY, MOMENT, PATHOS, SOUL

"Strength" and "force," but also "vivacity" and "vividness," derive their meaning within a project already largely launched by Hobbes and Hume, and which Jeremy Bentham characterized as "psychological dynamics." "Strength" and "force" designate a mental or physical process in motion: both name the difference between the state of a psychical (or physical) system at a given moment and another state of what one wants to identify as the "same" system, totally or partially affected by that difference. No more than for Hume, a force is not, for John Stuart Mill, an "existing fact" but rather "a name for our conviction that in appropriate circumstances a fact would take place" (*A System of Logic*). He could have said the same thing about strength. However, the word "strength" remains quite close to the adjective "strong" and the verb "strengthen": its vitalist connotations are hospitable to the objectivity demanded by a calculation.

I. The Distinction between "Strength" and "Force"

A. Mathematical aspects of the two notions

"Strength" and "force" are all the more difficult to distinguish in French translation in that the subterfuges resorted to as a solution, such as *vigueur* or *violence,* have their cognate counterparts in English (vigor, violence*)*, and they regularly accompany "force" or "strength" without being synonyms ("force and vigour" [Hume*, A Treatise of Human Nature*]; "force and violence" [ibid.]). French is constrained to speak uniformly of *force*, whereas English can use two terms concurrently to describe mental processes. Hume can even use the expression "strength and force of a body" (ibid.), without giving the impression of saying the same thing twice. No doubt, one speaks as easily of "force of mind*"* as of "strength of mind" (ibid., 418; Bentham, *Chrestomathia*, 5); of "force of the passion" (Hume, *A Treatise*, 427) as of "strength of the passion"; or of "force of imagination" (ibid., 319, 364, 385) as of "strength of imagination": but the intentions are different.

"Strength" is chosen to designate a tendency to increase or decrease without any calibration of degrees. "Strength" is always felt as being very close to the verb "strengthen." "Force" entails greater quantitative precision and discourse in terms of degrees. Hume speaks of "degrees of force" (*A Treatise*, 2, 5, 97, 103, 116, 119, 133, 138, 143), with all sorts of variants of forces superior, equal, or inferior to others (ibid., 150, 187, 194) rather than of "degrees of strength," and of "additional force" (ibid., 100, 184, 391, 420, 422, 426) rather than of "additional strength." In order to constitute his psychical dynamics, Hume borrows the word "force" from the natural philosophy and physics of his time, and "force," not "strength," signals that loan.

However, despite its arithmetical indetermination, "strength," more easily than "force," appears to express a geometrical sense, when forces balance out "obliquely" or, according to the law of the parallelogram, in conformity with a logic partaking of what would soon be called "vectorial calculus." Quite remarkable from this point of view is the change of terms when one passes from the first book of *A Treatise on Human Nature* to the second, which deals with the passions; the latter, which seeks to open a psychical space and attempts to develop a geometrical conception in their regard, resorts frequently to the term "strength" and expressions derived from it, like "as far as its strength goes" (*A Treatise*, 130, 278); on the other hand, the first book uses only "force" for mental processes, envisaged probabilistically (in sums of instances and cases [ibid., 130, 147, 163]), algebraically, or arithmetically (when it is a matter of the "addition of forces" [ibid., 130]).

The essays of Bentham on "psychical dynamics" confirm this point. "Force" is almost exclusively preferred to "strength" since it is a matter, if not of effecting a calculation, at least of attaining the conditions for doing so (*Chrestomathia*, 66, 68, 73, 283, 297, 303). Bentham is little inclined to Latinize his English, but if "strength" is geometrical in its connotations, and if the tendency of geometry, as noted in the *Chrestomathia,* is to be absorbed in an increasingly symbolic and algebraic discourse, one understands that the word "force" will emphatically take over.

B. The biological meaning of "strength"

"Strength," in addition, includes biological (and even vitalistic) aspects. One speaks of the "strength" of a body or a mind to emphasize its vital presence (Hume, *A Treatise*, 279, 299, 326, 365), even if it means appreciating the desire to excel in *strength* as an inferior ambition (*ibid.*, 300). Whereas "force" is implicated by the study of dynamics in a purely descriptive manner, in the way of objective observation, and inscribed in an artificial system of observation or measurement (ibid., 631), "strength," on the other hand, collaborates with the process, participates in it, regards it as a "strain," and posits itself as a manner of feeling it (Hume speaks willingly of "strength of conception" [ibid., 627]).

Force as a physical phenomenon is fundamentally related to a movement of transference: it can be "transported" (ibid., 176), "escorted" (142), or "transfused" (386); it "circulates" and is "exchanged" (109). Strength is more difficult to transport; it participates in another kind of movement, waxing and waning, which is rather sui generis. Thus the word "strengthen" almost always has the meaning of "firming up" from within rather than "reinforcing" from without. Hume speaks about resemblance that "*strengthens* a relation" (ibid., 112, 308, 349): in the same sense he writes, "strengthen the connection" 238). But it is always, in Hume, a supply of force that is qualified as new (131, 391, 421) and not some reinforcement of *strength.*

II. Adjacent Notions: "Vivacity," "Vividness," "Liveliness"

It is interesting to note with which notions "strength" and "force" are most often coupled in a philosophy that (like

Hume's) often uses concepts in pairs, without one term being strictly the equivalent of the other, but rather supplementing, specifying, displacing, and reorienting it.

One thus finds "force and evidence" (*A Treatise*, 31, 156, 197), an expression meaning not that evidence or proof is the same thing as force, but that the evidence or proof of an argument constitutes a kind of nonphysical force, partaking rather of "authority," which is often coupled with "weight" (ibid., 324). Hume speaks indifferently of the "force" of principles (ibid., 143, 198) or of their "authority" (31). "Forced" is paired with "unnatural" and denotes artifice (185).

Among these couplings, by far the most frequent is the linkage "force and vivacity" (ibid., 2, 85, 86, 96, 97, 98, 99, 119, 120, 122, 134, 138, 142, 143, 144, 148, 153, 184, 199, 215, 317, 354, 362, 365). If "force" is to be understood in a conceptual sense implying a link between mass and speed (whether or not it is squared), "vivacity" plainly signifies the speed required by dynamics. "Liveliness," often compared to "vivacity," is clearly differentiated from it, referring to a descriptive or phenomenological quality, whereas "vivacity," like "force," enters into a perspective of calculation: in the case of each of them one can add or subtract degrees (ibid., 19, 100, 112, 135, 137, 141, 354, 424). Vivacity, like force, can be divided, multiplied, accompanied (112, 142, 145, 208, 290). As for vividness, it is quite precisely what can be "quickened by some new impulse" (396).

French is tempted to translate with the single word *rapidité* the words "vivacity," "vividness," and "liveliness," but, in so doing, it effaces the difference between those terms, the first two of which are oriented toward speed, and the other toward life.

STRUCTURE, PATTERN, GESTALT

FRENCH   *structure*
GERMAN   *Struktur, Gestalt*
LATIN   *structura*

➤ AGENCY, ANALOGY, BEHAVIOR, CONCETTO, DISEGNO, *FORM*, GEISTESWISSENSCHAFTEN, LOGOS, *WORLD* [WELT, Box 1]

"Structure," a concept originating in architecture, designates the skeleton or armature, as opposed to the form or outer appearance. In the twentieth century, the use of "structure" has extended from linguistics and anthropology to the whole of the human sciences. Structuralism tends to conceive structure as an unvarying (but abstract or latent) network of relations. The hegemony of "structure" is in competition with the English "pattern" disseminated by psychologists and biologists. "Pattern" rejects the surface-structure opposition and designates a configuration that is less abstract, less rigid, and less permanent than structure. The German *Gestalt* (form) places the accent (like "structure") on form conceived as a set of relations, but shares with "pattern" a sense of the visual due to its roots in the psychology of perception.

I. *Structura*, Architectural Structure

In the nineteenth century, Viollet-le-Duc opposed (functional) architectural structure to exterior form and style. Latin *structura* (from *struere*, to dispose by layers, to dispose with order, to construct) designates: (1) the material or masonry of which walls are made (Vitruvius, *De generibus structurae* [On types of masonry], book 2, chap. 8); (2) the building itself, the edifice; (3) figuratively, the arrangement or disposition, for example, of words in the sentence to produce a rhythm ("verborum quasi structura" [so to speak, the masonry of the sentence]; Cicero, *Brutus,* 33). *Structura* thus designates the armature, the skeleton, what makes (a building, the human body) hold up as opposed to the appearance, the outer "form." Viollet-le-Duc (*Entretiens sur l'architecture*, 1863–76) defines Gothic architecture not by its style, but by an interplay of weights and thrusts, that is, by its functional structure. This is why Hubert Damisch sees in him the precursor of "structuralism" in the modern sense. The subordination of form to function by Viollet-le-Duc ("Everything is a function of structure") was taken up by the American architect L. H. Sullivan (*Form Follows Function*). It is opposed to the formal/stylistic approach given priority in the Germany of H. Wölfflin and A. Riegl and is clearly distinguished from the "nature" of the Gothic as defined by J. Ruskin, who, without failing to recognize the architectural structure, places more of an accent on the "moral elements" of Gothic design, notably on its capacity for infinite variety, its musical analogies, its naturalism ("The Nature of Gothic," in *The Stones of Venice*, 1853).

English continues to use "structure" regularly in the sense of building. This is notably the case in E. Panofsky's study *Gothic Architecture and Scholasticism*; only the back cover uses "architectural style" and "structure" in the abstract sense of Viollet-le-Duc. Similarly "the social structure" (in English, with the definite article) designates the "social edifice" and not *la structure sociale* in Lévi-Strauss's sense.

II. Structure, System, Model

In the twentieth century, "structure," for linguists and anthropologists, then for the full range of the human sciences, designated an abstract and invariant model, "the relational system latent within the object." The happy fate of "structure" in the human sciences of the twentieth century (whence "structuralism") stems from its use by linguists and anthropologists. Saussure did not use the word in his *Cours de linguistique générale*; it was C. Lévi-Strauss who popularized it (*Structures élémentaires de la parenté*, 1949; *Anthropologie structurale*, 1958, 1973), invoking the model and methods of Trubetskoy's phonology ("La Phonologie actuelle," 1933). For Lévi-Strauss, phonology succeeded in abandoning the study of conscious linguistic phenomena in order to focus on their underlying unconscious structure; it was interested not in isolated elements, but in relations between elements; it introduced the notion of system,

revealed concrete phonological systems, and exposed their structure; it aimed at establishing, inductively or deductively, general laws (see in particular "The Structure of Myths," in Strauss's *Structural Anthropology*). While structuralism underscored above all the "relational" character of structure, it should also be noted that the Lévi-Straussian structure pursued the opposition between (deep) structure and (apparent) form; if structure is an "unconscious" or "latent" system, one can better understand Lacan's formula, "The unconscious is structured like a language." What is more problematic is the precise relation between structure, system, and model: is there an underlying structure to every system, or is the structure the shared invariant of all the systems whose diversity is only apparent or relative? On this point, Lévi-Strauss gives answers that appear to be contradictory. After affirming that "the fundamental principle is that the notion of social structure does not relate to empirical reality but to the models constructed from it" (*Structural Anthropology*), he nonetheless takes his distance from the formalism of V. Propp (1928):

[A]s opposed to formalism, structuralism refuses to oppose the concrete to the abstract, and to recognize in the latter a privileged value. *Form* is defined in opposition to a matter which is foreign to it. But structure has no distinct content; it is the content itself, apprehended in a logical organization conceived as a property of the real.

The use of "structure" by T. Todorov is closer to Propp's formalism:

Each work is thus considered [by poetics] only as the manifestation of an abstract and general structure, of which it is only one of the possible realizations. It is in this, that that science is not concerned with actual literature, but with potential literature, in other words: with that abstract property which is the singularity of the literary fact: its *literarity*. The aim of this study [is] to propose a theory of the structure and functioning of literary discourse, a theory presenting a tableau of literary possibles, in such manner that existing literary works appear as particular and locally realized cases.

(*Introduction to Poetics*)

It was precisely the abstract and totalizing character (as well as the scientificity) of "structure," which made one lose sight of the concrete and individual texture of the text that Roland Barthes criticized: a sequence carved out of a Balzacian text, he maintained, has a basis that is "more empirical than rational, and it is useless to attempt to force it into a statutory order; its only logic is that of the "already-done" or "already-read"—whence the variety of sequences (some trivial, some melodramatic) and the variety of terms (numerous or few); here again, we shall not attempt to put them into any order. Indicating them (externally and internally) will suffice to demonstrate the plural meaning entangled in them" (*S/Z*). The plural text, infinitely dispersed, like the instability of particles of dust or the shimmering of meaning, traces a semantic field closer to that of "pattern" than of "structure."

Il s'agit, en effet, non de manifester une structure, mais autant que possible de produire une structuration. Les blancs et les flous de l'analyse seront comme les traces qui signalent la fuite du texte; car si le texte est soumis à une forme, cette forme n'est pas unitaire, architecturée, finie: c'est la bribe, le tronçon, le réseau coupé ou effacé, ce sont tous les mouvements, toutes les inflexions d'un *fading* immense, qui assure à la fois le chevauchement et la perte des messages.

(We are, in fact, concerned not to manifest a structure but to produce a structuration. The blanks and looseness of the analysis will be like footprints marking the escape of the text; for if the text is subject to some form, this form is not unitary, architectonic, finite: it is the fragment, the shards, the broken or obliterated network—all the movements and inflections of a vast "dissolve," which permits both overlapping and loss of messages.)

(Barthes, *S/Z*)

III. *Gestalt*, Form, Configuration

"Gestaltism," or the theory of form, places the accent on "totality," but remains principally restricted to psychology, even as the German word *Gestalt* remains restricted to a specialized lexicon.

Stemming from a past participle of *stellen*, "to put (together), to compose, to create," *Gestalt* (form, configuration) belongs to ordinary German usage, but has been used by psychologists, on the basis of the *Gestaltsqualität*, the "quality of form" of C. von Ehrenfels (1890), to designate the global form perceived as such, the whole or "totality" (*Ganzheit*) that is more than the sum of its parts. The examples most frequently cited are those of melody (which is more than the sum of the notes composing it) and optical illusions, in which global perception wins out over analytic perception. In that sense, disseminated by *Gestalttheorie*, *Gestalt* seems almost synonymous with structure. Here is the definition of that theory proposed by E. Clarapède in 1926:

It consists in no longer considering phenomena as a sum of elements that it would be above all a matter of isolating, analyzing, and dissecting, but as sets (*Zusammenhänge*) constituting autonomous units, manifesting internal solidarity, and having their own laws. It follows from this that the mode of being of each element depends on the structure of the set and the laws governing it.

(RT: *Vocabulaire technique et critique de la philosophie*)

Gestalt, nonetheless, insists more on the totality, and "structure" on the relational network; above all, *Gestalt* is distinguished from "structure" in the sense that it is perceived as such from the outset. It refers not to mathematical models, but to geometric figures. The link with (principally visual) perception explains its assignment to the fields of psychology and aesthetics.

In the 1930s, the theory and lexicon of *Gestalt* were disseminated in Anglophone countries by intellectuals of German origin like W. Koehler, one of the founders of the

theory, K. Koffka, and R. Arnheim. Panofsky quotes Arnheim, and the analogy he sketched between the Gothic cathedral and Scholastic philosophy is based on the Gestaltist concept of "totality," assimilated to the Thomist concept of the *Summa.* For Panofsky, indeed, *Gestalt* psychology breaks with the nineteenth century, with its scorn for sense perception, and reconnects with Saint Thomas, who deemed the senses to be endowed with "a kind of reason" (sensus ratio quaedam est). Like the *Summa theologica*, the Gothic cathedral aspired to "totality," and its "structural design" offered a simplified and pared down synthesis of all the principal architectural "motifs" elaborated by the prior tradition (*Gothic Architecture and Scholasticism*). E. Gombrich frequently cites *Gestalt* psychology, notably the work of Koehler and Arnheim, while proposing to rectify and complete it with the help of Popper and information theory, putting the accent not on the simplicity of the form or configuration, but on an innate sense of order that makes us look for and identify symmetrical *patterns* in our environment and makes us particularly attentive to every deviation in relation to that symmetry (*The Sense of Order*).

Attempts at translating *Gestalt* into French have not supplanted the original. Alongside *théorie de la forme* (Guillaume, 1937), we also find *psychologie de la Gestalt*, *théorie de la Gestalt*, *gestaltisme.* In English, "configurationalism," proposed by Tichener in the 1920s, had even less success against Gestalt Psychology, Gestalt Theory, Gestaltism, Psychology of "Gestalt," and Gestalt School of Psychology.

IV. "Pattern," "Design," "Structure"

"Pattern" (Fr. *patron, modèle*) remains currently in common use in English, particularly for biologists and cognitivists, to designate arrangements or configurations, whether empirical, natural, or artificial, which are more concrete and more varied than structures.

The English "pattern" is the same word as French *patron*, derived from Latin *pater*, "father," whence *patronus*, "patron, protector, guide," and later "model" or "design" in embroidery, weaving, tailoring, etc. The concept remains, for the most part, linked to the decorative arts, which limits its capacity for abstraction. A "patterned material" is one with motifs, a "pattern book" a book of models (for architects), an assemblage of samples (for weavers or tailors). As R. Escarpit has well shown, a pattern is something that is recognized, that emerges from random surroundings, and the concept is linked to design (including the capacity to design or conceive patterns; "Du Pattern à la structure").

Five characteristics distinguish a pattern from a structure: (1) Pattern is associated with what is concrete, and with daily experience (Escarpit: "A pattern is not the elaboration of an experience, it is an experience"). (2) A pattern belongs to the surface of the object, it merges with it. In the case of lace, the pattern is inseparable from the material itself (Gombrich, *The Sense of Order*). The design of the pattern may not be immediately apparent (as in Islamic patterns in which the name of Allah is at first neither legible nor even visible for the Westerner, who initially sees only "pure" geometric arrangements; Gombrich, *The Sense of Order*), but it is difficult, indeed impossible, to speak of deep patterns, as one does of "deep structure" (Barthes, *S/Z*). (3) Pattern permits

variation. This may seem paradoxical since a pattern is originally what is able to be reproduced, but the field of decoration favors, along with identical repetition, variation—in color or otherwise—in relation to the original. Certain patterns, like moiré, appear to be mobile. English commonly refers to changing, shifting, flexible patterns (Gombrich, *The Sense of Order*). (4) Concordantly, pattern can integrate a temporal dimension, as sequence, rhythm, melody, or dance (Gombrich, *The Sense of Order*): it is thus lacking the ahistorical character attaching to structure, despite the efforts of Viollet-le-Duc or Lucien Goldmann to endow it with dynamism. (5) If pattern is opposed to the random, the chaos of the aleatory, it can nonetheless include it; there is no problem in speaking of random patterns. A work on paper by Jackson Pollock titled *Pattern* (ca. 1945, the Hirschhorn Museum, Washington), crazy pavements (whose paving stones are irregular in shape), and crazy quilts (in French . . . patchwork) are so many artificial patterns that give chaos, so to speak, its share and which, to that extent, resemble Brownian motion, the "eternal combat" of the atoms in Lucretius, or the disposition of the spots on a leopard: patterns and not structures. What appears here is the ambiguity of "design," both *dessin* and *dessein* in French, and which leaves unresolved the question of intentionality (see DISEGNO). The fact that there are patterns in the biological world is less the indication of an overarching divine "design" than that of the infinite variety of Darwinian "design" emerging from chaos: a sensibility attuned to Ruskin, moreover, will see no contradiction in those two uses of "design."

The use of "pattern" by scientists has itself grown in diversity and flexibility. Behaviorists used to speak rather schematically of behavior patterns and pattern reactions. This was also the case for sociologists. "Pattern" evokes "schema" in such cases. American "structuralist" anthropologist-linguists, like E. Sapir or T. A. Sebeok, use "pattern" and "structure" practically interchangeably (Sebeok, *Language in Culture and Society*). The concept was pressed into service anew in the 1970s, thanks to computer science and psychology, both of which speak of pattern recognition; it will be noted that once again the forms or patterns in question can be either natural or artificial. Currently a number of biologists play on the two terms "structure" and "pattern," through which they tend to designate respectively a framework determined by the intangible laws of physics and chemistry, and the visible and shimmering variety of forms assumed in the world of living creatures (e.g., Turing patterns—leopard spots, or butterfly wings—whose design is explained by the theory of the mathematician Alan Turing). The part played by chaos has been palpably reduced, and there has been a return, in biology, to a conception close to that of Lévi-Strauss in the human sciences, with the invariant of structure intuited or unveiled behind the appearance of change in the kaleidoscope or pattern (Ball, *The Self-Made Tapestry*).

We will conclude by observing that it is practitioners of literary studies who are responsible for the success of "structure," which belongs to "scientific Esperanto" (Escarpit, "Du Pattern à la structure"), for they thought they saw in it a hard-scientific concept, a mathematical model, whereas biologists and cognitivists continue to use "pattern," which comes from ordinary language, because the concept allows

them, in a manner both familiar and almost poetic, to designate the relative order, the contingent, imperfect, and seductive symmetry of the reality of the senses, of living creatures, and of life itself.

STYLE

Style, from the Latin *stilus*, which designates the nib of a quill and its sharpened point, originally figures as a concept within the language arts and currently refers more generally to the characteristic manner of an individual, genre, or era: the difference between manner and style, as a function of epoch, cultural region, and language, is treated under MANIERA. See also FAKTURA.

Style is at the intersection of a certain number of problematics:

I. Style and Rhetoric

"Style" is one of the current translations of the Greek *lexis* [λέξις] (from *legô* [λέγω]), "saying-thinking"; see LOGOS), which designates as well "word" (see WORD, II.B) and meaningful expression (see SIGNIFIER/SIGNIFIED, II). Cf. HOMONYM and PARONYM.

The "styles" of sixteenth- and seventeenth-century treatises of rhetoric render the three Latin *genera dicendi*—elevated, middle, and low. Under SUBLIME will be found a comparative reflection on the "grand style"; see also STILL.

On the rules of style, and in particular suitability (Greek *prepon* [πρέπον]), see MIMÊSIS, Box 6; see also COMMONPLACE.

On figures of style, see COMPARISON, COMMONPLACE, TROPE; cf. ANALOGY, HOMONYM.

II. Style and Art History

The categories serving to define and delimit "styles" in time in art history and aesthetics are not superimposable in different traditions, even when the words themselves coincide in different languages. See BAROQUE, CLASSIC, NEUZEIT, ROMANTIC.

III. Style and Mark of the Subject

"Style is the man himself," said Buffon—"the man one is speaking to," Lacan added ("Ouverture," *Écrits*). On the mark of the subject, linked to the invention of a style appropriate to its role, see MANIERA, but also ARGUTEZZA, CONCETTO, GENIUS, INGENIUM, SPREZZATURA, *WITTICISM*.

The English word "subject" (French, *sujet*) is used in a variety of senses that are, at first sight, difficult to articulate in philosophical terms. We can, however, identify three main groups of meanings, dominated by the ideas of subjectness (*subjectité* in French), subjectivity (*subjectivité*), and subjection (*sujétion*). The three notions are not completely distinct, and it is clear that various combinations of them are, to a greater or lesser extent, operative in most philosophical usages of the term.

The notion of subjectness is the richest of the three (the French word *subjectité* is a translation of the neologism *Subjektheit*, which was probably coined by Heidegger) and condenses several possible usages. It derives more or less directly from Aristotle's *hupokeimenon* [ὑποκειμένον] and basically provides a link between the logical subject ("of which" there can be predicates) and the physical subject ("in which" there are accidents). It also has a much broader meaning that is bound up with the etymology of *hupokeisthai* [ὑποκεισθαι] ("to be laid or placed somewhere," to serve as a base or foundation, to be proposed, accepted). This sense overlaps with the network of *thing* and *pragma* [πρᾶγμα], or *res* and *causa*, that intervenes no less frequently than the *subject* (in the sense of matter, object, or theme) that we find in the modern usage. In the same way we find the sense of cause, reason, or motive in the fourth part of Descartes's *Discourse on Method*. In his discussion of the existence of bodies, Descartes writes: "Nevertheless, when it is a question of metaphysical certainty, we cannot reasonably deny that there are adequate grounds for not being entirely sure of the subject. We need only observe that in sleep we may imagine in the same way that we have a different body" (*Philosophical Writings*, 1: 130). French still uses *sujet* in that sense in everyday speech (*Quel sujet vous amène*? ["What brings you here?"]; *avoir sujet de se plaindre* ["to have cause for complaint"]). Another meaning, expressed in English by the reduplicated "subject matter," signals membership of two categories and merits attention (the expression is also attested in the sixteenth century as "matter subject" and is, in fact, a translation of Boethius's *subjecta*

materia, which itself reproduces Aristotle's *hupokeimenê hulê* [ὑποκειμένη ὕλη].) A third meaning makes "subject" synonymous with "object," as when we evoke the "subject" of a book or science.

The notion of subjectivity, on the other hand, makes "subject" the antonym of "object" when a more specific distinction has to be made between the sphere of the psyche or the mental, as opposed to that of objectivity (cf. the English "thinking subject," which is well attested in the seventeenth century).

Connotations of subjection are present in any usage of *sujet* that implies the idea of dependency or subjugation, or any form of domination that subjugates, compels or obliges; the first meaning of the English noun "subject" is "one who is under the dominion [= Latin: *dominium*] of a sovereign" or, in the adjectival form, "that is under the rule of a power" (fourteenth century). The articulation between this set and the first two remains problematic, despite the suggestions of ordinary language. Not everything that is *sous-mis* or "sub-mitted" (*subjectum*) is "subjected" (*subjectus*), nor is everything that is "submissive" (*soumis*); it is even clearer that "being placed beneath" should not be confused with "being subjected." Subjectivity is not the relative product of subjectness and subjection, even though a relationship of sub-position is present in both registers. The fate of the French term *suppost* (fourteenth century) and then *suppôt* (1611) provides a good illustration of these ambiguities. The term derives from the Latin *suppositum*, which is used in both grammar and logic as well as the natural sciences (physics, metaphysics, and psychology, to adopt the medieval classification of the sciences) in the sense of the Greek *hupokeimenon*; in its specifically French usage, the term *suppost* was, from the late fourteenth to the late seventeenth century, used in the sense of "vassal" or "subject of someone," or even in the sense of "subaltern." The spatial metaphor common to the fields of "sub-jectness" and "sub-jection" must not, however, lead us to trace the genealogy of subjectivity by identifying *subjectum* with *subjectus*. What is implicit in French or English is much less clear in German, where the "Aristotelean" *Subjekt* is not synonymous with *Untertan* and its derivatives *untertänig* (humble, submissive) and *Untertänigheit* (submission, humble obedience), even though both *Subjekt* and *Untertan* can be translated into English as "subject" and into French as *sujet*. By the same criterion the notion of a "legal" or "political" subject or a subject with rights is difficult to accept in a context where "subject" is predestined to belong to the register of "submission"—one has only to think of the harmonics of the term "Islam," which, depending on how it is translated, can evoke either radical subjugation ("Muslims" = "those who submit") or "trusting abandonment of the self in God." The introduction of "subject" into philosophy is doubled with the avatars of *subjectum* and *subjectus*.

We will attempt to elucidate a set of problems that has determined the entire history of Western philosophy by alternating between two contrasting points of view. We will begin with the Latin use of *subjectum* in order to identify the medieval origins of the Moderns' "self-certainty," which is torn between the heritage of Aristotle and that of Augustine. We will then look at the contemporary critique of the unity and univocity of "the subject" inaugurated by Nietzsche in order to identify the roots of the conflicting expressions to which it now gives rise in the context of the "internationalization" of philosophical language. We will in both cases give a central role to the historical and hermeneutic reconstruction proposed by Heidegger and will demonstrate both its importance and its limitations.

I. *Hupokeimon*: Subject Degree Zero

"Subject" is Anglo-Latin, and *sujet* is Franco-Latin. No one term in Greek simultaneously supports the threefold idea of subjectness, subjectivity (see CONSCIOUSNESS), and subjection; there is no Greek word meaning "subject," just as there is none meaning "object," even though we encounter, and cannot but encounter, both terms in translations (see OBJECT).

The Latin *subjectum* was in fact originally a translation of the Greek *to hupokeimenon* [τὸ ὑποκειμένον], especially as used in the Aristotelian corpus, even though it is not only a translation of *hupokeimenon*, and even if other terms, such as *suppositum*, can capture other aspects of Aristotle's *hupokeimenon* in all circumstances (see Box 1, "Suppositum"/"Subjectum" in SUPPOSITION).

To hupokeimenon is never an expression of subjectivity. Nor is it an expression of subjugation, except for the quasi-sexual connotations that link it to the idea of "matter," *hulê* (ὕλη) as united with *eidos* (εἶδος) or *morphê* (μορφή), that is to say, the "form" it receives or to which it is subject, and with which it makes up a complete substance or *sunulon* (cf. *Metaphysics* Zeta VII 1029a—"Primary subject [*hupokeimenon prôton*] is in one way matter, in another shape-form, and in a third sense the composite of both of them [*to ek toutôn*]," with *De generatione animalium* I, 20. 729a 8–11: "What happens is what one would expect to happen. The male provides the 'form' and the 'principle' of the movement [*to t'eidos kai tên archên tês kinêseôs*]; the female provides the body and the matter [*to sôma kai tên hulên*]. Compare the coagulation of milk. Here, the milk is the body, and the fig juice or rennet is the principle that causes it to set." Sylviane Agacinski stresses that the gender hierarchy "is applied, by analogy, to the basic concepts of metaphysics, as when the philosopher states that "matter aspires to form in the same way that the female desires the male" (*Politique des sexes*, 44).

On the other hand, the term does cover and bring together two kinds of subject whose composition proves to be a necessary part of the very idea of subjectivity: the physical subject, which is a substrate for accidents that occur through changes, and the logical subject, which is a support for the predicates in a proposition. This suture, which is onto-logical in that it allows being and "being said" to coincide, as if by nature, is the mark of Aristotle's *ousia* [οὐσία].

■ See Box 1.

Following Bonitz (RT: *Index s.v. hupokeisthai*), we will take as our starting point all the senses in which Aristotle uses *hupokeimenon* and *hupokeisthai* [ὑποκεῖσθαι]. We can leave aside the local, or nonterminological, sense of "being there," as well as all the current meanings that Aristotle simply established, particularly when he posits something as the basis, principle, or premise for reflection (*positum*, *datum*). This leaves a complex of three usages. Bonitz describes it thus:

We can identify three main genera in Aristotle's use of the words *hupokeisthai* and *hupokeimenon* in so much as *hupokeimenon* is either matter [*hê hulê*] that is determined by form, or *ousia*, in which passions and accidents are inherent, or the logical subject to which predicates are attributed; but as matter itself is also

1

Remnant (Italian *il resto*; Hebrew *she'-ar*; Greek *kataleimma*)

Theological term found in both the Old and New Testaments and taken to refer to the part of the nation of Israel that will be saved, as in Isaiah 10:22: "For although thy people be as the sand of the sea, yet a remnant of them shall be saved." Used by the Apostle Paul in a related context in the Letter to the Romans 11:5: "Even so then at this present time also there is a remnant according to the election of grace." The term plays a central role in the politico-theological reflections of Giorgio Agamben—principally in his books *The Remnants of Auschwitz* and *The Time That Remains*.

The passages from the Bible cited above present a number of interpretative dilemmas. It is Giorgio Agamben's attempts to solve them, as well as to develop a "paradigm" of the "remnant" that has given the term contemporary currency outside of its theological context. An initial question to be posed is why only a "remnant" of Israel will be saved. Is it because a purifying sacrifice is called for? Is it because only a part of Israel is worthy of salvation? Or is the idea to be understood in a different sense? In his discussions of the term, Agamben has stressed that "the remnant is a theologico-messianic concept" (*Remnants*, 162). This "theologico-messianic concept" is, obviously, concerned with salvation—a salvation that is to all appearances limited. Agamben, however, rejects this idea. "What is decisive," he writes, "is that . . . 'remnant' does not seem simply to refer to a numerical portion of Israel" (ibid., 163). "Remnant," for him, is to be understood in another sense than the conventional one of a remainder left over from some larger whole.

In *The Time That Remains* Agamben asks, "How should we conceive of this 'remnant of Israel?'" and offers as answer: "The problem is misunderstood from the very start if the remnant is seen as a numeric portion, as it has been by some theologians who understand it as that portion of the Jews who survived the eschatological catastrophe" (*Time That Remains*, 54–55, translation modified). This does not, however, resolve the problem

at hand, and Agamben is careful to stress that "it is even more misleading to interpret the remnant as outright identical to Israel" (ibid., 55). "A closer reading of the prophetic texts," he continues, "shows that the remnant is closer to being a consistency [*consistenza*] or figure that Israel assumes in relation to election or to the messianic event. It is therefore neither the whole, nor a part of the whole, but the impossibility for the part and the whole to coincide with themselves or with each other" (ibid., 55, translation modified). Agamben thus sees the "theologico-messianic concept" of the remnant as expressing a relation of part to whole that does not fall within the traditional lines drawn by dialectical thought and that has affinities with Adorno's "negative dialectics," Derrida's *différance*, and the Spinozist ideas of "immanence" and "multitude" that are important for Deleuze, Guattari, Negri, and Hardt. Like those ideas the remnant is located in a singular conceptual and strategic space as "the remnant is precisely what prevents divisions from being exhaustive" (ibid., 56).

Concerning divisions as it does, this "theologico-messianic concept" offers Agamben a paradigm for his idea of a "coming community." For Agamben the "remnant" "allows for a new perspective that dislodges our antiquated notions of a people and a democracy, however impossible it may be to completely renounce them. The people is neither the whole nor the part, neither the majority nor the minority. Instead, it is that which can never coincide with itself, as whole or as part, that which infinitely remains or resists each division and, with all due respect to those who govern us, never allows us to be reduced to a majority or a minority. This remnant is the figure, or the consistency [*la consistenza*], assumed by the people in the decisive moment—and as such, is the only real political subject [*l'unico soggetto politico reale*]" (ibid., 57, translation modified).

In Agamben's hands the remnant is a concept through which we can view how a totality conceives of itself and of its

component parts. At first sight the claim that "the only real political subject," "the true political subject," is a "remnant" may seem gnomic or paradoxical, but its sense lies in the idea that a true political subject is not merely a part of a totalizing whole. What is at issue is thus what Agamben calls "the problem of identities—ethnic or other. Such a thing as an ethnic identity will never truly exist because there will always remain a remnant" ("Das unheilige Leben," 20). This divided people becomes a paradigm for the idea that a people cannot and should not be thought of as pure, whole, or without remainder. A remnant is what results from every dialectical attempt at exhaustive identification and classification, every attempt to create a community that would completely subsume the singularity of its members. For this reason, remnant is a concept that Agamben applies not only to an entire people, but also to its individual members. For this reason he will claim that "the subject is a sort of remnant" (ibid.). The remnant is a response to the totalizing nature of dialectical thinking and its gradual elimination of differences. It is thus a paradigm for a conception of both part and whole.

related to the notion of *ousia*, the first and second genera are not differentiated by limits that are universally certain, and given that *einai* [*huparchein*, being in the sense of belonging to] and *legesthai* [*katêgoreisthai*, being said in the sense of being predicated of] are closely connected, the distinction between the second and third genera is little clearer.

(Bonitz, *Index Aristotelicus*, p. 798, col. 1)

Hupokeimenon's plurality of meanings is not, in other words, fixed or thematized in the same way that the meanings of "being" are fixed. (At best, we can read in *Metaphysics* Z, 13, 1038b: "περὶ τοῦ ὑποκειμένου, ὅτι διχῶς ὑπόκειται, ἢ τόδε τι ὄν, ὥσπερ τὸ ζῷον τοῖς πάθεσιν, ἢ ὡς ἡ ὕλη τῇ ἐντελεχείᾳ [There are two ways of being a subject (lit. 'subjected'), either as a possessor of thisness (as the animal is a subject for its properties) or as matter is a subject for actuality]." It is used, rather, to describe three

types of relations: (1) relations between matter and form, to the extent that they combine to make up the *sunolon*, or the individual as a whole without parts; (2) relations between the individual, substance-subject of physics and what happens to it, its affections and accidents (an animal is subject to movement, or to being "white," "large," or "ill"); and (3) relations between the subject of the proposition and its predicates ("animal" as "white," "large," or "ill"). In the first two usages the subject can be variously described as matter (*hulê*), as the individual, the primary substance or essence (*tode ti* [τόδε τι] or *ousia prôtê* [οὐσία πρώτη]), but in the third there is no substitute for *hupokeimenon.* No other word can designate the subject of the proposition as such. The irreducible meaning is also the meaning that unifies the set (just as *kinêsis* [κίνησις] refers both to local movements and to movement in general; it therefore refers to all types of movement, such as growth) in a radically nondialectical conceptual structure. This is typical of Aristotle's classificatory thinking: the key species gives its name to the whole genus.

This description requires some qualification: the reason why subjectness is able to combine in the single word *ousia* both the sense of substance and that of subject is that *ousia* itself can also be a combination of the two. Just as primary essence is *malista* [μάλιστα], first of all, essence, so that which is first of all proper to essence (*malista idion tês ousias* [μάλιστα ἴδιον τῆς οὐσίας]) is, "although it remains, notwithstanding, numerically one and the same, its ability to be the recipient of contrary qualifications (*to tauton kai hen arithmôi on tôn enantiôn einai dektikon* [τὸ ταὐτὸν καὶ ἕν ἀριθμῷ ὄν τῶν ἐναντίων εἶναι δεκτικόν]″)" (*Categories* 6, 4a 10–11). A color cannot be both black and white and still remain one and the

same, but essence can. For example, an individual man (*ho tis anthrôpos* [ὁ τὶς ἄνθρωπος]), this singular man who remains one and the same, can sometimes be pale and sometimes black (*hote men leukos hote de melas gignetai* [ὁτὲ μὲν λευκὸς ὁτὲ δὲ μέλας γίγνεται]) (*Categories* 4a 19–20). This is not like the statement "he sits," which becomes false when "he rises," but "through a change which belongs to it in itself" (*kata tên hautês metabolên* [κατὰ τὴν αὐτῆς μεταβολὴν]) (*Categories* 4b 3). The accidents that are predicated upon *ousia* therefore arise from *ousia* itself; its subjectness qua material substance is one and the same as its subjectness qua logical subject, and it is precisely this that makes it the *hupokeimenon.*

Aristotle's various attempts to define *ousia* reveal a constant tension between the singular and the universal; it is the *eidos* or essence and the *to ti ên einai* (τὸ τί ἦν εἶναι) or "what-it-was-to-be-that-thing," which are in *Metaphysics* book Zeta (7, 1032b), referred to as *ousia prôtê*, and not the *tode ti* of the *Categories* (see TO TI ÊN EINAI). Now it is the definition given in the *Categories*, where essence is primarily the concrete singular, that determines the conflagration between logical subjectness and physical subjectness. We can deduce from this that the individual, being a subject in two senses, is a necessary (but obviously not sufficient) precondition for the later developments that generate "subjectivity" and "subjection."

■ See Box 2.

II. *Subjectum*: From *Hupokeimenon* to Self-Certainty

A. From subjectness to subjectivity

While the term "subjectivity" (*subjectivité*) appears to have been borrowed from the German *Subjektivität*, thanks to the diffusion of the adjective *subjetiv* in the Kantian sense,

---

2

The definition of the *ousia prôtê*

Οὐσία δέ ἐστιν ἡ κυριώτατά τε καὶ πρώτως καὶ μάλιστα λεγομένη, ἡ μήτε καθ' ὑποκειμένου τινὸς λέγεται μήτε ἐν ὑποκειμένῳ τινί ἐστιν, οἷον ὁ τὶς ἄνθρωπος ἢ ὁ τὶς ἵππος.

Est essence, quand on le dit au sens le propre, premier et principal, celle [ou ce] qu'on ne dit pas d'un sujet et qui n'est pas non plus dans un sujet, comme l'homme en question le chevel en question.

(A substance—that which is called a substance most strictly, primarily, and most of all—is that which is neither said of a subject nor in a subject, e.g., the individual man or the individual horse.)

(Aristotle, *Categories* 5, 2a 11–13)

Against the grain of received usage (as evinced in the English translation of Aristotle's *Categories*) "essence" is substituted for "substance" in the French translation for

ousia. This indicates that what is at stake here is the determination of that which is, which is not substance. "Substance" places undue emphasis on the physical (substance/accidents) and on the conjunction of logic and physics.

This definition, which is presented as both the primary definition of essence and, the definition of primary essence, is remarkable already in purely stylistic terms. Rather than stating directly that essence is *hupokeimenon* [ὑποκειμένον], it juxtaposes two negatives: "neither said of . . . nor is in"; essence is a *hupokeimenon* in two senses, as it is neither a predicate (or, more accurately, something predicable; see PRÉDICABLE and PREDICATION) nor an accident. We are actually dealing with a crudely knit juxtaposition, operated by means of the word *hupokeimenon,* that establishes the preeminence of essence/substance in both the physical and the logical sense. This sense of "primary

essences," as was noted in the previous example, comes through in the French and not in the English translation:

Tout le reste ou bien se dit de ces sujets (*êtoi kath' hupokeimenôn toutôn legetai* [ἤτοι καθ' ὑποκειμένων τούτων λέγεται]) ou bien est dans ces sujets eux-mêmes (*é en hupokeimenais autais estin* [ἢ ἐν ὑποκειμέναις αὐταῖς ἐστίν]); de sorte que si ces essences premières n'étaient pas, impossible que quoi que ce soit d'autre soit.

Thus all the other things are either said of the primary substances as subjects (*êtoi kath' hupokeimenôn toutôn legetai* [ἤτοι καθ' ὑποκειμένων τούτων λέγεται]) or in them as subjects (*é en hupokeimenais autais estin* [ἢ ἐν ὑποκειμέναις αὐταῖς ἐστίν]). So if the primary substances did not exist it would be impossible for any of the other things to exist.

(Ibid., 2b 4-6)

the psychological meaning of the term, which is dominant in ordinary usage, is the result of a series of transformations that began in the Middle Ages. According to Martin Heidegger, the most decisive of all is the mutation that transforms Aristotle's *hupokeimenon* into *subjectum*. According to the author of *Sein und Zeit*, the essential feature of the Cartesian initiative is the assertion that the *subjectum*, which is the *substans* of the Scholastics, in the sense of "that which is constant" (subsisting) and "real," is the basis of any psychology of the subject, or in other words the transition from the Latin *subjectum* to the modern sense of "subject," or, if we prefer, the transition from *subjectum* to *ego*, from subjectivity to I-ness (*égoité*). In volume 4 of his *Nietzsche*, Heidegger remarks: "Since Descartes and through Descartes, man, the human 'I' has in a preeminent way come to be the 'subject' in metaphysics. . . . Why is the human subject transposed into the 'I,' so that subjectivity here becomes coterminous with I-ness?" (4: 96). Heidegger's explanation for this phenomenon, which is based upon the structure of "the lying-before" (*vor-herige*) that he finds at the heart of the Cartesian notion of representation, gives Descartes the central role: he completes the transformation of *hupokeimenon* into *subjectum* by ballasting its "actuality" with the new dimension of perceptive activity:

> According to the metaphysical tradition from Aristotle onwards, every true being is a *hupokeimenon* [ὑποειμένον]. This *hupokeimenon* is determined afterwards as *subjectum*. Descartes's thinking distinguishes the *subjectum* which man is to the effect that the *actualitas* of this *subjectum* has its essence in the *actus* of *cogitare* (*percipere*).
>
> (Heidegger, "Metaphysics as History of Being," in *End of Philosophy*, 31; trans. amended)

Heidegger's thesis is debatable. He claims that Descartes initiates a displacement that occurred either long before him or long after him and which does not in any case, directly or explicitly equate *subjectum* with *ego*. What is more, Heidegger's notion of "subjectivity" is too closely associated with the Lutheran notion of the certainty of salvation, which supposedly founds the certainty characteristic of "modern subjectivity" to be valid as a true genealogy of the subject.

- See Box 3.

Consideration must also be given to other experiences demonstrating that the moment when *mens humana* has an exclusive claim on the term "subject," it belongs to a history that predates the "Cartesian" golden age of representation. Heidegger's analysis does, however, have one merit: it demonstrates the need for a distinction between subjectness and subjectivity. Heidegger sets us a task that his own text does not complete: describing in historicological terms what leads from one to the other, and that means taking the medieval contribution into account.

B. "Subjectum" in medieval psychology

In the Middle Ages philosophical theories of the subject were originally inscribed within the space of subjectness. The medieval notion of the *subjectum* is still, at least in problematic terms, Aristotle's notion of the *hupokeimenon*, or of a "subject" in the sense of a support or substrate for essential or accidental properties. In terms of the genealogy of the subject and subjectivity, however, medieval thought was for a long time characterized by a remarkable chiasmus that can be described as follows: the Middle Ages had a theory of the ego or I-ness (*égoité*), or a theory of the *subject* in the obvious philosophical sense of the term *mens*, but that theory did not require the implementation of the notion of a *subjectum*;

3

Hupokeimeno [ὑποειμένο] in modern Greek

Aristotle defines matter as "the first *hupokeimenon* [ὑποκείμενον] of all the things from which they come and which belong to them not by accident" (*Physics* 1, 9, 192a 31–4). But while the term "subject" is an appropriate translation of *ousia* in the sense of "the ultimate subject of all predication," it is an inappropriate rendering of this text. *Hupokeimenon* is therefore often translated as "substrate," in keeping with the Scholastic tradition, which uses "substratum."

Like the English "subject" or the French *sujet*, the modern Greek [ὑποκείμενο] means both the grammatical and logical subject and "subjectivity." There is no adequate translation of "substrate." Théodorïs notes that "to the extent that 'subject' is, in our language, a worn-out and polysemic term, we are often obliged to resort to

something like 'substratum,' using the word *substructure* [*hupostrôma*]" (Introduction). This is why several modern Greek translations have been suggested. In his translation of the *Physics,* Kyrgiopoulos gives the impression of remaining close to the original by translating the term as "the primary subject (*hupokeimenon*) [ὑποκείμενον] in everything." Georgoulís suggests a periphrase: "that which is as lying beneath (*hôs hupokeimeno* [ὡς ὑποκείμενο]) all things." In his translation of Plotinus, Tzavaras sometimes uses the ancient Greek term, but he also adopts Georgoulís's suggestion and uses "that which lies below (κειμένη-απο-κάτω)"; he also extends that sense by using "substructure." While the modern Greek verb does indeed mean "to lie under something," and "to come under the authority of someone," the noun no

longer has the old meaning. The first translation simply uses the ancient Greek; the second resorts to a verbal form and uses the past participle of ὑπόκειμαι, which does not capture the ancient noun form; "substructure" forces the meaning, even though it does have the virtue of being a translation. These disagreements are an adequate demonstration of the difficulties involved in translating such an important term from Greek into Greek.

it also offered a complete theory of subjectness in grammar, logic, physics, and metaphysics but was reluctant to export it into psychology in the form of a theory of *mens humana*. The theory of *mens* did not, in other words, need to import the notion of *hupokeimenon*; conversely, the theory of the *subjectum* did not in itself claim to govern that of *mens*. And yet the two did intersect and were articulated several hundred years before the Cartesian theory of *ego cogito cogitatum*. It is impossible to reconstruct every stage in the process here. We can indicate the two poles that determine the very idea of subjectivity: on the one hand, a Trinitarian Augustinian model of the human soul based in part upon the idea of the circumincession (mutual in-dwelling) of the Persons of the Trinity and in part upon a non-Aristotelian notion of hypostasis (*hupostasis* [ὑπόστασις]; on the other, a non-Trinitarian Averroist model of subjectivity that is explicitly based on the Aristotelian notion of *hupokeimenon*. The two models are not intended to solve the same problem: the former is mainly concerned with the problem of consciousness and *self*-knowledge, while the latter is concerned with the *subject* of thought.

1. Averroism and the question of the "subject of thought"

It is with the translation of the *Long Commentary* on Book 3 of the *De anima* that the notion of subjectness really becomes part of the field of psychology. It represents an attempt to answer a specific question: what is the subject of thought? This question presupposes the validity of a model, Aristotle's analysis of sensation and the notions that make it possible: action (*energeia* [ἐνέργεια]), and actuality or the actualization of potentiality (*energein* [ἐνεργεῖν]). Aristotle's theory of sensation is not based upon the idea of a "feeling subject" that is affected by a sense of change but on the idea of sensation itself, defined as the joint action of a sense-object and a sense-organ (see SENSE 1.A, B). In Averroës it is this structure of the joint action that governs the question of the subject of thought. Just as sensation has two subjects, so thought, referred to here as *intentio intellecta* (see INTENTION), intelligible knowledge *in actu*, also has two subjects: (1) images (*intentiones imaginatae*), and (2) the so-called "material" intellect, which is divorced from the body and not numbered by it. The subject of thought is therefore twofold; only one of these subjects—the *ego* or the "me"—has anything to do with man.

According to Aristotle, cognizing through the intellect is like perceiving through the senses, and perceiving through the senses is accomplished through the intermediary of two subjects. The first is the subject [*subjectum*] through which what is sensed becomes true (the sensible that exists outside the soul), and the second the subject that ensures that what is sensed is an existing form (and this is the first perfection of the sensorial faculty). It follows that *intelligibilia in actu* must also have two subjects, one being the subject thanks to which they are true images, and the second, the subject that ensures that each *intelligibilia* exists in the [real] world. This is the material intellect. Indeed, to that extent there is no difference between the senses and the intellect, except in that the subject of what is sensed, and which makes it true, is external to the soul, whereas

the subject of the intellect, and which makes it true, is internal to the soul.

(Averroës, *Commentary on De anima* III comm. 5 on *De anima* III 4 429a 21–24)

According to Averroës, man is not his intellect: if he has a role to play in intellection as such, it is thanks to his cognitive faculty (Ar. *al-quwwat al-mufakkira* [القوة المفكّرة], Lat. *vis cogitativa, vis distinctiva*), which supplies images or, rather, particular "intentions" (see INTENTION, Box 2) to the material intellect, a unique substance that is divorced from the human soul. Man is therefore not the subject of thought in the precise sense that the eye is the subject of vision. In a certain sense his subjective position is, rather, on the side of that which is seen. This is, in fact, the basic criticism that Aquinas makes of Averroës's noetics in the *De unitate intellectus contra averroistas*. The theory of the two subjects of intellection does not allow us to say that man—or, rather, the individual man ("that man there")—thinks, but only that its images are thought by a separate intellect.

Assuming that one numerically identical species is both a possible form of intellect and simultaneously contained in images, that type of linkage would not be enough to allow this particular man to think. It is in fact clear that as, thanks to the intelligible species, something is *thought*, and as, thanks to the intellective power, something *thinks*, so something is felt thanks to the sensible species, just as something *feels* thanks to the sensible power. That is why the wall in which color is found, and whose sensible species *in actu* is vision, is something that is seen, and not something that sees; what sees is the animal endowed with the faculty of vision where the sensible species is found. Now the linkage between the possible intellect and the man in whom there are images whose species exist in the possible intellect is like that between the wall, in which color exists, and sight, in which the species of color exist. [If that linkage existed] just as the wall does not see, even though color is seen, it would follow than man does not think and that his images would be thought by the possible intellect. It is therefore impossible to defend the thesis that man thinks if we adopt the position of Averroës.

(Aquinas, *De unitate intellectus contra averroistas*, ch. 3, §65)

Far from accepting Aquinas's counterargument, some thirteenth-century Latin Averroists radicalize the thesis that the subject, which has to be described as "thinking," as opposed to "imagined intentions," is not the individual man. Strictly speaking, thought does not have "man" as its subject because "thought is not a human perfection," but the "perfection of the intellect," and a separate material. Introducing the subject/object duality for the first time in this context, the Averroists (see Siger of Brabant, *In De Anima*, q. 9; ed. Bazán, 28, 79–82) go so far as to argue that thought does not need man in order to "sub-ject itself to him" in the strict sense. It only needs man, or rather fantasms, or, in the last analysis, a material body as an object and not as a subject. As an anonymous

master writes: "As thought is not a human perfection, it needs man as an object . . . it needs a material body as an object, not as its subject" (cf. *Anonyme de Giele, Quaestiones de anima* II, q. 4; in Giele et al., *Trois commentaires,* 76, 91–96).

The thesis that the body is the object of the intellect enjoyed an exceptional longevity: we find it as late as the sixteenth century, when it is turned *against* Averroës in Pomponazzi's *De immortalitate animae* (1516). A follower of Alexander of Aphrodise's "materialism," Pomponazzi accepts the idea, which is doubly unacceptable for Averroism, that the body can be both the object *and the subject* of thought:

> According to its general definition, the soul is the action of a naturally organized body. The intellective soul is therefore the action of an organized natural body. Since the intellect is by virtue of its being the action of an organized natural organ, it therefore also depends, in all its operations, upon an organ, either as subject or as object. It is therefore never completely divorced from all organs.

> (Pomponazzi, *De immortalitate animae*, ed. Mojsisch, "Philosophische Bibliothek" 434, Hamburg: Meiner, 1990, ch. 4, p. 18)

For the Averroists of the thirteenth century, at least, it is clear that the existence of the ego and of the "fact of consciousness" certainly does not coincide with the assumption of man as *subjectum*. Man does not experience himself as the subject of thought; the "I" or "ego" does not experience itself as that which thinks or experiences thought. As the same *Anonyme de Giele* writes:

> You will say: I [and no other] feel and perceive that it is I who thinks. I reply: this is false. On the contrary, it is the intellect, which is naturally united with you as the motor (principle) and regulator of your body, that feels this, *lui ipse* [and no other], in exactly the same way that the separate intellect experiences that it has within it intelligibilia. You will say (again): I, the aggregate of a body and an intellect, feel that it is I who is thinking. I say: this is false. On the contrary, it is the intellect that is in need of your body as object (*intellectus egens tuo corpore ut obiecto*) that feels this and communicates it to the aggregate.

The heteronomy of the Averroist "subject" is very significantly illustrated by an episode in translation history that is worth recalling. We know that Averroës's *Long Commentary on the De Anima* is, given the current state of the corpus, fully accessible only in Latin, or in Michel Scot's tricky translation (the Arabic original having been lost). One of the most famous statements, in which Averroës appears to introduce the notion of the subject, is the passage on eternity and the corruptibility of the theoretical intellect—the ultimate human perfection. It asserts: "Perhaps philosophy always exists in the greater part of the subject, just as the man exists thanks to man, and just as the horse exists thanks to horse." What does the expression mean? Going against the very principles of Averroës's noetics, the Averroist Jean de Jandun understands it to mean that "philosophy is perfect in the greater part of its subject (*sui subiecti*)," or in other words "in most men" (*in maiori parte hominum*). There are no grounds for this interpretation. We can explain it, however, if we recall that

Averroës's Latin translator has confused the Arabic terms *mawḍū'* [مع ضوع] (subject or substratum in the sense of *hupokeimenon*) and *mawḍi'* [مع ضو] (place). When Averroës simply says that philosophy has always existed "in the greater part of the place," meaning "almost everywhere," Jean understands him as saying that it has as its subject "the majority of men," as every man (or almost every man) contributes to a full (perfect) realization in keeping with his knowledge and aptitudes. "Subjectivity" does slip into Averroism here, but only because of a huge misunderstanding resulting from a translator's error. It therefore contradicts Averroës.

Appearances to the contrary notwithstanding, the moment when, thanks to Averroës's theory of the "two subjects" of thought, Aristotle's *hupokeimenon*, recycled as a *subiectum*, enters the field of psychology, has, as we can see, absolutely nothing to do with *mens humana*'s exclusive claim on the name "subject" (*subiectum* and *ego*, or "subjectivity" and "I-ness" [*égotie*], therefore, take on exactly the same meaning). As we shall see, and by the same criterion, the attestation, in an originary experience, of the "fact of consciousness" was not, according to those who argued its case, originally bound up with the Aristotelian notion of subjectness.

2. The discovery of self-certainty

Confronted with the Averroist theory of the two subjects of thought, several medieval doctrines argue that the ego or the "I" can perceive itself, experience itself, and know itself, thanks, initially, to a kind of direct intuition. None of these doctrines, however, initially relates this apperception to the idea of self-apprehension as *subject*. The first thing they have in common tends to be an Augustinian denial of the specularity of the self-to-self relationship: "The mind [does not] know itself as in a mirror" (Augustine, *De Trinitate* X, 3, 5 BA 16, p. 128). Many medieval philosophers conclude from this theorem that, despite the claims of Aristotle and the Peripatetics, the soul cannot know itself in the same way that it can know other things, namely through representation or abstraction, and that it does not know itself either as another thing or as another soul. It knows itself as self-presence, and in, through, and as that self-presence. The absence of knowledge through representation is characteristic of both that which is present and that which is absent. Seeing is a more appropriate way of re-presenting that which is absent in its absence as though it were present. Self-presence is inadmissible. The soul can, Augustine goes on, therefore form an image of itself and can "love that image" but it cannot know itself in that way. To the contrary, Pierre Jean Olieu argues (*Impugnatio quorundam articulorum,* art. 19 f. 47ra) on similar grounds that it knows itself "through the infallible certainty of its being [*certitude infallibili sui esse*]": man knows from the outset "so infallibly that he exists and lives, that he cannot cast that into doubt [*scit enim homo se esse et vivere sic infallibiliter quod de hoc dubitare non potest*]." Even more so than the rejection of specularity, the dominant feature of the medieval Augustinian model of I-ness is the truly Trinitarian notion of circumincession. The primacy of circumincession explains why, in the Augustinian sphere, the notion of *hupokeimenon* does not have any particular role to play in the philosophical elucidation of the self-to-self relationship. The way in which the Greek *ousia* and *hupostasis* evolve in the Middle Ages is much more relevant.

a. The circumincession of Persons as a model for the theory of mind

The Augustinian theory of mind (*mens*) and mental actions does not depend solely upon the notions of essence and substance. It is entirely based on a notion derived from Trinitarian theology that was elaborated in order to explain how, to use Augustine's own terminology, a substance can be at once simple and multiple. This notion is what is usually known as the circumincession of Persons or perichoresis. Perichoresis means the mutual indwelling of the Persons of the Trinity. Their mutual immanence—which has two aspects: a *manence* (expressed in scholastic Latin by the term *circuminsessio*) and a dynamic and never-ending immanence (expressed by the term *circumincessio*)—excludes from the outset any recourse to the standard conception of the subject-substantial as a support for accidents. God cannot, in any strict sense of the term, be said to subsist in the same sense that a *substantia* subsists. That which subsists in the strict sense is that which is subjected to what is said to "be in a subject" ("ea quae *in aliquo subjiectoesse* dicuntur," *De Trinitate* VII 4, 10, BA 15, p. 536). That which exists *in substantia* is not substance; it is an accident, such as color, which exists "*in subsistente atque subjecto copore*" and which, when it ceases to exist, "does not deprive the body of its bodily being." The relationship between God and His attributes cannot be like this: God is not the subject of his goodness (*nefas es dicere ut subsistat et subsit Deus bonitati suae*), which does not exist in him as in a subject (*tanquam in subiecto*). It is preferable to say of God that He is himself his goodness, that He is an essence rather than a substance, and that the Trinity is in the strict sense "a single essence"—Father, Son, and Spirit are considered to be three "hypostases" or, more accurately, three mutually indwelling Persons. The rejection of the *substantia / id quod est in subiecto* in Trinitarian theology is of crucial importance to the history of psychology. The doctrine of the Trinitarian image, which is central to Augustine's theory of the soul, in fact holds that the same structure of mutual immanence is found in the inner man. But if that is the case, the notion of *substantia*, in the sense of *subjectum*, has to be banished from the field of psychology, on pain of reducing mental acts to mere accidents that befall the mind. This is why Augustine, who was quite familiar with Aristotle's notion of *hupokeimenon*, eliminates the *subjectum* from his analysis of the triads of the inner man. The *hupokeimenon* is incompatible with the transposition of the theological notion of mutual immanence to psychology.

b. The application of the perichoretic model to the theory of "mens"

What we are calling the perichoretic model of the soul (even though Augustine himself obviously never uses the expression) is at work in the description of the two triads that the author of the *De Trinitate* invokes in order to distinguish between knowledge and self-consciousness, namely (a) *mens-notitia–amor* and (b) *memoria* (*sui*), *intelligentia, voluntas*. The first analogy between the Trinity and the inner man subordinates self-consciousness to self-knowledge. The notions of *ousia* and *hupostasis* play an obvious role even at this level. Three theses articulate the perichoretic structure: the concept of *mens* necessarily implies its correlates: knowledge and the will; all three refer to substances: *mens* does so in the strict sense, while knowledge and the will do so in a broad sense insofar as, being acts, they differ from mere accidents; these three "substances," which are within one another, are simply "a single substance or essence."

■ See Box 4.

This structure allows the conceptualization of the transition from knowledge to self-consciousness: (1) the mind knows itself discursively and reflexively through the act of knowing; (2) this knowledge leads, directly and necessarily, to self-love; (3) in its self-love and self-knowledge, the mind becomes immediately self-conscious (*De Trinitate* IX, 2, 2–5, 8). In this analogy, which is still imperfect, between the inner man and the divine Trinity, *mens* represents the deity in his entirety, while the deity's acts correspond to the Persons of the Son and the Spirit.

In the second analogy (*memoria* [*sui*], *intelligentia, voluntas*), in which the perichoretic model is more adequately applied, an immediate and intuitive self-consciousness precedes and founds reflexive knowledge. Because the terms of the triad, which are really distinct, form a unity (because the mind is one), we can say that *mens*, which is the substance or essence of the soul, represents the deity in his entirety, while *memoria*

4

Heidegger: Self-certainty and the certainty of salvation at the dawn of modernity

There is no room for the Middle Ages in the scenario Heidegger constructs in order to explain the certainty that will "take man to sovereignty within the real world." Everything obviously begins with the new Lutheran conception of *Er-lösung* and the problematic of the "certainty" of salvation (which is problematized from a different point of view by Max Weber in *The Protestant Ethic and the Spirit of Capitalism*).

Before all (i.e., in the medieval period), God the creator, and with him the institution of the offering and management of his gifts of grace (the Church), is in sole possession of the sole and eternal truth. As *actus purus,* God is pure actuality and thus the causality of everything real, that is, the source and place of salvation that, as blessedness, guarantees eternal permanence. By himself, man can never become, and be, absolutely certain of this salvation. On the other hand, through faith and similarly through lack of faith, man is essentially established in the attainment of salvation's certainty or forced to the renunciation of this salvation and its certainty. Thus a necessity rules, hidden in its origin, that man make sure of his salvation in some fashion in the Christian or in another sense (salvation; *sôtêria* [σωτηρία]; redemption; release).

(Heidegger, "Metaphysics as History of Being," 21)

corresponds to the Person of the Father, *intelligentia* to the Person of the Son, and *amor* to the Person of the Holy Spirit. When taken either separately or together, each of the three is equal to the others. Each of the three necessarily implies the other three, as all three are correlates. In the full Trinitarian structure the acts of *mens* are described as proceeding from the memory in the same way that, in God, the Son and the Holy Spirit proceed from the Father (*De Trinitate* X, 11, 18).

The language of *ousia* and *hupostasis* has a specific function: to demonstrate that there is a type of unity between acts of *mens*, which are actually distinct from one another, and *mens* itself. This intimate correlativity is irreducible to the relationship between accidents and substance. This is therefore, and by definition, a non-Aristotelian model designed to evade the notions of substance-subject and accidents, which are incompatible with the perichoretic structure of the soul. The invention of the "subjectivity" of which Heidegger speaks therefore requires the *subjectum* to intrude into the Augustinian structure. It requires what at first sight appears to be an unnatural encounter between *certitudo infallibilis sui esse* and the Aristotelian notion of a subject. That encounter allows self-certainty to be reformulated as a "subjective" certainty. That encounter presupposes in its turn a more sophisticated version of the subject/object distinction. We have two lines of investigation here.

c. The encounter between the Augustinian perichoretic model and the Aristotelian "subjectum"

The first, which seems self-evident, is the dichotomy between the subjective mode of being or presence and the objective mode of being or presence, between the *esse subjective* and the *esse objective* of an *intentio* or *conceptus.* This dichotomy does not, however, lead directly from subjectness to subjectivity. On the contrary, the idea that an intention or affect has a "subjective" existence merely likens mental states to the qualities of the soul or the accidents that befall it, and they are characterized by the relation of inherence. It therefore violates the principle of circumincession. It can be applied to acts (as in William of Ockham) or equated with the Averroist theory of the two subjects (as in Pierre d'Auriole) and remains closer to Aristotle's subjectness than to *certitudo sui esse.* Even though the opposition between objectness/objectity (*l'ob-jectité*) and sub-jectness is essential if a sub-jective notion of the ego is to emerge, it is not enough to guarantee that it will do so. We therefore have to turn to our second line of investigation.

Although it is always dangerous to give a date for the appearance of new theories in the Middle Ages, we can advance the hypothesis that one of the first people to witness the "subjective" mutation of sub-jectness was precisely the author of the formula *certitudo infallibilis sui esse:* Pierre Jean Olieu.

The Franciscan was reacting to a specific situation: the reformulation, which had become standard since the late thirteenth century, thanks to the notions of "act" and "object," of the Peripatetic doctrine that the intellect knows itself (1) in the same way that it knows other things, and (2) on the basis of its knowledge of those other things. This so-called Peripatetic formulation had in a sense already violated the

Augustinian principle stating that the *mens* cannot be regarded as the subject of acts that can be likened to mental accidents. Man is assumed to arrive at an understanding of his mind (*mens*) and of the nature of his ability to think (*naturae potentiae intellectivae*) on the basis of his acts (*per actus eius*) and the object of those acts (*per cognitionem objectorum*). This conjectural knowledge is the product of a process of reasoning that, taking objects as its starting point, works back to acts by postulating (a) that these acts subsist (*manant)* only because of the power that supplies their substrate (*ab aliqua potentia et substantia*), (b) that they therefore "exist in a subject" (*sunt in aliqui subjecto*), (c) which allows us to conclude that "we have a faculty that assures the subsistence" of those acts. Arguing against Augustine, the Peripatetics posit the existence of a "*potentia sub-jectiva*" in order to demonstrate the existence of "a subject of knowledge acts that are oriented towards objects." This conjecture, which looks to Moderns like a decisive step towards "subjectivity," is in reality what the Aristotelian model supplied: self-certainty. It actually says nothing about the ego or the I; it makes it possible to posit that my acts have a subject, but it does not establish that "I am" that subject. Nothing in the Peripatetic argument allows me "to be certain that I am, that I am alive and that I am thinking"; on the contrary, it merely posits that my acts "subsist thanks to a certain power and that they are inherent in a certain subject":

> If we carefully examine this way of thinking, we will see not only that it cannot be beyond doubt, but also that no one can use it to arrive at any certainty that he is what he is, that he is living, and that he is thinking, even though he can therefore be certain that these acts subsist by virtue of a certain power and that they reside in a certain subject.
>
> (*Si quis autem bene inspexerit istum modum, reperiet quod non solum potest in eo contingere aliqua dubietas, sed etiam quod nunquam per hanc viam possumus esse certi nos esse et nos vivere et intelligere, licet enim certi simus quod illi actus manant ab aliqua potentia, et sunt in aliquo subiecto.*)
>
> (Impugnatio quorundam articulorum, art 19, f. 47ra)

In order to arrive at the self-certainty of the Moderns, we therefore have to take one more step: we must assume that I can intuit that I myself am the subject of my acts. We must, in a word, go back to Augustine's perichoretic conception of the soul and adapt the "peripatetic" language of subjectivity to it. This twofold manoeuvre brings about a forced synthesis and betrays both parties. The resultant thesis is, basically, neither Augustinian nor Aristotelian. But that is precisely why it is a farewell to "subjectness," or at least the precondition for that farewell. That is the step taken by Pierre Jean Olieu when he makes my perception of my acts depend upon "my prior perception of myself as subject of those acts." This leads him to formulate the theorem that "in the perception of my acts, the perception of the subject itself (= me) comes first according to the natural order of things." Expressions such as "*certitude qua sumus certi de supposito omnis actus scientialis*" or "*in hac apprehensione videtur naturali ordine praerie apprehensio ipsius suppositi*" signal the encounter between certainty and subjectivity that gives rise to the modern notions

of subjecthood and subjective certainty. They also introduce one more basic feature: acts are likened to attributes or predicates of the subject-ego. Olieu is very clear about this: "Our acts are perceived by us only as predicates or attributes [*actus nostri non apprehenduntur a nobis nisi tamquam praedicata vel attributa*]." The subject is perceived first because "according to the natural order of things, the subject is perceived before the predicate is attributed to it as such." The "subjectivation" of the soul is now complete in every dimension, including the assumption of the linguistic or logical form of predication, which is reduplicated when Olieu introduces the word *ego* into linguistic communication. Although the term is unnecessary in Latin, Olieu in fact stresses that, when we wish to signal the existence within us of some mental state, "we put the subject first by saying '*I* think that or *I* see that [*quando volumus hoc aliis annunciare praemittimus ipsum suppositum dicentes: ego hoc cogito, vel ego hoc video*]." We could therefore describe this first medieval theorization of subjectivity as both "substantialist" and "attributivist." It entails the idea of self-intuition as "substance," or as subject and principle (*subjectum et principium*), as the "experiential and almost tactile sensation" (*sensus experimentalis et quasi tactualis*) that I am a permanent subject. We can further intuit, thanks to the same "inner sense," that my acts are so many "attributes" that are distinct from my substance. They subsist thanks to it and exist within a "becoming" mode:

> When we apprehend certain of our acts through an inner sensation, we make an almost experiential distinction between the substance whence they derive their subsistence and in which they exist, and the senses, or sensations themselves. This means that we perceive through our senses that they subsist prior to that substance and not by virtue of our senses, and that substance is substance, and that it alone is something stable that subsists in itself, whilst its acts are in a permanent state of becoming.

> (*Quando apprehendimus nostros actus quosdam interno sensu et quasi experimentaliter distinguimus inter substantiam a qua manant et in qua existunt et inter ipsos sensus, unde et sensibiliter percipimus quod ipsi manant et dependent*

ab ea, no ipsa ab eise, et quod ipsa est quiddam fixum et in se manens, ipsi vero actus in quodam continuo fierii.)

Kant's description of the soul as it appears in rational psychology is, in any case, the full deployment of the theory outlined in the Middle Ages, thanks to a violent synthesis of two models that went on arguing over the theory of the soul until the fourteenth century: the Aristotelian model of sub-jectness, to which Heidegger restricts his analysis, and the Augustinian model of the circumincession of Persons (or hypostases), which, in this context, has been overlooked by almost all historians of the "subject."

■ See Box 5.

III. Subject: Subjectivity and Subjection

A. An untranslatable passage in Nietzsche

At the heart of the problems that are now raised by the use of the "subject" category—which has never been more central to philosophy, even though the twentieth century gave it a completely new orientation—there is a pun (intentional or otherwise) on two Latin etymologies: that of the neuter *subjectum* (which, like *suppositum*, has, ever since the Scholastics, been regarded by philosophers as a translation of the Greek *hupokeimenon*), and that of the masculine *subjectus* (equated with *subditus* in the Middle Ages). One gives rise to a lineage of logico-grammatical and ontological-transcendental meanings, and the other to a lineage of juridical, political, and theological meanings. Far from remaining independent of one another, they have constantly overdetermined one another, because, following Kant, the problematic articulation of "subjectivity" and "subjection" came to be defined as a theory of the constituent subject. That overdetermination can be overt, latent, or even repressed, depending on whether or not the language in question reveals its workings.

The best way to introduce these problems of modern philosophy is, perhaps, to read an astonishing passage from Nietzsche's *Beyond Good and Evil*. I cite the most authoritative French translation and include the German terms in parentheses.

5
The psychical trinity: I am, I know, I will

In the *Confessions,* Augustine uses the perichoretic model in his outline description of what might be termed the "psychical life" by invoking the triad of *esse, nosse, velle.* In this model Trinitarian relations permit a formal description of the interacting equalities that define the incomprehensible unity of the ego:

> I am, I know, and I will. I am a being which knows and wills; I know both that I am and that I will. . . . In these three—being, knowledge, and will—there is one

inseparable life, one life, one mind, one essence; and therefore, although they are distinct from one another, this distinction does not separate them.

> (Augustine, *Confessions,* XIII, 11, 12)

In the description of the *mens-notitia-amor* triad, the doctrine of the circumincession of the persons of the Trinity is evoked even more directly in order to conceptualize the mutual in-dwelling of *mens* and its acts:

The mind, love, and knowledge . . . each is a substance in itself, and all are found mutually in all, or each two in each one, consequently all are in all. . . . These three, therefore, are in a marvelous manner inseparable from one another; and yet each one of them is a substance, and all together are one substance or essence, while the terms themselves express a mutual relationship.

> (Augustine, *On the Trinity*, IX, 5, 8)

Les philosophes ont coutume de parler de la volonté comme si c'était la chose la mieux connue au monde. . . . Un homme qui *veut* commande en lui-même a quelque chose qui obéit ou dont il se croit obéi (*befiehlt einem Etwas in sich, das gehorcht oder von dem er glaubt, dass es gehorcht*). Mais considérons maintenant l'aspect le plus singulier de la volonté, de cette chose si complexe (*vielfachen Dinge*) pour laquelle le peuple n'a qu'un mot: si, dans le cas envisagé, nous sommes à la fois celui qui commande *et* celui qui obéit (*zugleich die Befehlenden und Gehorchenden*), et si nous connaissons, en tant que sujet obéissant (*als Gehorchenden*), la contrainte, l'oppression, la résistance, le trouble, sentiments qui accompagnent immédiatement l'acte de volonté; si, d'autre part, nous avons l'habitude de nous duper nous-mêmes en escamotant cette dualité grâce au concept synthétique du "moi" (*uns über diese Zweiheit vermöge des synthetischen Begriffs "ich" hinwegzusetzen, hinwegzutäuschen*), on voit que toute une chaîne de conclusions erronées, et donc de jugements faux sur la volonté elle-même, viennent encore s'agréger au vouloir. . . . Comme dans la très grande majorité des cas, la volonté n'entre en jeu que là où elle *s'attend* à être obéi, donc à susciter un acte, on en est venu à croire, *fallacieusement¸* qu'une telle conséquence était *nécessaire* (*so hat sich der Anschein in das Gefühl übersetz, als ob es da eine Notwendigkeit von Wirkung gäbe*). Bref, celui qui veut est passablement convaincu que la volonté et l'acte ne sont qu'un en quelque manière (*dass Wille und Aktion irgendwie Eins seien*). . . . "Libre arbitre," tel est le mot qui désigne ce complexe état d'euphorie du sujet voulant, qui commande et qui s'identifie à la fois avec l'exécuteur de l'action (*das Wort für jenen vielfachen Lust-Zustand des Wollenden, der befiehlt und sich zugleich mit dem Ausführenden als Eins setzt*) qui goûte au plaisir de triompher des résistances, tout en estimant que c'est sa volonté qui les surmonte. A son plaisir d'individu qui ordonne, le sujet voulant ajoute ainsi les sentiments de plaisir issus des instruments d'exécution (*Der Wollende nimmt dergestalt die Lustgefühle der ausführenden, erfolgreichen Werkzeuge*) qui sont les diligentes "sous-volontés" ou sous-âmes ("*Unterwillen*" *oder Unterseelen*) car notre corps n'est pas autre chose qu'un édifice d'âmes multiples (*ein Gesellschaftsbau vieler Seelen*). *L'effet, c'est moi* [in French in Nietzsche's text]: ce qui ce produit ici ne diffère pas de ce qui se passe dans toute collectivité heureuse et bien organisée: la class dirigeante s'identifie au succès de la collectivité (*dass die regierende Klasse sich mit den Erfolgen des Gemeinwesens identificiert*).

> (Nietzsche, *Oeuvres philosophiques complète*s, vol. 7, *Par-delà bien et mal*, §19)

In Hollingdale's English translation:

Philosophers are given to speaking of the will as if it were the best-known thing in the world. . . . A man who *wills*—commands something in himself which obeys or which he believes obeys. But now observe the strangest thing of all about the will—about this so complex thing for which people have only *one* word: insomuch as in the given circumstance we at the same time command *and* obey, and the side which obeys know the sensations of constraint, compulsion, pressure, resistance, motions which usually begin immediately after the act of will; insomuch as, on the other hand, we are in the habit of disregarding and deceiving ourselves over this duality by means of the synthetic concept "I"; so a whole chain of erroneous conclusions and consequently of false evaluations of the will itself has become attached to the will as such. Because in the great majority of cases willing takes place only where the effect of the command, that is to say obedience, was to be *expected*, the *appearance* has translated itself into the sensation, as if it were here a *necessity of effect*. Enough: he who wills believes with a tolerable degree of certainty that will and action are somehow one. . . . "Freedom of will"—is the expression for that complex condition of pleasure of the person who wills, who commands and at the same time identifies himself with the executor of the command—who as such also enjoys the triumph over resistance involved but who thinks it was his will itself which overcame these resistances. He who wills adds in this way the sensations of pleasure of the successful executive agents, the serviceable "under-wills" or under-souls—"for our body is only a social structure composed of many souls"—to his sensations of pleasure as commander. *L'effet, c'est moi:* what happens here is what happens in every well-constructed and happy commonwealth: the ruling class identifies itself with the successes of the commonwealth.

It is not a matter here of challenging the choices made by the French translator (which would imply that we intended to propose alternatives) but to point out the problems they raise. We attach particular importance to the fact that Nietzsche's text itself contains some thoughts about "translation" inasmuch as it is a process of misrepresentation (*travestissement*) that has to be given a basic anthropological meaning. No less remarkable is the fact that, given the illusions of unity that are inherent in willing, the invocation of the political metaphor (if that is what it is . . .) goes hand in hand with the construction of a "French" phrase (which cannot be translated into French) that is a parodic version of the famous allegory of absolute monarchy attributed to Louis XIV ("*L'État, c'est moi*").

Two striking features of the French translation are to be noted. It systematically introduces the word *sujet* ("*sujet obéissant*," "*sujet voulant*") because it makes the metaphysical assumption that an *Etwas* remains the same throughout the actions of commanding and the effects of obeying and thus gets around the critique that Nietzsche's text is making, at this very moment, of the illusion of the I (*Ich*). It also plays on one of the connotations of the French *sujet* that is not present in the closest German philosophical equivalent (*das Subjekt*), and therefore uses a generic term to express the ambivalence of the real or imagined relations of subordination (*archein* [ἄρχειν] and *archeisthai*) that exist between the parts of the soul; in Nietzsche's view, they constitute the essence of the phenomenon of "will": *sujet obéissant* looks like a tautology, and *sujet voulant* almost like a contradiction. Or is it the other way around?

Far from being a mere curiosity, such a text brings us to the very heart of the linguistic tensions characteristic of the construction and use of the notion of *sujet*. Their essential characteristic derives from the Greek and Latin notions, which tend to produce two different paradigms for the interpretation of "subject," one specific to the neo-Latin languages (and especially French) and one specific to German. In one case the simultaneously logical-ontological and juridico-political connotations of *sujet* are—thanks to a sort of "historiological" word play on the meanings of *subjectum* and *subjectus*—exploited in a systematic investigation into the modalities of the "*assujettissement du sujet*" ("subjugation of the subject"). In the other case the relationship between the subject's mode of being and the register of law or power can be found exclusively in an ontology of freedom that contrasts it with nature, because the political dimension is immediately concealed by language or is, rather, relegated to the latent system. The two paradigms do not, of course, develop independently of one another, as they share the same classical references and because the more or less simultaneous translation of the works of European metaphysics is one of the main determinants of their history. In that respect it is striking that it should be the divergent readings of Nietzsche's work that bring this out.

B. Sovereignty of the subject: Bataille or Heidegger?

The first paradigm is exemplified by Georges Bataille, who was probably one of the first contemporary authors working in the French language to consciously exploit the possibility of inscribing a dialectical (or mystical) antimony at the heart of anthropology by defining the subject in terms of its "sovereignty," or in other words its non-subjection. According to Bataille this is just a bad pun—even though his construct obviously relies upon it:

> If I have spoken of objective sovereignty, I have never lost sight of the fact that sovereignty is never truly objective, that it refers rather to deep subjectivity. . . . [In the world of things and their interdependencies] we perceive relations of force and doubtless the isolated element undergoes the influence by the mass [*la masse*], but the mass cannot *subordinate* [*subordonner*] it. Subordination presupposes another relation, that of object to subject. [Footnote: The custom of sovereigns saying "my subjects" introduces an unavoidable ambiguity: in my view the *subject* is the *sovereign*. The subject I am talking about is in no sense *subjected* [*assujetti*]]. The subject is the being *as he appears to himself from within. . . . The sovereign different from the others differs from them as the subject differs from the objective action of labour*. This unavoidable pun is unwelcome. I mean that the mass individual, who spends part of his time working for the benefit of the sovereign, *recognises* him; I mean that he *recognises himself* in him. The mass individual no longer sees in the sovereign the object that he must first of all be in his eyes, but rather the *subject*. . . . The sovereign, epitomizing the *subject*, is the one by whom and for whom the instant, the *miraculous* instant, is the ocean into which the streams of labour disappear.

> (Bataille, *La Part maudite* III, La Souveraineté, I, 4, in Œuvres *complètes* 8: 283–86; *The Accursed Share*, vol. 3, *Sovereignty*, pt. 1, ch. 4, 237–41; trans. amended)

The obstacle Bataille comes up against here may have influenced his decision to abandon his book. But it also provides Lacan, Althusser, and Foucault with their starting point when they transform the impasse into an opening.

The second paradigm is exemplified by Heidegger's suggestion that Nietzsche's doctrine of the "will to power" should be seen as part of the "history of being" characteristic of Western metaphysics. Nietzsche characterizes the subject that designates itself "I" (*Ich*) or "ego" as a grammatical fiction (see in particular the fragments from 1887–1889 published under the title *The Will to Power*). Heidegger, however, is trying to demonstrate that it "is grounded in the metaphysics established by Descartes," to the extent that, although he makes body rather than "soul" and "conscience" the substance of thought, he identifies the latter more closely than ever with subjectivity and makes the criterion of truth the definition of man as subject (Heidegger, *Nietzsche*, vol. 4, ch. 19, 123ff.). Heidegger's problem is how to determine, through a genealogical investigation into "metaphysics as the history of being," the preconditions for the moment of ontological conversion (which is closely linked to the mutation in the idea of truth itself) that made *subjectum,* which Latin philosophers regarded as a "translation" of Aristotle's *hupokeimenon*, not just the simple presupposition of the realization of an individual substance in a particular form, but "the" very power to think, from which all representations stem, and which reflects upon itself in the first person (*cogito me cogitare* is the key phrase attributed to Descartes by Heidegger). The "sovereignty of the subject" (*Herrschaft des Subjekts*), on which we are still dependent, is basically a creation of the Descartes of the *Meditations* and the *Principles of Philosophy*.

To begin to undo this tangle (and in doing so to elucidate at least part of the unsaid [*non-dit*] of late twentieth-century debates about the "philosophy of the subject" and the various critiques therefore), we must first restore Heidegger's construction of the history of Being as the history of successive generalizations of "subjectness" (*Subjektheit*, "I think") to the self-referentiality (or autonomy) of the transcendental subject and its retrospective attribution to Descartes and make it the starting point for the specifically modern attitude in philosophy. Despite Bataille's embarrassment about what he calls a pun, we must then reconstruct a *longue durée* semantics whose effects become ever more specific and conscious in the hands of his successors, whom it helps to unite, regardless of the obvious doctrinal disagreements. Let us begin with the first point.

C. The "Cartesian" subject: A Kantian invention

The expressions "Cartesian subject" and "Cartesian subjectivity" are so widely used and so often used to situate Cartesianism in a historical or comparative series (either in a French discourse or between French and other philosophical idioms) that it is worthwhile expounding in detail the prehistory of this construct, which is also a translation error. That error reveals the extraordinary conceptual work performed by the language itself (because of the syntactic differences between Latin, French, and German). The error is sufficiently powerful and suggestive to induce a retrospective understanding of Descartes's text and the issues at stake

in his philosophy, and we can no longer ignore the issue. Thanks to Kant's reading of Descartes, we can see it as an early instance of resistance to the transcendental problematic but cannot divorce it from the language of "subjectivity." From that point of view, we cannot undo what Kant has done.

As J. Ritter judiciously reminds us, *Subjektivität* is already an important term in Baumgarten's *Aesthetics*. It refers to the field and quality of phenomena that, in the thinking, perceiving, and sentient being, are the effect not of the external objects that affect it but of its own dispositions (they are what Locke or Malebranche would call "secondary qualities"). Ritter's suggestion to the contrary notwithstanding, the use of *subjectum*, or rather *Subjekt*, in German does not, however, precede this abstract conceptual formation; it comes later. It is in fact only with the *Critique of Pure Reason* that *das Subjekt* (variously described as the "logical subject," the "empirical subject," the "rational subject," the "transcendental subject," or the "moral subject") becomes the key concept in a philosophy of subjectivity. Kant's philosophy therefore simultaneously "invents" the problematic of a thought whose conditions of access to both the objectivity of the laws of nature and the universality of ethical and aesthetic values lie in its own constitution (the so-called "Copernican revolution") and gives the name "subject" (i.e., the opposite of "object") to the generic individuality inherent in the interplay between the faculties of knowledge; for all finite minds that interplay constitutes "the world" and gives a meaning to the fact of acting in the world. Even if we take into account its remarkable forerunners (such as that identified by A. de Libera in the work of the "brilliant" twelfth-century Franciscan, Pierre Jean Olieu; see above), who were in all probability not known to Kant, the only intrinsic connection between the *Subjekt* created by Kant and the scholastic notion of the *subjectum* or *suppositum* is that implied by the idea of the Copernican revolution: the categories, or in other words, the most general modalities that the activity of judgment uses to attribute predicates to things, are no longer genera of being, but categories of the subject, constitutive of the object (and, in that sense, of experience in general: "transcendentals").

Why, in these conditions, did Kant retrospectively project this discovery on to a "precursor," namely Descartes? For over two hundred years he has lent credence to the idea that the subject is a Cartesian invention and has thus encouraged even the greatest thinkers to look for traces of a semantic mutation in terms that are almost never used by the philosopher of the *Meditations*. The answer lies, as so often, in the letter of the text itself. We will compare three passages from the *Critique of Pure Reason* ("Transcendental Deduction" and "Paralogisms of Pure Reason"). It has to be said that they are still not easy to translate.

1. Das: *Ich denke*, muss alle meine Vorstellungen begleiten können; denn sonst würde etwas in mir vorgestellt werden, was gar nicht gedacht werden könnte. . . . Also hat alles Mannigfaltige der Anschauung eine notwendige Beziehung auf das: *Ich denke*, in demselben Subjekt, darin dieses Mannigfaltige angetroffen wird. Diese Vorstellung aber ist ein Aktus der Spontaneität, sie kann nicht als zur Sinnlichkeit gehörig angesehen werden. Ich nenne sie die reine Apperzeption . . . weil

sie dasjenige Selbstbewusstsein ist, was, indem es die Vorstellung *Ich denke* hervorbringt, die alle anderen muss begleiten können, und in allem Bewusstsein ein und dasselbe ist, von keiner weiter begleitet werden kann.

(The *I think* must be able to accompany all my representations; for otherwise something would be represented in me which could not be thought at all. . . . Thus all manifold of intuition has a necessary relation to the *I think* in the same subject in which this manifold is to be encountered. But this representation is an act of *spontaneity*; i.e., it cannot be regarded as belonging to sensibility. I call it the *pure apperception* . . . since it is that self-consciousness which, because it produces the representation *I think*, which must be able to accompany all others and in which all consciousness is one and the same, cannot be accompanied by any further representation.

(Kant, *Critique of Pure Reason*,
Transcendental Logic, §12, B 132)

2. *Ich,* als denkend, bin ein Gegenstand des inneren Sinnes, und heisse Seele. . . . Demnach bedeutet der Ausdruck: Ich, als ein denkend Wesen, schon den Gegenstand der Psychologie. . . . Ich denke, ist also der alleinige Text der rationale Psychologie, aus welchem sie ihre ganze Weisheit auswickeln soll. Man sieht leicht, dass dieser Gedanke, wenn er auf einen Gegenstand (mich selbst) bezogen werden soll, nichts anderes, als transzendentale Prädikate desselben, enthalten könne. . . . Zum Grunde derselben können wir aber nichts anderes legen, als die einfache und für sich selbst an Inhalt gänzlich leere Vorstellung: Ich; von der man nicht einmal sagen kann, dass sie ein Begriff sei, sondern ein blosses Bewusstsein, dass alle Begriffe begleitet. Durch dieses, Ich, oder Er, oder Es (das Ding), welches denkt, wird nun nichts weiter, als ein transzendentales Subjekt der Gedanken vorgestellt = x, welches nur durch die Gedanken, die seine Prädikate sind, erkannt wird.

(*I*, as thinking, am an object of inner sense, and am called "soul." Accordingly, the expression "I," as a thinking being, already signifies the object of a psychology. . . . I *think* is thus the sole text of a rational psychology, from which it is to develop its entire wisdom. One can easily see that this thought, if it is to be related to object (myself), can contain nothing other than its transcendental predicates. . . . At the ground of this doctrine we can place nothing but the simple and in content for itself wholly empty representation *I*, of which one cannot even say that it is a content, but a mere consciousness that accompanies every concept. Through this I, or He, or It (the thing), which thinks, nothing further is represented than a transcendental subject of thought = x, which is recognized through the thoughts that are its predicates.)

(Kant, *Critique of Pure Reason*,
Paralogisms of Pure Reason, A 342, 343, 345–46)

3. Der Satz: *Ich denke*, wird aber hierbei nur problematisch genommen; nicht sofern er eine Wahrnehmung von einem Dasein enthalten mag (das kartesianische *cogito ergo sum*), sondern seiner blossen Möglichkeit nach, um zu sehen, welche Eigenschaften aus diesem so einfachen Satze auf das Subjekt desselben (es mag dergleichen nun existieren oder nicht) fliessen mögen. Läge unserer reinen Vernunftserkenntnis von denkenden Weser überhaupt mehr, als das *cogito* zum Grunde . . . so würde eine empirische Psychologie entspringen.

(The proposition "I think" is, however, taken here only problematically; not in so far as it may contain a perception of an existence (the Cartesian *cogito ergo sum*), but only in its mere possibility, in order to see which properties might flow from so simple a proposition as this for its subject (whether or not such a thing might now exist). If more than the cogito were the ground of our pure rational cognition of things in general . . . then an empirical psychology would arise.)

(Kant, *Critique of Pure Reason*,
Paralogisms of Pure Reason, A 347)

Leaving aside the remarkable alternation between the pronouns (*Ich, Er, Es*; see I/ME/MYSELF), we can see that Kant is doing one thing while claiming to do another. He attributes to Descartes a nominalization of the statement *cogito*, or "I think," so as to make it the name of a self-referential operation whereby thought takes itself as its own object; the full formula should be "I am thinking that I am thinking that I am thinking." It therefore designates the "something" or the "being" that both intends and is intended by thought as a *subject* (*subjectum*, which Kant transcribes as *Subjekt*) in the sense that classical metaphysics defines a subject as a pole or support for the attribution of predicates. Kant thereby suggests to his successors (Fichte, Hegel) that the only conceivable subject (*hupokeimenon*) is a subject that thinks itself and whose predicates are its thoughts. From the Cartesian point of view these two operations are contradictory, as we can see if we go back to the text of the *Meditations.* Strictly speaking, there is no nominalization of the simple phrase *cogito/ je pense* in Descartes (it first appears in Arnauld's *Des vraies et des fausses idées*), even though the way it reflects upon the properties of its own proper enunciation anticipates it. The transition to the metaphysical subject is, on the other hand, incompatible with the *cogito* in the strict sense (in the *Meditations* it is reduced to the existential proposition "*je suis, j'existe*"). The *cogito* is in fact inseparable from a first-person statement (*ego*), which Descartes contrasts with the "he/it" (*il/ille*) of God and the "this" (*hoc*) of his own body (in a problematic of identity or ego: "*Ce moi, c'est-à-dire mon âme, par laquelle je suis ce que je suis*"—"Thus this self (*moi*), that is to say the soul, by which I am what I am," *Discours de la méthode, Sixième Méditation; Philosophical Writings, 32*). "I think" is equivalent to "I am," which is then developed into "I am who I am," or in other words, my soul (*mens*) and not Him (God) or that (my body). We have here a misunderstanding—which has very serious implications as, reading through Kantian spectacles, the whole of transcendental philosophy, right down to Husserl and Heidegger, constantly criticizes

Descartes for having "substantialized the subject" in the very moment of its discovery. As we now know, transcendental philosophy reads Descartes as though he were a medieval thinker (Olieu) but has nothing to say about the philosophy of the Middle Ages.

The misunderstanding arises, basically, because Kant finds it difficult to situate in historical terms an idea that is revolutionary in philosophical terms and that is a concentrate of all the originality of his own "transcendental dialectic" and that differs from both the "subjectness" of Aristotelian metaphysics (*todi ti, hupokeimenon, ousia*) and the "ipseity" of the Cartesian "thing that thinks" (*ego ipse a me percipior*): that of the truth of the perceptive appearance inherent in thought. According to Kant, we cannot think (form concepts, subsume intuitions, etc.) without our inner sense being affected and without, therefore, giving rise to the illusion that there is an "inner reality" that is itself the object of thought: the thinking "self" recognizes itself in its logical function (unifying experience) to the extent that it constantly misrecognizes itself because it believes it can be known (as a phenomenon, literally a "that which appears" in the scene of representation: *erscheint*) (see ERSCHEINUNG). Now, in Kant, "substance" is no longer of the order of being or of the Thing "in itself." Substance is no more than the concept of that which remains permanent in phenomena. Kant therefore explains to us that the *subject*, which in itself (qua potentiality or logical faculty) is nothing substantial because it is in no sense phenomenal, constantly *appears to itself* in the modality of a substance as it thinks (itself) and because it thinks (itself). In the *Transcendental Deduction*, Kant writes: "I am conscious of myself not as I appear to myself, nor as I am in myself, but only that I am" (B 155). The "I," which is given only in a form that is inseparable from an "I think" statement, which also functions as its "proper," or in other words generic, name, can be apprehended (*en s'effectant lui-même*) only in an illusory mode. But this illusion or transcendental appearance (*Schein*) is the only thing that can deliver a primal truth and the only possible form of ground. In one sense it is the truth itself. "Subject" is the word that now denotes this astonishing unity of opposites. And Kant attributes to Descartes the metaphysical illusion he himself claims to have escaped. Descartes's "error" is testimony to the fact that the false lies at the heart of the true.

It does seem that we are dealing here exclusively with epistemological propositions and the experience of thought—and it should be noted that the enunciation's syntactic forms and the translations or transpositions play a determinant role. There is nothing to evoke openly a "practical" and, a fortiori, "political" dimension of the subject. This is not, however, certain when we look at two characteristics of the arguments we have just described. The first is that Kant's *subject* (the *Ich* or, to be more accurate, the *Ich denke*) is basically caught up in a relationship of ascription. The reflexivity ascribes to it, or it ascribes to itself, a representation that is both truth and error, recognition and misrecognition. The second is that this circle of apperception results in an injunction. It is not only tempting but necessary to compare this injunction with the very form of the categorical imperative: we are enjoined to free our own representation from phenomenalism (or, which comes down to the same thing, substantialism) in

order to relate it to the idea of "pure" intellectual activity. Now as such an idea is meaningless in terms of nature, it is only as a correlate of freedom that it can acquire a meaning. This is the way the study of the "Paralogisms of Pure Reason" ends: the transcendental *subject* (the reflexive identity of the self or *Selbst)* is identified with the moral "personality" (*Persönlichkeit*): "a possible subject of a better world, which he has in its idea" (B 426).

In historical terms, one would like to be able to relate this substratum of Kant's thought to the "becoming a subject" of the revolutionary and postrevolutionary citizen, and especially to the establishment of the category of a "subject of law" (*Rechtssubjekt*) of which we do not, as yet, have a sufficiently clear idea. In a recent study, Yves-Charles Zarka notes in Leibniz, in contrast, a problematic of justice and equity that requires everyone to "put himself in the place of all," the emergence of the expression *subjectum juris*, in the sense of a "moral quality" that universalizes its bearer. But we also know that, even when he seems to come closest to defining the idea of it (as in the *Doctrine of Right* of 1795, where the divisions of right are deduced from the subjective relationship between the obligors and the obligees, Kant (and Hegel after him) never uses the expression *Rechtssubjekt*, which seems to appear only with the *Historical School of Law* (Savigny, Hugo, Puchta). These subjects (*Subjekte*), in "relation to whom" obligations can be conceptualized (and who "relate" those obligations to themselves) have strictly nothing to do with political *subjects* (*Untertan*, which Kant equates with the Latin *subditus*), who obey a sovereign (which may be the people, as constituted into a state). The encounter with the thematic of sovereignty and the law implicit in the idea of a liberation of the subject, and of the subject as one "he who frees himself," therefore remains repressed.

■ See Box 6.

D. Subjectivity à la française

It is, in contrast, possible to interpret the way in which contemporary philosophy—and especially contemporary French philosophy—understands the question of subjectivity: not as a question of essence, or as relating being to truth and appearance, or in the metaphysical opposition between nature and liberty, but as a political issue, a becoming or a relationship between forces that are "internal" to their conflict.

From the point of view of the history of ideas and words, we should obviously establish a certain number of intermediary links, but we can do no more than evoke them here. First and foremost, there is Rousseau. The two sides of his work and the corresponding turns of phrase leave traces everywhere. Think of the way *The Social Contract* establishes a strict correlation between the figures of the "citizen" who is a member of the sovereign (or, in other words, the author of the law) and the "subject," who finds freedom in absolute obedience to that same law thanks to the "total alienation" of individual wills that gives rise to a general will. That will founds a "collective ego" that is reflected in every individual consciousness (in *The Phenomenology of Mind*, Hegel makes explicit reference to Rousseau when he speaks of "*Ich, das Wir, und Wir, das Ich ist*"; see I/ME/MYSELF). Think too of the way in which Rousseau's autobiographical works associate the

theme of the authenticity of the ego with that of subjection (*l'assujettissement*):

> There is not a day when I do not recall with joy and emotion that unique and brief time in my life when I was completely me, when nothing prevented me from being truly myself and when I could say that I was alive. . . . I could not bear subjection [*assujettissement*], I was completely free, and more than free because I was subject [*assujetti*] only to my affections, and I did only what I wanted to do.
>
> (Rousseau, *Rêveries du promeneur solitaire* (dixième promenade))

We then have to take into account the revolutionary caesura, which not only has the effect of allowing the citizen (who is entitled to have political rights) to "take over" from the subject (*subjectus*, *subditus*) but also of allowing the subject (*subjectum*) to evolve into a citizen in the sense that his humanity is naturalized. This inscribes all anthropological differences (age, gender, culture, health, abilities, morality, etc.) in an "individual character," which determines the subject's social recognition, with which the subject identifies (to a greater or lesser extent) in the course of his education. Together with the Rousseauist theorem and the Hegelian or Nietzschean critiques that have been made of it, it is the historical and political precondition for Bataille's subversion of the relationship between sovereignty and subjectivity. Such (at least according to our hypothesis) is the genealogy of the identification of the *problem of subjectivity* with the *problem of subjection*, which will give a completely new meaning to the philosophical question of the subject (and at the same time our perception of its history).

Gilles Deleuze refers to this issue in his *Empiricism and Subjectivity:*

> It is the same difference [between the origin and the qualification of ideas] that Hume encounters under the form of an antinomy of knowledge: it defines the problem of the self [*moi*]. The mind is not subject: it is subjected. When the subject is constituted in the mind under the effect of principles, the mind apprehends itself as a self [*moi*], for it has been qualified. But the problem is this: if the subject is constituted only inside the collection of ideas, how can the collection of ideas be apprehended as a self, how can I say "I" under the influence of those same principles.
>
> (Deleuze, *Empiricism and Subjectivity*, 31)

Later (with Guattari), he carefully works upon the paradigms of servitude or slavery (*asservissement*, *servus*) and subjection or subjugation (*subjectus*, *subditus*) in order to explain the characteristic modernity of the capitalist subject:

> We distinguish machinic enslavement and social subjection as two separate concepts. There is enslavement when human beings themselves are constituent pieces of a machine . . . under the control and direction of a higher unity. But there is subjection when the higher unity constitutes the human being as a subject linked to a now exterior object. . . . It would appear, then, that the

6

Subject, thing, person

➤ ACTOR, *DROIT*, ESSENCE, LEX

Everyday language tends to assimilate the notion of "subject" to that of "person," and this appears to contradict interpretations of subjectness (*subjectité*) in terms of subjection or domination. Livy (*History of Rome,* VII, 2) traces *persona* back to the fourth century BC, and the term is basically political, referring to a "representation" that is assigned through a role. Thanks to this double metonymy, which moves from the mask worn by an actor to the role he is interpreting, and then to Cicero's definition of the magistrate as "spokesman" (*per-sona*) of the *civitas,* or one who "assumes the role" of the city ("*est proprium munus magistratus intelligere se gerere personam civitas* [It is … the particular function of a magistrate to realize that he assumes the role of the city]," *On Duties,* I, 34). This makes the magistrate nothing more than the voice of the law (conversely, the law is a "silent magistrate," *De Legibus,* III, 2). The *persona* is basically juridical; the first to hold it is the assembled Roman people, which, to the extent that it has a literal right to speak, is a de facto and de jure "person." Given that "*nul n'étant censé ignorer la loi* [ignorance of the law is no excuse]," a Roman citizen is a *persona.* The city is the supreme citizen or "supremely a persona" (*persona civitas*), and the magistrate is the persona of a person (*persona personae*). There therefore appears to be a hidden link between "person" and the dimension of subjection that is present in the notion of "subject." *Persona,* that is, provides the backdrop for the distinction between the free man (*caput*) and the slave (*servus*); it allows the distinction between autonomy and juridical hetermony. As the jurisconsult Gaius writes (ca. 135) "*Quaedam personae sui juris sunt, quedam allieno juris subjectae sunt* [some persons are *sui juris* (independent) and others are *alieni juris* (dependent on others)]" (*Institutes* I, 48). The history of "persona" is, in etymological terms, bound up with that of "role" (a political, juridical, social, or even ethical role) and with the emergence of "subjectivity"—subjection. In philosophical terms, however, "persona" is closely bound up with the phenomena of the translations and transpositions associated with the mutation of Aristotle's *hupokeimenon* [ὑποκείμενον] into *subjectum.*

Philosophical definitions of "person" first appear in the context of the controversies over Trinitarian theology that occurred in late antiquity. In chapter 3 of the *Contra Eutychen et Nestorium,* Boethius (84, 4–5) defines "person" as an "individual substratum endowed with a rational nature [*naturae rationalis individua substantia*]." This definition provides the backdrop for the philosophical encounter

between subjectness and personality. Yet Boethius uses not *hupokeimenon* but *hupostasis,* a term that is even more ambiguous and difficult to elucidate. In order to make the strange Trinitarian notion of "person" comprehensible to *Latini,* Aristotle's translator assumes that he first has to explain what the Greeks call *hupostasis.* The Latin word *persona*—which he regards as equivalent to the Greek *prosôpon* [πρόσωπον], even though the term refers to an optical model, to a visible representation such as the face of the law or the polis, rather than to a voice or to speech—does not, in his view, express what is at stake in the notion he is trying construct. And how indeed could a Latin speaker living in the 520s understand something of the Trinitarian mystery by using a term that evokes someone appearing on stage in a mask, the role that intervenes in the ethical formulation of "life choices" (in the sense in which Cicero writes: "*Ipsi autem* gerere *quam* personam *velimus a nostra voluntate profisicitur* [it is through a voluntary decision that we adopt the *role* we claim to be playing]"), or the death mask that wards off demons? The Greeks have the "much more expressive" (*longe signatus*) term *hupostasis,* which allows them to express the fundamental feature: the "individual subsistence of a nature [*naturae individuam subsistentiam*]" (Boethius).

Because of the initial hesitation over "substance" or "subsistence," Boethius's definition of "person" reveals the constituent features of the various medieval networks that use different combinations of "subject," *suppôt,* "thing," and "person."

The important thing here is the clarification of the distinction between subsistence and substance. Given that Boethius translates *ousia* as "essential," *ousiôsis* [οὐσίωσις] as *subsistentia,* and *hupostasis* as *substantia,* the first step is to make a systematic distinction between the three terms. This can be done by showing that an entity such as man has *ousia* or "essence" because he is; he has *ousiôsis* or "subsistence," because he is "in" no subject (is not, that is to say, an accident), and has *hupostasis* or "substance" because he is "subjected to others" who are not subsistencies (who are, that is, "accidents"). The second step is to demonstrate that that which is not accident, but which is a substrate for accidents, or in other words that which is a subsistence, "is" at the level of the universal, but "acquires substance," or in other words functions as a substance (as a substrate for accidents) in particulars ("*ipsae subsistentiae in universalibus quidem sint, in particularibus vero capiant substantiam*"). According to the Greeks, "substances subsisting in particulars"

deserve to be called "substances" in the strict sense ("*iure subsistentias particulariter substantes* [ὑπόστασις] *appelaverunt,*" ibid., 86, 35–8, 39). What Boethius calls a "hypostasis" or substance is therefore that which founds the particular existence of a nature, or which makes possible for its particularization and its existence, which are inseparable.

Quite apart from the way Aristotle's *hupokeimenon* mutates into *subjectum,* we must also make allowances for the way *hupostasis* mutates into *substantia,* if we are to understand the emergence of the personal dimension of subjectivity within the domain of Trinitarian theology. The history of the Latin reception of the Greek formula—"one essence in three hypostases"—provides the framework for a series of developments that are of great importance to the subjectness/subjectivity system. The replacement of the obscure term *substantia* by the word *res* or "thing" in the eleventh century is one of the hidden reasons for the philosophical debate between the realists and the nominalists. This also provided the framework for the first medieval reflections on the notion of *suppositum,* which affected grammar, logic, and theology alike. If we also recall that the formula "have *hypostasis* (in)," which Boethius translates into Latin as *habere substantiam (in)* was the pre-Scholastic way of expressing existence, we can see that this is also the theme that introduces ontology (the difference between essence and existence), which was initially part of Trinitarian theology's conceptual network.

From this perspective "subjective" is not the opposite of "objective" in the same way that "perceiving" is the opposite of "perceived," or that "inner world" is the opposite of "outside world." When we encounter the terms *subjectum* or *subjectivum* in medieval texts on psychology, we therefore have to take care not to interpret them in the sense of "subjective subject" or "ego-ness." Medieval philosophers were concerned with something very different, namely the substrate, *sub-jectum* or *suppôt* of thought. The way *subjectum* is used in the sphere of subjectness explains why authors such as Averroës give human thought two subjects. To ask what is the subject of thought is to raise questions about what it is that founds the *intentio intellecta* as an act *commun.* Averroës's answer—the imagination, which is a faculty situated in the body and numbered by it, and the "material" intellect, which is separate from the body and not numbered by it—is inscribed within what we would now call a "modular" psychology

and therefore does not assimilate the *sub-jectum* to the *ego*.

modern State, through technological development, has substituted an increasingly powerful social subjection for machinic enslavement. . . . In effect, capital acts as the point of subjectification that constitutes human beings as subjects; but some, the "capitalists," are subjects of enunciation that form the private subjectivity of capital, while the others, the "proletarians," are subjects of the statement, subjected to the technical machines in which constant capital is effectuated.

(Deleuze and Guattari, *Thousand Plateaus*, 456–57)

Jacques Derrida discovers this constitutive amphibology from Rousseau onwards:

From then on, writing has the function of reaching subjects who are not only distant but outside the entire field of vision and beyond earshot.

Why subjects? Why should writing be another name for the constitution of subjects and, so to speak, of constitution itself? Of a subject, that is to say an individual held responsible (for) himself in front of a law and by the same token subject to that law?

(Derrida, *Of Grammatology*, 281)

He also finds it in connection with Levinas:

The subordination of freedom obviously means a subjection of the *subjectum,* but this is a subjection which, rather than depriving him of it, gives the subject both his birth and the freedom it orders in this way. It is indeed a subjection, not in the sense of internalization but, rather, in the sense of a coming-to-self of the subject [*une venue du sujet à soi*] in the movement in which he greets the Quite Other [*tout autre*] as the All Mighty [*Très-Haut*]. This subordination orders and gives [*ordonne et donne*] the subject's subjectivity.

(Derrida, *Adieu*)

But he also tries to force it to the point of implosion and, to adopt Artaud's neologism, to "derange the subjectile [*forcener le sujectile*]."

Writing at the same time as Bataille, Louis Althusser also emphasizes the paradox of sovereignty:

This God is a King-Subject, or in other words a King-Slave. Hegelian freedom frees the subject from his subjection and converts his servitude into a kingdom. The concept is the kingdom of subjectivity, or in other words the subject who has become a King. . . . Such is the circularity of freedom in the concept: it is the

conversion of servitude, the conversion of the subject into its kingdom.

(Althusser, "On Content," 90, trans. amended)

He sees this as the general mechanism whereby ideology "interpellates" individuals as subjects. The prototype is supplied by religious consciousness:

It then emerges that the interpellation of individuals as subjects presupposes the "existence" of a Unique and central Other Subject, in whose Name the religious ideology interpellates all individuals as subjects. . . . God then defines himself as the Subject *par excellence*, he who is through himself and for himself ("I am that I am"), and he who interpellates his subject, the individual subjected to him by his very interpellation, i.e., the individual named Moses. And Moses, interpellated-called by his Name, having recognized that it "really" was he who was called by God, recognizes that he is a subject, a subject *of* God, a subject subjected to God, *a subject through the Subject and subjected to the subject. The proof: he obeys him, and makes his people obey.*

(Althusser, "Ideology and Ideological State Apparatuses," 167)

It is Lacan and Foucault who deploy the specter of subjectivity as a process of subjugation most systematically. But they do so in diametrically opposed ways.

Lacan draws upon the old heritage of two French phrases that are at once paradoxical but absolutely idiomatic: "the ego is hateful" (Pascal) and "I is an other" (Rimbaud). What is the subject, according to Lacan? Nothing more than the sequential effects of the living individual's alienation by the "law of the signifier." While it has to be regarded as irreducible, the subject is never originary, but always already dependent. The subject exists only as an effect of the speech (*parole*) that constitutes it (and names it, to begin with) in a symbolic world of discourses and institutions that it cannot, by definition, master. This is how Lacan interprets the "misrecognition" that constitutes the unconscious. Because it is "subject [*soumis*] to the signifier" that irremediably cut it off from itself, the subject must forever oscillate between the illusion of identity—the narcissistic beliefs of a "imaginary capture" are resumed in the figure of the *ego*—and the unknown element in the conflict: the recognition of a question from the other (beginning with the other sex) as to what is most characteristic about it.

If desire is an effect in the subject of the condition—which is imposed on him by the existence of discourse—that

his need pass through the defiles of the signifier . . . the subject [must] find the constitutive structure of his desire in the same gap opened up by the effect of signifiers in those who come to represent the Other for him, in so far as his demand is subjected to them.

(Lacan, *Écrits*, 525)

At best, analysis inverts the trajectory of the constitution of desire, which leads the subject to enunciate his own "lack of being" ("desire merely subjugates what analysis subjectifies," 520).

Foucault, for his part, found in the methods used to obtain admissions and confessions (which migrate from religion and the inquisition to psychology and psychiatry) a model for the relationship between subjectivity, appearance, and truth (*Madness and Civilization*, *History of Sexuality*). In Bentham's panopticism he finds an ideal diagram of all the "fictive relations" (which are materialized in the working of institutions of social normalization) in which "a real subjection is born mechanically" (*Discipline and Punish*, 202). On this basis, he drew up a program for an investigation into the "modes of objectification that transform human beings into subjects" and especially relations of power ("The Subject and Power," 326). But there is no power, either over the "self" or over "others," that does not involve the constitution of a knowledge (*un savoir*), and knowledge itself is not a purely theoretical activity: it is a social practice that produces objectivity. The question of the subject and that of the object, brought back to a twofold process of subjectivation and objectivation, of the subordination (*assujettissement*) of the individual to rules and the construction of a self-to-self relationship that takes various practical modalities, are therefore not opposed to each another. They are two aspects of a single reality:

Foucault has now undertaken, still within the same general project, to study the constitution of the subject as an object for himself: the formation of procedures by which the subject is led to observe himself, analyse himself, recognize himself as a domain of possible knowledge. In short, this concerns the history of "subjectivity," if what is meant by that term is the way in which the subject experiences himself in a game of truth where he relates to himself.

(Foucault, "Foucault," 461)

These are the very words that were used in the *Transcendental Dialectic*, but their original meaning has been inverted. We can see that there is a circle of presuppositions; the *subject* is the set of subjecting or subjectifying structures (*dispositifs d'assujettissement ou de subjectivation*) that act objectively on the "subjectivity" of the individual. They presuppose, that is, the subject's "freedom," or ability to resist, and turn it against him. We are, in other words, talking about a power differential. It results in both a politics (trying to free the individual from certain disciplines and certain types of individualism) and an ethics (inventing "practices of freedom," "new power relations," and modes of *askesis* rather than of self-consciousness). Precisely because they are dispersed and conflicting, these propositions

transform our reading of Europe's philosophical past. Because they reveal the associations and metaphors that underlie Nietzsche's text, they allow us to make different use of the subjectivity defined in the *Critique of Pure Reason.* Had an internal relationship not been established between the subject (*subjectum*, *Subjekt*) and personal subjection, and therefore with the political, juridical, and theological power of which it is an effect and inverted image, we would not be able to recognize in the paradoxical combination of truth and transcendental appearance described in the "Paralogisms of Pure Reason" the sign of an originary difference (or *différance*) that concerns the ethics of internal obedience and *askesis* as much as the metaphysics of the mind and self-consciousness, if not more so. To conclude, they reopen the question of the active finitude specific to the Cartesian subject (or non-subject), which is, perhaps, not so much a "nature" or thinking "substance," or in other words a representation, as a "demand" (as Canguilhem puts it) for the right to say "I," "between infinity and nothingness," or between God and the body.

E. How should we translate French philosophers?

To conclude what is not so much a history of translations as that of the *split* that has occurred in philosophical language as each idiom works on the basis of its own relationship with the juridical, theological, and metaphysical heritage of European culture, we can ask two questions. First, can what we have termed a new "idiomatic French" grounding of the problematic of the subject in French be translated into other idioms? Second, does the philosophy that in the twentieth century provided the framework for its invention have any choice but to go on repeating its terms ad infinitum, or can it purely and simply break with it by adopting other paradigms (such as that of analytic individuality) and more or less adequately "Gallicizing" their discourse?

A few summary remarks must suffice here. The *sujétion-subjectivation* paradigm can obviously be translated into the other Romance languages, give or take a few minor differences in the current usage of *soggetto* and *suddito*, *sujeto* or *sugeto* and *subdeto,* as both Italian and Spanish have retained the doublet (even though the Spanish introduces a significantly variant spelling).

■ See Boxes 7 and 8.

Modern Greek, which has retained *hypokeimeno* for *subject*, has forged *hypokeimenotêta* for *subjectivité*, can translate *sujétion* and *assujettissement* by expressions such as *hypotagê* and *hypodoulôsê*, though there could be some confusion with servitude or slavery.

Strictly speaking, this discourse cannot be translated into German. The only possible translation of *sujétion* is *Unterwerfung* (*soumission*; "submission"), whereas *subjectivation* translates as *Subjektivierung*. A revelatory example is supplied by Habermas in his *Der philosophische Diskurs der Moderne* (1996), a collection of twelve lectures devoted mainly to contemporary French philosophy (Bataille, Derrida, and Foucault). Here are two samples:

Für Bataille öffnet sich mit dieser Idee der Entgrenzung eine ganz andere Perspektive als für Heidegger: die sich selbst überschreitende Subjektivität wird nicht

7

Subjectus/*subjectum*: the historial pun

➤ OIKONOMIA, POLIS, *POWER*, RIGHT/JUST/GOOD

The English "subject," the French *sujet,* the Spanish *sujeto,* and the Italian *soggetto* immediately reveal what the German *Subjekt* cannot evoke because of the differences between it and *Untertan*. They have a twofold etymology: *subjectum,* which is a support for individual properties, and *subjectus,* meaning "subject to" a law or power. "Subject" implies both presupposition and subjection, the answer to the question "what?" and the answer to the question "who?" It is my considered view that this linguistic fact has played a determining role in the development of Western philosophy, and I have, parodying certain French translations of Heidegger, spoken of a historial (*historial*) pun whose effects can be traced from Hobbes to Foucault, via Rousseau, Hegel, Nietzsche, and Bataille.

"Subject" was not originally one of the words with "antithetical" meanings that so fascinated Freud. But it has become one, and the result is that freedom and constraint now look like two sides of the same coin. The origins of this overdetermination are, inevitably, Greek, even though the structural analogy between the terms *hupokeimenon* (substrate or support) and *hupostasis* (meaning ground or substance until it became the Greek Fathers' technical term for the "persons" of the Trinity [*hupêkoos* (ὑπήκοος): "he who obeys the word," the servant, the disciple, or the vassal who pays tribute]) can have a retrospective effect on our imaginations. They have never been theoretical "neighbors." We have to turn to Latin or, in other words, to imperial and Christian Rome, and then to the history of the theologico-political and of a moral anthropology centered on obedience as the path to salvation.

The *subjectus* is a juridical figure with a history lasting seventeen hundred years, from Roman law to absolute monarchy. This raises the question of how we can go from an enumeration of the individuals who are subject to the power of an other, to a representation of the human race as a set of *subjects*. The distinction between independent and dependent persons was basic to Roman law. A text from Gaius is sufficient reminder of that:

> Next comes another division in the law of persons. For some persons are *sui juris* (independent) and others are *alieni juris* (dependent on others). Again, of those *alieni juris* some are *in potestas*, others *in manu*, and others *in mancipium*. Let us consider first persons *alieni juris*, for, knowing them, we shall at the same time know who are *sui juris*.

> (Gaius, *Institutes* I, 48–50)

It is the dialectical division of forms of subjection that gives us, *a contrario,* a definition of free men or masters. But the notions of *potestas*, *manus*, and *mancipium* are not enough for that division to create a link *between* subjects. What is needed is an *imperium*. The idea of a universal subjection therefore emerges with the empire (and in relation to the person of the emperor to whom citizens, and many noncitizens, owe *officium* or "service"). But that is still not a sufficient precondition: Romans must (if they have not already done so) submit to the *imperium* in the same way that conquered peoples "submit to the people of Rome" (the incipient confusion emerges in contradictory fashion when the personal status of "Roman citizen" extends to the entire empire). And, above all, the *imperium* must be theologically founded as a Christian *imperium,* as a spiritual power derived from and preserved by God, and reigning not over bodies but over (and in) souls.

Understood in this sense, the subject (the subject of law) is the absolute opposite of what will later be termed the *Rechtssubjekt* (a subject by right or with rights, *sujet de droit).* The *sujet de droit* has two main characteristics: he is a *subditus* but not a *servus.* To describe the subject as *subditus* is to say that he enters into a relation of obedience. Obedience is not only something that applies between a leader who has the power to coerce and those who are under his power; it also describes the relationship between a *sublimis* who is elected as commander and the *subditi* or *subjecti* who turn to him to hear what the law states. The ability or power (*pouvoir*) to coerce is distributed throughout a hierarchy of powers (*puissances*). Obedience is the principle that ensures that all who obey are members of the same body. Although it is concentrated at the top in the figure of a *principium/princeps*, it basically comes from below; insofar as they are *subditi,* subjects "will" their own obedience, which is inscribed within the economy of creation and salvation. The "loyal subject" (*fidèle sujet*) is of necessity a "faithful subject" or "believer" (*sujet fidèle*) who knows that all power comes from God.

Such obedience, in its theoretical unity and its innumerable forms, therefore implies the notion of a commandant (*archôn* [ἄρχων]), but being commanded (*archomenos* [ἀρχόμενος]) then implies—at least in a democratic *politeia*—the possibility of becoming a commander (this is Aristotle's definition of the citizen); alternatively, it is a domestic-style natural dependence. In that

perspective, the very idea of "free obedience" is a contradiction in terms. That a slave can "also" be free is a late (Stoic) idea that has to be understood as meaning that he who is a slave in this world can also be a master (of himself and his passions) in another world (a "cosmic" city of spirits); he can also be a citizen who is bound to others by reciprocal ties (*philia* [φιλία]: see LOVE). There is nothing here to suggest the idea of a freedom that resides in obedience or that results from obedience. For that to be conceivable, obedience must cease to pertain to the soul and must cease to be considered natural; it must be the supernatural part of an individual who understands the divine nature of order.

A constant distinction was made between the *subditus* and the *subjectus,* just as a distinction was made between the sovereignty of the prince or *sublimis* and that of a despotism (literally, the authority of a slave-master). But that basic distinction took several forms. Within the theological framework the subject is a believer, a Christian. This can also mean that because, in the last instance, he obeys his soul, he cannot be the sovereign's "thing" (to be used or abused as he wishes); the counterpart of his obedience is the prince's responsibility (duty) towards him. This way of conceptualizing the freedom of the subject is, in practice, extraordinarily ambivalent: it can be understood as meaning that his will to obey is assertive and active (just as the Christian can, through his works, "cooperate in salvation"), or that his will has been extinguished (which is why mystics seek to annihilate themselves in the contemplation of God, who is the only absolute sovereign). Autonomy is close to nothingness, and "property" to "expropriation."

It is understandable that when the "citizen" reappeared in the towns of the Middle Ages and the Renaissance, he was no longer reducible to the *zôion politikon* [ζῷον πολιτικόν]; Aquinas (who translates the expression as "social animal") makes a distinction between man's (supernatural) *christianitas* and (natural) *humanitas,* between the believer and the citizen. So what becomes of the "subject"? In one sense the subject becomes more autonomous (his subjection is an effect of a political order that integrates "civility" and "polity," and is therefore part of nature). But it becomes increasingly difficult to see the subject as a *subditus,* as the concept of his essential obedience comes

(continued)

under threat. The contradiction explodes in the absolute monarchy, which stretches to breaking point the mystical unity of the "two bodies" of the temporal-spiritual sovereign. The same applies to the freedom of the subject. All that remains is a prince whose will is law, a "father of his subjects" who has absolute authority over them. "*L'État, c'est moi,*" as Louis XIV is supposed to have said. But an absolute monarchy is state power, or in other words a power that is established and exercised through the law and an administration: its subjects are, if not "subjects by right" (*sujets de droit*), as least *de jure* subjects (*sujets en droit*) and members of a "republic" (or commonwealth, as Hobbes would say). All

the theorists of absolute monarchy explain that "subjects are citizens" (or, like Bodin [*La République* I, 6] that "all citizens are subjects, some of their freedom being diminished by the majesty of the man to whom they owe obedience; but not all subjects are citizens, as we have said of slaves"). Boethius inverts the terms of the argument and answers them by defining the power of the One as a "voluntary servitude." At the same time *raison d'état* means that freedom no longer has any supernatural meaning. The controversy over the difference (or non-difference) between absolutism and despotism went on throughout the history of the absolute monarchies. And the subject's condition is retrospectively identified with that of the slave. And from the viewpoint of the new citizen and his

revolution (which is also an essential factor in his idealization), subjection is identified with slavery.

Sujeto, subdito, sugeto. The body of the subject: Montaigne and Saint Teresa

When we examine the process of the formation of the language of corporality and intimacy in Spanish, we should note the importance of the word *subjecto* or *sujeto,* which is very close to certain contemporary philosophical usages (Merleau-Ponty, Zubiri, Lacan), but also to the Montaigne of the *Journal de voyage en Italie.* The Spanish translation may help to bring this out. In this sense *sujeto* is closely related to the recognition of intimacy, to the experience of pain and, more generally, of the passions of one's own body. It applies to both the register of politics and the register of mysticism.

Sujeto enters the Spanish lexicon at some point in the mid-sixteenth century (see RT: Corominas and Pascual, *Diccionario crítico etimológico castellano e hispánico*). The Spanish *sujeto,* which derives from the Latin *subjicere,* has two meanings and refers both to "that thing underneath" and "one who is subject to an authority." But the difference between the two languages becomes apparent as Spanish prefers to derive the word from the radical *subdere*—which gives *subdita*—while *sujeto* is related to *suppositum* or, in other words, the materiality of the person and, ultimately, the body, with all its force or potentialities. The decisive moment for Castilian thought comes, however, when the terms begin to overlap.

Montaigne, writing in French, provides the essential contemporary account of the transition from the political to the intimate:

Nous y passasmes un chasteau de l'Archiduc qui couvre le chemin, comme

nous avons trouvé ailleurs pareilles clostures qui tiennent les chemins subjects et fermés.

(We passed a castle belonging to the Archduke that overlooks the path, just as we found elsewhere similar fences that keep the roads subject and closed.)

(Montaigne, *Journal du voyage en Italie,* 59)

This quotation exemplifies the transitive use of *sujeto,* which is a past participle designed to describe the act of squeezing or containing something from outside a passage or a pathway so as to prevent it from spilling out into the countryside. Leaving aside this technical sense, Montaigne describes other situations in which the first meaning of "subject"—the political subject—comes to the fore. But he also supposes (*suppositum* is the subject's other name) that it is possible to know an internal realm that is not divorced from the surrounding world and that finds in it the metaphors and signifiers that allow it to express itself. Travel is the path to intimacy. In his *Journal* Montaigne tries to appropriate certain words whose meaning has been altered in order to justify a new distribution of powers. "*Cuius regio eius religio*" is from now on the rule governing a process that Montaigne examines with an attention that is barely concealed by his air of nonchalance. *Subject* is an old word for a modern practice, for a strange practice that, for the first time, modifies what seemed to be part

of human nature or the unchangeable order of things. *Subject* is Montaigne's greatest discovery in Florence, and it seems to him to be as strange as the exotic animals (sables or black foxes) the Muscovite presented to the Pope. In his commentary on the Duke of Florence's policy towards his "subjects (of whom he must be wary)" Montaigne shows us the effort that was being made to naturalize a situation of conflict. And in Lucca, subjects are counted as "souls." "*Les seigneurs ont quelques chastelets, mais nulle ville en leur sujection* (ibid., 134) (The lords have several castles, but no city is subject to them)."

The specificity of Spanish allows *sugeto* to be displaced in the direction of a meaning that is directly linked to the disposition of both the body and the spirit. Cervantes provides an example: "*Es menester que me advirtáis si estais con sugeto de esucharme* (You must let me know if you are disposed to listen to me)," *Persiles* III 17. This semantic field includes a direct reference to the corporeal dimension of human beings, especially when they suffer some loss or are ill.

Autoridades's *Dictionary* (1726) gives this definition: "*se usa tambien por la actividad, vigor y fuerzas de la persona: y asi seulen decir del enfermo muy extenuado: No hai sugeto* [it is also used to refer to a person's activity, vigor, and strength, which is why it is said of someone who is ill and quite exhausted that there is no subject]." The last sense was in common use from the end of the sixteenth century onwards; the main evidence is supplied by quotations from so-called mystical or "spiritual" writers.

The Life of Saint Teresa gives twenty or so examples of the transitive *sujetarse* (to subject oneself, to restrict the discussion to a transliteration that has yet to acquire other cultural or psychoanalytic meanings). The beautiful thing about the text is that it gives a clear idea of a subject that is a product of work, of a "becoming-subject." Just as Montaigne saw paths that were "subject to" the walls of castles, the founder of the Avila convent was aware of the effort it took to become a subject—a subject of the law or, rather, of a novel and unwritten form of speech. This is why mysticism, which can be an experiment in writing that uses popular metrics, is of interest to the translator: Saint Teresa is trying not so much to say what cannot be said as to stay within the limits of what can be said. Theresa, an educated woman disguised (as she puts it) as an illiterate woman, exemplifies a very particular relationship with language. It is close to what Roland Barthes calls "logothesis," or the simultaneous invention of speech and a vital space. Its invention juxtaposes the two meanings of "subject": the political sense (henceforth, *subdito*) and the bodily sense (*sugeto*). Hence the surprising use of both *sugeto* and *yo*:

Padeciendo tan grandísimo tormento en las curas que me hicieron tan recias, que yo no sé cómo las pude sufrir; y en fin, aunque las sufrí no las pudo sufrir me sujeto.

(I . . . suffered the greatest tortures from the remedies they applied to me, which were so drastic that I do not know how I endured them. In fact, though I did endure them, my subject (that is to say my body) was not able to do it.)

(Teresa of Avila, *Life of Saint Teresa,* 35)

The same duality appears in the language of asceticism, as when Ignatius speaks of his penitence:

No es penitencia quitar lo superfluo de cosas delicadas o moles, ma es penitencia quando en el modo se quita de lo conveniente, y quanto más y más major, sólo que non se corrompa el subiecto, ni se siga enfermedad notable.

(Taking what is superfluous away from delicate and sweet things is not penitence. Taking away what is appropriate from our habit is penitence. In that case, the more we take away, the better,

provided that we neither injure the subject (body) nor risk serious illness.)

(Loyola, *Ejercicios spirituales*, 216)

This subject who scarcely suffers from illness, and this subject who can also be corrupted, are two examples of a new subject. What kind of subject is this, who signals its own existence without realizing it, or sends out signs pertaining to a different type of knowledge—the knowledge of the mystics to which Lacan refers: "This wisdom without wisdom passing all knowledge" (St. John of the Cross).

zugunsten eines superfundamentalistischen Seinsgeschicks entthront und entmachtet, sondern der Spontaneität ihrer verfemten Antriebe zurückgegeben. Die Öffnung zum sakralen Bereich bedeutet nicht Unterwerfung unter die Autorität eines unbestimmten, in seiner Aura nur angedeuteten Schicksals; die Grenzüberschreitung zum Sakralen bedeutet nicht die demütige Selbstaufgabe der Subjektivität, sondern ihre Befreiung zur wahren Subjektivität.

(Habermas, *Der philosophische Diskurs der Moderne*, 251)

(For Bataille, a completely different perspective from Heidegger's is opened up with this idea of unbounding: The self-transcendent subject is not dethroned and disempowered in favour of a superfoundationalist destining of Being; rather spontaneity is given back its outlawed drives. Opening towards the sacral domain does not mean subjugation to the authority of an indeterminate fate only hinted at in its aura; transgressing boundaries toward the sacral does not imply the humble self-surrender of subjectivity, but liberation to true sovereignty.)

(Habermas, *Philosophical Discourse*, 214)

And later:

In seinen späteren Untersuchungen wird Foucault diesen abstrakten Machtbegriff anschaulich ausgestalten; er wird Macht als die Interaktion kriegführender Parteien

. . . schliesslich als die produktive Durchdringung und sujektivierende Unterwerfung eines leibhaften Gegenübers verstehen.

(Habermas, *Der philosophische Diskurs der Moderne*, 300)

(In his later studies, Foucault will fill out this abstract concept of power in a more tangible way; he will comprehend power as the interaction of warring parties . . . and ultimately as the productive penetration and subjectizing subjugation of a bodily opponent.)

(Habermas, *Philosophical Discourse*, 255)

As one can imagine, this linguistic obstacle is not without its effects on the reasons why Habermas finds the object, internal divisions, and aporias or limitations of the "French" philosophy of the subject to be both incomprehensible and unacceptable.

In English, finally, the situation is quite specific. The pun is fully present (*Subject/subject*). The *sujétion/subjectivation* paradigm can therefore be legitimately transposed and assimilated. It can be further developed in English. A single sentence from Hannah Arendt's *The Human Condition* proves the point:

Somebody began it [= his own life story] and is its subject in the twofold sense of the word, namely its actor and its sufferer, but nobody is its author.

(Arendt, *The Human Condition*, 184)

What does create a problem is, rather, the fact that philosophical anthropology has, since the classical age, been organized around notions such as "person," "self," and "agent" (see I/ME/MYSELF and AGENCY), and not "subject." The first meaning of "subject" is political and institutional ("The idea of the servant makes us think of the master; that of the subject carries our view to the price" [Hume, *A Treatise of Human Nature* II, 2, 2]; John Stuart Mill's famous work on the civil and political inequality of the sexes, which was published in 1869, is entitled *The Subjection of Women*). The naturalization of "French ideas" is, however, changing this situation (and raising the tension). The work of Judith Butler, which is inspired by Freud, Derrida, Althusser, and Foucault, provides a remarkable example. At the beginning of her *Psychic Life of Power* (1997), subtitled *Theories in Subjection* (the syntax is perfectly idiomatic but probably also contains an allusion to John Stuart Mill's famous essay), she cites the *Oxford English Dictionary*'s entry on *subjection*:

> The act or fact of being subjected, as under a monarch or other sovereign or superior power; the state of being subject to, or under the dominion of another. . . . The condition of being subject, exposed, or liable to. . . . The act of supplying a subject to a predicate.
>
> (*OED*, cited in *Psychic Life of Power*, 1)

She later discusses the correspondences between the terms, but sometimes inverts the values to which we are accustomed:

> No individual becomes a subject without first becoming subjected or undergoing "subjectivation" (a translation of the French *assujettissement*). . . . The term "subjectivation" carries the paradox in itself: *assujettissement* denotes both the becoming of the subject and the process of subjection—one inhabits the figure of autonomy only by becoming subjected to a power, a subjection which implies a radical dependency.
>
> (Butler, *Psychic Life of Power*, 11, 83)

This is, however, part of her own development of the question: *subjection* becomes the general (tropological) concept of power "turning back upon oneself, or even turning on oneself."

As for the reciprocal question—how can French get away from being French (in philosophical terms, of course)—we can state that it cannot be answered by means of injunctions, either hermeneutic or analytic. This is not to say that it cannot be answered by remaining inside the French frontier. In his *Mythe de l'intériorité*, Jacques Bouveresse basically suggests (see, in particular, 356ff. and 656ff.) that we have to make a detour via Wittgenstein, or in other words invert Nietzsche's critique of the "grammatical privilege" conferred upon the subject, so as to turn it into an instrument for analyzing the ways in which, in every language game, a speaker—a philosopher, perhaps—articulates statements containing expressions of self-referentiality with public acts of enunciation in such a way as to be recognized as the author of certain meanings or thoughts. The suggestion deserves consideration.

SUBLIME

FRENCH	*sublime*
GERMAN	*Erhabene*, *erhaben*
GREEK	*hupsos* [ὕψος], *hupsêlos* [ὑψηλός]
LATIN	*sublimis*
SPANISH	*sublime*

➤ AESTHETICS, BEAUTY, COMPARISON, GENIUS, GOÛT, *IMAGINATION* [PHANTASIA], PATHOS, PLEASURE, *TO SENSE*

A profound and originary duality is concealed beneath the apparent uniformity of the vocabulary of the sublime. If, in English, French, Italian, and Spanish, the same term of Latin origin is currently used, with different ascriptions depending on whether it is an adjective or a noun, in aesthetic history the sublime wavers between Greek and Latin terms whose status differs grammatically and etymologically. Between the rhetorical tradition, stemming from Latin, and the philosophical tradition, stemming from Greek, there is a discontinuity. In the first tradition, "sublime" makes its appearance as an adjective, the synonym of "grave" and "elevated," but also of "vehement" and "terrible": a double sense that Cicero was already attributing to the grand style that Quintilian would name "genus sublime dicendi." In the second tradition, the sublime, far from characterizing only the "sublime style," is a noun designating in Longinus "a certain summit and eminence of discourse" ("akrotês kai exochê tis logôn" [ἀκρότης καὶ ἐξοχή τις λόγων]). "The sublime" is the term chosen by Nicolas Boileau to translate Longinus's *hupsos*, and it became, thanks to Edmund Burke in the middle of the eighteenth century, a principle systematically opposed to the beautiful: a principle whose theorization would accompany the birth of aesthetics in the eighteenth century.

I. Heterogeneity of the Ancient Tradition

A. *Sublimis*

Sublimis is an adjective in classical Latin whose meaning remains problematic. Its etymology has to be reconstructed: it is derived from *sub*, which indicates a displacement upward, and either from *limis*, "oblique, across," or, on the contrary, from *limen*, "limit, threshold." *Sub* does not designate in Latin merely a relation of inferiority, adjacency, or submission; it marks a displacement upward and is related to *super*, as the Greek *hupo* [ὑπό] is related to *huper* [ὑπέρ]. *Limis* (or *limus*) is an adjective characterizing an indirect and secretive manner of looking at something (as describes Athena, who is cross-eyed), or else a complex movement of elevation that is, in any event, not perpendicular to the ground. *Limen* is the noun favored by Sextus Pompeius Festus in the second century CE to explain the etymology of "sublime": the latter "comes from the upper threshold, because it is above us" (*Festus Grammaticus* [*De verborum significatu*], book 17, s.v.). Although Ernout and Meillet (RT: *Dictionnaire étymologique de la langue latine*, s.v.) reckon that this is a mere pun, one should not neglect the association established thereby between the

sublime and the idea of a threshold. If the sublime constitutes a superseding, and even a transgression, it would be appropriate to evoke what might be called the "surliminal" rather than the subliminal, contrary to what is suggested by the entirely fortuitous and material association between sublime and subliminal. That term does indeed designate what remains beneath the threshold and was introduced by J. A. Ward in English at the end of the nineteenth century to translate the title of a book by J. F. Herbart, *Unter der Schwelle.*

The first meaning of *sublimis* is "who goes while rising" or "which holds itself aloft." Thus Ovid distinguishes man from other animals by evoking his "sublime face" ("os sublime," *Metamorphoses* 1.85), which rises toward the heaven and permits him to gaze at the stars. And "sublimem aliquem rapere" means "to abduct someone into the air" (like Zeus ravishing Ganymede). One thus cannot insist enough on the dynamic sense as well as the obliqueness, both of which are absent from the semantic register of *hupsos* [ὕψος].

The adjective *sublimis* came only late to characterize a rhetorical style: it is to be found in neither the *Rhetorica ad Herennium* nor the *De oratore* of Cicero. Thus the expression "genus sublime dicendi" receives its quarters of nobility only with Quintilian, after whom the sublime style referred to the grand style, that is, the grave but also vehement style of the rhetorical tradition (*Institutio oratoria,* 12.10). The rhetorical tradition, having as its Latin source the *Rhetorica ad Herennium* (between 86 and 83 BCE), generally distinguishes three styles. The function of the first style is to teach (*docere*); of the second, to delight (*delectare*) or counsel (*conciliare*); and of the third, to stir up and put in motion (*movere*), rather than to "move" in the emotional sense of the term. It was to this third style that Cicero and Quintilian would give pride of place, at least when it is used advisedly.

B. *Hupsos* and the treatise *On the Sublime*

Hupsos [ὕψος] is a noun, belonging to an ancient, rich, and well-constructed family of terms, all of which are derived from the adverb *hupsi* [ὕψι], "on high, upward": it commonly designates height, conceived as the spatial dimension opposed to width and length, and it subsequently took on the meaning of "summit, peak, or high point."

Its use was fixed by Longinus in a favored relation to simplicity of speech, force of conception, and greatness of mind. But *hupsos* is not the only term that can be rendered by "sublime" in the *Peri hupsous* [Περὶ ὕψους].

1. Longinus uses *megaloprepês* [μεγαλοπρεπής] (having an air of grandeur) when he evokes amplitude and majesty—rather than sobriety—of style.
2. He also uses *megethos* [μέγεθος], "greatness," and all sorts of compounds formed with the adjective *mega* [μέγα]: *megalêgoria* [μεγαληγορία], "greatness in speech"; *megalophrosunê* [μεγαλοφροσύνη], "greatness of mind, elevated conception"; *megalophuês* [μεγαλοφυής], "great nature"; *megalophuia* [μεγαλοφυία], "genius, nobility"; *megalopsuchia* [μεγαλοψυχία], "great soul."
3. The adjective *hadros* [ἁδρός], which Quintilian gives as the equivalent of *sublimis*, enters into the compound expression designating the first source of the sublime, "to peri tas noêseis adrepêbolon" [τὸ περὶ τὰς νοήσεις

ἀδρεπήβολον] (8.1) and signifies literally "what attains its goal forcefully in thoughts."

4. Better still: Longinus uses the adjective *deinos* [δεινός] in a first sense (attested to by Homer) of "terrible, formidable," while the nouns *deinotês* [δεινότης] or *deinôsis* [δείνωσις], "vehemence, energy," serve him to designate the oratorical power of Demosthenes, that is, the very model of the sublime at its most concentrated and effective.

In addition, if one passes from terminology to thematic register as object of consideration, the network of citations subtending and at times overdetermining the theoretical text knows no end of instances of threatening death, parricidal rivalry, ravaging passion, horror at mutilated bodies, or terror at obstacles to be overcome: from this perspective, the hypothesis might be sustained that the meaning of *hupsos* would have been inflected or even revised in the sense of terror contributed by Burke in his *A Philosophical Enquiry into the Origin of Our Ideas of the Sublime and Beautiful.*

■ See Box 1.

When was the linkage between *sublimis* and *hupsos* established? It is not found in Quintilian, who gives as an equivalent of *sublimis* the adjective *hadros* [ἁδρός], until then rendered in Varro as *uber* (fertile, rich: *uber, -ris*, designates the teat or breast) or as *gravis* (having weight, that of the pregnant woman or that of authority) in the *Rhetorica ad Herennium* or in Cicero. He could certainly have used adjectives derived from *hupsi* available in Greek: *hupsagorês* [ὑψαγόρης] (who speaks loudly), of which there are four occurrences in the *Odyssey* (Quadlbauer, "Die genera dicendi bis"), and *hupsêlos* [ὑψηλός], "elevated," used by Longinus. But the real problem lies in the gap between an exclusively adjectival form and a nominal form of the word. In point of fact, the noun *sublimitas* in Quintilian or Pliny does not correctly render *hupsos*, since it does not designate the totality of what is sublime, but the mere fact of being sublime. The qualifying term tends to serve for description and evaluation, whereas the noun refers us to an essence. As much as Greek is concerned with the idea of the sublime and attempts to elucidate its genesis and status by surprising the sublime in its nascent state, so does Latin, a language of juridical and pragmatic efficacy, move toward determining one or several sublime characteristics, in order to define levels of discourse and perfect the prodigious rhetorical instrument constituted by the theory of styles.

We are the heirs to this heterogeneity of the ancient tradition: Is the unity of the sublime compatible with the diversity of its perceptible embodiments? Two symmetrical risks present themselves: either one presses abstraction to the point of rendering the sublime independent of all support and strips it of any capacity to attain presence, even negatively; or one defines a priori the character of the sublime and then tends to conflate its principle not only with one of its particularities, but also with a model that might be reproduced following a specific protocol. There have thus been at least three different ways of disposing of the sublime: by reducing it to a modality of the beautiful (its mere superlative), by assimilating it purely and simply to the terrifying, or, finally, by dissolving

1

Sublime *ekstasis*

The treatise *On the Sublime* retains even today a good measure of its mystery. We know neither its author (long assumed to be Dionysius Longinus, a Hellenistic philosopher, then Dionysius of Halicarnassus) nor, with any certainty, its date (which is no longer situated in the third century after Christ, but in the first, toward the era of Tiberius). The astonishment it arouses also stems from the sources it fuses: aside from the full range of the Greek tradition (Homer, Demosthenes, and Plato, but no less the lyricists, tragedians, and historians), and the Latin tradition (Cicero and the debates of the first century), the treatise cites "the lawgiver of the Jews" and Genesis—an occurrence almost unique in pagan literature—under the presumed influence of Philo of Alexandria. "Let there be light, and there was light; let there be land, and there was land" is an example, between two passages from Homer, of a presentation of the divine in all its power and dignity (*On the Sublime* 1.3–9, quoted in 9.9).

The "golden book," to take up Isaac Casaubon's expression, was genuinely known only in the modern age. It was published and translated during the second Renaissance, but it was Nicolas Boileau who first spread the fame of Longinus to a huge European audience. The celebrity of Longinus in the last quarter of the seventeenth century and the first two-thirds of the eighteenth century was such that the history of his interpreters tends to fuse with the vicissitudes of the concept of the sublime.

The definition of the sublime by Longinus puts the accent, as in the rhetorical tradition, on the effect that it produces. But it insists at the same time on what distinguishes that effect from the effects of persuasive discourse, which, according to Cicero's definition, aim simultaneously to instruct (*docere*), to delight (*delectare*), and to move (*movere*). The effect sought by the sublime essentially corresponds to *movere*, which Cicero, moreover, considered to be the most crucial effect in rhetorical discourse, one that won the agreement of the audience.

A sublime passage does not convince the reason of the reader, but takes him out of himself [*eis ek-stasis* (εἰς ἔκ-στασις)]. That which is admirable ever confounds our judgment, and eclipses that which is merely reasonable or agreeable. To believe or not is usually in our own power; but the Sublime, acting with an imperious and irresistible force, sways every reader whether he will or no. Skill in invention, lucid arrangement and disposition of facts, are appreciated not by one passage, or by two, but gradually manifest themselves in the general structure of a work; but a sublime thought, if happily timed, illumines an entire subject with the vividness of a lightning-flash, and exhibits the whole power of the orator in a moment of time.

(Longinus, *On the Sublime,* 1.4, trans. Russell)

The irresistible force of the sublime entails another characteristic that also distinguishes it from the discourse of persuasion: its universality. As opposed to rhetorical effects, which, according to Aristotle's definition, are often effective and are addressed to a majority of men, the sublime acts everywhere and on everyone: "In general we may regard those words as truly sublime which always please and please all readers" (*dia pantos . . . kai pasin* (διὰ παντὸς . . . καὶ πᾶσιν, 7.4). The question of universality thus opens onto another significant tradition for the philosophy of the sublime.

Barbara Cassin
Jacqueline Lichtenstein

it into the sphere of an absolute from which it would surface as a merely temporary mode of revelation.

II. Junction between the Greek and Latin Traditions: The German Exception

Boileau may not have invented the noun "the sublime." But he was undeniably the first to render *hupsos* as "the sublime"—a noun he even endowed with a capital initial—in the title of his translation of Longinus, *Traité du Sublime ou du merveilleux dans le discours* (1674). And he was the first to define "the sublime" by opposing it to "the sublime style":

One must then be aware that by Sublime, Longinus did not understand what the Orators call the sublime style, but that extraordinary and marvelous aspect which is striking in discourse and results in a work that captivates, ravishes, and transports. The sublime style always comes from great words; but the Sublime can be found in a single thought, a single figure, a single turn of phrase. A thing can be cast in the sublime style without, however, being Sublime, that is, without having anything extraordinary or surprising. For example, *The Sovereign Arbiter of nature with a single word formed light.* Here we are in the sublime style; it is not, however, Sublime; because there is nothing in it of the extreme-marvelous, and that one might not find [elsewhere]. But, *God said: Let there be light; and there was light.* This extraordinary turn of expression, which marks so effectively the obedience of the Creature to the orders of the Creator, is truly sublime and has something divine. One must thus understand by Sublime in Longinus, the Extraordinary, the Surprising, and, as I have translated it, the Marvelous in discourse.

(Boileau, preface to Longinus, *Traité du Sublime*, 70)

From France, the sublime moved on to all of Europe, notably to England, where Samuel Johnson declared it "a Gallicism, but now naturalized" (RT: *Dictionary of the English Language* [1755]). But the translation of *hupsos* by "the sublime," which seems a matter of course in the Romance languages, continues to pose problems in English. In the middle of the twentieth century, George Grube would render *Peri hupsous* as *Of Great Writing* (1957), recalling that W. Rhys Roberts, whose English version remains authoritative, confessed to regretting having been led by tradition to maintain that title (*Longinus on the Sublime* [1899]). It resulted in a "misconception which the existence of Burke's homonymous treatise . . . has done much to increase." More recently, Morpurgo-Tagliabue (*Demetrio*) has maintained that Burke's terrible-sublime would be closer to the *deinos* [δεινός] (vehement, terrible) of Demetrius than to the Longinian *hupsos.*

■ See Box 2.

In German, during the second half of the eighteenth century, *Erhaben* wins out over *sublim*, the use of which nonetheless persists and is revived, notably in Friedrich Nietzsche.

2

Sublime, privation, and "delight"

In opposition to John Locke, Edmund Burke proposed a distinction between pleasure stemming from the removal of pain and positive pleasure, just as, inversely, between pain produced by the disappearance of pleasure and positive pain. How is one to qualify relative pleasure stemming from a relation to pain, through a distancing and metamorphosis of the latter? Burke chose an already existent term, "delight," and ascribed to it a more restricted semantic range. "Delight" is the name of the sentiment that, according to him, accompanies the formation of the idea of the sublime. There is thus no simple pleasure, nor simple or relative pain.

It is most certain that every species of satisfaction or pleasure, how different soever in its manner of affecting, is of a positive nature in the mind of him who feels it. The affection is undoubtedly positive; but the cause may be, as in this case it certainly is, a sort of *Privation*. . . .

Whenever I have occasion to speak of this species of relative pleasure, I call it *Delight;* and I shall take the best care I can to use that word in no other sense. I am satisfied the word is not commonly used in this appropriated signification; but I thought it better to take up a word already known, and to limit its signification, than to introduce a new one, which would not perhaps incorporate so well with the language. . . .

WHATEVER is fitted in any sort to excite the ideas of pain and danger, that is to say, whatever is in any sort terrible, or is conversant about terrible objects, or operates in a manner analogous to terror, is a source of the *sublime;* that is, it is productive of the strongest emotion which the mind is capable of feeling. I say the strongest emotion, because I am satisfied the ideas of pain are much more powerful than those which enter on the part of pleasure. . . .

When danger or pain press too nearly, they are incapable of giving any delight, and are simply terrible; but at certain distances, and with certain modifications, they may be, and they are, delightful, as we every day experience. The cause of this I shall endeavour to investigate hereafter.

(Burke, *A Philosophical Enquiry into the Origin of Our Ideas of the Sublime and Beautiful*)

Sublim is inscribed in the great tradition of poetic and alchemical *Sublimierung* and is given new currency by Freudian *Sublimierung* in a way that leads to an interesting rivalry with Hegelian *Aufhebung.*

■ See Box 3.

Bur *erhaben* is the term chosen by Johann Joachim Winckelmann, who casts it as a noun and insists in 1764 on its exclusively Apollonian character: "Apollo hat das Erhabene, welches im Laocoon nicht stattfand" (Apollo possesses the sublime, which was not to be found in Laocoon: *Geschichte der Kunst des Altertums*, 155). From Winckelmann, *das Erhabene* passed to Immanuel Kant, for whom it was palpably revised under the influence of the Burkean sublime and in the light of the transcendental. Criticizing the Kantian assimilation of the sublime to absolute greatness, Johann Gottfried Herder emphasized the relative character of the sublime and linked *erhaben* with *erhoben*, that is, "that which rises through its own forces or by external forces." *Das Erhabene* would thus be the mark less of absolute greatness than of elevation (*Kalligone*, part 3, "Vom Erhabenen und Ideal," 227–81), and its character would be immediately sensed as "sublimatory"; the negative aspect of the sublime (the dispossession it establishes through the effect of a shock, vertigo, or terror that must nonetheless be held at bay) would thus tend to be diminished. It can therefore be argued that from the Latinate tradition of "genus sublime dicendi," *das Erhabene* would retain the idea of elevation, but would reject that of vehemence.

III. The Sublime and the Critique of the Beautiful

It thus becomes necessary to rediscover the guiding thread that allows Burke and, following him, Kant to give its status and range to the sublime; all the seriousness of the sublime resides in the systematic critique it manages to impose with regard to the beautiful or, more precisely, in the radical suspension of its values. Whereas the beautiful creates calm satisfaction and is the object of a taste that entails the spontaneous and immediate application of certain rules whose formulation is possible, at least after the fact, the sublime is troubling and involves a stirring of the entire being. The beautiful "subsists" independent of any recognition; but the sublime does no more than exist, in the fragility of what must be perpetuated elsewhere than in itself in order to survive: it demands of me and breaches my being, being born in the experience of its discovery. On the one hand is the calling into play of social passions that attach us to more or less contingent objects of pleasure and love; on the other, the stirring of fundamental passions affecting the love of self, or what we would today call narcissism, in its triple—physical, psychological, and moral—dimension. As much, then, as the beautiful will appear to be endowed with "means," and to that extent, to be capable of being reproduced and of being the subject of academic instruction, just so will the sublime, for its part, appear to dispose only of favored "vehicles," whose use will remain random and perilous.

What are those vehicles? At times we apprehend the sublime in a destabilized world under pressure of greatness, ugliness, darkness, or simplicity. The beautiful then finds itself threatened in its form, in the pleasure it provides, its visibility, and its diversity. At other times, on the contrary, its collapse provokes a radical dispossession, and we experience more directly the sublime within us as a suspension of the ego. No doubt on such occasions we are more or less overwhelmed with enthusiasm (*enthousiastikon pathos* [ἐνθουσιαστικὸν πάθος], Longinus 7.2.7), astonishment (according to Burke), or respect (*Achtung*, Kant). But what is essential is that the

3

Sublimation according to Freud

Rather than adopt the Hegelian term *Aufhebung*—which, in certain respects, might have been equally suitable—for his purposes, Freud chose *Sublimierung* to designate the "capacity to exchange [an] originally sexual aim for another one, which is no longer sexual but which is psychically related to the first aim" ("Civilized Sexual Morality," trans. Strachey, 187). He postulated that in order to exchange sexual aims for nonsexual ones, the sexual drive "places extraordinarily large amounts of force at the disposal of civilized activity, and it does this in virtue of its especially marked characteristic of being able to displace its aim without materially diminishing in intensity." Subsequently, in 1932, Freud would specify that this modification of the libidinal aim would be accompanied by a change of object (*New Introductory Lectures*, 97).

Now, the term *Sublimierung*, which comes from the adjective *sublim*, before entering the vocabulary of the fine arts, had previously belonged to that of alchemy (borrowed from the Latin *sublimatio*), then to that of chemistry, where the word designated the process of "subjecting solids in a closed receptacle to heat in such manner that volatile elements rise to the upper part of the receptacle, where they become solids again and are stabilized" (RT: *Dictionnaire étymologique de la langue française*, s.v. *Sublimierung*). It was by way of an adoption of the figurative sense of the idea that *Sublimierung* made its reappearance, notably in Nietzsche. In *Human, All Too Human* (1876), the latter raises the following question: "How can something be born from its opposite, such as reason from the irrational, sensitivity from inertness, logic from illogicality, disinterested contemplation from avid desire, altruism from selfishness, truth from errors?" He replies by contrasting the respective approaches of the old metaphysics with more recent historical philosophy. The former "has until now avoided such difficulties by denying that one might engender the other and by assuming, in the case of things deemed to be superior, a miraculous origin, issuing immediately from the very essence and existence of the 'thing in itself.'" As for the latter, it was inspired by the natural sciences, and specifically by chemistry:

> Finding that these are not at all opposites . . . and that there is at the bottom of that opposition an error in reasoning: according to its explanation, there exists, in all rigor, neither unselfish behavior nor completely disinterested contemplation, each of them being but sublimations [*Sublimierungen*] in which the fundamental element appears to have almost vaporized and no longer betrays its existence to any but the most subtle observer.

> (Nietzsche, *Human, All Too Human*, 1.1)

In *Daybreak*, Nietzsche pursued the same argument, evoked here under the rubric "The Chemistry of ideas and feelings."

The use made by Freud of the category of sublimation is deployed in a vast network of references that suffer, however, from ambiguities and absences such that Jean Laplanche and Jean-Bertrand Pontalis, the authors of the *Vocabulaire de la psychanalyse*, do not hesitate to conclude their article on the subject with these words: "The absence of a coherent theory of sublimation remains one of the gaps in psychoanalytic thought" (RT: *Vocabulaire de la psychanalyse*, s.v.). In relation to these references, moreover, sublimation is often defined negatively. It is thus clearly distinguished from the category of the sublime in the philosophy of art, from idealization, the ego-ideal, or *aphanisis* (the extinction of the capacity to experience sexual pleasure, according to Ernest Jones), and so on. On the other hand, other notions are more directly congruent with it. In point of fact, sublimation can be considered as a type of satisfaction occurring by way of desexualization, which, while continuing to have a libidinal source, has ceased being sexual in order to become social or cultural, and which, nonetheless, does not at all undergo the vicissitudes of a symptom. For Freud, such desexualization, which is directly related to his later thinking on narcissism, consists in the fact that the ego withdraws its power of attraction from the cathected sexual object in order to cathect a new object and aim that would be nonsexual. Thus sublimation, which Freud reduces to a form of derivation (*Ablenkung*, literally "deviation") and not suppression—or, even less, repression—has as its condition just such a desexualization (*Desexualisierung*), which itself requires the intervention of the ego or its mediation, in the context of the unifying power of Eros in the second topographical model.

It remains the case that in the eyes of many, Freud's theorization does not offer a convincing description of the qualitative leap through which sublimation moves from the sexual to the nonsexual. This, allows, for example, Melanie Klein to make of it a tendency to restore the "good object" destroyed by the aggressive drives, or François Roustang ("Sublimation") to locate its source in the anteriority and autonomy of fantasy in relation to the vicissitudes of the sexual drive.

reason for the impassioned effect be tied to the structure of the subject, which never stops transcending itself.

■ See Box 4.

An illustration of this crucial triumph of the sublime over the beautiful is to be found in the movement of abstraction. It was thus in vain that Worringer, who intuited its future developments in 1908, failed to use the word *sublime*; he endlessly evoked its presence in a perspective close to that of Kant, for whom the two Egyptian examples of the sublime (the Pyramids and the inscription on the Temple of Isis) play a major role.

> To whoever has just contemplated Egyptian monumental art and felt the extent to which its grandeur exceeds our capacity of apprehension . . . , the admirable works

4

On the introduction of the sublime in Kant

Kant removes the sublime from its preferred site, which, from antiquity on, was rhetoric. He does not even cite Longinus. On the other hand, he endorses the great discovery of the late seventeenth and the eighteenth century: that of the natural sublime associated with vast and irregular landscapes, specifically seascapes and mountain vistas. But he hesitates between two conceptions in presenting the sublime: the first, which became quite famous, insists on purely negative sensory stimulation; the second, barely noticed but more original, sought to develop a veritable asceticism of the sensibility, which forbade any projection of knowledge onto the spectacle contemplated.

1. No sensible form can contain the sublime properly so-called [*das eigentlich Erhabene*]. This contains only ideas of the Reason, which, although no adequate presentation is possible for them, by this inadequacy that admits of sensible presentation, are aroused and summoned into the mind. Thus the wide ocean, agitated by the storm, cannot be called sublime [*erhaben*]. Its aspect is horrible.

2. We must not think of [the sight of the ocean] as we ordinarily do, endowed as we are with all kinds of knowledge. . . . To call the ocean sublime [*erhaben*] we must regard it as poets do, merely by what strikes the eye; if it is at rest, as a clear mirror of water only bounded by the heaven; if it is restless, as an abyss threatening to overwhelm everything.

(Kant, *Critique of Judgment*, §23 and General Remark)

of the classical sculpture of antiquity . . . will not fail to appear like the products of a more childlike and inoffensive humanity, a humanity that has remained insensitive to the most powerful tremors. The term "beauty" itself will seem to him perfectly petty and inadequate.

(*Abstraction and Empathy*, trans. Bullock)

Closer to us, the most illustrious representatives of abstract expressionism, such as Barnett Newman or Mark Rothko, practice the same critique of the beautiful, while invoking the sublime and, quite remarkably, the Burkean sublime:

Without monsters and gods, art cannot enact our drama: art's most profound moments express this frustration. When they were abandoned as untenable superstitions, art sank into melancholy. It became fond of the dark.

(Rothko, "Romantics," 83)

One thus seems to arrive paradoxically at a unification of the category of the sublime. The difficulty remains, however, of thinking of its advent as problematical, not hypostatizing it, and according it the dimension of a mere principle—a principle of expropriation or overflow—while recalling its inherent value as stimulation. The sublime demands a reorganization of psychical life that offers a challenge to all of the productive faculties of man (power, knowledge, and will). The crucial matter thus becomes to analyze its bearing in each of those registers. In that perspective, it should not be reduced to the unrepresentable alone: the sublime will be identified with what seemed, until the moment of its advent, unthinkable, uninventable, and altogether beyond enjoyment.

SUPPOSITION

FRENCH	supposition
GERMAN	Supposition, Denotierung
ITALIAN	supposizione
LATIN	suppositio
PORTUGUESE	suposição
SPANISH	suposición

➤ ANALOGY, CONNOTATION, ESSENCE, INTENTION, *NEGATION,* PARONYM, PREDICATION, REALITY, *REFERENCE,* SACHVERHALT, SENSE, SUBJECT, TROPE

Between the twelfth and the sixteenth centuries, translators into French of treatises of logic called on the word *supposition,* which served as a barely intelligible replica of the Latin *suppositio,* a key word of medieval philosophical semantics and assuredly one of the most difficult to understand, if not to translate, of the scholastic lexicon. A creation of logicians of the twelfth century, *suppositio* was situated at the intersection of three different disciplines: grammar, theology, and dialectic, all three of which gradually infused it with their own theoretical interests and specific problematics. Understood, if not formed, on the basis of *suppositum,* the noun originally designated the subject term of a proposition: to refer to, to be placed as the "henchman" (Fr. *suppôt*), the term *suppositum* designating the subject on which the statement bears, the subject matter of discourse in English, the *Subjektgegenstand* in German. With the *suppositum* thus understood being spontaneously associated with the "referent" of Saussurean linguistics, some translators have proposed the term "reference" as the technical equivalent of *suppositio.* That translation, without being inexact, nonetheless masks the complexity of the term's semantic field and collides with some formidable difficulties as soon as it is called on to measure up to the texts. It may, in any event, seem paradoxical to attempt to eschew the ambiguities of the Latin by using a French—or English—term, which is itself equivocal and, at the least, saturated, and whose various uses—Saussurian, Fregean (in translation), Russellian—are, at a minimum, discordant. This paradox is, in fact, an integral part of the genealogy of signification and reference.

"Supposition" offers a marvelous illustration, starting with French, of the difficulty confronting the various lexicons of European philosophies—difficulties of language, first of all, but ones soon compounded by those of philosophical idiolects. German, which disposes *Bezeichnung* for *significatio,* does not have a term for *suppositio*; it is thus obliged to use *Denotierung*—which is part of a conceptual opposition (*Denotierung/Konnotierung*) largely subsequent to the theory of *suppositio* and different from it, although issuing from it via complex and indirect paths—or the Franco-German

neologism *Supposition,* which is as opaque to a nonspecialist reader as the Latin that it translates. Italian and English, which have no need of a neologism—the Italian *supposizione* being common usage, and the English "supposition" documented since the fifteenth century—are engaged with the same range of meaning as French: all idea of reference is absent from it. The situation is similar for the Portuguese *suposição* or the Spanish *suposición.* Here it is the idea of hypothesis (*suppositio* being the exact duplicate of the Greek *hupothesis* [ὑπόθεσις]) or conjecture that come to the fore, rendering the "referential" aspect imperceptible. But there is a final problem beyond the difficulties of language: the temptation to neutralize the question of translation by voiding what the noncoincidence of "supposition" and "reference" explains of the noncoincidence of the Saussurian, Fregean, and Russellian uses (*signification, reference*; *Sinn, Bedeutung*; "meaning, denotation"). Whether one decides to render *supponere* by *supposer* (Fr.), "supposit" (Eng.), or *supponieren* (Ger.), rather than by *être mis pour*, "to stand for," or *denotieren* has its importance, but more important still is the philosophical reason for the bind in which interpreters find themselves and which is linked not *solely* to language but also to the very idea that scholastic Latin is alone in expressing and that relates to a semantic labor on the syntactical concept of the subject. In calling *suppositio* the semantic function of the subject term of a proposition—to be placed as a *suppôt* or auxiliary—medieval logicians were philosophizing "within the language," in this case, in Latin. It is the originally syntactico-semantic nature of the concept of *suppositio* that the European languages of philosophy have strained to translate and preserve. And it is that aspect that marks the point of discontinuity between medieval and contemporary semantics.

I. *Suppositio* as Supplement and Substitution

In his *Petite Logique* (*Introduction to Logic*), in which he combines vocabularies borrowed from both late Scholasticism (John of St. Thomas) and the *Logic* of Port Royal, Jacques Maritain proposes to render the term *suppositio* by *suppléance* and *valeur de suppléance*, intending thereby "the manner in which a term takes the place of, or becomes a substitute in discourse for, a thing," and he does not fear to translate *terminus supponit pro re* by "the term stands for [*supplée*] the thing." In this lexicon, the *suppositio* of a term is thus defined: "We shall say then that the *suppositio* of a term, which we may translate as its 'substitutive value,' is its function in discourse—the while its meaning remains the same—of taking the place of a thing. This substitution (of term for thing) is, considering the copula, legitimate" (Maritain, *Introduction to Logic*, chap. 1, §3C). In this perspective, the latter part of the definition ("This substitution [of term for thing] is, considering the copula, legitimate") does not mean that a substitution of term for thing gives rise to a true proposition in the nature of things themselves, but rather: "the sort of existence—actual (past, present or future), possible or 'imaginary'—denoted by the copula permits this substitution" (ibid). Even though they are partially adequate to the medieval use of the term *suppositio*, the words *suppléance* and *substitution* have never prevailed in modern translations. *Suppositio* says more, in point of fact, than the French *substitution*

(the terms being synonymous only in the juridical expression *supposition d'enfants*, designating the fraudulent substitution of two newborns) or than the English "substitution" (which also presents, along with the adjective "supposititious," the meaning of "deceitfully substituted"). It is this supplementary meaning that we would determine here, at the border between medieval grammar and theology.

II. *Significatio/Suppositio/Appellatio:* "Signification"/"Reference"/"Denotation"

If the meaning of "referent" is rather well suited to the grammarian's sense of *suppositum* deposited in *suppositio*, it conveys only in part the various aspects implied by its theological sense. The theological suppositum is not, in fact, the *hupokeimenon* [ὑποκειμένον] of Aristotelian ontotheology, the "subject" understood as the support or substrate of essential or accidental properties, but rather the *hupostasis* [ὑπόστασις] of Greek Trinitarian theology, which became *Persona* in the West and which entertains with the *ousia* [οὐσία] an altogether different relation than that entertained by the Aristotelian subject-substance with essence. It is, in any event, thanks to theology and to the specific problems of Trinitarian semantics that the noun was given a linguistic use with a verb in the expression, of scarcely Latinate formation, *supponere pro*, charged with expressing the essential or "personal" semantic value—*supponere pro essentia* or *supponere pro persona*—of the terms figuring in the principal affirmations of the dogma. From these uses stems the distinction thematized in the terminist logic of the thirteenth century by the distinction between "simple" supposition (*suppositio simplex*) and "personal" supposition (*suppositio personalis*). If the English "to stand for" and the French *être mis pour* correspond more or less to that first sense of *supponere pro*, no expression is truly serviceable; on the other hand, when *suppositio* and *supponere* plus the accusative are opposed to *appositio* and *apponere* plus the accusative, it is a matter in such cases of expressing two kinds of properties, one semantic, the other syntactical, in a single syntactico-semantic function: the relation of a noun-subject to a substance, that of an adjective-predicate to a quality.

The field of *suppositio/supponere* is further complicated with turns of phrase such as *supponere verbo, supponere personam verbo,* or *supponere locutioni*, which render the identification of *suppositio* with reference still more difficult—unless it be taken into consideration that a predicated term does not "refer." Now, if it is true that medieval logicians frequently raise the question of knowing whether a predicated term or an adjective "supposes," it is clear that they do not strictly understand thereby what is normally understood as "referring." A term that "apposes" (*apponit*), "couples" (*copulat*), or "is coupled" (*copulatur*) does not "refer" any less than a term that "supposes," as is evidenced by the standard definition of *copulatio* in the thirteenth century: "Copulatio est termini adiectivi acceptio pro aliquo" (Coupling is the meaning of an adjectival term for any particular thing).

■ See Box 1.

Given the inelegance of the expression "to supposit for," "to refer to" would gain ground in the literature in English. An argument often advanced in favor of that translation is

---

1

Suppositum/subjectum

➤ SUBJECT, WORD ORDER

The term *suppositum* corresponds to a special case of a term originally meaning "support" or "auxiliary" and is used in grammar texts primarily to designate the referent of a pronoun: Priscian says, for instance, that one can raise the question of the substance of the support by way of the question *Quis ambulat?* (Who is walking?; *Institutiones*, 17.23). It can consequently be said that the pronoun, by virtue of the fact that it signifies a "pure substance" (*substantia mera*), that is, that it does not determine on its own the proper or common qualities of that substance, "may be applied to all referents" (*ad omne suppositum pertinent*; Pierre Hélie, ca. 1140), since each can say *ego* of itself. From the pronoun's referent, the transition is smooth to that of discourse, from the person or substance on which discourse bears ("*id de quo fit sermo*"; *Logica Porretani*) to the person about whom the statement speaks ("*suppositum locutioni*"). The use made in Trinitarian theology of the term *suppositum*, the equivalent of *persona*, for the three persons of the Trinity, naturally reinforces the sense of referent. With regard to a given statement (e.g., *Pater genuit*) in theological texts, one will have to guess which person the subject refers to and which person it "supports" (*supponit pro*). That use of the term *suppositum* as referent will be maintained throughout the Middle Ages, not only in grammar but also and above all in terminist logic, which evolved in the second half of the twelfth century, since the referential function of a noun in a propositional context will precisely be called *suppositio* (a noun "supports" or "supposes for" an individual, a form, etc.). It is naturally the sense of referent of the *suppositum* that will cause the noun *suppositio* to signify a referential property of the nominal term.

Starting in the middle of the twelfth century, logicians in the Porretanian group (around Gilbert de La Porrée) explained that a noun has two functions: "(sup)posing substance" and "apposing quality" (*officium supponendi substantiam et apponendi qualitatem*), a function it fulfills when it is respectively *subjectum* and *praedicatum*. There will thus be a slippage from a referential function to a syntactical function, whence the exclusive use by grammarians of the term *suppositum* for the latter. The expression *supponere verbo* (to be a subject for a verb) is in fact an abridgement of the original expression *supponere personam verbo* (to posit or determine the person connected to the verb). A distinction will be made between *supponere verbo*, referring to the person dictating the grammatical agreement, and *supponere locutioni*, referring to the actual or logical subject, which may be distinct from it. Thus, according to the grammarian Robert of Paris (at the end of the twelfth century), in "Socrates legit et ipsum legere est bonum" (Socrates is reading and the fact that he is reading is good), *ipsum legere* is the support for the verb, but it is the pronoun *ipsum* that serves as the support of the statement, what it is that is being spoken about.

The term *subjectum* (and words of the same family) goes back to an ancient use in logic: it will be noted that Boethius designated the subject as *subjectus terminus* (*subjectus, subjectum*) in contrast to the *praedicatus terminus* (*praedicatus, praedicatum*) and speaks as well of the *res subjectae* (things substrate) in the triad *res, intellectus, voces*. The Roman grammarians had neither a term nor a notion corresponding to the subject and used other terms when conveying the conditions of proper formation of a canonical statement (nominative, substance, etc.). The introduction of that notion in grammar, under the obvious influence of logic, occurred at the beginning of the twelfth century: discussing the function of the participle (in a context supplied by Priscian, *Institutiones* 17.18), a commentator introduced the noun *subjectum* (and the verb *subici*) as opposed to *praedicatum* (and *praedicari*) in the context of a discussion of the cause of the invention of the participle, which allows two acts to be construed together without need of a conjunction (*ego legens disputo*) and thus "to be predicates of the same subject."

One finds in the logicians' interesting discussions of the bearing (*inclusio*) of quantifiers, based on the distinction between grammatical subject and logical (or real) subject. Logicians generally decided that the grammatical subject ought to be in the nominative case but that the logical subject can be in an oblique case, as in the interesting example: *cuiuslibet hominis asinus currit*, which can be interpreted either as (1) for every man *x*, there exists an ass *y* such that *x* possesses *y* and *y* runs:

$$[\forall x \, [\exists y \, ((x \text{ possesses } y) \land (y \text{ runs}))]$$

Or as (2): there exists an ass *y* such that every man possesses it and it runs:

$$[\exists y \, [\forall x \, ((x \text{ possesses } y) \land (y \text{ runs}))]].$$

In each interpretation, the two nouns are affected differently by the quantifier and thus possess distinct quantities and modes of reference. The terminology used is far from uniform: one finds *subjectum attributionis* versus *locutionis*, and *subjectum enuntiationis* versus *praedictionis*. The definitional criteria of each of the two subjects are variable, both grammatically and logically. The grammatical subject is not always in the nominative, since certain grammarians consider as *suppositum*, notably, the agent in the ablative of a passive verb or the oblique constructed with an impersonal verb. The subject can then be defined either on the basis of the criterion of word order, as what is constructed *a parte ante*, that is, before the personal verb, a criterion based on the idea of a (problematical) natural order of the sentence subject, verb, object; or on the basis of the criterion of referential identity (what the subject refers to and what the verb relates to are the same "person"); or even, on the basis of terminology borrowed from Aristotle's *Physics*, "that from which the movement or action expressed by the verb proceeds" (*illud a qui egreditur actio*). In logic, examples of the sort referred to above have been the object of lively debate, depending on whether one regards word order, manner of utterance, speaker's intention, or listener's judgment to be the determining factor in interpretation.

In the terms *suppositum/subjectum*, one finds all the ambiguity in grammar and in linguistics contained by our term "subject": from grammatical subject to theme, by way of the agent or logical subject. In addition, the distinction between the term and what it refers to is not always made; one has in mind, to be sure, the former when one refers to its case or gender, but one is dealing with the latter when it is defined as *id de quo fit sermo*, "that on which the discourse bears."

the equivalence established by a number of modern interpreters between the couple *significatio/suppositio* and the various linguistic formations that have been more or less precisely associated since Russell with the Fregean distinction between *Sinn* and *Bedeutung*.

significatio	suppositio
Sinn	*Bedeutung*
sens/signification	*référence*
meaning	denotation
sens	*dénotation*

Of those translations the most debatable is certainly "denotation," which, aside from rendering unintelligible such technical expressions of fourteenth-century logic as *denotatur supponere*, blurs—not to say effaces—the marked distinction in the thirteenth century between *suppositio* (def., *acceptio termini substantivi pro aliquo*) and *appelatio* (def., *acceptio termini pro re existente*).

■ See Box 2.

In order to stabilize usage, it may be admitted that the least bad solution, for texts of the thirteenth century, is the tripartite choice:

significatio	suppositio	appellatio
signification	reference	denotation

This setup, however, would no longer be valid for a number of fourteenth-century texts, in which *appelatio* does not mean the denotation of existent things but rather the referral from a term to what it means in a secondary or connotative manner (see CONNOTATION) and for which it does not suppose. For Jean Buridan (*Sophismata*), for example, the term "white," in the proposition "Peter is white," is said "to suppose for a man" (Peter) and to "call"/*appeler* or "connote" the "quality" or "singular whiteness" (see TROPE) that is presently in him.

■ See Box 3.

Given such variations, it seems preferable in all circumstances to restrict oneself to replicas of the original: the semiartificial Latin of a medieval logician was neither more

2

Denotation of supposition

The inappropriate nature of the translation of *suppositio* as "denotation" appears clearly if one notes that the two verbs "suppose" and "denote" are associated in a technical expression, *denotari supponere*, which plays a central role in the nominalist semantics of propositions. Rigorously speaking "denotation of supposition" is a semantic property of propositions, whether affirmative or negative, concerning the subject terms of those propositions insofar as they are denoted by them as supposing or not supposing something.

That notion, which seems to have appeared in the fourteenth century, is one of the foundations of the Ockhamist theory of the conditions of truth. An affirmative proposition "denotes that the subject-term of a proposition supposes for something." A negative proposition "denotes that the subject-term does not suppose for something, or supposes for something whose predicate is denied in truth." The thesis can be illustrated as follows. A negative proposition has two "causes of truth." The proposition "the white man is not" is true either because the man does not exist and for that reason is not white, or because he exists but is not white. Inversely, an affirmative proposition always denotes that the term supposes for something. If it supposes for nothing, the proposition is false. Given *P* (the affirmative proposition "the white man is a man"), if no man is white, *P* is false. In point of fact, the subject of *P* is taken meaningfully and personally, not because it supposes for something, but because it is "denoted to suppose for something." However, it supposes for nothing, whereas it is "denoted to suppose for something." *P* is thus indeed false. The notion of "denotation of supposition" can thus be read: for the proposition, in the active mode (*denotare*)—the proposition denotes (or does not) that its subject supposes for something; for the term, in the passive mode (*denotari*)—the subject is denoted (or not) to suppose for something. From this point of view, the inference "the term *T* supposes, therefore it supposes for something," which is accepted by many philosophers under the Fregean form of the "presupposition of reference," is not valid. Thanks to the notion of *denotare / denotari supponere*, one can, on the other hand, formulate the valid inference: "The term *T* supposes, therefore it is denoted to suppose for something or it is denoted not to suppose for anything."

elegant nor less bizarre than the technical idiolect that modern translators are obliged to content themselves with.

III. The Different Schemas of Medieval Semantics

The vocabulary, from the thirteenth to the fourteenth century, would become steadily more precise. Without entering into the complicated details of the divisions and subdivisions of the *suppositio* or retracing the evolution of doctrines, one can, on the basis of a limited sample—Parisian and Oxonian semantics of the years 1230–60—show how, on the basis of the distinction between *significatio* and *suppositio*, diametrically opposed theories were elaborated. The Parisian masters of the 1230s generally admitted that a term like "man" in itself possesses two semantic properties: first, a *significatio* defined as *repraesentatio rei per vocem secundum placitum* (conventional representation of a thing by a vocal sound). Signification thus understood is an intensional property. The term "man" does not signify a plurality of singular extramental things but rather a certain common nature or participable intension (def., "an animate living being, a mortal endowed with sensation"). Second, the *suppositio* is founded on the *significatio*: it is an *acceptio ipsius termini iam significantis rem pro aliquo* (a sense of the term already signifying a thing for something else). In Saussurian terms, *res* can be considered here as a "signified," *aliquid* referring to one or several referents. The specificity of the original Parisian tradition is to admit in addition a *suppositio* said to be "natural," which is defined as follows by Peter of Spain (*Tractatus*):

Natural supposition is the acceptance of a general term for all those things of which, by its original imposition it can be a sign; as the term "man," when it is taken by itself, denotes all men, including those who exist, those who will exist, and those who have existed.

(Suppositio naturalis est acceptio termini communis pro omnibus a quibus aptus natus est participari, ut "homo" per se sumptus de natura sua supponit pro omnibus hominibus qui fuerunt et qui sunt et qui erunt.)

This clearly prepropositional "reference" is modified as soon as the term is inscribed in a phrastic context. Its *suppositio* becomes, in effect, in this case "accidental," that is, determined by the exigency of the predicate (ibid.):

Accidental supposition is the acceptance of a general term for all those things its adjunct determines.

(Accidentalis suppositio est acceptio termini communis pro eis pro quibus exigit adiunctum.)

In a proposition whose copula is in the future or the past, the exigency of the predicate, that is, that of the time whose vehicle is the copula, assures the "restriction" (*restrictio, coartatio*) of the supposition of the subject in the tense indicated by the verb. This position was globally rejected by several English masters. In 1245–50, Roger Bacon rejected the hypothesis of a *suppositio naturalis* and pitted against it a semantics whose terms presuppose only in a propositional context and—by their nature, that is, their imposition (see HOMONYM, IV and CONNOTATION, Box 2)—suppose only for presents (linguistic terms being normally imposed extensionally to present things). In this semantics, which can be called Oxonian, restriction thus does not have a role: the only problem is

3

Appellatio in medieval logic

The term *appellatio* presents quite different definitions in medieval logic. Behind the word's apparent unity several concepts are concealed, partaking of heterogeneous theories. The first sense attested to is the one which, in the thirteenth century, defined the *appellatio* of a common term, whatever it be, as the supposition of that term for existent things (*pro his qui sunt, pro existente, pro presentia supposita, pro suppositis actu existentibus,* etc.). This is the denotative sense. A second sense attributed *appellatio* to proper as well as common terms "when they designate an existent thing" (Peter of Spain maintains in this regard that the proper noun "Petrus" signifies, supposes, and names the same things, "since it signifies an existent thing"). Other theories, on the other hand, reserved *suppositio* for the subject term and *appellatio* for the predicate. The introduction of that syntactical criterion is characteristic of the fourteenth century. It appears, in particular, in the work of Walter Burley, who defined it as follows:

> Appellation is the property of a common term predicable on what is subordinated to it. Thus, just as supposition taken in the strict sense is the property of the subject insofar as it is related to the predicate, similarly appellation is the property of the predicate related to the subject or to what is subordinated to it.

(*Est appellatio proprietas termini communis praedicabilis de suis inferioribus. Unde sicut suppositio stricte accepta est proprietas subiecti, prout comparatur ad praedicatum, ita appellatio est proprietas praedicati comparati ad subiectum sive ad inferius.*)

(*On the Purity of the Art of Logic*, §2)

Independent of this syntactical redefinition of appellation, the fourteenth century also accomplished a revolution of a kind for which philosophical lexicography offers few comparable cases. In fact, where the logicians of the thirteenth century designated as *appellatio* what we call "denotation," Jean Buridan reserves *appellatio*, reconceived through his efforts, for what he calls "connotatives." With that, the denotation/connotation doublet was formed under the paradoxical aspect indicated above: that of a two-faced entity whose two halves are separated by several centuries. In Buridan, in fact, "connotation" is not opposed to "denotation." The term is absorbed into a different network, with "supposition" and "appellation" its only partners. Thus it is that in his *Summulae de dialectica* (4.5.1; his long commentary on the *Tractatus* of Peter of Spain), the logician from Picardy characterizes as "appellative" "any term that connotes something other than that for which it supposes," before explaining that only connotative terms have an appellation: they alone indeed "call what they connote [*appellant illud quod connotant*]." What remains to be clarified is the meaning of the expression *appellare suam formam*. Buridan's analysis is precise: by *material termini*, one must understand that for which this term supposes; by *forma termini*, "the form of a term," one should understand "everything that it connotes." If one takes, for example, the word *dives* (rich), one sees that the term supposes for a man (*material termini*), but that it "calls/names a house, fields, livestock, and many another thing possessed by him." It is that set of things owned that constitutes the *forma termini*. To say that the term *dives*, inserted in a proposition, "calls forth its form" signifies that it "connotes" or is "appellative" of "all things" possessed by the individual for which it supposes.

explaining how the supposition determined by the original imposition of a term *ad praesentia* can be extended in certain contexts to things past, future, or possible. This is what Bacon did in attributing to the verbal tense, past or future, and to the mode (*potest*) a function said to be of "amplification" (*ampliatio*).

If, as of the thirteenth century, the same term of *significatio* refers to models as distinct as the Parisian intensional thesis and the Baconian extensional thesis, it will be seen that the meanings of technical terms of medieval semantics should be approached, translated, and interpreted holistically within well-defined networks. In misconstruing them, the modern reader risks repeating, with regard to the fundamental concepts of various medieval semantics, the kind of forced synthesis that the Russell of *On Denoting* imposed on Frege's distinction between *Sinn* and *Bedeutung* (see SENSE).

IV. Buridan: The Logician's Supposition and the Grammarian's

In the fourteenth century, Buridan defined *suppositio* as follows:

> Est autem suppositio prout hic accipitur acceptio termini in propositione pro aliquo vel pro aliquibus quo

demonstrato vel quibus demonstratis per ista pronomina "hoc" vel "haec" vel equipollentia illis, terminus vere affirmatur de isto pronomine mediante copula illius propositionis.

(*Sophismata*, chap. 3, soph. 5, remark 1)

J. Biard translated it into French as follows:

> La supposition, telle qu'elle est prise ici, est l'acception d'un terme dans une proposition, pour quelque chose, ou pour quelques choses, telles que, si cette chose ou ces choses sont désignées par les pronoms "ce," "cet," "cette," ou des expressions équivalentes, le terme est affirmé véridiquement de ce pronom au moyen de la copule de cette proposition.

a translation that can be compared to D. Perler's German version:

> Die Supposition ist die Verwendung eines Terminus in einem Satz für einen oder für mehrere Gegenstände, auf die mit einem Demonstrativpronomen hingewiesen wird. Von diesem Pronomen wird der Terminus mittels der Kopula wahrhaft ausgesagt.

and finally with T. Kermit Scott's translation into English:

> But supposition as it is here used is the taking of a term in a proposition for some thing or things, in such a way that if that thing or those things are indicated by the pronoun "this" or "these," or the equivalent, then that term is truly affirmed of this pronoun, by the mediation of the copula of the proposition.

In this analysis, the *suppositio* is said of the subject and the predicate and is deeply anchored in what today would be called *deixis* [δεῖξις]. What Buridan means is that in a proposition such as "the horse is running," the term "horse" "supposes for every horse that exists, since, whichever the horse one designates, it will (or would) be true to say: this is a horse." That clause allows one to distinguish the logician's point of view from that of the grammarian. For the grammarian, "the nominative is said to be a *suppôt* or auxiliary in relation to the verb because it confers its person on it." *Reddere personam verbo, supponere verbo*: such expressions are, according to Buridan, typical of grammatical metalanguage (see Box 1). They permit an understanding of the fact that for the grammarian, it is licit to say that the term "Chimera" *supposes* in the statement "a Chimera is running": this is because in this metalanguage, "Chimera" *supposes to the verb* "is running." The expression "a Chimera is running" is congruent in that it respects the rules of grammatical agreement. For the grammarian, a term that does not mean anything that might exist can thus "suppose," but *to the verb* (*supponere verbo*). On the other hand, for the logician, "Chimera" does not *suppose*. The term undoubtedly has a meaning, but since it can not be taken in the proposition "a Chimera is running" for something of which it can be said, with the help of a demonstrative (deictic), "this is a Chimera," it has no supposition. In the strict sense of the terms, it thus cannot be said that the term "Chimera" does not "denote" anything, only that it does not "suppose." Buridan's thesis is alleged to cut short all speculation over that for which an empty term supposes or would suppose: intentional object, *fictum*, or "homeless" (*heimatlos*) object in the style of Alexius Meinong (see REALITY). An empty term is one that does not suppose in the logical sense of the word *supponere*.

As can be seen, the evolution of doctrines of "supposition" tends to redistribute with increasing refinement, to the point of having them pass from the object-language to the metalanguage, the semantic and syntactical elements naively confused in the first formulations of the notion. It is this aspect that no translation in terms of "reference" can capture.

SVET [свет] (RUSSIAN)

ENGLISH   light, world
FRENCH   *lumière, monde*

➤ LIGHT, *WORLD*, and *ACT*, BOGOČELOVEČESTVO, DRUGOJ, ESSENCE, GOD, *GRACE*, MIR, NAROD, PLEASURE, POSTUPOK

The ambiguity of the root *svet* [свет], "light/world," is valid for all Slavic languages and is based on the ancient cosmology that characterizes the world as a space defined by light. Difficulties in translation appear when authors deliberately play on the semantic tension between *svet* (light) and *svet* (world). Another distinctive feature of the Slavic concept of light relates to the quasi-etymological consonance between *svet* (light) and *svjatost* [святость] (holiness), which is rooted in the Orthodox theology of uncreated light (*phôs* [φῶς]).

I. *Svet* as "Light" and *Svet* as "World"

The noun *svet* [свет] in modern Russian has conserved the ancient Slavonic sense of "light." But another sense of the same word is "world." The ambiguity of the root *svet*, "light/world," is a phenomenon common to Slavic languages: Polish *świat*, Ukrainian *svit* [світ], Czech *svět*, Serbo-Croatian *svijet* mean "world," whereas Polish *światlo*, Ukrainian *svitlo* [світло], Czech *světlo*, Serbo-Croatian *svijetlo* mean "light' (RT: Herman, *Dictionary of Slavic Word Families*, 509). One finds

an analogous ambiguity in Hungarian with *világ* (light, world) and in Romanian with *lumină* (light) and *lume* (inhabited world, people) from the Latin *lumen,* "light." In both cases, the ambiguity is attributed to a semantic borrowing modeled on the Slavic languages (ibid., 511), which is thus all the more noteworthy.

It is regularly admitted that "world" is a secondary meaning of *svet* (RT: Herman, *Slavic Word Families*, 511; Machek, *Etymologický slovník jazyka ceského a slovenskeho* [Etymological dictionary of the Czech and Slovak languages], 488; Brückner, *Slownik etymologiczny jezyka polskiego* [Etymological dictionary of the Polish language], 535; Tsyganenko, *Ètimologiceskij slovar' russkogo jazyka* [Etymological dictionary of the Russian language], 412). According to V. Machek, this secondary meaning is due to the idiomatic expression *přijiti na svět* (literally, "to come to light"). This expression means "to arrive in a realm of light" and, at the same time, "to settle amidst the people and things of the place" (Machek, *Etymologický slovník,* 488). In Russian, *pojavit'sja na svet* [появиться на свет] (literally, "to appear in the light") means "to be born." The concept of *svet* as world seems to contain a visual intuition according to which to be, for something or someone, is essentially to be in the light, in the openness of space (cf. the ancient Greek *phôs* [φῶς—with a circumflex], "light," and *phos* [φώς—with an acute accent], "man." This concept of world/light—*svet*—succeeded in supplanting the more ancient concept of *mir* [мир] (world/peace) in a certain number of Slavic languages (for example, in Czech, Slovak, Polish, Ukrainian, Bulgarian), but not in Russian (see Herman, *Slavic Word Families*, 291; Machek, *Etymologický slovník*, 488).

II. *Svet* and *Svjat*

The other distinctive feature of this Slavic "light" is semantic proximity between the adjectives *svetlyj* [светлый], "luminous, radiant," and *svjatoj* [святой], "holy, sacred." Diachenko (RT: Diachenko, *Complete Church-Slavonic Dictionary*) concludes that the forms *sveti* and *svjat* are "philologically identical" (582). The elaboration of that identity is theological in nature:

> According to the most ancient beliefs, the sacred (*svjatoj*) is luminous (*svetlyj*) and white (*belyj* [белый]). This is because the very element of light is a divinity that does not tolerate any darkness, impurity, or, in its later sense, sin.
>
> (Ibid., 582)

But G. Diacenko's statement is not confirmed elsewhere. Thus, according to A. Brückner, *svet* (pre-Slavic *svet*) stems from Avestic *spaeta*, "white," whereas *svjatoj* (pre-Slavic *svet*) comes from Avestic *spenta*, "sacred," equivalent to Greek *hagios* [ἄγιος] and Latin *sanctus*. The connection between *spaeta* and *spenta* is thus not clear (Brückner, *Slownik etymologiczny*, 535, 537).

More plausibly, the idea of an etymological identity between *svet* and *svjat-* is simply a metaphysical invention, which is, moreover, quite appropriate. The consonance between light and holiness is amply corroborated in Orthodox theology, and its doctrine of powers or energies of God goes back to Dionysius the Areopagite. In Orthodox Christian

thought divine power manifests itself in an act of grace offering each human being the possibility of *theôsis* [θέωσις] (see BOGOČELOVEČESTVO). Gregory Palamas (ca. 1296–1359) developed, following the church fathers, the distinction between the essence of God and the divine energies. This distinction was canonized as a dogma of the Eastern Church: the "Palamite" councils recognized the possibility of seeing God—in his energies or in his grace—with bodily eyes. Palamas characterizes the "divine energies" (*dunameis theou* [δυνάμεις θεοῦ]) as *phôs*, "light," or *ellampsis* [ἔλλαμψις], "illumination." This divine light, which a human being can labor to see, is not a creation of God but his mode of existence and real manifestation.

> Transcendent through his essence . . . God proceeds out of his essence. He continually emerges from that retreat and that exit, those "processions" or *dunameis*, are a mode of existing in which the Divinity can communicate itself to created beings.
>
> (Lossky, *Image and Likeness*)

■ See Box 1.

III. *Svet* and *Blagodat'* [благодать]

The divine light is thus in no way a metaphor but rather a real manifestation of God and a mode of his existence:

> It is the visible character of the divinity, the energies in which God communicates and reveals himself to those who have purified their hearts. . . . This uncreated, eternal, divine, and deifying light is grace, since the name of grace (*charis* [χάρις]) fits as well the divine energies, insofar as they are given to us and effect the work of our deification.
>
> (Lossky, *Image and Likeness*, 52–53)

The divine Light is the very substance of the Transfiguration: it is the real quality of "those who have purified their heart"—the saints.

It will not come as a surprise that linguistic intuition tends to link "light" (Russian *svet*) and holiness (Russian *svjatost'* [святость]). To be a saint is to be filled with grace, with divine light. The representation of holiness by means of a halo is characteristic of Eastern iconography and particularly, if the expression be permitted, of that of Slavic expression. Pavel Florensky, in chapter 5 of *The Pillar and Ground of the Truth*, cites copious testimony confirming the visible and visual character of the light emanating from the saints.

> The notion of the light of grace (*sveta blogodatnogo* [света благодатного]) is one of the few fundamental ideas of the entire liturgy, since that liturgy was composed by spiritual men, pneumataphora, who had undergone the experience of beatific knowledge (*blogodatnoe vedenie* [благодатное ведение]).
>
> (Florensky, *Pillar and Ground*, 69)

It should be remembered that the first meaning of *spenta*, "sacred," is "exuberant, overflowing with supernatural power," and that the first meaning of *svjat-* (pre-Slavic *svets*) refers to the pagan idea of supernatural gifts (RT: Benveniste,

1

The theology of light

In order to understand the theology of light of Palamas, one must begin with the distinction forged by Saint John of Damascus between the essence or nature of God (*ousia* [οὐσία], *phusis* [φύσις]) on the one hand, and "what is close to nature [*ta peri tên phusin* (τὰ περὶ τῆν φύσιν)]," on the other. To designate the second term, Palamas used the term *energeiai* [ἐνέργειαι], "energies," borrowed from the Cappadocians, simultaneously with the Dionysian term *dunameis* [δυνάμεις]. These "energies" do not designate voluntary acts, such as the Creation, but are a mode of being of God. God reveals himself in his powers or energies (*dunameis te kai energeiai* [δυνάμεις τε καὶ ἐνέργειαι]); however, as opposed to the essence of God, his powers are accessible to religious or mystical knowledge. Insisting on the absolute unknowability of the divine essence, Palamas regarded the word *ousia* as unsuitable for God: he preferred the term *huperousiotês* [ὑπερουσιότης], "superessence" (cf. de Andia, *L'Union à Dieu chez Denys l'Aréopagite*, 155), to the extent that God, as opposed to his creatures is not limited by his essence. Similarly, considering that traditional *dunameis* and *energeiai* were too abstract to name the living God, Palamas identified the visible being of God and created light (*phôs* [φῶς]). Thus rearticulating the ideas of the fathers in terms of his metaphysics of light, Palamas elaborated the edifice of traditional Orthodox theology (cf. V. Lossky, *In the Image and Likeness of God*). The notion of divine light or deifying grace, associated with the light of the Transfiguration seen by the apostles at Mount Tabor, was canonized by the Orthodox Church in the fourteenth century.

de Andia, Y. *L'Union à Dieu chez Denys l'Aréopagite*, Leiden: Brill, 1966.

Le vocabulaire des institutions indo-européennes, 2:184). The "cultural baptism of paganism resulted in its transformation into "grace"; thus it was that against a Slavic backdrop, "holy" (*svjatoj*) became "luminous" (*svetlyj*) and "blessed" (*blagodatnyj* [благодатный], "full of grace"). This type of cultural baptism is a general phenomenon of European Christianity.

IV. Translating *Svet,* the Grace That Transfigures

Allusions to the *svet/svjat-* connection are part of the cultural heritage and do not imply, at least in the Russian tradition, a direct reference to the theology of light. Many such allusions are to be found in Dostoevsky. Light and holiness are for him, for example, the components of the respect owed to the *narod* [народ]: "There are in the people (*v narode est*) veritable saints (*svjatye*)—and what saints! Luminous themselves (*sami svetjat*), they illuminate (*osveščajut*) our common path [в народе есть . . . прямо святые, да еще какие: сами светят и всем нам путь освещают] (Dostoyevsky, *Dnevnik pisatelia za 1876 god* [*A writer's diary of the year 1876*]). In the translation, the consonance between *svetjat and osveščajut* (both derived from *svet*), on the one hand, and *svatje* (derived from *svjat-*), on the other, is lost. But plainly, the idea of a creative transformation, a transfiguration suited to the *narod* and represented by the image of light, is an important aspect of Dostoyevsky's thought (see NAROD). He thus writes, concerning the future of the *narod*:

Circumstances are going to change, things will go better, debauchery may even leave the people (*narod*), and the luminous principles (*svetlye načala*) within it will remain more unshakable and more holy (*svjatee*) than ever.

(А идеалы в нашем народе есть и сильные, а ведь это главное: поменяются обстоятельства, улучшится дело, и разврат, может быть, соскочит с народа, и светлые-то начала в нем останутся незыблемее и святее, чем когда-либо прежде.)

(Ibid., 43)

Light, perhaps more in Russian than in other languages, signals the spiritual, the ideal, the noble, the sacred. Whatever the case, the appeal to transfiguration via the image of the light of divine grace that is solicitous and divinizes, "*blogodatnyj svet* [благодатный свет]," has often been associated with the "Russian idea." Serge Troubetskoi, for example, writes in his article "The Light of Tabor and the Transfiguration of the Spirit" (1914):

Our creative, artistic and philosophical work has always needed not an abstract truth [see ISTINA], but one that is real and effective. . . . Intentionally or not, the greatest representatives of the genius of the Russian people (*narodnyj* [народный]) have always sought that light (*svet*) which cares for and transfigures from within the life of the body and the spirit.

(Troubetskoi, in M. A. Masline, ed., *Russkaja Ideja*, 242)

V. Strategies of Ambiguity

Other difficulties in translation emerge when authors play intentionally on the semantic tension between *svet*-light and *svet*-world. Vladimir Propp, in order to explain the complexity of the idea of the "other world [*tot svet* (тот свет)]" in fairy tales, writes:

The tale expresses things in a very naïve but perfectly precise manner: "There, the light (*svet*) is as it is with us. But the light (*svet*) changes, the forms of social organization change, at the same time as they do, 'the other world (*svet*)' changes."

(Propp, *Theory and History of Folklore*, 380)

To all appearances, the first occurrence of *svet* in this passage can also refer to the light of the other world just as well as to the other world itself, which renders the sentence "There, the *svet* is as it is with us" definitively ambiguous.

An even less translatable configuration of the meanings of *svet* is produced by Arsenij Tarkovskij in one of his poems:

There is no death in the world (*na svete* [на свете]). All are immortal, and everything is immortal. One mustn't be afraid of death, neither at seventeen nor at seventy. There is only the present (*jav'* [явь]) and light (*svet*), the shadows and death do not exist in this world (*na etom svete* [на этом свете]).

<div align="right">

(Tarkovskij, *Zemle—zemnoye*, 85)

</div>

The key to this passage is maintaining as inexistent all the entities incompatible with *svet* (light) in *svet* (the world). The affirmation of the exclusive reality of *svet* is reinforced by the image of the world full of the grace that confers immortality. But the more the theological reality is veiled, the better it achieves its aim.

SVOBODA [свобода], VOLJA [воля] (RUSSIAN)

ENGLISH	liberty, freedom
FRENCH	*liberté, volonté*

➤ *LIBERTY*, WILL and DRUGOJ, I/ME/MYSELF, ISTINA, NAROD, PLEASURE, RUSSIAN, TRUTH, WILLKÜR

The two Russian terms *svoboda* [свобода] and *volja* [воля] are translated into French as *liberté* (freedom); *volja* also possesses the meaning of will. In addition *volja* designates a vast expanse without limits, e.g., a steppe; this sense reinforces the connotation of arbitrariness present in *volja* in the sense of freedom. The *svoboda/volja* opposition is interpreted with the help of those between "culture/nature" and "form/matter": *volja* is the matter of the person (*ličnost'* [личность]), whereas *svoboda* is its form and structure. *Svoboda*, in contrast to *liberum arbitrium*—the structure of free will—is always beyond norms and rules. In its existentialist sense (notably in Dostoyevsky), it is founded on the relation between self and fellow creatures, objects of love and hatred. For Russian thinkers, *svoboda*, understood as a victory over necessity, has always been a value in itself, whereas *volja*, manifesting the spontaneity of man, has rather served as a popular (and even populist) ideal.

I. The Semantic Fields of *Volja* and *Svoboda*

Volja [воля] comes from the old Russian verb *voliti* [волити], Sanskrit *varayati*, "he chooses himself, solicits, searches"

(RT: *Etymological Dictionary of the Russian Language*). The term designates a psychological faculty of intention and desire, "will." It can also signify "the possibility of disposing, power." At the same time it means "the freedom to manifest something, a free situation, freedom, independence" (Preobrazhenski, *Dictionary of the Russian Language*, vol. 1). In addition, *volja* designates a vast expanse without limits (ibid.), of which the steppe is a paradigmatic case; this last sense is inherent in *volja* understood as "liberty."

The connotations of *volja* in the sense of "will" play a considerable role in the terminological field of *pleasure*. Thus the words *udovletvorenie* [удовлетворение] (satisfaction), and *udovol'stvie* [удовольствие] (pleasure), are derived from *volja* through the Old Russian lexeme *dov(o)l'*. The initial meaning is connected to satisfaction of the will (*volja*) to the point of satiety. In contemporary Russian one finds *dovlet'* [довлеть] (to suffice, to be sufficient), *dovol'nyj* [довольный] (who feels or expresses contentment, etc.); one finds as well the Ukrainian adverb *dovoli* [доволі] "quite enough." Thus *udovol'stvie* has the meaning of "joy of the sensations, the emotions, agreeable thoughts" (Preobrazhenski, *Dictionary of the Russian Language*, vol. 4). *Udovol'stvie* is not linked directly to the satisfaction of the desires or needs of the subject, as opposed to *udovletvorenie*. However, the etymological bond that attaches *udovol'stvie* to *volja* gives that word the nuance of abundance in relation to the will. The Russian term *svoboda* [свобода] (freedom) comes from the Slavic possessive pronoun *svoj* [свой], which means belonging to the person and is rendered, depending on the context by "(my, your, his, our, your, their) own"—as in Sanskrit *sva*, Latin *suus*, and Greek *swos* (RT: *Le vocabulaire des institutions indo-européennes*, vol. 1). Beyond that, *svoj* designates in contemporary speech (as in Old Slavonic and Russian) the member of a family, tribe, or community; *svoj* in this sense is the opposite of *čužoj* [чужой], "stranger." According to Vasmer's *Etymological Dictionary* (RT: *Ètimologicheskiĭ slovar' russkogo iazyka* [Etymological dictionary of the Russian language]), pre-Slavic *sveboda* initially signified "belonging to a family or tribe," the "state of a free man." One also finds this sense of identity in Slavic terms of the same root *osoba* [особа] and *sobstvo* [собство] "the person," as in the contemporary *sobstvennost'* [собственность], "property."

In Old Russian, *svoboda* possesses a connotation of independence; it can signify a free colony. In ordinary language the modern use of *svoboda* is indistinguishable from that of *liberté* in French. But at the level of philosophical conceptualization, one finds the original connotations.

II. The Diglossic Opposition *Svoboda/Volja*

The formation of the modern concept of *svoboda* in Russian was accompanied by a semantic tension between the synonyms *svoboda* and *volja*. According to George Fedotov, at the time of the Moscovite state, the idea of *svoboda* (a leading term of the opposition) had a positive value solely in cultivated circles. The spirit of freedom (*svoboda*) manifested itself in attempts by the boyars to constrain the power of the czar. For the common man, on the contrary, *svoboda* had a purely negative value, synonymous with impunity and slackening. The popular ideal of *volja* (a lower-class term), however, signified the possibility of living while following only

one's own will, in the margins of the limits imposed by the bonds of society.

> *Volja* finds its triumph either in a distancing from society, in the vast expanse of the steppe, or rather in power over society, in violence over men. . . . It is not opposed to tyranny, since the tyrant as well possesses *volja.* The brigand is the ideal of the Moscovite *volja,* just as Ivan the Terrible is the ideal of the czar. Since *volja*, like anarchy, is impossible in the cultural community, the Russian ideal of *volja* finds its manifestation in the cult of the desert, of nature in the wild, nomadic and bohemian life, wine, debauchery, the forgetting of oneself in passion—in criminality, rebellion, tyranny.
>
> (Fedotov, *Rossija i svoboda* [Russia and freedom])

These sociolinguistic remarks by Fedotov were written at the beginning of the 1940s, at the time of fascist and communist regimes that gave the *svoboda/volja* diglossic opposition political currency. For Fedotov *svoboda* refers to liberal and democratic: as an elevated term it was removed from connotations of arbitrariness and tyranny. "Personal freedom [*svoboda*] is not possible without respect for the freedom [*svoboda*] of the other" (ibid., 183). One can adduce here a passage from the *Two Treatises of Government* in which Locke states that man's original situation is a natural state or a "state of perfect freedom" (*Two Treatises of Government*, 287). According to Locke, "though this be a state of liberty, yet it is not a state of license" (288), since *liberty* includes obligations before God as before men. The two terms "freedom" and "liberty" are ordinarily both translated by *svoboda*, as they are translated by *liberté* in French, whereas "license," in the Russian edition of Locke is rendered by *svoevolie* [своеволие] (1988, 263), "the tendency to act by following one's whim or arbitrary caprice" (Preobrazhenski, *Dictionary of the Russian Language*, vol. 4). *Svoevolie*, which carries a negative charge, comes from the expression *svoja volja* [своя воля] (his own will); the adjective *svoevol'nyj* [своевольный] means "arbitrary, acting at whim"; thus the Russian translation of Locke's term "license" possesses a sense quite close to that of *volja* in Fedotov. *Volja*—as a debased term in the linguistic pair—designates an abuse of freedom.

III. *Svoboda* as Culture and Form, *Volja* as Nature and Matter

One says in Russian *svoboda slova* [свобода слова], "freedom of speech"; *svoboda pečati* [свобода печати], "freedom of the press"; *svoboda sovesti* [свобода совести], "freedom of thought"; *svoboda ličnosti* [свобода личности], "freedom of the individual." *Volja ličnosti* [воля личности] has the clear meaning of "individual will"; but the expressions *volja slova, volja pečati, volja sovesti* do not exist: *volja* as freedom does not allow a complement in the genitive. Indeed, *volja* cannot become partial or personal: it is a universal and indivisible reality, like the steppe, and has no owner. Even more, it is a homogeneous reality, opposed to every obligatory act and responsibility. It is pure formlessness, an indeterminate realm in which the defined character of things disappears—as in a Bakhtinian carnival.

The disorder and universalism of *volja* are opposed to the structural and specific character of *svoboda*. *Svoboda* is a cultural acquisition; it "presupposes an internal discipline" (Pomerants, "*Evropejskaja svoboda*," 139); it is even the "inner form of the personality [*ličnost*]" (140) that renders the free act possible. The *svoboda/volja* opposition is thus interpreted by way of the opposition between culture and nature and, ultimately, via the traditional form/matter opposition. *Svoboda* is the form of the *ličnost* (the person or personality), just as, in classical philosophy, the soul is the form of the human being.

From this point of view, *volja* can no longer be identified with destruction. For Fedotov as a social ideal it takes on a destructive aspect, whereas *svoboda* obtains a positive value, specifically that of democratic "freedom." But at the level of the individual, *volja* rather represents a spontaneous, Dionysian origin of the human personality. Thus the Russian expression *davat' volju* [давать волю] signifies to give free rein (to one's emotions, thoughts, etc.), whereas *davat' svobodu* [давать свободу] means bestowing freedom (e.g., on a slave). The idiomatic equivalent in English succeeds in conveying the connotation of spontaneity: *davat' volju* is translated as "to give free play"—as in "giving free play to one's feelings" (as opposed to "curbing" them. *Volja* is the free play of the human personality; it can, to be sure, take a destructive turn, but it can also take on defined form—thanks to culture. "A balance between the freedom (*svoboda*) of civilization and natural freedom (*volja*) takes a different turn in each culture and in each era" (Pomerants, "*Evropejskaja svoboda*," 141).

IV. *Svoboda* and *Drugoj* (Other People)

Russian thinkers frequently insist on the fundamental opposition between *svoboda* and the *liberum arbitrium* of an isolated subject. Our freedom (*svoboda*) is not the free will (*svoboda voli* [свобода воли], i.e., the freedom of choice (*svoboda vybora* [свобода выбора])" (Fedotov, *Rossija i svoboda*, 251). Similarly Berdyayev rejects the notion that *svoboda* can be understood as "freedom of choice, the possibility of turning left or right," (*Dream and Reality*, 72): such free will functions only in terms of responsibility and punishment, "from a juridical point of view, as criminology applied to human life." But "freedom [*svoboda*] has an entirely different bearing" (ibid., 72).

Svoboda reveals its structure in the novels of Dostoyevsky, whose characters are perpetually in intimate confrontations with Others (*drugoj* [другой], derived from *drug* [друг], "friend"), representing the entirety of the universe. The character must choose between the *caritas* of total responsibility for oneself and the universe, on the one hand, and the total diabolical destruction of "everything is permitted" (*vsedozvolennost'* [вседозволенность], derived from *volja*), on the other. The ground of *svoboda* is thus the relation between self and others, my fellow creatures, and ultimately objects of love and hatred. It is on that structure that the free act (*postupok*) [поступок] is ultimately based. Mikhail Bakhtin successfully integrated the existentialist notion of free choice in his philosophy of the act:

> My singularity as obligatory noncoincidence with everything that is not me always offers me the possibility

of a singular and irreplaceable act (*postupok*) in relation to everything that is not me.

(Bakhtin, Toward a Philosophy, 42)

According to Bakhtin, he who does not assume responsibility for himself and his situation toward Others cannot truly partake of being and is an impostor. It is solely in the responsible act toward others that freedom—the structure of the person—is achieved. Similarly, through love and friendship, freedom is an interpersonal structure: "I am not free unless you, too, are" (Berlin, *Russian Thinkers*, 107).

V. *Svoboda* and *Neobxodimosť* (Necessity)

Everything, however, that is imposed from without on the person—norms, rules, laws—becomes relative and conditional in that it restricts freedom. Paradoxically, *svoboda* as structure is anomic: it is nothing other than the elimination of necessity. Thus, according to Bakhtin, *svoboda* is an independence in relation to all laws, whether "political, criminal, or civil," that other men impose on the individual "against his private convictions" (*Toward a Philosophy*). But for all political thinkers—and not merely the anarchist Bakunin—*svoboda* as a triumph over necessity has always been a value in itself, whether understood as individual freedom (liberalism), communitarian freedom (of a Slavophile sort and *narodničestvo* [народничество]), or even as the freedom of workers (Marxism).

The feeling of *svoboda* has always been a value more appreciated than the rules of morality. "The truly free man (*svobodnyj* [свободный] creates his own morality," Herzen had already written in 1850 (Herzen, *Sobranie socinenij* [Collected works], 6:131). In elaborating the idea of *svoboda* as a triumph over necessity (*neobxodimost'* [необходимость]), religious thinkers (Solovyov, Vycheslavtsev, Lossky, Frank) developed the "ethic of love (*etika ljubvi* [этика любви])," which starts with the freedom of human action and contrasts with Kantian moral formalism. Berdyaev follows this ethical tradition:

> Freedom is my independence and the inner determination of my person; it is my creative force, not the choice between the good and evil that are placed before me, but my own creation of evil and good.

(Berdyaev, *Dream and Reality*)

For Berdyaev, *svoboda* as a source of creation is the opposite of the "congealed and static moral order" (Berdyaev, *Destiny of Man*, 11), and, finally, of being (*bytie* [бытие]), of given and objectified reality. Moreover, man apprehends the truth (*istina* [истина]) solely if he is free:

> It is in freedom and through freedom that one recognizes truth (*istina*). The truth (*istina*) that is imposed on me by asking me to renounce freedom (*svoboda*) is not at all truth (*istina*), but a temptation of the devil (*čërtov soblazn* [чёртов соблазн]).

(Berdyaev, *Destiny of Man,* 73)

This existentialist doctrine, according to which every objective science is a source of necessity and thus of subjugation of man, takes on a tragic character in Shestov: "What is

sure is that having stretched a hand toward the tree of science, men have forever lost their freedom" (Shestov, *Athens and Jerusalem*, 135). After the Fall they conserved "only the freedom of choosing between 'good' and 'evil,'" whereas formerly "they had the possibility not of choosing between good and evil, but of deciding whether evil would or would not exist" (ibid.). According to Shestov true freedom is "the freedom of ignorance (*svoboda neznanija* [свобода незнания])" (198).

Despite the diversity of contemporary philosophical meanings of *svoboda*, the concept retains its anomic and anarchistic character. The expression *svoboda voli*, which renders the Latin *liberum arbitrium*, expresses an anomie even more violent than its literal translation as "freedom of the will."

VI. *Volja* in Ukrainian

Volja has the same double meaning in other Slavic languages. Thus, the Ukrainian word *volja* signifies "will" as well as "freedom." In Ukrainian *volja* and *svoboda* are synonyms; as in Russian *volja* is never used with a genitive. However, it does not have the connotation of a vast expanse without limits. In a classic poem of the beginning of the twentieth century, *Odno slovo* (A single word), Lesia Ukraïnka presents us with a deportee of the era of the Russian czarist empire living in a colony amid a northern tribe, in the middle of the vast expanse of Siberia. In studying the local language, he tries to explain the word "freedom" to the inhabitants of the region, since their language does not contain that term. The deportee suffers from the vanity of his efforts. Obsessed by constant moral suffering, he falls gravely ill—without any visible illness. Nearing death, he says to a young man of the region: "I am going to die from what has no name in your land, even if it exists *without limit* here. What might bring me back to life does not have a name either, but in any event it does not exist among you. If the word were nonetheless to exist, I would still be able to live; but it doesn't exist" (Ukraïnka, *Tvory v dvokh tomakh*). Whereas in Russian *volja* is limitless, in Ukrainian the word does not at all connote the infinite. On the contrary, it is *nevolja* [неволя] (slavery), the antonym of the *volja* that exists "without limits." The freedom of the individual is unique and inexpressible outside the limits of one's own culture; the vast unlimited expanse of a foreign country crushes freedom. The feeling of untranslatability is reinforced by an effect of preterition: the story is told by a young native of the country, without the words *volja* and *svoboda.* It is because of the untranslatable character of *volja* that Lesia Ukaïnka's deportee died: he felt useless outside his language, his culture, his freedom, even if plunged in the limitless expanse of the empire.

The fusion in *volja* of freedom and an expanse without limits thus seems a phenomenon specific to the Russian language alone, even as the extremely anomic character of *svoboda* is a phenomenon of Russian philosophy. Beyond the double meaning of *volja* as "will" and as "freedom," another translation difficulty of the terminological field of *svoboda* is related to the fact that *volja* as freedom often functions as a synonym of *svoboda*, whereas in diglossic contexts, on the contrary, it is opposed to it. In such contexts *volja*, which can be translated as "arbitrary" or with the expression "acting by whim," is fully as subversive for *svoboda* as constraint.

Svoboda is truly a fragile substance: it is as fearful of unlimited freedom (*volja*) as it is of necessity (*neobxodimost'*).

T

TABLEAU

ENGLISH	picture, painting
GERMAN	*Malerei, Gemälde, Bild*
GREEK	*zôgraphêma* [ζωγράφημα], *pinax* [πίναξ]
ITALIAN	*quadro*
LATIN	*tabula*

➤ AESTHETICS, ART, BILD, DESCRIPTION, DISEGNO, HOMONYM, MIMÊSIS, PLASTICITY

Lord Shaftesbury gives a very precise tone to the issue when he affirms,

> But 'tis then that in Painting we may give to any particular Work the Name of Tablature, when the Work is in reality "a Single Piece, comprehended in one View, and form'd according to one single Intelligence, Meaning, or Design; which constitutes a real Whole, by a mutual and necessary Relation of its Parts, the same as of the Members in a natural Body."
>
> *(Historical Draught or Tablature of the Judgment of Hercules, in Characteristicks of Men, Manners, Opinions, Times, 3:349)*

The vocabulary of the different languages illustrates varying degrees of awareness of this material and formal autonomy.

I. *Zôgraphêma, Pinax, Tabula, Tableau*

"If on another hand, we compare the first names to these drawings (*grammasin* [γράμμασιν]) it is possible in the case of pictures (*zôgraphêmasin* [ζωγραφήμασιν]), to give them all the appropriate colors and forms, or not to provide them all and to make some omissions or some additions in their number and size." Without penetrating further into the rich vocabulary of this passage from Plato's *Cratylus* (431c), we can underscore the use of *zôgraphêma* [ζωγράφημα], which designates the painting insofar as it carries a representation—literally: the writing, the representation of the living creature—rather than the object-picture. *Zôgraphia* [ζωγραφία] signifies the painting and the art of painting at the same time, as a passage from *Phaedrus* confirms, in which Plato again compares writing to painting (275c).

The word *pinax* [πίναξ] will come later to designate the painting as object-picture. It no longer refers to the living model, but to the support. The term (which is related to the old Slavonic [pьnь] [tree trunk, log]) at first refers to a plank (*Odyssey*, XII.67), a plate, or a platter (originally out of wood), and is later used in reference to tablets for tracing out signs (starting with the *Iliad*, VI.169) and to the geographic maps within which the Ionian astronomers started drawing "the face of the inhabited world" (to borrow the expression from J.-P. Vernant), and then to votive tablets and paintings. Ex-votos and pictures might seem at first to be fully interchangeable terms, insofar as most

Greek paintings referred to in literature were to be found in the picture galleries of temples, the pinacothecas beginning with the gallery described by Pausanias, and located in the north wing of the Propylaeas to the Athenian Acropolis.

But he also refers to the presence of paintings in private houses and to visits to the workshops of painters (Zeuxis, Protogenes, and Apelles). The many details that one can glean from the Millet collection (Reinach, *La Peinture ancienne*) are indications of the beginnings of the institutional conditions of painting, whose origins are certainly religious, but which tend toward a relative autonomy, since aside from the relative rarity of religious subjects and the frequent references to literature, the works are the result of commissions from the cities or the kings, or are carried out as part of a contest (thus the famous rivalry of Zeuxis and Parrhasios; cf. Pliny the Elder, *Natural History*, XXXV.64).

The first paintings seem to have been fragments of walls taken from buildings (starting with the Greeks apparently, although our evidence for this hypothesis is limited to Pliny's description of a brick fresco taken down in Rome, a fragment of which was given a matching frame [*Natural History*, XXXV.49]), which naturally led to the idea of a mobile painting, on a support made of stone, marble, terracotta, slate, or wood. There seems to be evidence for paintings on wood dating from the Pinacotheca of the Propylaea. Canvas seems to have been first used in theaters, starting with Agatharchos (thus the false curtain painted by Parrhasios that deceived Zeuxis after he had presented his grapes [cf. ibid., XXXV.64]). The emergence of painting on canvas is dated to the epoch of Nero, based on Pliny's account of a gigantic painting of the emperor that was destroyed by lightning (ibid., XXXV.51). The support on which the painting is posed becomes an autonomous fragment, transportable, exhibitable, and self-contained yet open to the possibility of a unified, organic composition. Most of the meanings of *pinax* passed into the Latin *tabula* (board, chessboard, *tabula votiva, tabula picta,* and so on) and its diminutive *tabella* (little board, writing tablet, *tabella picta*).

II. The Specificity of *Tableau* (Picture)

The lexical subtleties used to distinguish the frame and the painting enable the development of thinking. On the one hand, the issue is to discern the abstract limit of the painting (comparable to the contour of the figures). Whatever its size, the painting is differentiated from the frame, which, when it is present, represents a sort of "no man's land" between the world of the painting and the environment in which it is displayed. On the other hand, the issue is to illuminate the material and formal conditions specific to painting, the manner in which this medium manifests itself in reality. When Lord Shaftesbury writes (in French) his *Idée ou Raisonnement du*

tableau historique du Jugement d'Hercule suivant Prodicus (published in English as *Historical Draught or Tablature of the Judgment of Hercules*) in 1712, its purpose is to propose a "scenario" to the painter Paolo de Matteis for an allegorical painting that the latter executes in the same year (*Hercules at the Crossroads*, Ashmolean Museum). The British philosopher takes the occasion to reflect on the pictorial medium: "Avant que d'entrer dans l'examen de notre Esquisse, ou *Tableau* projeté," one should know that "par le mot de *Tableau* nous désignons conformément au mot latin de *Tabula*." If Shaftesbury is in a position to give a precise definition to the object (materially different from the fresco, endowed with an organic character), this is not only because he is developing his conception of the plastic arts, but also because his work is further enabled by the necessity of speaking French in order to communicate with his Italian friend, since neither speaks the language of the other. One can see this *a contrario* in the awkward translation into English that the philosopher makes subsequently: "Before we enter on the Examination of our Historical Sketch, it may be proper to remark, that by the word Tablature (for which we have yet no name in English, besides the general one of Picture) we denote, according to the original word Tabula" (*Historical Draught or Tablature of the Judgment of Hercules*, in *Characteristicks of Men, Manners, Opinions, Times*, 3:348).

The subsequent history of the notion of the painting shows that the awareness of its specificity arises from reflections upon the conditions of its making (essentially, its planarity), but requiring some additional tightening of focus on the painting as the determinant of these qualities. Most of the classical definitions of painting, for example, by Raffaello Borghini (1584), Nicolas Poussin ("an imitation of everything under the sun, made up of lines and colors on some surface, whose purpose is delectation," in Letter to Fréart de Chambray, 1 March 1665, Rome) or by Roger de Piles ("the imitation of visible objects by means of form and colors," in *Course on Painting* [1708], p.8), refer back to the "general concept" of the painting, as Shaftesbury put it. Shaftesbury's own definition, on the other hand, introduces a specific concept. This same specific concept is found in Taine: "A painting is a colored surface upon which various tones and various degrees of light are distributed according to a certain choice; this is its intimate being" (*Philosophy of Art*). This definition will become the accepted scholarly one, as is evident in Maurice Denis's borrowings, in a famous injunction that is now the founding precept of many a visual artist:

> One should recall that a painting—before it is a warhorse, a naked woman, or some anecdote or another—is essentially a planar surface covered with colors that are assembled in a certain sequence.
>
> (*Art et Critique*, 23 and 30 August 1890, cited in *Le Ciel et l'Arcadie*)

This tightening of the concept no doubt reaches its culmination in what Denis says of Cézanne. After recalling Gauguin's ironic remark, "[N]othing resembles a daub (*croûte* in French) so much as a masterpiece," he adds, "Whether it is good or bad, Cézanne's canvas is definitely a painting" ("Cézanne," *L'Occident*, September 1907, cited in *Le Ciel et l'Arcadie*).

III. Approximate Equivalents to *Tableau* in the European Vocabulary

The English language, which contains "table" and "tablet" (as in a commemorative plaque), uses "tableau" only in the plural ("tableaux" or "tableaus") when speaking of a *tableau vivant*. An examination of the semantic potential contained within the lexical elements of the different European languages reveals extensive disparities. Only French and Italian (*quadro*, from the Latin *quadra* [square]) have a specific term at their disposal to refer to the object-picture—but one concentrates on the support, and the other on its limit (the frame).

■ See Box 1.

1

Cadre, "Frame," "Framing," "Framework," *Corniche*, "Cornice"

The word *cadre* in French signifies both the limits that define the edges of the painted scene and (traditionally) the piece of wood around the stretcher, with the latter also possibly called the framing. In the seventeenth century, the word *corniche* (projecting ornament) was employed, as Poussin's famous letter attests, in which he asks Chantelou to add some ornamental *corniche* (*orner d'un peu de corniche*) to a painting he had sent to him, "for the painting needs it, so that when seen in all its parts, the projecting rays of viewing would be held inside and not scattered about outside, such that light refracted from nearby objects would not be confused pêle-mêle with depicted objects." In fact, the Italian word *cornice* is used to refer to both the frame and the framing (which can also be called *incorniciatura*), while *quadro* is used only for the frame in a figurative sense, for example, the historical framework. Poussin for that matter uses the Italianism *quadres* to speak of a fresco independently of the stucco *corniches* that frame it. "Frame" in English designates both the frame and its framing. In theoretical texts (by Arnheim, Schapiro, etc.), this word is most often synonymous with "limit," "boundary," or "border." Depending on the context, this last also signifies the framing, as in the text by Gombrich: "The frame, or the border delimits the field of force with its gradients of meaning increasing towards the centre" (*The Sense of Order*, 157). One should also note the Greek distinction, which Kant uses in section 14 of the *Critique of Judgment*, between *Ergon* (work) and *Parergon* (ornament, "that is to say that which is not an integral part of the entire representation of the object"), and that this latter category includes the frames of paintings (*Einfassungen der Gemälde*).

A greater richness of vocabulary does not necessarily entail a greater flexibility in comprehension. The German language has two series of terms for *tableau* at its disposal, but no specific term. On the one hand, there are the terms *Malerei* and *Gemälde*, both designating painting as art, as well as picture and the portrait, and both formed from the root *Mal* (stain, mark, sign). On the other hand, there is the term *Bild*, which signifies image, painting, picture, and figure. One should also note that blackboard, table, and tablet are all referred to by the word *Tafel* (also used in a figurative sense in the expression *ein Tafel der Zeit*, meaning "a chronology").

English also lacks any one specific term. It sometimes employs "painting," which, like *peinture* in French, has the technical sense of support for the paint (*painting in oils*), but also the figurative sense of "description." Sometimes "picture" denotes a generic object-picture (as in Mussorgsky's *Pictures from an Exhibition*), sometimes a particular denoted "image" (as in *The Picture of Dorian Gray* by Oscar Wilde). The nuances of the two terms are sharpened by their contextual overdetermination, especially in a philosophical text, as this passage from Nelson Goodman's *Languages of Art* (p. 5) illustrates:

> A Constable painting of Marlborough Castle is more like any other picture than it is like the Castle, yet it represents the Castle and not another picture—not even the closest copy.... [F]or a picture can represent another, and indeed each of the once popular paintings of art galleries represents many others.

TALAṬṬUF (ARABIC)

ENGLISH	felicitous ability
FRENCH	*habilité salutaire*
LATIN	*solertia, sapientia, sagacitas*

➤ *RUSE* and GOD, HISTORIA UNIVERSALIS, INGENIUM, MÊTIS, PHRONÊSIS, *PRUDENCE*, *WISDOM*

In the Qur'ān Allah is crafty and more able to wheel and deal than his adversaries (III, 54). He is also *laṭīf* [الطف], an ambiguous word that can be translated, among other things, as graceful or charming (Fr. "*gracieux*"; cf. D. Gimaret, *Les noms divins en Islam*, 391–94). The notion of subtlety, *luṭf* [اللطف], links the two ideas: he steers things in the direction he wants to go, but he works softly and smoothly. The Brethren of Purity (or Brethren of Sincerity) in the second half of the tenth century applied the idea to the succession of generations of the living: the divine wisdom and the providence of God have cleverly arranged (*talaṭṭafa* [تلطّف]) for the permanence of the species, since an individual cannot exist forever (Epistles, IV, 1 [42], vol. 3). They take up an idea derived from Aristotle (*De Anima*, II, 4, 415a 29–b 7) but add to it the idea of ruse.

Averroës (who died in 1196) uses the verb to express the clever way that divine providence has ensured the continuity of the pure power and the pure act by placing between them the power according to place, the only one possessed by celestial bodies (*Epitome of Metaphysics*, 3rd ed. Jéhamy, 110). The verb also appears in a crucial passage of the *Decisive Treatise*: Allah "worked things out" so that those who are unable to accede to apodictic knowledge can partake of the truth through images (ed. L. Gauthier, 18, 4; ed. M. Geoffroy, § 38—the expression escaped the translators, who rendered it in French as "*faire la grâce de*" [have the grace of]). Maimonides (d. 1204) uses the term in the framework of a theology of history: God did not bring Israel directly to confront the peoples of Canaan but made a detour of forty years in the desert. The harsh life hardened the people who had become soft during their captivity in Egypt. It trained them in the warrior virtues and thus made them capable of conquering the promised land. In the same way, the law of Moses does not require a single leap from old habits to a pure cult of the spirit but is applied in degrees. (*Guide des égarés* [*Guide of the Perplexed*], III, 32, ed. Y. Joël, 383–86, Fr. trans. S. Munk, 249–54; cf. S. Pinès, *La Liberté de philosopher: De Maimonide à Spinoza*, [The freedom to philosophize: From Maimonides to Spinoza], 115–20). The notion of God's concessions to the weakness of human beings can be found in several of the Church Fathers: in relation to adaptation in Tertullian and later in Augustine, and in relation to condescension (*sugkatabasis* [συγκατάβασις]) in Justinian, John Chrysostomos, etc. If these refer to a basis, to a grace, the idea of ruse is nonetheless not explicitly addressed. The texts of the Brethren of Purity and of Averroës were unknown in Europe prior to the nineteenth century, but Maimonides was translated into Latin. The key word is rendered by expressions that link *solertia*, *sapientia*, and *sagacitas* (Latin trans. J. Buxtorf, 431). Hegel perhaps remembered

Maimonides's ideas when he formulated the concept of the "ruse of reason" (*List der Vernunft*), especially in the philosophy of history. History uses to its own ends passions that have no intention of serving it (*Leçons sur la philosophie de l'histoire* [*Lessons on the philosophy of history*], introduction, Glockner, ed., 11: 63, Fr. trans. J. Gibelin, 32ff.).

| TALENT

GREEK	*talanton* [τάλαντον]
ITALIAN	*talento*
LATIN	*talentum*
SPANISH	*talento, talante*

➤ *DESIRE*, and ART, GENIUS, GOÛT, INGENIUM, LOVE

The Latin word *talentum* first belonged in Greek to the vocabulary of weights, measures, and monies. The Old French *talent* belongs to the vocabulary of will and desire before taking on the meanings of "capacity" and "aptitude." Today, each of the three romance languages, Spanish, Italian, and French, has its own specific references for each of these different lexical units. In contemporary French, *talent* designates only gift or aptitude, whereas in addition to these, the Italian *talento* has retained the meanings of taste and inclination. In Spanish, *talento* referred to both desire and aptitude in the sixteenth century. It subsequently gained a doublet, *talante*, which remains closer to the Greek *etymon* and signifies desire and inclination. This obviated the semantic loss that in this case affected the French.

I. The Evolution of *Talent* in French

In Old French *talent* (like *talan* or *talen* in Provençal) had the meaning of desire, of inclination, of erotic attraction: *avoir en talent* meant to desire, to want to; *faire son talent d'une femme*, to take pleasure with a woman; *atalenter*, to please, to be right for, and to inspire desire; *atalentement*, fancy, love, affection for someone; *talentif* or *talentos*, seized with ardent desire; *maltalent*, ill-will, disaffection, a composite word that can still be found in Voltaire. In one of the *Lais* of Marie de France, a queen, irate at the rejection of her advances on the part of a young *chevalier*, declares, "I have often heard that you have no talent for women" (On m'a souvent répété que des femmes vous n'avez talent). This meaning, which predominated in the literature of the *trouvères* and the troubadours, was lost at the time of the Reformation and the beginning of the seventeenth century, and the word came to refer to capacity, aptitude, natural or acquired disposition: "Be a mason, then, if that is your talent" (Soyez plutôt maçon, si c'est votre talent) (Boileau).

In French the contemporary sense of *talent* came to replace the Old French meaning of "desire," whereas in Italian and Spanish both meanings persisted, thus attesting to how a metaphor with a common origin bifurcates in signification. Originally *talent*, borrowed from classical Greek through the Hellenic mode of speech of Marseilles, referred to the plate on a scale, then to the weight that would tip it, and then to the sum of gold or silver of a certain weight (somewhere between 20 and 27 kilos). Over time, the term was applied not only to decisions that rouse the will out of indifference and cause it to express a specific choice, but also to an attraction toward a person or a pleasure associated with an object choice. In the course of its semantic evolution, *talent* took on the meaning of "inclination" (*penchant*); both in the sense of a "feeling of love or sympathy for someone" and in the (older) sense of "decline" (*être sur son penchant*), with the latter containing a moralizing connotation, as in "ill-inclined" (*les mauvais penchants*).

The initial Greek usage acquired additional traction in Christian rhetoric, specifically in the Parable of the Three Servants. As told in Matthew (25:14), of the three servants entrusted by the master with some talents (a certain weight of gold or silver), two obtain interest, while the third buries his in the ground. The sense of "talent" as gift, which had remained current in ecclesiastical Latin *talentum* (in Saint Jerome, it refers to "the gift of God" or "grace," and for Calvin the "gift of the Holy Spirit"), was revived during the Renaissance and eventually replaced the earlier French meaning of bountiful desire and amorous attraction.

II. The Double Meaning in Modern Italian and Spanish

In addition to referring to aptitude, the modern Italian word *talento* retains the Old French sense of *talent*, especially when it is used in literary language. The word—which applies mostly to artistic activity—is to be understood in its ambiguous and composite sense of both "gift" and "particular taste," with the underlying assumption that disposition leads to inclination.

In the Castilian language of the sixteenth century, the word *talento* sometimes includes the sense of "desire" or "inclination," and sometimes refers to "capacity" or "natural gift." Thus Teresa of Avila speaks of *deseos y talentos* (desires and talents) that are required of those *postulants* who aspire to religious life (*Book of the Foundations*), and John of the Cross evokes *las inclinas y talentos de las personas* (the inclinations and talents

of persons) ("Ascent of Mount Carmel"). These ties between *talentos* and *deseos* or *inclinaciones* clearly indicate that the first of these terms belongs to the register of desire. Nonetheless, the second sense of capacity and aptitude will appear during the same period. In his celebrated bilingual dictionary, *Tesoro de las dos lenguas española y francesa* (1607; last edition, 1675), César Oudin, interpreter to Henri IV and the first translator of *Don Quixote*, gives the following definition (with the punctuation of the time): "*Talent, m.* Talent qui valoit six cens escus, *item,* Inclination, valeur" (*Talent, masc.* Talent which is worth six hundred écus, *item*, inclination, value).

The etymological dictionary of J. Corominas points out that *talento* takes on the double meaning of "natural gift one should cultivate" and "disposition," "inclination," as well as "will." This last usage will become generalized through the "ecclesiastical tendency to consider good will more important than intelligence," but in the lexical form of *talante*, "borrowed directly from the Greek through the intermediary of the Latin vulgate." Whereas the meaning of "natural gift" will pass into the vulgar languages during the Renaissance and under the influences of the religious predicates of the Reformation and Counter-Reformation, but in the "semi-scholarly form of *talento*, borrowed from classical Latin." In relation to this latter term, such dictionaries as that of R. J. Dominguez (1878) and of the *Real Academia española* (1991) will henceforth ignore the sense of disposition, inclination, or desire. *Talento* is thus limited to the meaning of aptitude. And *talante* is used instead to indicate desire or inclination (an acceptation resembles the common expression in modern Spanish of *de buen* [*o mal*] *talante*, that is to say, "of good [or ill] will"). The dictionary of the Real Academia also indicates that *talento* has a meaning that does not belong to the French *talent*: that of "understanding" (*entendimiento*, Fr. *entendement)* or "power of the soul."

TATSACHE, TATHANDLUNG (GERMAN)

ENGLISH	fact
FRENCH	*fait*
GERMAN	*Faktum*
LATIN	*factum*

➤ *FACT* and *ACT*, CONSCIOUSNESS, ES, EXPERIENCE, GEGENSTAND, I/ME/MYSELF, MATTER OF FACT, OBJECT, PRAXIS, REALITY, SPEECH ACT, TRUTH

Tatsache originally was the term proposed by German translators in the eighteenth century to translate "fact," a concept used widely in English empirical philosophy. The term refers to real experience, to

an event, or to factual data, which are the only source of legitimacy for any true knowledge. Kant sought subsequently to free the term from its excessive dependence on the theses of empiricism and proposed a new definition: The fact or *Tatsache* became an object whose objective validity could be proven or, in the Kantian context, any concept that can correspond to an intuition in a possible experience. This change in meaning is clearly a function of the theory of knowledge that Kant sought to develop as an alternative to empiricism. Its translation would be unproblematic except that Kant opposes *Tatsache* to the term *Faktum*, two terms that English renders as fact. Fichte attempted to surmount the opposition between *Faktum* and *Tatsache*, which had led in Kant to difficulties around a priori synthetic judgment (whether or not it implies an intuition). Fichte had recourse to the neologism *Tathandlung*, based on the requirements of his own *Doctrine of Science*. The expression *Tathandlung*, whose correct translation in English (it is sometimes rendered as "fact/act"), as well as in other languages, is not generally agreed on, involves all of Fichte's philosophy. It is a term that also entailed a new definition of knowledge that would influence all those thinkers generally referred to as German Idealists.

I. From "Matter of Fact" to *Tatsache*: The English Influence and Kant's Intervention

The German term *Tatsache* is at its origin a direct transposition of the English expression "matter of fact." *Tatsache* took on the philosophical dimensions of "fact" in the middle of the eighteenth century, as part of the rapid and powerful propagation of English empiricism in Germany (cf. M. Puech, *Kant et la causalité* [Kant and causality]). In this context *Tatsache* refers to real experience, to observable empirical events, and thus, by virtue of the key theses of empiricism, it designates a fact of which there can be no doubt.

In the face of this definition, which he considered excessively dependent on the empiricist grounds on which it was developed, Kant greatly extended the meaning of the term:

> Ich erweitere hier, wie mich dünkt, mit Recht, den Begriff einer Thatsache über die gewöhnliche Bedeutung dieses Worts. Denn es ist nicht nötig, ja nicht einmal thunlich, diesen Ausdruck bloß auf die wirkliche Erfahrung einzuschränken, wenn von dem Verhältnisse der Dinge zu unseren Erkenntnisvermögen die Rede ist, da eine bloß mögliche Erfahrung schon hinreichend ist, um von ihnen bloß als Gegenständen einer bestimmten Erkenntnißart zu reden.

> (Here I extend the concept of a fact (*Tatsache*), as it seems to me right, beyond the usual meaning of this word. For when the issue is the relation of things to our cognitive capacities it is not necessary, indeed not even feasible, to restrict this expression merely to actual experience, since a merely possible experience is already sufficient for speaking of them merely as objects of a determinate kind of cognition.)

> (Kant, *Critique of the Power of Judgment*, trans. Guyer and Matthews, 332)

For Kant *Tatsache* no longer refers only to empirical reality but applies to any object possessing "objective validity," as is the case of geometric properties. In this context any concept that can correspond to an intuition becomes a "fact."

Gegenstände für Begriffe, deren objektive Realität (es sei durch reine Vernunft, oder durch Erfahrung und im ersteren Falle aus theoretischen oder praktischen Datis derselben, in allen Fällen aber vermittelst einer ihnen korrespondierenden Anschauung) bewiesen werden kann, sind (*res facti*) Thatsachen.

(Objects for concepts the objective reality of which can be proved (whether through pure reason or through experience, and whether in the first case through theoretical or practical data for reason, but in all cases by means of intuitions corresponding to the concepts) are (*res facti*) facts (*Tatsachen*).)

(Ibid.)

The fact thus becomes synonymous with valid knowledge (which, for critical philosophy, is a knowledge that binds a concept to an intuition) and can be determined in opposition to "matters of opinion" (*Meinen*) and "matters of belief" (*Glaube*).

Kant subjects what had previously been an empiricist notion of *Tatsache* to a semantic displacement that is clearly conditioned by his own new determination of knowledge: the validity of a notion does not derive from a basis in factual data or on empirical events but resides in any concept that can be constructed from a pure intuition. Because knowing is no longer the observing or ordering of facts but is constituted by a concept's being made figural or representable through its application to an intuition, the term *Tatsache* loses its original empirical signification in favor of becoming the construction or mark of valid knowledge.

II. *Faktum* and *Tatsache*: A Kantian Exception

Once the slippage of the meaning of the term *Tatsache* in the Kantian context has been acknowledged, its translation poses no problems except in relation to other terms. French translators felt compelled to translate *Faktum* as *fait* ("fact"). Before Kant the Latin *factum* was equivalent to *Tatsache* and thus to fact. But with Kant its use essentially evolved into the opposite of *Tatsache*. The *Faktum*, as opposed to the *Tatsache* "is not based on any intuition, either pure or empirical" (*Critique of Practical Reason*, 28). This *Faktum* makes its first appearance in the *Critique of Judgment* (it had not appeared in the *Foundation of a Metaphysics of Morals*); in addition, it needs to be distinguished from the *Faktum* of jurisprudence, thematized in the *Critique of Pure Reason* in the opposition between *Quid facti* ("questions of fact") and *Quid juris* ("questions of law"); in which *Faktum*, treated as unable to ground or justify moral law, is taken as the neutral foil to legal right, the morally entitled law produced by the Deduction of Freedom. (*Critique of Pure Reason*, 3: 99–100). This *Faktum* is associated with the consciousness of the moral law within us. "It is not an empirical fact (*Tatsache*) but the sole fact (*Faktum*) of pure reason which, by it, announces itself as originally lawgiving" (*Critique of Practical Reason*, 29).

Since in French it was difficult to render *Tatsache* and *Faktum* using two different terms, most translators indicated in parentheses or a footnote which of the two words was used in the original. This is an absolutely necessary distinction, since *Faktum* is a synthetic proposition not dependent on any intuition, whereas *Tatsache* is defined as that which requires a corresponding intuition. In introducing *Faktum*, Kant admits the existence of a synthetic a priori, apodictically certain proposition that does not depend on any intuition. This exception to a nodal thesis of critical philosophy, based on the assumption that any valid proposition requires an intuition, would pose problems for Kant's immediate successors (Reinhold, Maïmon, and Fichte). What was the status, they would ask, of a synthetic a priori proposition that does not rest on sensible intuition? Didn't this exception to the Kantian theory of knowledge reveal its limits, if not its limitations? For either truth is defined by the link between a concept and an intuition, without exception, as had been maintained in the *Critique of Pure Reason*, or the Kantian definition of truth as a link between a concept and an intuition was insufficient (see, for this argument, Fichte's "Foundations of the Entire Science of Knowledge" in *The Science of Knowledge*). The post-Kantians would choose the latter of these possibilities and question the Kantian determination of knowledge. Rather than simply considering them as exceptions, they would try to think through propositions that, although absolutely true, did not require any construction in time and space, were not based on any sensible intuition: in a word, propositions that did not express *Tatsachen*.

III. *Tatsache* and *Tathandlung*: Fichte's Intervention

Since valid knowledge cannot be reduced to the establishment of facts or to the construction of concepts through intuition, mathematics, and physics (the only valid forms of knowledge according to the *Critique of Pure Reason*), it requires another form of knowledge or way of knowing and must be developed and theorized by philosophy accordingly. As an opposite term to the Kantian *Tatsache*, Fichte would create his own neologism—*Tathandlung*—and present it as the only true *Faktum* of reason, the sole foundation of all knowing. How does one translate this expression? What does it mean? What is at stake in this opposition between *Tatsache* and *Tathandlung* to which, in the last analysis, all of Fichte's work is arguably reducible?

Historically, Fichte employs *Tathandlung* for the first time in 1793, in the *Recension des Aenesidemus* [Review of Aenesidimus]. It functioned here to ensure an unshakable foundation for philosophy: "*ein solcher muss nicht eben eine Thatsache, er kann auch eine Thathandlung ausdrucken*" (Such a principle [i.e., the principle of any and all philosophy] does not necessarily need to express a *Tatsache*; it can also express a *Tathandlung*). The *Grundlage der gesamten Wissenschaftslehre* [Foundations of the entire science of knowledge] of 1794 thematizes the *Tathandlung* from its opening lines, and Fichte will return to the fundamental opposition between *Tatsache* and *Tathandlung*, for instance in the *Versuch einer neuen Darstellung der Wissenschaftslehre* [Attempt at a new presentation of the science of knowledge]:

Es ist gar nicht so unbedeutend, als es einigen vorkommt, ob die Philosophie von einer ThatSache ausgehe, oder von einer ThatHandlung (d.i. von reiner Thatigkeit, die kein Object voraussetzt, sondern es selbst hervorbringt, und wo sonach das Handeln unmittelbar zur *That* wird.

(Accordingly, the question of whether philosophy should begin with a fact or with an Act (i.e., with a pure activity that presupposes no object but instead, produces its own object, and therefore with an acting becomes a deed) is by no means so inconsequential as it may seem to some people to be.)

(Fichte, *Introductions to the Wissenschaftslehre and Other Writings, 1797–1800*, 51 [German edition *GA* 1, 4: 2210])

How can *Tathandlung* be translated from the German? There is virtually no concurrence in the French translations. As to the English, in their translation of the *Grundlage*, Peter Heath and John Lachs render the term simply as "act," and though legitimate, this has disadvantages. Most importantly, it gives no indication to the English reader that *Tathandlung* is a neologism entirely of Fichte's own making. Of course, the creation of composite expressions made by joining two existing terms is vastly more common in German than in French or English. Nonetheless Fichte himself underscored the idiosyncrasy of the term, which he intended as absolutely and unconditionally foundational to his whole doctrine of knowledge. Insofar as Fichte invents a word that he cannot find in the available lexicon, it would be desirable that any translation draw attention to the specificity of the term. For any translation to do justice to Fichte's term, it would be necessary to create an unusual expression (if not a new word), while taking care to avoid introducing connotations absent from the original German or defaulting to anachronistic applications of the term parasitic on recent usage. To respect Fichte's thinking, it is above all important to convey the redoubling of the act—the enactment of the act or action to the second power—expressed quite literally in *Tathandlung.* The two words that Fichte combines to create the expression, *Tat* (deed) and *Handlung* (action), are derived from verbs meaning "to do" (*tun*) and "to act" (*handeln*). *Tat* is taken from the past tense form of *Tun*, so the "deed" is literally the "did" (or the "done," but without the same emphasis on being finished or completed that this form conveys in English). This done-action or action-deed should convey a pure activity that presupposes no object but instead produces its own object and therefore with acting becomes a deed.

This notion of *Tathandlung* serves to characterize the specific actions of the self. Let us recall that for Fichte to philosophize is no longer to be interested in things, nor even in the relationship between knowledge and things—themselves defined in the Kantian manner as phenomena. To philosophize is to attempt to retrace the different actions through which the mind obtains knowledge. The issue is to restore through philosophical reflection the action immanent in every judgment. For Fichte two key acts can be theorized: the action through which the spirit posits something that is not itself (an act of opposition, or non-self, that works generically to designate the proposition set whose content is distinct from the positing subject), and the act of positing or "I = I." It is this latter form of positing that *Tathandlung* renders explicit. We can say of this notion of done-action or action-deed that the position of the "I" is the only proposition that contains both the positing of a reality and an action, in the sense in which the saying of "I" posits the "I" as an act and that act as existing. Within any other proposition there is a distance between the subject who makes the proposition and the object of the proposition. If I think, for example, that "the table exists" or that "the triangle has three sides," the act of positing and the object I posit are not identical. But, on the other hand, the "I" comes to exist in this very positing because there is no difference between the subject of the enunciation and the enunciated; the fact of enunciating suffices to realize the enunciation.

Contemporary analytic pragmatism may enable, *mutatis mutandis*, elucidation of this difficult notion of Fichte's. For pragmatic analysis does not analyze enunciations from the point of view of their propositional content (the information they deliver), but rather from the point of view of the act of their enunciation. As a result, any enunciation can be considered a speech-act. Within the vast ensemble of speech-acts, a relatively small group of enunciations has greater authority inasmuch as they are immediately and absolutely undeniable. Their opposite cannot be proposed without contradiction; the mere fact of their utterance would immediately invalidate the content of the enunciation. Such is the case with the proposition "I am speaking." No speaker would be able to say "I am not speaking" without denying the content of his proposition in the very act of saying it; whereas a proposition such as "you are speaking" or "he is speaking" can be empirically true or false but does not arrive as something whose opposite cannot be argued. Thus the "I," qua *Tathandlung,* functions as a performative utterance whose content derives from the very fact of saying it. The term *Tathandlung* aims then at showing how, in the determinate actions that constitute the "I," the affirmation of an act is the affirmation of the existence of the act.

The notion of *Tathandlung* as described here seems to have had, as such, no subsequent currency. One can find a few instances of the word in Novalis or Friedrich Schlegel, but only in reference to Fichte or as commentary on him. And yet, despite the abandonment of the term, one should still take into account the more general project crystallized by this neologism: to define knowing not on the basis of the content of a proposition but on the basis of a link between enunciative act and content of enunciation. Saying something without contradicting the fact of saying it is, in the end, the essence of the truth according to *Tathandlung.* Because this definition challenges traditional concepts of truth while backing off from the traditional Kantian determination of knowledge, it undoubtedly inaugurates the project that would eventually underlie German Idealism: theorizing a form of rationality that, though it be neither pure representational thought nor pure logic, would be no less a form of rationality or knowing as such. This is rationality that does not shy away from being called a science and that refuses to make of philosophy a discourse whose only meaning consists of declaring its own impossibility.

Faktum, Faktisch, Faktizität

➤ ANXIETY, DASEIN, ERLEBEN, LEIB, PROPERTY

Fichte's neologism did not survive him. Instead, the Kantian term *Faktum*, which it had been meant to clarify and replace, was subject to significant transformations, first by its passage from German to another Germanic language—Danish—and then through the development of two derived terms: *faktisch* and *Faktizität*. These transplants and modifications of the vocabulary expanded the scope and practical application of the "fact of pure reason" to religious and existential registers not hitherto included.

I. Faktum, from German to Danish: Kierkegaard

For Fichte the *Tathandlung*, signifying simultaneously event, product, and object of knowledge, refers to a form of history of the free and active subject. It is precisely this history that transforms the simple *Tatsache* into the *Tathandlung* of the originary subject. In his reflections on the object of faith, Kierkegaard simplifies and brings this development of thought to its conclusion by distinguishing two kinds of facts:

> Every historical fact is only a relative fact, and therefore it is entirely appropriate for the relative power, time, to decide the relative fates of people with respect to contemporaneity. More it is not, and only puerility and stupidity can make it the absolute by overestimation.

> (Kierkegaard, *Philosophical Fragments*, 99)

"The simple historical fact" is relative to those who exist at the same time, to its contemporaries—in order to establish it, one must either have been its contemporary or trust those who were. The "absolute fact" (*absolut Faktum*, ibid.), on the other hand, even if it takes place in time, is not relative to time insofar as it is "*declinable* in all instances of life" (ibid.) and remains constant despite the multiplicity of relations in time. These two facts are historical but can be distinguished from each other.

> If the fact of which we speak were a simple historical fact, the historiographer's scrupulous accuracy would be of great importance. . . . The heart of the matter is the historical fact that the god has been in human form, and the other historical details are not even as important as they would be if the subject were a human being instead of the god.

> (Ibid., 103)

There is a third type of fact different from either of these, the "eternal fact" (*evigt Faktum*), on which Kierkegaard ironically remarks:

> Er hiint Faktum et evigt Faktum, saa er enhver Tid det lige nær; men vel at mærke ikke i Troen; . . . det er derfor kun en Accommodation til en mindre correct Sprogbrug, at jeg benytter det Ord : Faktum, der er hentet fra det Historiske.

> (If that fact is an eternal fact, then every age is equally close to it—but please note, not in faith, for faith and the historical are entirely commensurate, and thus it is only an accommodation to a less correct use of language for me to use the word "fact," which is taken from the historical.)

> (Ibid., 99)

If Kierkegaard can only use the word *Faktum* without recourse to another word, it is because the Scandinavian languages do not contain the doublet *Tatsache/Faktum*. But this apparent poverty of the Scandinavian lexicon is in fact an opportunity for Kierkegaard. If there is only one word to designate the historical fact and the absolute fact, it is because they are both historical as facts. The requirements of language overturn previously established classifications. In order to account for the absolute fact, there is no need to leap out of time into eternity, to conceive of an eternal fact, as did Kant and all the subsequent fathers of the Lutheran church. One needs instead to think through the paradox of a fact that is both historical and absolute, all the while adhering to the intelligence of a language. The *Faktum* of reason and the *Tathandlung* of Fichte are ironically consigned to the excesses of the historicity of the fact in relation to the a priori. Historical facts are not to be seen in the light of the a priori but in the light of religious fact, which is to say, in the light of an event that continues to occur. What is at issue is not a return to formal conditions, but the distinction between two types of fact, two meanings of the word "history."

II. *Faktisch* and *Faktizität*: Husserl and Heidegger

Under the influence of Kierkegaard, the young Heidegger sought to give a philosophical statute to this idea of the absolute fact, by opposing it to the concept of the positive fact—which led to the concept of *faktishes Leben* and of *Faktizität*:

> We think of the fact as a particular, as opposed to the genre or species. The

fact is thus on one side in relation to another. Facts are projected into a schema imposed on them, placed in an ordered relation. In this objectivizing concept of the factual, its relation to meaning becomes a false problem. . . . The factual must be understood as *expression*. Once one considers factual life in this manner, it no longer raises old false problems, of which individuation is also an example. The facts of life themselves are not sitting one next to another like stones.

> (Heidegger, *Gesamtausgabe*, 58: 256–57)

Like Fichte, Heidegger gives up on the positivity of fact in the hopes of untangling the *aporia* of fact and essence in Husserl.

In the *Ideen* 1 (§2–3), Husserl had indeed defined the fact (*Faktum*) in its difference from the essence (*Wesen*). The fact is what could be otherwise. The essence could not be otherwise. A true religion is called true only in its relation to the unvarying essence of religion: It remains just as relative, for it is not the religion that is true, it is a true religion. The historical relativity of facts is not opposed to the essence, which instead prescribes its meaning. But how is the essence itself to be discovered? The answer is a surprise: on the basis of the fact (*Faktum*) as example. The fact as relative gains its meaning only from the essence as absolute, but this absolute essence is drawn from the fact. What else can be said about the essence? It is accessible in its own mode of being given as is a fact. But if the essence contains nothing of the fact, how can it be given?

It is important to note that Heidegger transforms "fact/essence" into "factual/facticity." This transformation of gnosis into an existential problematic affects three essential points:

1. The contestation of objective formal logic. "This 'something or another' of factical experience . . . has nothing to do with the 'something or another' of formal logic (Heidegger, *Gesamtausgabe*, 58: 106–7, *Basic Problems of Phenomenology*, chap. 2, paragraph 24 B). "'Factical' does not mean naturally real or causally determined, nor does it mean real in the sense of a thing. The concept 'factical' may not be interpreted from certain epistemological presuppositions, but can be made intelligible only from the concept of the historical" (Heidegger, *Phenomenology of Religious Life*). Factical life, discovered through the destruction of the fact as construed by

formal objective logic, must therefore be thought of with the help of a different logic, which Heidegger calls "formal indicative."

2. The affirmation of a direct tie between fact and meaning. "The factual must be understood as *expression*" (*Gesamtsaugabe*, 58: 257, *Basic Problems of Phenomenology*); "That which concerns life reveals itself in a certain manner" (ibid. Part I, chap. 2, paragraph 11a; *Gesamtausgabe*, 58: 49–50); "Life . . . is what it is only as a form of concrete meaning" (*Basic Problems of Phenomenology*, app. A I.5; *Gesamtausgabe*, 58: 148). *Faktisch* life presents itself as an expression, this expression being what one usually calls a "situation," which holds the ties of meaning, the contexts of meaning, that shape the dimension in which the facts of life need to be considered. "The 'expressions' are always to be taken as a 'cluster of relations, of sense-complexes'" (*Gesamtausgabe*, 60: 134), and this is why "factive life is emotional, not theoretical" (App. B; *Gesamtausgabe*, 58: 220).

3. The ambivalence or mobility proper to factive life: the first and only fact is that life is at every moment in charge of itself. Life seeks to discharge this charge in a "ready-made" interpretation, or else it takes on the burden in the anxiety of the subject itself. In an explicit reference to Pascal, Heidegger says, "The mobility of factive life is to be interpreted, to first be described as *anxiety*" (*Gesamtausgabe*, 60: 93). But Saint Augustine also provides a reference: "*Molestia*—the endangerment of Having-of-Oneself" (Heidegger, *Phenomenology of Religious Life*, 182; *Gesamtausgabe*, 60: 244). This weight is specific to factive life, to life insofar as it is factive, that is to say, in its facticity: "The

being-there of our own *Dasein* is what it is precisely and only in its temporally particular 'there,' its being 'there' for a while" (*Ontology*; *Gesamtausgabe*, 63: 29), whence the tendency of factive life to "indifference" or "self-sufficiency," as opposed to the tendency for "anxiety" in the "having-one's-self." Another opposition is also rooted in facticity, the opposition between proper and improper, between *eigentlich* and *uneigentlich*. One could say in a play on words that the question is whether life is actually "in fact."

The *Faktizität* of life is thus simultaneously a dimension of meaning, a lability induced by the facticity that weighs on life, and the demand for a logic other than the formal and objective. These analyses of the young Heidegger reappear in the vocabulary of *Being and Time* (§29 and §38):

Existence is not founded on anything, (it is thrown), it does not have an endpoint (it is understood factively, that is to say, at each instant), and this double movement describes the lability proper to factive life, a dimension of meaning that does not assign a final point to life and only roots itself in the primary fact that life has to do with itself before it has anything to do with something else. "Facticity is not the factuality of the *factum brutum* of something present-at-hand, but a characteristic of *Dasein*'s Being—one which has been taken up into existence, even if proximally it has been thrust aside."

(Heidegger, *Being and Time*, trans. Macquarrie and Robinson, 174)

The very precise meanings that Heidegger assigns to *Faktizität* and *faktisch,* and their imbrication in a series of complex oppositions in German (*Faktizität* versus *Tatsache,*

versus *Faktum*, versus *Wesen*) make them especially difficult to translate. Optimally, one would devise a way to render the conceptual strangeness of these technical terms, which in German remain direct borrowings from Latin and thus outline a German history of the Latin *factum*.

TERM

FRENCH	*terme*
GERMAN	*Begriff*
GREEK	*horos* [ὅρος]
LATIN	*terminus, nomen*

➤ *CONCEPT* [BEGRIFF, CONCEPTUS], INTENTION, LOGOS, MERKMAL, PRÉDICABLE, PREDICATION, PROPOSITION, SIGN, SUBJECT, *TO BE*, TRUTH, WORD

In the vocabulary of the Scholastic *Organon*, the Latin expression *terminus*, "term," designates an element of the *propositio*, the "proposition": this is what delimits a proposition, like the endpoint of a line. Rendering the Greek *horos* [ὅρος] as *terminus* did not raise major issues of translation for a reader of medieval texts on logic. The various classical/modern avatars of the elementary constituents of a proposition in the original Aristotelian sense of the term serve as markers for changes in epistemes, corresponding to changes in the understanding of the very object of logic. Characteristic of the Aristotelian form of the enunciation/proposition is a structure that is sometimes called binary, in which two terms, respectively called the subject (Gr. *hupokeimenon* [ὑποκείμενον]) and the predicate (Gr. *katêgorêma* [κατηγόρημα]) are linked or separated by a copula, itself affirmative/negative. This structure finds lexical form in the verb "to be" (which means that one has in fact three terms—subject, copula, predicate—in what would be more accurately called a ternary form, despite the affirmations of Kant or Hegel). In the classical period various rivals for the term "term" emerge, with the effect of moving away from the sense of enunciation/proposition and toward the idea of judgment. The principal rivals were "noun" (*nom*) and "concept" (*Begriff*). The fate of *terminus/horos* is an indication of the pendulum swing that starts in the Middle Ages and accelerates in the classical age, between two conceptions of the object of logic. "Noun" is a semiotic conception in which the terms are treated as signs (where *logica* is presented as a *scientia sermocinalis* [the science of discourse/language]). "Concept" is a more intentionalist than Thomist conception (even if Thomas remains the "great transmitter" of Scholastic language, from the Germany of the *Frühaufklarung* to present-day Germany). In the latter case terms are treated as concepts, making *logica* a "science of the secondary intentions that are added to the first intentions" (see INTENTION). This bears on the diverse "operations of the intellect"—the apprehension of simple quiddities, the composition/division of "terms" that contribute to a (propositional) judgment, and the forms of "reasoning" (Lat. *ratiocinatio remota*), understood as a syllogistic chain of judgments that are the products of the "second operation of the intellect." The fate of the Aristotelian "term" thus appears in the first analysis to be inherently caught up in a perpetual oscillation between sign and concept, between "nominalism" and "conceptualism." Yet its movement cannot be reduced to this simple oscillation. Other forces affect its semantic drift, from one translation to another. They include the Hegelian exposition—following in Kant's footsteps—of the ternary formal structure of the "Aristotelian" proposition, and the modern and contemporary critique of the "copula" whose confusion of functions is supposed to include, "on some occasions judgments of existence, on other occasions the inherence of a predicate within a subject, sometimes the membership of an individual in a class, at other times the inclusion of a class into a higher-order class, and sometimes the equivalence of a noun and its description, or the equivalence of a term and its definition" (Rougier, *La Métaphysique et le langage*). The history of the term "term" is also a history of the copula, and thus a history of the oppositions at work in the apophantic Aristotelian *logos*.

I. *Terminus* in Medieval Logic

In general, medieval authors followed the indications given by Aristotle in the *Prior Analytics* (24b 16–18): "I call the term that which resolves the premise [Ὅρον δὲ καλῶ εἰς ὃν διαλύεται ἡ πρότασις], that is to say the predicate and the subject of its affirmation [οἷον τό τε κατηγορούμενον καὶ τὸ καθ' οὗ κατηγορεῖται]; whether joined by being or separated by non-being [προστιθεμένου τοῦ εἶναι ἢ μὴ εἶναι]." This was translated by Boethius as: "Terminus vero voco in quem resolvitur propositio, ut praedicatum et de quo praedicatur, vel appositio vel divisio esse et non esse." The direction of *horos* [ὅρος] is obvious (Fr. *obvie*): it is the limit, which delimits a proposition (*protasis* [πρότασις] or *diastêma* [διάστημα]), like the endpoint of a line.

Aside from the obvious senses of "final term," "end" (*finis*), and "extremity," which explain the existence of periphrases such as *extra terminum* to designate the infinite, the word *terminus* has three meanings in medieval logic. Two of them are common:

1. the minimal syntactical/semantic unit that resolves a proposition: "the term is that which results from the analysis of a proposition, that is to say, a subject and predicate" (terminus est in quem resolvitur propositio ut subjectum et praedicatum) (Peter of Spain, *Tractatus*, 5–6);
2. the fundamental semantic unit in logic, as opposed to the noun or verb as grammatical units, which carries different couplets of difference depending on the competence of the logician: universal/particular, abstract/concrete, categorematic/syncategorematic, etc.

Finally a third use, rarer than the other two, makes the *terminus* a synonym for *definitio*; "the [objects] whose terms or definitions are different are themselves different" (quorum termini sive definitiones sunt differentes, ipsa quoque sunt differentia) (19–20). Aside from *terminus*, the lexicon of medieval logic also includes *extremum*. *Extremum* presents the same ambiguity as *subjectum*: most of the time, the referent of the word is that element through which the proposition can be analyzed and which is targeted by the vocable, but sometimes it is also or even only the object referred to by the proposition that is in question. This is especially the case in the various formulations of the rules regarding the truth of a proposition that stipulate that in "matters of nature" (*en matière naturelle*), "existence of the extremes is not required." The expression *existential extremorum* is thus partially equivalent to that of *constantia subjecti* (see SUBJECT, II). The only difference between the two is that the former extends to both the signified/referent of the subject as well as the predicate, while the latter is limited to only the signified/referent of the subject. A good example of this usage can be found in this passage from a sophism attributed to Robert Kilwardby (cf. "Omnis homo de necessitate est animal"; ms. Erfurt, *Amplon.* Q328, f. 8rb–10rb): "I say that the propositions 'every man is necessarily animal' [omins homo de necessitate est animal] and 'man is [an] animal' [homo est animal] are true, for in matters of nature the truth of a proposition does not require

the existence of its terms in act [quoniam ad veritatem propositionis in naturali material non exigitur existential extremorum actu]. Indeed, the concepts of man and animal are naturally coherent [naturaliter coherentes]; thus, whether or not it is any one man in question, as long as the speech of *man* absolutely signifies that 'Man' is speaking, 'Animal' shall be understood to be within the speaker [dummodo hec vox "homo" hominem significet simpliciter in ipso intelligitur animal]."

Terminus appears in several thematic networks. The first contains the distinction among "written term"/"spoken term"/"mental term," which touches upon the Augustinian notion of "mental verb" on several points. Following the distinction between three kinds of propositions—written, spoken, mental—taken from the first (16a2–3: "the sounds made by the voice are symbols of states of mind [τὰ ἐν τῇ φωνῇ τῶν ἐν τῇ ψυχῇ παθημάτων σύμβολα]") and the last (24b 1–2: the affirmations and negations put forth by the voice [αἱ ἐν τῇ φωνῇ καταφάσεις καὶ ἀποφάσεις], are symbols of those in the mind [σύμβολα τῶν ἐν τῇ ψυχῇ]") chapters of *De interpretatione*, certain medieval logicians accepted the idea of "mental terms." This is the case, for example, of Boethius, who is said to have handed down the notion from Porphyrius. In his first *Commentary on the Perihermeneias*, he presents the set of ideas as a doctrine of the *Peripatos*, insisting on the existence of "nouns and verbs" manipulated "in the silence of the mind" (*In Aristotelis De interpretatione* [RT: *PL*, vol. 64, col. 407B]):

> It is said that the peripatetics held that there are three kinds of discourse: one which is written with letter, one which is put forward with the voice, and the other which is articulated by the mind. If there are three kinds of discourse, there is no doubt that there are also three parts of discourse. Thus, since noun and verb are the principal parts of discourse, there are distinct written nouns and verbs, other spoken nouns and verbs, as well as those that one moves about silently in the mind.

> (Dictum est tres esse apud Peripateticos orationes, unam quae litteris scriberetur, aliam quae proferretur in voce, tertiam quae conjungeretur in animo. Quod si tres orationes sunt, partes quoque orationes esse triplices nulla dubitatio est. Quare quoniam verbum et nomen principaliter orationes partes sunt, erunt alia verba quae scribantur, alia quae dicantur, aliae quae tacita mente tractentur.)

The notion of "mental nouns" and "mental verbs" is a first step in the direction of a "mental language," even if the Porphyro-Boethian thesis does not conform to all the requirements of a theory of "mentalese," such as that which William of Ockham seems to be the first to have proposed (cf. Panaccio, *Le Discours intérieur*).

A second network carried by *terminus* is the distinction, based on scattered sources in Priscien and Boethius, between categorema and syncategorema, often expressed in Paris, if not in Oxford (where the word *dictio* and its derivatives, such as *dictions officials*, official terms, are equally prevalent), as a distinction between "categoremic terms" and "syncategoremic terms." In this approach, called "terminist," the notions of categoremic and syncategoremic terms are applied to various kinds of syntactic-semantic analyses. There is a modeling of the meaning of sentences by virtue of the relations of *inclusio* ("scope" in modern logic, in French, *champ* and *portée*) that exist between categorema and syncategorema or among syncategorema themselves. And there are theories of the "generation of discourse" (*generatio sermonis*) that seek to account not simply for the passage of thought to written or oral expression, but also for the formation of thought itself structured like a language. Some authors in this school use *signs* (*signa*) to designate the categoremas of quantity exclusively (see SIGN), the medieval form of quantifiers. Or they will use the term less restrictively to refer to all categoremas. These terminist distinctions, along with their discrepant applications, will reappear in Leibniz.

There is yet a third network carried by "term": that of the syntactic-semantic properties of categoremic terms understood within propositional contexts—the *proprietates terminorum*—whose analysis constitutes the most notable contribution of medieval logic to the history of logic. When they are inserted in a specific context, terms that carry signification acquire new semantic properties. Distinctions are drawn among the *suppositio* (reference; see SUPPOSITION)*,* the *appellatio* (denotation or reference solely to that which exists), the *copulatio* (a syntactic-semantic property of verbs and adjectives), and the *relatio* (anaphora). As employed by medieval logicians, the *terminus* is radically set off from the *nomen* and the *verbum*, which are reserved for the use of grammarians. The Platonic theory of the primordial interconnections of nouns and verbs, which is authentically binary, is expelled from logic in favor of the falsely binary theory of Aristotle, founded on the pairing of subject-predicate + copula. Even if the distinction between substantive and adjective, apprehended ontologically, is present in the analysis of various types of *suppositiones*, the term has more in common with the sign than with the *nomen.* At least for a while, it does not precisely correspond to the concept (until Occam's redefinition of the concept as a natural sign as a term of a mental language and referential act). This primacy of the *terminus/signum* over the *terminus/intentio/conceptus* is evident by virtue of the fact that the authors, principally theologians or intentionalists (who put forth concepts as the elementary units of meaning within a theory of judgment), experience certain difficulties in taking full advantage of the novelties of the *Logica moderna.* The increasing power of the concept in relation to the term/sign and to the *nomen* marks the beginning of one of the great debates of the classical age. But an unfortunate ambiguity weighs down the lexicon from one end to the other. It goes back to the restricted use of "sign," starting in the Middle Ages, as an equivalent for syncategorema or operator. As a result, for adherents of the binary interpretation of the proposition, only subject and predicate could be considered "terms," while the copula was simply a "sign."

II. *Signum, Terminus, Nomen* in the Classical Age

The proximity of meanings among "sign," "term," and "noun" is everywhere evident in the philosophical practice of the classical age. In the following passage, for example, Leibniz defines signification as the relationship between *nomen* and *terminus*, the latter also identified with *notio*:

By "term" I do not mean a noun but rather a concept, that is to say, that which is signified by a noun, which could also be called "notion" or "idea."

(Per terminum non intelligo nomen sed conceptum seu id quod nomine significatur, possis et dicere notionem, ideam.)

(Specimen calculi universalis)

This highly conceptual iteration of terminism is specific to Leibniz. It is clearly a new synthesis of several philosophical instruments, drawn from rather different traditions, but which constitute the common ground of logical and linguistic positions that are themselves occasionally contradictory. Since different medieval criteria enable the distinction between categorema and syncategorema, Leibniz retains the functional criterion—the being or non-being of the subject or predicate—whence this other definition of term:

I call everything that exists on its own a TERM, that is, everything that can be a subject or predicate of a proposition; for example: *man, chimera. . . .* A term is either possible or impossible. But what is POSSIBLE is that which can be conceived distinctly, without contradiction.

(Ibid.)

Leibniz no longer speaks of "syncategorematic terms." He refers instead to syncategorema using the medieval term *signum* (see SIGN). The *signum* is thus considered a prefix of the *terminus* or of the entire *propositio.* One also comes across *signum* in the vocabulary of mathematics. The French algebraics of the School of Viète spoke of the "sign of affectation" "+" or "-" (cf. Vaulézard, *La Nouvelle algèbre de M. Viète*) When this use became impossible by its proximity to the logical acceptation, the authors subsequently employed the Latin *nota* or the French *marque* (see MERKMAL). These multiple overlays and contaminations are linked, up to a point, to effects of translation. It is necessary in French, for example, to put *terme* in quotation marks when translating passages of Porphyry's *Introduction* (or *Isagoge*) to the *Logical Categories* of Aristotle in order to avoid recourse to words like *chose* (thing), *nom* (name or noun), and *concept* (concept), all of which are absent from the original Greek. To not do so would run the risk of placing Porphyrian definitions of species and kind under the rubric of "realism," "nominalism," or "conceptualism."

The word *terme* is also often added to translations into French during the classical age to render the generality and indeterminacy of the Latin neuter pronoun or the substantive adjective. For example, when Descartes writes in the *Regulae,* "Item quaedam interdum sunt vere magis absoluta quam alia, sed nondum tamen omnium maxime," the most scrupulous translator cannot avoid, "Et aussi certains *termes* sont véritablement plus absolus que d'autres, mais pas encore les plus absolus de tous" (Fr. trans. Marion) (In addition, some terms are truly more absolute than others, but yet not the most absolute of all). This habit may run the risk of surreptitiously conferring a logical background or underpinning that the author may not have intended. But on the other hand, it has the advantage of neutralizing as much as possible the term *terme* in French, relative to its cognitive

interpretations. This is not the case in the German logical treatises, starting with Christian Thomasius and Christian Wolff. In recent translations from Latin to German, *terminus* is sometimes rendered as *Begriff*, which is partly justified by history (the importation of Latin vocabulary into the logic of the *Frühaufklärung*), but which poses certain problems of intelligibility. In the Leibniz sentence quoted above, it is impossible to identify *Begriff* with *terminus* at the lexical level, even though it may seem appropriate at the level of the informational content carried by the statement. For if one makes this identification along with the equivalence of *notio/ Begriff*, one ends up with the statement that "Per terminum (*Begriff*) non intelligo nomen sed conceptum (*Begriff*), seu id quod nominee significatur, possis et dicere notionem (*Begriff*) ideam" (By "term" [*Begriff*] I understand not the word but the concept [*Begriff*], that is, what is signified by the word, for which one could also say "notion" or "idea" [*Begriff*]).

One cannot properly understand the constitutive conditions of the German language without considering it within a very general slide from terminism in the direction of conceptualism. In the German logicians who still wrote in Latin, in particular in Jungius, the tripartite Scholastic division of the *terminus* into mental, written, and spoken terms gave way to a dualistic distinction, according to which the *oratio* is considered either as an internal or as an external reality in relation to the mind. No doubt because he inherits this distinction, Jungius has a tendency to abandon the *terminus* in favor of the *notio*. He makes the analysis of notions ("De notionibus") the first chapter of the *Logica*, reinterpreting the traditional plan that has been generally if not exclusively accepted since the commentary of Thomas Aquinas based on the three operations of mind:

1. "intelligentia indivisibulium sive incomplexorum" (the understanding of indivisible or non-complex things)
2. "compositio vel divisio intellectus" (the intellect's action of combining or dividing)
3. "discurrere ab uno in aliud" (to advance from one thing to another [i.e., to go from what is known toward what is unknown])

(Aristotelis libros posteriorum analyticorum expositio [Commentary on the *Posterior Analytics* of Aristotle], *Proemium*, 4)

In the *Logica Hamburgensis* of 1638, these three operations become "notio, enuntiatio et dianoia sive discursus" (*Prologus*, §1–7), which in an author so concerned with historical accuracy, clearly indicate that the understanding of the incomplexes (*termini*) should henceforth be interpreted as the science of notions. The *notiones* are also the object of a separate study, entitled *Disputationes noematicae*, for the ancients, including Aristotle himself did not sufficiently develop this part of the *Organon*, which should not consist only of the study of predicaments. One of the most common errors in relation to the *notiones/noemata* (the text of Jungius constantly reminds the reader of this identity) consists of neglecting the cognitive dimension of the foundation of logic, as is the case when the words used by logicians are taken as having direct reference to things. According to the thinker from Hamburg, this is the principal error of logicians (which is a

reminder of the approach of the school of Ockham). For the nouns that occur in the phrases of calculation are the names of notions, and to claim otherwise would be to confuse the primary and secondary objects of logic.

The Latin word *terminus* still appears in the German of Thomasius, (e.g., in the *Einleitung zu der Vernunftlehre* [Introduction to the theory of reason]), although it is much less frequent or important than in Leibniz. It appears to be strictly limited to the technical vocabulary of syllogistics in the *Philosophisches Lexicon* of Johann Georg Walch: the expression *Ideen oder Termini* appears in the article "Syllogismus," itself completed by a short entry on "Termini Syllogismi." In Wolff's *Deutsche Logik*, the term has completely disappeared and been replaced with the concept of things (*von den Begriffen der Dinge*) and the usage of words (*von dem Gebrauche der Worte*) as if the elision of *terminus* resulted in the split of the first level of logic, which had traditionally been considered as one, into two different chapters (one more cognitive, the other more semantic).

Similar transformations occur in the corresponding passages from Latin to French and from Latin to English. But there are also differences, whether in relation to Hobbes's treatise on *computatio* or the *Logique* of Port-Royal. Whereas the very base of the edifice was contaminated by the *notiones* in Jungius, in these latter writers the whole construction is devoted to the mode of being of the idea in language, even if it does not build up a complete doctrine of the idea. For the idea enters into the signification of words, as "there would be a contradiction between saying that I know what I am saying when I say a word and my not conceiving of anything when pronouncing the very sound of the word" (*Logique*, I, I). As a general cognitive event, the Aristotelian-Thomistic "constituit intellectum" is clarified by the relation of the word to the idea. And the details of this relation account for the amphibology of signification, according to whether it is from one to one, from one to several, or from several to one.

■ See Box 1.

If the term is thus excluded from the first part of logic for the sake of the sign, this does not mean that it is reintroduced into the second part as an element of the proposition. For the latter is analyzed according to grammatical

Signifying/the constitution of a thought: Aristotle, Thomas Aquinas, Port-Royal

➤ SENSE

In the *De interpretatione*, 3.16b 19–25, Aristotle writes,

> When uttered just by itself a verb is a name and signifies something.

[αὐτὰ μὲν οὖν καθ' αὑτὰ λεγόμενα τὰ ῥήματα ὀνόματά ἐστι καὶ σημαίνει τι.]

This line has been one of the fundamental starting points of a philosophy of signification. The passage bears principally on verbs: *rhêmata* [ῥήματα] must be considered a kind of noun (*onoma* [ὄνομα]) insofar as they too signify something. In fact, Aristotle continues, in a kind of parenthetical remark, meaning is produced when the speaker arrests his intellection:

> [T]he speaker arrests his thought and the hearer pauses.

[ἵστησι γὰρ ὁ λέγων τὴν διάνοιαν, καὶ ὁ ἀκούσας ἠρέμησεν.]

The Greek phrase is rendered into Latin by Boethius as follows:

> Ipsa quidem secundum se dicta verba nomina sunt et significant aliquid—constituit enim qui dicit intellectum, et qui audit quiescit.
>
> (*Aristoteles latinus,* II, 1–2)

Despite what the translation might lead one to think, the Latin commentary (RT: *PL,* vol. 64, cols. 309–10) indicates that Boethius took the dynamic metaphor of movement and rest quite seriously, and that he took his own *constituere* as a "fixing in place" or "stopping," which is rendered rather well in Ackrill's English translation, here reproduced with the phrase in its entirety:

> When uttered just by itself a verb is a name and signifies something—the speaker arrests his thought and the hearer pauses—but it does not yet signify whether it is or not.

See PROPOSITION.

When we use a noun, Aristotle specifies through paraphrase, the thinking of the listener is put into motion (*inchoat*) along with our enunciation (*prolatio*). When I say, for example, "Hippocentaurus," the thoughts of the listener start with the first syllable and come into full effect only when the word has been completely pronounced. Verbs and nouns have in common this power of generating a kind of anxiety, which is only released upon understanding their meaning. Signification is nothing more than this effect: the possibility of being able to rest (*conquiescere*) on something completed, of operating in consecutive order on the anxiety and repose of the listener. According to Boethius, the "constituit qui dicit intellectum" of *De interpretatione* sets out a process of meaning-analysis that applies equally to the utterance of a verb and to a proposition, for it is only when one has understood the entire proposition, "Socrates ambulat" (Socrates walks), for instance, that the listener can settle fully on a completed signification.

Thus in Boethius's commentary, a wide interpretation of the *constituit intellectum* comes to light, but this is not without problems of its own. Everything happens in fact as if the relative positions of the parts of the discourse enabled a double analysis, both ascending and descending, depending on whether one stresses the relations of words to meanings or the relation of utterances to the truth. In the first case, the relations of words to meanings, every *oratio* or part thereof is meaningful when it answers to the *constituit intellectum* (that which establishes the understanding of a thing). The basic atomic unit is thus the *nomen*, insofar as the subdivisions within a word itself are not meaningful. The horizon of signification, on the other hand, is more or less wide open as a result of the multiplicity of possibilities afforded by the infinite combinatorics in the composition of words. In the end, it can be said of an entire discourse that its completion has produced a thought process.

According to the second case, the relation of utterances to truth, what signifies is that which is capable of telling things as

(continued)

(continued)

they are, that is, saying if they are true or false. Here, the basic atomic element is the *propositio*, defined as the smallest part of the *oratio* that can carry the predicate of truth. A closer analysis still leads to the *terminus* as part of the *propositio*. But on this point, except for the specific case of Leibniz, the *terminus* is not generally qualified as true or false, such that the analysis of discourse into categorema and syncategorema remains a proto-analysis, or rather, in Carnap's words, a quasi-analysis. The concurrence of these two axes (*vox significativa, oratio/terminus, propositio vera*) has been the starting point for an extensive debate on the proper scope of the "constituit intellectum." Thomas Aquinas notes, for example, that the *nomen* cannot be rigorously considered as significant in itself according to the criterion of movement and repose of the mind. If, for example, the speaker says "*homo*" (man), the mind of the listener remains, so to speak, in suspense until he knows that what is being said is *de homine* (of or about man); and likewise, when he hears only the verb *currit* (to run), his mind will not come to rest until he knows the answer to the question "Who is being spoken about?" (Thomas Aquinas, *In Peri hermeneias*, L I, 1. V, 68). The criterion traditionally applied to signification thus seems paradoxically to preclude any philosophy of the sign in favor of a hypothetical *oratio perfecta* (a sentence that yields a complete understanding in the mind of the listener), unless it is itself supported by another supplementary distinction that establishes the orders of discourse. This is the path undertaken by Thomas. Referring to the division of the *intellectio* according to the three operations of the mind, he affirms

that the *constituit intellectum* is only pertinent within the limits of an apprehension of the *intellectio* by the *concipere* (conception), but that it must be abandoned at the higher levels of the *divisio* (division) and *compositio* (composition), which the classical age will call "judgment." Just as the analysis of propositions through attention to terms is necessary to elucidate the concept of truth (even though the terms themselves are neither true nor false), so the grasping of meaning within a phrase does not entail any generalization in the use of the criterion of *constituit intellectum* that would apply only to their constituent parts. One can say that the *nomen* promotes signification (and this is true of all words that signify) as conception because at this level it effectively produces a state of rest. But at the same time it ignites anxiety in the subsequent sequence of the composition (*In Peri hermeneias*, LI, I. V, 69). Signification and conception thus have a deep historic tie, and Alberto Coffa seems to have been truly inspired when he suggested a correction to Quine's aphorism to say, "Meanings are what concepts became when wedded to the word" (*The Semantic Tradition*).

These remarks also serve to clarify the treatment of signification as developed in the logic of Port-Royal. We know that Arnauld and Nicole followed the classic Thomist tripartition of operations of mind, but that they claimed to enrich it in a fourth chapter inspired by Descartes and devoted to method. It would be highly unlikely for the whole edifice not to suffer from such an addition *in extremis*. As far as the tradition was concerned, this would in effect remove the structuring capacities of the three operations for rationality in general. And as far as modernity was concerned, it proceeded as if method had not

been introduced by the author himself in the place of logic, in order to correct the excesses of his precepts and distinctions. But out of this double infidelity a new philosophical and Scholastic object would be born, giving rise to the conventionally accepted uses of *term* and *noun* or *name* in philosophy in the French language.

categories: nouns, pronouns, and verbs (cf. Hobbes, who defines the *propositio* as "a statement consisting of two coupled nouns [*oratio constans ex duobus* nominibus *copulates*]"; *Logica*, chap. 3, §2). Any search for the *terminus* as endpoint of the analysis of propositions will be in vain. The concurrence of the two traditional axes remains (*vox significativa, oratio/terminus, propositio vera*) but it is now split into two separate and largely asymmetrical functions: on the one hand a semantics whose closure is ensured metaphysically by the idea, on the other hand a relatively open syntax, whose role it is to expose the deep structure of enunciations. In French-language philosophy *terme* becomes a sort of free electron used here and there in multiple contexts, and which attests, at the very least in a negative way, to the different paths set out during the classical age toward the deconstruction of terminism.

III. Binary Form/Ternary Form; Kant, Hegel, Heidegger

As Kant knew nothing of the Middle Ages, he knew nothing of termism. His critical efforts were directed instead at the

"modern" definition of the judgment/proposition as the representation of a relation between two *concepts* ("I was never satisfied with the definition that logicians give to judgment in general, when they say that it is the representation of the relation between two *concepts*" [*Critique of Pure Reason* §19]). His own concern was to introduce an innovation that one might call a first form of ternary judgment. His discovery is in effect the "medium," unknown to his predecessors, in other words, the relation of concepts to the "originary synthetic unity of apperception." The term "medium" has a long history; first and foremost it is the "middle term" of Aristotelian syllogistics. But the Kantian medium of judgment is not the middle term of a syllogism, it is not exactly a term enabling the passage from (two) premises to a conclusion. This "third" (Ger. *Drittes*) is neither another "concept," nor an "addition" (see PREDICATION) but rather, self-consciousness itself as a "principle of affinity" binding subject and predicate within a *single* judgment (A 766, B 794). One also finds a ternary schema in Hegel, this time pushed to its paroxysm, with the

same intention of breaking with "classical" logic. The difference between the two readings lies in the fact that, for Hegel, the complete form of the proposition, what he calls the "universal form of reason" (*Wissenschaft der Logik*) does not consist in the simple judgment, but in the syllogism itself—albeit revised. By "syllogism" Hegel does not mean a chain of three predicative enunciations, but the "judgment according to its foundation." Thus a single enunciation that is "wholly contained within the universal proposition," as in the example used by Hegel of Socrates, "through the particularity of his being a man." In virtually any predicative syllogism one can speak of a "life" of "triplicity," which can be unpacked in terms of the "movement" of the middle term in its "unifying of the extremes." The "is" of the Hegelian proposition is thus not the "simple copula of judgment," the "*is* without spirit [*geistloses Ist*]" of classical logic (PREDICATION, Box 3), but is the "dialectical movement of the proposition itself" (*Phänomenologie des Geistes*), in a word, it is the *Aufhebung*, "suppression, elevation, conservation" (see AUFHEBEN). It is actually rather amazing that Kant and Hegel (to different degrees) criticize or claim to move beyond binarism in the analysis of the proposition that originates in Aristotle. The "invention of the middle term" (*inventio medii*), as elaborated by Avicenna or Albertus Magnus in the context of reflections on natural prophecy has a number of resonances with the idea of a syllogism as a "judgment according to its fundament." But most importantly, the Aristotelian interpretation of the *propositio* is eminently ternary—something for which modern logicians have reproached it ever since Frege.

■ See Box 2.

On a more positive note, Heidegger (*Sein und Zeit*, §44) maintains that the Aristotelian proposition is not limited to uniting two concepts. In his view Aristotelian propositions are

---

2

Science, natural prophecy, and "invention of the middle term" according to Avicenna

➤ INGENIUM, Box 1

According to Avicenna, the practice of syllogisms requires an aptitude for discovering the middle terms that are necessary for deduction. This aptitude is the capacity to identify with active intelligence. It is present in varying degrees. Some have it to a degree sufficient to be able to obtain something of this activated intelligence without much effort or training. They also have a second capacity, which the *Avicenna Latinus* starts by calling *subtilitas* (subtlety) and then *intellectus sanctus in habitu* (intellect in habitus; see INTELLECT). This *subtilitas* renders the Arabic *hads* [الحدس] (Bakos translates it as "intellectual intuition" [Fr. *intuition intellectuelle*]; Van Riet as "flash of intellectual intuition" [Fr. *éclair d'intuition intellectuelle*]). It is the same word—*subtilitas*—which occurs later in the text to render the Arabic *ḏakā'* [الذكاء]. The Arabic text says that "Intellectual intuition [*hads*] is an action by which the mind discovers the middle term on its own, and that wisdom [*ḏakā'*] is the faculty (*quwwa* [قوة]; Lat. *virtus*) of intellectual intuition." The Latin version adds a further complication by stating "ingenium autem est actus rationis, cujus propria vi invenitur medius terminus; subtilitas autem est supra ingenium" (intellectual intuition is an act of reason; by reason's own power is the middle term discovered; subtlety, however, is above intellectual intuition)—whereas the Arabic says something that should be closer to "*subtilitas est virtus ingenii*" (subtlety/wisdom is the faculty of intellectual intuition). Returning to the original meaning of the Arabic, in the passages where *hads* [الحدس] was initially rendered as *subtilitas*, *ingenium* (intellectual intuition) would

have been the closer term. Étienne Gilson, following the Latin as written, says that *subtilitas* is superior to *ingenium*. And this, in fact, is what the Latins thought as well (as shown in Gilson's chart of "*Les sources gréco-arabes de l'augustinisme avicennisant*" [The greco-arabic sources of Avicennian Augustinianism]). Assuming that what is at stake in the Avicennian notion of natural prophecy (what we might today call "science") is an aptitude for discovering large numbers of middle terms, we see that men can be categorized according to a quantitative aptitude (the breadth of invention) and a qualitative one (the speed of invention). This natural inequality among men finds its lower limit in those who have no *ingenium* at all, and its upper limit in those whose *ingenium* applies to all questions (or at least most of them) and who can apply this *ingenium* rapidly. The *Avicenna latinus* thus describes the highest workings of intelligence in the form of the man whose spirit is so sufficiently purified and at one with the principles of intelligibility that it is as if he were inspired (*inspirata*); a person whose intelligence (*ingenium*) would seem to be on fire (*accendatur*). He obtains an answer to all of his questions from the intelligence at work; he knows everything in an instant (*subito*), or at least almost instantly (*pene subito*). The answers to his questions (the Latin mentions only *quaestiones*) are powerfully impressed upon him (*firmiter impressas*), and not just as a simple probability. He apprehends all the necessary middle terms in the correct order, not as some blind belief (*probata*) but as rational certainty (*intelligibilia*—the Latin a poor rendition

of the Arabic). Indeed, "belief does not entail rational certainty when it is applied to things that are known only if their causes are known." This state is one of the modes (or conditions) of prophecy; a *virtus sancta* (sacred virtue), the highest of all human faculties. The theory of Avicenna will be taken up by Albertus Magnus, who makes the Avicinnian natural "prophet" the prototype of the man of science, capable of "prediction" (Fr. *prévision*) in the sublunar world.

THEMIS [θέμις] / DIKÊ [δίκη] / NOMOS [νόμος] (GREEK)

ENGLISH   rule, juridical norm, principle, procedure, justice, law
FRENCH   *règle, prescription, jugement, justice, loi*
GERMAN   *Gottheit der Recht, Ordnung*

➤ *DESTINY* [KÊR], *JUSTICE*, LAW, LEX, RIGHT/JUST/GOOD, and FAIR, GOD, *LIBERTY*, *OBLIGATION*, PARDON, POLIS, PRAVDA, VIRTÙ, WILL

The vocabulary that organizes the theories and practices of justice in ancient Greece changes a great deal from Homer to Aristotle, with a succession of expressions for "rule" or "law" that includes *themis* [θέμις] (or the plural *themistes* [θέμιστες]), then *thesmos* [θεσμός]—both drawn from the root **dhe-*, "lay down," which refers to external sources of authority and divine power—and finally, starting in the fifth century, *nomos* [νόμος], "division," which signals a spatial notion of the city. These terms are always complements to *dikê* [δίκη] and, in the classical age, to its cognates (*to dikaion* [τὸ δίκαιον], "the just"; *dikaiosunê* [δικαιοσύνη], "justice"), which clearly refer to the situation of judgment; the meaning of the former is, in fact, a "sentence." The other values attached to the word, such as "justice" (as a principle or a virtue), are constructed out of this institutional signification: the law is established through procedure and does not preexist it. As a decision (be it divine or human) whose purpose is to put an end to a conflict dividing the community, *dikê* does not designate (at least before the distinctions drawn by Aristotle) a sphere of law considered to be autonomous, but rather refers to the political, moral, religious, and juridical norms that have been negatively affected by such conflicts.

I. *Themis, Dikê*, and Traditional Formulas

Translations of the terms *themis, dikê*, and their cognates, which encompass the notion of "justice" in Greek, are often hesitant and controversial for reasons that are not limited to the particularly open polysemy of each. The difficulty derives instead from the fact that ancient authors (before Plato and Aristotle) did not develop any terminological explanations, and the meanings of these concepts of law are only available through their repeated reuse of traditional syntagmatic formulas. It is this frozen quality of poetic diction (the only medium of a public reflection on the law) that explains that real juridical innovations resulted in a sudden change in terminology (whereas the vocabulary of law is generally more stable in other cultures).

In the epic poets (Homer, Hesiod, eighth century BCE), the law is apparently articulated through the couplet *themis/dikê* [θέμις/δίκη], that is to say, roughly, "rule, prescription" / "judgment." Later on, *dikê* (or rather the substantive adjective derived from this noun, "the just," *to dikaion* [τὸ δίκαιον]) is defined in its relation to other terms: in the seventh century BCE, the "codified rule" (for example, the "laws" of Dracon, around 621 BCE) is called the *thesmos* [θεσμός], a word from the same family as *themis*, which is absent, at least in this usage, from the epics; as *themis*, it refers back to the idea of a rule imposed from without, but it does not have the connotation of "tradition"—on the contrary, it often relates to new institutions. Starting at the end of the sixth century BCE in Athens (perhaps as part of the democratic reforms of Cleisthenes), *nomos* [νόμος] starts to be substituted for *thesmos*, before replacing it completely. In its political usage, *nomos*, unlike *thesmos*, seems to involve the idea of an order that is accepted by those who submit to it (cf. Ostwald, *Nomos*).

These radical changes correspond to differences in concepts and practices.

In his *Vocabulaire des institutions indo-européennes* (Vocabulary of Indo-European Institutions), Émile Benveniste examined the Homeric usages and compared them to languages related to Greek in order to expose the semantic kernels around which are organized the meanings of *themis* and *dikê* (RT: *Le vocabulaire des institutions indo-européennes*). Attached to the Indo-European root **dhe-*, "to put down, to place, to establish" (cf. Lat. *facere*, Fr. *faire*, Gr. *tithenai* [τιθέναι], "put down, make"), the feminine derivative *themis* marks the institution as the result of an act of external authority. It is the rule established by the gods, which Zeus, with his scepter, transmits to the kings (cf. *Iliad* 2.205ff., 9.97): "Coming face-to-face with Atrides Agamemnon / [Odysseus] relieved him of his fathers' royal scepter— / its power can never die—and grasping it tightly / off he strode to the ships of Argives armed in bronze (*Iliad* 2.214–17, trans. Fagles). These kings know the *themistes* [θέμιστες], that is to say, the collection of prescriptions that establish the rights and the duties of the individuals subject to them (the laws or sanctioned customs, the traditional sayings, the oracular proclamations). The application of these rules by the king is not simply automatic; it requires a decision, which may be good or bad, depending on whether it is linked to violence (*bia* [βία]): "When Zeus flings down his pelting, punishing rains—/ up in arms, furious, storming against those men / who brawl in the courts [*themistas* (θέμιστας)] and render crooked [*skolias* (σκολιάς)] judgments, / men who throw all rights to the winds with no regard / for the vengeful eyes of the gods" (*Iliad* 16.386–87, trans. Fagles, 16.457–61). The frequent use of the formulas "as is normally the case" (*hê themis estin* [ἡ θέμις ἐστίν]) or "it is not normal to . . ." (*ou themis esti* [οὐ θέμις ἐστί], followed by an infinitive) is based on this first meaning of a divine prescription guaranteed by the king.

Dikê refers to another order of activity (even if a *dikê* can also be described as "twisted," and even more often than the *themistes*). The word has the same root as the Latin *dicere*, "to say" (Fr. *dire*), and as the Greek *deiknunai* [δεικνύναι], "to show" (and comparisons to other Indo-European languages indicate that the latter meaning is the older one). Two interpretations are thus possible. If one starts from the "showing," the *dikê*, often accompanied by the epithet "right," would consist in designating a straight line, like a dividing line between two properties. This demonstration of visible evidence would be the original sense of "judgment," the meaning that *dikê* most often assumes during the archaic period (cf. Gagarin, *Early Greek Law*); on the other hand, if one wants to account for the passage using the sense of "saying" in Latin and with a word like *iudex* ("he who speaks the law"), then the supposed indexicality in the root will become a speech-act. Benveniste sees in *dikê* a formula that serves to "show what one should do," that "prescribes the norm" (RT: *Le vocabulaire des institutions indo-européennes*). From this comes one of the Homeric names for the judge: *dikaspolos* [δικασπόλος], or "he who guards over the formulas of the law."

■ See Box 1.

II. The Autonomization of the Sphere of Law

The classic question for interpretation is to determine when and under what conditions terms such as *themis* and *dikê*, which seem to have first referred to traditional forms validated by custom, acquired a fully juridical meaning. This required establishing at least some measure of autonomy for the sphere of law. The different interpretations have focused on two general historical lines of development that determined the juridical use of these words.

At the beginning of the twentieth century, *themis* and *dikê* were understood as embodying two forms of justice: the first, *themis*, was understood as applying to the archaic community of family (or "tribe"); the second, *dikê*, was considered to apply to an interfamilial justice on the way to becoming political organization. "That which is *themis*" is linked in its content to a "jurisdiction" internal to the tribe, whereas *dikê* as judgment (and not as simple arbitrage) requires an external authority (cf. Glotz, *La solidarité de la famille*; Gernet, *Recherches* and *Droit et société*; followed by RT: *Le vocabulaire*

1

Dikê

The word *dikê*, which is of the same family as *deiknunai*, "to show," has the primary meaning of "sentence" (as a "monstration" of the just, in an act of speech); from this derives *dikazein* [δικάζειν], "to judge." By extending this action to a procedure, it means "an action of justice" (from which comes "case argued, right claimed," in other words, the expected sentence given) and, more generally, "trial." In these institutional contexts, still linked to the temporal idea of a procedure that is meant to end in a decision, the word, unlike the Latin *ius*, does not designate a preexisting right that ought to be recognized. Instead, the rights are themselves defined by the judgment. The sense of "punishment," which it has in the fifth century (for example, in the expression *dikên didonai* [δίκην διδόναι], "to yield to what is due"), is derived from that of "verdict." When the word refers more abstractly to the principle of just action ("justice," as opposed to *hubris* [ὕβρις]), it is in fact still linked to procedure, providing it with a criterion of rectitude. In the classical period, this value is conveyed more by *dikaiosunê* [δικαιοσύνη] or *to dikaion* (in which *dikê* takes on a technical sense of "action of justice"). Another range of meanings derives from the notion of formula. It covers "usage" or habit, which occurs in archaic epic and in later archaizing prose (cf. *Odyssey* 11.218 for a "*dikê* of mortals," which prevents one from seizing the spirits of the dead). At stake is an imperative rule that determines the norms to follow. From here, one gets to the sense of "like" or "as" (Fr. *comme*) in comparisons taken on in the classical period by the accusative *dikên* [δίκην] accompanied by a genitive, as in *kunos dikên* [κυνὸς δίκην], "like a dog."

des institutions indo-européennes). This material and historical distinction does not, however, accord with what one reads in Homer and Hesiod, where the two terms are complementary, each with its own distinct function. Thus, the passage in the *Iliad* that refers to Zeus's rage at the kings "who had decided upon twisted *themistes*" (*Iliad* 16.387) is immediately followed by: "and who banished justice [*dikên*] without consideration for the vigilance of the gods" (16.388). Furthermore, the fully developed and most common form of the expression "who decided upon twisted *themistes*" is in fact "who decided *themistes* by means of twisted judgments [*dikai* (δίκαι)]" (or "rights," depending on the context). The core of the problem lies in establishing the relationship between these two uses of the same word, *dikê* (justice/judgments), in relation to the *themistes*.

Another weighty tendency of interpretation is to explain the development of archaic law in terms of the passage from orality to writing. According to this line of thought, there can be no law in the strict sense unless the rule can be identified as such, in its universal value and application ("whoever does *x* will be subject to *y*"), and unless it is independent of the traditional contexts of its enunciation, which are always specific and particular. This would only become possible with the institution of writing (which appeared in Greece in its alphabetical form in the first quarter of the eighth century, but became widespread later, at the same time that prose developed as distinct from oral poetry). In this context, the Homeric *themistes* and those in Hesiod cannot even designate an oral "code" (whose existence does not seem to be documented by other sources). They would be "norms of behavior," which the king, in a correct judgment, decides to apply (Gagarin, *Early Greek Law*). This stage would be considered as a "proto-legal" moment, in which the rules are not conceived as juridical rules, but in which there are recognized procedures (*dikai*) for the resolution of conflicts. On the cognitive level, this reconstruction, focused on the procedures and acts of language, leads one to defer until much later (in fact, not until Plato) the moment in which a general concept like "justice" not only can be extricated from each concrete situation in which speech about the law is uttered, but also and especially can be thematized in its universality (Havelock, *The Greek Concept of Justice*).

III. Reformulations and Displacements

A. Hesiod, or the expansion of norms

Though the general outlines of this framework can be accepted as stable (with a *dikê* that is first and foremost procedural in origin), one still needs to examine the workings of those Greek authors themselves on the notions and formulas that they inherited. The texts establish perspectives and theoretical positions antithetical to the received traditional terms. In an implicit and contradictory dialogue with the Homer of the *Iliad*, Hesiod reflects on the formulaic usage of the term *dikê* and proposes a new definition of the fundamental norm that governs the legitimacy of all norms or procedures in effect. According to the archaic poetic code, *dikê* is generally used in the plural, in the instrumental dative *dikais*, for "judgments": "deciding upon [*diakrinonta* (θιακρίνοντα)] prescriptions [*themistas* (θέμιστας)] by means

of straight and proper judgments [*itheiêisi dikêisin* (ἰθείῃσι δίκῃσιν)]" (*Theogony* 85–86)—or the opposite, "by means of twisted judgments" (*skoliêis . . . dikêis* [σκολιῆς . . . δίκης], *Works and Days* 221). The problem raised by this formulaic sentence concerns the criterion of rectitude that enables the king, in a pronouncement (*dikê*) adapted to a new situation, to apply a traditional prescription that is met by the general approval of his community. The goal of the right judgment is in fact to reestablish agreement where argument had taken over (law and politics are not differentiated). Other uses of *dikê*, this time in the singular, refer to the value or norm that is destroyed when judgments (*dikai*) are not correct: bad king-judges "banish justice [*dikên*]" (*Iliad* 16.388; cf. above).

Hesiod gives content to the norm of corrective judgment through his work on the poetic code. First, he seems to invent a formula that makes the expansion of the norm more explicit. The *Works and Days* opens with a request addressed to Zeus that defines the relation of the sovereign god to the king-judges: "You, with justice [*dikêi* (δίκῃ), in the dative singular], make judgments [*ithune themistas* (ἴθυνε θέμιστας)]. For my part, I will inform Perses of the confirmed truths" (9–10). A second-order corrective justice is superimposed over human justice in action. This statement presupposes that the king-judges themselves do not have at their disposal the principle of rectitude to inform their judgments. They must have recourse to a knowledge of Zeus and his justice, which only the poet can give them. This norm can be external, when a divine action is expected to reestablish it (in his other poem, the *Theogony*, Hesiod sets a framework for the validity of this norm when he makes Dikê the daughter of Zeus and a Titan, Themis; cf. below), or it can be internal as a criterion of just behavior (toward one's own: one's own family, people, inner circle, group of fellow citizens, or even the foreigners with whom one has contact). Its opposite, then, is *hubris* [ὕβρις], that is to say, transgression as "oppressive violence" (cf. Perpillou, *Recherches lexicales*). Morality and law are not distinguished (although Hesiod immediately asks that kings conform to "morality" in their judgments), and Aristotle will analyze this confusion in the uses of the expression *to dikaion* (the just) at the beginning of book 5 of the *Nicomachean Ethics*, in order to distinguish justice as properly juridical from the inclination to do what is just.

The debate that arises between the archaic Greek authors centers on the definition of this fundamental norm of behaviors and procedures. Hesiod does seem to take issue with Homer, for whom, in the *Iliad*, the correctness of a judgment is clearly evident (for example, in the judgment scene represented on Achilles's shield in book 18): the right and proper judgment is immediately praised by the community, which reunites as a result. The law, in Homer, can take care of itself, by respect for its own procedures. This implicit thesis has enormous influence over the course of the poem: the injustice of Agamemnon when he decides to take Achilles's captive Briseis for his own is apparent to all members of the Achaean warrior assembly; but this decision, which sets the whole account of the *Iliad* into motion, is necessary from a point of view that transcends the law and that, for Homer, is the very defining feature of reality, that is, Zeus's will to impose his own direction on history: as a result of this twisted judgment, he imposes both ruin on the Greeks and

the capture of Troy (which in an eschatological perspective leads to the end of the "age of heroes").

Hesiod, on the other hand, constructs a reality in which the principle of justice plays a determining role. This requires him to deduce the necessity of this norm from a general conception of things. The personification of Dikê (absent from Homer) and her genealogy enable this principle to take its proper place in the hierarchy of beings. By making Dikê one of the Horai (along with Eunomia, "well-ordered politics," and Eirene, "peace"), that is, one of the daughters of the Titan Themis and the Olympian Zeus (*Theogony*, 901–2; this union also produces the Moirai, or Fates), who determine the quality and length of existence of mortals, Hesiod indicates two things. Dikê has to do with human beings, not with the gods; and her birth reconciles the two previously antagonistic generations: the Titans (Chronos, Themis, Ocean, Tethys, etc.), and the Olympian gods (Zeus, Poseidon, Hades, Hera, etc.) who had succeeded them in the course of total war. As Heinz Wismann ("Propositions") has underscored, the differential norms of the Titans and the gods are mediated by those of Man. The Olympian order is characterized by a fixed and constraining differentiation of the regions of reality to ensure peace in the divine world (according to a spatial representation of the city). This world needs to be reconciled with the vitality and fecundity of the world of the Titans. Human beings enable this reconciliation because, by definition, they are subject to excess, since their survival depends at every instant on overcoming nothingness through their work. Order is not given to them, as it is to the gods, but must be imposed on their activity, in the form of justice.

B. Solon, or the violence of the legislator

In Hesiod, the law as a procedure for decisions that guarantee a good distribution of vital resources is thus drawn from a natural order that is already given. In fact, its criterion of rectitude lies in taking into account the necessity of work, the consequence of a general theodicy—from which comes the ambiguity in Hesiod's text between *dikê* as procedure and *dikê* as principle. The opposite position, already evident in Homer, of a right to self-legitimization will be developed later, in another conceptual and social context, when the traditional *themistes* will give way to the *thesmoi* [θεσμοί],

identifiable juridical and political rules that are the objects of a new legislation, breaking with the past.

Solon, the archon of Athens in 594–593 BCE and the author of many new laws (*thesmoi*), no longer bases the authority of the laws on an external divine authority, but instead (cf. Blaise, "Solon") assumes the role traditionally ascribed to Zeus and claims to have reconciled the two opposites, *dikê* (understood in the institutional sense of "procedure") and *biê* [βίη] (violence: fr. 36 West). He is violent as a legislator: force is not a support or compensation for the law, it is internal to it, because of the law's constraining dimension. As for the content of the law, it is not deduced from something preexisting, but is a direct result of legislative activity itself. Solon (fr. 36 West 18–20) transforms the traditional saying that links the *themistes*, the prescriptions, to right justice (in the sense of "sentence") and states a paradox: "I have written the laws [*thesmoi*] as much for the bad as for the good, and I have adjusted the right judgment for each [*eutheian . . . dikên* (εὐθεῖαν . . . δίκην)]." The sentence establishes the written law, the individual case makes the rule; norms are created by accounting for diversity, and they gain legitimacy through their application, not by virtue of a principle that transcends them. This position would wither away if one translated *dikê* as "justice," without taking into account the procedure of judgment.

Even if we already recognize in the differences between Hesiod and Solon (who is, in a sense, already prefigured by Homer) some elements of the discussion that will subsequently pit the adherents of the law as something deduced from a more fundamental ontological reality against those who posit an autonomous legitimacy of the law, the framework of the discussion will change when the pole of the "rule" (as opposed to the *dikê* or its cognate *to dikaion*, "the just") will come to be represented, starting in the fifth century BCE, no longer by a word that is almost always used in the plural (the *themistes* or the *thesmoi*), but by a generic term, usually found in the singular: *nomos*.

■ See Box 2.

Nomos is opposed by another term in the singular, *phusis* [φύσις], "nature": "The law [*nomos*] that tyrannizes men does violence [*biazetai* (βιάζεται)] to the nature of many

---

2

Nomos

The word *nomos* is derived from the root **nem-*, "to attribute, to distribute according to custom or propriety" (see RT: *Dictionnaire étymologique de la langue grecque*, s.v.). It has an older homonym (with the accent on the final syllable and not the first) that signifies "(out to) pasture," "nourishment" (cf. *nomeus* [νομεύς], "shepherd," *nomas* [νομάς], "pastoralist, nomad"). Accented on the first syllable, it has a meaning of "sharing" (cf. RT: *Le vocabulaire des institutions indo-européennes*, s.v., despite Ostwald,

Nomos). Not only is it a "habitual way of being" that would tend toward a meaning of "rule" ("law and order"); it also implies the idea of constraint: the notion of an "imposed division" is present from its very first uses (cf. Hesiod, *Works and Days* 276: if men, unlike animals, are subject to justice [*dikê*], this in fact results from a partition determined by Zeus, which establishes work as the means of subsistence, and not the devouring of other humans). The idea of an arrangement also appears in the use of *nome* in the

musical sense (as melody). With *nomos*, the rule becomes something that is admitted (and not "posed" like *thesmos*, which *nomos* supplants): the word in itself does not distinguish usage from custom, or from the law. The verb *nomizein* [νομίζειν] is derived from *nomos* and means "habitually using, recognizing, believing, thinking."

things" (Plato, *Protagoras*, speaking as the sophist Hippias). In this statement, the law is posited in its autonomy for the first time, as a positive law, and as Hippias's statement points out, it can be contrasted with the norm that underlies it, with justice (through the idea of a tyrannical, i.e., unjust *nomos*). Plato will isolate the principle of a just, and hence natural, *nomos* by connecting it to the mind's faculty of intelligence (in the *Laws*, he derives *nomos* from *noos* [νόος], the "spirit," 4.714a). Aristotle will be the first to detach political (or juridical) justice from absolute (or moral) justice and thus move beyond the opposition between law and nature by turning them into two aspects of political justice whose existence as such depends on their realization in particular laws. The variability of the laws is thus naturalized: "The politically just [*to politikon dikaion* (τὸ πολιτικὸν δίκαιον)] is in part natural [*phusikon* (φυσικόν)] and in part legal [*nomikon* (νομικόν)]" (*Nicomachean Ethics* 5.10.1134b18–19).

IV. Justice and Equity: Aristotelian Distinctions

Book 5 of the *Nicomachean Ethics* is devoted to the just, *to dikaion*, and to justice, *dikaiosunê* [δικαιοσύνη]. Aristotle explores their multiple meanings (*pleonachôs legêtai* [πλεοναχῶς λέγηται], 5.2.1129a26). These meanings are pregnant with most of our modern distinctions, but with some distortions and differences in emphasis, which is why it is important to understand their exact significance.

A. Global and partial justice, distributive and corrective: Equality and proportion

Justice is first of all a virtue, *aretê* [ἀρετή], that is to say, an individual disposition (*hexis* [ἕξις]; cf. chap. 13). It is all the more fully developed (*teleia* [τελεία], 5.2.1129b30) in that it serves (*chrêsis* [χρῆσίς], 1129b31) in the relation between the self and itself, as well as between the self and other (*pros heteron* [πρὸς ἕτερον], 1130a4). It is also an *allotrion agathon* [ἀλλότριον ἀγαθὸν]: a good for the other, a good for someone else, an altruistic good (insofar as the goal is to promote and maintain the harmony of the political community [*politikê koinônia* (πολιτικὴ κοινωνία)]), but not a good for the foreigner. It has the same final purpose as the laws, and in a sense, it coincides with the obedience that is owed to them (1129b12–19). Aristotle thus returns to the ethico-political nexus of the old myth of Protagoras, in which Zeus adds to the technical gifts of Prometheus and grants to humans those excellent political qualities of *aidôs* [αἰδώς] (modesty, respect [as an awareness of others]) and of *dikê* so that they can live in peace (see VIRTÙ, Box 1). According to Aristotle, this is a total or global (*holê* [ὅλη]) justice that is dependent on the culture of the community, on education in the common interest (*peri paideian tên pros to koinon* [περὶ παιδείαν τὴν πρὸς τὸ κοινόν], 1130b26).

The new distinctions that will carry into the future concern partial justice (*kata meros* [κατὰ μέρος]) as a part of global justice (1130b30). Aristotle distinguishes between distributive justice, which regulates public participation and applies "to the distribution [*en tais dianomais* (ἐν ταῖς διανομαῖς)] of honors, riches, or other advantages to be split up among the members of the community" (1130b31–32) and so-called corrective justice "that directs or redresses." The latter supplies the meaning of *diorthôtikon* [διορθωτικόν]

(1131a1) as private relations (*en tois sunallagmasi* [ἐν τοῖς συναλλάγμασι]), whether based on free choice (a sale and a purchase) or not (as in clandestine cases, such as false witness or theft, or violent cases, such as defamation or armed robbery). These two parts of justice have as their goal not the legal, but the equal (*to ison* [τὸ ἴσον]).

What is not so obvious to us, if we are used to the formal universality of republican equality ("all men are born equal and with equal rights"), are the Aristotelian definitions of equality. For an equal distribution does not consist in giving the same share to each, but requires instead a proportional estimation (*axia* [ἀξία], 1131a26) of persons and of parts: "the just is an analogue" (*to dikaion analogon ti* [τὸ δίκαιον ἀνάλογόν τι], 5.3.1131a29; see LOGOS). Depending on the political regime, value can be defined in terms of liberty, wealth, birth, or excellence, but in each case equality is calculated as a geometric proportion establishing a one-to-one correspondence between persons and things. Injustice consists, then, not in a different distribution, but rather in a lack of proper proportion.

Corrective justice, by contrast, follows an arithmetic proportion (1132a1). It treats all persons as being of essentially equal value (*chrêtaios isois* [χρήταιός ἴσοις], 1132a5). Yet upon closer analysis, its workings only serve to maintain proportion (in the case of a transaction) or to reestablish it (if there is a grievance), by averaging out loss and gain. The judge "equalizes" (*ho de dikastês epanisoi* [ὁ δὲ δικαστὴς ἐπανισοῖ], 1132a24). This is not so different, says Aristotle in a play on words, from the judge (*dikastês*) being someone who "cuts in two" (*dichastês* [διχαστής], 1132a32), that is, he returns the distribution to its prior state ("as before," 1132b20).

Proportionality as the only guarantor of equality: this is the Aristotelian position, and it is politically fundamental. Rather than start by considering all social atoms as identical, it starts with those differences without which there is no community. In order to enable exchanges and organization—a city, in short—distinct forms of competence and virtue are needed, as well as a common currency to make them commensurable (cf. all of *Nicomachean Ethics* 8). This is why, for example, money relates to *philia* [φιλία] (see LOVE, II.B.2). One can thus appreciate the difference in principle between the equality of the ancients and the equality of the moderns, and why some would advocate a return to antiquity (see LIBERAL).

B. The *epieikeia*, or soft rule

Aristotle proposed a form of justice to serve as a corrective to justice itself: the *epieikeia* [ἐπιείκεια] (a term formed from *eikô, "resemble, appear to conform, to be suitable for"; see EIDÔLON, Box 1), which we have rendered as "equity" along the lines of the Latin *aequitas*, "equality," although it is as far as possible from formal equality. Equity redresses legal justice, not because the law is incorrect or erroneous, but because, by definition and structure, the law is general. "It is the imperfections [*lacunae*] that we are correcting [*epanorthoun to elleiphthen* (ἐπανορθοῦν τὸ ἐλλειφθέν)]" (5.14.1137b22), by acting "as if the legislator himself were there," by ruling "as he would have ruled if he knew the particular case" (1137b22–24; cf. also *Rhetoric* 1.1374b10). It is the rigidity of the law that needs redressing, by bending it like a soft rule(r): "In relation to the indeterminate,

the canon is also indeterminate [*tou gar aoristou aoristos kai ho kanôn* (τοῦ γὰρ ἀορίστου ἀόριστος ϰαὶ ὁ ϰανών)], like the lead in the canon of the architects of Lesbos." It moves and adapts to the curves of the stones like a *psêphisma* [ψήφισμα], a decree adapted to a particular affair (1137b28–31).

The inventive consideration of the individual and of difference (one will refer to "personality" and "circumstances") is thus inscribed at the very heart of the evaluation and reestablishment of equality.

Equity in Nietzsche

The status of equity in Nietzsche is, of course, inseparable from his conception of justice, essentially developed over the period extending from *Human, All Too Human* (1878–79) to *Dawn* (1881). Justice—or equity—does not originate in a disinterested or unselfish act, but rather in a barter or exchange between equally powerful men who consider this preferable to a mutually damaging struggle (*Human, All Too Human*, 1.92; cf. *Genealogy of Morals*, 2.8). Properly speaking, equity is

> a development of justice that is born among those who do not sin against equality in the community: it is applied to cases where the law does not prescribe anything, in which a subtle sense of equilibrium intervenes, which takes the past into account, and whose maxim is to not do to others what you would not wish to have done to yourself.

> (*The Traveler and His Shadow*, §32, in *Human, All Too Human*)

Equity is thus defined primarily through the figure of the "equitable man," whose virtue consists in his ability to determine what is just (as to equality or inequality) when the law is mute or where the legal relations are unstable (cf. *Dawn* §112). Nietzsche takes up Aristotle's analyses (*Nicomachean Ethics*, 5.14.1137a31–1138a30) and gives them an "aristocratic" interpretation, which also grants a certain reciprocal indulgence to the "equals":

> *Aequum* means specifically: "it conforms to *our equality*." Equity levels out our little differences to reestablish the appearance of equality, and means that we forgive many things in ourselves that we shouldn't forgive.

> (*The Traveler and His Shadow*, §32, in *Human, All Too Human*)

THING

I. *Chose: Causa, Res*

The French words *chose* and *cause* come from the same Latin word, *causa*, which is part of the juridical vocabulary and designates a case in which interests are at stake—simultaneously the trial, the object of the trial, and the parties concerned—all things that French also designates by *cause*. *Causa* is often joined with *ratio*, and then it takes on (or recovers, for some uses seem to have occurred earlier; see RT: *Dictionnaire étymologique de la langue latine*) the meaning of *cause* as "reason," "motive," "influence," what in French is called *cause* in the causal sense of the term (*à cause de*). Moreover, *causa* is often joined with *res* to designate the "matter" or the "facts of the case." *Causa* and *res*, which first meant "the family goods," "property," "wealth" (cf. Sanskrit *revā̄n*), and then "matter," "object," grow weaker and at the same time contaminate each other to designate together what we call *chose* (Ger. *Ding* and *Sache*, Eng. "thing," in which we also hear an old word for assembly or tribunal). On the other hand, the

Greek doublet *aition/aitia* [αἴτιον, αἰτία], which translates *causa* in both the legal and the causal sense, remains quite distinct from *pragma* [πρᾶγμα] (from *prattein* [πράττειν], meaning "act") and especially from *chrêma, chrêmata* [χρῆμα, χρήματα] (that which is used, wealth), which are the best equivalents of *res*.

We will begin by using the example of *res* in these ancient and modern systems to explore the word's polysemy and at the same time its extreme indetermination: see RES, Box 1 on Greek, RES, Box 2 on Arabic, and RES, Box 3 on all the etymologies of *res* and *Ding*, which refer to both the objective, solid consistency of Being (*ratum*) and thought and representation (Lat. *res/ratitudo*, Ger. *Ding/Denken*, Eng. "thing"/"think").

II. *Chose, Quelque Chose*, "Being," "Nothing"

1. On the extension of the term "thing," which applies to everything that exists, and even to everything that does not exist (thus we speak about "something" that does not exist, and in French, especially about *rien* (nothing), derived from the Latin accusative *rem*, see ESSENCE, *IL Y A, NOTHING,* OBJECT, REALITY, RES, SACHVERHALT, SEIN; cf. *NEGATION, PERSON, II.4, TO BE*). See also VORHANDEN for a determination of the thing as "subsisting" or "available." On the relationship between "thing" and "word," see SIGN and TRUTH, WORD; see also LOGOS, Box 4.
2. On the difference between "thing" and "person," see ANIMAL, I/ME/MYSELF, SUBJECT; cf. *LIFE/LEBEN, PERSON.*
3. On "the thing in itself" (*Ding an sich*), see ERSCHEINUNG, GEGENSTAND; cf. GERMAN.

➤ NATURE, WELT

| TIME / TENSE

FRENCH   *temps*
GERMAN   *Zeit, Wetter, Tempus*
LATIN   *tempus*

The French language has a particularly striking number of meanings attached to the word *temps*, each corresponding to a distinct and different word in the other European languages. First, there is *le temps qu'il fait*, which in English is the weather, and in German *das Wetter*. Second, there is *le temps qui passe*, which refers to time in English and *Zeit* in German. Third, *le temps des verbes* correlates to the tense of verbs in English and the *Tempus* in German. The Latin word *tempus*, from which the French word derives, had, interestingly enough, already applied to both chronology and grammar. It was also linked to meteorology: in addition to *tempestus*—whose first meaning is "opportune" and which translates the Greek *kairos* [καιρός]—starting with Ennius, the word *tempestas* refers to "the state of the atmosphere," and hence euphemistically to "bad weather" (Fr. *mauvais temps*), or tempest. Finally, the plural *tempora* designated portions of time, the "epochs" as well as the "seasons." Thus the Latin term encompassed all the usages of the Greek words *chronos* [χρόνος], "time," and *kairos*, "opportunity." The broad French usage attests to the term's ample range. See *ETERNITY, INSTANT,* MOMENT.

I. Objective Time and Subjective Time

1. Time is often analyzed by differentiating objective time, which can sometimes be physical and an object of mathematics, and at others historical and chronological, from a subjective time defined as time in relation to life and as duration. These two models, of the Greek *chronos* and *aiôn* [αἰών], of the Latin *tempus* and *aevum*, are in fact very intertwined and cannot be simply superimposed: see AIÔN.
2. On physical time, which is objective, measurable, and used as a measure itself, which Aristotle defines as "something of movement," see FORCE, MOMENT; cf. NATURE, *WORLD*. On its linear or cyclical representations, see also CORSO. On the measurement of musical time, see MOMENTE.
3. On subjective time and its representation specific to human existence, one can refer to DASEIN, ERLEBEN; cf. *DESTINY,* ESSENCE, *LIFE, MALAISE.*

II. Cut-Up Time; Present, Past, Future

1. There is some dispute as to the etymology of *tempus* (in linking *tempus* as weather and *tempus* as *tempe*). It is sometimes described in relation to the Greek *temnô* [τέμνω], to cut; see MOMENT, II.

   Whence the importance of the three instances that define time by cutting it up into present, past, and future, and the inflections suggested by the doublets that occur in certain languages (Ger. *Gegenwart* and *Anwesenheit*, *vergangen* and *gewesen*; Fr. *futur* and *avenir*); see PRESENT. On the preeminence of the present, see also ESTI, *IL Y A.*
2. The objectivity of these moments in time, linked to events and to narrative, is implied by history (see HISTORIA UNIVERSALIS, HISTORY, *PROGRESS*), and their subjectivity, which is sometimes upset or overturned, is linked to memory and forgetting (see MEMORY).
3. This objective partitioning (a "period piece" of furniture) and/or subjective partitioning is a characteristic of the notion of "epoch" (from the Gr. *epi* [ἐπί], on, and *ochê* [ὀχή], support, bearing, superimposed on *echein* [ἔχειν], to have to hold on to). A return to or reinvestment in the Greek meaning of "suspension" and "stop" characterizes the phenomenological method; see EPOCHÊ.

This way of cutting up also applies to the great periodizations of time, for example, in aesthetics—see BAROQUE, CLASSIC, ROMANTIC (and *STYLE*)—which vary somewhat in different cultures, and to the determination of the contemporary; see NEUZEIT.

III. Remarkable Instances of Time

Under the rubric of MOMENT, one can find a study of the expression of some singularities in the course of time, especially the Greek *kairos,* which designates the opportune moment. Its seizure and use properly belong to GENIUS, to INGENIUM (see also *WITTICISM*). See also, under JETZTZEIT, the irruption of a messianic present into the course of history, under *RÉVOLUTION*, a study of the ambiguity of change.

On the sudden, the instantaneous, and the immediate (Gr. *exaiphnês* [ἐξαίφνης]), which is tied to perception (see PERCEPTION), to evidence (see CONSCIOUSNESS, I/ME/MYSELF, and cf. *CERTITUDE*), to intuition (ANSCHAULICHKEIT; see also INTELLECTUS, UNDERSTANDING, and cf. *INTUITION*), and which is subject to mediation (see AUFHEBEN), see also *INSTANT* and ETERNITY.

IV. The Expression of Time

1. On time in narrative, see ERZÄHLEN; for time in chronicle and history see GESCHICHTLICH, HISTORIA UNIVERSALIS, HISTORY (cf. above, II.2).

   On the enunciations of time in the grammar and syntax of languages, see ASPECT, ESTI.

2. We have paid special attention to the Danish philosopher Kierkegaard as an example of the idiomatic construction of a network of time within a language; see CONTINUITET, EVIGHED, MOMENT, Box 4, NEUZEIT, Box 1, PRESENT, Box 2, PLUDSELIGHED; cf. STIMMUNG.

➤ EREIGNIS, *TO BE*

| TO BE

I. "To Be": The "First Verb"

"To be" is, according to Friedrich Schleiermacher, the "first verb," and even it is "illuminated and colored by the language" ("Of the Different Methods of Translation," §239, Eng. translation in *The Translation Studies Reader*, 2nd ed. [Routledge]).

We have examined the following in particular:

a. the pecularities of Greek: ESTI; cf. TO TI ÊN EINAI;
b. the Spanish pair *ser/estar*, see SPANISH, to which add the Portuguese verb *ficar*, see FICAR; cf. HÀ;
c. the complexity of post-Kantian terminology: see SEIN.

II. The Different Senses of "Being"

We generally distinguish four main senses of being: existence, copula, veridical, identity. These senses involve several cross-cutting and complex divisions: essence/existence (quiddity/quoddity), object/subject, truth/falsehood/fiction.

A. Being-existence / being-essence

See under ESSENCE the study of the major ambiguities and translation that yield the divisions of *essence/substance/existence*.

On the fact of being, see OMNITUDO REALITATIS.

For the existential meaning, related to the object, see *IL Y A* [ES GIBT, ESTI, HÁ] cf. EREIGNIS; related to the subject, see DASEIN, ERLEBEN, EPOCHÊ; see also SUBJECT and cf. CONSCIOUSNESS.

On being in the sense of objective reality and in its relationship to "things," see GEGENSTAND, OBJECT, REALITY, RES (and under RES, especially the Greek *pragma* [πρᾶγμα], *chrêma* [χρῆμα], and the German *Ding, Sache*), SEIN, VORHANDEN. Cf. *THING.*

On the ontological-theological identification of being with God, see I/ME/MYSELF, Box 4); cf. GOD.

Cf. *ACT.*

■ See Box 1.

B. Being-copula

See, besides ESTI: PRÉDICABLE, PREDICATION, Box 4, SUBJECT.

C. Being-veridical

See, besides ESTI, SACHVERHALT, TRUTH; see also SEIN, III. Cf. *APPEARANCE,* DOXA, ERSCHEINUNG, *FALSE, FICTION, LIE.*

D. Being-identity

See I/ME/MYSELF, Box 2, SELBST, SUBJECT (under which we discuss the Latin *persona*, especially SUBJECT, Box 5; cf. AGENCY). See also IMPLICATION.

Cf. *IDENTITY.*

➤ *EVENT*

1

Impotentiality

It is well known that Aristotle created the category of "potentiality" (*dynamis*) and opposed it to the category of "actuality." But the philosopher also invented a third modal notion, "impotentiality" (*adynamia*), and it may be that it alone explains the other two. In his *Metaphysics*, Aristotle undertook to define and distinguish potentiality and actuality. His argument was directed against the Megarians, who held that potentiality exists only in actuality. According to the Megarians, the cithara-player, for example, is capable of his art only during the moment in which he actually plays his cithara; at all other times he possesses no potentiality to set his art into effect. Wishing to vindicate the autonomous existence of skill (*technê*) and other potential beings, Aristotle posited the existence of impotentiality as a structural requirement of potentiality. "All potentiality is im-potentiality of the same [potentiality] and with respect to the same [potentiality] (*Metaphysics*, 1046.a.32), since "that which is potential can both be and not be, for the same is potential both to be and not to be" (ibid., 1050.b.10). Aristotle thus argued that the notion of potentiality constitutively requires that every potential to (do or be) be at the same time a potential not to (be or do), that every potentiality, in short, be also impotentiality. His reasoning can be simply summarized: if potentiality were always only potentiality to (be or do), everything potential would have always already been actualized; all potentiality would have always already passed over into actuality, and potentiality would never exist as such.

In his Freiburg lecture course of 1931, Martin Heidegger drew from these Aristotelian lines a single conclusion: all force (*Kraft*) is originally "un-force" (*Unkraft*). Giorgio Agamben is the contemporary thinker who has most incisively developed this thesis. Commenting on Aristotle, Agamben has written that "the 'potentiality not to' is the cardinal secret of the Aristotelian doctrine of potentiality, which transforms every

(continued)

potentiality in itself into an impotentiality" (*Potentialities*, 52). Something can be capable of something else only because it is originally capable of its own incapacity, and it is precisely the relation to an incapacity that constitutes the essence of all potentiality: "in its originary structure, potentiality maintains itself in relation to its own privation, to its own *steresis*, its own non-Being. . . . To be potential means: to be one's own lack, *to be in relation to one's own incapacity*" (ibid., 15). But Agamben's analysis leads to a further conclusion, which concerns the passage from potentiality to actuality. Aristotle taught that "a thing is said to be 'potential' if, when the act of which it is said to be potential is realized, there will be nothing impotential" (*Metaphysics*, 1047a.24–26). Agamben notes that "usually, this sentence

is interpreted as if Aristotle had wanted to say, 'What is possible (or potential) is that with respect to which nothing is impossible (or impotential). If there is no impossibility, then there is possibility.' Aristotle would then have said a banality or a tautology" (*Potentialities*, 20). But another reading is possible. If impotentiality is understood as a structural condition of potentiality, then the sense of the affirmation changes greatly. "What Aristotle then says is, 'if a potentiality not to be originally belongs to all potentiality, then there is potentiality only where the potentiality not to (be or do) does not lag behind actuality but, rather, passes wholly into it *as such*'" (ibid., 21). Impotentiality is not effaced in the passage into actuality. On the contrary, actuality is itself nothing other than the full realization of impotentiality. Actuality shows itself as an impotentiality turned back upon itself: a potentiality

capable of *not* not being and, in this way, of passing into the act.

| TO SENSE

I. *Sentir, Sentio, Sensus*

The meaning of the Latin verb *sentio, sentire* (from which the verb "to sense" is derived, by way of the French *sentir*) is presented in classical dictionaries along two major axes:

1. to perceive by or with the senses, or to experience;
2. to think, to notice, or to realize, to furnish an opinion (from the Latin *sententia,* partially corresponding to the Greek *doxa* [δόξα]), see PROPOSITION, SENSE, III, and DOXA.

It may be more comprehensive, however, to present a tripartite definition with respect to the term *sensus*: (1) perception; (2) intelligence; (3) signification.

The entry SENSE expands upon the origins and variations of this tripartite definition.

For the meaning of "signification," consult, beyond SENSE, the following: HOMONYM, LANGUAGE, LOGOS, SIGNIFIER/SIGNIFIED, TERM, TO TRANSLATE; cf. INTELLECTUS, INTENTION.

II. Sensation, *Sentiment,* Sensibility

1. For English terminology related to "sensitivity," see FEELING; cf. *PASSION.* For terminology related to morality, see MORAL SENSE; cf. COMMON SENSE.

    There is a difference among languages with the adjectives *sensitive/sensible*. In French the adjective *sensible* preserves both an objective and a subjective quality (for example, a sensitive person, a sensitive trait), whereas English privileges a link to the notion of signification or sense-making (sensible, related to the expression "to make sense"): see SENSE, Box 1), COMMON SENSE [*SENS COMMUN*]; cf. LOVE (particularly LOVE, Box 2).

2. Concerning the verb *sentir*, the French seemingly preserves only the first of the two registers given above in

section I, although the language generates here a certain ambiguous polysemy between:

a. the modality of "sensation, Greek *aisthêsis* [αἴσθησις], see CONSCIOUSNESS (particularly CONSCIOUSNESS, Box 1), and SENSE, I, PERCEPTION;
b. and the modality of *sentiment*.

    The difference between modalities does not rely on an opposition between "external" and "internal" feeling, but is rather due to the latter modality's effect on the soul and its communication with the passions; see GEMÜT, *PASSION,* PATHOS, STRADANIE.

3. The German doublet *Gefühl/Empfindung* does not divide along the lines of the French amphibology between sensation and sentiment, but rather introduces other connections and convergences, notably with the concept of moral sentiments; see GEFÜHL; cf. STIMMUNG.

4. French philosophy has developed a phenomenology of both the senses and of sensitivity that builds on (and is distinct from) a tradition of philosophical reflection on *le corps propre* from Descartes (his sixth meditation in *Meditations on First Philosophy*, and *Passions of the Soul*) and Malebranche to Maine de Biran, Bergson, and Merleau-Ponty. Privileged in this instance are states that unite the soul and the body, such as pain: see ERLEBEN, *FLESH,* LEIB, PATHOS, SOUL; cf. *MALAISE.*

The relative untranslatability of this discourse is ably demonstrated by Locke's reaction to Malebranche's *The Search after Truth.* In his personal annotations to the work, Locke expresses his incomprehension of what Malebranche means by the term *sentiment intérieur.* Conversely, French readers of Locke stumbled over the term "consciousness." See CONSCIOUSNESS, GEFÜHL.

➤ GOGO, *HEART, REASON*

TO TI ÊN EINAI [τὸ τί ἦν εἶναι] (GREEK)

ARABIC *ḥaqīqa* [حقيقة], *māhiyya* [ماهية]
FRENCH *la quiddité, l'essentiel de l'essence*
LATIN *quidditas*

➤ *QUIDDITY*, and *ACT*, *ASPECT*, *ESSENCE*, *ESTI*, *LOGOS*, *REALITY*, *RES*, *SEIN*, *SPECIES*, *TO BE*

The Greek *to ti ên einai* could literally be taken to mean something like "the what it was to be" or "the what it was being." Few Aristotelian expressions fundamental for all of ontology raise as many issues as to their literal meaning. The most commonly accepted translation, "quiddity," is a perfectly opaque term operating as a mere signal, and is itself already symptomatic of this difficulty. The English "quiddity" (as well as the French *quiddité*) is just a modernized version of the Scholastic *quidditas*, itself a simplified and abbreviated form of the Latin *quod quid erat esse*, which can be found, for example, in the translation by Guillaume de Moerbecke of Aristotle's *Metaphysics* (cf. Thomas Aquinas, *In duodecim libros Metaphysicorum Aristotelis expositio*, nos. 1270, 1307–10, and passim). The undeniable progress of philology due to the great modern editions of Aristotle in the nineteenth century led to a slew of attempts at retranslation. It is impossible to choose between the translations without starting by (1) recognizing the specific structure of the question and differentiating it from the more general question of *ti esti?* [τί ἐστι;], "What is it? What is the essence of . . . ?"; (2) clarifying the syntax of Aristotle's formulation; and (3) taking a position on the meaning of the imperfect tense used with the verb "to be" in this expression. To these three approaches we have added Schelling's speculative interpretation as an illustration of all of these exegetical difficulties.

I. An Overly Translated Expression

Quidditas appears in the Latin translation of Avicenna (Avicenna Latinus, *Liber De philosophia prima, sive Scientia divina*), in which it serves for both *ḥaqīqa* [حقيقة] and *māhiyya* [ماهية]. This last term

is formed from *ma*, "that which," and *hiya*, the third-person personal pronoun meaning "she is." It was selected by . . . Al-Kindi to translate the Greek *to ti* [τὸ τί] in the putative *Theology* of Aristotle. In Avicennius, the term is a response to the question: *Mā huwa*, "What is it?"

(Goichon, *La distinction*, 32; RT: *Lexique de la langue philosophique d'Ibn Sina*, no. 679)

Ḥaqīqa, built from the root *ḥqq*, which expresses "the general idea of reality, of truth," is usually rendered in medieval translations by *certitudo*.

■ See Box 1.

II. Determinants Internal to the Aristotelian Corpus

The first obstacle to grasping the meaning of the formula is posed by the difficulty of holding together the series of determinations that characterize it within the *corpus aristotelicum*.

If one asks what is in fact the *to ti ên einai* [τὸ τί ἦν εἶναι], several features emerge that combine to form a complex figure. First of all, the *ti ên einai* is what defines a thing: "*esti d' horos men logos ho to ti ên einai sêmainôn* [ἔστι δ' ὅρος μὲν λόγος ὁ τὸ τί ἦν εἶναι σημαίνων]" (*Topics* 101b38). Or, more precisely, in the *Metaphysics* (Z 4, 1029b13): "For each being, the *ti ên einai* is what is said to be of itself [*esti to ti ên einai hekastôi ho legetai kath' hauto* (ἐστὶ τὸ τί ἦν εἶναι ἑκάστῳ ὃ λέγεται καθ' αὑτό)]." In the "philosophical lexicon" that makes up book Δ of the *Metaphysics*—in reference, it seems, to Antisthenes and his doctrine of "proper definition" (*oikeios logos* [οἰκεῖος λόγος])—Aristotle invokes the *logos*, "which manifests the *ti ên einai* [*ho dêlôn to ti ên einai* (ὁ δηλῶν τὸ τί ἦν εἶναι)]." Antisthenes, for his part, according to Diogenes Laertius's account, was the first to define "discourse" as "that which manifests what it was, which is to say, what it is [*prôtos te horisato logon eipôn: logos estin ho to ti ên ê esti dêlôn* (πρῶτος τε ὡρίσατο λόγον εἰπὼν· λόγος ἐστὶν ὁ τὸ τί ἦν ἢ ἐστι δηλῶν)]" (*Lives and Doctrines of the Philosophers* 6.3).

It may be helpful to compare the expression—coined by Aristotle, but never justified or explained as such—to the Platonic formula of the *Phaedo* 78d: "*auto ho estin, auto hekaston ho estin* [αὐτὸ ὃ ἔστιν, αὐτὸ ἕκαστον ὃ ἔστιν]"—that very

---

1

On some translations

The difficulties of the Aristotelian expression are already apparent in the great variety of translations that have been proposed. Below is a mere sampling:

English

"The answer to the question, what was it to be so-and-so" (W. D. Ross);
"Essence" (W. D. Ross, H. Tredennick);
"What it is to be something" (W. D. Ross);
"The what it was to be," "the what it was for each to be" (E. Buchanan);
"What it is to be a thing/something/it" (J. Barnes, M. Furth);
"The-what-has-been" (P. Merlan).

French

"Quiddité" (P. Aubenque, J. Tricot);
"Le fait pour un être de continuer à être ce qu'il était" (E. Bréhier);
"L'essentiel de l'essence" (J. Brunschwig).

German

"Das, was war das Seyn, dass heist, das gedachte Wesen, vor der Wirklichkeit der Sache," "Der hervorbringende und vorangehende Grund"
(F. A. Trendelenburg);
"Das Sosein" (H. Seidl);
"Das Wesenswas" (H. Bonitz);
"Das, was es war, sein" (C. Arpe);
"Das jeweils zugehörige Sein"
(F. Bassenge);
"Das vorgängige und durchgängige Was des Seins von Seiendem"
(K. H. Volkmann-Schluck);
"Das Wesen als wesentliches Wassein"
(W. Bröcker);
"Was es heisst, dieses zu sein" (M. Frede, G. Patzig).

thing that each thing is in its being, in its identity, its permanence, its stability.

Thus *to ti ên einai* seems to become an overdetermined form of *to ti esti* [τὸ τί ἐστι] (*Metaphysics* Z 4, 1027b28), a substantiation of the question that bears on the "definition," on the *kath' hauto* [καθ' αὐτό], the "by virtue of itself," of the *eidos* [εἶδος].

So, to understand the meaning and structure of *to ti ên einai*, it is crucial to start from the question *ti esti?* [τί ἐστι;] (What is [it] . . . ?), or from its nominalized version: *to ti esti* [τὸ τί ἐστι] (The what is [it] that . . .).

At any rate, this is what is suggested by the Aristotelian variations on the (still indeterminate) question *ti esti?* in the *Topics* (1.9.103b27–29, as translated into French by Jacques Brunschwig):

Il est claire . . . qu'en désignant une essence [*ho to ti esti sêmainôn* (ὁ τὸ τί ἐστι σημαίνων)], on désigne tantôt une substance, tantôt une qualité, tantôt encore l'une des autres prédications [*hote men ousian sêmainei, hote de poion, hote de tôn allôn tina katêgoriôn* (ὁτὲ μὲν οὐσίαν σημαίνει, ὁτὲ δὲ ποιόν, ὁτὲ δὲ τῶν ἄλλων τινὰ κατηγοριῶν)].

(It is clear . . . that by referring to an essence [*ho to ti esti sêmainôn* (ὁ τὸ τί ἐστι σημαίνων)], one sometimes refers to a substance, at other times to a quality, and sometimes to one of the other predications [*hote men ousian sêmainei, hote de poion, hote de tôn allôn tina katêgoriôn* (ὁτὲ μὲν οὐσίαν σημαίνει, ὁτὲ δὲ ποιόν, ὁτὲ δὲ τῶν ἄλλων τινὰ κατηγοριῶν)].)

In Aristotle, then, the ambiguity of the question "What is it?" is such that one could respond by "signifying" essence, substance (*ousia* [οὐσία]), or some other category. Previously in the same chapter, Aristotle had enumerated the "genres" or "types" of possible predications or categories, numbering ten: *ti esti, poson, poion, pros ti, pou, pote, keisthai, echein, poiein, paschein* [τί ἐστι, ποσόν, ποιόν, πρός τι, ποῦ, ποτέ, κεῖσθαι, ἔχειν, ποιεῖν, πάσχειν] (essence, quantity, quality, relation, location, time, position, state, action, passion). To the question "What is it?" (*ti esti?*), the relevant answer is one that indicates the primary or secondary *ousia*. A few lines later, it becomes clear that this polysemy of the question *ti esti?* is in turn only an echo of the polysemy of being, or rather, of *esti* [ἐστι]. It is clearly unnatural in modern European languages to answer a question like "What is it?" with "numerous," "large," "blue," "cold," "on the horizon"; but when, "about a white color over there," one says, "It is white, and it is a color [*to ekkeimenon leukon einai kai chrôma* (τὸ ἐκκείμενον λευκόν εἶναι καὶ χρῶμα)]," then one is in fact saying what it is (in response to the question "What is it?") while simultaneously referring to a quality ("*ti esti legei kai poion sêmainei* [τί ἐστι λέγει καὶ ποιὸν σημαίνει]," 103b31–33).

Thus it is possible to think that one of the first objectives of the complex formula *to ti ên einai* was to disambiguate the socratico-platonic question *ti esti?* as Plato had already attempted to do, by emphasizing that the "good" answer to the question about the essence of *x* is one that designates *auto ho esti*, that which is proper to and of itself (*kath' hauto*).

One can also say, and in a more rigorously Aristotelian manner, that a good answer to the question "What is it?" once narrowed and reformulated as *ti ên einai* is one that puts forward a well-articulated definition that can narrow down as much as possible the *x* in question, instead of simply giving it a name, even a proper name: "*esti d' horos men logos ho to ti ên einai sêmainôn* [ἔστι δ' ὅρος μὲν λόγος ὁ τὸ τί ἦν εἶναι σημαίνων]" (101b38). What we have here is a case of "*logos ant' onomatos* [λόγος ἀντ' ὀνόματος]," which is to say a "discourse," an "articulated utterance" (a "formula," says Brunschwig), which takes the place of a pure and simple name that would otherwise simply be in apposition to the object in question.

In his French translation of Aristotle's *Topics*, Brunschwig addressed the difficulties of settling on a translation of the term *to ti ên einai* in a "supplementary note," and explained his rendering of it as "that which is essential in essence [*l'essentiel de l'essence*]":

Lorsqu'on demande *ce qu'est* [*ti esti*] telle chose ou tel être, un homme par exemple, on peut d'abord répondre en nomman son *genre*, en l'occurrence *animal*. La réponse est bonne; mais elle a la propriété de convenir aussi bien à d'autres êtres qu'à celui dont il s'agit. Si'l paraît souhaitable d'obtenir une réponse plus *ajustée*, il est nécessaire de serrer davantage la question, et c'est à ce besoin que répond la formulation *ti ên einai*. . . . Le redoublement du verbe *être* [*ên-einai*] a pour fonction, dans cette formule, d'écarter, parmi toutes les réponses possibles à une question posée, tout ce qui pourrait convenir à d'autres êtres qu'à celui dont il s'agit.

(When one asks *what is it* [*ti esti*] about some thing or being, a man for example, one can start out by indicating his *genre*, in this case an *animal*. This is a good answer; but it also applies to beings other than the one in question. So if it seems desirable to obtain a more fitting answer, it becomes necessary to further narrow the question. The expression *ti ên einai* is meant to respond to this requirement. . . . The doubling of the verb *to be* [*ên-einai*] in this formulation is intended to eliminate all the possible answers to a particular question that might apply to beings other than the one concerned.)

(*Topiques*, 119–120 n. 3)

In other words, the *logos* (*horos* [ὅρος], *horismos* [ὁρισμός]) that expresses the *ti ên einai* is carefully distinguished from all that is predicated *kata sumbebêkos* [κατὰ συμβεβηκός] as accidental determination. By the same strict logic, this *logos* is distinguished from anything that relates to the universal or generic (as both Bonitz in his *Commentarius* and Trendelenburg in his article from the *Rheinisches Museum* [1828] had clearly indicated).

Brunschwig subtly illustrated the function of this "redoubling" in reference to perfectly common French turns of phrase:

On n'a pas assez remarqué que le français possède des ressources d'un type tout à fait semblable, puisque, à côté de la formule simple "qu'est-qu'un homme?" et de la formule déjà dédoublée "qu'est-ce que c'est

qu'un homme?" il présente des formules dédoublées ("qu'est-ce qu'être un homme?") et même détriplées ("qu'est-ce que c'est qu'être un homme?"). Si l'on pouvait substantiver cette dernière expression, on obtiendrait à coup sûr le meilleur équivalent possible de *to ti ên einai.*

(It has not been sufficiently pointed out that the French language has perfectly similar resources, since in addition to the simple question *qu'est-ce qu'un homme?* [What is a man?] and an already double formula *qu'est-ce que c'est qu'un homme?* it also contains other doubled formulas, *qu'est-ce qu'être un homme?* and even tripled formulas, *qu'est-ce que c'est qu'être un homme?* [What is it (that which is) to be a man?]. If one could turn this last form into a substantive, it would be the closest possible equivalent to *to ti ên einai.*)

Despite the fact that his translations were not always consistent or very well explained, we are not far in this instance from what Léon Robin pointed out in his *La théorie platonicienne des idées et des nombres d'après Aristote* (The Platonic theory of ideas and numbers according to Aristotle):

> We know that Aristotle, for his part, distinguished between *to ti esti* [τὸ τί ἐστι], which is the part of the definition that designates the genre [*Topics* 6.5.142b27ff.: *to de genos bouletai to ti esti sêmainein* (τὸ δὲ γένος βούλεται τὸ τί ἐστι σημαίνειν); cf. also 4.6.128a23–25] from *to ti ên einai* [τὸ τί ἦν εἶναι], which is *the unified whole of all elements of the definition.* The *ti ên einai* is proper to the definition itself, whereas the *ti esti* [τί ἐστι], in signifying the genre, extends beyond it.

> (Robin, *La théorie platonicienne,*
> 27–28 n. 24 [emphasis added])

Another striking confirmation of this restriction or narrowing down of the question *ti ên einai?* in relation to the question *ti esti?* is to be found in the passage of *De anima* in which Aristotle emphasizes that the intellect, in its direct intellectual apprehension, is always "true," just as *aisthêsis* [αἴσθησις] is always true in relation to its proper sensible object. Both intellection and sense discover their proper object. Intellection is always true when it is "*tou ti esti kata to ti ên einai* [τοῦ τί ἐστι κατὰ τὸ τί ἦν εἶναι]" (the thinking of the definition in the sense of the essence). The translation by Bodéüs is basically correct, but it completely misses the point of the text: "When it grasps something in conformity with its essence"; Tricot translated it thus: "L'intellect, quand il a pour objet l'essence au point de vue de la quiddité, est toujours dans le vrai" (The intellect, when it has as its object the essence from the point of view of quiddity, is always within the truth).

III. The Structure of the Greek Expression

The second difficulty arises when one attempts to analyze the expression itself through its morphological and syntactic structure.

One should note at the outset that the *ti ên einai* constitutes in effect a nominal group, as it can be employed as follows:

a. in the plural: *Second Analytics* 93a13; *Metaphysics* Z 6, 1031b28;

b. as a predicate—without *to*—after *einai*: for example, *Metaphysics* Z 6, 1031b31: "*kaitoi ti kôluei kai nun einai enia euthus ti ên einai . . .* ? [καίτοι τί κωλύει καὶ νῦν εἶναι ἔνια εὐθὺς τί ἦν εἶναι . . . ;]" (*mais alors qui empêche, dès maintenant, que des êtres soient immédiatement leur propre quiddité . . .* ? [But what prevents beings from being immediately their own quiddity . . . ?], trans. Tricot); and

c. as a member of a coordinated group—for example, *Metaphysics* 983a26ff.: "*tên ousian kai to ti ên einai* [τὴν οὐσίαν καὶ τὸ τί ἦν εἶναι]" (*l'essence et la quiddité* [the essence and the quiddity]).

These examples clearly show that the entire phrase *ti ên einai* is nominalized by the neuter article *to*, not just the infinitive part of it.

In analyzing the expression, one must choose between two possibilities: (1) It is a question that has been made into a substantive (similar to the substantification of the question *ti esti?*); or (2) it is a complex variation in usage of the substantivized infinitive, *to . . . einai*, with a dative construction.

If one construes it in the manner suggested by Trendelenburg (*Ein Beitrag zur aristotelischen Begriffsbestimmung und zur griechischen Syntax*) as *to . . . einai*, then *ti ên* should become the predicative complement of *einai*: "the fact of being. . . ." But this interpretation is not convincing, because if this were correct, instead of the dative, one would expect here a relative construction and hence a different word order (for example, as "*to einai ho ên* [τὸ εἶναι ὃ ἦν]" or "*to ho ti ên einai* [τὸ ὃ τι ἦν εἶναι]"; cf. Aubenque, *Le problème de l'être chez Aristote*). It appears from William David Ross's translation that he takes *ti ên einai* as one single syntagm, since he interprets the *to ti ên einai* as a generalization based on phrases that apply to particulars, such as one found in *De partibus animalium* 649b22: "*oion ti ên autôi* [tôi haimati] *to haimati einai* [οἷον τι ἦν αὐτῷ (τῷ αἵματι) τὸ αἵματι εἶναι]" (Blood inasmuch as it is for it to be blood).

This analysis seems correct, and it is further confirmed by two linguistic features:

1. In the *Metaphysics* Z 17, 1041b6, one finds "*oikia tadi dia ti? hoti huparchei ho ên oikiai einai* [οἰκία ταδὶ διὰ τί; ὅτι ὑπάρχει ὃ ἦν οἰκίᾳ εἶναι]" (Why are these materials a house? Because that which was the essence of a house is present, the "quiddity" of the house belongs to them—or, more literally: Because there is present what it was for them to be a house). Here, *ho ên . . . einai* can be taken as an example capable of clarifying the formula *ti ên einai*. *Ho ên oikiai einai* is the subject of *huparchei*; within the relative clause, *ho* is the subject of *ên* and of the infinitive *einai*. This infinitive should be understood as a "final" infinitive (for the construction of *eimi* [εἰμί] + infinitive, cf. RT: *Ausführliche Grammatik der Griechischen Sprache*, 2:10: the infinitive can be the complement of verbs such as *eimi*, *pareimi* [πάρειμι], *pephukô* [πέφυκω], "when they signify: I am here for that, I am naturally capable of, the right one for, I have a natural capacity for, the natural quality of . . ."; these turns of phrase, which belong to everyday language, are very

pertinent to our formula). As for *oikiai* [οἰκίᾳ], this dative should be taken as a predicative dative with a "possessive" dative—*autois* [αὐτοῖς], being implied with the verb *huparchei*, and referring back to *tadi* [ταδί]. It is also possible that the syntax of *huparchei ho ên oikiai einai* was influenced by the common construction of a predicative dative with a noun in the dative (cf., for example, Plato, *Phaedo* 81a: "*huparchei autêi eudaimoni einai* [ὑπάρχει αὐτῇ εὐδαίμονι εἶναι]" (It belongs to her to be happy: cited by RT: *Ausführliche Grammatik der Griechischen Sprache*, 2:25).

2. In the *Metaphysics* Γ 4, 1007a21, one finds:

Holôs de anairousin hoi touto legontes ousian kai to ti ên einai. Panta gar anagkê sumbebêkenai phaskein autois, kai to hoper anthrôpôi einai ê zôiôi einai mê einai [ὅλως δὲ ἀναιροῦσιν οἱ τοῦτο λέγοντες οὐσίαν καὶ τὸ τί ἦν εἶναι. Πάντα γὰρ ἀνάγκη συμβεβηκέναι φάσκειν αὐτοῖς, καὶ τὸ ὅπερ ἀνθρώπῳ εἶναι ἢ ζῴῳ εἶναι μὴ εἶναι].

(En général, ceux qui raisonnent de cette manière anéantissent la substance et la quiddité. Il sont, en effet, dans la nécessité de dire que tout est accident et de dire que tout ce qui constitue essentiellement la quiddité de l'homme, ou la quiddité de l'animal, n'existe pas.)

(Trans. Tricot)

(In general, those who reason this way obliterate the substance and the quiddity. They are in fact obliged to say that everything is an accident, and to say that nothing exists that essentially constitutes of the quiddity of man or the quiddity of animal.)

(Et de façon générale, ceux qui disent cela détruisent l'essence, à savoir que quelque chose soit ce qu'il est. Car ils doivent nécessairement affirmer que tout arrive ensemble, et que être, pour un homme ou pour un animal, cela même qu'il est, n'est pas.)

(Trans. Cassin and Narcy)

(And in general, those who say this destroy the essence, which is to say that something is what it is. For they are forced to claim that everything occurs together, and that being itself, for a man or for an animal, is not.)

Here, the characteristic generalizing expression of *to ti ên einai* is illustrated by *to hoper anthrôpôi einai* (This is what being is for a man: based on the French translation by Cassin and Narcy, 129). Drawing on a range of French translations of *to hoper anthrôpôi einai* by Léon Robin, Monique Dixaut, Raphael Kühner, and Bernhard Gerth, the formula *to ti ên einai* is analyzed thus:

a. Implicit in the various constructions of the expression, there must be an underlying question (whose existence can only be imputed , since it never literally appears in Aristotle) along the lines of "*ti ên einai hekastôi*? [τί ἦν εἶναι ἑκάστῳ;]" (What was it for each entity to be?). To this, the answer (also assumed) would be:

"*ho ên oikiai einai* [ὃ ἦν οἰκίᾳ εἶναι]" (What it was [for] being a house; cf. *Metaphysics* 1041b6);

or:

"*to hoper anthrôpôi einai* [τὸ ὅπερ ἀνθρώπῳ εἶναι]" (What it was [that which was] to be [for a] man; cf. *Metaphysics* 1041b6);

or:

"*leukôi einai* [λεύκῳ εἶναι]" (To be [for] white; cf. *Metaphysics* 1031a20–22);

or still yet:

"*Kalliai* [Καλλίᾳ]" ([For] Callias); cf. *Metaphysics* 1022a27, "*hippôi* [ἵππῳ]" ([For a] horse); and cf. *Metaphysics* Z 6, 1031b30), "*sphairai ê kuklôi* [σφαίρᾳ ἢ κύκλῳ]" ([For a] sphere or [a] circle; cf. *De caelo* 278a3).

b. The interrogative phrase has been transformed into a substantivized and generalized formula, without an interrogative dimension, which itself assumes several variants:

"*to ti ên einai autôi, ekeinôi einai* [τὸ τί ἦν εἶναι αὐτῷ, ἐκείνῳ εἶναι]" (The what it was for him / this one to be; cf. *Historia animalium* 708a12; *Metaphysics* Z 6, 1031b6);

"*to ti ên einai hekastôi* [τὸ τί ἦν εἶναι ἑκάστῳ]" (The that which it was for each entity to be; cf., for example, *Metaphysics* 988b4, 1022a9, 1022a26);

"*to ti ên einai tôi toiôide sômati* [τὸ τί ἦν εἶναι τῷ τοιῷδε σώματι]" (The that which it was for such a body to be; cf. *De anima* 412b11);

"*to ti ên einai* [τὸ τί ἦν εἶναι]" (ibid.);

"*ti ên einai* [τί ἦν εἶναι]" (predicative form, cf. *Metaphysics* 1031b31).

IV. The Problem of the Imperfect Tense

Beginning with the Greek commentators, the imperfect *ên* [ἦν] has been interpreted in widely different ways. Alexander of Aphrodisias wrote in relation to the *Topics* (5.3, 132a1; RT: *CAG*, 2:2.42, *In Topica*, 1.4) that this use of the imperfect tense had no temporal dimensions. This interpretation is maintained today by Brunschwig (*Topiques*, trans. Brunschwig, 120), Horst Seidl, and others; yet one can wonder if this use of the imperfect, in referring to the present, is not directly linked to dramatic dialogue.

Ross seems to accept, with some hesitation, the interpretation that dates, via Schwegler, at least back to Trendelenburg, which sees in the use of the imperfect an expression of the "Aristotelian doctrine of the existence of the form, prior to its incorporation into a particular substance," its "designated" matter. Other interpretations, like Arpe's, specifically reject this interpretation as Platonic.

In order to understand this usage of the imperfect in the canonic formula, it is certainly possible to start from the use of *ên* in the passage cited above: "oikia tadi dia ti? huparchei ho ên oikiai einai [οἰκία ταδὶ διὰ τί; ὑπάρχει ὃ ἦν οἰκίᾳ εἶναι]" (Why are these materials are a house? Because there is present what it was for them to be a house). Here, the imperfect tense of the verb "to be," *ên*, is clearly the predicate of a relative proposition, and thus a standard predicate in a standard utterance. Like every predicate, *ên* needs to be attached to a referent term. Since Aristotle's

question is posed in the present (cf. *tadi*), within a kind of mini-dialogue, it is the present of the utterance *huparchei* that provides the point of reference and orientation. The materials that will constitute the house in question possess *hic et nunc* what they already had prior to this *hic et nunc*, "before their incorporation in a designated matter," to use Ross's terms. In this way, the imperfect tense conveys a precise temporal reference. But in the general formula, nominalized by the neuter article *to*, in which *ên* is followed by the infinitve *einai*, *ên* no longer has a fixed point of orientation and hence does not refer to some specific past, any more than any particular name would do. As a result, the entire formula has acquired an omnitemporal value. One should note that it is not just the imperfect alone, as Seidl and Brunschwig believe, but the combination of *ên* with *einai* that results in this omnitemporal quality.

But in that case, how is this rendering of *to ti ên einai* different from that other ontological formula *to ti esti*, which also expresses omnitemporality? This latter expression is more directly tied to the *genos* [γένος] (cf. *Topics* 120b29a: "*to genos en tôi ti esti katêgoreitai* [τὸ γένος ἐν τῷ τί ἐστι κατηγορεῖται]," literally, "The genre is predicated in the that which it is," or "It is an essential predication"; cf. also *Topics* 142b27–28: "*to genos bouletai to ti esti sêmainein* [τὸ γένος βούλεται τὸ τί ἐστι σημαίνειν]," "The genre aims to signify the essence"). Aside from *to ti esti*, with its Platonic tone, Aristotle coined another expression whose purpose was to designate *eidos*, in the specific technical sense of *species* and not *genos*. Employing the grammatical model of the substantivized phrase *to ti esti*, he took care to adapt it to his own purposes. So, even though *ên* does not refer to the past in this new turn of phrase, the imperfect tense still evokes the fact that the *eidos* exists prior to its realization in matter. Aristotle relied on this linguistic fact to underscore this aspect of the *eidos*, and especially to indicate without any equivocation his interest in a purely non-Platonic meaning of *eidos*. On the other hand, one can deduce from the fact that the *to ti ên einai* is never employed in referring to the *genos* that the latter does not directly precede its own realization in matter, but does so only through the intermediary of the *eidos*.

We can conclude with some remarks relating to translation:

"Essence" can certainly be rejected as a translation of *to ti ên einai*: the term is too vague, and it works just as well for translating *to ti esti*.

"Quiddity," whose only purpose is to underscore this distinction between *to ti esti* and *to ti ên einai*, is both artificial and cryptic.

The German *das, was es war, sein* and the French *le fait pour un être de continuer à être ce qu'il était* (in English: "What it is for a being to continue to be what it was") should also be rejected, for the reasons listed above. The French translation as *l'essentiel de l'essence* (the essentiality of the essence), which clearly indicates the distinction from the *ti esti*, even if it diverges substantially from the Greek text, is to be preferred.

The English versions, "What it is to be something" and "What it is to be it," remain much closer to the structure of the Greek and, aside from omitting the imperfect tense, make clear that *to ti ên einai* applies to an individual being.

Schelling's interpretation

We give here as an example of interpretation, or better yet an exemplary interpretation, the main passages of *The Historical and Philosophical Introduction to the Philosophy of Mythology*, in which Friedrich Wilhelm Joseph Schelling works through *to ti ên einai* (*Sämtliche Werke*, 11:402–7). We have added, in brackets, some of the main Aristotelian references.

We should distinguish between being and that which being *is*. Every become-being is nothing but a determinate figure of being, and the closer it comes, in its materiality, to being in its entirety, the stronger will be the attraction it exerts on *that which is being*, and this latter will be in it as that which *is*. No matter whether the issue concerns being as such or being under a determinate figure, that which *is* is thus in the first place characterized by Aristotle by saying: its nature is *to ti ên einai*. And Aristotle uses the same expression to refer to the fourth cause, the first by rank [*Metaphysics* A 3, 983a27–28], but the last from the point of view of knowledge, for he considers it the limit of knowledge [*Metaphysics* Δ 17, 1022a8–9]. Despite the different interpretations to which this formula, specific to Aristotle, has given rise, the context within which it appears shows us that we were correct in maintaining that it must express not only what belongs to being, but that whose nature is *to be* being. Given that all the difficulty derives from the grammatical construction of the formula and that the analysis of this grammatical construction will help us more completely clarify the thing itself, we will start by examining its literal signification. . . . In fact, as far as the *content* or real meaning of the formula is concerned, there has in general been no possible doubt. We have always been guided by the passage in which it is noted: one could say that up to a point, the house is born of the house. The material house, constructed of stones and timbers, is born of the immaterial one, that which is only present as a concept, which was in the mind of the architect before the material house [*ek tês aneu hulês tên echousan* (ἐκ τῆς ἄνευ ὕλης τὴν ἔχουσαν), *Metaphysics* Z 17, 1032b12], where Aristotle adds that he calls "*ti ên einade*" the thing in question its immaterial *ousia* in the mind [*legô de ousian aneu hulês to ti ên einai* (λέγω δὲ οὐσίαν ἄνευ ὕλης τὸ τί ἦν εἶναι), *Metaphysics* Z 17, 1032b14]. But the question of the grammatical form of the expression remained

(continued)

(*continued*)

unresolved, particularly the imperfect tense. So it was tempting to maintain that the imperfect *was being* [*ên* (ἦν)] was based on the having-been-present of the form (the form having been in the mind of the sculptor prior to the statue), while the "being" refers back to the fact that the form is in the statue, that it was already previously. . . . Those who have followed us this far will not fail to realize that it would have been easy *for us* to provide an explanation of this sort: there needs to have been a unity prior to the separation of the three powers, none of which was being for itself; this unity is that which *was being*, and that which over the course of the reunification of the three powers enters into the resulting union and is its very soul. So it is not at all impossible to reconcile the imperfect with our presuppositions, insofar as we explain ourselves. Yet what still shocks us at the outset here is that, to a certain extent, the imperfect ἦν seems to fall on the good side, so to speak, while the present *being* falls on the lesser one. For example, the flesh and blood, and everything that constitutes the material side of man, can be crushed, destroyed, and obliterated, but that which *is* this material side (which for itself is nonbeing) cannot be destroyed. It *is* in a different sense than *was being*, and by its nature is eternal.

But the imperfect? It, too, is eternal, we will maintain, but this can only be explained by the extraordinary subtlety of the sense of the language that caused the Greeks to use the imperfect in identical or similar cases. For example, where we

would say: "What all the world desires is the good," Aristotle says: "*hou pantes ephientai, touto agathon ên* [οὗ πάντες ἐφίενται, τοῦτο ἀγαθὸν ἦν] (It was [being] the good) [*Rhetoric* 1.24, 1363a8–9]. It was the good even before anyone desired it; it is not the good because everyone desires it, but it is desired because it was already being the good. And it is only through this confrontation that the good shone because of what it was. Likewise, the *ti esti* of each thing, that *which is* what each thing is (its *quid*), becomes *ti ên* when confronted with what it *is* (that by which it Is). It is thus that we answer that question, which had heretofore remained unclear, of the relation between the *ti esti* and the *ti ên einai*. . . . The painter who paints a portrait of Callias sees first of all *what* he is: dark or light in tone, hirsute or bald, etc., but none of this is Callias yet; there is nothing that is not shared by many others, and all of it put together would produce only a material resemblance; but the artist continues his explorations until he reaches that which *is* all of that, that for which everything else was mere presupposition, that which, properly speaking, was being—and it is only then that Callias himself is presented. When Aristotle explains himself most clearly and simply, he says: the *ti ên einai* is each thing according to which it is *Itself*, disengaged from all accident, from everything that has to do with *hulê* [ὕλη], from everything that is other. We can fully render the Aristotelian expression by saying that it means "*das, was das jedesmal Seyende* ist" (Fr. "*ce qui* est *l'à chaque fois étant*"). For Aristotle, the *eidos* is *actus*, and consequently not a simple *quid*, but rather the *quod* [*dass*] of the *quid* posed in

the being; the *eidos* is synonymous with *ousia*, insofar as it is for that which is the cause of being every time—in our terminology, "*das es* seyende" (Fr. "*ce qui l'*est"). . . . I can answer the question "What is Callias?" with a generic concept, and say, for example: he is a living being; but that which for him is the cause of being (in this case, of living) is no longer something general, but rather the *ousia*, not in its secondary, but in its primary and highest meaning, the *prôtê ousia* [πρώτη οὐσία]. And this is *proper* to each, belonging to *no other*, while the general is shared in common with others. . . . It is *each one* itself; in the living being, it is what we call the *soul* (Fr. *l'âme*), of which it is said that it is the *ousia*, the "energy" of an organic body. And as energy, the soul is the *quod* of any determinate body. . . . Being what is [what it is] or even further—if one thinks of it as anterior—what was being [what it was being], this is the fundamental concept, the nature of the fourth cause, that by which it rises up far above the simple being.

(Schelling, *Philosophische Einleitung*, trans. Christian Hubert, based on French trans. by Courtine and Marquet, 376–80)

TO TRANSLATE

FRENCH	*traduire*
GERMAN	*dolmetschen, übersetzen, übertragen, überliefern*
GREEK	*hermêneuein* [ἑρμηνεύειν], *metaballein* [μεταβάλλειν], *metaphrazein* [μεταφράζειν], *metapherein* [μεταφέρειν], *metagraphein* [μεταγράφειν], *metharmozein* [μεθαρμόζειν]
LATIN	*vertere, convertere, exprimere, reddere, transferre, interpretari, imitari, traducere*

➤ ANALOGY, COMPARISON, CONNOTATION, EUROPE, HEIMAT, HOMONYM, INTENTION, ITALIAN, LANGUAGE, LIGHT, LOGOS, MIMÊSIS, SENSE, SUPPOSITION, TROPE, WORD

"To translate," in the generally accepted sense of "passing from one language to another," derives from a relatively late French adaptation of the Latin verb *traducere*, which means literally "to lead across" and whose application is both more general and vaguer than translation itself. We do well to keep in mind this initial, indefinite vagueness attached to the verbs we translate as the verb "to translate," verbs that always also designate something additional or something other than the passage from one language to another. We should keep in mind as well the determining role of Latin culture as it appropriated and adapted Greek culture in the construction of the Latin language. It takes at least two languages for any translation, but the Greeks, even when they spoke other languages, were willing to recognize only the *logos* [λόγος], their *logos*, the Greek language. Yet the lexicon of translation is partly Greek as well, since it derives from another foundational moment, the commission in Alexandria of a translation into Greek of the Old Testament, the Septuagint Bible, which joins together both interpretation and translation within *hermêneuein* [ἑρμηνεύειν] and in the hermeneutic gesture.

In different languages, particularly in Latin and German, a skein of recurring and varying tension runs through this lexicon of translation: between the precise and exact relations from one word to another (the *verbum e verbo* of the *interpres*) and the literary image (the *sensum* and *sensu* of the orator). The close proximity between translation, metaphor, and equivocation (the medieval *translatio*) is troubling for us. As a result, translation can both be appreciated as "treason," treachery, or betrayal, according to the Italian saying "*traduttore, traditore*," and, on the other hand, as the very essence of tradition (starting with that *translatio studii* that applies to the displacement of Greek, then Latin, then Christian knowledge right through to the *Überlieferung*, or transmission, that enabled Heidegger access to an authentic *Übersetzung*, or "translation." But as Schleiermacher explains, there are basically two, and only two, manners of translation: the exchange of supposedly equivalent linguistic values in the passage from one language to another according to the methods of an interpreting agency (*dolmetschen*) that "leaves the reader in peace as much as possible"; and the displacement of the reader in relation to his native language by virtue of the translation (*übersetzen*) such that they become foreign to each another, which is perhaps the best method for presenting it.

I. Greek Monolinguism: Hellenism or Barbarism

A. *Hellênizein*

One needs at least two languages in order to translate. But the Greeks, in A. Momigliano's expression (*Sagesses barbares*), were "proudly monolinguistic." Instead of speaking their language, they let their language speak for them. In this way, the polysemic value of the term *logos* [λόγος] allowed them to dispense with distinguishing between discourse and reason, between the language they speak and the language proper to man (see LANGUAGE, LOGOS, and GREEK, Box 4).

In a more definitive manner, *hellênizein* [ἑλληνίζειν] (after the adjective *hellên* [ἕλλην], "Greek") fixes under the same term the meanings of "speaking Greek" and "speaking correctly," or even, insofar as the corpus of rhetoric and the historico-political corpus are bound together here as one, to "behave as a free, civilized, and cultivated individual"—in short, as a person. To speak, to speak well, to think well, and to live well—these goals all nest together. Two occurrences in Plato reveal their interrelatedness. In the *Meno* (82b), the only criterion that Socrates applies to the young slave in order for him to come to understand the idea of the square root is that he "Hellenize": "*Hellên men esti kai hellênizei?*

[Ἕλλην μέν ἐστι καὶ ἑλληνίζει;]" (He is Greek and speaks our language?). Answer: Yes, he is "born to the household" (*oiko-genês* [οἰκογενής]). In the *Protagoras*, the apprenticeship into Hellenism is indistinguishable from the apprenticeship into political competence and the practice of *isêgoria* [ἰσηγορία], that equality of speech that is a characteristic of Athenian democracy. (327e: In the city, all are teachers of virtue, just as everyone in the home teaches the child to speak Greek. "In the same way, if you asked who teaches *hellênizein*, you would not find anyone." See VIRTÙ, Box 1; cf. B. Cassin, *L'effet sophistique*, pt. 2, chap. 2).

Beginning with Aristotle, *hellênizein* or *hellênismos* [ἑλληνισμός] serves as a chapter heading in treatises on rhetoric (Aristotle, *Rhetoric*, 3.5: "On correction") or on grammar (Sextus Empiricus: "Is there an art of the Greek? [*Esti d'archê tês lexeôs to hellênizein* (Ἔστι δ᾽ ἀρχὴ τῆς λέξεως τὸ ἑλληνίζειν)]"; *Adversus mathematicos*, 1.10). One has the choice of rendering the first sentence of the Aristotelian description as "The basis of expression is to express oneself in Greek" or as "The principle of style is in speaking correctly" (*Rhetoric*, 3.51407a20–21; on *lexis* [λέξις], see WORD, II.B and SIGNIFIER/SIGNIFIED).

In order for what one writes to be easily read or spoken aloud, one must simply respect the "natural order" (*pephukasi* [πεφύνασι]), the sequences set out by articles and conjunctions (that remain within the reach of memory in the same way as they are within hearing in the city) that respect semantic propriety (proper nouns, *idia* [ἴδια]; see PROPERTY), propriety of reference (by avoiding ambiguities and circumlocutions; see COMPARISON, HOMONYM), and propriety of grammar (the internal consistencies of genre and number). Speaking naturally, by following the accepted norms of clarity and precision—this remains the definition of Hellenism and of the classical "style": "whoever Hellenizes [*ho . . . hellênizôn* (ὁ . . . ἑλληνίζων)] is able to present the idea of things in a clear and distinct manner [*saphôs hama kai akribôs* (σαφῶς ἅμα καὶ ἀκριβῶς)], as in a conversation [*homilia* (ὁμιλία)] which signifies a band of warriors, companionship, society, commerce, relation—including sexual relation—the lessons of a master, discussion and the normal usage of a word" (*Adversus mathematicos*, 1.10.176–79). This concept cannot but provide support for a claim to universal legitimacy.

▪ See Box 1.

B. The semantics of verbs that touch upon the operation of translation

If translation does not constitute a problem all unto itself, this is because the difference between languages is not taken into consideration as such. Instead, the place of translation is more of a gap or void. So it should come as no surprise that there is no Greek verb that signifies "translating" purely and simply, even if a certain number of them can be rendered that way.

One of the most explicit and general models of the difference between languages is sketched out by Plato in the *Cratylus*: it is presented as a simple matter of phonetic difference. As long as there is a competent nomothete capable of forming names that take into consideration the *eidos* [εἶδος] (the

form which is the name in itself, naturally appropriate to its object), then the matter itself is of little import, and the user will be the one to judge if the tool (*organon* [ὄργανον]) is of value:

> And the legislator, whether he be Hellene or barbarian, is not to be deemed by you a worse legislator, provided he gives the true and proper form of the name in whatever syllables—this or that country makes no matter.

> (*Cratylus*, 390a)

The verb that Catherine Dalimier chose to render as "translation," *apodidôi* [ἀποδιδῷ], literally signifies "to render to someone by right," "to restitute," "to give in exchange," "to transmit." It substitutes for the expression *tithenai eis ti* [τιθέναι εἰς τι] (389d, 390e), "to transpose, to impose" (the name in itself) "in" (syllables), as one imposes the form of a shuttle on a particular piece of wood: the terms definitely derive from another technical model. Most often, besides, the difference between languages is taken into account in the major philosophical texts only as a gap or void, as if by inadvertence. It is only implicit in the text or in a concept, and there is simply no term to specifically designate the operation of translation; thus, Aristotle's *De interpretatione* simply mentions that "just as all men have not the same writing, so all men have not the same speech sounds" (1.16a5–6; see SIGN, Box 1) and refers to the Stoics' "signified" as that which Sextus Empiricus defines as "what the barbarians don't understand when they hear the sound" (*Adversus mathematicos*, 8.11; see SIGNIFIER/SIGNIFIED, II.A).

The operation of translation is touched upon from many different points of view. Thus our verb *hellênizein*, when used transitively, can mean "learning Greek" (Thucydides, 2.68), to "Hellenize" a barbarian, or later—but essentially only in relation to the translation of the Bible—to "express in Greek," and thus to "translate" words or a text (in the second century CE, in Dion Cassius [55.3], in relation to what we would call the transliteration of "Noah" or "Jacob"; see Flavius Josephus, *Antiquities of the Jews*, 1.6.1). The same holds true for a number of composite verbs that incorporate *meta*, as indicating trans-port and trans-formation: *metapherein* [μεταφέρειν] (to transport, transpose, employ metaphorically, or report); *metaphrazein* [μεταφράζειν] (to paraphrase), and especially *metagraphein* [μεταγράφειν] ("to change the text," "to falsify" but also "to transcribe," "to copy"). These all designate literary operations of a poetic, rhetorical, or philological nature and only marginally take on the meaning of "translating" in classical Greek. (For *metaphrazein*, see Flavius Josephus, ibid. 9.14.2; for *metagraphein*, see Thucydides ["On being translated," 4.50.2] and Lucian, *How History Must Be Written*, 21, in which a purist claiming to be an inheritor of Thucydides purports to "transform Roman names [*metapoiêsai* (μεταποιῆσαι)]" and "to translate them into Greek [*metagrapsai es to hellênikon* (μεταγράψαι ἐς τὸ ἑλληνινόν)] such as Chronion for Saturn" or others even more ridiculous.)

The Aristotelian title *Peri hermêneias* is rendered as *De interpretatione*, as *Lehre vom Satz*, but never as "On Translation," and yet it is the phrase *hermêneuein*, meaning "interpreting, explaining, expressing," in the manner of one who puts his

1

What is a "barbarian" for a Greek?

➤ *AUTRUI*, COMPARISON, PEOPLE

Hellên and *barbaros* [βάρβαρος] are, as Koselleck puts it, "asymmetrical antonyms" (*Futures Past*, pt. 3, chap.1): the former is both a noun and a proper name as well, while the latter is only a common noun. *Barbarizein* [βαρβαρίζειν] is an onomata-poesis similar to "blah-blah-blah" (Fr. *bla-blater*; cf. Lat. *balbus*, stutter) and refers to a conjunction of linguistic, anthropological, and political features that make the "barbar-ian" altogether other from the self, a *heteros* [ἕτερος]—that make it unintelligible, per-haps even not altogether human.

In the rhetorical and grammatical cor-pus, "barbarism" refers to an effect of un-intelligibility: for instance, in poetry, when one diverges from the proper meaning or common use (*to idiôtikon* [τὸ ἰδιωτικόν], *to kurion* [τὸ κύριον]) and uses "foreign" expressions instead (*xenika* [ξενικά]). Too many metaphors result in *ainigma* [αἴνιγμα]. a confusion of the signifier, and too many borrowings (*glossâi* [γλῶσσαι]) lead to *barbarismos* [βαρβαρισμός], gib-berish, and the confusion of the signi-fied (Aristotle, *Poetics*, 22.1458a18–31; see LANGUAGE, II.A). Diogenes Laertius went so far as to specify the difference, which is still current in classroom exercises, between "so-lecism" (*soloikismos* [σολοικισμός]), which is an error of syntax, and "barbarism," which is an error of morphology—which renders a word morphologically unrecognizable (7.44 and 59).

For the Greeks, the underlying problem was apparently to determine whether bar-barianism (and hence Hellenism as well) is itself a fact of nature or a fact of culture (see BILDUNG, Box 1). Hence Antiphon uses the verb *barbarizein* to refer to those who make the distinction between Greek and barbarian into a natural distinction: "We make ourselves into barbarians in relation to each other [*bar-barômetha* (βαρβαρώμεθα)] whereas by virtue of nature itself, we are all naturally made to be barbarians and Greeks [ὁμοίως πεφύναμεν καὶ βάρβαροι καὶ Ἕλληνες εἶναι]" (P. Oxy, 1364 + 3647, fr. A, col. 2, in Bas-tianini and Decleva-Caizzi; cf. Cassin, *L'effet sophistique*).

Similarly, Euripedes's *Orestes* contrasts a barbarian conception of Hellenism, which Orestes believes is a result of a natural differ-ence, with a Greek conception of Hellenism, based on respect for legality, for the law, and maintained by Tyndareus (Cassin, ibid.), and Isocrates praises Athens for this advance:

Our city has made the use of the word *Greek* no longer as a reference to the race [*mêketi tou genous* (μηκέτι τοῦ γένους)] but as a reference to the intellect [*alla tês dianoias* (ἀλλὰ τῆς διανοίας)], and we refer to those who play a part in our upbringing [*paideuseôs* (παιδεύσεως)] as Greeks, rather than to those who have the same nature [*phuseôs* (φύσεως)] as us.

(*Panegyric*, 4.50)

But in either case, the question is in the end a political one: barbarians are those who sub-mit to, or even seek out, despotism. If, accord-ing to Aristotle, "barbarians are more slave-like by nature [*doulikôteroi* (δουλικώτεροι)] than are the Greeks" (*Politics*, 3.14.1285a20; cf.1252b9, 1255a29), it is because, like the slave in his mas-ter's house, the barbarian is de facto ruled des-potically (*despotikôs* [δεσποτικῶς]), according to the Persian model (every Persian, a slave to the great ruler, is "another's man") in contra-distinction to the hegemonic (*hêgemonikôs* [ἡγεμονικῶς]) Greek model, which binds a leader (*hêgemôn* [ἡγεμών]) and a free man. This is what is at stake in the entire book 7.7 of *Politics*, which lays out a first theory of cli-mate, in which the Greeks occupy a temperate middle zone between the thymic, passionate, and cold zones of Europe, in which life is free but disorganized, and a hot, dianoetic, and technical Asia, in which life is lived in submis-sion. As for Greece, it is both passionate and intellectual; it is "capable of living in freedom within the best political institutions, and it has the capacity to give directions to all." An inter-nal domination, the slavery of the slave, rests on an external domination, the slavery of the barbarians, who require a master, in a theoreti-cal compact to which the modern era will no longer so easily subscribe (cf. Cassin, *Aristote et le logos*, pt. 1, chap. 3).

thoughts into words (Plato, *Laws*, 966b) as well as one who serves as the interpreter for the gods (the poet, the rhapso-dist, the seer), that is the most likely candidate for the retro-version of "translating" (starting with Xenophon, *Anabasis*, 5.44). At least this is what the future will hold (see below, II and III).

II. Greece in Rome: Translating/Adapting

In the classical Latin authors, the translation from Greek into Latin very barely satisfies modern criteria, and the process of translation itself is not clearly defined in the Latin language: the verbs *vertere, convertere, exprimere, reddere, transferre, inter-pretari, imitari* can all refer to what we would call "literal translation" as well as to looser adaptations of Greek mod-els. The fact that we are unable to find a sharp distinction between literal translation and literary adaptation in these verbs rather clearly indicates that the question of transla-tion is posed differently in the classical period than it would subsequently be raised starting with Jerome and the transla-tion of sacred texts, when faithful rendering *verbum pro verbo* will become the very principle of translation: for the classics, translation consists of adhering to a meaning (*vis*) and not to a word (*verba*), and it is primarily an occasion for reflection on the creative modalities of the Latin language. At play in "translation" is the very reception of Greek culture in Rome, with all that entails.

A. Fluidity of meanings and contradistinctions

The uses of the verb *interpretari* in a single author reveal the fluidity of meanings that only contradistinctions can fix point by point. Thus Cicero has Varro say (*Academics*, 1.8) that he has imitated (*imitari*) rather than translated (*inter-pretari*) Menippus. Cicero himself specifies that he followed (*sequi*) Panetius rather than translating (*interpretari*) him in his treatise *On Duties* (2.60). But the same verb applies as much to the hermeneutic activities of the Stoics in relation

to the mythic narratives (*On the Nature of the Gods*, 3.60) as to the interpretation of a philosophical doctrine (*On Moral Ends*, 2.34) or the adaptations of Greek works by the founders of Latin literature, such as Ennius did for *Sacred History* of Euhemerus (*On the Nature of the Gods*, 1.119).

None of the other verbs referred to above is sufficient to specifically designate the activity of translation: instead, each of them allows the Latin authors to define their work in relation to a Greek "model." The lexicon of translation can thus be understood only in relation to the tensions of literary polemics and within the specific context of Latin literature.

When Plautus uses the verb *vertere* to refer to his translation/adaptation of a Greek play, his usage is not neutral but instead underscores the difficulties that underlie the development of the literary Latin language (*The Comedy of Asses*, v. 11) In Greek, this play is called *The Donkey Driver*. It was written by Demophilus, and Maccus [Plautus] translated it into the barbaric language (*vortit Barbare*). "To translate into the barbaric tongue," that is to say, into Latin, is a provocative expression that Plautus also employs in *The Three Crowns* (v. 19), and it must be understood as a literary manifesto: that it is not a matter of submitting to the original language, the Greek, in relation to which everything else is the barbaric. On the contrary, in order to avoid the loss of meaning and end up with an incomprehensible language, one must write in one's own language and create one's own language. This is why Terence can contrast his comic rival's ability to translate well and his inability to write well:

> By translating well, but by writing poorly, he took good Greek comedies and made them into Latin ones that weren't.
>
> ([Q]ui bene vertendo et easdem scribendo male / ex graecis bonis latinas fecet non bonas.)
>
> (*The Eunuch*, v. 7–8)

B. Cicero and the sparkle of philosophical translation

The articulation between translating/adapting/creating sketched out by the Latin playwrights is explicitly taken up by Cicero, who defines his conception of philosophical translation in reference to the practices of the founders of Latin literature:

> Even if I were to translate [*vertere*] Plato or Aristotle literally, as our poets did with the Greek plays, I hardly think I would deserve ill of my fellow citizens for bringing [*transferre*] those sublime geniuses to their attention. . . . If I think fit, I will translate certain passages, particularly from those authors I just mentioned, when it happens to be appropriate, as Ennius often does with Homer and Afranius with Menander.
>
> (*On Moral Ends*, 1.7)

What is at work in this "transfer" from Greece to Rome is not some simple transport of booty, even if this dimension is always present in the background (see, e.g., *Tusculan Disputations*, 2.5: where it is expressed that it is necessary to tear away [*eripere*] Greece's philosophical preeminence in philosophy and transfer it to Rome): the verb *transferre*

also describes the displacement of meaning that is at work in the deployment of metaphor. By using the same verb for the activity of translation and the creation of metaphors, Cicero establishes the link in language between translating and writing; one has only to apply to translation what he has to say about the development of metaphor, undoubtedly starting from the Aristotelian reflections on metaphor as a process of enrichment of language, to define translation as a true creation:

> The third genre of ornament, the metaphorical use of a word, is born of necessity and constrained by need and inconvenience; it subsequently finds general application as a result of the pleasure and ease which it provides.
>
> (*On the Ideal Orator*, 3.155)

But this *rapprochement* has a broader scope as it is inscribed in language itself. The Greeks, who have no need to "translate," do not take advantage of this potential usage of *metapherein* (Plato uses it once to designate the transcriptions of proper names: *Crito*, 113a), and when Plutarch invokes the philosophical works of Cicero (*Life of Cicero*, 40), he uses the verbs *metaballein* [μεταβάλλειν] and *metaphrazein* to designate his "translations" in general and employs the term "metaphor" only in connection with isolated translations of terms that Cicero was unable to render through a word in its common form of usage. The work of polysemy that Cicero achieves through *transferre* is invisible to the Greek language because its referent is something only thought in Rome: to translate is to achieve a new splendor, a new brilliance that results from a use of language that is out of the ordinary, that results from borrowings instead of the familiar and proper usage: "these metaphors are a kind of borrowing [*mutationes*] which enable us to find elsewhere what we are lacking ourselves" (*On the Ideal Orator*, 156). The language of the other can thus provide what is lacking, but borrowings are only acceptable and provide appropriate ornamentation if they are fully reappropriated. To put metaphors (*verba translata*) to good use, "rather than suddenly appearing in some place that does not belong to them [*alienum locum*], they must appear to take up residence [*immigrasse*] in their own surroundings" (*Brutus*, 274). This is none other than an integration, a borrowing that does not arrive as a foreigner but makes itself at home. Seneca will also say that the "Latin grammarians give the [Greek] word *analogia* the right to the city [*civitas*]" (*Seneca's Letters to Lucilius*, 120.4). This idea of the reception of the Greek language, described as the integration into the body of citizens, validates the link established between translation and the use of metaphors by the verb *transferre*. It does not consist of a change from one language to another. It takes place within a single language, as a result of the transfer from Greece to Rome, as displacements and borrowings that create splendor: "[T]he metaphors draw attention to the discourse and illuminate it like so many shining stars" (*On the Ideal Orator*, 3.170). This is the sense in which Lucretius calls his poem a "translation" of the doctrine of Epicurus: "bringing to light the obscure discoveries of the Greeks" (1.136–137) and "composing sparkling verses on obscure subjects" (1.933)—bringing a new splendor and

luminous intelligibility through translation by appeal to the senses. If "all metaphors are addressed directly to the senses, especially to the sense of vision, the most penetrating of them all" (*On the Ideal Orator*, 3.160), one can see that what is at stake in the transference by translation is precisely to achieve a form of immediacy in the form of the "living" language of Latin.

III. Translations of the Bible: The Lexicon of Translation and the Status of the *Hermêneus*

The translation of the Bible into Greek is not a counterexample to the monolinguism of the Greeks but rather an illustration of it. This translation is of Jewish inspiration rather than of Greek, born from the idea that Greek is de facto the language of culture par excellence, which enables it to render accessible the Book par excellence.

The body of literature that will be given the overarching title of *Biblia* [Βιβλία] in the twelfth century of the Common Era was translated into Greek first, though only in part, in Alexandria starting in the third century before Christ. It was a great novelty in the world of culture. These Greek "writings" (*graphai* [γραφαί]), which even today embody the Old Testament in the Greek Orthodox Church, served straightaway as the linguistic matrix for Christian doctrine, providing the concepts and expressions that course through the new phraseology. These texts provided the basis for most of the older versions of the Bible, right up to the translations of Cyril and Methodius (middle of the eleventh century) into old Slavonic. Competing Greek versions of the text appeared in the course of the second century, including an extremely literal one commissioned by the rabbis from the proselytizer Aquila. But this did not keep the former from serving as the exclusive source of the first Latin translations. Saint Jerome first proposed a series of scientific and literary revisions before deciding to directly translate the Hebrew texts of Jewish writings directly into Latin. The end result of his work of revision and translation was the Latin Vulgate, the official Bible of Roman Catholicism until the middle of the twentieth century. Jerome remained the champion of what he would himself call *hebraica veritas*. This conception even served as a model for Luther's German Bible. But in actuality, and despite his intent, a reign of *latina veritas* was the result of Jerome's labors instead. For centuries the Latin Vulgate would provide the textual basis for most translations into the so-called vernacular languages. Whatever the destiny of the Greek Bible itself, its appearance in classical antiquity signals an important moment in the very history of culture. Moses, in fact, lays down a challenge to Homer! And most of all, the objective foundations of the lexicon and of the discourse that have subsequently come to be known as "translation" are put irreversibly in place.

A. The Greek Bible of the Septuagint

Thus, in the third century before Christ, the peoples of *Iouda*, or the *Ioudaioi* [Ἰουδαῖοι], took up the translation of their *hagiai graphai* [ἅγιαι γραφαί], "holy writings," into Greek, starting first and foremost with the Law of Moses, *nomos* [νόμος]—or as they would say, their *nomothesia* [νομοθεσία], or "constitution." The *politeuma* [πολίτευμα], the "community within the city" that they formed in Alexandria, protected their difference of nationality, and it would subsequently gain political recognition as well. Versions of the other books followed: spread out over two or even three centuries and probably completed by Christian writers. This was an event without precedent. The idiom of the Greeks, the language of thought that aspired to universality, now became the language of the Bible. Toward the end of the second century BCE, a widespread legend, first referred to in the *Letter of Aristeas*, would introduce "the book" (*hê biblos* [ἡ βίβλος]), as the law in question became Greek, as the extraordinary work of seventy or seventy-two scholars of *Iouda* at the request of the grand priest of Jerusalem. The order is said to have come from the royal librarian of Alexandria at the request of the second monarch of the Ptolemaic dynasty, Ptolemy Philadelphus (Ptolemy II). The latter wanted the books of the *Ioudaioi* included in the famous library of his sumptuous city. According to the same source, each of the translators translated the text in a rigorously consistent way, identical to the work of the other translators. In the middle of the second century CE, Christian authors circulated or forged the letter and set in place the Latin word *septuaginta*, "seventy." They made this into the general title of this collection of Greek writing that they had inherited and would henceforth be the only ones to use. The word is still in use today—although not without ambiguity, since the legendary role of the "seventy" applied only to the five books of Moses—as the title of the Greek Old Testament.

B. Translation, interpetation, inspiration, prophecy

The unprecedented event of the translation of the Law appealed immediately to the theoreticians of the local Judaic community, which was entirely hellenophonic. It was thus and at that moment that the conceptual field of translation became established in the Greek lexicon. The verb *hermêneuin* and the nouns, *hermêneia* [ἑρμηνεία] and *hermêneus* [ἑρμηνεύς] saw their respective meanings of "express" or "signify," "expression," "signification" or "interpretation," and "interpreter" become qualified to specifically signify "translate," "translation," and "translator." Other etymologically related and practically synonymous terms, such as *diermêneuein* [διερμηνεύειν] and *diermêneusis* [διερμήνευσις], were subject to the same process. The word *metagraphê* [μεταγραφή], "copy" or "transcription," came itself to signify "translation," and *metagraphein*, "to transcribe" or "to copy," became equivalent to "translate." The verb *metagein* [μετάγειν], to "deport," now applied to the text as "transferred into another language"; in other words, "translated" (*Prologue* by the translator of the *Siracides* around 100 BCE). Recourse was also taken to *metharmozein* [μεθαρμόζειν], "to arrange differently." Three great agents or Judaic witnesses of this semantic innovation succeeded one another between the second century BCE and the first century CE, all of them convinced that the translation of the Law was in response to an external political will. Around 180 BCE, the philosopher Aristobulus claimed that the "entire translation [*hermêneia*] of the Law" was realized under Ptolemy Philadelphus, but he insisted that there had been previous attempts at translation, ones that were fragmentary or flawed, which is impossible to verify anyway. His intention was to make more credible his own belief that Moses, the father of universal culture, was the original teacher of the Greek thinkers,

especially of Plato and Pythagoreas, who would have learned directly from the Greek sources of "the Law" (text cited by Eusebius of Caesaria, *Praeparatio evangelica*, 13.12.1). Aristobulus was the first to demonstrate the use of *hermêneia* in the technical sense of "translation." A half-century later, and still in Alexandria, a lengthy piece of fiction appeared carried down in its entirety under the title *Letter of Aristeas*. This work decisively confirms the use of *hermêneia* as "translation," a term it immediately distinguishes from *metagraphê*, "transcription." It also contains the formulaic expressions *ta tês hermêneias* [τὰ τῆς ἑρμηνείας] and even *ta tês metagraphês* [τὰ τῆς μεταγραφῆς], the "work or works of translation" that one "executes" (*epitelein* [ἐπιτελεῖν]), or that one "achieves" (*telein* [τελεῖν]). As for the "translators," it would seem that they are still designated only by a participle of the verb *diermêneuein*.

The decisive setting up of the complete lexicon of translation is both certified and commented upon by the Alexandrian exegete and philosopher Philo in the first decades of the first century. The relevance, if not the legitimacy, of the act of translating the *hierai bibloi* [ἱεραὶ βίβλοι] (the sacred books) or simply *graphai* (writings) is demonstrated within the framework of a theological reasoning in which the mythological figure Moses plays the central part. Here are two essential texts:

1. For any time that Chaldeans who know the Greek language, or Greeks who know Chaldean [i.e., Hebrew] were to come upon the two versions [*graphai*] simultaneously, namely the Chaldaic and the translated version [*hermêneutheisê* (ἑρμηνευθείση)], they would look upon both of them with admiration and respect them as sisters, or rather as one and the same work in both substance and form, and they would call their authors not translators [*hermêneutheisê*] but hierophants and prophets to whose pure minds it had been granted to go along with the purest spirit [*pneuma* (πνεῦμα)] of Moses.

("A Treatise on the Life of Moses," 2.37)

2. For a prophet does not utter anything whatever of his own, but is only an interpreter [*hermêneus*] of another being who prompts and suggests to him all that he utters, at the very moment he is seized by inspiration [*enthousia* (ἐνθουσία)].

("The Special Laws," 4.49)

For Philo, the Greek translation of the writings is equally as "inspired" as the Hebrew original. The same holds true in his eyes for the interpretation of the sacred texts, which is limited to a small number of the elect, or the "initiates." To add force to his argument, he resorts to the register of the mysteries in the same manner as the Alexandrian writers in their explications of Homer's works. The schema that underlies his propositions is that of language (*logos*) as the interpreter (*hermêneus*) of thought or spirit (*nous* [νοῦσ]), whence his expression *ho hermêneus logos* [ὁ ἑρμηνεὺς λόγος], "the speech which translates our thought" (*De somniis*, 1.33). He uses the same schema in relation to the fact or process of divine revelation. The science and God's word (*logos*) have

their interpreter (*hermêneus*) in Moses. Philo designates the latter as *ho theologos* [ὁ θεολόγος] (*De proemiis et poenis*, 53; *De vita Mosis*, 2.115). Insofar as the divine *logos* expresses itself through the "holy laws [*nomoi hieroi* (νόμοι ἱεροί)]," Moses is their *hermêus*, or more precisely, *prophêtes* [προφήτης]. Yet he himself needs interpreters in his own image and of his stature, whence Philo's report of a chain of interpreters, "prophets," in which the translator and commentator hold the same rank, each "inspired." (We can compare this with Plato's *Ion*, in which the chain of enthusiasm goes from the muse or from the god to the poet and then to the rhapsodes, whose performances interpreted the interpreters [533c–535a]). Thus all the quantitative and qualitative divergences of the Greek version of the holy books are a priori justified and already fully recognized as authentic *graphai*. In some cases, the translator went to great lengths to repair the language of the works, occasionally going so far as to write what amounts to a new text. This is particularly evident for the book of Proverbs, entirely redrafted by a talented author of Greek wisdom. This is indeed the case of a *hermêneus* who is not so much a "translator" as an "interpreter" with literary and even musical connotations, since the book also contains poetry. But if there is translation nevertheless, it is insofar as the biblical message remains constant through its potency and deep articulations in relation and opposition to everything else. The semantic plenitude of the word *hermêneus* is thus assured.

C. Jerome, translator (*interpres*) or writer (*orator*)?

With Jerome (born in 347 CE near Emona, now Ljubljana in Slovenia, and died in Bethlehem in 420 CE), who was trained at a high level of humanism in Rome, the occidental destiny of the Christian Bible arrived at a decisive threshold. Very early on, he undertook to revise the text of the Latin scriptures, which appeared first in Africa around the beginning of the third century CE, then in Spain and in southern Gaul, and finally in Rome. Aside from the so-called Vulgate of Jerome, these writings are known as *Vetus Latina*, "old Latin," *Vetus edition, Antiqua translatio,* or *Vulgata editio.* Augustine called them *Italia*, "the Italian." Jerome considered all translations prior to his to be *vulgata editio*, or "commonly accepted editions," starting with the Septuagint (*Letters of St. Jerome*, letter 57, to Pammachius, para. 6). The variants of this *editio*, and especially the recensions, seemed to reflect a very ancient model of Greek related to a Hebrew family of texts that were found among the scrolls of Qumran.

This Bible made a significant contribution to the establishment of Christian Latin as distinct from classical Latin. The vocabularies of occidental languages that derive from Latin are deeply influenced by it. Shocked by the profusion of variants and its general literary impoverishment (at one point a *sermo humilis* had been the rule), Jerome wanted the Bible to be worthy of a Roman society that was rediscovering its classics. An extended stay in the East enabled him to perfect his knowledge of Greek and to properly learn Hebrew. He first used these skills with the encyclopedic accounts of Eusebius of Caesarea. Upon his return to Rome, he began to revise the Latin text of the Septuagint, limiting himself to stylistic corrections. In 386, he settled in Bethlehem permanently, where he discovered the *Hexapla of Origen*. His confrontation

with this exhaustive synopsis in six columns raised profound questions regarding the truth of the text and its language. And he undertook the task of addressing them, limiting himself to the Hebrew canon of writings. He became increasingly open to Greek versions of the text other than the Septuagint, such as those of Aquila, Symmachus ben Joseph, and Theodotion. These were much closer to the Hebrew text that was already the official Jewish version than was the Alexandrian translation, the classic text for the Christians. Jerome thus adopted the Hebrew text as the only basis for the "revealed" truth, what he called *hebraica veritas*. This would be the third and final phase of his work as a translator, which lasted from 390 to 405. In his Latin translation of the Hebrew corpus, he was returning *ad fontes*, "to the sources." He put aside, although not completely, the other books contained in the Christian Bibles, generally known as deuterocanonic, which he called apocryphal. Beginning in the thirteenth century, the Latin Bible that derived from the work of Jerome was called the Vulgate. Its contents do not all come from Jerome. As in the case of most of the deuterocanonic books, it limits itself to adopting the older revision of the text of the *Vetus Latina*. The success of the long work of editing that the Vulgate embodies results from the fact that it answered the pressing need to have a standard text with a prestigious signator as well as being partly anonymous. It would thus remain the official Bible of the Roman Catholic Church until the middle of the twentieth century.

As a firm proponent of the *hebraica*, or *hebrea veritas*, Jerome saw the Hebrew language as the "matrix of all languages" (*matrix omnium linguarum*; *Book of Commentaries of the Prophet Sophonias*, 3.14–18), as the first language from which all others derive. As the originary language, Hebrew was thus at constant risk of having truth erode. Jerome was sympathetic to the pessimistic theory of history dear to Hesiod, which sees history as the progressive decay of humanity with perfect truth found only at its point of origin. So the Greek version of the Septuagint could only be a pale reflection of the Hebrew bible. Nonetheless, Jerome believed himself qualified to translate the holy books because his interventions occurred after the coming of the Christ, the historical principle of all truth. In regard to the technical framework that he formulates, his competence is far greater than that of the Septuagint, whose version, he admits, had "prevailed with good cause in the churches because it had been the first one . . . and the apostles had made use of it" (*Letters of St. Jerome*, letter 67, §11). But he justifies his rule of the *hebraica veritas* through the philosophy of language, influenced by Origen and Plato's *Cratylus*). Adopting the doctrine of the indivisible link between "being" in Greek, *on* [ὄν], and the "name," *onoma* [ὄνομα], he shows that this union is most forcefully achieved in the Hebrew language, the primordial idiom and the most apt to express and guarantee the truth. He comments upon it in these terms:

Just as there are twenty-two letters in Hebrew with which to write everything that is said, and that the human language is captured through the elementary functions of the letters, so too are there twenty-two books of the Bible, through which, as by the letters and

basic rudiments the tender childhood of the just man is instructed in the divine doctrine.

(Prologue to the Book of Samuel
in the Book of Kings)

Thus, there was the need to have recourse to the Hebrew text in order to translate the Bible and to limit the translation to the Hebrew corpus as a remedy to both the excesses and deficiencies of the Septuagint. The "revealed" truth, which is one with the "name," in other words the formula itself, will thus be preserved. The books translated by Jerome will not be "corrupted by the transfer into a third vase [*in tertium vas transfusa*]." "Stored in a very clean jug as soon as they leave the press, they will retain all their taste" (Prologue to the books of Solomon).

For profane works and in his youth, Jerome claims to have applied the rules of Cicero or Horace, translating not "*verbum e verbo* but *sensum e sensu*," not "as a simple translator, but as a writer [*nec . . . ut interpres sed ut orator*]." He specifies that "I have not translated the words, but rather the ideas [*non verba sed sententias transtulisse*]" (*Letters of St. Jerome*, letter 57, §5 and §6). And he invokes those authors, starting with the Septuagint, who "translated according to the meaning [*ad sensum interpretati sunt*]," or some others, like Saint Hilary of Poitiers, who "captured the ideas in his own language by the law of the victor [*victoris jure transposuit*]" (ibid.). For the sacred texts, Jerome requires *verbum e verbo*. But what this means is that he does not want to lose a single word, for each and every one contains part of the divine "mystery" (*mysterium* or *sacramentum*). He is thus a "translator" and not a "prophet": "It is," he states, "the erudition and richness of the words that translate what one understands [*eruditio et verborum copia ea quae intellegit transfert*]" (Prologue to the Pentateuch). Even if he uses it, he rejects Aquila's Greek translation, done by a "meticulous interpreter [*contentiosus interpres*] who translates not only the words but also the etymologies" (*Letters of St. Jerome*, letter 57, §11)—in other words, Jerome rejects the servile forms of literality that evacuate the "mystery," the carrier of truth. In addition, he affirms that the *ad verbum*, or literal, version "sounds absurd" (ibid.). The hermeneutic way of putting *verbum e verbo* to use allows the talent—or even the genius—of the translator, in this case Jerome, to come into play without affecting the meaning or *mysterium*. It is even possible sometimes to "keep the euphony and propriety of the terms [*euphonia et proprietas conservetur*]" (ibid., letter 106, §55). This explains and justifies the literary qualities and even the audacities of Jerome's translation, which is certainly exempt of all servility.

Jerome's contemporary and correspondent Augustine rejected the rule of *hebraica veritas*. For him, the Greek text of the Septuagint is "inspired by the holy Spirit": it is the very best version in existence. This means that if there is an original truth, it is contained within this text. This Greek Bible had truly announced the Christ (e.g., by introducing the adjective *parthenos* [παρθένος], "virgin," to translate "young woman" in reference to the mother of the Emmanuel, in Isaiah 7:14), and the church made this translation its own. Augustine believed in the progress of humanity through history, culminating in its final stage, which the Christ had "completed." In addition, his position is directed by a

concept of language that stems from the Stoic doctrine of the *res et signa* (the things and the signs; *On Christian Teaching*, bks. 1 and 2, passim). If *on* and *onoma* are fused, *res* and *signa* are separated. The unique and only *res* for Augustine is God, and *veritas* is just another way of saying God. Language, on the other hand, falls under *signa*, and writing is only a "sign" of a "sign": it cannot be identified with truth, which belongs to the order of the *res* (see SIGN, and below, IV).

IV. Medieval *Translatio*

In the Middle Ages, the term *translatio* encompassed different usages, all of which referred to a common idea of "displacement" or "transfer":

1. "transfer from one meaning to another" for one word, or "from the name of one thing to another" in a given language;
2. "transfer of a term from one language to an equivalent term in another," whence "translation" (see the difference with *etymologia* and *interpretatio*);
3. "transfer of culture or government from one epoch to another," "from one place to another" (*translatio studii, translatio imperii*).

A. Transfer of meaning

The notion of *translatio* is truly at the confluence of the arts of language (grammar, logic, rhetoric) and of theology. In its widest accepted meaning, the term *translatio* designates a transfer of meaning, a displacement of signification, from a proper usage to an improper usage. In a narrower acceptance, which one can find in grammar or rhetoric (in Quintilian or Donatus, for example), *translatio* is equivalent to *tropus*, defined as a change in signification for reasons of ornament or necessity (cf. Quintilian, *The Orator's Education*, 12.8–9) In an even narrower sense, *translatio* is equivalent to *metaphora*, which is one of the tropes; it entails using a word in some unusual and particular way, either because there is no proper word for this meaning or because this usage intensifies the meaning. The new use of the word is based on a perception of a resemblance between the thing that it properly signifies and the object to which it applies by transfer (e.g., when one says of some person: "he or she is a lion" because of his or her strength). The two first meanings apply equally to a single word as to a sequence of words; the third applies to a word in isolation. The terms *translatio* and *transumptio*, which had been distinct from each other in antiquity (e.g., with Quintilian), were, according to some medievalists, used interchangeably in the Middle Ages.

1. *Translatio*: Equivocation/ornament

In a very influential passage of his first chapter of the *Categories* of Aristotle, Boethius introduces the notion of *translatio*. He distinguishes two cases: (1) the transfer of meaning that occurs when one uses the name of one thing to designate another that has no name; this is done out of "penury of names" and results in equivocation, since the same name now applies to two different things; (2) the transfer of meaning that occurs for reasons of ornamentation and that does not result in equivocation (e.g., using *aurigia* [cart driver] to refer to the pilot of a ship, although this has its own proper name: *gubernator*) "*Translatio nullius proprietatis est* [transfer is a property that belongs to no thing]," says Boethius, and this formula must be understood in relation to case (2): the transfer does not establish the property of a thing (since it does not receive its proper name by transfer) nor of a name (since the transferred usage does not constitute a stable or permanent property of the name). Abelard will also emphasize this latter point: the transfer occurs for some given length of time as part of a specific utterance and is to be understood in its context. He thus confirms that this does not lead to equivocation, since there is no new imposition of meaning, only an "improper" usage. He adds that this kind of *translatio* is a form of *univocatio* because there is only a single imposition, even if the term takes on an acceptation different from the original acceptation. The analysis of several of these variations in acceptation that are contextually determined, along with the idea of *univocatio*, forms the basis for elaborating the theory of supposition: one speaks of *translatio disciplinalis* for the specific ways terms are used in expressions of grammar (e.g., *homo est nomen* ["man" is a noun]), of logic (*homo est species* ["man" is a species]), or of poetry (*prata rident* [the prairies are laughing]). It is a matter of determining if the predicate is the reason for the particular acceptation or if it only actualizes some semantic potentialities already contained in the term. In the context of the medieval commentaries on Aristotle's *On Sophistical Refutations*, *translatio* is often analyzed as the second kind of equivocation: between the equivocation that is produced when two signifieds are equally present in the term (e.g., *canis*) and the contextually determined equivocation (e.g., *monachus albus*, "white monk" [Cistercian], where *albus* can only refer to the Cistercian in this particular context), one finds *translatio*, in which the two acceptations of a term are in a hierarchy "according to the anterior and the posterior [*secundum prius et posterius*]." One can see that the medieval commentaries are more precise than Aristotle's original text, which is difficult to interpret because of the absence of examples to illustrate this second kind; it seemed to concern the semantic variations due to use, when we make a habit of using a word in a sense that it did not originally have (166a–b16–17): "another manner, is when we have become used to expressing ourselves in a certain way"). In the thirteenth century, the notion of *analogia* would be developed within this second category, as when one acceptation is primary and all the others can be traced back to it according to a determinant relation (e.g., *sanum* relates first to the health of the animal, then later, and in relation to the first, to the urine, the potion, etc.).

2. The theological context

In a theological context, Augustine contrasted *signa propria* and *signa translata* (*De doctrina christiana*, 2.10.15); among the latter, he mentions the name "bull," which properly refers to the animal but also, by *usurpatio*, refers to the evangelist: the name properly refers back to a thing, which itself refers back to a second thing, and it thus signifies the second by transfer. In a different perspective, the *De trinitate*, §4 of Boethius, which takes up in part the *De trinitate*, §5 of Augustine, is the point of departure for a series of important reflections. In this text, Boethius speaks of the *mutatio* of categories when applied to the divinity: they are modified as a function of

the subjects they are applied to, whence the adage "*talia sunt praedicamenta qualia subjecta permiserint* [the categories are such as their subjects permit them to be]"; when the predicates apply to something other than the divine reality, they can be substance or accidents; but they are modified when they apply to the divine ("*cum qui in divinam verterit predicationem cuncta mutantur que predicari possunt* [when one turns to divine predications, that which can be predicated finds itself completely changed]"). The adage is subject to two modifications in the context of the analysis of the propositions of Trinitarian theology. The first substitutes *predicata* for *praedicamenta* and gives it a semantic application: the value of predicates, when applied to divine reality, can change, even to the point of rendering false the utterance, says John of Salisbury in the first half of the twelfth century, and on the same occasion, Thierry de Chartres specifically talks of the "*verborum transsumptio.*" The second transformation consists in the inversion of the terms *subjecta* and *praedicata* ("*talia sunt subjecta qualia praedicata permittunt*" [subjects are such that predicates allow]) It is no longer an issue of showing the "improper" character because of the "transfer" of the discourse on God, but rather of setting out a general principle making the semantic and referential properties of the subject depend on the nature of the predicate (e.g., the predicate "engender," in "God engendered" [*Deus generat*] restricts the subject "God" to refer only to God the Father). Through this latter acceptation, the adage becomes the very principle of contextual semantics developed by the determinist logicians of the thirteenth century.

The notion of the transference of meaning was also influenced by the Dionysian tradition, starting with John Scotus Erigena, who took up the teaching of Pseudo-Dionysius. The term "metonomy" (translated as *transnominatio* in Erigena or as *denominatio* in John Sarrazin) is generally used here, and the trope by the same name likewise designates a transfer of sense based on different relations, especially from cause to effect, which makes it particularly useful in this context. Erigena chooses the term *translatio* (and its derivations) both for the transfer of categories and the transfer of names, and this usage would continue in all subsequent literature devoted to the divine names. He also speaks of *metaphora* when he considers types of relation and resemblance, but also relations of opposition and difference, which legitimize the transfer of names to God. These latter are affirmations that are called *per translationem*, which are improper and false, while the negations are proper and truthful.

The idea that names are attributed to God by a process of *translatio*, which results in an improper usage because it is different from the one assigned to the name by virtue of the first imposition, leads to the analysis of translated usages as examples of equivocation, *aequivocatio* (Abelard, and then the commentators on *De trinitate* of Boethius: Gilbert de Poitiers and Thierry de Chartres). At that time, one generally considered there to be "equivocity" between a noun or name applied to a created reality (which the name is proper to, having been first imposed upon it) and a noun applied to God. Toward the end of the twelfth century, several authors would think the opposite, that there is "univocity" in "God is just" and in "man is just" because in both expressions the word "just" signifies the same thing (whence the *univocatio*)

but *connote* different properties (the root of all justice and the effect of divine justice, respectively). So there is no incommensurability between the two kinds of discourse themselves, only a partial incommensurability, and the notion of *connotatio* permits the precise designation of this difference (see CONNOTATION). Alain de Lille, starting from the different theological sources mentioned previously and borrowing from the arts of language, specified the notion of *translatio* by distinguishing between the *translatio nominis* (transfer of the name) from the *translatio rei* (transfer of the thing). When one says *linea est longa* (the line is long), there is a transfer of both the word and the object it specifies; in *seges est leta* (the harvest is a happy one), there is only a transfer of the thing (the joy is transferred from a human, to which it properly belongs, to an inanimate object); in *monanchus albus*, there is a transfer of word only (only the name is transferred, as a "white monk" is not white), and only this latter mode comes into play in the *translationes in divinis* (see HOMONYM). In this way, Alain de Lille shows how language is subject to a general displacement when it is applied to God, a global distortion:

> Here, the words do not express existing realities. The terms are removed from their proper signification . . . here the nouns become pronouns, the adjectives become substantives, the verb does not apply in the usual way, the predicate has no subject, the subject has no content, here the affirmation is proper, the negation true, the words cannot be evaluated by the meaning they provide, but according to the meaning from which they originate, here syntax is not subject to Donatus's laws, metaphor (*translatio*) is a stranger to Cicero's rules.

> (Quoted in Dahan, *L'exégèse chrétienne*)

3. *Translatio* and analogy

The introduction of the notion of analogy in the thirteenth century reduces the scope of *translatio* (see ANALOGY). Analogy is introduced based on the second mode of equivocation of *On Sophistical Refutations*, the very same passage that had been previously considered a mode of *translatio* and following the same formula calling out the passage from *prius* to *posterius* ("healthy" refers first to health and then to urine, a constitutional walk, etc.). In theology, the question of ineffability is subdivided, starting with Pseudo-Dionysius, into two distinct parts: the first includes the case of "mystical" nouns, essential nouns, or nouns of perfection ("justice," "truth," etc.). The second applies to "symbolic" nouns (e.g., when one uses the name "lion"). The real philosophical and theological problem, according to Duns Scotus, applies to the former: to determine the relationship between divine justice and human justice, which will permit the analysis of the relation between the expression "God is just" and "man is just." *Translatio* or *metaphora* will be limited to "symbolic" nouns: purely linguistic questions that do not address resemblance or similarity between God and man (these are the dissimilar symbols, or metaphors without resemblance, of Pseudo-Dionysius). In order to determine the kind of "transfer," it is important to consider the location of the *per prius* that is transferred. Thus justice as a "thing" or "signified object" is found *per prius* in God, and secondarily *per posterius* in man (according to different modes of analysis, but, e.g., by virtue of a relation of participation).

But on the level of names or words, the relation is reversed, since the word "justice" applies *per prius* to the living creature (since names were first imposed on the things of this world, and then *per posterius*, "transferred" to God). On the basis of signification, such a noun applies "properly" to God, but it applies "improperly" on the mode of signification, since the latter is necessarily adequate for its user and thus inadequate to speak of unthinkable and ineffable realities (see SENSE, III.B.3). For a symbolic name like *leo*, there is no relation between the signified and the thing that the subject it is applied to signifies; the transfer, which is purely nominal (*translatio nominis*), is achieved by virtue of a property judged to be one of similarity and of a relation of proportionality (one says "God is a lion" by positing God/strength : lion/strength); for this reason, says Bonaventure, these are the only words that are truly "transferred names" (*nomina translativa*) (*In IV Sententiarum*, distinction 1.22, a. un., question 3 resp.). We should note that Albertus Magnus, on the other hand, considers that there is in fact a "transfer of thing" due to the fact that it is the property (strength) that is transferred from the lion to God. Whatever the case, these symbolic names are absolutely improper, both on the level of the signification and, as is the case with all names, on the level of the modes of signifying.

B. Transfer from one language to another: *translatio*/"translation"

The medieval grammarians and lexicographers sought to distinguish the different modes by which two terms can be set in relation to each other, on the condition that they have something in common. It is the recognition of what they have in common that allows one of them to serve as a gloss (*expositio*) of the other. One can see some of the difficulties they encountered by considering the following couplings of terms, where the equals sign points out an equivalence that is precisely what needs to be specified.

1. *deus = Dans Eternam Vitam Suis* (God = Giving Eternal Life to his Own): etymology called "by letters";
2. *episcopus = epi + skopos* [ἐπί + σκοπός]: analysis by composition;
3. *deus = theos* [θεός];
4. *homo = anthropos* [ἄνθρωπος];
5. *Iacob = Ioacobus*;
6. *sapientia* (wisdom) *= amor philosophiae* (love of philosophy).

The most common generic term for these equivalences is *expositio*. It is also used in logic to designate the logical structure of an utterance (e.g., *homo qui currit disputat*, "a man who runs discusses" = *homo qui currit et ille disputat*, "a man runs and he discusses"). In the same way, the *expositio* enables the recovery of multiple meanings or acceptations of a term, which may also explain its material form: the more difficult a word is to understand, the more one is tempted to capture it by a multiplicity of *expositiones* based on more commonly understood expressions, as in the case, in the *Catholicon* of John Balbi of Genoa, of the word *dues* (we find, among others, [1] and [3]).

The authors of the twelfth century distinguish two kinds of *expositions*. As for the first, "etymology (*etymologia*) is the *expositio* of a term by one or more better-known terms, based on the property of the signified object and the similarity of letters and sounds, and it (most often) occurs within a single language." It includes examples of type (1) but excludes (6) due to the absence of formal similarity. It can include the process of composition/derivation, although, as illustrated by example (2), which is fairly representative of what one finds in the dictionaries known as *Derivationes* (Hugh of Pisa, for example), the passage from one language to another is also authorized, since a Latin term is decomposed into Greek units. As for the second: "*Interpretatio* is the *expositio* or the *translatio* of a term into another language, whether or not there is similarity in sound." *Interpretatio* can be applied to (4). Depending on the author, the distinguishing criterion is either: in the same language / in another language; or: with a formal similarity / not necessarily with a formal similarity. Some authors distinguish between the two first notions of *translatio*, which occurs when a term is "transferred" from Greek to Latin—for example, *ego*, *tu*, *sui*, which are therefore "derived," according to John of Genoa. He then asks himself if there is always derivation (*derivatio*) whenever there is *translatio*, to which he replies in the negative: in the case of translation (3) or (5), one cannot say that there is derivation, since in both cases the *same noun* is subjected to a simple formal modification in passing from one language to another (*detorsio unius lingue in alteram*); each of the words in these copulas is thus the same in both its signification and its signifier. One can speak of derivation when this is not the case, as in the coupling (Latin) of *olor* (swan) "derived" from *olon* ("completely"; *Gr. holon* [ὅλον], "because the swan is COMPLETELY white," or in the case of *gigno* (to engender) from *gê* [γῆ] (earth). One should note that this problematic of the "unity of the noun," which originates from a theological context (it needed to be demonstrated that the Gospel was everywhere the same, even if it was written in various languages, see WORD), is also raised in relation to example (4) of *interpretatio*.

We can see from these remarks that it would be misleading to start from a problematic of *translation* when the heart of the matter is establishing the relationship between two words (or expressions). The function of all these *expositiones* is to account for the signification of words and/or to justify their formation, which explains how *etymologia* as a form of *veriloquium* (true talking) sometimes becomes the generic term applied to the different types we have encountered. Only with Roger Bacon did the notion of *etymologia* become defined by precise characteristics that are closer to modern criteria and clearly exclude what came to be called fantasy etymology (what Buridant, in "Les paramètres de l'étymologie médiévale," calls *ontological*, because of the kind of relationship between objects they depend on; cf. Rosier, "Quelques textes sur l'étymologie au Moyen Âge"). Thus we see that only some of these *expositiones* serve as translations, *translatio*, in the modern sense, for example, (3), (4), and (5).

- See Box 2.

V. The German Tradition of Translation: *Dolmetschen/Übersetzen/Übertragen*

A. *Dolmetschen*: "To render in German" and "to translate"

It is often said that modern German was formed primarily through a translation: Luther's translation of the Bible.

2

Translatio studii: The constituent languages and traditions of philosophy in Europe

The theme of *translatio studii* constitutes a *topos* in medieval thought destined to illustrate how, at different moments, knowledge (*savoir*) "moved" from Greece to Rome and then from Rome to the Christian world. The concept was first developed by the defenders of Charlemagne and the empire as a defense of Capetian power. From the twelfth century on it reappeared at different times and under different forms, notably in the Scholastic setting, and then especially in the universities: the University of Paris was thus legitimized as the culmination of a long journey of knowledge, first from Greece to Rome, and finally as an essential component of the "identity of the French realm." One problem with this *topos* derives from the term *studium* itself when identified with knowledge or wisdom (*sapientia*): is this sacred knowledge or profane? Roger Bacon's approach was an original one. In discussing *translatio philosophiae*, he stated that "[i]t pleased God to give whatever wisdom

he wanted, since all wisdom comes from God; he thus revealed it to philosophers, both to the faithful and the infidel alike" (*Opus Tertium*). This voyage of philosophy was necessarily a voyage through the languages, a *translatio linguarum*:

> God first revealed philosophy to his saints and gave them the laws. . . . It was thus primarily and most completely given in the Hebrew language. It was then renewed in the Greek language, primarily by Aristotle; then in the Arabic language, primarily through Avicenna; but it was never composed in Latin and was only translated/transferred [*translata*] based on foreign languages, and the best [texts] are not translated.
>
> (Bacon, *Opus Tertium*)

The improbable status of the Latin language is clearly apparent here. It is simultaneously a language of sacred knowledge,

since it is one of the three languages of the cross, along with Hebrew and Greek, but it is not really a language of profane knowledge, since, according to Bacon, the "Latins" did not add anything to that domain, unlike the Greeks and the Arabs.

Luther designated the act of translating, constitutive of language and culture, as *dolmetschen*, and he often clarified it by substituting the verb *verdeutschen* ("to make German," to "Germanize," or as Philippe Büttgen translated it into French, "to put in German"). To explain *dolmetschen* by *verdeutschen* is to specify the method and purpose of translation: to make it understandable for the people, for "the mother at home and the ordinary man" ("Ein Sendbrief" [1530]), and to facilitate the mediation of cultures.

In our day, *dolmetschen* has remained close to "interpreting agency," that is to say, the oral and immediate translation of the interpreter-guide or the interpreter-translator. In *Truth and Method* by Hans-Georg Gadamer, "The Translator as Interpreter" ("*Der Übersetzer als Dolmetsch*") designates the intepreter-translator as part of a living dialogue. We should note nonetheless that within the domain of translation, the German language does not contain a term that in itself refers to interpretation as a necessary part of the understanding of meaning. *Dolmetschen* has simply been progressively replaced by *übersetzen*, and the two terms, which had started out as synonyms, have ended up being opposed to each other to the point of excluding *dolmetschen* from the philosophical vocabulary. Thus Schleiermacher sets them in radical opposition ("Über die verschiedenen Methoden des Übersetzens" [1813]): the two verbs designate two distinct manners of passing from one language into another and thus two perspectives on the activity of translation. Schleiermacher distinguishes authentic translation, which takes the signified content as its object and draws upon reflection (*übersetzen*) from simultaneous or immediate translation (*dolmetschen*), which is a simple exchange of linguistic values

that are judged to be equivalent. This is why *dolmetschen* is rarely used in philosophy: Fichte, for example, used it occasionally to designate the interpretive activity of the preacher, the intermediary between human beings and the gods (*Fichtes Werke*, 7:600; 8:254), but never as part of a theoretical discussion. In contemporary philosophical language, both in the hermeneutic tradition (Gadamer) and in the analytic tradition, *übersetzen* is rendered as "to translate" (Quine, Davidson) or *traduire*.

B. *Übersetzen, übertragen*: "Translation" and "transposition"

The German language also includes a synonym of *übersetzen*, the verb *übertragen*. *Übersetzen* literally means "to transpose," whereas *übertragen* means "to transport." *Übertragen* is the more general term and designates all sorts of "transposition," "transfer," or "transmission," whereas today *übersetzen* is limited to the written transposition of discourse. Thus "to translate" is generally applied to *übersetzen*, while "to transpose" is used for *übertragen*. *Übertragung* can also designate "transfer" or even "metaphor." In Nietzsche, the verb is translated (into English) as "to transfer" ("On Truth and Lie"). In their normal usage, the terms are strictly equivalent, but they are distinguished from each other in the reflections and analytic writing of Heidegger and Gadamer, who used the nuances of this distinction in philosophical discourse.

C. *Übersetzen, übertragen, überliefern*: "Translation" and "transmission"

In fact, like "transmission" in general, *übertragen* can underscore the existing link between translation and transmission. In this sense, the two terms are complementary, as for Kant,

for example. He writes in *Religion within the Bounaries of Mere Reason* (RT: Ak., 6:166):

> Indessen es ist nicht genug, es in Übersetzungen zu kennen und so auf die Nachkommenschaft zu übertragen.
>
> (It does not suffice to be acquainted with the book [the Bible] in translation and to transmit it to posterity in this form.)

It is this proximity that binds in French *traduction* and *tradition*.

It is in this same sense that Heidegger took up the philosophical problem of translating: *übersetzen* is to pass from one shore to another, the translator being the ferryman (*passeur*). *Übersetzen* signifies "translation" in the Latin sense of *traducere*, "to lead across." "To translate" is to bring a discourse across from one language into another, that is to say, to insert it into a different milieu, a different culture. Translation is not to be understood as a simple "transfer" or as a pure linguistic "version," but instead within the general development of the spirit. This idea, already present in Luther, would be taken up by Goethe, Herder, and Novalis, and in a general way by the first romantics that considered this exchange between languages as the condition of *Bildung* (Berman, *The Experience of the Foreign*). Schleiermacher's theory of the methods of translation, which favors the reader's encounter with the foreign, is likewise completely based on the analysis of this movement. "Translation" is thus considered as a "transplantation": to translate is "to transplant [*verpflanzen*] to a foreign soil the products of a language in the domains of the sciences and the arts of discourse, in order to enlarge the scope of action of these products of the mind" ("Über die verschiedenen Methoden"). F. Schlegel used similar formulas as early as 1798: "Each translation [*Übersetzung*] is either a *transplantation* [*Verpflanzung*] or a *transformation* [*Verwandlung*], or both at the same time" (*Kritische Friedrich-Schlegel Ausgabe*, 18:204, fr. 87). The same metaphor allows Benjamin to talk of a *Nachreife*, that is to say, a ripening of words past the point of their usefulness ("Die Aufgabe des Übersetzers").

1. *Über-setzen*: Trans-late

This is the classical perspective that Heidegger inherited when he affirmed that translation transposes the work of thought into the spirit of another language and thus transforms thought in a fruitful manner: this is why a translation "serves mutual comprehension in a higher sense. And each step in this direction is a blessing for the peoples" (Heidegger, author's prologue to Henri Corbin's French translation of *What Is Metaphysics?*). The "translation" of *Über-setzung* (*Über-*setzung, with the accent on the penultimate syllable) is thus, "trans-lation" (Über-*setzung*), the transposition of a thought into another universe of thought (Heidegger, *Off the Beaten Track*). The displacement of the stressed accent indicates the focus of the thought: to lead to the other side, to another context that will reveal its truth. Such a passage can be measured by what it passes over, "a bound over a trench," a "*Sprung über einen Graben*" (*Off the Beaten Track*), which becomes in Gadamer an "abyss" (*Kluft*; *Truth and Method*).

Thus, translation is no longer a simple transfer, but an inscription into another relation to the world or global form of comprehension of the world, according to the general structure of understanding. *Übersetzen* is thus not a "replacing" (*ersetzen*) but a "transposing" (*es setzt über*): there is a true "transfer," "transport" (Heidegger, *Parmenides*).

2. *Überliefern*: "Tradition" and "revealing"

If Heidegger's analysis of the term "translation" as "transmission" remains within the classical perspective, he nonetheless inflects it by introducing the dimension of truth. In translation as tradition (*tradieren*), Heidegger gives the idea of transmission (*Übertragung*) a particular form in which "to transmit" is called *überliefern*. By its connection to "tradition" (as Préau translates *Überlieferung*, without being able to render the full Heideggerian sense), the German language does not promote the relationship between translation and treachery (*Verrat*) that is imprinted so forcefully in the Italian expression *traduttore-traditore*. *Trahir* (to betray) is an adaptation of the Latin *tradere*, which signifies "to surrender," "to hand over," or "to bequeath," so that in French *trahir* also means "to reveal." The German connotation is different from the common usage in French and the Romance languages. If "translation" is "treason" or "betrayal" in French, it is because even a beautiful translation does not express the original text. The translation "abandons" the original. But by underscoring the tie to tradition, Heidegger instead conveys the *Übersetzung* of fundamental concepts into the historical languages, that is to say, the translation of a culture, touching upon the essence of language, as an *Überlieferung* (*The Principle of Reason*): *Übersetzung* as *Überlieferung* ensures a reprise, a taking over (*Übernahme*), which is a reception or "collection." In *Übersetzung/Überlieferung*, the transposition is a reappropriation, a deliverance, a liberation:

> [T]radition [*Überlieferung*] is what is proper to its name: a transmission, a handing over, a delivery [*ein Liefern*] in the Latin sense of *liberare*, a liberation. As a liberation tradition opens up and brings to light hidden treasures of what has never ceased from being, even if this light is only a first tentative dawn.
>
> (Heidegger, *Principle of Reason*)

There is thus an inflection despite the relation between *überliefern* and *tradere*, "to betray," "to hand over," "to reveal" (German has kept *tradieren* and *Tradition* as synonyms of *überliefern*, *Überlieferung*). For the connotations are different in French: if *livrer* can be traced back to its origin in *liberare* by Heidegger, to link *traduire* to *trahir* is to place it under the sign of infidelity and falsehood. But in following Heidegger's German, on the other hand, what translation reveals instead is the "truth," the "unconcealment." The French language seems less inclined to think of tradition as a revealing, whereas the German seems less inclined to think of tradition as treachery and betrayal.

The importance attributed to translation in contemporary German thought, and especially in Gadamer's hermeneutics (*Truth and Method*), is based on this approach. In effect, Gadamer sees "Heidegger's genius" in the analyses that lead back to the "natural meaning of words and to the wisdom that can be discovered in language" (*Philosophical Hermeneutics*). In this context, the rehabilitation of tradition

is inseparable from the concept of translation. In *Truth and Method*, it is this notion that opens up the reflection on the "ontological turn taken by hermeneutics with language as its guide": not only is tradition usually transmitted to us through translation (*Truth and Method*), but it is essentially "translation." Tradition-translation transmits interpretations, that is to say, the understanding of the world that constitutes the framework in which the world reveals itself to us and in which the existential dimensions of comprehension are inscribed (Heidegger, *Being and Time*, para. 31). So to understand is both to receive and to translate what we have received. But this translation is *trans*-lation, a form of passage "beyond" that Gadamer calls the "fusion of horizons" (*Truth and Method*). From this point on, inscribed within an encompassing comprehension, translation carries with it a passivity that refers back to the idea of a comprehension that is always other. In effect, if translation liberates by submitting to tradition, and this liberation is also a betrayal, then one can understand how "*we understand in a different way, if we understand at all*" (*Truth and Method*). Heidegger made the same claim, although in a less radical fashion: explication does not yield a better understanding, but just another one "all the while still encountering the same" (*Off the Beaten Track*). Difference and identity are the gap that translation straddles and that becomes an abyss for Gadamer. Here, translation, in its inevitable infidelity, becomes the revealer of truth.

Thus translation-tradition-treason loses the linguistic rigor on which it was based and becomes in Gadamer and later in Heidegger, the very revelation of the essence of language as a dimension of human accomplishment (cf. Escoubas, "De la traduction"). "To translate" becomes synonymous with "to think." In this context, it is in the very term in German that we can read the passage of translation from simple transfer to translation as an interpretation of the world (see WELTANSCHAUUNG).

Duhem-Quine: On the underdetermination of theory and the indeterminacy of translation

1. The underdetermination of epistemological translation

In Pierre Duhem's work on the philosophy of science, *The Aim and Structure of Physical Theory*, one encounters the word "translation" in its original epistemological meaning. It allows Duhem to formulate a conception of the relation between experiment and theory, which profoundly influenced the epistemology of the twentieth century (see EPISTEMOLOGY). Starting with a critique of the notions of observation and the "experimental method," Duhem redefined the relation of scientific theory to facts using the idea of translation:

> The mathematical elaboration of a physical theory can be tied to observable facts only through a translation. In order to introduce experimental conditions into a calculation, one must make a *version* that replaces the language of concrete observation by the language of numbers; in order to make the results which the theory predicts into something observable, one needs a *theme* to transform a numerical value into an indication formulated in the language of experiment.
>
> (*Aim and Structure of Physical Theory*)

The interest of Duhem's thesis lies in the fact that it affirms that the nontransparency and asymmetry inherent in each of these two translations is subject to indetermination. The first translation (version) is a mathematical translation upon concrete *things*, linked to methods of measurement: "The methods of measurement are the vocabulary which render translation possible in both directions" (ibid.). Duhem continues:

> But he who translates also betrays; *traduttore, traditore*; there is never a perfect fit [*adéquation*] between the two texts that a version makes correspond to each other.

Translation makes it possible to define the distance between theory and experiment, whose consequence for contemporary theories will be the underdetermination of theory in relation to experiment (the plurality or even empirical equivalence of theories that can account for the same facts), which will also lead to holism (the impossibility of assigning a specific experimental content to a theoretical point). From this, Duhem draws important methodological conclusions, which account for the posthumous reputation of *Aim and Structure* and its renown under the name of the Duhem-Quine thesis: an experiment cannot apply to an isolated hypothesis because there is a work of symbolization between a fact and its theoretical translation that is part of the work of theory: "a fact of practice does not translate into a single fact of theory," and "an infinite number of theoretical facts can be taken as translations of the same fact of practice" (ibid.). Recourse to the idea of translation allows the formulation of an incommensurability between a fact and the theory applied to it.

Long before Popper, Duhem developed a critique of the inductive method. He took the transition from Kepler's laws to the Newtonian theory of gravitation as an example. Newton's theory is not an inductive generalization of Kepler's laws: on the contrary, it is incompatible with them. If Newton believed he had made a generalization based on Kepler's laws, it is because he *translated* those laws. "For them to acquire this fecundity, they needed to be transformed, to be translated symbolically" (ibid). Once Kepler's laws were "translated" into Newton's theoretical framework, they gained new meaning: "The translation of Kepler's laws into symbolic laws required the physicist to have already adopted a whole set of hypotheses" (ibid.). We can see the modernity of Duhem's approach: in the translation of the laws, the adoption of a new theory entails a change in usage and meaning of earlier concepts and facts within a new paradigm.

Duhem's use of the word "translation" to describe the process of scientific constitution

(continued)

is thus neither metaphorical nor trivial: his affirmation of the nontransparency and asymmetry of any translation allows him to expose the indeterminacy between theory and experiment in a new light. *Aim and Structure* would have a considerable influence subsequently, both in epistemology through the ideas of paradigm and empirical influence (Kuhn, Feyerabend) and in the debates around Quine's thesis on the indeterminacy of translation, which radicalized Duhem's indeterminacy.

2. The indeterminacy of radical translation

The thesis on the indeterminacy of radical translation set out by the American philosopher W. V. O. Quine in 1960 in his book *Word and Object* played a central role in the development of philosophy of language, as well as in the philosophy of mind and the epistemology of the twentieth century. Quine attacked the idea of shared signification between different languages and affirmed that in a situation of radical translation (without prior contact and with nothing in common between his language and the local language) a linguist could develop contradictory manuals of translation that would be compatible with the facts; in other words, there would be *no basis* on which to determine whether the translator was right or wrong. The radicalness of this thesis and Quine's notion of a "conceptual schema" put his work at the center of the debate on relativism. It starts out with a "thought experiment": a linguist "on the ground" goes into the jungle to discover a completely unknown language. How will he produce a translation manual that makes correspondences between the terms of the foreign language and his own without a dictionary or interpreter? The linguist goes

for a walk with the native and sees a rabbit hop away in front of him. "*Gavagai,*" exclaims the native. What does this expression mean? Quine's answer is to say that there is no sense in asking him, especially if one is wondering not only about the signification of the utterance but also what entity is designated by the word *Gavagai* (a stable object, a sense-datum, a spatiotemporal segment of rabbit-hood, an event—"he rabbits"; see SENSE).

The thesis of indeterminacy, with its critique of signification, is a "philosophical point," according to Quine: as soon as one leaves behind any linguistic community, synonymy becomes opaque. The point is also an anthropological one, since what is at stake in the question of synonymy is the very idea of a common core shared by several languages, such as one finds in Frege's classical formulations. Quine calls the belief in such a common core, which is expressed differently by each language, the *myth of meaning*. We can compare this thesis to the idea of paradigm as developed by T. S. Kuhn in *Structure of Scientific Revolutions* (1962), a work that is contemporary with Quine's. The question of the indeterminacy of translation is in fact the question of whether a form of thought, a meaning, or a reality can be held in common by all of humankind, or by all languages, even with different conceptual schemes. In a famous text, "On the Very Idea of a Conceptual Scheme," Donald Davidson applies his critique of relativism to what he calls the "conceptual relativism" of both Quine and Kuhn (see EPISTEMOLOGY). The idea of conceptual scheme extends the problem of translation between utterances to the commensurability of conceptions of the world, to conceptual schemas, and to *common sense* (see COMMON SENSE).

Translation is indeterminate, but not impossible; it is indeterminate because it is possible. "Indeterminacy means not that there

is no acceptable translation, but that there are many." Indeterminacy is the possibility of choice: "the freedom of conjecture, the field of free creation are both wide open" ("The Behavioral Limits of Meaning," Quine, unpublished conference paper of 1984). The choice is settled according to criteria that behavior and experience cannot settle or decide. This is true of the attribution of logic or rationality. Attributing binary logic to the native is not the result of discovering it in his language, even less so in his thought: it is an invention.

The thesis of indeterminacy means that one always translates *within* one's own language, *at home*. It consists of "catapulting oneself into the foreign language" with the momentum of one's own. According to Quine, we have *nothing* on which to be right or wrong. There is no *fact of the matter* (see MATTER OF FACT). This theme of radical skepticism paradoxically inscribes the question of the plurality of languages at the very heart of an analytic philosophy that has always tended to erase it.

Qur'ān [قرآن]

The Qur'ān (or Koran, according to the usual English transliteration), the name of the Muslim holy book, comes from the verb *qara'a,* which means "to read," "to recite," or "to proclaim aloud." Muslims believe that it is the very word of God revealed to the prophet Muhammad and through him to humanity. The Qur'ānic text, which is often self-referential, declares (97:1): "We have indeed revealed this [message] in the Night of Power," an allusion to the "descent" of the word of God into this

world, which Islamic tradition (*hadith*) narrates as follows. It was a habit of Muhammad, before he declared himself a prophet, to go to the top of Jabal an-Nūr, one of the mounts near the city of Mecca, to spend many days in solitary meditation in a cave known as Hirā'. This was during the month called Ramadan. The "Night of Power" (or "Night of Destiny," as it is also translated) is a night during that month when he was visited in his solitude by the angel Gabriel, who commanded

him: "*Iqra!*" ("Read!"), using the very word that would give its name to the message he brought: "the Reading." After he had repeated three times in terror that he could not read (he was illiterate), Muhammad asked what he was supposed to read. Then the angel revealed to him the very first words of what would become the book of the Muslims: "Read! In the name of thy Lord and Cherisher, who created—created man, out of a (mere) clot of blood. Read! And thy

Lord is most Bountiful, He who taught (the use of) the Pen—Taught man that which he knew not" (96:1–6). After the experience was over, Muhammad ran home completely terrified and only gathered his spirits when his wife Khadija expressed her faith in him and in the truth of what he had been told by the angel: that he was the prophet of God chosen to proclaim His Qur'ān. The Message would then be revealed bit by bit during the twenty-three years that followed, during which the new religion founded upon it, Islam, started its expansion. It was only under the third caliph of Islam that the verses revealed by Muhammad and often known by heart by his followers were collected and put together into a book of 114 chapters classified by length, after the first one known as "The Opening."

As this narrative shows, at the core of Islamic belief is the notion that the Qur'ān is the miracle of a revelation by God to a simple man, Muhammad, and in a simply human language, Arabic, of a message He directly authored. Again, in self-referential statements, the Qur'ān declares that the evidence for its divine origin does not require

any miracle further than its "inimitability" (Qur'ānic verses are called *āyāt*, which means "miracles," or "signs"). Thus, chapter 17, verse 88 states: "Say: if the whole of mankind and Jinns were to gather together to produce the like of this Qur'ān they could not produce the like thereof, even if they backed up each other with help and support."

Does "inimitability" mean untranslatability, and what does the notion of a choice by God of a human language to carry His own word imply? These are important philosophical and theological questions. An early theological school in Islam, characterized by its rationalist outlook and known as Mu'tazilism, held the view that the Qur'ān is the word of God but created in a human language. One consequence of that view would be that the book, meant for human comprehension, is, de jure, fully understandable by human reason and translatable into all human languages. Conservative schools of thought would insist on the fundamental untranslatability of the word uttered by God Himself, parts of it being known solely by Him. Those schools would reluctantly accept translations of the Qur'ān only as a makeshift solution

because the majority of Muslim populations do not speak Arabic and use it merely as a liturgical language. One important aspect of the issue of translatability is the meaning of the "election" of the Arabic language: is there anything special in that language that called for its election or, on the contrary, does the Qur'ānic miracle consist precisely in the fact that this is simply a human language, equivalent to and translatable into any other human language?

No untranslatables!

> There's nothing in Greek that can't also be said in Latin.
>
> (Leonardo Bruni, *On Correct Translation*)

It was through the Italians that translation as a theoretical enterprise was revived in the Renaissance. This was in large part thanks to Leonardo Bruni, erstwhile chancellor of Florence and indefatigable translator of Greek into Latin at a particularly heady moment in the history of humanism: the early fifteenth century, two generations after that other indefatigable humanist (albeit one ignorant of Greek), Petrarch. Indignant over criticism of his translation of Aristotle's *Nicomachean Ethics*, Bruni threw himself into *De interpretatione recta* (*On Correct Translation*) in the mid-1420s. His anger at a churchman whose critique revealed misunderstanding not only of Greek but also of his own "mother tongue," Latin, produced a passionate statement about translation's importance to the modern Western world.

Bruni seems to be the first to have used *traductio* and *traducere* to mean "translation": words that would come to replace

interpretare, *vertere*, and *convertere*, as Remigio Sabbadini has noted, and thus words that insist on the act of transporting, and even transformation. Transformation is, in fact, at the heart of Bruni's meditations: the "best translator will turn his whole mind, heart, and will to his author, and in a sense be transformed by him" (*De interpretatione recta*). But after losing his identity, the translator must regain it, and he can only do so if he is absolute master of his own language, dominating all in his power ("Deinde linguam eam, ad quam traducere vult, sic teneat, ut quodammodo in ea dominetur et in sua totam habeat potestate"; ibid., chap. 11). In this act of transporting, nothing must be left behind, and all that is carried across must be transformed into the new tongue: "Don't go begging for words or borrowing them; leave nothing in Greek out of your ignorance of Latin. The translator must know with precision the exact value and efficacy of terms." Not to translate is to remain a beggar, a mendicant, trapped in the no-man's land between two languages and thus in exile. Bruni, utterly terrestrial and at war with the Scholastics who shoehorned Aristotle to fit their own theological and

pedagogical ends, was far more interested in a cultural patrimony whose greatest works looked not to otherworldly Christianity but defined and defended one's earthly homeland. Demosthenes's orations as he stood at the gate of Athens and exhorted the citizens to take a stand against Philip of Macedon were some of Bruni's earliest translations. Even Aristotle—despite his tutoring of Philip's son Alexander—becomes a supporter of civic identity and independence, the very independence Florence was struggling to maintain in the early fifteenth century.

But Aristotle (and along with him, Plato) becomes something else: a supreme and superb stylist, whose books possess "the splendor and clarity of a painting," in a comparison that harks back to Horace's *ut pictura poesis* from the *Ars poetica*. Bruni's Latin was not the medieval Latin of the Scholastics— and hence of Aristotle's prior translators. The closing chapters of the treatise are a tour de force, as Bruni lists examples of bad translations he had come across—sheer acts of "barbarism," he calls them—and enumerates

(continued)

their many weaknesses. For one thing, these incompetent translators use words no one has ever used; thus "*oligarchica sophistica legislationis*"—a literally "Latinized" version of the Greek that means nothing in Latin. But the major reason for their "*ignorantia ruditatesque loquendi*"—their ignorance and rustic way of speech—is their lack of familiarity with Aristotle as a stylist: "and every writer has his own particular style" (*cum singulis fere scriptoribus sua quedam ac propria sit dicendi figura*; chap. 14). Bruni goes on to list Aristotle's stylistic traits, marveling at one point that "a philosopher, in the midst of the subtlest discussion, should take such care for the way he wrote" (chap. 24): he is full of ornaments, elegance, and dignity. Philosophy thus becomes indistinguishable from style, as the *way* one writes becomes just as important as *what* one writes, and the pilfering of antiquity for presentiments of the Christian revelation a misguided and misleading occupation. In so focusing on style, on what he calls the "*vim ac naturam verborum*"—the force and nature of words— Bruni recasts Aristotle and Plato alike as writers and orators. Rescued from the theologians, their words sparkle with the rhetorical and literary efficacy denied them by "barbarous" translators.

As Horace's *Ars poetica* attests, Romans generally felt their civilization to be distinctly secondary to the Hellenic world they had nonetheless vanquished. The cry of Aeneas's father, Anchises, in the sixth book of the *Aeneid* expresses Virgil's sentiment on the matter: "Others, I have no doubt, will forge the bronze to breathe with suppler lines . . . plead their cases better, chart with their rods the stars that climb the sky and foretell the times they rise" (6:976–80; Robert Fagles's translation); the Romans could excel in the art of government alone. Translate everything! is Bruni's response. In reveling over the "force and nature" of the Latin language, he turns Greek philosophy into Latin oratory and poetry, setting Plato and Aristotle alongside Sallust, Livy, and Cicero. It is thus through the act of translation that one recognizes the philosopher as an artist, an orator, a "stylist." Far from being diminished with respect to his status as a *philosophe*, Aristotle gains something, as the discourse of philosophy is considerably broadened, no longer prey to the clutches of theologians. Philosophy once again becomes powerfully transformative, as it had been with Plato, prompting its readers to reflect on how they live and how they speak. One is reminded that for Bruni translation itself is a transformative act, as the translator transforms himself into the author and the author's words are transformed into the translator's tongue. Bruni closed the preface to his translation of Saint Basil's letter to his nephews with "*Et iam Basilium ipsum audiamus*" (and now let us listen to Basil himself), as though Basil himself stood before us and the translator had vanished. Except it is a Basil—one who wisely counsels his nephews to read the great works of pagan, Greek philosophy—who speaks in Latin.

Is not this dictionary, with its inclusion of "poetic" terms such as *sprezzatura* and *leggiadria*, "strength," "to stand," and thus terms from texts that are only marginally "philosophical" in the strictest sense, also a transformation of philosophical language into something broader: a way of speaking, or even a way of life? A philosophy for nonphilosophers?

TORAH [תּוֹרָה] (HEBREW) / ŠARĪʿA [الشريعة] (ARABIC)

ENGLISH	law
FRENCH	*loi*
GERMAN	*Gesetz*
GREEK	*nomos* [νόμος]
LATIN	*lex*

➤ LAW [LEX], and *DESTINY*, DUTY, EUROPE, GOD, SOLLEN, THEMIS, TO TRANSLATE, WILLKÜR

In European philosophical discussion, the word "law," as it is developed in political philosophy, does not only derive from the Greek philosophers—Plato, Aristotle, the Stoics, Cicero—and the Roman jurists. It also has sources in the Bible, which have been the object of reflection by theologians such as Saint Augustine or Saint Thomas Aquinas. And it is an object for philosophical reflection as well, starting with Machiavelli's project to read the Bible judiciously (*Discourses on Livy*, 3.30), and continuing with Hobbes and Spinoza, right up to Kant. The idea of law comes to modern Europe through Luther's German translations (*Gesetz*) (RT: *Die Bibel nach der Übersetzung Martin Luthers*) or through the Authorized (King James) Version of the Bible. Both occur within a context already set forth by the Greek translation of the Septuagint (*nomos* [νόμος]) and the subsequent Latin translation known as the Vulgate (*lex*), with the focus of the discussion most often set by the value of the "law" in the Epistles of Paul. We shall attempt to explore the intersections of the different vocabularies of the law, starting from the Hebrew and the Arabic.

I. The Hebrew Vocabulary of the Law

In Hebrew, *torah* derives from the root YRH [ירה], which signifies "to throw," and in modern Hebrew, to "fire" with a firearm. It no doubt originally refers to "throws" of chance and their subsequent interpretation as expressions of divine will. The priests are known as the "keepers of the *torah*" (*tōfesëy hat-tōrāh* [תּוֹפְשֵׂי הַתּוֹרָה]; Jer 2:8). It is not a written text, but an oral teaching that applies to the domain of sacerdotal

competence: ritual questions about, for example, the pure and the impure (Hg 2:11–13), or what is the appropriate kind of sacrifice to offer (Zec 7:2–3). This teaching is reputed to be given by YHWH himself. Obedience to the priests is required—one should act "according to the *torah* they will teach you (*yōrūḫā* [יֹורוּךָ]), and according to the judgment (*mišpāṭ* [מִשְׁפָּט]) they will tell you" (Dt 17:11) The law is subsequently replaced during the exodus, thus becoming the Law of Moses, or more exactly, the Law of YHWH (1 Esd 7:10, etc.), transmitted through the intermediary of Moses. The word is subsequently expanded to the five books of the Pentateuch, and thence to the whole of the Bible, including the prophets and books of wisdom. It ends up encompassing the two aspects of the Law: the written Law and the oral Law, which was supposed to have been given in the Sinai. The meaning of "teaching" is taken up in the title of Martin Buber's translation, with Franz Rosenzweig, of the Pentateuch: *Die fünf Bücher der Weisung*. Franz Rosenzweig translates it as *Gesetzeslehre* (doctrine of law) (*Der Stern der Erlösung*, 3.1 §321).

Mitzvah [מִצְוָה] signifies "order, commandment." Initially, the word refers to every sort of injunction, but later comes to designate the precepts, both positive and negative, contained in the Torah. Efforts were made to distinguish them from each other and to enumerate them in an exhaustive manner; explanations were sought to explain all 613 precepts, and special attention was accorded the 365 negative precepts. In its extended sense, *mitzvah* can also designate the action that carries out a commandment, a meritorious action, and in the popular sense, a good deed.

Mišpāṭ comes from the root ŠPṬ [שׁפט], "to judge, to direct." The judgment is pronounced with authority by a director, a *šōfėṭ* [שׁוֹפֵט]—the "judge" in the sense of the book of Judges or "*suffète*," the highest Carthaginian magistrate. From this idea of "sentence" is derived the modern Hebrew meaning of "phrase" as well as the English sentence.

ḤOQ [חֹוק] (plural, *ḥuqqim* [חֻקִּים]) comes from the root ḤQQ [חק], "to engrave," from which derives "to inscribe" and then "to prescribe." The Hebrew word is related to the Arabic *ḥaqq* [حَقّ], "the part that returns," or "truth." It refers to everything that is determinate and fixed. The feminine form *ḥuqqāh* [חֻקָּה] can also designate the regularities of natural processes (Jer 5:24). These two latter terms took on technical meanings in the Talmud. *Mišpāṭ* designates those plausible seeming and easily universalized commandments (those that forbid idolatry, murder, incest, or rape). *Ḥoq*, on the other hand, designates those commandments whose meaning is not apparent (the ban on eating pork, or wearing fabrics that mix animal and vegetable fibers, etc.) (Talmud of Babylon, *Yoma* [VI], 67b). The justification of these latter commandments constitutes a genre of literature to which almost all Jewish thinkers have contributed—and even Christians, who call these commandments "ceremonial." A great variety of methods and arguments are employed: allegory, the idea of a divine condescension adapting itself to the customs of a particular period, a correspondence with celestial reality, a concern for counterbalancing idolatrous practices, etc.

The root HLḤ [הלך], which signifies "to go," was in use since ancient times, but the substantive *halāḫāh* [הֲלָכָה] (halakhah) is not in the Bible. It spells out the rules to follow, whether in practice or only theoretically: first some specific ordering principles, then a general code of conduct to adopt in Jewish life.

II. The Arabic Vocabulary of the Law

The Qur'ān contains few terms that can be translated as "law." Some precepts of legislative value are called "commandments" or "laws of God" (2:183/187 and 229–30; 4:17/13; 58:5/4; 65:1). The word that is used, *ḥadd* [حَدّ] (plural, *ḥudūd* [حدود]), suggests an idea of partition and delimitation, such that philosophers employ it to translate the Greek *horos* [ὅρος], in the sense of "definition." In Muslim law, the word has gained a specialized meaning of "legal punishments": stoning, crucifixion, mutilation, decapitation, flagellation.

Šarī'a [الشريعة] derives from the root ŠR' [ش ر ع], which has been linked to ŠRB, "to drink." The primary meaning is probably "the path leading to a source of water." A Bedouin's life depends on this kind of knowing, and the path that leads to water is the good path par excellence. In the Qur'ān, the verb *šara'a* [شرع] is employed in speaking of a divinity who imposes a code of conduct. Thus: "(Allah) has established [*šara'a*] for you, in matters of religion, what he prescribed to Noah" (42:13; cf. also 21).

A substantive noun, *šir'a* [شرعة], perhaps borrowed from the Ethiopian, indicates the path to follow. Thus: "We have given each of you a rule [*šir'a*] and a custom [*minhāǧ* [منهاج]]" (5:48)—this latter word is itself drawn from rabbinical Hebrew. This is the sense in which the Qur'ān has Allah say: "we placed you on a path proceeding from Order" (*ǎlā šarī'atin min al-'amri* [على شريعة من الأمر]) (45:18). The *šarī'a* has become the entire system of obligations and prohibitions drawn from a synthesis of the sources of Islamic law, in different proportions according to the main juridical schools (sometimes called "rites"): Qur'ān, traditions relating to the Prophet, customs of Medina, analogy.

The word has become more narrowly specialized to designate a law given by divinity, not a human law. To refer to these laws, philosophers have simply transcribed the Greek *nomos* [νόμος], in the form of *nāmūs* [ناموس] (plural, *nawāmīs* [نواميس]). The word thus serves to "translate" the title of Plato's *Laws*, or to designate apocrypha by the same title. When written in Arabic, medieval Judaism did not hesitate to pick up the word *šarī'a* to refer to Jewish law.

The primary meaning of *sunna* [سنّة] (plural, *sunan* [سنن]) is "habit." In the Qur'ān, it refers to the customary behavior of Allah, especially in his punishment of the infidel of the past (8:38, etc.). Even before Islam, the word designated the normative custom, the precedent to refer to in judgment. With the constitution of an Islamic law, it designates the exemplary conduct of Allah, including his companions. *Sunna* can also refer to Allah's "habits." These take the place of the "laws" of nature, rendered unthinkable by the vision of the world of the *Kalām* [كلام] (the word of Allah) in its main current of interpretation, according to which things do not have a stable nature of their own, but are bundles of accidents held together at every instant by divine will alone. It was only later that the word came to refer to that tradition adopted by the main tendency of Islam, those who call themselves the people of the *sunna*, the "Sunnites."

Finally, there is also a series of terms designating the measures taken by governments without relying on religious law:

qānūn [قانون] (plural, *qawānīn* [قوانین]) is none other than the Greek *chanôn* [χανών] "rule"; *niẓām* [نظام] literally signifies "regulation" (Fr., *ordonnance*), and *marsūm* [مرسوم], "decree."

TROPE

GERMAN   *Moment*

➤ ABSTRACTION, ANALOGY, COMPARISON, CONNOTATION, ESSENCE, IMPLICATION, MOMENT, PROPERTY, SUPPOSITION, UNIVERSALS

In classical language, the word "trope" designates a figure of rhetoric (Lat. *tropus loquendi*). This is the sense understood by Condillac in his *Art d'écrire* (Art of writing) and by Dumarais in his celebrated *Traité des tropes* (Treatise on tropes), VII, 2, when he writes that "one should not think that tropes"—in other words, figurative expressions—"were only invented out of necessity, because of the deficiencies and scarcity of proper names." In logic, the Greek word *tropos* [τρόπος] designates a mode (*modus*) in the sense of modal logic, that is to say, a syncategorematic expression that transforms an utterance into a modal expression, in other words: *necessary*, *possible*, *impossible*, *contingent* (the aletheic modes or "modalities" of *true* and *false* do not give rise to modal expressions). In modern philosophical usage, the word "trope" has a completely different meaning, unrelated to previous ones: it designates a specific instance (Fr. *instance*, Ger. *Einzelfall*) of a property or relation. Introduced in 1953 by the American philosopher D. C. Williams in the sense of the "occurrence of an essence" (in contrast to an earlier use of the term by Santayana as the "essence of an occurrence"), "trope" has become generally understood in contemporary Anglo-Saxon philosophy as the equivalent of the expression "abstract particular" employed by Stout in 1921. In English, "trope" is synonymous with what are called "concrete properties" (Küng, *Ontology and the Logistic Analysis of Language*), "quality instances"/"relation instances" (D. C. Long, "Particulars and Their Qualities"), "unit properties"/"unit relations" (Matthews and Cohen, "The One and the Many"), "quality bits"/"relation bits," "individualized forms," cases or aspects (Wolterstorff, *On Universals*), and "particularized qualities" (Wilson, *Statement and Inference*; Strawson, *Individuals* and *Subject and Predicate in Logic and Grammar*).

Williams's initiative, further extended by K. Campbell, is clearly unfortunate and all the more inexplicable in that the word "trope," in English just as in French, refers to a figure of speech. But today it would be impossible to go against this usage, given the currency of the expression in the philosophical literature. The only exception is in German, with the term *Moment*, which was introduced by Husserl in the mereological analysis of the notions of ontological dependence and independence (*Logical Investigations*, III), and which referred to the sense of "dependent part," as employed by B. Smith or K. Mulligan. With the ambiguity of the French meaning of *moment* added to the ambiguities in German, the substitution of this saturated term for the Franco-English "trope" fails to provide any decisive advantages. The reader of Husserl should still keep in mind that the Husserlian *moments* correspond to the "tropes" of Williams and Campbell.

I. Concrete Particular/Abstract Particular

In the theory advanced by Williams, tropes are "the first constituents of the real world or of any possible worlds": they are "the very alphabet of being." According to this analysis, Socrates is a concrete particular; the wisdom of Socrates—a "component" of Socrates—is an abstract particular, or "trope." The general wisdom of which any particular wisdom is a component or member forms an abstract universal. All creatures exactly identical with Socrates are part of or members of an abstract universal of a total "Socrateity" or "Socratesity." Humanity as a universal is not the class of concrete human beings, but of abstract humanities. That is to say, it is not a class whose members are Socrates, Plato, and so on, but of the human trope within Socrates, the human trope in Plato, and so on. According to Williams, an individual is thus defined as a "sum of concurrent" or "co-present" tropes, that is to say, the wisdom of Socrates as a trope belongs to the "class of resemblance" of Wisdom. The proposition "Socrates is wise" [a est φ] thus signifies that the sum of tropes "concurrent to Socrates" includes a trope that is a member of the trope of "resembling wisdom." The relation of "concurrence," inherited from Whitehead and Keynes, corresponds to Russel's "compresence," Mill's "coinherence," Stout's "concrescence," and Goodman's "togetherness," and it is the "limit value" of localization; the relation of "precise or exact resemblance"; the "limit value" of resemblance traditionally known as "identity." The distinction between abstract universal and concrete universal allows the clear expression of the difference between instantiation and exemplification: Socrates is a concrete "instance" of Wisdom. The component wisdom is an "abstract" instance (= exemplification) of Wisdom. In the current theory of tropes, trope bundle theory individuals are considered as "bundles of tropes," "co-presence" and "exact resemblance" as second-order "bundling relations," and the notions of "individual," "particulars," and "universals" all follow Williams's mode of definition, using the notions of "compresence classes of tropes" and "similarity classes of tropes." The definition of an individual as a "mereological sum of a class of compresent tropes," set forth by Williams in 1953, has been the object of various critiques. The most widespread of these consists in claiming that a "class of compresence" cannot account for the individuality of an object, because as Martin puts it in "Substance Substantiated": "An object is not collectable out

of its properties or qualities as a crowd is collectible out of its members."

According to Armstrong, every theory of tropes makes claims to the state of affairs (see SACHVERHALT): "States of affairs are required as part of the ontology of any trope theory."

II. A Loaded Genealogy

D. W. Mertz has proposed a genealogy of the notion of tropes going back to Plato, Aristotle, Boethius, Avicenna, Averroës, Thomas of Aquinas, Duns Scottius, Buridan, Suárez, Leibnitz, and Russel (in his early writings). This overview can be further specified—as far as Buridan (and Ockham) are concerned—by a certain interpretation of the distinction between absolute terms and connotative terms (see CONNOTATION). For Buridan, in fact, a term like "album" (a concrete accidental term according to common terminological usage) presupposes an individual, a singular composite of substance-quality, and connotes a singular quality that is "adjacent." A specific white, this white here, has all the characteristics that one expects from a trope. In the first sophism of chapter 4 of the *Sophismata*, Buridan specifically discusses the proposition that "Socrates and [this] white are the same thing," a *sophisma* that he proves thus: if he points to Socrates with his finger, it is true to say that "this is Socrates" and the same holds for "this same thing [*hoc idem*] is [this] white," thus "Socrates and [this] white are the same thing." This sentence makes it clearly understood that this white and Socrates, the individual possessing the same whiteness, are the same thing "by virtue" of the "identity of reference" between "this is Socrates" and "this same thing is [this] white"—which Buridan calls *material termini*. Once he establishes the identity of Socrates and this white, that is to say, "once posited that Socrates *is* the same thing as [this] white," he goes so far as to infer, "by virtue of the matter" (= supposition, in opposition to the *forma termini* = connotation), that both "Socrates and this white exist . . . and even that they are beings, since Socrates consists of beings—given that he is made up of parts." In addition to this mereological of the individual (made up entirely of a substance and tropes), we can also add that the notion of "bundle" is present in the porphyrian idea of "gathering up proper characters" (*athroisma idiotêtôn* [ἄθροισμα ἰδιοτήτων]) referred to in the *Isagoge* to determine what makes an individual an individual. To state what constitutes the particular substance (literally, "the property of the subsistence") of an individual, the *Commentary on Categories* of Simplicius employs the expression *sundromê sumbebêkotôn* [συνδρομή συμβεβηκότων], "syndrome of accidents"—*concursus accidentium* in the Latin translation of Guillaume de Moerbeke. The source of Simplicius's theory is the porphyrian one, which integrates the Stoic "individual quality" (*idiôs poion* [ἰδίως ποιόν]) and Aristotle's ontological schema of subject-object, with the aid of the notions of "concurrence" (Fr. *concours*) (*sundromê* [συνδρομή]) and "description" (*hupographê* [ὑπογραφή]). The porphyrian and Simplician theory of the "syndrome of qualities" (*sundromê poiotêtôn* [συνδρομή ποιοτήτων]) is a mixture combining what D. M. Armstrong called the "substance-attribute view" with a "bundle theory" (these being, according to him, the two main types of theories of tropes); nonetheless, the properties that enter into the "syndrome" are not tropes, that is, abstract particulars, but

"common" properties. In this sort of theory, it is the bundling (Fr. *rassemblement*) that is particular, not what is bundled. The individual is first and foremost a primary substance in the Aristotelian sense of the term, constituted by an essential form, added to which is a "bundle of individualizing qualities," an object of "description."

In the twelfth century, Abelard will maintain that there are as many determinate species within the animal genre as there are different particular forms of rationality. By reducing the properties in common to differences all predicated on the species *de voce*, Abelard considers the specific differences of the sort that establish *de re* the singularity of individuals to be attributed to the name of the species. If the species seems to admit "bundled particulars," its ontology does not go so far as to define an individual as a "bundle of compresent particulars." Instead, it rejects the thesis claimed by "some" that (1) this particular man is not the result of accidents, whereas Socrates is; and (2) Socrates is the product of the ensemble of accidental properties not as a man, but as Socrates. Abelard mentions three versions of this theory, depending on whether the name "Socrates" is considered to designate all the accidental properties of Socrates, be they separable or inseparable, or only those accidental properties that are inseparable from Socrates, or only the "proper form" of the accidental properties of Socrates, which are called "Socraticity." Some maintain that all the accidental properties of Socrates, both separable and inseparable, are included in the name "Socrates," but that this name was "imposed" in such a way that whenever it is invoked, "Socrates" refers to all the accidental properties that Socrates possesses at that moment. Thus the meaning of "Socrates" "varies quite often," depending on the variability of accidental properties of Socrates. Abelard indicates that the adherents of this latter variant call the complete collection of the accidental properties of Socrates "Socraticity." For them, "Socraticity" is not a "single fact of nature," but a "composite individual." This medieval formulation of the doctrine of *individuum compositum* is no doubt the closest to the tropic theory of individuation.

TRUTH

FRENCH	*vérité*
GERMAN	*Wahrheit*
GREEK	*alêtheia* [ἀλήθεια], *orthotês* [ὀρθότης]
HEBREW	*ʾèmèṯ* [אֱמֶת], *ʾèmūnāh* [אֱמוּנָה]
LATIN	*veritas, adaequatio, aequalitas, concordia, convenientia*
RUSSIAN	*istina* [истина], *pravda* [правда]

➤ ISTINA, PRAVDA and *APPEARANCE*, BELIEF, DOXA, DUTY, EREIGNIS, *FALSE*, *FICTION*, HISTORY, *IMAGE*, IMPLICATION, *INTUITION*, *LIE*, LOGOS, MEMORY, MIMÊSIS, OBJECT, PREDICATION, PROPERTY, PROPOSITION, SACHVERHALT, SENSE, SUBJECT, *TO BE*

The European languages generally have only one word for "truth," with the notable exception of Russian, which distinguishes *istina* [истина] (which designates truth in its ontological and epistemological relation to being) and *pravda* [правда] (which is also translated as "truth" but which includes a notion of "justice") to designate truth as that which ought to be. These different terms (truth, *Wahrheit, vérité,* etc.) pose no significant problems of translation insofar as their semantic scope is more or less coextensive: they all carry a similar charge of signification that is simultaneously ontological, gnosiological, logical, and moral. These different languages have all incorporated a similar development of the notion of truth, first by freeing it from its initial poetic, religious, and juridical context, then by constituting it as a concept of philosophy, and subsequently by carrying it over to the field of science. After several centuries of this shared history, a generally agreed-upon definition has emerged: of truth as a "correspondence" between a thing and the mind, or *adaequatio rei et intellectus*. And yet our tradition is in this case particularly composite and heterogenous: three principal paradigms coexist within it, each of which can be traced separately through its etymology and semantics. The Hebrew paradigm *ʾèmèṯ* [אֱמֶת] is theological/juridical; it signifies "solid, durable, stable" based on faith

in the alliance between human beings and God and confidence in its promise, which makes the term semantically analogous to the English "truth." The Greek paradigm *alêtheia* [ἀλήθεια] constructs truth as an elimination of the hidden, of the forgotten (*alpha* privative, then *lanthanô* [λανθάνω], which signifies "being hidden" and at times "forgetting"—which is why Martin Heidegger constantly renders *alêtheia* as *Unverborgenheit*, "unconcealment"). The Latin paradigm *veritas*, which is the determining one for most modern vernacular languages, is normative: it designates the correct and the proper foundation of the rule; it is a juridical truth that "locks up" (Fr. *verrouille*—the etymological relationship is sometimes considered), that "guards" and "conserves" (like *Wahrheit,* based on *wahren* in German) a legitimate institution. These three paradigms do not necessarily exist in isolation from each other: thus the tradition of the New Testament, linked to the translations of the Bible, ties together the meanings of *ʾèmèṯ*, *alêtheia*, and *veritas* in truth understood as divine self-revelation, with the arrival of God the Son fulfilling the promise of the Father, in the institution of the church. But the differences between the three paradigms, forged in prephilosophical times but inherited by the philosophical treatment of truth, still give "truth" an analogical character that is often underestimated and enable us to illuminate some of its antinomies or instabilities.

I. The Different Paradigms

According to Pavel Florensky, who was one of the first to undertake a comparison of the paradigms of truth, *ʾèmèṯ* [אֱמֶת] is the imprescriptable promise of God. It is a "historical" notion that derives from theocracy; as for the truth of orthodoxy (*istina* [истина]), it is ontological, while *alêtheia* [ἀλήθεια] is gnosiological, and *veritas* is juridical. Nonetheless, according to the orthodox theologian, these notions can be conjugated as pairs:

> The Russian *istina* and the Hebrew *ʾèmèṯ* refer primarily to the divine content of truth, while the Greek *alêtheia* and the Latin *veritas* refer to its human form. On the other hand, the Russian and Greek terms have a philosophical character, while the Latin and Hebrew terms have a sociological character . . . in the Russian and Greek understanding, truth has an immediate relation to every person, whereas for the Romans and Hebrews, it is mediated by society.
>
> (Florensky, *Pillar and Ground*)

These observations, with their occasionally summary and cavalier formulations, call for further exploration.

A. *ʾÈmèṯ* and *ʾèmūnāh*

The Hebrew root ʾMN [אמנ], the direct source of the exclamation *Amen!*, which has passed into all the Western liturgies, also yields two related words: *ʾèmūnāh* [אֱמוּנָה] and *ʾèmèṯ* (from **am(i)nt*). It is this latter word that the Septuagint most often rendered by *alêtheia*, "truth." The primary meaning of the Hebrew root seems to be "solid," not so much in a concrete sense of "hard" or "resistant," but more in the sense of "durable, stable"—with the temporal dimension of something one can count on into the future, like the German word *zuverlässig*. If one "plants a stake in a *nèʾèmān* [נֶאֱמָן] place" (Isa. 22:23), one can count on its still being there when one comes back. To he who "lives in heights, whose residence is a

rocky fortress, his bread is given, his water is sure [nè'èmānîm (נֶאֱמָנִים)]" (Isa. 33:16): his shelter and sustenance are assured (cf. Jer. 15:18b). A nè'èmān illness is persistent, chronic (Deut. 28:59).

'Èmèt qualifies as that which will definitely occur in the future: a sure sign (Josh. 2:12), a leavening sure to rise (Jer. 2:21), a sure reward (Prov. 11:18). The travels of the servant that Abraham charged to get a wife for his son Isaac turns out to have been "a path of 'èmèt" (Gen. 24:48) because God ensured that it ended in success (ibid. 24:21, 40:56). The "truth" in question has less to do with the adequacy of a representation than with the satisfaction of an expectation. It is not so much something beyond time as a guarantee of continuity beyond the distance it introduces. It is on the basis of this fundamental meaning that one can understand others such as "security," associated with "peace," or rather "integrity" (šalōm [שָׁלוֹם]) (Isa. 39:8; Jer. 33:6, etc.); the word can even take on the supposedly "Greek" meaning of correspondence between an account and reality (Gen. 42:16; Deut. 13:15, etc.).

The God of Israel is a historical god: at first, perhaps, a nomadic god living in a portable tent, then the god who marches at the head of his people—for example, to bring his people out of the Egyptian captivity—and who promises his help in alliance with them. He manifests himself as the one who can be relied on at any moment—this is perhaps the meaning of the famous self-definition: "I am / will be who I am / will be" (Exod. 3:14; see I/ME/MYSELF). He keeps his promises and is a sort of "God of truth" (Ps. 31:6). YHWH presents himself as rich in 'èmèt (Exod. 34:6).

Another word that derives from the same root, 'èmūnāh, has meanings similar to 'èmèt, including that concrete sense of "firmness" that is said for example of Moses's hands in prayer (Exod. 17:12). It refers above all to the attitude that is worthy of confidence: the seriousness of someone who can be counted on, a conscientious attitude, honesty. Fidelity is first and foremost the faithfulness of God, who keeps his promises. The word is normally translated into Greek by pistis [πίστις], except in the psalms. In the Bible the word only rarely has the meaning of "faith of human beings in God" and not as something that is held as true but as something that one can lean on with confidence, that one can consider worthy of faith. Actually, this is only the case in one verse, but what a verse! The "just man who will live by his faith" (bè-'èmūnāṯō [בֶּאֱמוּנָתוֹ]) (Hab. 2:4) is placed at the very heart of Saint Paul—ho dikaios ek pisteôs zêsetai [ὁ δίκαιος ἐκ πίστεως ζήσεται]—as the opposing alternative to the law (Gal. 3:11, and cf. Rom. 1:17) and is subsequently inflected by Luther as the expression of the sola fide.

It is in playing on the meanings of the root 'MN that Isaiah can write: "If you do not have confidence [ṯa'amînū (תַאֲמִינוּ)], you will not be able to hold on [ṯē'āmēnū (תֵאָמֵנוּ)]," which is first of all an invitation to maintain morale. The Vulgate (credideritis . . . permanebitis), Luther's (gläubet . . . bleibet), the Authorized Version ("believe . . . be established"), all remain literal. But the Septuagint (pisteusête . . . sunête [πιστεύσητε . . . συνῆτε]), followed by the vetus Latina (credideritis . . . intelligetis), enable the link between "believing" and "understanding." This gives a scriptural foundation to the dialectic of fides and intellectus—believing in order to understand, understanding in order to know—that starts with Saint Anselm (Cur Deus homo, Dedication; De l'incarnation du Verbe, 1, PL, v. 158, col. 263d–264c) and extends to Hegel and beyond.

B. Alêtheia

1. Etymologies and synonyms: A position of enunciative strategy

The adjective alêthes [ἀληθής] appears earlier than the substantive; it is constituted by the negative particle a- and lêthos [λῆθος], lathos [λᾶθος], "escape from detection," and much later (in modern Greek) as "error," or lêthe [λήθη], "forgetting." When one looks for alêthes, "true," in Chantraine (RT: Dictionnaire étymologique de la langue grecque), one is also referred to lanthanô [λανθάνω], which signifies "remaining hidden," and even "forgetting." The Odyssey is often cited, when Odysseus, listening to the Iliad at Alcinous's palace, registered the bard "singing the famous deeds of fighting heroes" and "buried his handsome face, ashamed that his hosts might see him shedding tears [enth' allous men pantas elanthane dakrua leibôn (ἔνθ' ἄλλους μὲν πάντας ἐλάνθανε δάκρυα λείβων)]" (Odyssey 8:93); see MEMORY). Lêthê is a sister to Pain, Famine, and Suffering, and along with Lies and Falsehoods (Pseudeas Logous [Ψευδέας Λόγους]) and False Oaths (Horkos [Ὅρκος]), is daughter of Discord and Strife (Eris [Ἔρις]) and is considered one of the "children of night" (Hesiod, Theogony, v. 227, cf. 210–32). Alêthês (true, veridical) is said of "things and events that one does not hide," in opposition to "false" (pseudês [ψευδής]) (RT: Dictionnaire étymologique de la langue grecque), and thus as well in opposition to that which is "loyal, just, and fair" (Iliad, XIII: 433, with the image of the chernêtis alêthês [χερνῆτις ἀληθής], the painstaking "working widow," who struggles to properly balance the scales) (Homer, trans. Fagles, 502), and, after Homer, of persons who do not deceive, do not lie, oracles and dreams that come true in other words, everything that is "real and true" as opposed to "appearance" (philos alêthês [φίλος ἀληθής], "a true friend," [Euripides, Oresteia, Fr. trans. L. Méridier, Les Belles Lettres, "CUF," 1968, 424]).

The privative alpha, which indicates a specific form of negation that implies possibility rather than prohibition, involves a gesture of "de-concealment" (Unverborgenheit is the translation that Heidegger adopts; hors de l'oubli, "unforgetting," was Mallarmé's way of putting it in Crise de vers) that is a noticeable part of its meaning outside of any philosophical context. Alêtheia appears in epic narratives and poetry from Homer to Hesiod and Pindar in a manner that evokes the problematic of its construction: alêthês refers not to an accurate representation but to a strategy of utterance, in the interplay of the hero and his fame (doxa [δόξα]) or the poet with the Muse. In Homer the neuter plural form alêthês is placed next to declarative verbs (alêthea muthêsasthai, agoreuein, eipein [ἀληθέα μυθήσασθαι, ἀγορεύειν, εἶπεν], Iliad, VI: 382, Odyssey, III: 254, XIII: 254) to indicate that the questioner's request for information has been satisfied by a well-composed account. It is storytelling and the poetic act that give the hero his heroic character; his glory coincides with the power of his discourse, which triumphs over forgetting. This is what Hannah Arendt characterized in The Human Condition as the Greek solution to the fragility of human affairs.

And the privative etymology of *alêtheia* is always available for use in developing an argument. In the *Peri alêtheias* of Antiphon, the sophist and orator of the fifth century BCE (around 480–411), for example, nature is precisely "that which one cannot escape," as opposed to the conventional laws of the city (see *nomos* in THEMIS and LEX), and is thus founded "in truth"—which is why one has an interest in obeying nature, even when one is alone and without witnesses.

> If one breaks the laws of one's city, insofar as one gets away with it [*eian lathêi* (εἰὰν λάθη)] and keeps it out of sight of those who have agreed to the rules, one is free of both shame and punishment; but not if one does not get away [*mê lathôn* (μὴ λάθων)] and is caught. On the other hand, if one does violence to a natural law, even if it remains hidden from men [*lathêi* (λάθη)], the harm is no smaller; and if it becomes known, the harm is no greater. For the harm does not derive from opinion, but from the truth itself [*ou gar dia doxan . . . alla di' alêtheian* (οὐ γὰρ διὰ δόξαν . . . ἀλλὰ δι' ἀλήθειαν)].

> (POxy 1364 + 3647, fr. B, col. II;
> cf. B. Cassin *L'Effet sophistique*, esp. 168–71 and 273–78)

It is important to see that the usage of *alêthês* and of *alêtheia,* unlike our usage of "true" and "truth," does not immediately entail a corresponding real and observable referent. This is clearly the case in the three terms employed by Hesiod in the *Theogony*: *alêthês*, *pseudos* [ψεῦδος], and *etumos* [ἔτυμος]. For it is not *alêthês* but rather *etumos* that is paired with *pseudos*. The *pseudos* is constructed to mimic the "real" (*etumos*), as if it presented and duplicated all the opacity of the real, but not as embodying the "true" (*alêthês*). As Homer puts it to describe the manner in which Odysseus, upon his return to Ithaca, speaks to Penelope when he still does not want her to recognize him (Odyssey, XIX: 203): "*iske . . . homoia* [Gr. text]" (falsehoods all . . . ring of truth; trans. Fagles, XIX: 235–36). And as the Muses say to Hesiod:

> ἴδμεν ψεύδεα πολλὰ λέγειν ἐτύμοισιν ὁμοῖα·
> ἴδμεν δ', εὖτ' ἐθέλωμεν, ἀληθέα γηρύσασθαι.

> (We know how to speak many false things as though they were true; but we know, when we will, to utter true things.)

> (Hesiod, *Theogony*, v. 27–28, in *Homeric Hymns*)

Etumos, *etêtumos* [ἐτήτυμος], and *eteos* [ἐτεός] belong to the same family as the verb *etazô* [ἐτάζω], "examine, test" (which is also related to *hetoimos* [ἕτοιμος], "ready, available, imminent"). From Homer on, *etumos*, which is at the heart of the word "etymology" and supplies its eponymy, is used to indicate the register of the effective real. In Parmenides, *etêtumos*, an expressive elongation of *etumos* (the way "which exists and which is real [*tên d' hôste pelein kai etêtumon einai* (τὴν δ' ὥστε πέλειν καὶ ἐτήτυμον εἶναι)]," VIII: 18) is used to refer to the authenticity and effectiveness of the way of truth guaranteed by the goddess, attached to which is persuasion (*eupeitheos* [εὐπειθέος], I: 29; cf. II: 4); and *eteêi* [ἐτεῇ] will be a term in Democritus used to distinguish the effective reality of atoms and vacuum as opposed to their sense qualities, which are simply conventional, *nomôi* [νόμῳ] (68B 6–10; 9,

117 and 125 DK). One can see that *alêtheia* is not defined as completely separate from the "false" but includes within its condition relations to certain kinds of falsity: "negativity is not isolated, set apart from Being; it is the hem of reality. It is reality's inseparable shadow" (Marcel Detienne, *Masters of Truth*). The art of the ready-voiced Muses whose "words are well-suited" (*artiepeiai* [ἀρτιέπειαι]) (Hesiod, *Theogony*, v. 29) is an art of proper adjustment of words between each other, an art of the very structure of song and of "truth" as linked to the idea of structured rhythm (Hesiod, *Works*, v. 768, in which *alêtheia* designates the proper arrangement of works and days), and this art defines truth in harmony.

Nonetheless, *alêtheia* enters into a great variety of configurations that survive one within another in the practices of exegesis and palimpsest. These relations are unstable and vary between contradictions, external oppositions, or internal splittings, depending on the context, the poetic narrative, or categorical elaboration.

2. A plausible history of Greek truth: From *alêtheia* to *orthotês* and the analysis of propositions

Even today, the debate around the Greek conception of truth is a caricature: either Parmenides, Plato, and Aristotle are timeless Oxford fellows, and we measure their truth by the yardstick of our own, or else it is first and foremost a question of history, of change of scene, of appropriation and interpretation, and their truth astonishes us just as much as it is part of our own construction.

a. Parmenides and the path of co-belonging: the "Open without withdrawal"

Parmenides's *Poem*, written in the fifth century BC, gives the first impetus to what will become philosophy by giving dramatic figuration to the concepts of being and truth (fr. II). In the prologue, written in the manner of the grand epics of Homer and Hesiod, a young hero guided by the gods "travels a road [*hodos* (ὁδός)]"—far indeed does it lie from the steps of men, at the doors of Day and Night. The Goddess Justice (*Dike*; see THEMIS) welcomes him thus:

> χρεὼ δέ σε πάντα πυθέσθαι
> ἠμὲν ἀληθείης εὐπειθέος [εὐκυκλέος Simplicus]
>   ἀτρεμὲς ἦτορ
> ἠδὲ βροτῶν δόξας, ταῖς οὐκ ἔνι πίστις ἀληθής.

> (It is proper that you should learn all things, both the unshaken heart of well-rounded truth, and the opinions of mortals, in which there is no true reliance.)

> (Kirk, Raven, and Schofield, *Presocratic Philosophers*)

Or, with these Heideggerian words (Heidegger chooses the lesson of Simplicius: *eukukleos*):

> Du sollst aber alles erfahren / sowohl der unverborgenheit, der gutgegrundeten nichtzitterndes Herz / als auch der sterblichen Dafürhalten, dem fehlt das Vertrauenkönnen auf unverborgenes.

> (Heidegger, *Gesamtausgabe*, vol. 14)

> (But you should learn all: / the untrembling heart
> of unconcealment, well-rounded / and also the

opinion of mortals / who lack the ability to trust what is unconcealed.)

(Heidegger, "End of Philosophy")

Or else, in these more traditionally exact words:

You should be learned in all
Both of the untrembling heart of well-persuasive truth
And of what appears to mortals, where there is no true belief.

(Cassin, *Parmenides*)

Heidegger's translation seeks to convey the way in which being and thought belong to each other in the "clearing" (*Lichtung*; see LIGHT, Box 2), which is *alêtheia*: "It is not for the sake of etymology that I stubbornly translate the name *alêtheia* as "unconcealment" [Ger. *Unverborgenheit*, Fr. trans. J. Beaufret *état de non-retrait*] but for the sake of the matter which must be considered when we think adequately that which is called Being and thinking. Unconcealment is, so to speak, the element in which Being and thinking and their belonging together exist" ("End of Philosophy").

This step backwards in the direction of origin exhibits some of the characteristics of a meditation on immanence, which dismisses any "aiming at truth" from its claims. For one does not aim at *alêtheia*, one follows its path, which brings together the three dimensions of being, thinking, and saying. This triple unity at the heart of *alêtheia* is expressed in fragment II (v. 2 and following) as the relationship between truth and being: "The one that [it] is [*esti* (ἔστι)] and that it is impossible for [it] not to be, is the path of Persuasion (for she attends upon Truth)" (Kirk, Raven, and Schofield, *Presocratic Philosophers*, 291), and in fragment III for the identity between thinking and being: "for the same thing is there both to be thought of [*noein* (νοεῖν), "notice"] and to be" (ibid., 292), and in fragment VI for the identity between saying, thinking, and being: "What is there to be said and thought [*to legein to noein te* (τὸ λέγειν τὸ νοεῖν τε)] must needs be: for it is there for being" (ibid., 293) (these enigmatic textual fragments are par excellence open to being interpreted and translated in different ways).

But one can conclude that it is the Greek language itself that is deployed in and through the *Poem*: we can hear, in fragment after fragment, a subject, "what is" (*to eon* [τὸ ἐόν]), suddenly emerging from the impersonal verb *esti*, "to be," via a certain number of marked forms such as the infinitive and participle. In other words, in *alêtheia* it is a language that reveals and exploits its own structure, and it is to this self-deployment of language, in the narrative account of the road and the voyage, that the very act of ontology is entrusted (see ESTI).

Yet, and this is more legible in the second translation of the prologue,

We must acknowledge the fact that *alêtheia*, unconcealment in the sense of the opening of presence, was originally experienced only as *orthotês*, as the correctness of representations and statement.

(In Gesichtskreis dieser Frage muss anerkannt werden, dass die Alêtheia, die Unverborgenheit im Sinne der Lichtung von Anwesenheit sogleich und nur als *orthotês*, als die Richtigkeit des Vorstellens und Aussagens erfahren wurde.)

(Heidegger, "*End of Philosophy*," 390)

No less fundamental and "always already," there is the system of opposition that conditions the mutation of *alêtheia*-opening into *veritas*-adequation, that is, the difference between the path of truth and the path of opinion (*brotôn doxai* [βροτῶν δόξαι], "the opinion of mortals," "what appears to mortals"; see DOXA).

b. Plato and the *orthotês* or the correctness of the gaze

Whatever the status of the world of mortals, be it the manifestation of beauty or deceiving confusion, all of Platonic thought and all of subsequent philosophy is structured by Parmenides's distinction between *alêtheia* and *doxa*. For one can or must today detach oneself from one world and aim at another: in the Platonic allegory of the cave, one must turn away from the appearances and opinions of this world that are represented by the projected shadows on the walls ("*tas skias* [τὰς σκιάς]," *Republic*, VII, 515a) and direct one's gaze to objects that are more "true" ("*ta tote horômena alêsthestera / tôn nun legomenôn alêthôn* [τὰ τότε ὁρώμενα ἀληθέστερα / τῶν νῦν λεγομένων ἀληθῶν]," ibid., VII, 515d 7/516a 2), which are the objects that project those shadows, or even leave the cavern to emerge in the full sunlight of "forms" or "ideas" so as to contemplate this new and only authentic "truth," in the sense of intelligibility, which derives from the Idea of the Good ["*autê kuria alêtheian kai noun paraschomenê* (αὐτὴ κυρία ἀλήθειαν καὶ νοῦν παρασχομένη)," ibid., VII, 517c 3; cf. VI, 508e 1–3]. Because of this duplication of worlds into the "world of appearances" and the (real) "world of truth" ("*die wahre Welt*" is Nietzsche's term in *Twilight of the Idols*, as in "How the 'true world' finally became a fable"), one must now strive to become a "philosopher," to seek to reach the idea, the very being of the existing through appearance: "outside the cavern, *sophia* is *philosophia*." Heidegger comments that

Everything depends on the *orthotês*, the correctness of the gaze. . . . Thus, the priority of *idea* and of *idein* over *alêtheia* results in a transformation in the essence of truth. Truth becomes *orthotês*, the correctness of apprehending and asserting. . . . As the correctness of the "gaze," it becomes a characteristic of human comportment toward beings.

(Heidegger, *Plato's Doctrine of Truth*, 155–82)

■ See Box 1.

c. Aristotle and adequation

There is no need for the Platonic duality of worlds for truth to become a task to undertake and an objective to attain. All that is required is for *alêtheia* of itself to be no longer thought of as the open paradise of co-belonging or of immanence, if one prefers to call it thus.

If Plato is the proper name of truth as transcendence, Aristotle is the proper name for truth in the modern sense, as the adequacy of utterances. The key text is the beginning of his treatise

1

The accuracy of the names *orthotês* and truth

➤ EIDÔLON, MIMÊSIS

The *Cratylus* is the turning point for a definition of truth as rectitude. In it *orthotês* [ὀρθότης] does not signify correct vision but rather the accuracy of names (*orthotês onamatôn* [ὀρθότης ὀνομάτων]): how one passes from naming to knowing. It hedges the question of the Parmenidian equivalence of saying and being and its unfolding in the sophistical thesis of the impossibility of uttering falsehoods (*Cratylus*, 429d).

The etymological fantasies and play on *alêtheia* break apart their belonging to each other. "It is the divine motion of existence (*hê gar theia tou ontos phora* [ἡ γὰρ θεία τοῦ ὄντος φορὰ]) that seems to be called out by this locution *alê theia* [ἄλη θεία]"; *alê* as wandering is the pure movement of the goddess, and Socrates finds himself becoming Heraclitean: "*on* [ὄν] and *ousia* [οὐσία] are 'ion' with an 'i' broken off; this agrees with the true principle, for being (on) is also moving (ion)" (trans. by Benjamin Jowett).

The dialogue takes the form of an interrogation on the "correctness" or *orthotês* of names, whether it be, as Hermogenes first believes, that there is no "principle of correctness in names" (*xunthêkê kai homologia* [ξυνθήκη καὶ ὁμολογία]) "other than convention and agreement" (*nomôi kai ethei* [νόμῳ καὶ ἔθει]); or that there is instead a "natural" truth or correctness, which is thus approximately the same for Hellenes as for barbarians (383b), that consists in showing that the correct name indicates the nature of the thing (*onomatos . . . orthotês estin hautê hêtis endeixetai hoion esti to pragma* [ὀνόματος . . . ὀρθότης ἐστὶν αὕτη ἥτις ἐνδείξεται οἷόν ἐστι τὸ πρᾶγμα]) (428e); cf. 433d, and that a name is the representation (*dêlôma* [δήλωμα]) of a thing (433d), such that for Cratylus, logically, all names are correct, "at least, those that are names" (429b). Socrates examines several hypotheses: phonetic mimicry (423a–b), pictorial mimicry, and the ontological deficiencies of the image (beginning at 430b). In 430d, Socrates separates out the case of naming from the portrait, to which only *orthotês* can be applied. Naming requires another mode of assignment, *dianomê* [διανομή], which Socrates compares to the division between "man" and "woman" (431a). Thus Socrates can introduce "right assignment" (*alêtheuein* [ἀληθεύειν]) and "wrong assignment" (*pseudesthai* [ψεύδεσθαι]) (431b), and as a result there may also be a wrong or inappropriate assignment of names and verbs (*xunthesis* [ξύνθεσις]) and of the sentences (*logoi* [λόγοι]) that are made up of them (431c). At issue is how to know things on the basis of their relations and affiliations (*di' allêlôn ge, ei pêi xugenê estin* [δι' ἀλλήλων γε, εἴ πῃ ξυγγενή ἐστιν]) without entering into a problematics of orthology and to show the "truth of what is" (*tên alêtheian tôn ontôn* [τὴν ἀλήθειαν τῶν ὄντων]) (438d–e). So, in the end, Socrates concludes, no matter what the correctness of names, the knowledge of things is not to be derived from names. No, they must be studied and investigated in themselves (*ouk ex onomatôn, alla polu mallon auta ex hautôn* [οὐκ ἐξ ὀνομάτων ἀλλὰ πολὺ μᾶλλον αὐτὰ ἐξ αὐτῶν]) (ibid., 439b). The accuracy of names, unlike correct vision, and despite all the pleasures of etymological play, does not give access to truth.

On Interpretation. Here he distinguishes between "things" (*pragmata* [πράγματα]) and "affections of the soul" (*pathêmata tês psuchês* [παθήματα τῆς ψυχῆς]) that resemble things, as well as "speech sounds" (*ta en têi phônêi* [τὰ ἐν τῇ φωνῇ]), which are both natural signs of these affections, in the case of animals, and conventional symbols in the case of human beings and their different languages. Three strata, or three places: things, the soul, language. As a result, there is no guarantee of transitivity, of full passage from one stratum to another (see SIGN). In fact, one can be mistaken (*pseudein* [ψεύδειν], *psuedesthai*): one can perceive inaccurately; one can speak falsely; in fact, one can seek to mislead, for example by lying (*pseudein* once again). The truth is like a target that one aims for but can miss (*hamartanein* [ἁμαρτάνειν]), whether on purpose or not.

Aristotle's great discovery, which provides the foundation for this new doctrine of truth, and on which classical Western thought is built, at least until Hegel, is to propose an analogous structure for being, which is given objectively, and for discourse, which is held subjectively. Being is analyzed in terms of "substance" (*ousia*, which comes to take the place of platonic *eidos* [εἶδος], and which is translated no less correctly as "essence") and of "accidents" (*sumbebêkota* [συμβεβηκότα], exactly the way a proposition is broken down into "subject" (*hupokeimenon* [ὑποκείμενον]) and "predicates" (*katêgoroumena* [κατηγορούμενα]). The substance is the subject, which is to say it is defined through the supposition, the assumption, and the reception (it is the same verb: *hupokeisthai* [ὑποκεῖσθαι], "to stand under") of accidents like the predicates and itself is not supported or predicated by anything (see ESSENCE and SUBJECT).

This structural discovery, which as always is presented in the form of an observation and something evident, guarantees the possibility of a correspondence between the being as he appears and the discourse as it is proposed, and this is what will henceforth be called "truth." Truth is described in the same terms from Aristotle, the metaphysician of antiquity, to Tarksi, the modern logician. There is a clear line of filiation between the manner in which the goddess in Parmenides describes the lines of research into thought ("The one that [it] is and that it is impossible for [it] not to be, is the path of Persuasion (for she attends upon Truth)" fr. II, 3–5), through the Aristotelian definition of Truth ("To say of what is that it is not, or of what is not that it is, is false, while to say of what is that it is, and of what is not that it is not, is true." Aristotle, *Metaphysics,* Γ, 7, trans. W. D. Ross; cf. *Metaphysics* Θ, 10, 1051b 3–9: "It is not because we think truly that you are pale, that you are pale, but because you are pale we who say this have the truth" [trans. W. D. Ross]), up to Tarski's "semantic" turn: "The proposition 'the snow is white' is true if and only if the snow is white" for analytic propositions that are based on identity, and "'it is snowing' is a true proposition if and only if it is snowing," for synthetic propositions that entail facts ("The Semantic Conception of Truth" and "The Concept of Truth in Formal Languages" in

Logics, Semantics, Metamathematics). But the term "correspondence" itself does not appear in Aristotle, nor in any of the proponents of the "correspondence theory of truth" of the twentieth century (the most plausible equivalent—*homoiôsis* [ὁμοίωσις], *homoiotês* [ὁμοιότης], "comparison, similitude, resemblance"—never defines truth; cf. Bonitz). Whatever the case, the most enduring definition of truth is traditionally referred back to Aristotle, formulated in the Latin of the Middle Ages as *veritas est adaequatio rei et intellectus*, "truth as the adequation of intellect and things," which should be simultaneously understood, as Heidegger emphasizes, as "adequation of intellect to the thing" and in a preexisting or primary reciprocity, "adequation of the thing to the intellect" (see Box 4).

As a matter of fact, we still think "truth" as Aristotelians. We continue to define ourselves as "animals endowed with *logos* [λόγος]," that is, language-reason. The entire logical apparatus of the *Organon* (both "instrument" and "organ" or second nature) consistently comes to the rescue of the *logos*, helping it tell the world as it is. First of all, when we speak, we *signify* something; we say something that has one single meaning, both for us and for others. The principle of non-contradiction is a principle of being ("it is impossible for the same to both belong and not belong to the same and according to the same, at the same time") that reveals and instantiates itself as a principle of discourse (it is impossible for the same

"word" to have and not have the same "meaning" simultaneously). It provides a foundation for being by starting with the identity of meaning and by forbidding any unmastered homonym (see PRINCIPLE and HOMONYM). After that, our utterances are structured into propositions of the type "S is P"—subject-copula-predicate—and thus also substance-accident (see SUBJECT). Finally, our reasoning is "logical," in particular "syllogistic." As a result we are able to engage in "discourse" about a world become legible, and that discourse is also a "calculus" (*logos*; see LOGOS), from which derive its claims to universality and to universal truth, which Leibniz expressed so clearly in his conception of a universal characteristic (*mathesis universalis*).

■ See Box 2.

C. *Verus, veritas*

1. Etymologies

Unlike *alêtheia/alêthês*, the substantive *veritas* appears after the adjective *verus*. The adjective *verus* and its adverbial form *vero* existed previously; for a long time the substantive *veritas* only existed in its ablative forms. *Verus,-a,-um* relates to the series "veritable," "veridical," "veracity," Fr. *vrai*, and by extension "commonly used at all times," while verbs such as *verifico*, as used by Boethius, signify "presenting as true."

2

"True"/"better" or: What is relativism?

The *logos* of ontology is framed in the opening of *alêtheia* as the speaking of being, so that man, in Parmenides, as well as in Plato and Aristotle, is committed to this speaking; in the Heideggerian idiom he is the "shepherd of being." But this tradition is in tension with one of a sophistical sort, for whom discourse is not mimetic of the real or aimed at truth but rather produces the real. It is performative and performing, veracious as such: "every discourse proves to be" (this is one of the possible interpretations of the quote from Antisthenes, "*pas logos alêtheuei* [πᾶς λόγος ἀληθεύει]," *Proclus in Platonis Cratylum Commentaria*, ed. Pasquali, Tübner, chap. 37, scholie 385d). The sophist Gorgias, in his *Treatise on Non-being*, in fact analyzes the *Poem* of Parmenides as a performance of this genre, which is particularly effective because it succeeds in using language to produce this being that will be the object of all ontology. Instead of thinking of what lies on this side of the objective of truth, like the phenomenologists of today, like a received wisdom, one can instead think of it as an art of production (see SPEECH ACT).

This change of perspective translates into a change of vocabulary, which Plato impartially puts on display in the apology of Protagoras. Protagoras explains in what way

"man is the measure of all things" ("For I affirm," says Protagoras [*Theaetetus*, 166d], "that *Truth* [this is the title of Protagoras' treatise that remains] behaves just as I have written: each of us is the measure of what is and what is not"; see LEX, Box 1, "*Gnômôn*"). It is no longer "truth" (*alêtheia*) that is at issue but the "true" (*alêthes*), and even the "more or less true": we have passed from the substantive to the adjective with its various degrees. And this more or less true turns out to be a "more or less good," implying a passage from a state that is less good to a better one: "It is imperative to bring about this change in states, for one is worth more than the other [*ameinôn gar hê hetera hexis* (ἀμείνων γὰρ ἡ ἑτέρα ἕξις)] . . . as the doctor effects this change with his drugs, the sophist with his speech" (ibid., 167a). Here is the crucial text:

> Not that anyone ever made another think truly [ψευδῆ δοξάζοντά τις], who previously thought falsely [ἀληθῆ ἐποίησε δοξάζειν]. For no one can think what is not [τὰ μὴ ὄντα . . . δοξάσαι], or think anything different from that which he feels [οὔτε ἄλλα παρ' ἃ ἂν πάσχῃ]; and this is always true [ἀεὶἀληθῆ]. But as the inferior habit of mind [πονηρᾶς ψυχῆς ἕξει] has thoughts of kindred nature, so

I conceive that a good mind [χρηστὴ] causes men to have good thoughts; and these which the inexperienced call true [τινες τὰ φαντάσματα ὑπὸ ἀπειρίας ἀληθῆ καλοῦσιν], I maintain to be only better [βελτίω], and not truer than others [ἀληθέστερα δὲ οὐδέν].

> (Plato, *Theaetetus*, 167a–b, trans. Jowett)

This position has been stigmatized as relativistic. It makes no distinction between *doxa* and *alêtheia*, being and appearance, and claims full justification in so doing (as Aristotle puts it as well: "because they maintain that it is sensation [*aisthêsin* (αἴσθησιν)] which is thought [*phronêsin* (φρόνησιν)] and that it is also alteration [*alloiôsin* (ἀλλοίωσιν)], they can claim that that which appears in sensation [*to phainomenon kata tên aisthêsin* (τὸ φαινόμενον κατὰ τὴν αἴσθησιν)] is necessarily true" (*Metaphysics*, Γ, 5, 1009b12–15). At any rate, it has nothing subjectivist about it. The truer is better, and is more useful for the individual, as well as for the city (Plato, *Theaetetus*, 167c). This is why Protagoras, the expert in discourse, accepts without false modesty to be called "wise," or even better in the comparative form, "more wise" (ibid., 166e).

Most contemporary hypotheses propose that *verus*—and the words signifying true, *vrai, vérité, wahr, Wahrheit*—derive from an Indo-European root, **wer*, which would retainmeanings of "to please, pleasing, manifesting benevolence, gifts, services rendered, fidelity, pact." Chantraine (RT: *Dictionnaire étymologique de la langue grecque*) links it to the Homeric expression *êra pherein* [ἦρα φέρειν], "to please," as well as to *epiêra* [ἐπίηρα], *epiêros* [ἐπίηρος], and *epiêranos* [ἐπιήρανος], "agreeable" (*Odyssey*, 19, 343), just like the Latin *verus* (cf. *se-vere*: "without benevolence"), the German *war*, and the Russian *vera*, "faith," or *verit'* [верить], "to believe." Pokorny adds to this same theme the Greek *heortê* [ἑορτή], "religious feast, cult." And from the same basis have come terms signifying "guarantee, protect": French *garir* and later *garant*, German *Gewähren*, English *warrant, to grant*.

According to Chantraine, this root **wer* should be distinguished from another root *ver-*, whence *eirô* [εἴρω] in Greek, *verbum* in Latin ("word" in English, etc.), and words from the family of *vereor, revereor*, "to fear, to respect," *verecundia* (respectful fear). Alfred Ernout does not support this separation. We should recall that plays on the words *verum* and *verbum* were common, as Augustine mentions (*verbum = verum boare*, "proclaiming the truth," *Dialectics* 1, 1; see WORD). Pavel Florensky, following Georg Curtius (*Grundzüge der griechischen Etymologie*, 1873), also claims a single root for the ensemble of these derivations, including the Sanskrit *vratum*, "sacred act, vow, promise," the Greek *bretas* [βρέτας], "cult object, wooden idol" (Aeschylus, *Eumenides*, v. 258), and the Latin *verbum*. For Florensky the signification of *verus* must be considered as belonging first to the field of religious ritual and subsequently of juridical formulas: "strictly speaking, *verus* means protected or grounded in the sense of that which is the object of a taboo or consecration" (*Pillar and Ground*, 18).

2. From the juridical to the philosophical

Verus implies a rectification of an adversarial allegation considered to be fraudulent, as is indicated by the original opposition *verax/fallax-mendax*. It thus signifies the properly founded (in fact or in the rules of law): "*crimen verissimum*" a well-founded accusation (Cicero, *In Verrem*, 5, 158.) In texts of grammar and rhetoric, but also in juridical texts as well, *verus* and *veritas* signify the veracity of the rule, inasmuch as it can be distinguished from usage: "*Quid verum sit intellego; sed alias ita loquor ut concessum est*" (I know what is correct, but sometimes I avail myself of the variation in usage), (Cicero, *De oratore*, Loeb Classical Library); "*Consule veritatem: reprehendet; refer ad auris: probabunt*" (If you consult the strict rule of analogy, it will say this practice is wrong, but if you consult the ear, it will approve) (ibid., 158–69). The juridical connotation of the word *verus* (and thus of *veritas*) is retained and subsequently reinforced. In the glosses of the Middle Ages, *verus* signifies "legitimate" and the Latin sense of the word, "legal and authentic" or "conforming to existing law." One normally finds *verum est* in legal texts to certify that a new rule conforms to preexisting ones (*Digest*, 8, 4, 15).

It is this juridical dimension that produces the meaning of *verus* as "authenticated, authentic" (in contrast to "false," "imitative," "deceiving") and thus "real" as in "real cream" or "a genuine Rolex watch." The juridical here provides a foundation not only for the moral ("*Verum et simplex bonum

quod non possit ab honestate sejungi" [The true and simple Good which cannot be separated from honesty], Cicero, *Academica*, I, 2), but also for the ontological (which one can find in Cicero's translation [*Topica*, 35] of *etumologia* [ἐτυμολογία] by *veriloquium*). The association of *vera ratio* is particularly polysemic in consequence (see *ratio* under LOGOS) because of the equivocal status of *ratio* in its ascription as explication, cause, doctrine. Thus Lucretius introduces epicurean physics by "*animum nobis adhibe veram ad rationem*" (*De rerum natura*, II, 1023); *vera ratio* is simultaneously true reason, the true cause, and the manifestation of a new aspect of things ("*nove se species ostendere rerum*," ibid., II, 1025), in relation to a theory of causes ("*semina rerum*," ibid., II, 1059).

In turn, *veritas* first refers to the qualities of witnesses, which is not simply an issue of their sincerity but of their capacity to speak the truth: "*in tuam fidem, veritatem confugit*" (he seeks refuge in your good faith, in your truth and compassion) (Cicero *Pro Quinctio*, 10. trans. C. D. Yonge, 1903), "*veri testes*" (unimpeachable witnesses) (Cicero, *In Verrem*, 5, 165). This dimension of *truthfulness* in English has no French equivalent outside of *fiabilité*, which plays upon the register of confidence (see BELIEF, GLAUBE).

In this manner truth comes to be instituted, but not uncovered. *Veritas* qualifies an accreditative function, the power of having the last word, according to Roman law: "The judgment holds the thing to be true" (*res judicata pro veritate accipitur*) (*Digest*, 50, 17, 207). *Veritas* is performative: it does not designate a relation of adequacy between the utterance and reality but enacts the authority of judgment, the well-founded juridical utterance.

II. The Posterity of the Paradigms

A. ʾÈmèṯ / *alêtheia* / *veritas*: Christian "revealed truth"

Alêtheia in Paul first takes on the meaning of ʾèmèṯ: the "God of truth." This does not refer back to the idea of a supreme reality, but to veracity "in fulfilling his promises" (*eis to bebaiôsai tas epaggelias* [εἰς τὸ βεβαιῶσαι τὰς ἐπαγγελίας]) (Rom. 15:8). And if Paul speaks of the "truth of Christ" and of his "true word" (2 Cor. 11:10 and 6:6), it is to refer to his veracity. In return the "truth" asked of the Christians refers to sincerity (2 Cor. 7:14), uprightness in relation to divine expectations or requirements (cf. "those who rebel against truth," Rom. 2:8). Linked to truth are ideas of constancy (1 Pet. 5:12), solidity (1 Tim. 3:15), and plenitude (Col. 2:9), but always in relation to the imperatives of Genesis of the generative *fiat*. In 2 Thessalonians 2:11–12, one finds a revealing opposition between "belief in truth" and "belief in a lie."

It is only with the Epistle to the Galateans that the registers of ʾèmèṯ and *alêtheia* become intermingled and that the evangelist is identified with truth and its revelation. Paul transforms the biblical notion of "the truth of the law" into "the truth of the evangelist" (Gal. 2:5 and 14) and points to the correspondence between the Revelation and his interpretation by stressing the contrast between the Evangelist, which is "power of God unto salvation" (Rom. 1:16) and the ineffectiveness of the law. John's *alêtheia* is completely defined by its Christological content. Thus the expression to "speak the truth," which in Paul is solely a matter of veracity (cf. Rom. 9:1) becomes in John the proclamation of true

revelation (see LOGOS). Christ is truth as the fulfillment of Revelation and as the word of God the father. *Alêtheia* is defined along two axes: Revelation and Incarnation. Two texts are fundamental to this point of view: the prologue that describes the incarnation—the Christ is "*plêrês charitos kai alêtheias* [πλήρης χάριτος καὶ ἀληθείας]" (full of grace and truth) (John 1:14) and the text of the Last Supper—the words of Christ: "*Egô eimi hê hodos kai hê alêtheia kai hê zôê; oudeis erchetai pros ton patera ei mê di' emou* [Ἐγώ εἰμι ἡ ὁδὸς καὶ ἡ ἀλήθεια καὶ ἡ ζωή· οὐδεὶς ἔρχεται πρὸς τὸν πατέρα εἰ μὴ δι' ἐμοῦ]" (I am the way, the truth, and the life: no man cometh unto the Father, but by me) (John 14:6).

Two expressions are taken from the Old Testament and given a meaning specific to John, to indicate the subjectivization of truth "in us." The Old Testament expression "*poien tên alêtheian* [ποιεῖν τὴν ἀλήθειαν]" (to wreak the truth) (2 Chron. 31:20), which signifies "keeping to obligations" and "being faithful to the Law," is reinterpreted by John in the sense of subjective faith: "*ho de poiôn tên alêtheian erchetai pros to phôs* [ὁ δὲ ποιῶν τὴν ἀλήθειαν ἔρχεται πρὸς τὸ φῶς]" (he that doeth truth cometh to the light) (John 3: 21, King James version). The formula "in truth" (*en alêtheiai* [ἐν ἀληθείᾳ]), which is found in the Old Testament (for example to "walk in truth," 1 Kings 2:4) and in Paul, sets up in John a dialectic of interiority: we are in truth, and we come "from the truth" (John 3:18–19) and truth "abides in us" (2 John 1–2). The work of faith entails the inhabitation of truth (living in truth).

It is Saint Augustine who gives the New Testament truth its specifically ontological determinations in his elaboration of the Trinity. He introduces a significant modification to the truth of John by applying the term of truth to God himself, and not just to Christ. He puts to use all the resources of *verus*, "true God," veracious God: "*Deus unus, solus, magnus, verus, verax, veritas* [one God, alone, great, true, truthful, the truth]" (*De Trinitate,* VIII, 2, 3). Augustinian "truth" extends itself in man in the concept of the interior "Master" and the intimacy of the "mental verb" in *De Trinitate.* According to *De Magistro*:

> It is not a speaker who utters sounds exteriorly whom we consult, but it is truth that presides within, over the mind itself. . . . And He who is consulted, He who is said to *dwell in the inner man,* He it is who teaches—Christ (*qui in interiore homine habitare dictus est Christus*).
>
> (Colleran, *Ancient Christian Writers*)

■ See Box 3.

B. From '*èmèṯ* to "true" and from *verus* to *wahr*

1. From '*èmèṯ* to "true"

The history of "truth" is distinct from the history of *veritas/verum* and follows a schema similar to that of '*èmèṯ*. Etymologically, "true" derives from "tree" ("firm as a tree"). "True" (cf. Ger. *treu*), which has yielded "truth," is originally close to "faithful" (loyal, constant) and is related to "trust," entailing an idea of fidelity or solidity ("firmness"). As the expression "being true to a person" indicates, "truth" signifies first of all "confidence, trustworthiness" ("They had

Textual truth and allegory

➤ ANALOGY, COMPARISON, OIKONOMIA, SENSE

The Christian paradigm of truth implies a truth to the text: it is the register of the *oikonomia* [οἰκονομία] as "economy of salvation"; Tertullian translates *oikonomia* by *dispensatio*, and Augustine calls it *dispensatio temporalis*. The revelation is only such that it announces in advance, hidden behind the veil of actuality, another event of a higher order; the new is the accomplishment of the old and "completes the preludes" (*per adimpletionem*) (Tertullian, *Adversus Marcionem*, IV, 11). Tertullian invokes the "conspiracy between the meaning of the Scriptures and the deadlines of events and the order of time" (ibid., III, 23). He employs a Roman juridical term, *praescriptio* (the fact of having been written in advance), to characterize the mode of truth of the text, which is proven through the temporal continuity of the realization of the prophecies (ibid., V, 11). And Hilaire de Poitiers writes: "*Signata sunt omnia, et per spiritalem doctrinam resignanda* [all things are signified and must be unsealed through the spiritual doctrine]" (*Commentary on Psalm 118*, 17).

This conception of the *oikonomia* conforms to Paul's allegories of hermeneutics and "typology" when he declares in 1 Corinthians 10:11 that everything that occurs in the New Testament was already *in figura* in the whole of antique law and that Christ was the "type" (*tupikôs* [τυπικῶς]) announced by the earlier figures, especially Moses and the prophets: "*Haec autem omnia in figura contingebant illis / Tauta de tupikôs sunebainen ekeinois* [ταῦτα δὲ τυπικῶς συνέβαινεν ἐκείνοις] / *Solches alles widerfuhr ienen zum Vorbilde* [Luther, Ger. translation]." Everything had already arrived as figures (*written down as warnings*): the events, the actions, and the persons of biblical history were thus "figures," "antetypes," or "prefigures" of the arrival of Christ—Adam himself being "a type of the one that was to come" (*tupos tou mellontos* [τύπος τοῦ μέλλοντος]) (Rom. 5:14, English Standard Version). Here allegory does not have only a simple semantic sense but an ontological sense. It rests on what is. The *orthotês* does not designate correct vision but the correctness of names, a relation between things, not between words, and it involves the introduction of temporality. The *tupoi* [τύποι] are only identifiable through a double movement of retrospection-prospection that takes into account the fulfilled Revelation.

This new architecture of exegesis or articulation between the meaning of a text and the event, between the idea of "body" and of "letter," gives rise to the theology of the four senses of the Scripture, and beyond that, it provides the very paradigm of hermeneutics.

been friends in youth, but whispering tongues can poison truth," Coleridge, *Christabel,* II). Like belief, it can be assimilated to faith (the suffix -*th* indicates the kinship of the two terms, according to the *Middle English Dictionary*) (see BELIEF, FAITH). The idea of dependability and loyalty ("trustworthiness") inherent in "trust/truth" leads to two new usages: on the one hand, conformity to an agreement, to a promise (cf. "faith") that can have a political meaning associating truth and normativity to sociality. In this case "truth" designates adherence to a norm or rule (agreement with a standard). On the other hand, truth is linked to sincerity, the inclination to tell the truth (veracity). For the liar, unlike the person in error, knows the truth. It is not enough to be in the truth or to know it; for social harmony one must also be disposed to say it or to agree to it.

The central problem is the duality of "truth": "sincerity" and "veracity." Thus "truthful" and "truthfulness," when said of a person, imply that "reliability" is not just a matter of faith but that faith itself is founded on an inclination to tell the truth. Similarly, "truly" moves from a moral sense ("faithfully, sincerely" as in the standard expression "yours truly") to a veridical sense. There is an amusing example in Austin, in his essay on "Truth":

> Yet between stating, however truly, that I am feeling sick and feeling sick, there is a great gulf fixed.

(Austin, *Philosophical Papers*, 123–24)

One finds then, even in contemporary uses of the word "truth," an ambiguity proper to *verum*, in which the dimension of sincerity/reliability is prior to that of the veridical dimension.

2. From *veritas* to *wahr*

The paradigm of *verus-veristas* is not easy to separate from any epistemological dimensions, as is evident in the varied fates of the Indo-European root **wer*, from which derives, in addition to *vera* (in Russian, "belief"), the old French *garir*, in the sense of "certifying as true, designating as true," whence the participle *garant*. The evolution of these derived words inscribes *wahr* and *Wahrheit* in a semantic network from which emerge two directions, belief and salvation.

a. Belief

Wahr is often linked back, in composite words, to the idea of belief, in the sense of true belief, to take as true: *wahrsagen* (to predict), *wahr haben* (to admit, agree upon), *für wahr halten* (to hold as true, to believe). This is the term that Kant employs in the *Critique of Pure Reason*, "Transcendental theory of method," chap. 2, 3 ("On Opinion, Science, and Belief"): "*das Fürwahrhalten*" is a belief, as a modality of subjectivity, that can be divided into conviction (*Überzeugung*) or persuasion (*Überredung*) and that is capable of three degrees: opinion (*Meinung*), belief (*Glaube*), and science (*Wissenschaft*).

b. Safeguarding, conservation

Similarly *wahren, bewahren* in the sense of "to guard, to conserve" is linked to *Wahrung* in the sense of "defending one's interests" or "safeguarding." One might refer to Heidegger's use of this etymological and semantic relation in reference to Nietzsche:

Nietzsche reserves [*bewährt*] the rubrics "true" [*das Wahre*] and "truth" [*Wahrheit*] for what Plato calls "true being." . . . Holding [*wahren*] the "truth" is a representational holding-to-be-true [*Fürwahrhalten*]. . . . Truth is a condition for the preservation [*Bewahrung*] of will to power. Preservation [*Wahrung*] is of course necessary, but it is never adequate.

(Heidegger, *Nietzsche*: 3: 235–36)

In its sense of safeguarding, *wahr* makes no mention of any materiality. It deals with either the *real*, "actual, concrete" (*real Wert*, "real value"; *real Ich,* "the real and concrete me") or else with the *wirklich*, "effective," *Wirkung*, "effect, result," *Wirklichkeit* (the Hegelian translation of *energeia* [ἐνέργεια]); *wirklich* belongs to the paradigm of works, of labor. Here we find the ontological dimension of *verus*, as in the English usage of "real" (true in the sense of real: see REALITY).

3. "Real" and "true" / *wahr* / *vrai,* and the status of ontological truth

Two fundamentally different relations to ontology and the *ontos on* can be traced through the legacy of the paradigms of *alêtheia*/ʾὲmὲ̲t̲/*veritas*: the true as real and effective, or the true as authentic, nonimitative, or false (being such as it speaks itself). Two incompatible approaches to truth emerge, one corresponding to something said of things, the other to something said of speech.

It is not clear, as Austin put it so well, that the ordinary meanings of "real" and "true," which share the same intent, actually refer to an ontological questioning of reality.

> "Real" is an absolutely normal word, with nothing new-fangled or technical. . . . For instance, if we are going to talk about "real," we must not dismiss as beneath contempt such humble but familiar expressions as "not real cream."

(Austin, *Sense and Sensibilia*, 63–64)

In order to know what Austin calls "the Nature of Reality," one needs to examine the meaning of "real," "genuine," "authentic," as analogous to the sense of "true" in its non-veridical usage. There is a specific play between French and English and a complex relation between "real" and French *vrai*. "Real" is often translated into French as *vrai* (and in German as *wahr*) and not by *réel.* The English "real" is more common and less theoretical than the French *réel* or the German *real.* This is precisely why Austin claims in *Sense and Sensibilia* that "real" is "absolutely normal" and why he rejects the attachment of ontological over-investment to the term. "Real cream" would be rendered in French as *vraie crème* and "real color" (in hair color, for example) would be rendered as *couleur naturelle* or *véritable* (natural or true color). When one is dealing with expressions such as "not real cream," one is dealing with an "ersatz" or substitute (as in the case of a hair dye); a "not real color" in which "not real" hardly implies a large-scale illusion. "Real" poses no great problems for "reality" in expressions such as "a real Vuitton" or "a real idiot." But the problem can only be raised by Austin as a result of the flexibility of "real" (unlike the French *réel*), which brings it much closer to "true" and to a whole lexical field of terms, including "proper," "genuine," "live," "true," "authentic," "natural" (ibid., 71). This use of "real/true" separates

questions of truth from questions of authenticity, making the latter the central question.

There is a significant difference between English usage, on the one hand, and French and German on the other. *Wahr* can be employed in the sense of "real, authentic," as can *vrai.* But Bolzano qualifies this sense of the inauthentic (*uneigentlich*) and claims that it only applies to the adjective, not to the noun: "*das Adjectiv 'wahr' werde auch im Sinne von 'wirklich,' 'echt' gebraucht.*" But the English translator of Bolzano uses "real, genuine" as the equivalent of *wahr*, not "true." Following in the Aristotelian tradition, Bolzano points to the *derived* nature of this meaning of true, which is always a manner of translating or abbreviating one of the "primary" senses of *wahr* and *Wahrheit*, that is to say, it is part of a proposition. Even in what Bolzano calls "common usage," "true" is said primarily of utterances, not of things.

An additional problem derives from the fact that German establishes reference to the true within the very idea of perception. The verb *wahrnehmen*, "to perceive," is indeed constructed on *wahr* and literally means to "take as true." *Wahrnehmung* is thus the "grasp of the true" (see PERCEPTION, Box 3, "*Wahrnehmung*"). Thus in Husserl:

> It is clear that it belongs to the essence of perception that it perceives [*wahrnimmt*] some thing as its object, and consequently I can ask how the object is taken for real [*als was nimmt sie den Gegenstand für wahr*].

> (Husserl, *Introduction to Logic*)

Later on, Husserl proposes a curious construction relating to the false representation 2 x 2 = 5: "The representation does not conform to a corresponding perception, the represented does not reach the level of proper perception [*Wahrnehmung*] but of false perception [*Falschnehmung*]." Thus a false perception is a *Falschnehmung*, a direct grasp of the false. Part of German language philosophy insists in fact on the "truth" of perception based on a supposed "proper" meaning of *Wahrnehmung.* Brentano in particular speaks of internal perception as the only perception, "in the proper sense of the term," as the phenomena of external perception cannot be shown to be "real and true." "External perception is thus not, in the rigorous sense of the word, perception at all." Gandillac clarifies in a footnote that it is the etymological signification of *Wahrnehmung* that justifies the author's argument (*Psychology from an Empirical Point of View*). *Wahrnehmung* presents a problem of translation into French or English as soon as one plays on its construction based on *wahr.*

Thus German and French have a broader usage for *wahr/ vrai* than the English "true," but on the other hand, "real" in English has a broader and more "ordinary" usage. All of this is further complicated by the problems resulting from successive redefinitions of the relations of reality and truth since Aristotle. This is evident in the ambiguities of the term "realism," which is nonetheless easily transferable from one language to another but whose history and occasional incompatible meanings were developed in parallel to the terms "true"/*vrai/wahr*. Recent discussions of realism, especially in the United States, have focused on the notion of truth (especially Tarski's definition of it) without clearly separating the two issues.

It remains to be said that many common or colloquial expressions, in French as well as in English, play on the semantic slippages of *vrai* and "real," between the ontological sense and linguistic meanings. Thus in French, *c'est pas vrai!* does not mean it is false, but rather that it is not reality. In English, the opposite is the case: "get real!" means "come back down to earth," "accept the truth."

III. From Medieval to Classical Truth: Truth of the Matter, Rectitude, Adequation, Evidence, Certainty

The term *veritas* has three distinct standard acceptations during the Medieval period. The first, called the "Augustinian," is the "truth of the thing" (*veritas rei*); the second, called the "Anselmian," is truth as "the correctness grasped only by the intellect" (*rectitude sola mente perceptibilis*); and the third, generally credited to "Isaac" and Avicenna, is truth as "adequation of the thought to the thing" (*adequatio rei et intellectus*). All three uphold or, if need be, rectify, limit, or relativize the "logical" and predicative conception attributed to Aristotle. Within this network of meaning, one reformulation, called "Aristotelian," affects the first usage: truth as an "ontological disposition" (*dispositio rei in esse*), as a foundation of logical or "predicative" truth. Thomas Aquinas's *De veritate*, which contains a fairly exhaustive inventory of medieval elaborations, can serve as our guide.

A. The truth of the thing: Predicative and antepredicative

As Thomas presents it, the notion of "truth of the thing" is connected to an Aristotelian interpretation of truth as antepredicative before being logical. The three standard uses—Augustinian, Anselmian, Avicennian—clearly appear as the obligatory references starting with the first question of Thomas's *De veritate.* But in this system the first definition is supposed to look at "that which concerns the notion of truth and that which founds the true itself" (*illud quo praecedit rationem veritatis et in quo verum fundatur*), this truth that is called today "antepredicative" or "ontic." The tie between truth and existence, or rather beingness, is placed under the sign of Aristotle (*Metaphysics*, β, 1, 993b30) as an affirmation of the complete synonymity of "true" and "being" ("the true and the existent are completely the same thing" [*verum et ens sunt omnino idem*]). This is often alleged by the proponents of the theory of "making true" in the light of the dominant interpretation of the text, which is evident in the translations of Tricot ("*autant une chose a d'être, autant elle a de vérité*") or Reale ("*ogni cosa possiede tanto di verità quanto possiede di esse*").

■ See Box 4.

B. Truth and correctness: Anselm, or the two ways of "making true"

In his dialogue entitled *De veritate* (around 1080–85), especially in chapter 2, Anselm is determined to distinguish two types of truth and to define truth in relation to rightness or correctness (*rectitudo*). Anselm does not agree with the common usage according to which a discourse is said to be true when it signifies that what is actually exists. In that case truth would be found outside of the utterance, in things, whereas it is important that it be located within what it is, that is, in discourse itself. But truth cannot be immediately

4

Logical truth and antepredicative truth: On the Heideggerian reading of Θ, 10

➤ INTELLECTUS, *INTUITION*

In the Middle Ages the canonical Aristotelian thesis as it is expressed in the *Metaphysics*, Θ, 10, 1051b4–5 "He who thinks the separated to be separated and the combined to be combined has the truth, while he whose thought is in a state contrary to that of the objects is in error" (trans. W. D. Ross)—has now become *auctoritas* and circulates in a form similar to "saying the truth is to say that what is combined is combined and that what is separated is separated." The medieval version accentuates the "logical" aspect of the definition.

But for modern interpreters the primacy of the ontic truth (the truth of the thing) can lead to a very different reading. The Greek "*epseustai de ho enantiôs echôn ê ta pragmata* [ἔψευσται δὲ ὁ ἐναντίως ἔχων ἢ τὰ πράγματα]," rendered in Italian by G. Reale in the form of "*sarà, invece, nel falso, colui che ritiene che le cose stiano in modo contrario a come effetivamente stanno*" (Aristotle, *Metafisica*, trans. G. Reale, Milan: Rusconi, "Testi a Fronte," 1993, 429), which is closer to a beginning of considering the "state of affairs" (*Sachverhalt, état de choses*), claims to be closer to the authentic Aristotelian inspiration than the anachronistic "*nature des objets*" in the French translation of Tricot. The two translations are still based on the same supposition: the "primordial character of truth in things," the foundation of the theory that we call today the "correspondence theory of truth," which

Tricot stresses, following in the steps of Thomas Aquinas: "*compositio et divisio rei est causa veritatis et falsitatis in opinione et oratione*" (in *Metaph.*, 1899, 549). This "antepredicative" truth and its primacy are still at issue in the course held in 1926 in Marburg on the *Grundbegriffe der Antiken Philosophie*, in which Heidegger contrasts the Aristotelian conception of truth in Θ, 10 with that from E, 4 (truth as the "truth of proposition"), with the second based on the first. In regards to the truth in Θ, 10, Heidegger posits that it is known through "a simple dis-covering (or un-veiling by a simple gaze (itself)." In the *Grundfragen der Philosophie*, *Ausgewählte "Probleme der Logik"* of 1937–38 (a course given in Freiburg in the winter semester), Heidegger attributes to Aristotle a concept of truth as "correspondence," "correction" (exactitude), or "adequation" between thought and being, all the while recalling that his concept is based on the concept of truth as unconcealment or nonlatency of being from Θ, 10, "the ultimate resonance of the originary essence of truth" in the history of philosophy (cf. Heidegger, *Gesamtausgabe*, 45: 15, 97, 139, and 205). In *Metaphysics* Θ, 10, 1051a35ff., Aristotle explains that "the terms 'being' and 'non-being' are employed firstly with reference to the categories" and "secondly with reference to the potency or actuality of these or their nonpotency or nonactuality, and

thirdly in the sense of true and false" (trans. W. D. Ross). This passage, which is a prelude to the thesis of 1051b4–5, has been the object of different interpretations. Ross places the words *kuriôtata on* [κυριώτατα ὄν] in square brackets in the expression "*to de kuriôtata on alêthes ê pseudos* [τὸ δὲ κυριώτατα ὄν ἀληθὲς ἢ ψεῦδος]," and Tricot (p. 522) comments that "if one keeps these words, one must reattach them to [ἀληθὲς ἢ ψεῦδος], and not to [τὸ δὲ], because Aristotle did not intend to say that Being par excellence is the true and the false, when in his doctrine (as affirmed in E, 4, 1027b34), Being as true is only an affection of thought." Heidegger's interpretation is quite different. According to him, the adverb *kuriôtata*, which Schwegler rejected and Ross eliminated, should be maintained: Aristotle's thesis lies in this place, contrary to the claims of E, 4, that being as true exists in things in two forms, one of them relating to "composite realities" (= complex), expressed in judgments, and the other in "noncomposite realities" (= not-complex), expressed by the thought (*noein*), which is not a judgment. The true thesis of Aristotle on truth is thus that being in the sense of true (being) is, of all the meanings of "being," the most proper to it, that it is the truth of things and in things, that it is the "constant presence" on which the truth of thought, i.e., judgment, is based.

within discourse either, since, as Aristotle says, a specific utterance, made out of the same constituent parts, can be either true or false and can even be first one and then the other as a function of the state of affairs to which it refers. Anselm overcomes this difficulty by asking himself at what the affirmation had "been aimed" (*ad quid*). The statement has been made to signify that what-is is (or that what-is-not is not). But it has also has the capacity to signify that what-is is not, for if this were not the case, the statement could signify falsely. A statement that does what it ought to do (*facit quod debet*), in signifying what it has undertaken to signify (*significant quod accepit significare*) thus signifies "correctly" (*recte*) at a first level, just as the truth or rightness of a creature consists in doing what God has given him to do, that which he must do. This first correctness or truth is independent of any conformity with things and states of affairs.

Nonetheless, when the statement effectively signifies that what-is is, it doubly does what it ought to do, for it signifies both what it has undertaken to signify, as well as what it was designed to signify, that for which it was fashioned (*significant et quod accepit significare et ad quod facta est*). This second correctness and truth is normally what we call a true statement. The statement "it is day" is true at a first level when

it signifies that it is day (whether this is actually the case or not), for this is what it has naturally undertaken to do; it is true at a second level when it is in fact day, and the utterance is correctly used for the purpose for it was fashioned.

In statements that we would qualify as analytic, like "a human being is an animal" or "a human being is not a stone," the two truths of discourse are inseparable, since these utterances always and inextricably signify what they undertake to signify, as well as the truth of what they are meant to signify. The first correctness is immutable. It belongs naturally and permanently to the statement. The second correctness is mutable, accidental (since it occurs only when the state of affairs actually conforms to the meaning of the statement, and those states of affairs are subject to change) and impermanent, according to use.

Alia igitur est rectitudo et veritas enuntiationis, quia significat ad quod significandum facta est; alia vero, quia significat quod acceptit significare. Quippe ista immutabilis est ipsi orationi, illo vero mutabilis. Hanc namque semper habet, illam vero non semper. Istam enim naturaliter habet, illam vero accidentaliter et secundum usum. Nam cum dico: dies est, ad significandum esse

quod est, recte utor hujus orationis significatione, quia ad hoc facta est; et ideo tunc recte dicitur significare. Cum vero eadem oratione significo esse quod non est, non ea recte utor, quia non ad hoc facta est; et idcirco non recta tunc ejus significatio dicitur.

(A statement then is right and true either because it is correctly formed or because it fulfills its function of signifying correctly. The former belongs immutably to it, the latter is mutable. The former it always has, the latter not always. The former it naturally has, the latter accidentally and according to use. For when I say, "It is day" in order to signify what it is, I correctly use what the utterance means, because this is why it was fashioned, and therefore it then is correctly said to signify. But when by the same utterance I signify that what is not is, I do not use it correctly, because it was not fashioned for this purpose, and its signification is not then called correct.)

(St. Anselm, *De veritate*, 154–55)

At the moral level, the distinction between the two forms of correctness is only of value for rational beings, who are free and can thus recognize what they are fashioned to do, what they owe themselves to be, and to decide to do or not do what they are fashioned to do. The difference between man and God becomes the difference between the being who is because he is what it is his duty to be and the being who is because he is. The duty that defines man is a debt because in fulfilling it, man submits to a truth whose cause lies ultimately in God. In a similar manner true discourse conforms to what it signifies and pays off its initial debt because it has been fashioned to signify the true, and in this case it signifies it effectively and conforms to its original purpose.

C. Truth and adequation

The most celebrated definition of truth is "*adaequatio rei et intellectus.*" It is the canonical expression of truth as correspondence. One finds it for the first time, it would appear, in William of Auxerre (*Summa aurea* I, ed. J. Ribaillier, 1980, 1: 195, 228). It is also often attributed (from Thomas [*De veritate*, q.1a 1, c] through Heidegger [*Sein und Zeit*, § 44a, 214], to the Jewish philosopher Isaac Israeli (850–950). His *Book of Definitions*, written in Arabic, was translated into Latin by Gérard of Cremona (ed. H. Hirschfeld, *Festschrift . . . Steinschneider*, Leipzig, 1896, Hebrew, 131–41). A fragment of the original has been found (H. Hirschfeld, ed. *JQR,* no. 15 [1903]:

689–93 [= Latin, 318, 1–326, 32]). As it turns out, not only is the definition of truth as adequation not to be found, but the text contains another formula explicitly presented as defining the truth: "*ḥadd al-ḥaqq: huwa mā huwa aš-šayʾ*" (691, 6–8); *veritas est quod est res* (322, 10 and cf. 307; Hebrew 139, 14ff., and cf. 134, 9). The definition is not to be found in al-Kindī either (d. 870), who defines truth, or rather veracity (*ṣidq* [صدق]), as the fact of saying what-is is and what-is-not is not (*Definitions*, ed. Abu Rida, Cairo, 1950, 117). One should look to Avicenna (d. 1037) for the true and original context of the idea of adequation. One of his definitions of truth is: "the state of discourse or of thought which designates the state of the exterior thing, when this 'is' correspondent [*mutābiq* (مطابق)] to that" (Shifā, *Metaphysics,* I, 8; Fr. trans. ed. G. C. Anawati, Cairo, 1960, 48, 6ff.). The Arabic participle suggests an image of two layers precisely covering each other, in the way two geometric figures can be superimposed. The Latin is more vague: "*Veritas autem quae adaequatur rei*" (*Avicenna latinus, Metaphysica*, ed. S. Van Riet, Louvain, 1977, 55). It is this idea of "correspondence" between discourse and the thing that William of Auvergne will attempt to express with the aid of other synonyms: *convenientia, concordia, aequalitas* (*De universo,* I, 3, XXVI, 795a). The term *adaequatio* will predominate in the subsequent medieval tradition and give rise to new distinctions, particularly between the *adaequatio* of discourse and the thing, which defines true (*verus*) discourse from false (*falsus*), as opposed to the *adaequatio* of the discourse to the intention of the sincere (*verax*) or nonsincere (*fallax*) interlocutor—see the text of Bonaventure referred to *infra*, in IV.A.2. Averroës builds on a definition that is already a classic: "the veridical [*ṣādiq* (صادق)] as is said in its definition, is 'the fact' that what is to be found in the soul 'is' according to what is outside the soul" (*Tahafot*, I, 188; ed. M. Bouyges, 103, 5ff.). The English translation of S. Van den Bergh (London, 1954, 60 and 179) introduces the terms "agreement" or "conformity," which are not explicit in the Arabic. The definition has remained a classic. The substantive "correspondence" (*muṭābaqa* [المطابقة]) is to be found in the *Book of Definitions* of Gurgani (d. 1413, s.v. "*ḥaqq* [حقّ]," Flügel ed., Leipzig, 1845, 94).

Hoc est corpus meum, or how adequation is set in crisis by the performative

➤ ANALOGY, SIGN, SPEECH ACT, II, *TO BE*

Can the definition of logical truth as *adaequatio rei et intellectus*, rather than correctness, define the truth of all utterances or only of assertions? What is the status of truth with respect to different kinds of enunciations,

those, for example, of a performative kind? The analysis of the formula for the consecration of the Eucharist, *Hoc est corpus meum*, is an important place for such discussion in the Middle Ages.

The truth of the formula for Eucharistic conversion depends crucially on the reference one assigns to the pronoun *hoc*, the subject of the statement. If the demonstrative pronoun refers to "this bread is my body,"

the statement is false. If it refers to the body of Christ, the proposition is true, but it does not serve in the conversion, since Christ is then already present from the beginning of the utterance. Thomas Aquinas succeeds in finding a solution that relies on a distinction between two types of utterances: assertive statements and operative statements. He bases the distinction between them on the Aristotelian opposition between speculative and practical intellect. Thomas makes an original use of the adage taken from the first chapter of the *Peri hermeneias*, according to which words are signs of intellection (*voces sunt signa intellectuum*). He explains that there are two types of intellections or concepts. The concepts that pertain to the speculative intellect are drawn from things; they come from them because speculation is a contemplation of existing things. Thus, the truth of an assertive utterance depends for its adequation on a state of affairs that pre-exists it. If it conforms, the statement is true; otherwise it is false. Conversely, concepts belonging to the practical intellect precede the thing, since an artisan needs to have a model or concept of the object in his mind beforehand so the object can be made in its image. In this case the truth of an operative utterance can only be determined in reference to the thing it has created. Given the specificity of the utterance within which it occurs, the *hoc* cannot refer to a thing that exists prior to its utterance (the bread), but rather to the thing that the formula helps to create in the last instant of its being pronounced, that is, the very moment at which the conversion will take place. It turns out that using a pronoun is absolutely ideal because it possesses within itself an indeterminacy of reference that allows it to recruit bread and wine as substances that can become the body of Christ. Thomas thus draws out the particular

properties of performative utterances that enable them to determine truth or assign reference to the deictic function contained within them.

According to Duns Scotus, the truth of the Eucharistic utterance is not a condition of its operation. The utterance is pronounced, and it engenders a signification that enables it to realize what it has been commanded to realize by convention (in an original pact set in place at the moment of command). It is at this point "neutral" and does not carry veridical value. But once realized, *hoc est corpus meum* is true in that it refers to the body of Christ, which is present as a result of the conversion. So the utterance is operative insofar as it is neutral, not insofar as it is true. This constitutes a major reversal of previous analyses, which always sought to find a value for the *hoc* that would make it possible to say that the statement was true in order to explain how it could be operative.

In chapter 15 of *Logic or the Art of Thinking*, Arnauld and Nicole take up the problem of the signification of the word *hoc* in the formula. They consider it "a troublesome quarrel which the ministers made famous, on which they based their main argument establishing their metaphorical interpretation of Eucharist" (ibid., 71). And for them this argument is "more worthy of logic than theology." The whole mystery of the assertion, they point out, "arises not from the obscurity of terms, but from the change effected by Christ, which caused this subject *hoc* to have two different determinations at the beginning and at the end of the proposition" (ibid., 72). *Hoc* indicates only "the confused idea of a present thing," and the apostles added to the confused idea of a present thing the distinct idea of bread that Christ held in his hands, an idea "which was only prompted and not precisely signified by this term. . . . And so

when Christ uttered 'this,' which meant his body, the Apostles only had to subtract the distinct ideas of bread they had added. Retaining this same idea of a present thing, they conceived at the end of Christ's assertion that this present thing was *now* the body of Jesus Christ" (ibid.). The distinction between after and now indicates the movement of transformation that the verb "to be" accomplishes during the act of utterance. As the authors write somewhat later, in chapter 12, "This which is bread at this moment is my body at another moment" (ibid., 112). If one finds the medieval arguments in Arnauld and Nicole, new issues are here at stake. For the logicians of Port-Royal, the insistence on a distinction between literal and figural in temporal movement is part of an answer to those (i.e., the Protestants) who would reject the idea of a real transsubstantiation in the name of a purely symbolic interpretation of the proposition.

between standard uses of *veritas*. Three principal ways were explored in the Middle Ages and after:

1. Medieval thinkers sought to explain and to justify the content of the Augustinian definition by reversing the direction of the truth known as "adequation." Instead of the obvious sense of the *adaequatio rei et intellectus* as the adequation, conformity or conformation of human thought to the things of creation, the *adaequatio intellectus ad rem* becomes the *adaequatio rei ad intellectum*, the adequation or conformity of creation to its exemplary cause, the creative thought of the Divine. The adequation of the created to its model is defined as "certitude." Truth and certainty thus come together in the idea of determination, which will later be called objective, whereas here, at its origin, it is more ideal-real.

This reversal enables the reconciliation of two usages of the word *veritas* that are often opposed in the *sophismata* and the *disputationes*—the question as to whether truth resides in things or in thought, or else first in things and only then in thought, a set of questions that were commonplace in the philosophy and theology of the thirteenth and fourteenth centuries and were inherited from Anselm's *De veritate.*

■

2. In the classical age, the thesis of adequation is passed on in various ways. In Spinoza the notion of *convenance* allows the axiomatic formulation that "a true idea must agree with [meet with, be suitable] that of which it is the idea," or more literally, with its "ideation": "*Idea vera debet cum suo ideato convenire*" (Benedictus de Spinoza,

6

Certainty and raison d'être (essential purpose)

➤ PRINCIPLE, RES

In keeping with the distinction between two meanings of the word *res* (see RES)—"*res a reor reris*," "*res a ratitudine*"—certain medieval theologians restrict "certainty" or "determination" (Ger. *Bestimmung*) to only those things called *a ratitudine*, which possess "being of essence" (*esse essentiae*) as paradigms (*ratio exemplaris*) of God, which render them naturally able to be produced in actual being. The *ratitudo* thus designates, in a fashion, the "certification" of a thing, an indication of its "authenticity." For Henry of Ghent, the "ratification" or "certification" of a thing determines both its beingness and its truth ("*quanto aliquid in se plus habet ratitudinis sive firmitatis, tanto plus habet entitatis, quare et veritatis*" [the more a thing has of ratification or certification, the more it has of beingness and consequently of truth], Henry of Ghent, *Summa*, art. 34, q. 2, fol. 212rS), as opposed to the inconstancy and inconsistency of fiction, as lacking an example in God (ibid., art. 21, q. 4, fol. 127rO). The ratification or "certitude" of a thing is sufficient reason for its creation: whatever does not have an example in God is nothing "in essence and in nature"; such a "thing" is not a "predicamental thing" (it does not belong to categorial being) and "cannot become effectively real," for God does not put into effect, "produce," "that which has no exemplary *raison d'être* in some creature or another." The exemplary reason is the *raison d'être*: an "authentic" thing is "a nature or absolute essence, endowed with an exemplary reason in God, *destined to exist in existence* through divine operation." The acceptation of truth as "a conformity of things with their essence, such as is thought by God" has been illuminated in a celebrated page of Heidegger:

> According to the traditional concept, truth [*veritas*] is the *adaequatio intellectus et rei*, the adequation of thought and thing [*die Angleichung von Denken und Ding*]; in the place of *adaequatio*, one also refers to *commensuratio* or *convenientia*, accordance or suitability [*Anmessung oder Übereinkunft*]. This definition of the essence of truth is ambiguous, with an ambiguity that already characterized the question of truth in the Middle Ages. . . . As an adequation, truth is part of a determination [*Bestimmung*] of the *ratio*, of the utterance [*der Aussage*], of the proposition [*des Satzes*]. A proposition is true insofar as it comes into line with things [*Wahr ist ein Satz, sofern er sich an die Dinge angleicht*]. But the definition of truth as adequation does not only apply to the proposition in its relation to things. It also applies to things, insofar as they are created and, referring back to the project of the creative spirit, conform to this project. Conceived this way, truth is the conformity of things to their essence, such as it is thought by God [*die Angemessenheit der Dinge an ihr von Gott erdachtes Wesen*].

> (Heidegger, *What Is a Thing?*)

BIBLIOGRAPHY

Heidegger, Martin. *What Is a Thing?* [Die Frage nach dem Ding]. Translated by W. B. Barton, Jr., and Vera Deutsch. Analysis by Eugene T. Gendlin. Chicago: Regnery, 1967.

Ethics, I, *De Deo, Axiomata,* VI: Wordsworth Classics of Literature, trans. W. H. White, A. H. Stirling, 29). In Locke, the matrix of joining/separating (for signs) and agree/disagree (for things) serves to repatriate truth to these sole propositions: truth is "nothing but the joining or separating of signs, as the things signified by them do agree or disagree one with another"—whence "the joining or separating of signs here meant is what by another name we call proposition. So that truth properly belongs only to propositions" (*An Essay Concerning Human Understanding*, IV, chap. 5, §2, ed. J. W. Yolton, London: Dent, 1974, 176–77). This purely predicative redefinition of truth constitutes, up to a certain point, a nominalist reading of Aristotle's thesis in the *Metaphysics*, Θ, 10, 1051b4-5, ("He who thinks the separated to be separated and the combined to be combined has the truth, etc."). As such, this is also what Leibniz rejects: if one looks for truth in signs, one ends up reducing truths not only to "mental or nominal" truths, "according to the species of signs," but also to "literal truths, which are indistinguishable from the paper truths or parchment ones, ordinary-ink truths or printers'-ink ones" (Leibniz, *New Essays*, 183). Via the voice of Philalethe, Leibniz in his *New Essays* takes up / translates Locke's thesis thus: truth would consist of "the joining or separating of signs according to how the things signified by them agree or disagree with one another." To which, via the voice of Théophile, he objects that "it would be better to assign truth to the relationships amongst the objects of the ideas—i.e., the items that the ideas are ideas *of*—by virtue of which one idea is or is not included within the other" (ibid., 182). This accent on the objects can be considered a step toward the common notion of "objective" truth, independent of our expressions and on the "good pleasure of men." The "relationship" in question "doesn't depend on languages and is something we have in common with God and the angels. And when God displays a truth to us, we come to possess the truth that is in his understanding, for although his ideas are infinitely more perfect and extensive than ours, they still have the same relationships that ours do," to which Leibniz adds that "truth should be assigned to these relationships. Then we are free to distinguish truths that *do not* depend on our good pleasure, from expressions, which we invent as we see fit" (IV, V, §2, ibid., 183).

3. In the modern period there have been attempts to combine the theme of *rectitudo* with that of *adaequatio.* To this end Anton Marty (1847–1914) defined truth (in Latin) as *adaequatio cogitantis et cogitati* (adequation of the judging [subject] to the [object] of judgment)—a formula in which *cogitare* has the same sense as *urteilen* (judging) and *cogitatum* has the same meaning as *Urteilsinhalt* (judgment-content). According to this definition, a judgment is correct if and only if "the judgment-content

of a judgment exists," which is to say if and only if "a co-existence of a process of judging and a corresponding state of affairs is actually the case [*wirklich gegeben* ist]" (*Untersuchungen*, 426). The *Urteilsinhalt* is "that which objectively grounds the correctness of our judgment" (*was die Richtigkeit unseres Urteilens objectiv begründet*). As the *Urteilsinhalt* is independent of the *Urteilsakt* (the act of judging) and from the *urteilende Person* (the person judging), the *Urteil* must "be directed towards this content" to be true (ibid., 404). Marty's thesis could be reformulated in more contemporary terminology as stating that the content of judgment is its truth-maker.

IV. Truth, Sincerity, Authenticity: Evolution of Antonyms

We can see how the process of truth's subjectification comes to be considered one of the distinctive markers of the modern period. This is particularly evident in the evolution in meaning of antonyms. Subjectification occurs in tandem with a redefinition of responsibility and of the implication of the individual. Instead of the Greek lack of differentiation among the false, the erroneous, and the deceitful, all included in the term *pseudos*, Latin proposes a double terminology: *fallax* is someone who is in error, while *mendax* is someone who lies. Modern terminology promotes confusion between truth value and moral value, as the semantic drift of certain key terms indicates. In French, for example, the word *sincère*, which appeared in 1475 and which derives from the Latin *sincerus*, "pure, uncorrupt," "of one growth" (formed, like *crescere*, on an Indo-European root that expresses ideas of "seed" and "springing forth"), is used in 1763 for "a state of consciousness which is effectively felt" (RT: *DHLF*, under heading "*sincère*"). Even more sincere than sincerity is "authenticity," which first appears in the juridical sense (*authentês* [αὐθέντης]) as indicating someone who acts on his own, *autos* [αὐτός], whether as an absolute master (Euripides, *The Suppliants*, v. 442) or as a murderer (Euripides, *Rhesus*, v. 117). The term subsequently assumes a resolutely moral sense that implies sincerity in relation to oneself. "Authenticity" comes to define the third age of ethics, after the age of excellence and the age of merit (Luc Ferry, *Homo Æstheticus*, Grasset, 1990, "*Les trois âges de l'éthique*," 329–46, trans. Robert de Loaiza: *Homo Aestheticus: The Invention of Taste in the Democratic Age*, 1993; see VIRTÙ).

A. From *pseudos* to *mendax*

1. *Pseudos*: falsehood, error, fiction

For us in the modern age, the most striking feature of the Greek *to pseudos* (adj. later *pseudês*) is the confounding in a single term of what we take pains to distinguish: on the one hand, what we consider under the rubric of lie and falsehood, of deception and feint, as opposed to sincerity and authenticity; and on the other hand, what we consider under the rubric of error and the fake, as opposed to the true and real. The substantive is derived from the verb *pseudô* [ψεύδω], "to deceive," which one finds first and foremost as a means, *pseudomai* [ψεύδομαι], "to cheat, to lie, to fail (an obligation), to betray," but one should also take note of the meaning of the passive constructions: "to be mistaken" with the genitive (*epseusthai tês alêtheias* [ἐψεῦσθαι τῆς ἀληθείας],

to be deprived of the truth) (Plato, *Republic*, 413a, trans. Benjamin Jowett), with the accusative (*pseusma pseudesthai* [ψεῦσμα ψεύδεσθαι], "to be mistaken") (Plato, Meno, 71d), with the dative (*pseusthênai gnômêi* [ψευσθῆναι γνώμῃ], "to be deceived in one's judgment") (Herodotus 7, 9), or with various prepositions (*en tini* [ἔν τινι], *peri tinos* [περί τινος], "to be mistaken about something," "to be mistaken in something") (RT: *Dictionnaire grec français*, and LSJ, s.v. ψεύδω). Dictionaries list "lie" and "lying" as the primary meanings, and for its etymology Chantraine proposes a radical **pseupsu*, a slightly enlarged form of the radical **bhes-*, "to blow," entailing a semantics of "blowing, the blowing wind, lying," which form the basis for the Greek *phêmi* [φημί] or Latin *fari*, "to say."

Perhaps what we call "fiction" will enable us to hold both ends of this chain. At the outset, as we have seen, the *pseudos* leads back to an enunciative strategy, similar to *alêtheia* but in opposition to it (cf. *supra*, I.B.1). We can hear its affirmative dimension in the complaints of the swineherd Eumaeus to Odysseus, unrecognizable in beggar's disguise (*Odyssey*, Bk 14, 124–25):

ἀλλ' ἄλλως κομιδῆς κεχρημένοι ἄνδρες ἀλῆται
ψεύδοντ', οὐδ' ἐθέλουσιν ἀληθέα μυθήσασθαι

(all' allôs komidês kechrêmenoi andres alêtai pseudont', oud' ethelousin alêthea muthêsasthai)

(Tramps in want of a lodging keep coming with their mouths full of lies, and not a word of truth.)

(trans. Samuel Butler)

(Random drifters, hungry for bed and board, lie through their teeth and swallow back the truth.)

(trans. Robert Fagles)

The *pseudos* is simultaneously error, mendacious accounts, and fiction. It is a construction, superimposed and out of sync, but not a counter-truth. The beggars do not lie about Odysseus and know nothing about him. Yet, based on this ignorance, they make up stories that enable them to hide who they really are, thus concealing the truth about themselves (cf. on these "two moments in the lie," Jean-Pierre Levet, *Le Vrai et le Faux dans la pensée grecque archaïque: étude de vocabulaire* [Truth and falsehood in archaic Greek thought: A study of vocabulary], Les Belles Lettres, 1976, 82–83).

The false, in its traditional and more philosophical usage, is in turn nothing more than a bad construction. *Pseudos* or *pseudês* becomes a pure and simple antonym to *alêthês* and *alêtheia* insofar as it implies combining elements that do not belong together. This is how Plato defines it in the *Thaetatus*: There is *pseudos* when there is a "permutation" of two entities in thought and one interchanges one thing for another (*antallaxamenos têi dianoiai phêi einai* [ἀνταλλαξάμενος τῇ διανοίᾳ φῇ εἶναι], *Thaetatus*, 189c), or when we make a bad "connection" between a perception and a thought ("*têi sunapsei* [τῇ συνάψει]," ibid., 195d; see DOXA), or when one "messes up" or "misses" (this is the primary sense of *hamartanein*, "to mistake") by taking one science for another, or a pigeon for a dove ("*anth' heteras heteran hamartôn labêi* [ἀνθ' ἑτέρας ἑτέραν ἁμαρτὼν λάβῃ]," ibid., 199b). The false is

above all the result of a poor adjustment between beings and words. This is its definition in the *Cratylus* ("*hos an ta onta legêi hôs estin, alêthês; hos d' an hôs ouk estin, pseudês* [ὃς ἂν τὰ ὄντα λέγῃ ὡς ἔστιν, ἀληθής· ὃς δ' ἂν ὡς οὐκ ἔστιν, ψευδής]" [the discourse which says things as they are is true, that which says them as they are not, is false]) (*Cratylus*, 385b, cf. *Sophist*, 241b), and it is the definition of the *Sophist*, which puts forth the idea of a bad "synthesis," a poor "composition" of nouns and verbs (263d): "When other, then, is asserted of you as the same, and not-being as being [*thatera hôs ta auta kai mê onta hôs onta* (θάτερα ὡς τὰ αὐτὰ καὶ μὴ ὄντα ὡς ὄντα)] such a combination of nouns and verbs [*hê toiautê sunthesis ek te rhêmatôn gignomenê kai onomatôn* (ἡ τοιαύτη σύνθεσις ἔκ τε ῥημάτων γιγνομένη καὶ ὀνομάτων)] is really and truly false." This is, in the end, the classical logical definition of truth as correspondence since Aristotle (cf. *supra*, I.B.2.c).

We should keep in mind that the subjective intention to deceive makes no difference in the Greek terminology: the *pseudos* is part of the coherent and inseparable scope of *alêtheia*, which is simultaneously objective and subjective (truth of being, truth of propositions), and of *doxa* (appearance, opinion); but perhaps we find this all the more repugnant when we hear its echo in the French *fausseté* or the English "falsehood."

■ See Box 7.

2. *Falsus-fallax*, then *fallax-mendax*

Medieval reflections on the lie are based on Augustine (*De mendacio, Contra mendacium*). The most commonly retained definition is from the *Contra mendacium* (XII, 26): "*falsa vocis significatio cum intentione fallendi*" ("A lie is a false signification with will of deceiving," trans. H. Browne). This, however, is not a complete expression of Augustine's thought because for him the lie resides in the nonconformity between the "mouth of the heart" and the "mouth of the body." The liar expresses something other than what lies in his heart, with the intent of deceiving. It matters less whether what he says conforms to a state of affairs or not: he who swears that it is raining, if he truly thinks it, is not a liar, even if it is not raining. But he who says something is true while thinking the contrary, is lying, even if what he says is not a lie. Thus for Augustine it is the *sincerity* of the speaker that matters

Apatê

➤ ART (Box 2), *FICTION*, PLASTICITY, PROPERTY

There is nonetheless a Greek word, no less difficult to translate than *pseudos*, which implies an intention to deceive, as opposed to the simply false or untrue. It is *apatê* [ἀπάτη], which might be rendered through a series of words, themselves in chronological order—from Homer to later Greek—by "deception," "illusion," "fakery," "ruse," "artifice," "illusion," "pastime," "pleasure." The word's etymology is unknown, even though Aeschylus compares it to *atê* [ἄτη], "folly, fault, crime, the goddess of misfortune," in describing human insolence (*hubris* [ὕβρις]) (*Suppliants*, v. 111). There is a proliferation of verbs: *apataô* [ἀπατάω], to "cheat" or "deceive"; *exapataô* [ἐξαπατάω], to "completely deceive"; *pro-exapataô* [προεξαπατάω], to "completely deceive from the start." Gorgias enables us to understand the particular value of the *apatê*: "He who deceives [*ho . . . apatêsas* (ὁ . . . ἀπατήσας)] is more just than he who does not deceive, and he who is deceived [*ho . . . apatheis* (ὁ . . . ἀπατηθείς)] is wiser than he who is not deceived" (82 B 23 DK). "He who deceives is more just [*dikaioteros* (δικαιότερος)]," he says, "because he keeps to his promise, and he who is deceived is wiser [*sophôteros* (σοφώτερος)], because being easily pleased by discourse [*huph' hêdonês logôn* (ὑφ' ἡδονῆς λόγων)], he is not lacking in sensibility [*anaisthêton* (ἀναίσθητον)]." This fragment comes to us through Plutarch as being in reference to tragedy (*De gloria Atheniensium*, 5, 348). Thus

justice, the founding principle of the city, and wisdom, the basis of *paideia* [παιδεία], are tied to tragedy: *apatê* leads us to the entanglements of literature, pedagogy, and politics. This is a measure of the gulf between the entirely negative *pseudos* that philosophy attributes to the sophist (who, as Plato and Aristotle never cease to point out, deceives by falsely speaking, passing off the false for the true, imitating wisdom and philosophy), and this *apatê*, which results from discursive activity.

With sophism, *apatê* or illusion finds itself not only linked to justice and wisdom but even more radically, through the theater and aesthetic invention, to *aisthêsis* [αἴσθησις], to this very "sensibility" that characterizes our relationship to the world. *Apatê* is the tie between speaker and listener; it means that one recognizes the *pseudos* as *plasma* [πλάσμα], as "fiction," and that one becomes aware of the demiurgical power of the *logos* (see SPEECH ACT and LOGOS). But such a remark only becomes meaningful in contrast to the ontological use of language, implicated since Aristotle in what will become the phenomenological tradition. In *De anima*, the passage from things to words, from phenomena to the *logos*, is thematized and woven together, with the soul acting as guarantor of adequation. Indeed, as for the feeling of one's own sensations, the *idia* [ἴδια], for example, the visible-as-seen for sight (see SENSE, I), a sort of degree zero of sensation, the soul cannot be deceived. Or more exactly, the *apatê* is *impossible*, in the sense of its being radically "improper" (*mê endechetai* [μὴ ἐνδέχεται], *non decet*), and this impossibility characterizes the immediacy of the aesthetic reception as a noetic reception: *peri ho mê endechetai apathênai* [περὶ ὃ μὴ ἐνδέχεται ἀπαθῆναι] (*De anima*, II, 418a12); *peri tauta ouk estin apathênai* [περὶ ταῦτα οὐκ ἔστιν ἀπαθῆναι] (*Metaphysics*, Θ, 10, 1051b31); "There can be no illusion about that" (cf. Cassin, *Aristote et le logos*, 140–47). Heidegger cannot but comment, playing the antepredicative against the *logos* and *De anima* against *De interpretatione*:

> The Greek conception of truth has been misunderstood. *Aisthêsis*, the sheer sensory perception of something, is "true" in the Greek sense. . . . Any *aisthêsis* aims at its *idia,* those entities which are genuinely accessible only *through* it and *for* it, and to that extent, this perception is always true.
>
> (Heidegger, *Being and Time*, § 7)

more than the *truth* of his utterances. The fact that language enables a disjunction between what is thought and what is signified thus constitutes an argument against the fact of language being an adequate instrument for access to knowledge: "For I am not questioning the fact that the words of truthful [*veracium*] people attempt and in some way profess to express the spirit of the speaker; and they would succeed, as everyone freely would admit, if it was forbidden for liars [*mentientibus*] to speak" (*De magistro*, XIII, 42).

Alexander of Hales distinguishes a *duplex veritas* as a pendant to a *duplex falsitas*, the *falsitas dicti*, the falsehood of what is said, and the *falsitas dicentis*, the "falsehood" of the speaker. As a result, according to Bonaventure, the outer speech can be considered in two modes: in comparison to the thing, the discourse (*sermo*) is said to be *verus* (as opposed to *falsus*) when there is adequation between the thing and the discourse (*adaequatio rei et sermonis*); but in relation to the intentions of the speaker, the discourse is said to be *verax* (as opposed to *fallax*) when there is adequation between the discourse and the intention (*adaequatio sermonis et intentionis*). As we see, the formula follows the wording of the truth as *adaequatio rei et intellectus*. The terms *verax* and *mendax* can also describe a discourse as well as a speaker. But in Thomas Aquinas it would seem that *verax* can only be applied to the speaker (the translation as "sincere" is not precisely correct, in that the term is simply "[he] who says the truth straightforwardly"). He thus very clearly distinguishes, in the line just described, between logical truth, by which something said is true (*adaequatio intellectus vel signi ad rem intellectam et significatam*), and moral truth, by which someone is said to be *verax*, and it is this latter that constitutes a virtue and whose infraction results in a lie (*Summa theologica*, 11, 11, q. 109, a. 1).

The reflections on lying reveal a development that will profoundly modify Augustinian thought. The first underscores the responsibility of the speaker in regards to his use of language; the others relate to the speaker's responsibility to the other. The Augustinian definition refers to *intentio fallendi* (an intention to deceive), while in fact it results from a "determination to speak falsely," as Alexander of Hales emphasizes, by reformulating it thus: "*falso vocis significatio cum voluntate falsum enuntiandi*" (a false utterance with the intention of uttering falsehood) (*Summa theologica*, p. 402, § 399). The speaker is expected to know the rules of language as fixed by convention; if he speaks in a way that does not reflect his intentions, or speaks in equivocal terms, or in formulae that are open to different interpretations from the intended meaning on the part of the listener, he is at fault. Thomas Aquinas puts this reformulation together in proposing an analysis of lies in three parts: (1) falsehood in matter, when the utterance is false; (2) falsehood in form, or the desire to utter the false (*voluntas falsum enuntiandi*); (3) falsity in effect, or the intention to deceive (*intentio fallendi*). Since it is beyond man's capacities to fully say or know the truth, the lie can only be defined as a *voluntary* deviation from the truth (*Summa theologica*, d. 39). In addition, the Augustinian vision of the lie as a discordance between intention and speech presents difficulties of its own, insofar as the intention itself is only accessible to God. But speech, and especially speech that carries an investment of commitment,

such as a vow that explicitly takes God for its guarantor, is uttered for the sake of a listener who does not have access to the intentions of the speaker, only to what he says. In this case is it the intention of the speaker (*intentio dicentis*) or the intention of the recipient (*intentio recipientis*) that creates the obligation? This problem becomes even more complex when the utterances are equivocal: one solution sets up a distinction between the judgment of the Church, which considers the obligation of a vow as a function of what is said, and the judgment of God, which is based on the profound intention and "the spark of conscience" (Bonaventure, *Book of Sentences III*, d. 39, a. III, q. 2).

3. Authenticity and the proper

The modern era prizes the authentic (Ger. *echt*, Eng. "genuine," based on Latin *genus* and Greek *gignesthai* [γίγνεσθαι], "to be born, to become"; see GENIUS, INGENIUM) and prizes authenticity as the task of the subject, an existential meta-sincerity of the self in relation to the self. This is in a way the impact of the "decentering of the subject"—whether it comes out of Marx (see PRAXIS), out of Freud (see ES, UNCONSCIOUS), out of structuralism (see STRUCTURE), or out of existentialism (see DASEIN)—on the intersecting requirements of logic and morality.

One can refer to the articles on PROPERTY and EREIGNIS and the deployment of the German *eigen* (from *eigen* to *Eigentlichkeit* and to *Ereignis*, from the "own particular" [Fr. *propre*] to "authenticity" and to "appropriating event") for the analysis of a fecund terminological nexus.

■ See Box 8.

V. Comparison of Some Singular Features of English and German in Contemporary Theories

There are three possible paths for expressing the adequation of language to the real in the philosophy of language and to translate the classical *adaequatio* into contemporary terminology: depiction (theory of the image/*Bild*), immanence (redundancy, disquotation), and adequation updated in ordinary language philosophy ("fitting").

A. Theory of the image: Wittgenstein

One of the most powerful paradigms of the representational theory is to be found in Wittgenstein's *Tractatus logico-philosophicus*, according to which propositions (*Sätze*) represent (*abbilden*) states of affairs (*Tatsache*). What is difficult to unpack is this relationship of representation, as soon as it is conceived in terms of an image, *Bild* (see BILD and REPRÉSENTATION). We make a picture of the world for ourselves (2.0212: "*ein Bild der Welt*"), and, more precisely, we picture facts (2.1: "*Wir machen uns Bilder der Tatsachen*"). *Bild* belongs both to the order of representation (*Darstellung, Abbildung*) and of modelling (2.12: *Modell*). It is precisely this link between the *Bild* and reality—the *Abbildung*—and its specific manner of attaining the real that cannot be expressed in language (2.1511: "*Das Bild is so mit der Wirklichkeit verknüpft; es reicht bis zu ihr* [that is how a picture is attached to reality; it reaches right up to it]").

The enigma of truth in the *Tractatus* is to be found in the definition of "logical form," common to the *Bild* and to reality (*Wirklichkeit*), which cannot be rigorously conceived

8

Mauvaise foi, a French affliction

► BELIEF, CONSCIOUSNESS, DASEIN, *FAITH*, GLAUBE, *MALAISE*, NOTHING

One of the most remarkable transpositions of the malaise engendered by the imperative of authenticity is Sartre's *mauvaise foi* ("bad faith"), a French rendition of Heideggerian idiom that in turn is difficult to transpose into other languages. For Jean-Paul Sartre, *mauvaise foi* is a structural and defining condition of man as being other than he is, as nonconjunctural: "How can he *be* what he is, when he exists as consciousness of being?" (*Being and Nothingness*, trans. Hazel Barnes, Simon and Schuster, 1992). Or, as we know of the waiter at the café: "from within, the waiter in the café cannot be immediately a café waiter in the sense that this inkwell *is* an inkwell, or the glass is a glass" (ibid., 102); and for my part, "if I represent myself as him, I am not he; I am separated from him as the object from the subject, separated *by nothing*, but this nothing isolates me from him. I cannot be he, I can only play *at being* him; that is, imagine to myself that I am he. And thereby I affect him with nothingness" (ibid.,103).

This is why the ideal of sincerity is a task impossible to fulfill, whose very meaning contradicts the structure of my consciousness. In fact, it is the impossibility of being what one is that is "the very stuff of consciousness." Thus, "in the final analysis, the goal of sincerity and the goal of bad faith are not so different" (ibid., 110). Indeed, sincerity aims at itself in the immanent present such that "bad faith is possible only because sincerity is conscious of missing its goal inevitably, due to its very nature." Bad faith differs from the lie in that "bad faith is *faith*." Bad faith decides not to demand too much; it is in the end "a decision in bad faith on the nature of faith." In even more stringently Sartrean terms, "good faith seeks to flee the inner disintegration of my being in the direction of the in-itself which it should be and is not. Bad faith seeks to flee the in-itself by means of the inner disintegration of my being. But it denies this very disintegration as it denies that it is itself bad faith."

Contemporary consciousness has, at any rate, recognized itself in this type of analysis, which locates in *Da-Sein* the structural impossibility of sincerity.

---

as a "relation" to be defined or expressed: the tie between *Bild* and the *Abgebildet* cannot be uttered, only pointed to. But this showing is not exterior to language and to reality (the logical form that they share, *gemein*; cf. 2.2: "*Das Bild hat mit dem Abgebildeten die logische Form der Abbildung gemein* [a picture has logico-pictorial form in common with what it depicts]").

Truth turns out to be intimately dependent on the notion of *Abbildung.* For one to be able to call a proposition true or false, it must be a *Bild.* Truth (*Wahrheit*) and falsehood (*Falschheit*) are defined by the agreement or disagreement (*Übereinstimmung, Nichtübereinstimmung*) of its meaning (*Sinn*) with reality. Once again we come across the division between correctness and truth that the theory of the image is able to efface.

2.203 Das Bild stimmt mit der Wirklichkeit überein, oder nicht; es is richtig oder unrichtig, wahr oder falsch.

(A picture agrees with reality or fails to agree; it is correct or incorrect, true or false.)

2.222 In der Übereinstimmung oder Nichtübereinstimmung seines Sinnes mit der Wirklichkeit, besteht seine Wahrheit oder Falschheit.

(The agreement or disagreement of its sense with reality constitutes its truth or falsity.)

Although a theory of truth-as-correspondence is often attributed to Wittgenstein, based on this idea of *Übereinstimmung*, it nonetheless splits the correspondence into two clearly distinct questions, the issue of the *Abbildung* (the logical form of representation in language) and the question of *Übereinstimmung*, the agreement between the representation and the fact (which can be determined through comparison, *vergleichen*). Thus Wittgenstein sets up the dominant paradigm of analytic philosophy (which also comes out of Frege and his definition of sense as thought) in the association between meaning and truth. A proposition (*Satz*) is true (*wahr*) when it states what is the case, and for a proposition to have meaning is precisely for it to be able to be true or false.

4.024 Einen Satz verstehen, heisst, wissen was der Fall ist, wenn er wahr ist.

(To understand a proposition means to know what is the case if it is true.)

This sentence has been interpreted, especially by Moritz Schlick and other members of the Vienna circle, as a verificationist definition of truth and signification, in terms of the empirical and concrete verification of the proposition. In reality, Wittgenstein's proposition is other: it seeks to show the link between meaning and reality by saying that only the *Satz* that says something (be it true or false) of reality is *sinnvoll*. The true, or the possibility of being true or false, thus defines both meaning and language, but also thought and spirit. The final consequence for truth is the bipolarity of the proposition. Even though they have opposite meanings, "p" and "not p" correspond to one single reality, so that negation does not correspond to anything in reality (4.021). The proposition "p" is thus seen as a nonassertive entity, neither affirmative nor negative (see BELIEF).

All of this contributes to redefining truth and correspondence in strongly realistic logico-linguistic terms, making thought and meaning dependent on the *possibility* of being true. Such a redefinition turns out to be tied to the impossibility of saying *in* the language (or demonstrating from outside it) the adequation between language and the real. Far from being a new avatar of correspondence (or of the metaphysics of adequation), the picture theory of the *Tractatus* definitively reveals its aporia.

One should also take note of Popper's reversal of Viennese verificationism in the *Logik der Forschung* (1934, Fr. trans. *Logique de la recherche*, and curiously translated into

English in 1959 as the *Logic of Scientific Discovery*). According to Popper, scientific theories cannot be verified (*verifizieren*) but only corroborated (*bewähren*): "*Theorien sind nicht verifizierbar; aber sie können sich bewähren*" (*Logik der Forschung*, 198). Against Carnap's advice Popper preferred to translate *bewähren* as "corroborate" rather than "confirm" or "retain." He saw *bewähren* as a process of testing by attempts at falsification (*Falsifizierung*), which had nothing to do with any "positive" or empirical confirmation (impossible as far as he was concerned) or with any issue of probability (*Wahrscheinlichkeit*). This translation of *Bewährung* by "corroboration" crystallizes the way Popper aimed to bring analytic philosophy into the English language. He would link the idea of empirical proof to his own method of testing through attempts at falsification (*bewähren* signifies both confirming and testing, as in the expression "a confirmed or proven player") and then separate it from verificationism. This led to numerous debates, but what disappeared in "corroboration" was the *wahr* in *bewähren*. Popper addressed this problem in *Conjectures and Refutations* by reelaborating the concepts of truth and verisimilitude ("truthlikeness"), all the while differentiating them from probability (*Wahrscheinlichkeit*). All of these discussions, reevaluations, and redefinitions were only made possible though the problematic but fecund passage of Viennese German–language epistemology into English at the time of the massive emigration of German and Austrian intellectuals (including Popper and Carnap) during the 1930s.

B. Redundancy, disquotation, immanence: Ramsey, Quine

Another option, in the face of the aporia of correspondence, would be to eliminate the predicate of truth. Frank P. Ramsey, following the *Tractatus*, sought to clarify the question of truth (and Wittgenstein's notion of the impossibility of expressing *in language* the adequation to the real) by proposing his "redundancy theory of truth." This theory is one of the first passes at "deflationism." The points in common between the different variants of deflationist theories of truth—disappearance theory of truth, no-truth theory of truth, minimalist theory of truth—are sufficiently important that one can group them together under the heading of "redundancy," as so many theories that maintain that the words "true" and "false" simply function in a statement as signs of assertion or negation. The foundation of redundancy theory (unfortunately translated into French as "*théorie redondante de la vérité*"—the "redundant theory of truth") used the meaning of the Latin *nugatio* ("useless repetition"). It was illustrated by Ramsey in 1927 (and subsequently by Ayer in 1935) that the phrase "it is true that Caesar was murdered" means no more than that "Caesar was murdered." "Deflationism" seems to be too vague a term to precisely qualify the thesis according to which the affirmation that a statement is true is nothing more than the affirmation of the statement. Another way of labeling the theory was the "disquotational theory of truth," but it remains a poor expression for this simple act of eliminating quotation marks. Whence Tarski's utterance, paradigmatic of the correspondence theory of truth: "The snow is white." According to Tarski's theory, "the snow is white" is true if and only if the snow is white. In Quine's analysis, since quotation (in quotation marks) is a name for a sentence that contains a name (*snow*, which is a name for snow): "By calling the sentence true, we call the snow white." Quine concludes by stating that "the truth predicate is a device for disquotation." The quotation marks are made for being removed: "The truth predicate is a reminder that, despite a technical ascent to talk of sentences, our eye is on the world." (*Philosophy of Logic*, 97). This claim to an outside of language brings back something of the verificatory meaning of *esti* and of "existing" (see ESTI). This is why, according to Quine:

> Along with this seriocomic blend of triviality and paradox, truth is felt to harbor something of the sublime.
>
> (Quine, *From Stimulus to Science*)

C. Adequation revisited

1. Austin and "true"

A third option would be to rethink adequation by bringing it down to the level of ordinary language. Austin is equally critical of metaphysical doctrines of truth and its various epistemological and verificationist versions, and he goes after the idea of correspondence without sparing the *Tractatus*. Rather than taking on the idea of truth, he proposes to examine the true, and hence the usage of the word "true."

> We ask ourselves whether Truth is a substance (the Truth, the body of knowledge) or a quality inhering to truths, or a relation ("correspondence"). . . . What needs discussing rather is the use, or certain uses, of the word "true."
>
> (Austin, *Philosophical Papers*, 117)

Rather than taking an interest in the truth, philosophers should, in his estimation, concern themselves with that which is at their level (cf. his formula "*Be your size*"): the usage of words. In a celebrated phrase (and following the traditional word order, cf. above), Austin adds that he places *verum* before *veritas*:

> "*In vino,*" possibly "*veritas,*" but in a sober symposium, "*verum.*"
>
> (Ibid.)

If we limit ourselves to our usages of "true," we observe that we can neither reduce them to a correspondence with the real nor eliminate them, which means that we must conclude that the two analytic paradigms of truth—correspondence and redundance—cannot fully account for "true." The idea of a correspondence between every utterance and a determinate fact is illusory and leads one to think that each true utterance has "its own" corresponding fact: "for every cap the head it fits" (ibid., 123) Austin also points out that it is difficult to establish any purely internal and language-based criterion of truth: truth requires two elements. "It takes two to make a truth" (ibid., 124). On cannot eliminate the qualification "is true" nor consider "true" without a family of related qualifiers, about which it cannot be said that they are "logically superfluous": exaggerated, simplistic, vague, imprecise, general, or concise (ibid., 129).

2. After correspondence: "Fitting" / *es stimmt*

For Austin "true" designates only one of the possible ways of saying how words "fit the facts" of the world. "Fitting"

thus designates a concept of adequation that is no longer correspondence, in the sense of being exact or correct but that designates the appropriate or proper quality of the utterance for the occasion, thus coming back into contact with a dimension of the rhetoric of antiquity (Greek *prepon* [πϱέπον], see MIMÊSIS, Box 6).

> There are various degrees and dimensions of success in making statements: the statement fits the facts always more or less loosely, in different ways on different occasions.
>
> (Austin, *Philosophical Papers*, 130)

This analysis of "true" is carried still further in *How to Do Things with Words*, in which Austin looks at the true within the framework of performatives in order to extend his conception to utterances known as "constatives," which describe a reality. "True" designates a general dimension of being proper, of what is appropriate to a particular circumstance. In that case "true" can also be said of a performative, since all of language is being considered under this aspect of convention.

> It is essential to realize that "true" and "false," like "free" and "unfree," do not stand for anything simple at all; but only for a general dimension of being a right or proper thing to say as opposed to a wrong thing, in these circumstances.
>
> (Austin, *How to Do Things with Words*, 145)

Such a conception of the true as "fitting" or appropriate is also proposed in the later Wittgenstein, with regard to certain relations of adequation between words and things, situations, and experiences that cannot be thought of in terms of correspondence (either logical or mental). This is what we understand by "the right expression," the words that are proper or convenient (*treffend, passend*)—that one looks for and does not necessarily find easily. But when one does find them, one says "*Das ist es*," "*ça y est*," "got it" to describe the thing or situation.

> Denke nur an den Ausdruck und die Bedeutung des Ausdrucks "das treffende Wort."
>
> (Just think of the expression, and the meaning of the expression: "the word that hits it off.")
>
> (Wittgenstein, *Philosophical Investigations*, II)

A feeling of adequation cannot be accounted for by a logic-based (Fr. *logiciste*) notion of meaning (see SENSE, III) but is essential to Wittgenstein's understanding of signification, as when one feels that a proper name just "fits" a person or a thing.

> Mir ist, als passte der Name Schubert zu Schuberts Werken und seinem Gesicht.
>
> (I feel as if the name "Schubert" fitted Schubert's works and Schubert's face.)
>
> (Ibid.)

To describe this feeling, Wittgenstein deploys an entire vocabulary: "*Es stimmt*" ("that's right"; Fr. *ça va*), "*Dies Wort passt, dies nicht*" ("*this* word fits, *that* doesn't"; Fr. *ce mot convient, l'autre non*) (ibid., 219). His entire effort in the second part of the *Investigations* is directed toward defining this specific "life experience" that conditions the usage of language and is the condition of its truth.

To understand what is at stake in this redefinition of the truth, one can compare it to certain reflections by Brentano and Husserl on truth, no longer conceived as a correspondence between thought and object but as an agreement, an adequation revisited: to be adequate (*übereinstimmen*), according to Brentano in *Wahrheit und Evidenz*, is not to be the same or similar but to be in agreement, to be suitable: *entsprechend sein, passend sein, dazu stimmen*. Husserl extends this questioning of the model of correspondence by differentiating *Übereinstimmung* from *Adäquation* (which causes problems for translation) (*Logical Investigations*, VI § 66). These reinterpretations of the scheme of adequation entail an extension of the scope, not the elimination of the concept of truth. The formulations of Wittgenstein and Austin have nothing to do with any "pragmatist" conception of truth, and even less with any relativistic one. Austin argues that there is a great difference between his conception of truth and the pragmatist doctrines. "This doctrine is very different from almost everything the pragmatists say, which is that the true is *what works*, etc." The characteristic that makes a statement appropriate, that Austin's doctrine and Wittgenstein's reflections seek to grasp, is determined by precise and enumerable criteria that cannot be collapsed into the success or effect of discourse, to what "works." There is a great difference between the verbs to "work" and to "fit," between the fuzziness of what "works" or functions and the rigor of the adjustments required. One can only be struck by the poverty of the French vocabulary when one tries to underscore or translate these differences.

UNCONSCIOUS, UNCONSCIOUSNESS

FRENCH   *inconscient, inconscience*
GERMAN   *unbewusst, Unbewusste; Unbewusstheit,*
          Unbewusstsein

➤ CONSCIOUSNESS, DRIVE, ES, I/ME/MYSELF, PERCEPTION, ROMANTIC, SOUL,
SUBJECT

Unlike other terms from the vocabulary of psychoanalysis, the term "unconscious" has never posed any particular problems of translation. French and English were already equipped to receive the German noun *das Unbewusste* and to render it using the equivalent terms "the unconscious" and *l'inconscient*. Similarly, *das Vorbewusste* is translated without difficulty in French as *le préconscient* and in English as "the preconscious." Does this mean that the "unconscious" has effectively been understood exactly as Freud conceived it? It is important to emphasize first of all that the term only really acquires its meaning in his first topographical theory, which made a distinction among three systems: the unconscious, the preconscious, and the conscious. This theory is unrivalled in its rigor in the psychology of the end of the nineteenth century and the beginning of the twentieth century. It is perhaps precisely this rigor that causes problems for translators. Thus, Freud is led to reject the term "subconscious," which was very much in vogue in France and in English-speaking countries, or to put aside "unconsciousness" (*die Unbewusstheit, l'inconscient*). The translation of *das Unbewusste* as "the unconscious" is perhaps not sufficient to fully grasp its meaning. In order to understand what is at stake in this question, one has to tease out the threads of several successive moments in its history.

I. "Non-Conscious Representations" and Unconsciousness

The problem of "non-conscious representations" is posed in the wake of Leibniz and his "small perceptions." For Leibniz it is a matter of affirming, against Descartes, that if the soul is always thinking, it is not always conscious of its thoughts: "at every moment there is in us an infinity of perceptions, unaccompanied by awareness or reflection; that is, of alterations in the soul itself, of which we are unaware because these impressions are either too minute and too numerous, or else too unvarying" (*New Essays*, preface). These perceptions are said to be "insensible," this adjective thus corresponding in classical language to the future "unconscious" (cf. also Descartes, *Meditations on First Philosophy*, 12–15). To be conscious is, in effect, to sense oneself (from the Latin *sentire*).

The question that continuously haunts philosophical and psychological debates is the question of degree. If full, complete consciousness has a status determined by clarity and consciousness of self (which Leibniz calls awareness; see CONSCIOUSNESS and PERCEPTION), how does one then go from simple perception to insensibility? Kant took the Leibnizian principle of continuity to its furthest consequences, and thus proposed an infinite number of degrees between the fully conscious and the unconscious, in a text that is part of a psychological, nontranscendental perspective:

> Just as between consciousness and the fully unconscious (psychological darkness) [*zwischen einem Bewusstsein und dem völligen Unbewusstsein (psychologischer Dunkelheit)*], yet smaller degrees occur; therefore no perception is possible that shows a complete absence, e.g., no psychological darkness is possible that could not be regarded as a state of consciousness that simply is outweighed by another, stronger one, and thus it is in all cases of sensation.

> (Kant, *Prolegomena to Any Future Metaphysics*, §21)

Ever faithful to Leibniz on this point, Kant therefore affirms, in *Anthropologie in pragmatischer Hinsicht*, that "the field of *obscure* representations is the largest in the human being" (*Anthropology from a Pragmatic Point of View*, 25).

Philosophically, there is a great deal at stake here, since the adversary is not Descartes, but rather Locke, the founder of empirical psychology, who cannot admit that a representation is unconscious (ibid., 23–24). We can also see that Kant is in no way interested in clearing the way for a particular *topos*, which would have specific laws (what *das Unbewusste* will be for Freud), but simply in articulating the negative of consciousness (*das Unbewusstsein*), that is, a "negative state of consciousness": what darkness is to light. Translating this as "unconsciousness" seems inevitable.

II. Substantivizing the Unconscious: Romanticism and von Hartmann

With Romanticism, a wide range of terms were adopted in German, English, and French, joining a privative prefix to the lexical field of consciousness, such as *unbewusst*, "unconscious," and *inconscient*, and the nouns *Unbewusstheit, Unbewusstsein*, "unconsciousness," and *inconscience*. The substantivized adjective *das Unbewusste* was less common, even though it is found, for example, in the opening lines of a work by the Romantic philosopher and doctor Carl Gustav Carus (1789–1869), in a first edition dating from 1846:

> The key to the knowledge of the nature of the conscious life of the soul is to be sought in the reign of the unconscious [*des Unbewusstseins*]. Hence the difficulty, if not impossibility, of understanding fully the secret of the soul. If it were absolutely impossible to find the unconscious [*das Unbewusste*] in consciousness, man would be left to despair of ever being able to attain knowledge of his soul, that is to say, knowledge of himself. But if this impossibility is merely apparent, then the first task of a

science of the soul will be to determine how man's mind can go down into these depths.

(Carus, *Psyche*, 1)

Generally speaking, and as this extract testifies, the importance of this trend is in the recognition that this unconscious realm has a positive quality: far from being the lowest degree of consciousness, the darkness of the unconscious is a guarantee of its richness and its truth value.

A third stage occurred when one work, *Philosophie des Unbewussten* by Edouard von Harmann (1870) definitively established the substantivized adjective *das Unbewusste* as a noun in its own right. Its title reveals how fully accepted and recognized the term was philosophically, since in this text *das Unbewusste* refers to the metaphysical basis of all things, which Schopenhauer had named *der Wille*, "the will." The choice of term is significant: in Schopenhauer the will is set in opposition to representation (*die Vorstellung*), which excludes the idea that there can be unconscious representations. The Freudian unconscious would itself be inseparably made up of affects and representations. Hartmann's work made a considerable impact and was soon translated into French (*Philosophie de l'inconscient*, translated by D. Nollen, 1877) and English (*Philosophy of the Unconscious*, translated by W. C. Coupland, 1884). Dictionaries, notably the French Littré (RT: *Dictionnaire de la langue française*), refer to this translation as full recognition of its use as a noun.

III. The Subconscious and Psychophysiology

Shortly before Freud there was a huge growth in scientific psychology from about the middle of the nineteenth century (in particular the *Grundzüge der physiologischen Psychologie* by Wilhelm Wundt or the works of Alexander Bain in England and Théodule Ribot in France), as well as research into multiple consciousness in somnambulism and hysteria. The intellectual context of these debates is no longer Romanticism but Positivism, which returns to the classical question of the degrees of consciousness. One can locate an effect of this vocabulary of the unconscious in the translation of texts in which the term was not present. Thus, in an early twentieth-century English translation of Leibniz's *La Monadologie*, the term "unconsciousness" is used to render the French *étourdissement*, which refers to the states of apparent death. The first sentence of paragraph 23 thus introduces into the translation a vocabulary of consciousness and unconsciousness that was altogether absent in Leibniz:

Therefore, since on awakening after a period of unconsciousness we become conscious of our perception, we must, without having been conscious of them, have had perceptions immediately before.

(Donc, puisque réveillé de l'étourdissement on s'aperçoit de ses perceptions, il faut bien qu'on en ait eu immédiatement auparavant, quoiqu'on ne s'en soit aperçu.)

(Leibniz, *Monadology*, 1902)

But it was the term "subconscious" (in French, *subconscient*; in German, *unterbewusst*) that came to designate that which

is just below the threshold of consciousness. In an article entitled "Consciousness and Unconsciousness," for example, the psychologist G. H. Lewes defended the thesis of the psychic nature of the *unconsciousness* and of the *subconsciousness* against the partisans of "unconscious cerebration," that is, of the purely reflex nature of unconscious mechanisms. But in any case, it is merely a question of complexity: "All of the arguments thus tend to show that between conscious, subconscious and unconscious states, the difference resides solely in the degrees of complication in the neural processes." In the field of psychopathology, Pierre Janet accords great importance to "subconscious acts" (*actes subconscients*), or "actions having all of the characteristics of a psychological fact except one, which is that the person who performs it is unaware of it at the very moment at which he or she performs it" (Janet, *L'automatisme psychologique*). These acts are due to "psychological weakness" (*faiblesse psychologique*), to the narrowing of the field of consciousness, which thus allows automatic acts to be expressed.

IV. The Freudian Moment

If we turn now to Freud, we can see that he himself uses the term "subconscious" (*subconscient*) in an article written in French in 1893, "Quelques considérations pour une étude comparative entre les paralysies motrices organiques et hystériques" ("Some Points for Comparative Study of Organic and Hysterical Motor Paralyses" in *The Standard Edition of the Complete Psychological Works of Sigmund* Freud, 160–72). Freud had been commissioned by Charcot to write this article, and we find him using the French terminology that was current at the time. It is from the *Interpretation of Dreams* on, however, and in the final chapter devoted to the "psychology of dream processes" (Strachey) that we find the first elaboration of the first topological theory, which is explained in the metapsychological article entitled precisely "Das Unbewusste" (1915). The unconscious—*das Unbewusste*—is therefore one of the three psychic systems. It follows its own laws (the primary process: condensation, displacement, etc.), which enable Freud to account for the formal particularities of dreams and the mechanisms for interpreting them. The *Vocabulaire de la psychanalyse* (Language of Psychoanalysis) summarizes neatly the characteristics of the "unconscious system" as follows:

a. Its "contents" are "representatives" of the instincts.
b. These contents are governed by the mechanisms specific to the primary process, especially by condensation and displacement.
c. Strongly cathected by instinctual energy, they seek to reenter consciousness and resume activity (the return of the repressed), but they can only gain access to the system *Pcs.-Cs.* in compromise-formations after having undergone the distortions of the censorship.
d. It is more especially childhood wishes that become fixated in the unconscious.

(Laplanche and Pontalis, *The Language of Psychoanalysis,* trans. Donald Nicholson-Smith, London: Hogarth, 1973)

Freud materializes this topological aspect by using abbreviations to refer to the different systems: *Ubw*, *Vbw*, *Bw* (in English *Ucs*, *Pcs* and *Cs*, and in French *Ics*, *Pcs*, *Cs*). This is a strange thing to do: the epistemology is on the face of it positivist, but Freud breaks away from any differentiation by degree (the differences between the *Pcs-Cs* and the *Ucs* are natural differences), and he appears to return to the Romantic proposition concerning the unconscious foundation of being. He only "appears" to, however, since on the one hand the unconscious "in itself" remains inaccessible, and on the other hand it is not endowed with any metaphysical attributes. We might well wonder whether the specificity of the unconscious "system" is duly conveyed by the term *das Unbewusste*, burdened as it is with the Positivist and Romantic double origin.

■ See Box 1.

An interesting example of the way in which Freud's "unconscious" was received in France can be found when we look at its fate in the first issues of the *Revue française de psychanalyse* (*RFP*), the official journal of the Société Psychanalytique de Paris, founded in 1926. The translations of Freud's texts are characterized by a scrupulous respect for the transition from the German *das Unbewusst* to the French *l'inconscient* and by the disappearance of the vocabulary of the "subconscious." There are traces nonetheless of the gap left by the word "subconscious." A significant example surfaces in Édouard Pichon's review of *Traité de psychologie* by Georges Dwelshauvers, a psychologist from the neo-Thomist school, an important school at the time. We find the following:

L'inconscient, ce n'est que l'insu. Il est toujours virtuellement sujet aux atteintes de la conscience. . . . Ainsi se complète pour moi la définition de l'inconscient: *l'ensemble des choses actuellement étrangères à la conscience du je, mais que cette conscience peut être éventuellement amenée à saisir sous l'espèce des siens états d'âme.*

(*RFP*, no. 2 [1928]: 369–70)

(The unconscious is only what is unknown. It is always virtually subject to the reach of consciousness. . . . For me, then, the definition of the unconscious is to be completed as follows: *the set of all things presently outside the consciousness of the self, but which can eventually be accessed as consciousness through states of feeling associated with self.*)

We see, then, that it was that much easier for French psychoanalysts to get rid of the subconscious since the term *inconscient* retained what was most essential, that is, the negative relationship to consciousness. Pichon, who was a good grammarian, must have been satisfied with a term that was constructed as a privative. Freud would perhaps have preferred a term that was not simply the negative of consciousness. We remain uneasy about the fact that English and French both lack a positive term to refer to this other psychic place. But is this not simply a linguistic problem?

Freud in effect chose the term *das Unbewusste* by default, no doubt because he was afraid of the many misunderstandings to which a term laden with dual Romantic and psychophysiological history lent itself. Since German has no term that clearly designates the "systematic" character of the new unconscious any more than it has a term for its conceptual character, there are gaps of reference. This was no doubt what Jacques Lacan noticed when, in the introduction to a lecture on the unconscious delivered at a conference in Bonneval, he declared: "The unconscious is a concept forged from the trace of what is at work in constituting

---

1

Unconsciousness and the unconscious as a system

We find an interesting example of the linguistic and theoretical stakes of the unconscious as Freud understands it, and of his perspective on the term itself, in an article he wrote in English that was almost certainly translated into German by Hanns Sachs, although Freud would have proofread it. The article is "A Note on the Unconscious in Psychoanalysis" (Einige Bemerkungen über den Begriff des Unbewussten in der Psychoanalyse), originally published in the *Proceedings of the Society for Psychical Research* (1912). The final paragraph of this text presents the transition from the quality of that which escapes consciousness, simple *unconsciousness*, to the properly Freudian *unconscious*, characterized by its systematic dimension. The German text, curiously, does not take into account this shift, nor do the first French translations, up to and including 1968. Ultimately, only the English and French (in its final version, that of the OCFIP) are in this respect faithful to Freud's theoretical operation.

Unconsciousness [*das Unbewusste*] seemed to us at first only an enigmatical characteristic of a definite psychical activity. Now it means more to us. It is a sign that this act partakes of the nature of a certain psychical category known to us by other and more important characteristics and that it belongs to a system of psychical activity which is deserving our fullest attention. The index value of the unconscious [*der Wert des Unbewussten als Index*] has far outgrown its importance as a property. The system [*das System*] revealed by the sign that the single acts forming parts of it are unconscious [*unbewusst*] we designate by the name "the unconscious" ["*das Unbewusste*"], for want of a better and less ambiguous term [*in Ermangelung eines besseren und weniger zweideutigen Ausdruckes*]. In German, I propose to denote this system by the letters *Ubw*, an abbreviation of the German word *Unbewusst*. And this is the third and most significant sense which the term "unconscious" has acquired in psychoanalysis [*dies ist der dritte und wichtigste Sinn, den der Ausdruck "unbewusst" in der Psycho-analyse erworben hat*].

(Freud, *Standard Edition*, 12: 266; *Gesammelte Werke*, 8: 438–39)

the subject. The unconscious is not a type that defines within psychic reality the circle of what has no attribute (or virtues) of consciousness" ("Position de l'inconscient," in *Ecrits*, Seuil, 1966, 830; "Position of the Unconscious," in *Ecrits*, trans. Bruce Fink, W.W. Norton, 2006, 716). And Lacan would in turn "invent" a term, not a translation but a transcription of the German into the French: the unconscious is "*l'une-bévue*" [lit. "one-slip"], or that which produces an unexpected meaning, not that which is outside of meaning, or which would contain the essence of all meanings (*Le Séminaire*, 24, *L'Insu qui sait de l'une bévue s'aile à mourre*, 1976–77, unpublished).

UNDERSTANDING

FRENCH	*entendement*
GERMAN	*Verstand, Verstehen*
GREEK	*nous* [νοῦς]
ITALIAN	*intelletto*
LATIN	*intellectus*
SPANISH	*intendimiento, intelecto*

➤ BEGRIFF, CONSCIOUSNESS, GEMÜT, I/ME/MYSELF, INTELLECT, INTELLECTUS, *INTUITION*, LOGOS, PERCEPTION, *REASON*, *SENS COMMUN* [COMMON SENSE], SENSE, SOUL

Now philosophically obsolete (we speak rather of "reason," "mind," or "intelligence"), the term "understanding" was used to refer to the activity of the mind for two centuries in what corresponds to the classical period (seventeenth and eighteenth centuries), before disappearing, or rather, being transformed. As a translation of the Latin *intellectus*, it inherits a long conceptual history that contrasts it, as an act of intuition (Gr. *nous* [νοῦς]), with rational discursive acts (Gr. *dianoia* [διάνοια]), and it is defined in contradistinction to reason (Lat. *ratio*). But these words, being defined in terms of one another, exchange characteristics several times: the more prestigious one becomes ordinary, the ordinary one is reevaluated. The peculiar interest of these conceptual shifts derives from the clear impact of the different languages and conceptual schemes in virtue of which they redefine themselves. We can thus discern an analogy of distinctions between *nous/dianoia, intellectus/ratio, entendement/raison*, as well as, later, between *Verstand/Vernunft*, as long as we notice immediately that they are never interchangeable in their use. For between classical rationalism, which speaks French or Latin, and the thought of the Enlightenment, which is based on the English notion of human understanding, there is a conceptual break, just as there is between these two universes and that of German idealism. With the dilution of the latter, contemporary philosophy has reappropriated the term for a kind of grasp or comprehension: *das Verstehen*.

I. From *Ouïr* to *Entendre* and *Comprendre*

The reinterpretations of the word "understanding" rely on the resources of language and of individual languages. Arsène Darmesteter even used this complex term a century ago to illustrate the phenomena of semantic adjustments between words:

> Take the group *ouïr*, *entendre*, and *comprendre*. *Ouïr* (Lat. *audire*) gradually falls out of usage towards the 16th-17th centuries and is replaced by *entendre*, which only had the figurative sense indicated by its etymology: *intendere* (*animum*); from the idea of *intelligere*, *entendre* changed its meaning to that of *audire*; but how could it be replaced in the sense of *intelligere*? The language went and found *comprendre*, which, to the meanings of *grasp* and *contain within itself* (*cumprehendere*), added that of *intelligere*.

> (*La vie des mots*)

The medieval Latin *intellectus*, which Saint Thomas had etymologized as *inte-lectus intus-legere*, "to read in" by the vision of the intellect (see INTELLECTUS), was followed in vernacular European languages by *entendement* in French, which associates intellection with acuity of hearing and the mental

grasp of words and things, by "understanding" in English, and finally *Verstand* in German, coming from *stehen* (to stand up), which is more clearly related to material representation—*vor-stellen/ver-stehen* (see Bréal, *Essai de sémantique*). Italian preserved *intellectus* with *intelletto*, which in a way transcends the displacements of the concept at the mercy of languages (*intendimento* remained rare, although Carl Friedrich Flögel's *Geschichte des menschlichen Verstandes*, from 1765, was translated in 1835 as *Istoria dell'intendimento umano*). Spanish, however, adopted *entendement* and dropped *intelecto/intendimiento*. The equivocity of the terms differs from language to language: *entendement* does not mean either "listening" or "agreement," whereas "understanding" can, for which German uses *Einverständnis*.

II. A Complex Prehistory: *Nous/Dianoia* and Their Translations

Entendement, rather than *intellect*, is the standard French translation for *intellectus* (see INTELLECT); *intellectus* is the standard translation of *nous* [νοῦς] (see INTELLECTUS). We would be wrong, however, to believe that *entendement* is the standard translation of *nous* or that the Greek pairing of *nous/dianoia,* even mediated by the *intellectus/ratio*, can ever be translated into French by the pairing of *entendement/raison*.

The pairs are similar in that they all contrast something on the order of immediate intuition with something on the order of discursive rationality, as is suggested by *dia* and its implication of process. Thus, Plato distinguishes intellectual vision and intuition (*noêsis* [νόησις]) from discursive knowledge, *dianoia* [διάνοια] (*Republic*, 6.511d–e). Anaxagoras's

earlier usage was of a different scope, since there it involved a function of cosmic organization, a "governing intelligence" as Leibniz would translate it in his *Discourse on Metaphysics* (§20), referring to the *Phaedo* (97b–c: *nous . . . ho diakosmôn kai pantôn aitios* [νοῦς . . . ὁ διακοσμῶν καὶ πάντων αἴτιος]; see WORLD). *Nous* is characterized by the power of immediate contemplation of ideas: it is intuitive knowledge, whereas *dianoia* moves by way of hypotheses and demonstrations. Immediate knowledge is superior to mediated knowledge. In the "plain of truth," the souls of the gods (and any soul who seeks the appropriate nourishment) are in direct contact with ideas: "*dianoia* [*pensée*, Robin, Brisson] of a god, nourished by *nous* [*intellection* for Robin, *intellect* for Brisson] and knowledge [*epistêmê* (ἐπιστήμη)] without mixture . . . rejoices, and, contemplating the truths, is nourished and feels good" (*Phaedrus*, 247d).

However, no contemporary translator has had the thought of translating *nous* by *entendement*, either for Anaxagoras or Plato. How can we account for these distortions?

In part, they result from the fact that the paradigm brought into play by the Greek *nous* is neither that of hearing (*entendement*) nor of vision (*intuition*), but rather that of smell. In addition, with regard to the *entendement/raison* distinction, the word *raison* is preempted by *logos* and thus cannot be used to translate *dianoia* (see LOGOS).

■ See Box 1.

Despite its various determinations, there is a constant in what French translates as *entendement*: its intuitive and pre-eminent character in contrast to the discursive character of knowledge based on chains of reasons. It is interesting to

Scent: The origins of *nous*

Noos [νόος] (or *nous* [νοῦς]) is the complement of *thumos* in the description of the "mind" of the Homeric man; as Bruno Snell puts it, in terms that can only be inadequate: "*Thumos* means that which is the source of movements, reactions, and emotions; *noos*, that which gives rise to representations and ideas." Even though their semantic fields partially overlap (*noein* implies, as von Fritz shows, a situation with genuine emotional impact and engages the specific attitude of the individual), *noos* refers, according to Chantraine (RT: *Dictionnaire étymologique de la langue grecque*), to the "intelligence, the mind," insofar as it "perceives and thinks." *Noein* [νοεῖν] gives substance to the link between perception and thought, not in the sense of empiricism (in which nothing is in the mind that is not first in the senses) but rather in the suddenness, the immediacy of a perception. It is thus that *noein* is related to "to sense" in the sense of "to scent"— von Fritz mentions an almost Cratylian

etymology in English, which Chantraine does not even bother to consider, from the root "to sniff" or "to smell." It is true that Odysseus is "recognized" (*enoêsen* [ἐνόησεν], *Odyssey*, 18.301) under his rags by his old dog Argos, who then dies on his pile of manure. It is related, equally, to sight, "in the eyes" rather than "with" or "through" them (e.g., *Iliad*, 24.294), and describes in particular the way in which one "intuits" the god behind the man or not (*Odyssey*, 16.160). *Noein* also means "to put oneself in mind of" (to perceive, understand), "to have in mind" (to consider, project, to have good sense, to be intelligent and prudent). Perfectly congruently, *noein* (in contradistinction to *gignôskein* [γιγνώσκειν], 2.2 and 2.7) in Parmenides's poem expresses the immediate relation to being and saying, in the triad that constitutes the "Way of Being" (3, 6.1, 8.34–36). In later usage, allegedly intellectualized (Anaxagoras's *Nous*, the *noêsis noêseôs* [νόησις νοήσεως], or Aristotle's god, and up

to the *noêma* [νόημα] of rhetoric, "concept" or "meaning" rather than the word), this relationship to intuition, and more precisely to scent, is probably never forgotten.

note that the shift to vernacular European languages leads to an attenuation of the foundational Platonic distinction. We may see in effect that 1) The use of *entendement* is restricted to a single meaning; and 2) *entendement* ends up referring to the power of thinking in general.

III. From Human Understanding to Good Sense

The translation of *intellectus* by *entendement* is an interesting exception in relation to Romance languages such as Italian and Spanish, which use a calque (*intelletto, intelecto*). Although Descartes does not specifically identify *cogitatio* with *entendement*, but also associates it with *mens, animus, intellectus*, and *ratio* (*Méditation seconde*), he does adopt a rather ordinary distinction in the *Principes de philosophie* between "*perception de l'entendement*" and "*action de la volonté*" (art. 1, §32), which involves a more or less passive view of *entendement*, insisting on its finitude and the limits of its comprehension. From that point on, *entendement* mostly falls within the domain of logic and takes on the discursiveness of its procedures, distinguishing true from false. And thus, the difference between *entendement* (*intellectus* in philosophical Latin) and *raison* (*ratio*) becomes blurred. This tendency, which becomes cemented in Anglo-Saxon philosophy, has one notable exception, namely Spinoza, who harks back to the intuitive aspect proper to the medieval notion of *intellectus*. The four modes of knowledge described in his *Tractatus de emendatione intellectus* (*Treatise*, §19–24)—1) by hearsay or arbitrary sign, 2) by vague experience undetermined by the intellect (*entendement*), 3) by inference that is not adequate, and 4) adequately by the essence or proximate cause—establish a contintuity between the third and the fourth. The third allows us to formally infer the essence of one thing from that of another, and the fourth is this same inference extended intuitively in the knowledge of proximate causes. Spinoza's example shows how his *intellectus* (*entendement*) reconciles mathematical discursiveness and the intuition of the mind: the intellect may be able, on the basis of knowledge of a series of three numbers, to "invent intuitively without any operation" (*intuitive nullam operationem facientes*; ibid., §24) the fourth term.

In English, "understanding" does a better job than French or German of preserving the idea of comprehension; thus in Hobbes, it is the capacity "in a man, out of the words, contexture, and other circumstances of language, to deliver himself from equivocation, and to find out the true meaning of what is said" (*Human Nature*, chap. 5, §8). Similarly in Locke, although the more general sense of "power of perception" is dominant (*Essay*, bk. 2, chap. 21, para. 5), it can be analyzed as 1) perception of ideas in our minds, 2) perception of the meaning of signs, and 3) perception of the agreement or disagreement between our ideas. The semiotic dimension remains, even if the dichotomy between *understanding* and *will* tends to mask it. Furthermore, while Descartes, Spinoza, Malebranche, and Leibniz consider finite understanding by distinction with, but also with reference to, infinite understanding, for Locke it is rather a matter of a direct inspection of the understanding as a specifically human capacity, as the title of the *Essay* itself reveals. The same is true for Hume (*Enquiries concerning Human Understanding*, 1758). The understanding, in English, is decidedly *human*, and it is also as a finite power that it appears in Germany (see Tonelli, "La question des bornes"). We may note that Kant's teacher in Königsberg, Martin Knutzen, had Locke's essay translated into German by the orientalist Georg David Kypke, whose house Kant shared (*Anleitung des menschlichen Verstandes*, 1755). This inflection leads to a trivialization of the notion of understanding, which is thenceforth not only always human, *Menschenverstand*, but is also often qualified as "healthy," *gesunder Menschenverstand*; in other words, "good common sense." The insistence on the finitude of understanding leads to a defense of common sense, as is often the case among "popular" German philosophers. This is a far cry from the universally shared common sense mentioned by Descartes at the beginning of *Discours de la méthode*.

IV. *Verstand* or *Vernunft,* Understanding or Reason?

A new twist comes with Kant that leads to a devaluation of the understanding (*Verstand*) in favor of reason (*Vernunft*), even though one could take much of the *Critique of Pure Reason* (1781) as an analysis of understanding. Understanding is defined as the faculty of rules; it knows through concepts (discursively) and synthesizes the data of the senses into a unity. It is reason (*Vernunft*), however, the faculty of principles, that makes it possible to order them into a whole. The one is governed by the other. Kantian understanding is a superior faculty of the mind (see GEMÜT) that is synthetic and spontaneous even though it is only legitimately exercised with regard to sense data. That which performs the synthesis is the "transcendental I" (see I/ME/MYSELF), which unifies the categories or concepts of the understanding. Although the understanding is a "power of judgment" just as much as reason is, it is assigned to singular judgments rather than to reasoning. Although the post-Kantian idealists (Fichte, Schelling, Hegel) criticized Kant for his servitude to finite understanding and the proscription it entails against metaphysical knowledge, it is with Kant that the change takes place. The conception of the understanding as something finite, discursive, and analytic that draws distinctions (in contrast to reason, which is able to reach principles, synthesis, and syllogisms) is a legacy of German idealism, especially notable in Hegel (*Encyclopedia of the Philosophical Sciences*, §14). With the notion of intellectual intuition (*intellektuelle Anschauung*) championed by Fichte, but especially by Schelling, we move beyond the complementary pair of *Verstand/Vernunft* and return to the intuitive *intellectus* of the medievals (see Tilliette, *L'intuition intellectuelle*).

It is instructive to see how this reversal could, with regard to terminology, be used to the advantage of the enemies of idealism. Jacobi, the great attacker of rationalism, was thus able to pit reason (*Vernunft*) against understanding (*Verstand*), arguing that the latter cannot acquire unconditioned knowledge but must always depend on principles it cannot demonstrate. Reason, on the other hand, which Jacobi considers a faculty of reception (*Vernunft* being related to *vernehmen*, "to perceive" [see PERCEPTION]) is passive and open to revelation (Jacobi, preface, in *David Hume on Faith*).

In the context of the controversy over pantheism started by Jacobi, it is common to appeal to Spinoza to underwrite the intellectual intuition banished by Kant (Tilliette, *L'intuition intellectuelle*). The understanding is placed by Schlegel, however, above reason, which knows all things, insofar as it interprets (*deutet*), and thus allows for a historical recapitulation ("Transcendentalphilosophie").

V. Hear, Listen, Understand: Hermeneutic Understanding, *das Verstehen*

German romanticism rehabilitates "understanding," in a way, by effecting a radical redefinition. In the letter "On Philosophy," published in the *Athenäum* (1799), Friedrich Schlegel begins a reformulation of the understanding, which is characterized as being "the highest of human faculties," as against the recent usage of "contemporary philosophy," which privileged reason. The reversal called for by Schlegel expresses his rejection of absolute idealism:

> It is entirely natural that a philosophy which progresses towards the infinite rather than presenting that infinite, which mixes and binds everything together rather than completing the particular, should prize no part of the human mind so much as the power of attaching representations to each other [*im menschlichen Geiste, als das Vermögen, Vorstellungen an Vorstellungen zu knüpfen*] and should ceaselessly pursue the train of thought concerning infinitely numerous modes . . . everything takes on meaning for [the understanding], man sees each thing justly and truly [*alles wird ihm* (*dem Verstand*) *bedeutend, er sieht alles recht und wahr*].

Schlegel moves imperceptibly to a hermeneutic meaning of "understand," replacing the "power of knowing" that was understanding (*Verstand*) with "the act of understanding" (*Verstehen*): "An absolute understanding is denied by a philosophy which denies an absolute truth" ("Transcendentalphilosophie," §12). By shifting from the noun to the nominalized verb (*das Verstehen*), the understanding reclaims its link to interpretation, even though the analytic understanding of the classical age had broken it. Nevertheless, German retained the equivalence between *Sinn* and *Verstand* in expressions like "in the proper sense" (*im eigentlichen Verstand*) and "in the figurative sense" (*im bildlichen Verstand*) all through the eighteenth century, as in Chladenius or Herder. The abandonment of speculative claims on the part of idealism that had magnified the importance of reason (*Vernunft*) to the detriment of the understanding (*Verstand*) had the effect of a historicist reevaluation of the latter as "hermeneutic understanding," *Verstehen*. Schleiermacher's (1819) hermeneutics thus presents itself as the "art of understanding," *Kunst des Verstehens*. Wilhelm von Humboldt insists equally on this historical and linguistic dimension of understanding, which is related to the possibility of misunderstanding as to its shadow. Through Dilthey and his students (J. Wach, G. Misch) and then in Gadamer's hermeneutics (*Truth and Method*, 1960), *Verstehen* is distinguished from the formal procedures of method and explanation in order to defend an individual approach that is situated in a history and indefinitely revisable. Only English retained "understanding" throughout these inflections with its prior importance, while *Verstand*, *entendement*, and even *intelletto* have given way to other terms. The rise of cognitive science and artificial intelligence encourages the appeal to the terminology of intelligence (*Intelligence, Intelligenz*), whereas the critique of rationality, on the other side, gives preference to interpretation, to *Verstehen*.

UNIVERSALS

GREEK	*to katholou* [τὸ καθόλου]
	to koinon [τὸ κοινόν]
LATIN	*universale*

➤ ABSTRACTION, ANALOGY, ESSENCE, LOGOS, MIMESIS, PRÉDICABLE, PREDICATION, RES, *TO BE*, TROPE

The term "universal" has a wide range of uses: one can speak of linguistic universals, logical universals, mental universals (in the sense of "translinguistic categories of thought"), or social universals. In its contemporary philosophical use, the "problem of universals" comes down to asking whether one should allow their ontology to include properties and *nonparticular* relations outside of individual substances. As an important confrontation point, although not the only one, between nominalism and realism, the problem of universals has a long history. A correct approach to the problem of universals, of its difficulties and its vocabulary, entails more than a description of current theories. It requires an archeological investigation back to the very source of the debate via Porphyry and Alexander. The "problem of Porphyry" is in fact conceptually saturated, by a distinction made upstream, as it were, by Alexander between the common (*to koinon* [τὸ κοινόν]) and the universal (*to katholou* [τὸ καθόλου]), and downstream by a distinction made by Ammonius between three "states" of the universal, popularized through the Scholastic triad of *ante rem/in re/post rem*. In his vocabulary, Porphyry's set of questions indicates the same level of saturation, formulated in the Stoic language of "incorporeals" (see SIGNIFIER/SIGNIFIED, II), which carries an opposition between Platonism and Aristotelianism, itself overlaid by a grid of readings initially set out by the Neoplatonic commentators of Aristotle, in order to determine the object (*skopos* [σκοπός]) of the *Categories*: words, things, or concepts. The history of the problem of universals thus presents itself, right up to the modern oppositions of nominalism, realism, and conceptualism, as the ongoing fusion of two sets of questions and two different lexicons, one Aristotelian-Stoic, the other Neoplatonic, with the latter replacing the former to such an extent as to entirely obscure the Stoic dimension of the problem.

I. The Questionnaire of Porphyry

The history of the "problem of universals" usually starts with Porphyry's celebrated questionnaire beginning at the second paragraph of the *Isagoge*.

> About genera and species—whether they subsist, whether they actually depend on bare thoughts alone, whether if they actually subsist they are bodies or incorporeal and whether they are separable or are in perceptible items and subsist about them—these matters I shall decline to discuss, such a subject being very deep and demanding another and larger investigation. Here I shall attempt to show you how the old masters—and especially the Peripatetics among them—treated from a logical point of view, genera and species and the items before us.
>
> *Introduction*, trans. Barnes

This set of questions, which Porphyry refrains from answering himself, has passed through various transpositions and simplifications over the course of time. By a sort of feedback of the traditional discussion of the subject (*skopos* [σκοπός]) of the *Categories* of the *Isagoge,* the Greek commentators, conveyed by the medieval ones, came to ask themselves whether the genera and species were words or voiced (*phônai* [φωναί]), concepts (*noêmata* [νοήματα]), things (*pragmata* [πράγματα]), or beings (*onta* [ὄντα]), which opens the way to those responses—vocalism or nominalism, conceptualism, realism—and their ongoing confrontation down through the centuries. In our day, the principal formulations set the partisans of "primitive natural classes" (Quinton) against the proponents of "Resemblance nominalism" (Price), or of "universals" in the strict sense (a thesis that is invoked, but without a representative), of "natural classes of tropes" (Stout), or "resemblance classes of tropes" (Williams)—and some philosophers try to combine the theory of tropes with the acceptance of universals (Wilson).

■ See Box 1.

The medieval debate on universals is often presented as an opposition between Platonism and Aristotelianism. Contemporary philosophers use the term "Platonism" to refer to transcendent realism, that is to say, any theory that admits the existence of universals or "uninstantiated properties"; and they assign to Aristotle the attempt to "bring universals back to earth," by attributing to him, as does Armstrong, the theory of *universals in things*, "whose Latin tag is *universalia* in rebus" (*Universals*). Rather than directly confronting the Platonic theory of Ideas and its Aristotelian critique, it would seem more fruitful to start from the construction of the problem by an author who, even more than Porphyry, set the framework for the questions, concepts, and strategies of argument: Alexander of Aphrodisias and his collection of *Quaestiones.* We will then follow the course of Alexander's theses through the Neoplatonic and medieval tradition and trace the genealogy of the distinction between the universals *ante rem/post rem/in re* to which the modern lexicon is deeply indebted.

II. Alexander's Construction: Community and Universality, *To Koinon* and *To Katholou*

Alexander's *Quaestio*, 1.11 consists of an "exegesis" of Aristotle's "*to de zôion to katholou êtoi outhen estin ê husteron* [τὸ δὲ ζῷον τὸ καθόλου ἤτοι οὐθέν ἐστιν ἢ ὕστερον]" (*De anima*, 1.1.402b7). Alexander's question is rendered by Sharples as "What is meant by the saying in the first book *On the Soul* [that] 'the living creature *that is* universal is either nothing or posterior'?" This question has been handed down in two versions: the shorter one, *Quaestio*, 1.11a, which proposes a single answer to the question (S2), and a longer one, *Quaestio*, 1.11b, which proposes two answers (S1 and S2) (402b7). The Arabic versions of the text include slightly discordant titles that draw our attention to the central problem of the Alexandrian theory and lexicon of the universal (the Arabic tradition includes two documents of 1.11a). In the inventory of Arabic Alexandrian texts drawn up by Abdurrahman Badawi, the two versions appear under the French title: *Traité d'Alexandre d'Aphrodise: Des choses communes et universelles, qu'elles ne sont pas des essences existentes* (Alexander of Aphrodisias: On common and universal things, which are not existing essences).

1

Six contemporary responses to the problem of universals

D. M. Armstrong sets out the six contemporary positions by considering how each would deal with the property of whiteness.

1. Primitive natural class view: The class of all the white things forms a natural class, a class with a reasonable degree of naturalness. That is all that can be said about what makes a white thing white.
2. Resemblance nominalism: The white things form a natural class in virtue of the objective fact that they all resemble each other to a certain degree.

Resemblance is an objective but unanalyzable fact.
3. Universals: All white things have an identical property in common (or a set of slightly different properties to correspond to the different shades of white).
4. Natural classes of tropes: Each white thing has its *own*, entirely distinct, property of whiteness. But the class of the whitenesses forms a primitive natural class.
5. Resemblance classes of tropes: Each white thing has its own property of whiteness. But the members of the class

of whitenesses all resemble each other more or less closely, resemblance being a primitive.
6. Tropes plus universals: Each white thing has its own property of whiteness. But these particular properties themselves each have a universal property of whiteness.

David Malet

BIBLIOGRAPHY

Armstrong, David. *Universals: An Opinionated Introduction*. Boulder, CO: Westview Press, 1989.

The problem posed by the title of the first Arabic version is clear, if not easy to resolve: is the expression "common things" when added to the original formula of *De anima* (1.1.402b7) ("the universal animal") itself a synonym? Or, to put it differently, should one distinguish between "universal" and "common" in Alexander? In short, should one distinguish between *to katholou* [τὸ καθόλου] and *to koinon* [τὸ κοινόν]?

A first part of the answer is provided by S2, which can be paraphrased thus:

S2 [1.11a, Bruns = 1.11b, Bruns]: Aristotle is correct in saying that the universal animal is "posterior," because he speaks of the universal in the sense of a "generic" universal, which is a concept engendered from individuals. On the other hand, this thesis cannot apply to the universal animal "in the sense of the common animal." To be fully rigorous, one must distinguish between *commonality* [Fr. *communauté*] and "universality." The latter is an "accident" that arrives from outside of "nature," from the fact that it is realized in a number of individuals. The former is not. In fact, a "nature" is in itself common. As soon as an individual exists, this nature—which is in itself common—also exists, even when only instantiated or realized in that individual, and reciprocally, an individual exists only "because" this nature is instantiated in it.

The distinction between *to katholou* and *to koinon* that S2 demands, and which has been discussed by various commentators, is fundamental for understanding the difference between the universal *in re* and the universal *post rem*, whose paternity historians like to attribute to Alexander.

■ See Box 2.

III. The Universal *In Re*

Even if the formula itself is the result of a series of reworkings, starting with Alexander, by the "Greek" commentators of Aristotle, which were further pursued by Avicenna and culminated in Albertus Magnus and the Scholastics, the notion (but not the expression) of the "universal *in re*" can still be traced back to Aristotle himself. In fact, in *De anima,* he maintains that since the notion is the "form" of the thing, it is "necessarily inherent in any given matter if it is [real]": Ὁ μὲν γὰρ λόγος εἶδος τοῦ πράγματος, ἀνάγκη δ' εἶναι τοῦτον ἐν ὕλῃ τοιᾳδί, εἰ ἔσται (*De anima*, 1.1.403b2–3). No notion, no *logos* [λόγος]—for example, that of an animal, that is to say, an "animated essence endowed with sensation"—can *be*, which is to say *be* the *eidos* [εἶδος] of anything at all, if it is not realized in some matter. What Alexander adds to Aristotle is the idea that such a notion, even while it needs realization, is still distinct from the universal that corresponds to it, which is to say that it remains distinct from itself as a universal, by virtue of the fact that universality is for it a mere accident. Alexander's thesis is thus that the animal—or as Aristotle calls it, the *logos*-form of animal—only exists insofar as it is realized "in at least one individual," but that universality is not part of its "essence." Thus there is nothing "universal" in the notion of an *ousia empsuchos aisthêtikê* [οὐσία ἔμψυχος αἰσθητική], that is, in the notion of the animal (*to zôion* [τὸ ζῷον]). But this notion is not real; it only "exists"—as the *ousia* (essence) which it is—as realized in a body. Despite a few superficial dissonances, the Alexandrian lexicon of the universal is quite settled: the *logos*-form for an *ousia*, in itself a commonality—in other words, communicable to more than one—must be (and is in fact) realized in a matter (an individual) at least. Its realization in more than one accidentally confers the status of universal upon it. Such a *logos*-form for an *ousia* is, insofar as it is realized in more than one, what commentators and many modern philosophers would call a "universal *in re*." The concept that can be drawn by "abstraction" from the individual in which the *logos* is realized is what one calls a "universal *post rem*." It is this concept that Aristotle refers to in *De anima* (1.1.402b7) when he (problematically) qualifies it as "posterior" (*husteron* [ὕστερον]). In the terms of Alexander's language, the difference between the "universal *post rem*" and the "universal *in re*" can be defined by a weighty thesis that implies a certain difference between "being" and "existing" (in the sense of "being subject to oneself" [Fr. *se subjecter*, having hypostasis]:

2

The grasp of the universal according to Alexander of Aphrodisias

In the *Peri psuchês* Alexander presents the perception of the universal as follows (see ABSTRACTION):

[The intellect] that perceives (*labôn* [λαβών]) the form of something (*to eidos tinos* [τὸ εἶδός τινος]) apart from matter (*chôris tês hulês* [χωρὶς τῆς ὕλης]) possesses the common and the universal (*echei to koinon te kai katholou* [ἔχει τὸ κοινόν τε καὶ καθόλου]) since what grasps the form of man aside from material circumstances (*chôris tôn hulikôn peristaseôn* [χωρὶς τῶν ὑλικῶν περιστάσεων]) possesses the common man (*echei ton koinon anthrôpon* [ἔχει τὸν κοινὸν ἄνθρωπον]). Indeed, the differences between individual men in relation to each other (*pros allêlous diaphora* [πρὸς ἀλλήλους διαφορὰ]) is engendered by the fact of matter (*para tês hulês ginetai* [παρὰ τῆς ὕλης γίνεται]) since their forms, thanks to which they are men, are not at all different one from another. But [the intellect] that grasps what individuals have in common (*ho te to koinon to epi tois kath' hekasta sunidôn* [ὅ τε τὸ κοινὸν τὸ ἐπὶ τοῖς καθ' ἕκαστα συνιδών]) also perceives (*lambanei* [λαμβάνει]) the form apart from matter. In fact, this is what is common and identical (*to koinon te kai tauton* [τὸ κοινόν τε καὶ ταὐτόν]) to them.

Alexander, *Peri psuchês*, based on Bruns, ed.

B I B L I O G R A P H Y

Alexandri Aphrodisiensis praeter commentaria scripta minora. De anima liber cum Mantissa. In *Supplementum Aristotelicum* 2.1. Edited by Ivo Bruns. Berlin: de Gruyter, 1961.

"the universals have 'being' [*einai* (εἶναι)] in thought and *hupostasis* [ὑπόστασις (*Quaestio*, 59, 7–8; *In topicorum Aristotelis libros*)]/[ὕπαρξις (*De anima*, 90)] in the particulars."

Alexander's distinction between *to katholou* and *to koinon*, and his formulation of the difference between "being in thought" (*epinoia* [ἐπίνοια]) as the product of an "abstraction" and "having hypostasis" in particulars are the epochal foundations of several important theories, the tracks of which can be followed to the end of the Middle Ages, and in some cases beyond. We will limit ourselves here to the two most important. The first is the distinction of "three types of universals." The second is the "indifference of the essence." The following section deals with the typology of universals.

IV. Universal *Ante Rem/Post Rem/In Re*

In their search for a "harmonic" or "concordant" reading of the two "great philosophies" of Aristotle and Plato, the Neoplatonic commentators of Aristotle and Porphyry formulated a scholastic division between three types of universals. In a sense, this division does not take into account the Alexandrian distinction between nature common in itself and universal by accident. But it is also clear that in another sense this division is required, even if tacitly, in order to be able to think that a "same entity" can assume different states of "being" in different substrates or "hypostases" without paradox or contradiction.

The first great source for the doctrine of the three types of universals is Ammonius, in his commentary on the *Isagoge*. Here one finds its two main features: the distinction between universals *pro tôn pollôn* [πρὸ τῶν πολλῶν] (anterior to the multiplicities), universals *en tois pollois* [ἐν τοῖς πολλοῖς] (in the multiplicities), and universals *epi tois pollois* [ἐπὶ τοῖς πολλοῖς] (posterior to the multiplicities); and the reuse of a metaphor, of the seal, the wax, and the imprinted image, which derives from the *Timaeus*, 50c–d (also mentioned by Aristotle in his critical account of Plato's doctrines in the *Metaphysics*, 1.6, 987b–988a with the help of the term *ekmageoin* [ἐκμαγεῖον], "seal," to explain the multiplication of the one in the many). The desired objective is clearly to reconcile the three points of view: the theological (in Plato), the physical (in both Plato and Aristotle), and the logical and noetic (in Aristotle). The universal *en tois pollois* provides a form of synthesis, based on a certain understanding of the middle term, between the Platonic theory of Ideas and the Aristotelian theory of abstraction.

■ See Box 3.

Ammonius's theory had a long afterlife. One finds it of course in the commentaries of David and Elias, but also in Simplicius—when he denounces "those certain people" who only see "the second sort of genres," who do not rise up to the level required for contemplating the transcendent (extrinsic) genres, and who believe that "common natures" only subsist in the singular; it could be found as well in the Syriac Christian Sergius de Rešʿayn (d. 22 April 536)—who clearly locates the genera and the species anterior to the multiples in the spirit of a *God* the "creator." But it is also the source of the mereological doctrine of the universal and of the whole by the Byzantine Eustratius of Nicaea, who presented it through the prism of the Alexandrian theory of homeomeric and nonhomeomeric wholes (cf. Alexander, *Problem*, 28); of the Avicennian doctrine of the three states of the universal; and through the latter to the Scholastic distinction imposed by Albertus Magnus and his contemporaries between *universale ante rem*, *in re*, and *post rem*.

Each different kind of universal that emerged from this system has had its own series of problems, but these concern the history of doctrines, not the languages of philosophy.

The Albertian triad has been subject to various adaptations. Although most authors until the end of the fifteenth century reproduced it unchanged, some of them focused on Avicenna's binary distinction between *logicalia* and *intellectualia* and a distinction between an abstract "logical" universal (or "universal of predication") and a separate

3

The Neoplatonic theory of the three states of the universal

Ammonius follows the "trajectory" of the universal from the Platonic Idea to the abstract concept as follows:

> In order to clarify what the text [of Porphyry] means, let us present it by means of an example, for it is not true that [philosophers] designate simply and by chance some things as corporeal and some others as incorporeal. Rather, they do so according to a reasoning, and they do not contradict each other, as each of them says reasonable things. Let us imagine a ring, with an imprint [that represents] Achilles, for example, along with a multitude of sticks of wax; let us suppose that the ring is used to mark each piece of wax with its seal; now let us suppose that someone comes afterward and that he looks at all the pieces of wax and observes that [the marks] come from a single imprint: he himself will also have the mark imprinted in his discursive faculty [*dianoia* (διάνοια)]; we can thus say that the seal on the ring is "anterior to the multiplicity," that the mark in the blobs of wax is "in the multiplicity," while the mark that is in the discursive faculty of the person who made the imprinted seals is "posterior to the multiplicity" and "posterior in the order of being." Well, this is what one needs to understand in the case of genera and species.

> Ammonius, *In Porphyrii Isagogen*, based on Busse, ed.

The Syriac Christian commentator Sergius de Reš`ayn completes the process undertaken by Ammonius by transposing the universal anterior to the multiple into the "divine idea."

> [This is how] species and genera of things are divided. Some are close to the creator, and they are called simple and primary. Others are in materials and they are called material and natural. Still others are in the intellect, and they are called last and intellectual. These are the teachings of Plato and the other members of the Academy regarding genera and species, which state that each and every thing which is naturally in the world is its own or proper species and also has a proper species near its creator—a species that subsists by itself—through which [the thing in the world] has been imprinted and has come down here to existence. And when someone sees it, he takes its species into memory, and it subsists in his thought, such that this species exists in three ways, that is: near by the creator, in the thing itself, and in the memory of the person who has seen it, the one who knows it.

"theological" universal (or "universal of production") imbued with elements of Proclus's theory of "precontent" (*praehabere, praehabitio, praecontinentia*). This is the case of the Germans Dietrich of Freiberg (*De cognitione entium separatorum*, 10, 1–4) and Berthold de Moosburg (*Super elementationem theologicam Procli*, prop. I A); and it is also the case of some Oxonian realists of the fourteenth century, such as Wycliff (*Tractatus de universalibus*, II, 2), who opposed "logical" universals to "metaphysical" universals. In the fifteenth century, the "Albertists" of Cologne and Paris added a fourth type of universal, which allowed them to inscribe the ensemble of "modern" philosophies into a four-part structure inherited from Albertinian philosophical doxography. In this new arrangement, the nominalists, who proposed reducing all universals to the status of universal *post rem*, hold the role of a kind of "Epicurism" they called "literal" (*epiccurei litterales*).

If modern and contemporary philosophy has largely abandoned the thematic of the universal *ante rem*, modern forms of nominalism and realism have helped extend the perennial debate between Plato and Aristotle as orchestrated by antique and medieval commentary. The contemporary lexicon holds few problems for the (Continental) reader, outside of some expressions specific to English, with its own ellipses and shortcuts—such as the expressions "predicate nominalism" and "resemblance nominalism" (see Box 1), which are difficult to render into French (for example) without recourse to inelegant periphrases such as *nominalisme réduisant les universaux à des prédicats,* or *nominalisme fondé sur la resemblance.* "Predicate nominalism" (directly transposed into French as *nominalisme du prédicat*) is defined as a doctrine that maintains that some individuals can be grouped together insofar as they have the same relation to the *token* (SIGN; cf. PROPOSITION, Box 4), either written or spoken of a same linguistic *type* ("some individuals, ordinary or relation instances, are *related to a shared entity—i.e. to a spoken or written token of a linguistic type*"; cf. Mertz, *Moderate Realism and its Logic*). "Concept nominalism" is understood as a doctrine that replaces the idea of "linguistic type" by that of "mental construct" in the role of type—and both doctrines agree on the rejection of universals, understood as properties common to several individuals, and "instantiated" or "exemplified" in them.

| UTILE

The French *utile* derives from the Latin *uti* ("to use"). This study traces a network of meanings via the English language, as inflected by Jeremy Bentham's invention of "utilitarian" as something different from "useful": see UTILITY; cf. FAIR, RIGHT/JUST/GOOD.

It should be compared to the network of "availability" which has recently been marked by the Heideggerian notion of *Vorhandenheit*: see VORHANDEN, and *DISPOSITION, I.*

➤ BEAUTY, ECONOMY, ENTREPRENEUR, PRAXIS, *VALUE, VIRTUE*, WORK

UTILITY, UTILITARIAN, UTILITARIANISM

➤ *UTILE*, and BEAUTY, ECONOMY, FAIR, *HAPPINESS*, RIGHT/JUST/GOOD, VALUE, VORHANDEN

One starting point for the widespread incomprehension among the French vis-à-vis the utilitarian philosophy of Jeremy Bentham, John Stuart Mill, and Henry Sidgwick can probably be found in a problem of translation. When the first French translators of Bentham and his friends sought an equivalent for the English neologism "utilitarian," which Bentham had created to describe his new philosophy of the general interest (in his *Introduction to the Principles of Morals and Legislation*, first appearing in 1780 and published in 1789), they invented a French neologism: *utilitaire* (1831). But by 1802, Bentham was aware of the perjorative sense that his term had gained through hostile reactions to his doctrine, and he proposed another term, utilitarien, in order to distinguish the technical term from everyday usage. But this new word met with no success or acceptance, and in 1922, the French word *utilitaire* was belatedly replaced with *utilitariste* to render the English "utilitarian," a term that has retained a pejorative connotation in addition to its philosophical content, and which is distinct from the more positive term "useful."

In French, *utilitarisme*, which had appeared in 1842, ultimately supplanted *utilitairianisme* (1845) or *utilitarianisme* (1872) to render the original English term "utilitarianism," but the expression *philosophie utilitaire* persisted, contributing to the misunderstanding of utilitarianism over the course of the nineteenth century. In his celebrated reference book *La Morale anglaise contemporaine, morale de l'utilité et de l'évolution* (1885), Jean-Marie Guyau described his objective as "the history and critique of *la morale utilitaire*." Likewise Élie Halévy would write in 1901 (*La Formation du radicalisme philosophique*, vol. 1) that "to the spiritual philosophy of the rights of man (in France), corresponded (in England) the utilitarian philosophy [*philosophie utilitaire*] of the identity of interests."

I. "Utilitarian" and "Expedient"

It is fascinating to see how quickly the neologism "utilitarian" fell in public esteem and took on such a negative meaning. In *Hard Times* (1854), Dickens caricatured the "utilitarian" mentality as an attitude hardened toward moral feeling and concerned only with the facts, the eponymous "Gradgrindism" of the novel's main character. The problem is to understand whether this negative reading derives from the hostility of the spirit of the time—the rejection of burgeoning capitalism by romanticism, and subsequently by Marxism—or whether it derives from a weakness internal to utilitarianism that should then be subject to question. The philosophical meaning of the term, the criterion of benefit or harm based on "the greatest happiness for the greatest number, each one counting equally" (Bentham, *Introduction*, 1789), needs to be critically unpacked.

As Mill remarks at the beginning of *Utilitarianism*, the adjective "utilitarian" has come to designate only that which is instrumental or advantageous, that which dispenses with any concern for pleasure, for the beautiful, or for the "useless." The philosophy of utilitarianism has come to be identified with the shopkeeper and his or her short-term interest. "Freedom, equality, property and Bentham," proclaims Marx in *Capital.* In order to dispel this confusion and to defend utilitarianism against these accusations of immorality, Mill

proposes to distinguish between "utilitarian" and "expedient." This latter term is identified with that pejorative sense of a pure means to an end, of short-term advantage, of an easy or effective means, of utility without any notion of morality. The simply expedient is a means to an end of which we may not necessarily approve, but that we accept because it functions efficaciously. Utility, on the other hand, is useful only in relation to a good end. Mill explains it thus:

> [The doctrine of] Utility is often summarily stigmatized as an immoral doctrine by giving it the name of Expediency, and taking advantage of the popular use of that term to contrast it with Principle. But the Expedient, in the sense in which it is opposed to the Right, generally means that which is expedient for the particular interest of the agent himself; as when a Minister sacrifices the interests of his country to keep himself in place. When it means anything better than this, it means that which is expedient for some immediate object, some temporary purpose, but which violates a rule whose observance is expedient in a much higher degree. The Expedient, in this sense, instead of being the same thing with the useful, is a branch of the hurtful.
>
> (*Utilitarianism*, chap. 2)

Utilitarianism, on the other hand, seeks a fundamental moral principle that can be used to define the morally right and wrong: the quantity of happiness that results from an action, from a decision, from a political system, from a redistribution of goods, material and social benefits, and so forth. In short, it proposes an objective and impartial method for evaluating justice and injustice, benefit and harm, in the place of criteria based on opinion, personal interest, or power. It takes the side of Socrates against Callicles.

II. "Utility" and "Usefulness"

So why the pejorative meaning? Why not link utility and the Good instead of saying that utility is a moral criterion only if it leads to a good end, only if it is *useful*? Because this would lead to an uncomfortable circularity, already observed by G. E. Moore (*Principa Ethica*, 1901), which is that in order to ground the distinction proposed by Mill, we would need to know what constitutes a good end in itself, independent of our immediate advantage: an independent criterion of the Good. This is precisely what utilitarianism rejects in defining the Good as utility or happiness. As Hume already wrote before Bentham,

> Usefulness is only a tendency to a certain end; and it is a contradiction in terms, that anything pleases as means to an end, where the end itself no wise affects us.
>
> ("An Enquiry Concerning the Principles of Morals," §V, part 2)

From here we understand Hume's insistence on agreement and approval in defining utility, and his conclusion that "Everything that contributes directly to the happiness of society directly recommends itself to our approbation and well-meaning" (ibid.). This is the crucial point that Mill should have insisted upon if he had really wanted to release the utilitarian from the instrumental, and it is to Hume, in fact, that we owe the solution to our problem. What defines

the useful as a good for the utilitarians and differentiates advantage from the useful is the general consensus, the approbation of universal suffrage, as Kant would say. Herein lies the essential point of the doctrine: utility, according to Hume, is collective; if it is not, then it is not utility:

> Usefulness is agreeable, and engages our approbation. This is a matter of fact, confirmed by daily observation. But, USEFUL? For what? For somebody's interest, surely. Whose interest then? Not our own only: For our approbation frequently extends farther. It must, therefore, be the interest of those who are served by the character or action approved of.
>
> (Ibid.)

The useful can only be understood in reference to the happiness and the reduction of pain for all, in relation to human happiness in general. This is why Bentham ultimately called the principle of utility the "principle of the greatest good for the greatest number, each counting equally." The utility of the British philosophers is thus not to be confused with the simply *expedient*—for it must lead to a good end, to that which has real value to us, to our happiness and satisfaction. It is not a matter of egotistical personal interest, but can be evaluated only by a general consensus, by what Halévy called an *identité des intérêts* (a community of interests or common interest). For the utilitarians, it is impossible to separate the individual from the whole. And it is precisely this universalist dimension that offers utilitarianism a way out of the confusions besetting its current usage.

The philosophical use of the term "utility" broadens its scope to mean that which procures a satisfaction for the greatest number. It thus loses any instrumental connotation or neutrality in relation to the desired end. Like Kantian morality, as a moral principle, it relies on a principle of impartiality. The happiness to be maximized is the happiness of all, with each and all treated in equal manner:

> The good of a specific individual, whoever he may be, has no more importance, from the point of view of the universe, if I can put it that way, than the good of any other individual, unless there are some special reasons to think that a greater Good is to be attained in one case rather than another.
>
> (Sidgwick, *The Method of Ethics*, bk. 3, chap. 13)

V

VALUE

"Value," like the French *valeur* or the German *Gewalt*, derives from the Latin *valere* ("to be strong, vigorous, in good health, well"; "to have force, to be able"; "to be worth"; cf. the salutation, *Vale*, in PLEASURE, Box 1), which is a translation of the Greek *dunasthai* [δύνασθαι] (see *POWER*). The German language contains a constellation of terms without equivalent, which includes *Wert* (worth), which connotes an "ought-to-be" (Fr. *devoir-être*; Ger. *werden* ["to become," Fr. *devenir*]) and *Geltung* (value) or *Gültigkeit* (validity) from *gelten* (to pay tribute). In German philosophy at the turn of the twentieth century, the different uses of "value" were developed in a systematic fashion. A rigorous distinction was made among terms, based primarily on the Kantian distinction between theoretical and practical philosophy (the Baden School) or on an attempted challenge to that distinction (Nietzsche's "conversion" of values, *Umwertung der Werte*), whose impact extended to attempts to establish a phenomenology of values (Max Scheler). The German network of meanings is thus an essential starting point; see WERT; cf. SOLLEN, WILLKÜR.

The difficulties around the term "value" derive from the diversity of domains in which "value" takes on its significance. In addition to WERT, which articulates the ensemble of these domains, one should refer to parts of the following entries.

I. Value and Virtue

"Value" comes under the lexicon of physical and moral personal qualities ("strength, bravery, courage"): see VIRTÙ (especially for the Greek *aretê* [ἀρετή], L. *virtus*, It. *virtù*). See also *VIRTUE*. On ethics as a system of values more generally, see DUTY, MORALS.

II. Value and Verity (Truth)

The central question is the articulation among "true," "valid," and "valuable," with the notion of "truth-value": see TRUTH, and PROPOSITION; see also *CROYANCE* [BELIEF, DOXA, GLAUBE]. On the separation of the spheres of ethics and knowledge, in particular, see WERT, IV.

III. Value and Meaning

On the relation between the meaning and value of a word, see SENSE (especially SENSE, III and SENSE, Box 4; cf. HOMONYM, SIGNIFIER/SIGNIFIED, *WITTICISM,* WORD.

IV. Value and Economy

See ECONOMY, ENTREPRENEUR, OIKONOMIA. On the relation between moral value and economic value, see more specifically BERUF, UTILITY; cf. SECULARIZATION, SOBORNOST'.

On the question of a thing, see RES (and RES, Box 1), VORHANDEN.

On the question of "surplus value," refer to WERT, Box 1.

V. Value and Aesthetics

On the question of values in color and timbre, see STIMMUNG. On the judgment of aesthetic value, see GOÛT, STANDARD, and especially AESTHETICS, ART, BEAUTY, INGENIUM, SUBLIME.

VERB

The word "verb" derives from the Latin *verbum*, which signifies "word, term, expression," based on an Indo-European root that led to the Greek *Fereô* [Ϝερέω] ("I will say"), the English "word," and the German *Wort*. Thus the translation of *verbum e verbo* refers to the translation "word to word"; see TO TRANSLATE, III.

1. On the manner of designating the minimal unit of language, on the differences between word, noun, and verb, as well as on the evolution in the meaning of the terms that designate them, see WORD; cf. LANGUAGE, LOGOS, SENSE, SIGN.
2. On the verb as a structuring element of a proposition and as a grammatical category, see ESTI, PROPOSITION; see also *CATEGORY,* PREDICATION, SUBJECT, *TO BE.*

   On the verb as an expression of time and aspect in particular, see ASPECT, PRESENT, TO TI ÊN EINAI; cf. MEMORY. See also ESTI for the present participle, ENGLISH for the gerund.
3. On the primacy of the verb as expression of action, linked to being and existence, see *ACT* and SPEECH ACT.
4. On the relation between *logos* [λόγος], *verbum, davar* [דָּבָר], verb, and divine word, see especially LOGOS, III.B; cf. *ALLIANCE,* GOD.

➤ DICHTUNG, *DISCOURSE, THING*

VERGÜENZA (SPANISH)

ENGLISH	shame, modesty
FRENCH	*vergogne, honte, fierté, honneur*
GREEK	*aidôs* [αἰδώς]
ITALIAN	*vergogna*
LATIN	*verecundia*

➤ *SHAME* and ART, CIVILTÀ, DESENGAÑO, FAIR, GENIUS, MIMÊSIS, NEIGHBOR, PHRONÊSIS, POLIS, RELIGIO, SPREZZATURA, THEMIS, VIRTÙ

In Spanish and in Italian, the terms *vergüenza* and *vergogna* have not fallen out of favor. Indeed, they are used in many different

situations. In Spanish, the term has become oriented toward one's own dignity and self-esteem; but as the Spanish psychologist Eduardo Crespo reminds us, it must be understood as a collective sentiment, illustrated by the expression *vergüenza ajena* ("the shame of the other"), which refers to the shame one feels as a result of the behavior of another. Here we find one of the essential features of *aidôs* [αἰδώς], the Greek personification of modesty.

I. *Vergüenza/Vergogne*

The terms *vergüenza* (Sp.), *vergogna* (It.), and *vergogne* (Fr.) share the same Latin root, *verecundia*, "diffidence," "bashfulness," "modesty" or "decency"—which in imperial Latin means "shame in the face of the blameworthy." *Verecundia* is itself derived from the adjective *verecundus*, "respectful," "reserved"/"revered," "venerable." The latter comes from the verb *vereor* (or *vereri*): in religion, "to fear," "to revere," "to have respect or scruple for." *Vereor* belongs to a family of words that derive from the Indo-European root °*swer-*, meaning "pay attention," like the Greek *horan* [ὁρᾶν] (to look, pay attention, see).

Current French usage of *vergogne* is limited to the negative form: *sans*. The very obsolescence of the term is incorporated into its indication of a well-meaning disapproval bordering on irony. But what does he or she lack when one speaks of someone being or acting *sans vergogne*? In the adverbial form, one would say a lack of scruples and restraint; the attributive form adds a connotation of immorality: debauched (Fr. *dévergondé*). The definition of *vergogne* seems only to reside in the space of its opposite: *sans vergogne* is used exclusively as a figure of accusation or judgment.

One must take the path in exactly the opposite direction in Spanish. Before being *sin vergüenza*, one must first be *con vergüenza*. Persons *con vergüenza* are persons of honor, persons of their word. It is not so much that they keep their promises, but that they are bound by the word that they have given: they commit to *cumplire* and to *à ser cumplido*, "to carry out," "to accomplish a mission" (to fulfill their duties in relation to the community), and "to be fulfilled" (Fr. *s'accomplir*). In this context, the oath prevails over judgment. The motif of shame, at that point, derives from betrayal, the violation of a commitment that constitutes an affront to dignity. Self-accomplishment is a "compliment" to the group. The dignity of each is to the credit of the community, is a mark of its worth; on the other hand, to lack *vergüenza* is to attack the community, to injure it.

In French culture, the negative judgment is a reflection of immoderation, or the extreme nature of a person's conduct that is stigmatized. Here, the reaction of indignation translates or conjures with the rupture of an implicit contract based on norms and conventions (see MIMÊSIS, Box 6), whereas in Spanish the negative judgment is what guarantees and constructs relations of social solidarity.

To delve more deeply into the Spanish nuances, one can examine the expression *vergüenza ajena*, which, according to Eduardo Crespo, captures the feeling of shame that is experienced in the face of the incompetent or inadequate conduct of another person. The feeling of shame in this case has nothing to do with the subject's actions, for he or she has not done anything and cannot feel responsible or be held guilty. It is precisely because there is no direct relation to the person for whom one feels shame that the sentiment of *vergüenza* exhibits and constructs the tie. *Vergüenza* in this instance helps build a sense of community. The one who brings *vergüenza* (as in the related expression *¿No te da vergüenza?* [Aren't you ashamed?]) does not stand accused or excluded from the community but is, rather, recalled to the duty of dignity.

■ See Box 1.

II. *Aidôs* and the Gaze of the Other

The relation to the community expressed in the Spanish expression of *vergüenza ajena* is clearly transmitted in the Greek *aidôs* [αἰδώς], which *A Greek-English Lexicon* (RT: LSJ) translates as "reverence, awe, respect, shame, self-respect, sense of honor, regard" and also the so-called active sense, "that which causes shame or scandal," whence the plural form the "shameful parts" (Homer, *Iliad*, 2.262).

Although both terms can be translated as a sense of shame, *aidôs* is to be distinguished from *aischunê* [αἰσχύνη], "to shame or dishonor" (RT: LSJ). The family of the latter word also refers to deformity and ugliness (as opposed to beauty); *aischunô* [αἰσχύνω] has the primary meaning of "to dishonor," "to tarnish," or "to disfigure" (Homer, *Iliad*, 18.24), and Plato opposes *aischos* [αἶσχος] or *aischros* [αἰσχρός] to "beauty," *kalos* [καλός], in the *Symposium* (201a 4–5, 206c 4–5; see BEAUTY, Box 1). *Aischunê* is often tied to the body, and in the case of the female body, to modesty in the modern sense. *Aischunô* takes on the meaning of "blush," and in botany, *aischunomenê* [αἰσχυνομένη] means "the sensitive," as in the "sensitive plant" (whether *Mimosa pudica* [RT: *Dictionnaire grec-français*] or *Mimosa asperata* [RT: *Dictionnaire étymologique de la langue grecque*; RT: LSJ]). In this sense, it can even designate the feeling of shame that results from rape, and in the plural to the act of rape itself, the "the most extreme outrage" (for example, Isocrates, 64d [= *Panegyric*, 4.114]).

Both *aidôs* and *aischunê* move from the possibility of feeling shame to that which causes it, so that one could well translate the nuances of either term in the same author sometimes as "honor" and sometimes as "dishonor" (Thucydides, *History of the Peloponnesian War*, 2.51.5; 1.5.1). This fold in the structure of shame is illustrated by Phaedra, who does not know in which direction (honor or dishonor) *aidôs* will incline her love for Hippolytus: "Yet they are of two sorts, one pleasure being no bad thing, another a burden upon houses. If propriety [*kairos* (καιρός)—due measure or proportion: RT: LSJ] were always clear, there would not be two things designated by the same letters" (Euripides, *Hippolytus*, 385–87; for a different analysis, see Williams, *Shame and Necessity*). The Latin *pudor*, from *pudeo* (to be ashamed, to cause shame) has the same type of extension: "*ecqui pudor est*?" (where is your sense of shame?; Cicero, *In Verrem*, 4.18); "*vulgare alicujus pudorem*" (to broadcast someone's dishonor; Ovid, *Heroides*, 11.79). But unlike *pudor*, which, when used by itself is normally rendered by *aidôs*, the doublet *pudor/pudicitia* denotes "modesty"/"chastity": the syntagm *pudor et pudicitia* speaks to chastity, morality, and high morals (Cicero, *Orationes in Catilinam*, 2.25; on the Spartan conjunction of *aidôs-aischunê*, see Thucydides, *History of the Peloponnesian War*, 1.84.3).

1

The *sans vergogne* of Francis Ponge

Many uses of *vergüenza* resemble those of the Italian *vergogna*. Many invocations and exclamations in French are to be found in the lexical field of *honte*, and some of the common expressions from Spanish and Italian can be translated as *Quelle honte! C'est une honte!* (For shame! That's shameful!), but the meaning in French is most often considerably weakened. For in both Spanish and Italian, to call on *vergüenza* or *vergogna* is to bring pride into play. We would like to revive the French *vergogne* and give it back its meaning, a meaning that Francis Ponge was able to recover from disuse. Three examples suffice to show how the power of the term's signification can be reactivated.

> As far as syntax, prose, or rhetoric goes, renewal is a matter of instinct, without shame [*sans vergogne*] (yet prudent, concerned only with the result, and with efficacy).
>
> But first and foremost, one must insist that the experience of recent successes (and setbacks) in matters of literary or artistic fame has been most enlightening (Mallarmé, Rimbaud).
>
> We have seen how daring in these areas *pays off*.
>
> ("My Creative Method," in *Méthodes*)

Some may reproach us for expecting our ideas to come from words (from the dictionary, from limericks, from rime, from who knows where . . .): well, yes we admit it, one has to use this process, to respect the material, to foresee how it will age, etc. . . . But we would answer that this is not the only way and we also ask that an unprepared contemplation, and a cynicism, a shameless [*sans vergogne*] honesty of relations, provide some of them as well.

> (Ibid.)

[I]f you want to go off on a tangent, follow me—it may look pretentious—but it is so simple at the same time. You won't have to follow me very far. Just as far as this cigarette butt, for example, to pretty much anything, as long as it is considered honestly, which in the end is to say (without concern for everything we are told about the mind, about man) that it is considered shamelessly [*sans vergogne*].

> ("Tentative orale," in *Méthodes*)

This search for the "height of propriety in the use of terms" (*comble de la propriété dans les termes*) revitalizes the word "shame" (*vergogne*). Even if Ponge only uses the negative form *sans vergogne*, he lets it loose by placing it in other systems of opposition; in a system of echoes and resonances (which he calls being "only concerned with the result"—from the Latin *resulto*, which in poetic usage "resounds," "rebounds as an echo"). In the first quotation, *sans vergogne* connotes spontaneity of instinct and invention, and it is linked once again, with daring and prudence, to the concept of being "without fear"—*verecundia, verecundus, vereri*. In the second quotation, *sans vergogne* implies the leveling of relationships, freed from the weight of literary and social convention, effectively liberated from an approach that takes the side of the human (or ideas) against the side of things. In the third quotation, considering anything (even a cigarette butt) *sans vergogne* means to look at it "honestly," as worthy of interest without regard to ontological hierarchies. The beauty of the paradox—and the sign of the inventiveness of the work—lies in the following: Ponge needs to *do away* with shame in order to bring into existence the "honorability" of the side he has chosen. By contrast, the Spanish and Italians must cultivate the positive side of "with"—as in (*avec*) *vergogne*—to translate their demands for dignity.

Ponge, Francis. *Méthodes*. Paris: Gallimard, 1961.

For its part, *aidôs* defines the Homeric hero: the word (*aidomai* [αἴδομαι]) designates, according to RT: LSJ, "to stand in awe of," "to fear especially in a moral sense," "to have regard for a reputation for valor." In the French translation of *The Illiad* by Paul Mazon, Ajax rallies the Argives thus: "Amis, soyez des hommes, mettez-vous au coeur le sens de la honte [*aidô thesth' eni thumôi* (αἰδῶ θέσθ' ἐνὶ θυμῷ)]" (put a sense of shame in your hearts), followed by "Faites-vous mutuellement honte [*allêlous t' aideisthe* (ἀλλήλους τ' αἰδεῖσθε)]" (shame each other mutually, instill a sense of collective shame) (*Iliad*, 15.580–90). The 1900 Samuel Butler English translation renders these lines: " 'My friends,' he cried, 'be men and fear dishonour [*aidô thesth' eni thumôi* (αἰδῶ θέσθ' ἐνὶ θυμῷ)]; quit yourselves in battle, so as to win respect from one another' [*allêlous t' aideisthe* (ἀλλήλους τ' αἰδεῖσθε)]." In the 1990 translation by Robert Fagles, shame is more clearly foregrounded as the rallying point of the call to battle: " 'Shame, you Argives! All or nothing now— . . . Quick, better to live or die, once and for all, than die by inches, slowly crushed to death . . . by far inferior men!' "

Aidos and *Nemesis* (*Aidôs kai Nemesis* [Αἰδὼς καὶ Νέμεσις]) appear together in Homer (*Iliad*, 13.122) and Hesiod (*Works and Days*). *Aidôs* is comparable to an individual conscience, while *Nemesis* is comparable to a public conscience (for example, the feeling of righteous indignation aroused especially by the sight of the wicked in undeserved prosperity). But perhaps one can say more correctly that in both shame-honor-respect and justice-vengeance, the look of the other is at issue more than the consciousness of self and that the other's look determines or insists upon a behavior or punishes a misbehavior (see CONSCIOUSNESS, Box 1 and THEMIS). We would support Van Windekens's (RT: *Dictionnaire étymologique complémentaire de la langue grecque*) etymological hypothesis, according to which *aideomai* [ἀιδέομαι] would derive from **a-Fidomai* [*ἀ-Ϝιδομαι] of the same family as the Greek *Fidein* [Ϝιδειν], the Latin *videre*, and the French *voir*. *Aidôs* precisely identifies the definitive requirement of the hero, his "regard" for his *philoi* [φίλοι] and his *genos* [γένος].

Aidôs as "honor in the eyes of the other" leads to the pursuit of *kleos* [κλέος], "fame," and *timê* [τιμή], "honor as esteem," and more precisely (in Homer), that part of honor that men and gods accord to royal dignity and that is materialized in the *geras* [γέρας], the gift of honor, the prize due to the king (cf. RT: *Le vocabulaire des institutions indo-européennes*, vol. 2, chap. 5, "honor and honors"). The threat to *aidôs* is *hubris* [ὕβρις], "insolence, arrogance, excess, wantonness, outrage" (it can also be a heading for legal accusations; cf. RT: LSJ, s.v. *hubris* [2.3]: a term covering all the more serious

injuries done to the person) and can apply to both the actor and the object. Thus the intrigue of the *Iliad* is entangled around the *hubris* of Agamemnon for his quarrel with Achilles over Chryseis and the intrigue of the *Odyssey* culminates in the *hubris* of the arrogant suitors (*Odyssey*, 4.627; "behaving with their old *hubris*"). *Hubris*, which a popular etymology connects with *huper* [ὑπέρ], "to be superior," consists for Aristotle "in doing and saying things that cause shame to the victim, not in order that anything may happen to yourself, or because anything has happened to yourself, but simply for the pleasure involved" (*Rhetoric*, 2.2.1378b23–25). *Hubris* is an indication of a bad or false superiority that men should avoid among themselves as well as when they face the jealous gods: it is an insult to the cosmic and human order.

It is against this background of the regulation of the world in common that one must interpret the myth of Protagoras: an assembly of citizens replaces the assembly of warriors. Even though they already have at their disposal the Promethean *technai* [τέχναι] as well as the *logos* [λόγος] of the arts and discursivity (see ART, LOGOS), humankind is still being killed off by animals or, if they gather in cities, people kill off each other. Fearing that the race would be wiped out, Zeus "sends Hermes to bring to men *aidôs* and *dikê* [δίκη] [in A. Croiset's French translation, *pudeur et justice*; in C.C.W. Taylor's English translation, "conscience and justice"] to serve as the organizing principles of cities and as the bonds of friendship" (Plato, *Protagoras*, 322c2–3). *Aidôs* and *dikê* together constitute the *aretê politikê* [ἀρετὴ πολιτική], the "excellence or virtue in politics," which, unlike technical competence, needs to be distributed equally among all: "and lay down on my authority a law [*nomon* (νόμον); see LEX] that who cannot share [*metechein* (μετέχειν)] in conscience and justice [*aidôs* and *dike*] is to be killed as a plague on the city" (Plato, *Protagoras*, 322d3–4). *Aidôs* is behavior, good comportment, self-restraint (the term is conveyed by *sôphrosunê* [σωφροσύνη] "moderation" 323a2; see PHRONÊSIS) provoked by the regard and expectations of the other. *Dikê*, before it came to signify "justice," referred to the rule, usage, procedure, everything that could "bring to light" (*deiknumi* [δείκνυμι]), public codes of conduct. Thus *aidôs* is the motivation to respect *dikê*, and *dikê* carries weight insofar as everyone experiences *aidôs*. The Protagorean combination is not concerned with ethical intention, and even less with the autonomy of the moral subject, but instead with a definition of politics as respect for the rules of public behavior—such that, as concludes Protagoras with no risk of moral scandal, the man that we know to be unjust, if he does not pretend in public to be just, is not showing his wisdom, his sincerity, or his moderation (*sôphrosunê*), but simply revealing his folly (*mania* [μανία], 323b–c).

Aristotle underscores this political dimension of *aidôs*. Insofar as politics is not to be confused with ethics (*Nicomachean Ethics*, 1.1; see PRAXIS), it is of important consequence that *aidôs* not be a virtue, nor an *aretê*, but a pathos [πάθος], an affection that involves the body, rather than a *hexis* [ἕξις], a state or disposition chosen by the soul (4.15.1128b10–11; see 2.6.1106b36–1107a1 for a definition of virtue as *hexis proairetikê* [ἕξις προαιρετική]). As a result, the distinction between *aidôs* and *aischunê* becomes increasingly fragile (cf. *Rhetorics*, 2.6 and J. Tricot's protestations in his notes to the *Nicomachean Ethics*, 4.15), in which he renders *aidôs* as the

French *modestie*, but it appears more than ever that *aidôs* hangs on the intersection of the gazes: as the proverb goes, "shame [*aidôs*] dwells in the eyes" (*Rhetoric*, 2.6.1384a33–36). This is why in the *Politics*, the "visible presence" (*en ophthalmois parousia* [ἐν ὀφθαλμοῖς παρουσία]) of the magistrates is recommended in the gymnasia, for the young as well as the old, because it "induces the true respect which is the form of fear proper to free men" [ἐμποιεῖ τὴν ἀληθινὴν αἰδῶ καὶ τὸν τῶν ἐλευθέρων φόβον] (*Nicomachean Ethics*, 7.12.1131a40); *a contrario*, the multitude, *hoi polloi* [οἱ πολλοί] "do not by nature obey the sense of shame, but only fear, and do not abstain from bad acts because of their baseness but through fear of punishment" [οὐδ' . . . διὰ τὸ αἰσχρὸν ἀλλὰ διὰ τὰς τιμωρίας] (ibid., 10.9.1179b20–31).

From *aidôs*, which is linked to the Latin *videre* (to see), to *vergüenza*, which is linked to the Greek *horan* (to see), we remain in the space of the gaze. But the structure of this space changes. As the public and private spheres diverge, the difference between what has been more recently labeled "shame civilization" and "guilt civilization" is recuperated (cf. Williams, *Shame and Necessity*). When the public space is primary, the *oikos* [οἶκος], the "home" or the "family," takes on the role of the private, specifically of privacy shielded from the public, or the properties proper to truth (see TRUTH, especially I.B, and PROPERTY). In serving thus to give structure to the relationship to the gods as well as that between persons, *aidôs* becomes constitutive of shame civilization. With the rise of subjectivity and the mediation of links between human beings and God, it is conscience (see CONSCIOUSNESS)—the eyes of the self and the eyes of God, not the eyes of the other—that gives structure to a form of the private that can be publicly presented: guilt civilization. But perhaps the notion of shame civilization is not refined enough to signify *aidôs*. The English word "shame," or the German *Scham*, derives from a root that means to "cover up" (see, for example, RT: *Comprehensive Etymological Dictionary of the English Language*). There can be little doubt that error and culpability were required when "the eyes of both of them were opened, and they realized they were naked" (Gen. 3:7)—Greek statuary did not conceal the pudenda. This is why *vergogne*, and to a lesser extent *vergüenza*, both of which preserve a connection to the Greek *aidôs* and the Latin *videre*, are vestigial remainders of a shame culture that continues to mutate.

VERNEINUNG (GERMAN)

ENGLISH   negation, denial, denegation

➤ *NEGATION* and ANXIETY, AUFHEBEN, CONSCIOUSNESS, DRIVE, ENTSTELLUNG, ES, SUBJECT, UNCONSCIOUS

Formed from the verb *verneinen* ("to say no [to a question], to answer in the negative," and by extension, "to deny, refuse"), the substantive *Verneinung* has come to designate, in psychoanalysis, a turn of phrase in which the analysand becomes conscious of a thought-content while simultaneously disowning what he is saying. To achieve this, the analysand employs a grammatical or logical denial of the content of the judgment he offers and attributes the undesirable thought to the other, the analyst. The classical Freudian example goes as follows: "You ask who this person in the dream can be. It's not my mother" ("Die Verneinung"; "Negation," 235). The French translations initially proposed, *denégation* or *déjugement* (the terms used by Jean Hyppolite), erased the linguistic connection between the logical operation of negation and the conflictual relationship of the subject in relation to his own thought-content. But after lengthy discussions regarding the relations of psychoanalysis to German language philosophy, both Kantian and post-Kantian, the translation of *Verneinung* returned to "negation." As J. Laplanche reminds us in the French edition of the *Standard Works*, the *Œvres complètes* of Freud, there were more than ten different translations of the term by French psychoanalysts. The first dates from 1934 (H. Hoesli, *Revue française de psychanalyse* 7, no. 2: 174–77). The review *Le Coq Héron* published several others in 1975 (and 1976) for comparison.

I. The No and Negation in Psychoanalysis

The history of the translation of *Verneinung* is a function of the fact that psychoanalysis seeks to understand what is happening in relation to the instinctual drives when a subject uses logical categories. And in philosophy, one must take into account the fact that this same term is usually used as a synonym for "negation," a word that takes up the Latin term. In addition, modern metaphysics sometimes approaches the question of the status of the real in relation to thought through the certainty of the subject in his affirmations, making use of the same vocabulary by which Freud characterizes the various compromises that construct the subject as divided through the recognition of castration on the one hand, and on the other hand, by the subject's refusal of the same. For Freud, the subject is formed by the ways in which he compromises with everything that poses a threat to the omnipotence of his desires, whether he becomes set in the negation (*Verneinung*) of castration, in its denial (*Verleugnung*), or in its repudiation (*Verwerfung*) (Fr. *forclusion*), which lead, respectively, to neurosis, perversion, or psychosis.

Thus, the specific manner by which to deny the fact of castration is constitutive of the different modes of structure for the subject. At first glance it would seem that philosophy and psychoanalysis do not engage one another on the subject of *Verneinung*. The former speaks of logical inferences and of utterances relating to the world. The latter, on the other hand, approaches negation as a certain way of setting up a subjective division that applies to a subject of desire faced with a "lack of being" that sexual difference introduces into human reality. But on closer analysis the question of beliefs is a place of multiple encounters between psychoanalysis and philosophy in relation to negation.

For Freud "negation" and *Verneinung* are synonymous. He approaches the use of the expression "don't" (Ger. *nicht*, Fr. *ne pas*) by superimposing the linearity of discourse and the dissymetries of the system of the cure; in speaking, the analysand speaks to an Other. In a first moment, negation enables an accommodation, a distribution, between the self and the supposed Other, of what constitutes the subject. By attributing the thought to another through negation, the patient can come to terms with a thought-content that constructs him or her as a subject, all the while rejecting that construction. In a second phase, knowledge as such, even in its positive affirmation, can be caught up in that same system of alterity that sets negation to work: to know something, whether something of one's self or something outside the self, always consists of keeping at bay that which threatens us. Denial keeps that distance, as long as an Other can be assigned that which we cannot admit even as we express it. The theory of negation stands with the theory of knowledge, when understood as being carried along by drives. As one can see, it is precisely because the linearity of discourse carries with it a set of coordinates of a condition of language linked to the work of desires that Freud's *Verneinung* is distinct from an ontology of negation.

But in a third pass at an approach to negation, Freud in 1925 makes an incursion into the logic of judgment by referring to Aristotelian logic, which serves to articulate ontology and logic. By distinguishing the effect of the copula "to be" as joining or dis-joining subject and predicate, from the absolute meaning of "to be," it is possible to define two functions for negation in the implication of the subject in his or her judgments. To untie the bonds between subject and predicate through a judgment in the form of a negative attribution is to spit out or expel (*ausstossen*) something to an outside that is constituted as bad and as outside by this very act of expulsion. The negation of the judgment of existence, which rejects while it knows, is a way of coming back on this first exclusion of an outside. It is an important point: the *Verneinung* as refusal is less radical a refusal than the expulsion that sets up the excluded. It is a victory over the radical exclusion of some content that would cause too much pain if it were recognized as inside the self. But this

victory comes at a high price: the intellectual recognition of content distances it from the self; for Freud, it serves to maintain the repression. One could even claim that it establishes the repression by leaving affect out of the new-found awareness. Negation does not establish just any repression: repression through consciousness occurs nearest the most menacing figures of alterity, in the immediate vicinity of that which a subject has been tempted to radically expel from the self. Negation is a second recourse, in the face of imminent threat—and in relation to a primary defense that consists of destroying the threat by expulsion—but negation requires the prior destruction of affect in the subject. Here Freud expresses himself "backwards": he says that negation shows how the "intellect separates itself from affect." But by dwelling on negation as a second recourse to an expulsion that sought to abolish a content through expulsion, he in fact establishes the reverse: negation restores that which had previously been abolished, but without reestablishing the affect or instinctual content of what it enables to come to consciousness. Negation does not illustrate how the intellect separates itself from affect, but rather that negation is an attempt by the subject to limit or offset the previous exclusion of a content. It is an attempt that establishes conscious thought without being able to reconcile the subject with his own experience. Negation does not suffice to account for repression, but it characterizes that form of repression that is linked to the establishment, in thought, of logic. Freud locates negation in the sequences of discourse and judgment, but he relates it to an experimental plan, somewhat like what Kant did when he left behind the formalism of onto-logic and reflected on the negative grandeurs, or more generally on the transcendental situations that our utterances and judgments return to. But in Freud, negation does not return to non-being.

The text of 1925 still does not make explicit the question of the relations between the lack inherent in desire and negation. Affirmative judgments of existence, according to Freud, are not a matter of finding an object in reality that corresponds to a desire, but to find it again, to regain it, which means that there is the possibility, already inscribed in the system of the psyche, of "not" regaining it. Admitting the absence (of the object that would be good to regain) would be another possible function of negation, which Freud does not address explicitly in this text, but which is nonetheless implicit in it. It is on this point that Lacan, making reference to Hyppolite, takes up the question again.

II. Philosophical and Psychoanalytic Readings of Negation

When Lacan asks Hyppolite whether the Freudian *Verneinung* has anything to do with Hegelian negativity, he returns to this possible relation between negation and non-being: in the first function of judgment, which unties the bonds between subject and predicate in such a manner that the bad is radically expelled to the outside, Lacan dwells on the effective workings of the death drive and wonders about its link with Hegelian negativity. He asks Hippolyte if the use of negation in language has something to do with the reality of death: whether there is a relation not only between negation and the lack internal to desire, but also between the destructiveness of desire and the negation that functions through expulsion (*Ausstossung*). He stresses the death instinct, which was, of course, a notion found in Freud, but which Freud did not set in direct relation with an ontology of negation. Freud limited himself to considering the psychotic's compulsion to deny everything as a panic of negation, which at that point no longer plays the role of *Verneinung*, as a compromise between radical exclusion and the acceptance of a threatening thought-content. Lacan, on the other hand, asks the philosopher who specializes in Hegel to clarify such a possibility, which also means that the bridges between psychoanalysis and philosophy have been mended.

Hyppolite's reading is a subtle one: by translating *Verneinung* as *dénegation* (denegation) or *déjugement* (readjudication), he separates psychoanalysis from philosophy, since Hegelian negation has an ontological reach: death is active in reality, not just in the case of the desiring and thinking subject, but in the real taken as a universal whole. Freud relies on a distinction between affirmative judgment (*Bejahung*) and negative judgment (*Verneinung*), which is why he uses the latter as a general term, as the correlate and opposite of affirmation.

Curiously, Hyppolite does not give a direct answer to Lacan's question regarding the lack of desire in relation to Hegelian negativity. What he focuses on in Freud is the privileging of negation in relation to affirmation: in the relationship set up between the two functions of judgment, affirmation is the simple substitute for the logical unification of subject and predicate, that is to say, between a subject and a thought-content in psychoanalysis. Negation, on the other hand, is more than an impulse to untie the subject from the predicate, to expel something from the self. *Verneinung* is a subsequent *effect* (*Nachfolge*) of the *Ausstossung*. There is something creative about negation, something that produces out of a previous destruction. "A margin for thought can be generated, an appearance of being so in the guise of not being so" (Lacan, *Écrits*). Hyppolite clearly sees that the purpose of Freud's incursion into the theory of judgment is not to lead him back to Aristotle but to characterize the function of negation as a sublimating link between the two functions of the verb "to be." Affirming replaces unification. To deny is more than to destroy. Taking Hyppolite's formulation as a basis, one could say that for psychoanalysis the appearance of being, ontology, is conveyed by an instinctual process in which negation is the operator. Being and language are never alone in their own company.

It is all the more astounding that Hyppolite nonetheless brings together this instinctual function of negation and Hegelian negation, which is an ontological operator. Indeed, the latter occurs in being and experience, rather than in judgment. Hyppolite refers to an example in the *Phenomenology of Mind*: the struggle to the death for recognition invents a negation that modifies the absolute negation of animal desire. This first negation destroyed its object. The second negation, on the other hand, opens the way to the future by removing a situation of mastery and slavery from the risk of complete destruction. Hyppolite borrows the term "sublimation" from Freud and speaks of an "ideal negation," an idea that the philosopher obtains from the Freudian *Verneinung*, and which would avoid a real destruction. The relations between psychoanalysis and philosophy are thus more complex in the case of negation: Hyppolite starts from the

idea of a revocation of judgment (*déjugement*), which serves to distinguish psychoanalysis from philosophy and which limits the scope of *Verneinung* to settling conflict internal to a subject. But in the end he draws on the idea of the sublimation of destruction to reinterpret Hegelian negativity.

Hyppolite starts out by distinguishing negativity from (de)negation. Nonetheless, he brings Freud and Hegel together on two points: first—and this is perhaps superficial—he calls the Freudian example in which the patient goes back on the first negation of a thought-content "negation of the negation" (Lacan, *Écrits*, 883). But this Freudian example is not a case of negativity, that mysterious sojourn that converts nothingness into being. What is at issue is how an intellectual acceptance of a previously denied content can still maintain the nonacceptance of that content. But this connection is made in order to introduce another observation: Hyppolite then connects the inventive character of Freudian *Verneinung*, which manages to limit a first exclusion, to the inventive character of negativity, which manages to limit the destruction at play in the work of the negative. The example he takes here is the passage from the absolute destruction of its object by animal desire according to Hegel, to the resource that in the "dialectic of master and slave" substitutes a situation of domination and slavery for the death of the adversary, enabling the possibility of a later invention of human existence. The negation of negation would be an ideal negation, as the *Verneinung* is an end result of expulsion, which limits the destructiveness of the Freudian death instinct.

The rapprochement between philosophical negativity and negation in psychoanalysis has one more consequence: the unilateral underscoring of the inventive aspect of negation in psychoanalysis, even though it is true that this negation differs from *Verwerfung* as the complete abolition of a content that cannot be recovered later. Yet it still does not eliminate the repression; it establishes it in a manner particularly difficult to transform in the therapeutic context of the transference: the destruction of part of the self derives sustenance from the activity of knowledge and the development of logical thought.

III. "Negation," *Verneinung, Verleugnung* in the Philosophical Problematics of Belief

Verneinung is the term employed in German to designate negation as applied to the form of attributive judgment (in Kant, for example) or to a proposition (for example, in Frege). So we can understand that Frege would entitle a text from 1921 *Die Verneinung*, as Freud would do in 1925, even though they were dealing with separate sets of problems. Frege is only interested in objective thoughts "independent of anyone thinking them," and the only negation that he is concerned with applies to a complete proposition: "It is the case that / It is not the case that. . . ." Freud, on the other hand, is interested in the way a subject carries on his thinking, so to speak, but he finds it in a counterpoint of affirmative and negative judgments, which brings him too to speak of *Verneinung.*

Kant bases his redefinition of formal logic into transcendental logic on a study of judgment: it is important for him to distinguish cases in which a judgment—either positive or negative—has an objective correlative from cases in which reason confuses a nothing with a something. He thus has recourse to the term *Verneinung* in its transcendental function as constitutive of a real object of knowledge. Thus, as early as 1763, he sees the importance of the concept of negative grandeur: an algebraic algorithm for finding the resultant of conflicting forces can be made to correspond to opposing judgments, one positive and the other negative. But since attention to judgment is for Kant only a stopping point on the path to transcendental and critical propositions, one can understand how *Verneinung* would be a synonym for "negation" in his terminology and that both words could apply either to a proposition as a whole or to one of its terms. This is the case, for example, when he opposes two pairs of antinomic judgments in relation to the world: the world is infinite or it is not infinite / the world is finite or infinite. What is important for Kant in relation to such pairs is to understand the difference between two cases. In one case negation divides the two alternative terms in a mutually exclusive way because the transcendental judgment, if it is correctly formed, has a real correlate. In another case the negation—whether it applies to a term or to the whole proposition—makes no distinction between the two alternative terms for the simple reason that there is no "case" at all, even if the formal appearance of the judgments seems to depict some "something" in this opposition of poorly formed propositions. Thus Kant usually uses *Verneinung*, but sometimes he has recourse to "negation"; and he accepts the difference between a negation that applies to a term and the negation that applies to a judgment (especially when he reflects on the question of knowing whether there are negations compatible with the idea of God), but he recognizes it as being of secondary importance compared to his transcendental concerns.

■ See Box 1.

When the authors we have referred to use other German verbs such as *leugnen, ableugnen, bezweifeln,* and *verneinen* in relation to negation, we can see in these different choices a concern to distinguish the different positions of consciousness of metaphysics when it comes to doubting the reality of the external world. Kant has recourse to the difference between doubting (*bezweifeln*) and denying (*leugnen*) to distinguish Descartes from Berkeley, that is to say, questioning idealism from dogmatic idealism. Schelling establishes the same distinction between *bezweifeln* and *leugnen* so as to oppose Descartes from both Berkeley and Malebranche together (*Einleitung*, 76–77).

Kant does not maintain these distinctions in the second edition of the *Critique of Pure Reason*, which claims to "refute idealism," instead of inscribing, as he did in the first edition, the theses on the real within the discourses on reason that constitute so many forms of belief. In that text, in effect, he affirmed that the existence of external reality could not be demonstrated but that it could be placed "out of doubt" (*ausser Zweifel*). One can understand, *a contrario*, that when psychoanalysis distinguishes between the positions of belief by which a human subject works out its relations to the real and to sexual difference—and hence indirectly to what philosophers call reality—it defines the work of negation in discourse in a far more explicit and precise fashion, by

1

The alternatives of *Verneinung* (Kant) and *Negativität* (Hegel)

Unlike Kant, Hegel never uses the term *Verneinung* but uses "negation" instead. This is consistent with his philosophical direction: he shows that the form of the proposition, specifically because it distinguishes between subject and object—whether to separate them or unify them—is ill suited to grasp the speculative element of thought. In effect, the latter consists in the destruction and internal critique of the propositional form of thought that occurs when negation affects each part of the proposition in turn, thereby critiquing the abstract hypothesis of their separation. It would seem that Hegel never gave his reasons for rejecting *Verneinung*, but his radical renunciation of the term is an integral part of his critique of the attributive proposition.

Such an abandonment is all the more remarkable in that it extends to the author's treatment of consciousness and all relations it has to itself, as well as to pure concepts of logic. In his critique of the moral vision of the world, one might well expect his descriptions of the tortuous displacement of moral consciousness in relation to itself, even including

its disguises (*die Verstellung*), to include terms like "misreading" (Fr. *méconnaissance*) or "misjudgment" (Fr. *déjugement*). But such is not the case. Only the terms "negation," *Negativität*, and *Aufhebung* are employed. The moral conscience "abolishes" its own conviction, without denial, misreading, or rejection. Even if the empirical positions of consciousness resemble those experiences in which consciousness revokes its judgment (Fr. *se déjuge*), to use Hyppolite's term, Hegel never comes back to *Verneinung* because his primary interest is to break down the separation of subject and predicate in judgment (whereas Kant relies on it in order to evaluate, depending on the case, the capacities for tying them together, to establish a position of existence by means of the transcendental synthesis). To this end, Hegel works on what starts to move in Being when "negation," in the *logos*, affects in turn the subject, the verb, the predicate, and the adverb (for example, the passage of the adverbial form *nichts*, "in no way," to the noun *das Nichts*, "nothingness," enables the stringing together of the first

categories in the *Science of Logic* [*Wissenschaft der Logik*], 66–67, §133, chap. 1). Even when he describes the arcana of self-consiousness, Hegel's intent is ontological. This is why he resolutely puts aside the verb *verneinen*. This is even more striking when he occasionally refers to specific Kantian expressions (*Phänomenologie des Geistes*, 565; *Phenomenology of Spirit*, 374) ("a whole nest" of thoughtless contradictions). In that very context Kant used the term *Verneinung* (*Kritik der reinen Vernunft*, A 573–75, B 601-3, in *Werkausgabe*, 4: 506–17). But in his reference to Kant and without explanation, Hegel replaces *Verneinung* by *Aufhebung*. For example, when he describes the permanent perversion (Fr. *travestissement*) of the moral consciousness, he employs the expression that Kant reserved for the illusory and tortuous reasonings regarding God, the ideal of pure reason. But at the same time, without explanation, he replaces *Verneinung*, which Kant had employed in that very passage, with "negation." With all due respect to Jean Hyppolite, the negation of negation is thus not a *Verneinung*.

distinguishing between "denying" (*verneinen*), "disavowing" (*verleugnen*), and "foreclosing" (*verwerfen*).

VIRTÙ (ITALIAN)

ENGLISH	virtue
FRENCH	*vertu*
GERMAN	*Tugend*
GREEK	*aretê* [ἀρετή]
LATIN	*virtus*, *virtutes*

➤ *VIRTUE* and *DESTINY*, FORCE, GENIUS, GLÜCK, LEX, MORALS, PHRONÊSIS, PIETAS, SECULARIZATION, TALENT

The Italian *virtù*, constructed within the semantic field of the Greek *aretê* (excellence) and the Roman *virtus* (courage) as well as the Christian *virtutes* (virtues), takes on a new complexity with Niccolò Machiavelli and could be said to rise to the rank of concept. For Machiavelli, *virtù* must relate to two fundamental paradigms: the paradigm of virtue/fortune, as a principle of distinction between the new States, and the paradigm of virtue as decision and resolute action. In Machiavelli, the transition from the first to the second of these paradigms occurs through a transvaluation of the qualities traditionally associated with virtue, the result of which is to pass beyond these two paradigms in conceiving fortune as historical necessity. This necessity, to which abstract virtue must pay heed, is

what Hegel in the *Phenomenology of the Spirit* will call "the way of the world" (*Weltlauf*). In relating *virtù* to temporality and historical necessity, Machiavelli moves away from the virtue of ancient philosophers, from Plato to the Stoics and to Augustine, to reconnect with the tradition of *virtus* of the Roman Republic, and he announces the relation between power and necessity that will be found in Spinoza, Hegel, and Nietzsche.

I. The Two Fundamental Paradigms: *Virtù/Fortuna* and *Virtù-Impetus*

It is only in his major writings after 1512, *The Prince* and *The Discourses*, that Machiavelli takes advantage of his experience as a diplomat and his familiarity with the work of Greek and Roman historians to speak of *virtù*, and to lay claim to the two fundamental paradigms that give it structure. Though he neither explicitly lays out the problematic nor pens the word itself, his missions to Cesare Borgia in 1502–3 and to Julius II in 1506 clearly helped to orient his thinking on the topic.

The first paradigm concerns Cesare Borgia and the distribution of virtue and fortune. The specific virtue of this model of the "new prince" for Machiavelli was to set the proper basis for his politics, but the model's success depended on chance—in this case, the life of the pope. Thus in *The Prince* (chap. 6), Machiavelli made Cesare Borgia the very model of the "virtuous man" who nonetheless is struck down by "extraordinary and extremely malign fortune." Still, Borgia's defeat was determined not only by the death of the pope, but also by his lack of foresight in allowing an enemy (Julius II) to then be elected pope. The relationship between virtue and fortune is constructed in an unstable equilibrium dependent on the success or failure of the enterprise.

In the course of his mission to Julius II, Machiavelli encountered the second paradigm of *virtù*, which is a matter of decisiveness, determination, and audacity. In an important letter to Giovan Battista Soderini, who was the nephew of the *gonfalonier* of Florence (published under the title *Ghiribizzi*, or "fantasies"), Machiavelli sketched out the principles of political decision-making. He asked himself how, in his conflict with his enemy Gianpaolo Baglioni, the pope was able to obtain by chance and without force that which he would probably only have succeeded in obtaining with difficulty through orders and arms. This is because, as Machiavelli says, men govern themselves according to different whims and talents. And since the times are unstable and changing, he who succeeds, whether he is good or bad, is the one who either best adapts his nature to the order of things (the role of *virtù*), or is lucky enough to live in times that correspond to his nature (the role of *fortuna*). As far as the first possibility is concerned, Machiavelli is quite skeptical. Since for him, human nature is something rigid and immutable, it is just as unlikely for there to be men capable of changing their natures according to the times as it is for there to be wise men capable of ruling the stars. So what is to be done? Human actions, wrote Machiavelli (*The Prince*, chap. 25), depend in equal parts on free will and fortune, the latter of which reveals its might most clearly where there is no clear virtue in place to resist it. In this respect, *virtù* is related to Greek *phronêsis* and to Roman *prudentia*, qualities that consist in taking precautionary measures, as when one erects dikes to protect against river flooding.

Machiavelli returns to the theorem of *Ghiribizzi* and concludes that if there are no qualities that are good in themselves, "it is better to be impetuous than cautious, because fortune is a woman who to be kept under must be beaten and roughly handled" (*The Prince*, chap. 25). In addition to virtue as prudence, there is virtue as *impetus*, in the decisive and deciding act. It is the "impulse and passion" of Julius II (*Discourses,* 3.9, trans. Thomsen). It is the principle according to which "fortune is more friendly to the one who attacks than to the one who defends" (*Florentine Histories*, 4.6, trans. Banfield and Mansfield). And it is the "extraordinary" act by which one obtains that which is beyond the reach of ordinary actions (*Discourses,* 3.36 and 44). The problem of fortune returns in the *Discourses* (3.9), providing further fodder to the partisans of Machiavelli's republicanism, who argue that republics have a better "fortune" than principalities, "since they are better positioned to adapt themselves to diverse circumstances." The issue of fortune returns one last time in the *Discourses* (3.21), linked to the counsel that a careful dose of cruelty and generosity can provide the proper mixture of personal virtue with the terror one needs to inspire if one wants to obtain respect.

II. The Transvaluation of Values from Antiquity

The second paradigm of *virtù* would seem to qualify the basic elements of political decision-making: preemptive prudence on the one hand, resolutive *impetus* on the other. Fortune acts as an independent variable relative to virtue (as shown throughout the *Discourses*). Virtue is all the stronger and fortune all the weaker when men act out of necessity and not out of choice (1.1). Good institutions lead to good fortune (1.11). Rome was able to benefit from the "fortune and virtue" of its consuls, and a well-organized republic should necessarily have a succession of able rulers (1.20). Machiavelli claims that the Romans were able to dominate more through their valor and ability (virtue) than through good fortune (2.1). And he constantly criticizes Italian princes who attribute the ruin of Italy to fortune rather than to their lack of virtue. The culmination of Machiavelli's thought is to be found in chapters 29 and 30 of the *Discourses*, in which he outlines a kind of pre-Hegelian philosophy of history, in which fortune no longer appears in opposition to virtue but rather seems to flow through it. Fortune blinds the minds of men who are opposed to her desires, but when she "wishes to effect some great result, she selects a man of such spirit and ability that he will recognize the opportunity which is afforded him." Machiavelli concludes that men can second-guess Fortune, but they cannot oppose her: "They may weave the threads, but they cannot break them. They should never abandon her though, because they can never know her aims, which she pursues by dark and devious means. Men should remain hopeful, never giving up no matter what troubles or ill fortune may befall them."

After arriving at a wager in the second paradigm that recalls the Virgilian adage *audaces fortuna iuvat* (Fortune favors the bold), Machiavelli's qualification of virtue reaches another adage, from Seneca this time: "fata volentem ducunt, nolentem trahunt" (The Fates lead the willing soul, but drag along the unwilling one). One must submit to this kind of necessity if one wants to succeed. But if fortune comes to the aid of *volentem*, what is

the object of this will? What does it "intend"? What is its eidetic target? Since antiquity, virtue (whether it takes the form of the Greek *aretê* [see Box 1], the Roman *virtus*, or the Christian *virtutes*) has referred to a form of human action based on a teleological principle, whether it be Socratic wisdom, Epicurean pleasure (*hêdonê*), Stoic happiness (*eudaimonia*, *vita beata*), or those actions that, since Augustine, are meant to provide access to the City of God. With Machiavelli, however, the value of virtue or of good political conduct consists of love of country, affection for liberty, and state security. Regarding love of country, the object of the sagacious legislator and founder of a new state should be "to promote the public good, and not his private interests, and to prefer his country to his own successors" (*Discourses*, 1.9). The "exaltation and defense of country" is, according to Machiavelli, something that even the Christian religion endorses, despite its location of the ultimate good "in humility, lowliness, and a contempt for worldly objects" (2.2). As for Brutus's assassination of his sons, the crime is nonetheless an object of praise for Machiavelli (and thus an act of virtue) because it was committed "for the good of his country, and not for the advancement of any ambitious purposes of his own." Thus virtue is that "natural affection that each man should hold for his country" (letter of 16 October 1502), or (as he claims in a letter of 16 April 1527) the ability to esteem his fatherland more than his own soul, like those Florentine magistrates who dared oppose Pope Gregory IX in 1357–58 (*Florentine Histories*, 3.7, trans. Banfield and Mansfield).

Machiavelli's transvaluation of ancient values has contributed to the negative reputation of *The Prince* because it is proposed in the name of state security rather than of wisdom, pleasure, or happiness. In chapters 15 through 21 (summarized in *Discourses* 3.41), he condenses love of country and security of the State into the formula "safety of the country": "For where the very safety of the country [*salute della patria*] depends upon the resolution to be taken, no considerations of justice or injustice, humanity or cruelty, glory or shame, should be allowed to prevail. On the contrary, the only question that is valid is: What course will save the life and liberty of the country?" So it is as a function of the "safety of the country" that the "qualities" of traditional ethics change their meaning, as well as their relation to vice and virtue. Thus a prince should not shy from those vices without which he may not be able to safeguard the State. To follow what might seem to be the virtuous course could be his downfall, while taking the vicious one could ensure his security (*securità*) and well-being. The prince must then eschew liberality and not fear the infamy of cruelty if he wants to hold his subjects "united and faithful." He must not hold to his word if it would damage his rule. He must know how to be as wise as a fox or as strong as a lion depending on the circumstance, and he must act if necessary against faith, charity, humanity, and the respect of religion. Machiavelli does seem to deplore conduct that plays on appearance and reality, on simulation and dissimulation. It can ultimately lead to a kind of absolute relativism of political action (of the Jesuitical type), if it is not required by necessity. It is only out of necessity that the prince must adopt "a versatile mind, capable of changing according to the winds and

changes of fortune . . . [he should not] swerve away from the good if possible, but [he should] know to resort to evil if necessity demands it" (*The Prince*, chap. 18).

■ See Box 1.

III. *Virtù* and the Public Sphere, between Rigorism and Utilitarianism

These chapters of *The Prince* effect the transition between the first paradigm and the second, because they qualify the value of an act that invariably relates to fortune in the assumption of power and is defined as a variable because of the choice involved, as *impetus* and as *furor*. But it does not involve, as it does in Kant, a universal value that holds for all circumstances. For on the one hand, if success in politics depends on the conjunction of the times in keeping with either the nature of man (on the side of fortune) or his capacity to adapt that nature to the times (on the side of virtue), then there are no good or bad qualities, nor absolutes of good and evil, and Hannibal's cruelty can be as much of a virtue as Scipio's humanity. On the other hand, this is not a form of absolute relativism, as in the Marquis de Sade, for the virtuous act must be linked to the common good, to the security of the State, to patriotic purpose (*The Prince*, chap. 26).

This reference to the public sphere locates Machiavellian virtue in a sort of conditional generality, equidistant from Kantian rigorism (which addresses the subject confronting the universality of law) and Sadean utilitarianism (which only concerns an individual through his particular interests). All of these parameters serve to define what one could call Machiavelli's "system," but it is a system that is far from coherent, stable, or linear, because it is affected by fluctuations, changes, and frequent contradictions. It is a function of two variables: first, the mixture of hope (desirable) and necessity (unavoidable); and second, the inscription of these thoughts not onto a peacetime logic (of better government, theories of justice, ideal or imaginary states, etc.), but onto a wartime logic, in times that are defined by the effective truth (*verità effettuale*) constituted by variation, circumstance, and accident. This is what Machiavelli calls the "quality of the times" (*qualità dei tempi*), which already points to a history being made, to the radical historicity of the world. It is thus within this system, with its instability, that it is necessary to evaluate the general significance of *virtù* in all of its various occurrences. This significance is refracted throughout a multiplicity of local and particular ascriptions as a result of context and what is called for by the argument.

■ See Box 2.

On a more general level, Machiavellian virtue radically distances itself from the ethico-philosophical Greco-Roman and Christian traditions. It is not something acquired through practice and exercise (*askêsis* [ἄσκησις]), nor by the lengthy and assiduous work of the self on the self (*cura sui*). It is not something that can be learned like an art (*technê* [τέχνη]), which has fed a debate from Socrates to the Stoics and Plutarch; nor is it a measure of moderation (*metron* [μέτρον]; see LEX, Box 1) between excessive extremes (as it is in Aristotle); nor is it even a simple rule for living (*technê tou biou* [τέχνη τοῦ βίου]). It is something that one either

1

Aretê: Excellence and purpose

➤ ART, GLÜCK, MORALS, PLEASURE, PRAXIS

Aretê [ἀϱετή]: excellence, value, virtue, merit, consideration. . . . In ancient Greek, a single word, based on *aristos* [ἄϱιστος], the superlative of *agathos* [ἀγαθός], "good" (see also BEAUTY, Box 1), serves to designate all sorts of excellence that are thus bound together: excellence of the body ("value," in the sense of "valor" and "courage," which is linked to strength, beauty, and health—and is inseparable from the qualities of the heart and intelligence that already in Homer constitute the excellence of the hero [*Iliad* 15.642ff.], of the gods [ibid., 9.498], and even of women [*Odyssey* 2.206]), as well as the soul (with "virtue" defined as control of the self [*sôphronein aretê megistê* (σωφϱονεῖν ἀϱετὴ μεγίστη), Heraclitus 112], by respect [*to aideisthai* (τὸ αἰδεῖσθαι), Democritus 179], and by political and public virtues just as by ethical and private ones [Plato, *Republic* 6.500d, 9.576c16]), including the rewards of that excellence, the consideration and happiness that come with it (*Odyssey* 12.45; Hesiod, *Works and Days* 313). In a much broader context, the word refers to the "competence" of a workman as well as to the "performance" of a well-adapted organ that functions correctly. *Aretê* is thus the accomplishment or realization of purpose, whatever that may be, and for any being. *Aretê* always has an ontological dimension, even when it is translated as "virtue" in a moral sense. And if the value of human action can effectively be defined within moral systems according to some determinate teleological principle (wisdom, *sophia* [σοφία]; pleasure, *hêdonê* [ἡδονή], etc.), it is because every value as such is essentially the enactment of a *telos* [τέλος], of an end, of a proper aim, as in the notion of perfecting an art: *hê aretê teleiôsis tis* [ἡ ἀϱετὴ τελείωσίς τις] (Aristotle, *Metaphysics* Δ.16, 1021b20, trans. Tredennick), "goodness is a kind of perfection" such that one can speak of a "perfect doctor" and, as even he points out, a "perfect thief."

In order to illustrate some of the difficulties of translation into a modern moral idiom, let us look at two classical texts whose intent is to define what we call "virtue," to determine whether it can be taught and to see it in practice, but whose breadth of examples forces us to considerably enlarge our framework of understanding.

In Plato's *Protagoras*, Protagoras claims to teach the *technê politikê* [τέχνη πολιτική], and Socrates doubts whether this is possible, because he doubts that virtue can be taught (320b). The two registers of art and ethics are indissolubly tied, and both fall under the rubric of *aretê*. Everything hinges on the comparison between competence in the *technai* [τέχναι] (for example, the *aretê tektonikê* [ἀϱετή τεκτονική], which can be translated as "architectural merit" or "excellence in building," 322d) and excellence in politics (*aretê politikê* [ἀϱετή πολιτική], 323a), which opens up the question of "human excellence" (325a2) and "excellence" *tout court* (328e9). There is no satisfactory translation, even if "excellence" is the most common denominator, because no translation makes sense for every occurrence. If one wants to find out about technical competence, one consults the practitioners of an art—architects, for example, if one wants to build a rampart. But if one wishes to understand the practices of the Athenian assembly, which pertains to how to run the city well, then one listens to everyone, the blacksmith and the sailor, the rich man and the poor man, the nobleman and the commoner. For Socrates, the fact that the Athenians do not consider virtue to be teachable proves that they think there is nothing to teach. But for Protagoras, this is the proof—as illustrated in the celebrated myth of Zeus's equal distribution of *aidôs* [αἰδώς] and *dikê* [δική], respect and justice (see *aidôs* under VERGÜENZA and *dikê* under THEMIS), to all men in common—that political virtue, unlike technical competence, is shared simply and equally by all those who make up the city.

That, Socrates, is why the Athenians—as indeed everyone else—hold the view that when their deliberations require excellence at building [*peri aretês tektonikês* (πεϱὶ ἀϱετῆς τεκτονικῆς)] and other such practical skills [*ê allês tinos dêmiourgikês* (ἢ ἄλλης τινὸς δημιουϱγικῆς)], only a restricted group of men should contribute advice, and so they refuse to tolerate advice from anyone outside that group, as you say (naturally so, I would add); and that is why, on the contrary, when their deliberations involve *political excellence* [*politikês aretês* (πολιτικῆς ἀϱετῆς)] and must be conducted entirely on the basis of justice and moderation [*dia dikaiosunês . . . kai sôphrosunês* (διὰ δικαιοσύνης . . . καὶ σωφϱοσύνης)], they quite naturally tolerate everyone. For they believe that all men must have this excellence in common [*tautês ge metechein tês aretês* (ταύτης γε μετέχειν τῆς ἀϱετῆς)], since otherwise there would be no *cities*.

(Plato, *Protagoras*, 322d–323a, trans. Hubbard and Karnofsky)

This breadth of meaning is equally evident in Aristotle, in the second book of his *Nicomachean Ethics*, in which he defines ethical virtue and the moral actions that correspond to it. In order to convey in what sort of disposition of *habitus* (*poia hexis* [ποία ἕξις]), the *aretê ethikê* [ἀϱετή ἐθική] consists, and before singularizing it as a mean between two extremes (*mesotês* [μεσότης]), he defines it as a virtue—and once again, "excellence" is the least misleading equivalent:

Every virtue or excellence [*pasa aretê* (πᾶσα ἀϱετή)] both brings into good condition [*auto te eu echon apotelei* (αὐτό τε εὖ ἔχον ἀποτελεῖ)] the thing of which it is the excellence and makes the work of that thing be done well [*to ergon autou eu apodidôsin* (τὸ ἔϱγον αὐτοῦ εὖ ἀποδίδωσιν)]; e.g., the excellence of the eye [*hê tou ophthalmou aretê* (ἡ τοῦ ὀφθαλμοῦ ἀϱετή)] makes both the eye and its work good [*spoudaion* (σπουδαῖον)]; for it is by the excellence of the eye that we see well [*têi gar tou ophthalmou aretêi eu horômen* (τῇ γὰϱ τοῦ ὀφθαλμοῦ ἀϱετῇ εὖ ὁϱῶμεν)] . Similarly the excellence of the horse makes a horse both good in itself and good [*agathon* (ἀγαθόν)] at running and carrying its rider and at awaiting the attack of the enemy.

(*Nicomachean Ethics* 2.5.1106a15–21, trans. Ross, 36–37)

Spoudaios [σπουδαῖος] (from *spoudê* [σπουδή], haste, effort, zeal, ardor, serious engagement) is opposed to *phaulos* [φαῦλος] (ugly, trivial, paltry, petty, sorry, poor), and is used as a term, in the *Politics* for instance, to distinguish good citizens from bad. Thus a single Greek expression carries a "physiological" meaning, such as "the excellence of the eye," and a "moral" meaning: "The excellence of the eye makes both the eye and its work good." Since excellence is thus the optimum of the *ergon* [ἔϱγον] proper to each thing, by rights and when unobstructed, we can understand that Aristotle's version of happiness is part and parcel with virtue, and that this conception is far from Kant's precautionary hopes for the sovereign good.

Virtù and *virtus*

The multiple uses of *virtù* and *virtus* reflect the various significations of *virtù* in the Roman semantic field in which *virtus*—as Joseph Hellegouarc'h has shown—is associated in turn with qualities of character: with generosity of spirit (*magnitudo animi*), with judgment (*consilium*), with wisdom (*sapientia*), and with prudence (*fortitudo, animus*) on the one hand, and with the capacity for governing on the other. In Machiavelli, virtue can in turn be associated with discipline and the stability of the military, with courage and the exploits of an army or its leader, with force (*dunamis*) and the proper disposition of affairs (the virtue of a city, people, or institution), with the excellence of great men and legislators of States, with political and military power, with generosity and prudence as capacities for foresight, for "seeing the problem from some distance" (*Discourses*, 1.18 and 3.28). This is in contrast to the disorder, the cowardice, the lack of foresight, the hesitation, the common behavior and half-measures that can be part of "humanity and patience," yet for conduct that fits the times, the impetuosity and fury of Julius II (*Discourses*, 3.9) is still to be preferred.

The model for this kind of virtue is classical virtue (*antiqua virtù*), the Spartan and especially Roman forms of virtue, which are opposed not so much to wealth and the vices that result from it, as in the ancient philosophers, but to corruption and its political consequences, like the weakening of, the insecurity of, the threats to, and the ruin of States. Machiavellian virtue is never an abstract principle: on the one hand, it always corresponds to real forms of behavior, to concrete and historically determined examples; on the other hand, these are carried by and subject to historical translations. This is the theory of *translatio imperii* (transfer of rule/authority): virtue as exceptional ability, says Machiavelli (in the introduction to book 2 of the *Discourses*), was first lodged in the "world" by the Assyrians, moved to Media, passed into Persia, from there to Rome, and subsequently to the peoples (of the North primarily) who still today "live in virtue." At any rate, as Cicero points out, there is no virtue except "in practice [*in usu*]" (*Republic* 1.2) and "in action [*in actione*]" (*De officiis* 1.19). In the face of this multiplicity of meanings, the translation of the word *virtù* in Machiavelli must take into account these two sets of coordinates, position in the system and situation in context, even if some will still prefer to always translate Machiavelli's *virtù* as "virtue" in English, *vertu* in French, and *Tugend* in German.

has or does not have. *Virtù* does not exist outside of an act, a conduct, or a behavior that inflects time or tries to reorder its course. It is thus not the Stoic practice of individual subjectivation posited in a solitary relation of self to self, or of self to others and to society. It is a modification of the world made by public man through acts of taking and maintaining power or through increasing the size of the State. It is never linked to some form of natural or cosmopolitan universalism, but is inscribed as effective action in a historico-political context that gains legitimacy from civic and patriotic objectives or a commitment to preserving the State. In *The Prince*, the most significant act is the founding of a new State; in *Discourses*, it is a return to the basic and original foundations of the State.

The precedents for Machiavellian *virtù* should be sought not in the philosophers, but in the historians (Thucydides, Titus-Livy, Sallust, Plutarch, and especially Tacitus) who rely for their models on the Sparta of Lycurgus and Republican Rome (before the outbreak of civil wars and the establishment of the empire, in which, as they acknowledge, ancient virtue was lost). It was on the basis of the Roman models—revived by the English republicans of the seventeenth century and leading to the French equation of "virtue" with "republic" by Montesquieu, Rousseau, and Robespierre that the Anglo-Saxon "Cambridge" school (J.G.A. Pocock and Quentin Skinner) retracted the second paradigm of virtue as *impetus*. Virtue as *impetus* connotes the conduct of someone like Septimus Severus, a villain as an individual, but endowed, like Servius Tullius, with "great good fortune and virtue" (*Discourses*, 1.10), or Cleomenes in Sparta (*Discourses*, 1.9) or Agatocles in Syracuse (*The Prince*, chap. 8), neither of whom hesitated to employ extraordinary, violent measures to protect themselves from enemies and reestablish State power.

IV. *Virtù* and the Way of the World: *Exemplum* and *Weltlauf*

At the stylistic level, Machiavelli's use of *virtù* differs from the language of his diplomatic correspondence, where the term almost never appears. When he uses it in his major writing, he seems to want to elevate the political discourse to the "high" level of literary language, as if he had not so much "invented" his political subject as brought it back to the grand style of the history-writing of antiquity. His political analysis, previously limited in his diplomatic dispatches to deciphering current conditions and making conjectures about the future, is anchored by the use of *virtù* in the *exemplum*, which constitutes something that is not teachable, neither a warning, nor a precept, nor a piece of advice. The example consists of a history lesson that modern princes, in an era of corrupt morals and political institutions, are incapable of understanding or imitating.

Machiavellian virtue irrevocably marks the irruption of history and historicity into political discourse: ancient history as *exemplum*; contemporary history as an ensemble of occasions, circumstances, and accidents; history to come as a matter of intention and political will. Machiavelli's radical novelty lies in having transposed the sovereign virtue of the philosophers, in what Hegel, criticizing the "knights of virtue [*Ritter der Tugend*]" from the time of the Stoics to *Don Quixote* and Kant, called the "world process" (*Weltlauf*). As a result of this transposition, the previously irreconcilable opposition between abstract virtue and worldly event was

suddenly annulled, voiding the "pompous discourse" of the supreme good, along with the waste of precious gifts. In this discourse, according to Hegel, the individual "puffs himself up and fills both his empty head, and that of others," with the verbiage of virtue as a value in itself, an "abstract unreal essence" (*The Phenomenology of Mind*, trans. Baillie, 172–74) separate from the world's processes and struggles. The virtue inscribed in the *Weltlauf* (and the virtue of Machiavelli) is that of the historians from antiquity, which is to say, a virtue referring to historic republican practices.

> Virtue in the olden time had its secure and determinate significance, for it found the *fullness of its content* and its solid basis in the *substantial life of the nation*, and had for its purpose and end *a concrete good that existed and lay at its hand*: it was also for that reason not directed against actual reality as a *general perversity*, and not turned *against a world process*.
>
> ("Virtue and the Course of the World,"
> in *The Phenomenology of Mind*, trans. Baillie, 174)

What Machiavelli calls "fortune" in his first paradigm is none other than the representation of what Hegel calls *Weltlauf*; immediate temporality within the immanence of a secularized time, and a brazen law of necessity according to which the man of virtue, the great man, "is what he does; of whom one must say that he wanted what he did just as he did what he wanted." Within the world process, virtue is no longer wisdom, pleasure, happiness, mastery of self, or any of the other principles that served to measure the value of acts in traditional ethics. It is an irruption into temporality, the abrupt encounter of human nature and history, the will to resolute action. Thus—and here is the second paradigm—virtue has become nothing but power, pure power, and power in its pure state, in Benedict de Spinoza's sense of the word:

> Virtue is human power [*virtus est ipsa humana potentia*] defined solely by man's essence . . . that is, . . . which is defined solely by the endeavor made by man to persist in his own being. Wherefore, the more a man endeavors, and is able to preserve his own being, the more is he endowed with virtue, and, consequently in so far as a man neglects to preserve his own being, he is wanting in power.
>
> (Spinoza, *The Ethics*, pt. 4, prop. 20, proof 20:1;
> trans. Elwes, 203)

According to Friedrich Nietzsche, it is with Socrates that *aretê* is written into a moral framework and into a system of "values" in the Heideggerian sense of the term. It is no longer the manifestation of an originary power, but is the evaluation of merit as a function of values (knowledge, rectitude, conviction) that are necessarily outside of it. Nietzsche's conception of values is the same as that which Callicles claims in Plato's *Gorgias* and which Socrates is quick to refute, specifically in the name of "values" such as moderation and the mastery of desires. The virtue of Callicles, the force and energies of intelligence in the service of passions, are, according to Nietzsche in the *Posthumous Fragments* of 1887–88, "virtue in the style of the Renaissance, *virtù*, virtue not embittered by morality" (Nietzsche, *The Will to Power*, trans. Kaufmann and Hollingdale). And in the *Tractatus politicus* that he was thinking of writing

during the same period, Nietzsche talks of the "politics of virtue, of how virtue is made to dominate." This politics of virtue is none other than Machiavellianism. "But," as Nietzsche says, "Machiavellianism *pur, sans mélange, cru, vert, dans toute sa force, dans toute son âpreté*, is superhuman, divine, transcendental, it will never be achieved by man, at most approximated" (ibid., 304). It is the virtue of the historians of antiquity, revisited by the Greco-Roman and Christian philosophers. As he says in the *Twilight of the Idols* in 1888, his "*cure* from all Platonism" has been Thucydides, "and perhaps the *Principe* of Machiavelli . . . by their unconditional will not to deceive themselves and not to see reason in *reality*—not in 'reason,' still less in 'morality'" (*Twilight of the Idols,* trans. Hollingdale).

Machiavelli's *virtù* revives the tradition that goes back to the *theia moira* (the unteachable divine element of Aristide, Themistocles, and Pericles), according to the definition that Socrates gives to virtue in the *Meno* (100a). It harks back to the Spartan *aretê* of Tyrtaeus (which indicates military valor, not caste membership, as in Homer) and the *aretê* of the Athenians in the speech that Thucydides attributes to Pericles in his funeral oration (*The Peloponnesian War,* bk. 2); and finally it reasserts its relationship to the history of republican virtue at the end of the Roman Republic and under the empire. But the real posterity of this virtue is to be found in Spinoza, Hegel, and Nietzsche, rather than among the "skeptics" with their relativism (from David Hume to François de La Rochefoucauld and Sade) or among the politicians with their realism (from Montesquieu to Rousseau and Robespierre). Without a doubt, Machiavellian virtue is nothing but power, the will to power, in the grip of time, with the "character of the times" (*qualità dei tempi*), and with that fortune that is just another name for the Hegelian *Weltlauf*.

The Machiavellian concept of *virtù* thus bears no relation to the "liberty" of ancient moral philosophy (the becoming free through practice and prudence; the proper measure of, government of, and concern for the self). It is related, rather, to historical necessity, with its constraints and submissions. For Machiavelli, *virtù* appears only where there is necessity. Free will, on the other hand, awakens the ambitions and desires that cause the downfall of the States (cf. *Discourses*, 1.5, 1.37). In the face of necessity, virtue lies in the collection of acts and decisions that increase the power of an individual or State. And this historical necessity has not waited for modern revolutions to bring it into the open, as Hannah Arendt would seem to think in her book *On Revolution*. Indeed, Machiavelli, Francesco Guicciardini, and their contemporaries experienced very early on the instability of the word, the changing times, the multiplicity of incidents and accidents, and the insecurity of States that followed the Italian wars after 1494. At some level, Machiavellian virtue, when confronted with the State logic of modern warfare, strangely resembles the attitude of the reformation in the face of salvation through grace—except that the *faith* of Luther and Calvin corresponded to what Machiavelli called *virtù*, whereas *grace*, in that century, corresponded to what Machiavelli called *fortuna*, fortune-necessity: the invincible force of the times, the brazen law of the world process, and the reasons and inscrutable ruses of history.

VIRTUE

In his clarifications to *The Spirit of the Laws*, Montesquieu writes, "Le mot de vertu, comme la plupart des mots de toutes les langues, est pris dans diverses acceptations: tantôt, il signifie les vertus chrétiennes, tantôt les vertus païennes, souvent une certaine vertu chrétienne, ou bien une certaine vertu païenne; quelque fois la force; quelque fois, dans quelques langues, une certaine capacité pour un art ou de certains arts. C'est ce qui précède ou ce qui suit ce mot qui en fixe la signification" (*Œuvres complètes*, Gallimard, 2:1169). (The word "virtue," like most words in every language, takes on different meanings: sometimes it refers to Christian virtues, sometimes to pagan virtues, often to a specific Christian or pagan virtue; sometimes to strength, and sometimes to special talents and abilities in the practice of an art or craft. The meaning of this word is determined by what precedes it or what follows it.) The French word derives from the Latin *virtus*, which refers to the physical and moral qualities that define the value of a man (*vir*). The polysemy of

"virtue" calls for a complex history of the term that does justice to the various strata of time and language. In particular the following should be noted:

1. The Greek *aretê* [ἀρετή] (excellence): see VIRTÙ, Box 1, where one can see this excellence conceived ontologically as an *energeia* [ἐνέργεια], as the actualization of a power or capacity; see also ART, I and PRAXIS; cf. *ACT, POWER, I, II*, and INGENIUM. On the relationship between the physical and the moral, see BEAUTY, Box 1; on the link to measure and moderation, see TRUTH, Box 2, and LEX, Box 1. Lastly, on *phronêsis* [φρόνησις] as practical wisdom, and the relationship between virtue and wisdom, see PHRONÊSIS and GLÜCK.

2. The Latin *virtus* (courage): see VIRTÙ, especially VIRTÙ, Box 2; cf. PIETAS, RELIGIO.

3. Christian virtues: see LOVE, cf. BERUF, *SERENITY*.

If the meaning given to "virtue" by Montesquieu—*l'amour des lois et de la patrie* ("the love of laws and the homeland")—which goes with a renunciation in relation to the self—does not derive directly from any of these other meanings, that is because it draws on another moment of the term's history: Machiavelli's elaboration of *virtù*. From Machiavelli on, the notion takes on a more distinctly political sense that will be taken up not only by Montesquieu but also by Hegel and Nietzsche: see VIRTÙ. Cf. DEMOS/ETHNOS/LAOS, *FATHERLAND*, LAW, POLIS, POLITICS, STATE/GOVERNMENT.

➤ DUTY, *GOOD/EVIL*, MORALS, SECULARIZATION, SOBORNOST', *VALUE*

VOCATION

The concept of "vocation" (based on the Latin *vocare*, "to call") is not simply a milder form of destiny, in the sense that a person could take charge of his or her fate (see *DESTINY*). Instead, it specifically addresses Martin Luther's notion of a *Beruf* (calling), as taken up and developed by Max Weber, whose French translations as *vocation* or *profession* have never proven themselves satisfying. See BERUF and *VOICE.*

➤ *ALLIANCE,* ECONOMY, ENTREPRENEUR, SECULARIZATION, WORK

VOICE

"Voice" (Fr. *voix*) derives from the Latin *vox* (the voice, the sound of the voice, word), which in turn, like the Greek *epos* [ἔπος] (speech, word, discourse, song), is formed from the Indo-European root **wekʷ⁻*, which indicates the voice's emissions as well as the religious and juridical force carried by them.

I. The Human Voice

1. The "voice," or at least the Latin *vox,* can serve to distinguish the human from the animal—as for the Greek *phônê* [φωνή], which can also be used in connection with animals and refers to the power and sharpness of the sound emitted, one needs to specify that it is

articulated and conveys meaning: see ANIMAL, LOGOS (especially LOGOS, II.B), SIGN, SIGNIFIER/SIGNIFIED, WORD (especially WORD, II.B.2) and also cf. HOMONYM.

2. It is linked to music and song: see SPRECHGESANG, STIM-MUNG; see also ACTOR, DICHTUNG; cf. ERZÄHLEN.

On *epos* (Fr. *épopée*; cf. epic poem) as distinct from *muthos* [μῦθος] (speech, discourse, account, myth) and *logos* [λόγος] (speech, discourse, reason, proportion), see LOGOS, MIMÊSIS; cf. MÊTIS, *RÉCIT*.

3. It is also linked to destiny (Lat. *fatum*, from *fari*, "to say"); see DAIMÔN, Box 1, *DESTINY,* KÊR, SCHICKSAL, STIM-MUNG, cf. BERUF, *VOCATION.*

4. Finally, it serves to speak and to lay claim to a right: see CLAIM and *DROIT,* RIGHT/JUST/GOOD.

II. Voice in Grammar

1. *Vox* is one of the most common ways of designating the "word" in Latin. See WORD; cf. LANGUAGE and PROPOSITION.

2. It is also one of the grammatical characteristics of the verb, along with tense, mode, and aspect; see ASPECT (especially as to the meaning of normal voice in Greek).

➤ *HUMANITY, RELIGION*

VORHANDEN / ZUHANDEN / VORHANDENHEIT / ZUHANDENHEIT (GERMAN)

ENGLISH	presence-at-hand / ready-to-hand / readiness-to-hand; extant, extantness / handy, handiness; occurrent/available
FRENCH	*subsistant / disponible, présence-subsistance / disponibilité, sous la main / à portée de la main*
SPANISH	*estar-ahí-delante / estar a la mano*

➤ UTILITY and ART, DASEIN, ES GIBT, ESSENCE, *IL Y A*, OBJECT, POETRY, PRAXIS, PRESENT, REALITY, RES, SEIN, *THING, TO BE,* WELT, WERT, *WORLD*

In Martin Heidegger's *Being and Time* the analysis of the surrounding world (Ger. *Umwelt*) opens with a contrast between two clearly defined modes of being: that which is present-at-hand, or extant (Ger. *Vorhanden*, Fr. *sous la main*), which is an object of simple consideration, and that which is ready-to-hand and available (Ger. *Zuhanden*, Fr. *à portée de la main*). While the former mode is merely deficient in relation to the second, both stand in contrast to *Dasein*, being-there (Fr. *être-là*). This triplicity is clearly fundamental and raises numerous problems of translation. Ontological determinations, we would suggest, should be considered in a more general framework in order to take into account the distinctions thematized by Lotze or Meinong. We will thus start by examining the first occurrences of *Vorhanden* in *Sein und Zeit* (Being and Time) and comparing a series of translations, most into French. We will then seek to disengage the doctrinal background that is the object of Heidegger's "destruction" before finally establishing the indispensable and irreducible polysemy of *Vorhandenheit*, which precludes any simple opposition between *Vorhanden* and *Zuhanden*.

I. The Multiple Senses of Being

The coupling of the adjectives *vorhanden/zuhanden* is not actually an invention of Heidegger's, but before Heidegger

the abstract substantive *Vorhandenheit* is rarely used, and, to our knowledge, the term *Zuhandenheit* not employed at all. Heidegger's purpose, in starting with the fairly common terms *vorhanden, Vorhandenheit* and then differentiating them from *zuhanden, Zuhandenheit*, is primarily to characterize a specific mode or manner of being. This is clearly evident in their first unmarked occurrence in *Being and Time*.

Let us start with the original text:

> "Seiend" nennen wir vieles und in verschiedenem Sinne. Seiend is alles, wovon wir reden, was wir meinen, wozu wir uns so und so verhalten, seiend ist auch, was und wie wir selbst sind. Sein liegt im Daß- und Sosein, in Realität, Vorhandenheit, Bestand, Geltung, Dasein, im "es gibt." An welchem Seienden soll der Sinn von Sein abgelesen werden, von welchem Seienden soll die Erschließung des Seins ihren Ausgang nehmen? Is der Ausgang beliebig, oder hat ein bestimmtes Seiendes in der Ausarbeitung der Seinsfrage einen Vorgang? Welches ist dieses exemplarische Seiende und in welchem Sinne hat es einen Vorrang?
>
> (Heidegger, *Sein und Zeit*)

The English translation by John Macquarrie and Edward Robinson goes as follows:

> But there are many things which we designate as "being" [*seiend*], and we do so in various senses. Everything we talk about, everything we have in view, everything towards which we comport ourselves in any way, is being; what we are is being, and so is how we are. Being lies in the fact that something is, and in its Being as it is; in Reality; in presence-at-hand; in subsistence; in validity; in *Dasein*; in the "there is." In *which* entities is the meaning of Being to be discerned? From which entities is the disclosure of Being to take its departure? Is the starting-point optional, or does some particular entity have priority when we come to work out the question of Being? Which entity shall we take for our example, and in what sense does it have priority?

From the point of view of our present investigation on *Vorhandenheit*, there is no significant difference between "presence-at-hand" (Macquarrie/Robinson) and "being-at-hand" (Stambaugh).[1]

This extended quote clearly describes what is at stake in the determination of manners of being: if, as is classically

---

[1] A note on translations of Heidegger in English: One of the main difficulties in standard English is that *Sein* (infinitive) is normally translated as "Being,"—that is to say, already a present participle. How then shall we distinguish between *Seiend* (*etant*, "being") and Sein (*etre*, "Being")? The solution adopted by Macquarrie and Robinson is to translate the present participle *seiend* using "entity"/"entities" (the difference between singular and plural in the English translation seems arbitrary), and to maintain Being for *Sein*. Two problems then arise: 1. The so-called ontological difference *Sein/seiend, etre/etant* is no longer recognizable in the word pair "Being"/"entity." 2. It is difficult to maintain the translation "entity" when Heidegger underlines the present participle and the presence of the present in it (cf. the first occurrence of "being" for *seiend*).

Stambaugh's translation proposes an alternative that more fully takes into account the present participle. She translates *seiend* by "in being," insisting on the progressive present. She maintains Being with a capital "B" for *Sein*. We are thus confronted with the manifold uses of "-ing" forms in English and the difficulties of nominalization in English.

the case, Being is understood in various senses (*to on lege-tai pollachôs* [τὸ ὂν λέγεται πολλαχῶς]), if we refer to various things as being (Ger. *seiend*, Fr. *étant*, both participles of verbs) and in different senses of the word, the question at issue is whether there is some sense that can serve as a guiding principle, or even better, if there is some exemplary being that can be privileged and thus serve as a model for reading the meaning of "Being."

How would we recognize such a being, if there is one? asks Heidegger. This fairly rough paraphrase of the text quoted above already shows that Heidegger formulates the question—and no doubt, very deliberately—in a more or less explicit reference to the doctrine of the analogy of Being, or even more precisely to the doctrine of the focal unity of senses of being (*pros hên legomenon* [πρὸς ἓν λεγό μενον]). It is through this doctrine that Heidegger addresses "the formal structure of the question of Being," starting in section I.2 of *Being and Time* (*Die Grundbegriffe der antiken Philosophie*, §55, in *Gesamtausgabe*, vol. 22). We will start by examining three existent French translations—but not for the purpose of a contest or choice between them:

1. Étant est tout ce dont nous parlons, tout ce à quoi nous pensons, tout ce à l'égard de quoi nous nous comportons, mais aussi ce que nous sommes nous-mêmes et la manière dont nous le sommes. L'être réside dans l'existence, dans l'essence, dans la réalité, dans l'être subsistant, dans la consistance, dans la valeur, dans l'être-là, dans l' "il y a." En quel étant faudra-t-il lire le sens de l'être, en quel étant l'exploration de l'être prendra-t-elle son point de départ? Le point de départ peut-il être arbitraire, ou quelque étant jouit-il d'une primauté dans le développement de la question de l'être? Quel est cet étant exemplaire et quel est le sens de sa primauté?

   (Trans. R. Boehm and A. de Waelhens, 22)

2. Nous appelons "étant" beaucoup de choses, et dans beaucoup de sens. Étant: tout ce dont nous parlons, tout ce que nous visons, tout ce par rapport à quoi nous nous comportons de telle ou telle manière—et encore ce que nous sommes nous-mêmes, et la manière dont nous le sommes. L'être se trouve dans le "que" et le "quid," dans la réalité, dans l'être-sous-la-main, dans la subsistance, dans la validité, dans l'être-là [existence], dans le "il y a." Sur quel étant le sens de l'être doit-il être déchiffrée, dans quel étant la mise à découverte de l'être doit-elle prendre son départ? Ce point de départ est-il arbitraire, ou bien un étant déterminé détient-il une primauté dans l'élaboration de la question de l'être? Quel est cet étant exemplaire et en quel sens a-t-il une primauté?

   (Trans. E. Martineau, 29)

3. "Étant," nous le disons de beaucoup de choses et en des sens différents. Est étant tout ce dont nous parlons, tout ce que nous pensons, tout ce

à l'égard de quoi nous nous comportons de telle ou telle façon; ce que nous sommes et comment nous le sommes, c'est encore l'étant. L'être se trouve dans le fait d'être comme dans l'être tel, il se trouve dans la réalité, dans le fait d'être-là-devant, dans le fonds subsistant, dans la valeur, dans l'*existentia* (*Dasein*), dans le "il y a."

   (Trans. F. Vezin, 30)

We can start with a few preliminary remarks. Unfortunately, the BW translation drops the quotation marks around the term "seiend." This immediately gives too much ontological intent to a remark that applies primarily to terms that are clearly "voices" (*voces*) that signify things (*pragmata*), as is the case in Aristotelian categories. The translation goes on to reinsert the classical terminology of essence and existence in speaking of an appreciably different distinction. Heidegger does not say that "being is to be found in existence, in essence" (Fr. *l'être réside dans l'existence, dans l'essence*). He says, "*Sein liegt im Daß- und Sosein*" (Being lies in the fact that something is, and in its Being as it is). He says, in what may be an implicit reference to Schelling and is most certainly a reference to Alexius Meinong, that being is or occurs in the *quod,* the "that" of the "that is" or the "that is the case" (*hoti esti* [ὅτι ἐστι]), and not only in the *quid,* the "what is?" or the "what is this?" (*ti esti* [τί ἐστι]): thus in the "that" as well as in the so-being or suchness (Ger. *Sosein*, Fr. *être-tel*).

The opposition between *Sein* and *Sosein* had already been thematized by Meinong as early as the *Theory of Objects* (*Über Gegenstandstheorie*, 1904), at the same time as he set out the principle of the independence of the so-being or suchness in relation to being in the sense of affirmation, of positing a fact or a state of things ("that is!" or "that is the case") (see SEIN, SACHVERHALT). F. Vezin misses part of the point of this first opposition by making the *Daßsein* into "the fact of being" (Fr. *le "fait d'être"*). But it is in the subsequent sentences that the slippages become more serious. In all three French versions the translators resolutely overtranslate, without concern for the context of the general problematic, which is nothing but a very first pass at the question of being, or rather of the meaning of "being," by way of the guiding thread of fundamental ontology.

■ See Box 1.

II. Some Classical Concepts of Ontology in German Metaphysics

The original text spoke of *Realität, Vorhandenheit, Bestand, Geltung, Dasein, es gibt.* In his reference to *Realität*, we can assume (though this is doubtless the most difficult point to establish) that Heidegger is using the term in its classical sense (up to Kant), which he luminously presented in a course during the summer of 1927, *The Fundamental Problems of Phenomenology.* The term *Vorhandenheit* only gains its "technical" sense (which can be translated as "presence-at-hand") through its contrast to *Zuhandenheit*, that is to say, when it is an issue of opening up domains or regional ontologies. Here *Vorhandenheit* should be understood in its uncomplicated sense, characterizing everything that is there, that is present—to provide an ordinary example, a book on

1

Existence, Arabic *wuǧūd*, and *Vorhandenheit*

Like Hebrew, Arabic does not use the copula in the present: the verb that serves its function in the past and in the future (*kāna* [كانَ], yakūnu [يكون]) has no existential meaning. To render the Greek *einai*, translators had recourse to the verb "to find" (Fr. *trouver*), which in the passive voice can mean "to find oneself there," "to be there." The grammatical noun (in Arabic grammar *maṣdar* [مصدر]) that corresponds is *wuǧūd* [وجود], "the fact of finding," or "the fact of being found." [Ibn] The Hebrew of the translators of the ibn Tibbon school has the exact equivalent, *nimṣā* [נִמְצָה]. Al-Fārābī (d. 950) retains the memory of this derivation: "It may be that what they understand by "being" [lit.: "found"], used by them [the Arabs] in an absolute sense, is that the thing becomes known by the place where it is found, that it can be used however one wants, and that it lends itself to whatever one demands of it." (Al-Fārābī's *Book of Letters* [Kitâb al-Hurûf], *Commentary on Aristotle's* Metaphysics, I, §80; Arabic text, edited with an introduction [in Arabic] and notes by Muhsin Mahdi. Beirut: Catholic Press, 1969; 110, I, 12–14). When Avicenna's writings in Arabic were translated into Latin, the translators recognized the origin of the term and rendered it by *esse*, *ens*, or *existentia*. The verb "to be," whose existential significance had remained more or less latent in Greek, was able to deploy it to the full only at the end of a journey in which the Arabic leg is an important one. When Heidegger sought to find a term capable of embodying the thesis of being in traditional ontology, he chose *Vorhandenheit*, "being available" or "at hand" (for example, *Grundprobleme der Phänomenologie* [The fundamental problems of phenomenology], summer semester course, 1927, *Gesamtausgabe*, 24: 173). It is interesting to note that the concept he focuses on has a semitic prefiguration.

Rémi Brague

the bookshelf, as long as it was not borrowed (in which case it would be checked out, *nicht vorhanden*). A single example should suffice to illustrate this traditional usage, taken from the "German Metaphysics" of Christian Wolff: "*Wo etwas vorhanden ist, woraus man begreifen kann, warum es ist, das hat einen zureichenden Grund* [Wherever there exists something whose reason for being one can grasp, it has a sufficient ground]" (*Vernünftige Gedanken*, §30). The French translations of *être-subsistant*, *être-sous-la-main*, or *être-là-devant* are all overtranslations whose principal drawback is precisely their obscuring of the lexical and doctrinal background on the basis of which (as in the case of *endoxa* [ἔνδοξα] and the Aristotelian construction of aporia; see DOXA) Heidegger elaborates the question of the meaning of being. In the *Ideen* Husserl still used *Vorhanden* in its most common sense:

> By my seeing, touching, hearing, and so forth, and in the different modes of sensuous perception, corporeal things with some spatial distribution or other are *simply there for me*, "*on hand*" in the literal or the figurative sense [*. . . sind für mich einfach da, im wörtlichen oder bildlichen Sinne "vorhanden" . . .*] whether or not I am particularly heedful of them and busied with them in my considering, thinking, feeling, or willing.
>
> (Husserl, *Ideas Pertaining,* trans. Kersten)

The term *Bestand*, just like the term *Geltung*, needs to be taken in the sense it receives from Bolzano, through Lotze and Rickert, up to Meinong—but not further. It is truly misrepresented when a violent retrospection already imbues it with the meanings that it will later accrue through Heidegger's analysis of technique, and already translates *Bestand* into French as F. Vezin does, as some "*fonds subsistant*" ("standing reserve").

■ See Box 2.

III. The Vocabulary of Being in Lotze

What we have just described as an indispensable lexical/doctrinal context enables us to follow Heidegger's way of addressing the question of being—by starting with the concrete and by subsequently overturning it. This can be read, for example, through Lotze's classical distribution of terms. When he questions the mode of being of Truth, Lotze seeks to distinguish between the specificity of *gelten* (to be valid or effective, or to have value) and of *es gilt* (it holds).

> We all feel certain in the moment in which we think any truth, that we have not created it for the first time but merely recognized it; it was valid before we thought about it and will continue so [*auch als wir ihn dachten, galt er und wird* gelten]. . . . The truth which is never apprehended by us is valid no whit less than that small fraction of it which finds its way into our intelligence.
>
> (Lotze, *Logic*, 212)

These precisions of definition allow Lotze to distinguish two types of reality/actuality. In a passage that is all the more remarkable because he draws explicitly on the German language and its specific resources, Lotze continues:

> Finally it must be added that we ourselves, in drawing a distinction between the reality/actuality that belongs to the Ideas and laws and the reality/actuality that belongs to things, and by calling the latter Being [*der Wirklichkeit der Dinge als dem* Sein] and the former Validity [*Wirklichkeit als Geltung*], have so far merely discovered a convenient expression which may keep us on our guard against interchanging the two notions. The fact [*die Sache aber*] which the term validity expresses has lost none of that strangeness which has led to its being confused with Being.
>
> (Ibid., 217–18)

Just prior to that passage, Lotze had listed four forms of *Wirklichkeit* (as distinguished through their verbs):

> Wirklich nennen wir ein Ding welches ist, im Gegensatz zu einem andern, welches nicht ist; wirklich auch ein Ereignis welches geschieht oder geschehen ist, im Gegensatz zu dem, welches nicht geschieht; wirklich ein Verhältnis, welches *besteht*, im Gegensatz zu dem,

2

From Bolzano to Heidegger: The common meaning of *Bestand*

B. Bolzano, *Wissenschaftslehre*, I, §48:

The subjective idea [*subjektive Vorstellung*] is thus something real [*etwas Wirkliches*]; at the particular time at which it is present, it has a real existence [*wirkliches Dasein*] in the mind of the subject for whom it is present. As such, it also produces all sorts of *effects* [*Wirkungen*]. This is not true of the *objective* idea or *idea in itself* [*objective oder Vorstellung an sich*], which belongs to every subjective idea. I mean by it something [*etwas*] not to be sought in the realm of actuality [*das Reich der Wirklichkeit*], something that makes up the direct and immediate *material* [*Stoff*] of the subjective idea. This objective idea requires no *subject* to whom it is present, but would have being [*besteht*]—to be sure not as something existent, but nevertheless as a certain *something*—even if no single thinking being should apprehend it [*auffassen*]. And it is not multiplied when one or two or three or more beings think of it, as the subjective idea related to it then exists in plural number.

(Bolzano, *Theory of Science*, 78)

Objectness changes into the constancy of the standing-reserve, a constancy determined from out of Enframing [*Gestell*].

(Heidegger, "Science and Reflection," in *Question Concerning Technology,* 173)

If technique is "provocation" and "interpellation," it assures itself of that which is in respect of its own position and stability (*Stand*):

Whatever is ordered about in this way [being immediately at hand] has its own standing. We call it the "standing-reserve" [*Bestand*]. The word expresses here something more, and something more essential, than mere "stock." The name "standing-reserve" assumes the rank of an inclusive rubric. It designates nothing less than the way in which everything presences that is wrought upon by the challenging revealing. Whatever stands [*steht*] by in the sense of standing-reserve [*Bestand*] no longer stands over against us as object [*Gegenstand*].

(Heidegger, "Question Concerning Technology," in *Question Concerning Technology*, 17)

This collage of quotations is not meant to suggest that Bolzano's *Wissenschaftslehre* constitutes the backdrop to the introduction of *Sein und Zeit* but only that every supposedly immanent and violently self-interpretative

translation runs the risk of creating its own misapprehensions. There is no question of "standing reserve" (*fonds subsistant*) in *Being and Time*, where *Bestand* is the specific mode of being of that which *besteht*, which consists or subsists, without existing, as is the case of an "idea in itself," of an ideality, a fiction, even a chimera, or an internally contradictory entity like a square circle. As Heidegger notes in the margins of his own copy of the book, *Dasein* here is also to be taken in its common meaning, in the sense that Kant for example spoke of the impossibility of an ontological proof of the *Dasein Gottes* (the existence of God), or the sense in which Bolzano spoke of the effective existence of the subjective idea in the one who conceives of something. This is a precision that E. Martineau incorporates in his French translation by adding the word "existence" between brackets to his translation as *être-là*. As for the last *es gibt*, we believe that it is meant to be understood in a technical sense prior to any of Heidegger's elaboration, in the way that Heidegger had treated it from his first course in Freiburg in 1919.

welches nicht besteht; endlich wirklich wahr nennen wir einen Satz, welcher *gilt*, im Gegenstand zu dem, dessen Geltung noch fraglich ist.

(Lotze, *Logik*, 512)

For we call a thing Real/Actual which is, in contradistinction to another which is not; an event Real which occurs or has occurred, in contradistinction to that which does not occur; a relation Real which obtains, as opposed to one which does not obtain; lastly, we call a proposition really true which holds or is valid as opposed to one of which the validity is still in doubt.

(Lotze, *Logic,* 208)

The point about Validity stems from Lotze's conviction that "the language of ancient Greece never found any term to express the reality of simple Validity as distinguished from the reality of Being, and this constant confusion has prejudiced the clearness of the Platonic phraseology" (ibid., 211).

Let us recall that in 1925–26 Heidegger had already cited Lotze's passage on Validity in relation to the four meanings of *Wirklichkeit* in a course in Marburg (*Logik, die Frage nach der Wahrheit*). The course was also an occasion for him to take

some distance from it: "In an earlier research into the ontology of the Middle Ages, I myself returned to Lotze's distinction and used the expression 'actuality' for 'being,' but I no longer consider that correct."

Heinrich Rickert, who was a teacher of Heidegger, noted for his part in his celebrated *Logik des Prädikats:*

Ich nenne jetzt alles "seiend," was es überhaupt "gibt," oder was sich als "etwas" denken läßt, also auch das Gelten, den Sinn, den Wert, und das Sollen. . . . Wir haben also zunächst "Seiendes überhaupt" als den Begriff, unter den alles Denkbare fällt.

(Now I call "being" anything that "there is" in general, or anything that can be thought of as "something," and thus also validity, meaning, value, and that which ought to be. . . . So we take "being in general" to be the concept which subsumes everything that is thinkable.)

(Rickert, *Die Logik des Prädikats und das Problem der Ontologie*, 264)

We can take analyses of this sort (Lotze's or Meinong's on the one hand, or Rickert's on the other) as the background for the celebrated paragraph in *Sein und Zeit* in which Heidegger outlines different modes of being corresponding to different

regional ontologies: *quod est* (the fact that something is) and Being as it is (*Daß- und Sosein*), Reality (*Realität*), presence-at-hand (*Vorhandenheit*), consistence and subsistence (*Bestand*), validity (*Geltung*), and existence (*Dasein*).

IV. *Vorhandenheit/Zuhandenheit*:
The Play of Difference in Heidegger

The English translation by John Macquarrie and Edward Robinson suffers from the same lack of contextualization, and the direct consequence, once again, is overtranslation:

> There are many things which we designate as "being," and we do so in various senses. Everything we talk about, everything we have in view, everything towards which we comport ourselves in any way, is being; what we are is being; and so is how we are. Being lies in the fact that something is, and in its Being as it is; in Reality; in presence-at-hand; in subsistence; in validity; in Dasein; in the "there is."

In 1962 the first English translators, in a particularly unfortunate reference, were already claiming that the term *Dasein* was untranslatable (27n1). "The word *Dasein* plays so important a role in this work and is already so familiar to the English-speaking reader who has read about Heidegger, that it seems simpler to leave it untranslated." And yet if there were one and only one passage in *Being and Time* where it would be appropriate to translate *Dasein*, it would surely be that one!

Joan Stambaugh and J. Glenn Gray, in *Basic Writings, from Being and Time (1927) to the Task of Thinking (1964)*, proposed with more precision, "Being is found in thatness and whatness, reality, the objective presence of things, subsistence, validity, existence, and in the 'there is'" (47).

The very remarkable Spanish translation, *Ser y tiempo*, by Jorge Eduardo Rivera Cruchaga does not escape overtranslation either: "*El ser se encuentra en el hecho de que algo es y en su ser-así, en la realidad, en el estar-ahí* (Vorhandenheit) *en la consistencia, en la validez, en el existir, en el 'hay'*" (30).

The turn of phrase *estar-ahí* is proposed as a translation of *Vorhhandenheit/Vorhandensein* in counterpoint to the *ser-ahí* of José Gaos's translation (1951). The Gaos translation was intended to restore the *terminus technicus* "*Dasein*" in an apparently literal fashion, following the French *être-là* or the Italian *esserci*. Gaos had suggested translating *Vorhandenheit* as *ser ante los ojos*. In this he was followed by Jean Beaufret in his *Dialogue avec Heidegger*, speaking of *être devant / sous les yeux*. In this regard Beaufret's presentation remains especially illuminating: Beaufret recalls how Heidegger, in *Being and Time*, sought to follow an analytic of the everyday as a guiding thread to determine being's mode of being in its immediate presence for us, by looking to an analysis of the first objects that present themselves, not to *theôria* [θεωρία], but to that practical outlook (*praktische Umsicht*) that clarifies them in commerce (*Umgang*) with something whose reliability (*Verläßlichkeit*) is supposedly well established. This is the mode of being of *pragmata* [πράγματα], those ordinary things of this world that we deal with, or even better of *procheira* [πρόχειρα] (Aristotle, *Metaphysics* A, 2, 982b13):

> In this respect, as Jean Beaufret noted, things are essentially available to us [*disponible*]. Heidegger uses

the expression *zuhanden* "within reach" [*à portée de la main*]. . . . He opposes this term to *vorhanden . . .* which situates the same things beyond the horizon of their availability, where they generally first encounter us. Still present, but no longer a utensil, the thing as *Vorhandenes* is no longer . . . anything but the subject of predicates that apply to it when its use is no longer a preoccupation. . . . From the beginnings of philosophy, what characterizes the presence of things is that the *pragmata* are no longer anything other than *onta* [ὄντα], *beings étants* much more within view *sous les yeux* rather than within reach *à portée de la main.*

> (Beaufret, *Dialogue avec Heidegger,* 3)

The Chilean translator justified his decision in the following terms:

> *Estar-ahí . . .* in German, *Vorhandensein* or also *Vorhandenheit. . . .* Gaos translates it as "*ser ante los ojos*" [to be in front of one's eyes]. This translation is not bad, and it affords a basis for following the young Heidegger's courses, but it doesn't seem excellent to me. First of all, because the expression "*ser ante los ojos*" doesn't say much in Spanish; it does not "speak" to us [*no dice nada en español, no nos "habla"*]. We would of course say "*estar delante, estar a la vista*" [to be there in front of us, to be in view]. I have preferred to translate *Vorhandensein, Vorhandenheit* as "*estar-ahí*" and sometimes for emphasis as "*estar-ahí-delante.*" This is the Spanish way of saying what in classical German is meant by *Dasein,* which was the common translation of the Latin *existentia. Dasein* literally means "*estar-ahí*" (and never *ser-ahí*). What is fundamental about the idea of *Vorhandenheit* is simply that something "is there" [*está* without our necessarily being affected by it. Unlike *Zuhandenheit,* which we translate as "*lo que es o está a la mano*" that which is at hand], and which has some meaning for us, because there is something at stake [*lo que tiene un significato por nosotros, lo que nos importa porque en ello nos va algo*], *Vorhandenheit* is that which does nothing else but be there, which is, if you will, "pure presence" [*es lo que no hace más que estar-ahí; es, si se quiere, "pura presencia"*].

> (Rivera Cruchaga, *Ser y tiempo,* 462)

One might perhaps object once again that this is a case of overtranslation. Perhaps it is, but with the difference that here the proposed translation extends Heidegger's own approach of reinterpreting *existentia,* or *Dasein* in its standard accepted use, in terms of *Vorhandenheit.*

Rivera Cruchaga justified his translation of *Zuhandenheit* in these terms:

> *Estar a la mano*: in ordinary German, the term *zuhanden* is used as an adjective to indicate that something is at hand [*encuentro a mano*], that it is available: Heidegger creates the neologism *Zuhandenheit* to express the particular manner of being of that with which we have a daily commerce, a mode of being. . . . The *Zuhandenes* is that which we handle [*lo que "traemos entre manos"*] without paying attention, so to speak, without any

form of objectification [*cas sin advertirlo y sin ninguna objetivación*].

(Rivera Cruchaga, *Ser y tiempo,* §69, note s.v., 467)

This is indeed well put, yet it seems to us impossible to be satisfied with a simple opposition of two modes of being that correspond to two attitudes—one purely theoretical and always secondary, abstract, and impoverishing, the other primary and "pragmatic—even if this opposition is often stressed by Heidegger in *Sein und Zeit.* It is indeed within the "pragmatic" horizons of preoccupied commerce that being is first discovered in its utensil dimension, as *zuhanden, à portée de la main,* within reach, at hand. But for its part, *Vorhanden,* according to Heidegger's quasi-genealogical account in *The Basic Problems of Phenomenology,* does not immediately lead to some form of seeing or to pure consideration, but rather to *poiêsis* [ποίησις]. It is in consideration of creative production that being is first apprehended as *Vorhandenes* (literally, *procheiron* [πρόχειρον]) and is thus referred to an "agent" in front of whom being comes "at hand" (*vor die Hand*) so to speak, for whom it is something handy (*ein Handliches*) (Heidegger, *Basic Problems of Phenomenology*, 143).

   In Heidegger's genealogy of the notion of existence (*existentia*), this "return to the productive behavior of being [*Rückgang auf das herstellende Verhalten des Daseins*]" leads him to shed new light on fundamental ontological concepts (*eidos* [εἶδος], *morphê* [μόρφη], *to ti ên einai* [τὸ τί ἦν εἶναι]). He relates them no longer to a specific target or intentionality of perception but to a *Verhalten,* a "behavior" or primordial "posture" in relation to being. Such behavior can just as easily be called "pragmatic" or "poetic," since it is a matter of going beyond Aristotelian separations among *theôria, praxis* [πρᾶξις], and *poiêsis.* The *Vorhandenes,* in its "primitive" usage, can thus be understood not as *présent-subsistant* (the received French translation, meaning present-abiding), but as *vorhandenes Verfügbares* (Heidegger, *Basic Problems of Phenomenology,* 153), *present-sous-la-main disponible*—"available, present-at-hand."

   Should we conclude from all of this that the distinction that seems to have been drawn so firmly in *Being and Time* is in fact a moving target and that we should put aside vain quarrels of translation and resign ourselves to arbitrary transpositions? Surely not. The principle of establishing an equivalent for a German term with a single univocal term in French or any other language is a falsely rigorous one. It runs the risk, especially in the case under consideration, of obscuring the complexity of Heidegger's gesture toward genealogy and phenomenological destruction. This gesture aims at rediscovering, beneath the sedimentations of traditional philosophical conceptualization, the living source from which the first conceptual elaborations were drawn, as well as their primary meanings. It is how *ousia* [οὐσία] (*Wesen,* essence) is led back to *Anwesen* (presence), and from thence to property, possession, and holding. It is how *Wirklichkeit* (the translation of *actualitas*) is led back to *Verwirklichung* (realization, effectuation) and to *Gewirktheit,* the effectuated (also translated as that which has been actualized), by which we understand the result of an operation.

V. Beyond the Division: The Circularity of *Vorhandenheit/Zuhandenheit*

Let us return once more to the passage in *The Basic Problems of Phenomenology* that previously drew our attention:

Schon die Worterklärung von *existentia* machte deutlich, daß actualitas auf ein *Handeln* irgendeines unbestimmten Subjektes zurückweist, oder wenn wir von unserer Terminologie ausgehen, daß das Vorhandene seinem Sinne nach irgendwie auf etwas bezogen ist, dem es gleichsam *vor die Hand kommt,* für das es ein Handliches ist.

(Heidegger, *Grundprobleme der Phänomenologie,* 143)

The verbal definition of *existentia* already made clear that *actualitas* refers back to an acting on the part of some indefinite subject or, if we start from our own terminology, that the extant (*das Vorhandene*) is somehow referred by its sense to something for which, as it were, it comes to *be before the hand*, at hand, to be handled.

(Trans. Albert Hofstadter, 101)

L'explicitation littérale du terme d'*existentia* a déjà fait apparaître clairement que l'actualitas renvoie à l'agir (*Handeln*) d'un sujet indéterminé, ou encore, selon notre terminologie, que l'étant-subsistant (*das Vorhandene*) est, conformément à son sens, référé d'une certaine façon à un sujet devant lequel il *vient* pour ainsi dire *à portée de la main (vor die Hand)*, pour lequel il est maniable.

(Trans. J.-F. Courtine, 130)

   A passage like this one is obviously a challenge to translation, especially if one wants to retain the lexical play of *handeln, Vorhandene, vor die Hand.* But it becomes singularly opaque with the superimposition of the "well-known" distinction of *vorhanden/zuhanden.* At issue here is not the legitimacy of the distinction; Heidegger will maintain it for as long as the meaning of being is getting worked out in the framework of fundamental ontology. Yet one needs to take into account that the terms must have maintained their separate identities and that they should still be able to do so. Before becoming coupled to *Zuhandenheit,* vorhanden was used by Heidegger to unpack, or to interpret, the Greek and subsequent Latin work of ontological conceptualization, and this through a procedure of trans-lation (Fr. *tra-duction,* Ger. *Über-setzung*) in its literal sense. In this case, the *vorhanden*—beyond its opposition to the specific mode of being of the utensil, and in the broadest meaning of *Zeug*—can serve to designate anything that is present, more or less at hand, and capable metaphorically of coming to hand. Such is the case of *ousia* as Heidegger interprets it, reinvesting it with its primary and concrete meaning: property, real estate, "farmland." Here *ousia*—restored to its earlier, prephilosophical meanings of *Wesen* or *Anwesen,* in the sense of "goods, riches, possession, property"—is clearly "available," like wood in the forest, marble in the quarry, fruits on the trees, or grain in the barn. Here *ousia* carries with it a natural dimension but

one that, according to Heidegger, can open up only within the framework of *technê* [τέχνη].

So we should not confuse the two meanings of *Vorhandenheit*. Its first meaning , which we cannot dare call its original or first meaning, still maintains—and this is the whole point of Heidegger's analysis of the term—an essential tie to action and handling. Its second meaning, which has been divested of its originally "technical" or pragmatic dimension by its philosophical usage, signifies only the "given," that which is there-present, present-subsistent. It is in relation to that second sense that it has been possible to speak (Granel, *Traditionis traditio*) of Heidegger's destruction of the ontology of *Vorhandenheit* or of *Vorhandenes* (whose second meaning is retained in the English "extant," "occurrent").

We can recognize a certain priority to the first meaning insofar as the *Vorhandenes* is literally "*vor der Hand*" ("at hand," *devant la main*), present, available as a "material." It is always already there (in the sense of *prouparchein* [προυπάρχειν]); it is "*das schon Dastehende*," which is there, which persists there (*estar-ahí*) (Heidegger, *Gesamtausgabe*, 25: 99). In this "first" meaning, *Vorhandenes*, which is always there (Fr. *là devant*), which does not need to be produced or brought out into presence, becomes confused with what lies at hand before us (*das Vorliegende*, Fr. *le pro-jacent*), the *hupokeimenon* [ὑποκείμενον]. Anteriority, permanence, stability, these are the constitutive features of *Vorhandenheit*. The *Vorhandenes* is, in fact, *vorfindlich*—it comes forward, it finds itself "there already" (Fr. *il y en a*). Availability (*Verfügbarkeit*) can be taken as the proper characteristic of *Vorhandenheit*, in its first meaning (ibid., 24: 153).

> The wood is a forest of timber, the mountain a quarry of rock; the river is water-power, the wind is wind "in the sails."
>
> (Heidegger, *Being and Time,* trans. Macquarrie and Robinson)

On the other hand, *Vorhandenes* in its second meaning is given a negative definition: it consists of deficient modes of preoccupation that include "abstaining from," "neglecting to," "refraining from." The fundamental feature of access to the *Vorhandenes* in this sense is the "*nur noch*": "to only," to refrain from any handling, to refrain from any use, to abstain from the practical attitude and only "consider" (*nur noch hinsehen*) (*Sein und Zeit*, 57).

VI. The Available World and the Workshop: Grounded Presence

One should not be surprised that the analysis of *Zuhandenheit* and of the *Zuhandenes* that begins as early as §15 of *Sein und Zeit* is conducted within the framework of a study of the being of beings such as it is initially encountered in the environment (*Umwelt*) and that it starts with the destruction of the concept of thing (*Ding*), guided by insistent references to the hand and to handling (*Handlichkeit*, 68–69). *Ding* is to be understood here as a metaphysical concept, a translation of *ens* rather than *res* (see RES).

As opposed to this metaphysical reduction of being as *pragmata* [πράγματα], *chrêmata* [χρήματα], *prokeimena* [προκείμενα] (so many Greek terms that can be translated

as *vorhanden* in its first meaning, as that which comes *vor die Hand*), in *Being and Time* Heidegger attempts to clear away the specific meaning of *Zeug* (the tool or instrument) such as it is experienced in the workshop (cf. §15–16), and, more generally, wherever there is work to be done, where the tool is to be put to work.

In 1925 (Heidegger, *Gesamtausgabe*, 20: 263) he introduces *Zuhandenheit* (*Zuhandensein*), as opposed to *Vorhandenheit*, to characterize the mode of being of instruments or tools, as distinct from the being of natural entities. The question (as will still be the case in *Sein und Zeit*, §15) is of being as it is initially encountered, as it first presents itself. In volume 20 (*Prolegomena*), the analysis clearly starts from the *Werkwelt*, the world of works and working (cf. also *Sein und Zeit*, 117, 172). Why is the *Werkwelt* given this importance? Precisely because of its *Begegnisfunktion*: it is through the *Werkwelt* that we encounter a person or thing. It enables the encounter with the ready-to-hand, with the immediately available: "*das Zuhandensein, besser die Zuhandenheit, das Zuhandene als Nächstsverfügbare*." As for the *Vorhandenes*, as we have seen, it is always already there. We can better understand what Heidegger is aiming at if we go back again to the *Werkwelt*: the world of work refers us back to nature, to the world of nature (*Welt der Natur*), at least insofar as we think of it as a world that is available ("*Natur aber hier verstanden im Sinne der Welt des Verfügbaren*," *Gesamtausgabe*, 20: 262). It is, then, in the very midst of "availability" that it becomes important to take note of a difference: the difference between the wood in the woodworker's shop, for instance, and the tools that are ready to hand. Thus the *Werkwelt* is not self-contained but open to nature as being available. In its very constitution working always refers back to "*das Werk selbst hat eine Seinsart des Angewiesenseins auf, der Schuh auf Leder, Faden, Nagel, Leder aus Haüten* [The work itself has a way of *being-dependent-on*, the shoe on leather, thread, nails, the leather from hides]" (*History of the Concept of Time*, 193). That form of being that refers to, that relies on, explains that Greek ontology, in its emphasis on the primacy of *Vorhandenheit*, passed over the phenomenon of the world. It is precisely because Greek ontology is developed in the context of working, of producing (or even better, of *poiêsis* [ποίησις]), that it is oriented toward nature (Heidegger, *Gesamtausgabe*, 24: 162) and misses the world, for if the world is "*daseinsmäßig*" (at the measure of the being-there), it is nonetheless inaccessible from the starting point of nature (ibid., 20: 231).

In the *Prolegomena*, Heidegger borrows Husserl's concept of "underpinning" (*Fundierung*) to clarify the primacy of the *Werkwelt*. The world of work, where the artisan is caught up in his work, "appresents" the ambient world close by, as well as the public world (in common) and the world of nature ("*die Welt der Natur*," in the sense of always already being there, as resource, as materiel, as available stock). One should posit that the world of preoccupation, the *Werkwelt*, underpins worldliness in general. *Weltlichkeit* reveals itself first as the worldliness of the ambient world: the phenomenon of the world reveals itself as and in the worldliness of the environment.

> We maintain that the specific world of preoccupation is the one by which the world as a whole is encountered.

We maintain that the world in its worldhood is built neither from immediately given things or sense data nor even from the always already present subsistence of nature, which consists of itself as one puts it [*aus dem immer schon Vorhandenen einer—wie man sagt—an sich bestehenden Natur*]. The worldhood of the world is grounded rather in the specific work-world [*Die Weltlichkeit der Welt gründed vielmehr in der spezifischen Werkwelt*]

(Heidegger, Prolegomena, 194; *Gesamtausgabe* (mod.) 20: 263)

We can thus say that *Vorhandenheit* and *Zuhandenheit* are co-originating, inasmuch as both are complementary modes of being that the *Werkwelt* necessarily opens up. *Vorhandenheit* and *Zuhandenheit* are the features that make a priori possible any "encounter with." Primacy is not a feature of *Zuhandenheit* but more fundamentally of the *Werkwelt*. The *Werkwelt*—the world-of-work, the world-of-labor: despite appearances it is not a composite term, the sort that the language of German philosophy is fond of. The world only opens itself through and for working. *Vorhandenheit* is not just thought of as a foil, as a simple correlate to the abstraction that results from an objectivizing intent entirely cut off from the world. Here the *Vorhandenes* is a co-constituent of the world of work, as a dimension of "nature," of "natural products," or of materials (*Sein und Zeit*, 70). What Heidegger characterizes as "founded presence" (*fundierte Präsenz*) is thus the *Zuhandenes*, without any real contradiction in relation to *Sein und Zeit*. If handiness (Fr. *l'à-portée-de-la-main*) is founded presence, this is always insofar as it presupposes a "taking care of," "concern for," "having to do with." The "givenness" for the factive being, which is in the world, is always the *Zuhandenes*, and certainly not the *Naturding*, which is apprehended through perception, the *Naturding* in its claim to be given as "in the flesh" (*Leibhaftigkeit*).

What is given? What gives? What is there (Ger. *Was "gibt es"*)? This could well be the question that leads ultimately from *Sein und Zeit* to *Zeit und Sein*.

Das echte zunächst Gegebene ist . . . nicht das Wahrgenommene, sondern das im besorgenden Umgang Anwesende, das im Greif- und Reichweite Zuhandene. Solche Anwesenheit von Umweltlichen, die wir Zuhandenheit nennen, ist eine fundierte Präsenz. Sie ist nicht etwas Ursprüngliches, sondern gründet in der Präsenz dessen, was in die Sorge gestellt ist.

The genuine immediate datum is thus . . . not the perceived but what is present in concerned preoccupation, the handy within reach and grasp. Such a presence of the environmental, which we call handiness, is a founded presence. It is not something original but grounded in the presence of that which is placed under care.

(Heidegger, *Gesamtausgabe* 20: 264; Eng. trans. Kisiel, *Concept of Time*, 194–95)

Presence (*Präzens*) is here to be understood as *Besorgtheitspräsenz*, the coming into presence whose origin and guiding thread lies in preoccupation and care. The insufficient attention that has been paid to this double meaning of *Vorhandenheit* has made it possible to repeatedly deplore the absence of any ontology of nature or of natural reality in *Being and Time* (cf. Michel Haar, *Le chant de la terre*). One must not reduce all the ontological determinations elaborated in it (except of course for *Dasein*) to an "ontology of the workshop" or of "work" when, in fact, what is at stake in the complex play of *Vorhandenes* and *Zuhandenes* is to find a means of access to the phenomenon of the world.

WELT (GERMAN)

DANISH	*verden, verdensalt*
DUTCH	*wereld*
ENGLISH	world
FRENCH	*monde*
GREEK	*kosmos* [κόσμος], *aiôn* [αἰών], *pan* [πᾶν], *ta panta* [τὰ πάντα]
LATIN	*mundus*
SWEDISH	*vårld*

➤ *WORLD* and AIÔN, DASEIN, ES GIBT, LEIB, NATURE, OLAM, OMNITUDO REALITATIS, *TO BE*, WELTANSCHAUUNG, *WHOLE*

Is there something like a predisposition to phenomenology or even to existentialism in the "Germanic" concept of the world? One that should be properly separated out from any strictly cosmological conception? If such is actually the case, it is nonetheless the semantic trajectory of the ancient Greek *kosmos* [κόσμος] (from Heraclitus to Saint Paul and Saint John, passing through Plato) seems to have prefigured the splitting of meaning, to be clearly found in Kant, between a cosmological sense corresponding to the universe and a cosmo-political, anthropological, or existential sense referring to a way of relating to both the universe and the community of human beings. Paradoxically, Kant himself emphasized, in an anthropological perspective, how the French word *monde* had rubbed off some of its connotations on the German word *Welt* in its cosmopolitan acceptations. *Welt* is further enriched, in the philosophical vocabulary of the twentieth century, through an impersonal verb, *welten*, *es weltet*, a word coined by Heidegger or at least endowed with new meaning by him.

I. "Germanic" Conception of the World?

It has been possible to detect a "Germanic" concept of the world underlying Heidegger's thought on the subject "because the sense in which it is to be understood is suggested by the etymology of the terms" in Germanic languages, including the German *Welt*, the English "world," the Dutch *wereld*, Swedish *vårld*, the Danish *verden, verdensalt*, and so forth. The Germanic etymon is a compound word that combines an element signifying "man" (from the Latin *vir*) and a second element signifying "age" (cf. English "old"). The resulting meaning would be something like "where man finds himself as long as he is alive" (*ce dans quoi l'homme se trouve tant qu'il est en vie*) (R. Brague, *Aristote et la question du monde*, 27–28n37). We can note in passing that the seventeenth-century German word *Weltalter* ("age[s] of the world") is essentially redundant, since it can be taken apart as: Ger. *wer-alt* ("epoch," "world," "generation") + Ger. *Alter* ("age"), whence *age of ages of man*. As opposed to the cosmological concept of the world, which defines a whole of which I am but a tiny part, there is then perhaps a predisposition in the Germanic etymon leading in the direction of its phenomenological conception—that

within which the human being deploys his being, according to a triple determination: cosmological, anthropological, and ontological.

Etymologically, *Welt* maintains an optional relationship with time. This relationship is underscored by Schelling, the author of the *Weltalter* (Ages of the world), by means of a contestable (albeit illuminating) etymological link between *Welt* and *währen* (to endure). This link is made at the end of lesson 14 of the *Philosophy of Revelation* in order to keep in place a speculative equivalence between world and time (the cosmic eon):

> Die Wahre Zeit besteht selbst in einer Folge von Zeiten, und ungekehrt, die Welt ist nur ein Glied der wahren Zeit, und insofern selbst eine Zeit, wie ja das Wort, das von w(ae)hren herkommt und eigentlich eine W(ae)hr ung, eine Dauer, anzeigt, und noch unmittelbarer das griechische aion beweist, das ebensowohl eine Zeit als die Welt.

> (True time itself consists of a series of times, but the world is only one element of true time. In this respect, as the very name *Welt* suggests, true time derives from *währen* (to endure) and thus indicates a *duration*, which the Greek *aiôn* reveals even more directly, as it can equally designate a time or the world.)

> (Schelling, *Schellings Werke*, 6: 308, italics added)

Even if *Welt* does not come from *währen*, which is itself a term related to *wesen* and to the third root in the etymology of the verb "to be" (Sanskrit *vasami*, Germanic *wesan* ["to dwell, remain, to live"] [cf. Heidegger, *Introduction*]), Schelling has nonetheless instinctively sensed the essential co-belonging of the world and time in his reference to the Greek *aiôn* [αἰών] "cosmic eon," even if in an essentially Paulist sense (1 Cor. 7:31): "the form of this world [*kosmos* (κόσμος)] will pass away."

II. Mundus and Immundus

As in the case of Semitic languages, there are several words or expressions in ancient Greek to designate what we call the "world," depending on the aspect under consideration. Still, we should return to the concept of "world" that we are familiar with, which seems to have been barely examined, in order to appreciate the amount of speculative effort that it took to conceive of a totality that synthesized the two other Kantian categories of quantity, that is to say, the singular and the plural. "Ancient Egyptian has no word for 'world,' nor do any of the languages of Mesopotamia" (Brague, *Wisdom of the World,* 10). In Greek, the *kosmos* is actively "produced" in fragment 30 of Heraclitus and was "installed definitively and without ambiguity in its meaning as 'world' " in Plato's *Timaeus* (ibid.; see also Kirk, Raven, and Schofield, *Presocratic Philosophers,*

197–200). The cosmic tends to gloss over the "cosmetic," the world of elegance, beauty, and order, as the opposite of the impure (the French *im-monde*). The Latin *mundus*, in the sense of the ensemble of celestial bodies, skies, universe of light, "seems to be the same word as *mundus*, 'finery,' which was chosen to designate the 'world,' no doubt in imitation of the Greek [κόσμος]." Thus, according to Amyot (*Vie de Dion*, X: 2, in Plutarch, *Vies parallèles*, 1559), the universe that obeys and is governed by the divinity "*est de faict et de nom* Monde, *qui autrement ne serait que désordre immonde*"—is in both name and actuality World (*monde*), which otherwise would only be a filthy mess (*immonde*).

■ See Box 1.

The meaning of *kosmos* will take a decisive turn in the Greek New Testament, and it will take its place alongside *mundus*, *Welt*, and *monde*, especially in Saint Paul (1 Cor. and Gal.) and Saint John: it comes to designate a way of being human, the ensemble of conditions and possibilities for terrestrial life, in the form of an attitude that turns away from God. The meaning of *kosmos* is no longer cosmological, but

historical, even eschatological. "The *sophia tou kosmou* [σοφία τοῦ κόσμου], human wisdom as opposed to divine wisdom . . . *ho kosmos* [ὁ κόσμος], on its own is interchangeable with *ho kosmos outos* [ὁ κόσμος οὗτος], an expression interchangeable in turn with *ho aiôn outos* [ὁ αἰὼν οὗτος] (Bultmann, *Theology*, § 26, 254–59). It is also another name for philosophy: until the beginning of the nineteenth century, there was a discussion in German around *Weltweisheit*, the "wisdom of the world" (the cover page of Hegel's article of 1801 on *The Different between Fichte's and Schelling's Systems of Philiosphy* presents the author's credentials as *der Weltweisheit Doktor*, "the doctor in wisdom of the world"). Starting with the Greek-language versions of the New Testament, whose Hebrew origins specifically led them to set themselves apart from any Greek (pagan) sources, "world" comes to be understood as based on "this world" (this transitory world down below, with its existential attitude that entails turning away from God), and it takes on a negative connotation, even one of damnation, that brings it into almost direct opposition to *mundus* as the pure or the orderly. "World" paradoxically comes to connote that which the French refer to as *immonde*, literally "unworldly."

1

"Order for the city": The meaning of *kosmos*

➤ BEAUTY, DOXA, SPEECH ACT (Box 1), STRUCTURE

One could render the term *kosmos* by the Baudelairian syntagm of "order and beauty" and compare it to our modern "structure." Already in Homer the range of meaning resonates in every use of the term: thus the famous *toilette* of Hera, as she prepares herself for addling the mind of Zeus, in the seclusion and secrecy of her bedroom: ambrosia, oil, perfume, braids, dress, pin, belt, earrings, veil, and sandals, "she surrounds her body with *panta kosmon* [πάντα κόσμον]," all her finery, in other words, that glorious order which makes her woman's world (*Iliad*, XIV, 186)—the world that Sophocles in his *Ajax*, 293, defines as silence: *gunaixi kosmon hê sigê pherei* [γυναιξὶ κόσμον ἡ σιγὴ φέρει], "it is silence that brings women their finery / their world" (cf. Democritus 68 B 274 DK; even today we still think to say "just be beautiful and be quiet") (Fr. *sois belle et tais-toi*). And when Odysseus at Alcinous's house asks the bard Demodocus to "sing the *kosmos* of the wooden horse" (*Odyssey*, VIII, 492ff.), Victor Bérard's French translation refers to the "*histoire*," the Lattimore translation into English refers to it as "another part of the story," and Robert Fagles has Odysseus ask the bard to "shift his ground." At issue in the story is the construction-fabrication, the technique and the ruse, and the course of the world it determines. The goddess of Parmenides deploys both the "world of deception" in her speech (*kosmon . . . apatêlon* [κόσμον . . . ἀπατηλόν]) and the world of *doxa* [δόξα]

that men adhere to in their minds (*diakosmon* [διάκοσμον]), the "whole arrangement" of the world (VIII, 60), in the interweaving of a discursive arrangement and the order of the world. Finally, Gorgias brings to light the optimal form of organization that constitutes the *kosmos* and its corresponding excellences: "The order [*kosmos*] proper to a city is the excellence of its men; to a body, beauty; to a soul, wisdom; to a deed, excellence; and to a discourse, truth—and the opposites of these are disorder [*akosmia* (ἀκοσμία)]," Gorgias, Encomium of Helen, 82 B11 DK, §1).

In Heraclitus, cosmology does not triumph over cosmetics either: in fragment B 30 DK, which "produces" the *kosmos*, not only is fire required, but it is required in precise amounts ("This world-order [*kosmon*] did none of gods or men make, but it always was and is, and shall be: an everliving fire, kindling in measures and going out in measures [*metra* (μέτρα)]") (Kirk, Raven, and Schofield, *Presocratic Philosophers* §217, 198). And the world so "cosmologized," both elementary and measured, is also "the most beautiful" ("The most beautiful order of the world [*ho kallistos ho kosmos* (ὁ κάλλιστος ὁ κόσμος)]" is still a random gathering of things insignificant in themselves—Guy Davenport trans.). Thus in Plato's *Timaeus*, Critias is left with but one hypothesis to consider: "that this world is most beautiful [*ei men dê kalos estin hode ho kosmos* (εἰ μὲν δὴ καλός ἐστιν ὅδε ὁ κόσμος)] and that the demiurge is good" (29a 2–3). This equivalence of world and order

(*kosmos kai taxis* [κόσμος καὶ τάξις]) (Aristotle, *Metaphysics*, A, 984b16–17) is always at play: From the Pythagorean "harmony" to the *Timaeus* or the Aristotelian treatise *De caelo*, this identity is what makes it possible to physically describe or even to make mathematical calculations about the sky, celestial spheres, or the universe. But it also opens up the rhetorical and poetic sense of the *kosmos* as ornament (Aristotle, *Poetics*, 21, 1457b1–2: "a noun must always be either the ordinary word for the thing, or a strange word, or a metaphor, or an ornamental word [*kosmos*]," Bollingen Series 71, vol. 2), as well as an easy usage of the plural (Plato, *Protagoras*, 322c2–3: "the principles of organization of cities [*poleôn kosmoi* (πόλεων κόσμοι)] and the bonds of friendship").

Does the much praised beauty of the Greek world hang from this: that the *kosmos* always also involves the aesthetic?

Kirk, G. S., J. E. Raven, and M. Schofield. *The Presocratic Philosophers: A Critical History with a Selection of Texts*. 2nd ed. Cambridge: Cambridge University Press, 1984.

"The 'world,' in the pejorative sense, flows in again unceasingly to the very midst of these islands which have been won from its expanse of miry waters" (Lubac, *Catholicism*, 272).

Once on this theological trajectory, *mundus* in the patristic and subsequent scholastic Latin will still designate a "totality," but the totality "of creation," the *ens creatum* that is thus distinct from God. In the modern era it is especially between Leibniz and Kant that the very concept of "world" will be defined. There is a branching out and differentiation of the concept in the overlap of languages (Latin, German, French).

III. World and Universe

■ See Box 2.

Leibniz's classical definition of the "world" does not admit of a plural form, according to the explicit terms of article 8 of the *Theodicy*:

2

"Whole" and "ensemble": *Pan* open / *holon* closed

➤ *IDENTITY*, UNIVERSALS

Ancient Greek has two main ways of saying the "whole": the adjective *pas* [πᾶς] and the noun *to pan* [τὸ πᾶν], or the adjective *holos* [ὅλος] and the noun *to holon* [τὸ ὅλον]. The difference is all the more difficult to grasp as it cannot be mapped onto the Latin distinction between *omnis* and *totos*. The word *holos* is basically to *pas* what *omnis* is to *totus* (RT: *Dictionnaire étymologique de la langue grecque*, see "*Holos*"), except for the fact, noted in even the most elementary grammars and indicated in the dictionaries as well, that "[πᾶς] *pas*, whole, each, corresponds to *omnis* and *totus*, while [ὅλος] *holos*, entire, only corresponds to *totus*" (Ragon, 39). Word order further complicates the semantics, since *pasa polis* [πᾶσα πόλις] is supposed to mean "any city," while *pasa hê polis* [πᾶσα ἡ πόλις] means "the whole city," and *hê pasa polis* [ἡ πᾶσα πόλις] "the city as a whole" (Fr. *l'ensemble de la ville*). In addition, there is an intensive form *hapas* [ἅπας], "the whole, completely," pl. *hapantes* [ἅπαντες], "all without exception, all together." Thus the LSJ (RT: LSJ) gives three ways of understanding *pas*, the collective pronoun: "when used of a number, *all*; when used of one only, *the whole*; of the several persons in a number, *every*." But the second translation holds equally for *holos*: "whole, entire, complete in all its parts" (LSJ, s.v. "*Holos*"). So how can one make the precise distinction between *to pan* and *to holon*?

Etymology gives an indication of the specificity of *to holon*, better rendered in English by "the whole" than by the French *totalité* or *ensemble*: *holos* is identical to the Sanskrit *sárva-*, "complete, intact," from which the Latin adjective *salvus* ("well, safe, unhurt") derives (cf. also the greeting *salve*, and the French *salut*) and which is also no doubt the source for "whole" and "holy" (Fr. *saint*), as well as "hale and healthy" (Fr. *sain*). *Holon* designates the whole as something more than the sum of its parts. Socrates takes the syllable *hê sullabê* [ἡ συλλαβή] (literally "com-position," or "com-prehension," or even "con-cept") as an example to illustrate the difference between *to holon*, ensemble rather

than totality, and *to pan*, the sum of the two elements S and O:

> Socrates: Or would you say that a whole [*to holon*], although formed out of the parts, is a single notion different from all the parts [*ek tôn merôn gegonos hen ti eidos heteron tôn pantôn merôn* (ἐκ τῶν μερῶν γεγονὸς ἕν τι εἶδος ἕτερον τῶν πάντων μερῶν)]?
>
> Theaetetus: Yes, that is what I should say.
>
> Socrates: And would you say that all and the whole [*to holon tou pantos* (τὸ ὅλον τοῦ παντός)] are the same, or different?
>
> (Plato, *Theaetetus*, 204a–b, trans. Benjamin Jowett)

We cannot help observing that this passage is immediately and irresistibly complicated by the play of the plural *ta panta kai to pan esth' hoti diapherei?* [τὰ πάντα καὶ τὸ πᾶν ἔσθ' ὅτι διαφέρει], "Or would you say that a whole, although formed out of the parts, is a single notion different from all the parts?" [Fr. trans.: Diès: "*la totalité et la somme*"; Narcy: "*l'ensemble et le total*"] as well as by the intensive form "then in predicating the word 'all' of things measured by number we predicate at the same time a singular and a plural? [*to te pan kai ta hapanta* [(τὸ τε πᾶν καὶ τὰ ἅπαντα)]," 204d [Diès: "*la somme et la totalité*"; Narcy: "*le total et l'ensemble au complet*"]. Where French is concerned I would propose keeping the relation among the singular *pan* "*tout*," the plural *panta* "*total*" of the parts, and the plural *hapanta*, "*totalité*" or "*totalisation*" of the parts.

Aristotle takes up the example of the syllable, as opposed to the "heap" (*sôros* [σωρός]) to explain what makes the unity of a composite; what Socrates referred to as the *eidos* [εἶδος], as opposed to the letters that make up matter (*hulê* [ὕλη]), "causes the fact that it is a syllable" (*aition . . . tou einai . . . todi de sullabên* [αἴτιον . . . τοῦ εἶναι . . . τοδὶ δὲ συλλαβήν]), (see TO TI ÊN EINAI). Aristotle calls *ousia* [οὐσία], "essence," which is to say *phusis* [φύσις], "nature" ("their substance would seem to be this nature, which is not

an element but a principle "(*hautê hê phusis ousia, hê estin ou stoicheion all' archê* [αὕτη ἡ φύσις οὐσία, ἥ ἐστιν οὐ στοιχεῖον ἀλλ' ἀρχή]) (*Metaphysics*, Z, 1041b25–32; see NATURE, PRINCIPLE). And he chooses to call *to sunolon* [τὸ σύνολον] what is usually understood as the "concrete thing" (or "complete substance," *LSJ*), the "formula taken with the matter" (or *eidos* with the *hulê*, *LSJ*), but which properly refers to the concrete "individual," Socrates himself or Callias, constituted by "the indwelling form" of what he refers to elsewhere as *ousia prôtê* [οὐσία πρώτη] or "primary substance (or essence)" (cf. Z, 11, 1037a29–33, *hê sunolê ousia* [ἡ συνόλη οὐσία]; see ESSENCE III.A.1 and SUBJECT, Box 1). Chapter 26 of book Δ very succinctly specifies the difference between *pan* and *holon*, for finite quantities that have a beginning, middle, and end: "those to which the position does not make a difference are called totals (*pan*), and those to which it does, wholes (*holon*)." Some things can be both wholes and totals, for instance, wax or a coat. "These are the things whose nature [*phusis*] remains the same after transposition, but whose form [*morphê* (μορφή)] does not" (ibid., 1024a3–6). But it is clearly the joining of body and soul, or that whole that is the body, which is holistic par excellence. (When a "part," such as a foot or hand, is removed, it is mutilated and no longer itself; they are "organs" only as homonyms: *Politics*, A, 2, 1253a20–21; cf. for example *De partibus animalium*, 645b14–17). We can see how the difference of *pan/holon* refers to the constitution of unity and of unicity, juxtaposition/organicity, and thus determines a powerful and lasting ontological modulation (cf. for example its application to *Dasein* in Martin Heidegger's *Sein und Zeit*, Niemeyer, §648, 244 and note 3).

The primacy and status of the *holon* is tied to the superiority of the finite over the infinite, of the closed over the open. With Parmenides (his being is *houlon* [οὖλον], "whole," and *tetelesmenon* [τετελεσμένον], "finished, completed," VIII, 38 and 42), but in

(continued)

(continued)

opposition to Anixamander, Atomism, and later Epicurus, Aristotle shapes an entire "classical" Greek tradition: the infinite *to apeiron* [τὸ ἄπειϱον] "turns out to be the contrary of what it is said to be. It is not what has nothing outside it that is infinite, but what always has something outside it" (*Physics*, 6, 206b34–35, trans. R. P. Hardie and R. K. Gaye). The infinite is linked to matter, to privation, to the absence of *telos* [τέλος], to *dunamis* [δύναμις] (see FORCE and PRAXIS), and by definition it can neither be measured or known. The prevalence of the whole and holistic can function in every domain. In aesthetics, for example, it is of necessity the rule, and it is beautiful that tragedy represents a *holê praxis* [ὅλη πϱᾶξις], an action that is complete of itself, with a beginning, middle, and end that is of a length that can be held in the memory (*Poetics,* 7). In logic it meets up with the problem of the "universal," *to katholou* [τὸ ϰαθόλου] (which prior to Aristotle was no doubt written *kath' holou* [ϰαθ' ὅλου], "on the whole" [RT: *LSJ*], "*d'ensemble*" [RT: *Dictionnaire grec français*]), which could be articulated analytically with *kath' hekaston* [ϰαθ' ἕϰαστον], "the particular," one by one, according to the distributivity of *pan* (cf. *Metaphysics*, Δ, 26, beginning; see UNIVERSALS), but which, unlike the latter, defines all objects of science. In politics we can see a strong dividing line separating

Platonism and Aristotelianism: the Platonic city is a *holon*, a hierarchical organism completely oriented toward a single goal, whereas democracy for Aristotle is a *pan* and even a *pantes hoi Athênaioi* [πάντες οἱ Ἀθηναῖοι], "all Athenians," in other words, a mass and mixture of citizens (cf. B. Cassin, "De l'organisme au pique-nique"; see POLIS).

But it is clearly in cosmology that this difference is thematized most powerfully, as in its original domain. The Stoics, who insisted so strongly on the organic and systematic, make it into a difference of doctrine: *to holon* designates the *kosmos*, the "world," while *to pan* designates both the world and the incorporeal emptiness that surrounds it, which it requires in order to dilate ("the whole [*pan*] is different from the universe [*holon*] for the Stoics. They call the "universe" the world [*holon men . . . ton kosmon* (ὅλον μὲν . . . τὸν ϰόσμον)], and "whole" the world with the void [*pan de meta tou kenou* (πᾶν δὲ μετὰ τοῦ ϰενοῦ)], RT: *SVF*, II, 523, cf. Goldschmidt, *Le système*, 27–28). Thus *to holon* is to be rendered as "the universe" (*universus*, literally "turned as a whole toward"): the choice of term is understandable. It lays emphasis on the unity of a common goal (see already, in Aristotle's *De caeolo*, the characterization of the *holon* and of the parts as "according to the prevailing element" [*eis to auto pheretai to holon kai to morion* (εἰς τὸ αὐτὸ φέϱεται τὸ ὅλον ϰαὶ τὸ μόϱιον)], A, 3, 270a4). But the intersections and crossings of traditions

through translation, via Cicero (*Timeaus*, 6, where *pan* is rendered as *universitas*; of *De natura deorum*, I, 120 [*de universitate rerum . . . in eodem universo*], II, 29–32 [*mundum universum*], for example), via Lucretius, and through translations of translations, leads to an utter terminological imbroglio: thus in Lucretius *omne*, the infinite whole, and *summa* are both rendered at random, sometimes within the same passage, as "whole" (or "Whole") or as "universe," "ensemble," "space," etc. (compare, for example, the French translations by A. Ernout and J. Kany-Turpin for I, 706, 951–984, or II, 1044–1096). Small wonder, then, that at the dawn of the modern era, given all the confusion and regroupings of the differences of *pan/holon*, the world would be closed and the universe infinite (A. Koyré).

I call "World" the whole succession and the whole agglomeration of all existent things, lest it be said that several worlds could have existed in different times and different places. For they must needs be reckoned all together as one world or, if you will, as one Universe.

> (Leibniz, *Theodicy*, "Essays on the Justice of God and the Freedom of Man in the Origin of Evil," I, 8, 128)

Baumgarten defines it thus in Latin, in 1743:

Mundus (universum, pan [πᾶν]) est series (multitudo, totum) actualium finitorum, quœ non est pars alteris.

(The world [universe, *pan* (πᾶν)] is the series (multitude, whole) of actual areas that is not part of another [i.e., that is not in turn part of a larger whole].)

> (Baumgarten, *Metaphysica,* II, §354)

And Christian August Crusius, two years later, in German:

Eine *Welt* heißt eine solch reale Verknüpfung endlicher Dinge, welche nicht selbst wiederum ein Teil von einer andern ist, zu welcher sie vermittelst einer realen Verknüpfung gehörte.

(A *world* is a real connection of finite things, which itself is not part of another in turn, which it would belong to through any real connection.)

> (Crusius, *Entwurf der notwendigen Vernunft*, §350)

Mundus will come to be defined as "*totum quod non est pars,*" "a whole which is not a part [in turn]," as in *Sectio I*, entitled "*De notione mundi generatim*" (Of the notion of world in general) of Kant's *Dissertation* of 1770:

In compositio substantiali, quemodium Analysis non terminatur, nisi parte quœ non est totum, h.e. SIMPLICI: ita Synthesis non nisi toto quod non est pars.

(As the analysis of a substantial composite terminates only in a part which is not a whole, that is, in a *simple part*, so synthesis terminates only in a whole which is not a part, that is, the *world.*)

> (Kant, *Dissertation,* section I, §1)

In section two of the same *Dissertation*, Kant enumerates the three "moments" that constitute the "world": *material, forma, universitas* (universality); this last defined as "*omnitudo compartium absoluta,*" "the *absolute* totality of companion

parts" (translated by Eckoff as "absolute allness of the appertaining parts"), which is, according to a celebrated formula, "the crucial test of philosophers":

> Nam statuum universi in *æternum* sibi succedentium *numquam absolvenda series*, quomodo redigi possit in *Totum*, omnes omnino vicissitudines comprehendens, agere concipi potest.

> (For it is scarce conceivable how the inexhaustible series of the state of the universe succeeding one another eternally be reducible to a whole comprehending all changes whatsoever.)

> (Ibid., §2)

The fact that the "crucial" difficulty inherent in the concept of "world" thus defined lies in the third constitutive moment, which is the *universitas*, indicates that the problem of the "world" is none other than the problem of the *universe*, with whom it becomes henceforth confused—the "entire universe" (Leibniz), or "that continuous vicissitude which produces the beauty of the universe" (Malebranche, *Éclaircissements,* 3: 218; *Élucidations,* 665). In other words, the problem has less to do with the "world" and more to do with the *universitas mundi*—at least for the Latin author, Immanuel Kant.

IV. The German Adventures of "World"

The same does not hold true of Kant the German author, who in positing the equivalence of anthropology (or *Menschenkunde*) and *Weltkenntnis*, "knowledge of the world," draws out the existential meaning of *Welt* from German phraseology, which, unlike Latin, was his mother tongue. (We might also note the old French *toz li mon* in Commynes, in modern French *tout le monde,* "everyone," or the Creole *timoun* ["little world," "child(ren)"]; beginning in the sixteenth century *du monde* signifies "people" [Fr. *des gens*], and *kosmos* has the same meaning in modern Greek.)

> Noch sind die Ausdrücke: die Welt *kennen* und Welt *haben* in ihrer Bedeutung ziemlich weit auseinander: indem der Eine nur das Spiel *versteht,* dem er zugesehen hat, der Andere aber *mitgespielt* hat.

> (In addition, the expression "to *know*" the world and "to *have* the world" are rather far from each other in their meaning, since one only *understands* the play that one has watched, while the other has *participated* in it.)

> (Kant, *Anthropology*, 4)

Michel Foucault translates the passage into French as follows:

> Encore ces deux expressions: *connaître* le monde et *avoir* du monde sont-elles, quant à leur signification, passablement éloignées l'une de l'autre vu que dans un cas on ne fait que *comprendre* le jeu auquel on a assisté, tandis que dans l'autre on a *joué le jeu.*

> (Kant, *Anthropologie,* Preface, in *AK,* 8: 120,
> Fr. trans. Foucault (modified), 11–12)

The translation of this passage into English poses particular difficulty. On one hand we are dealing with the thorny issue of idiomatic anachronism—does one say *Welt haben* in contemporary German with the same meaning that Kant had implied in the late eighteenth century? Does one ever say "having the world" in English, especially when it is being contrasted with "knowing the world"?—and on the other hand we are faced with an additional maneuver of translation (the Foucault), which has inadvertently complicated the thrust of the original. To parse this out, we can start with Kant's German. Kant's equivocation of anthropology (*Menschenkunde*) and world-knowledge (*Weltkenntnis*) places "knowing the world" (*Welt kennen*) squarely in opposition to the notion of "having the world" (*Welt haben*). As Kant subsequently makes clear, having the world requires an active engagement—one who has the world has played within it (*gespielt*)—while knowing the world is a separate form of passive engagement, perhaps akin to the attentive remove of ethnographic fieldwork, wherein the observer is attuned to the play of the natives without directly affecting their behavior. Thus, a basic dichotomy emerges, from which we can formulate a sense of Kant's implied meaning. Here, *Welt kennen* is the analytic mode of the dispassionate, academic observer, the one who does not enter into the action of the world but merely comprehends it as it plays out—who knows the world insofar as he or she would approach it, as from a distance, as critical object. *Welt haben*, by contrast, is an affair of contact and action. Like a certain *Dasein* in motion, to have the world is to engage with its sensorial splendor, to be materially involved in its goings-on, getting caught up in the mucky bits—being a body interacting with other bodies.

In this sense the contemporary French expression "*avoir du monde*" gains both philosophical ballast and justification in Foucault's translation. One uses the expression to denote a flood of people in one place, a surfeit of bodily contact; on the dance floor, at the parade, or in the train station at rush hour, *il y a du monde.* In such instances to inhabit the space of the real is manifestly to have contact with other bodies, to be pushed along among them, to be caught up in play. Thus, Foucault's casual shift from German's formal "*die Welt*" to French's partitive contraction "*du monde*" privileges the tangible and corporeal aspects of the experience of "having the world." And yet, his rendering of the opposite term seems to contribute to a new confusion. *Welt kennen* has become *connaître le monde*, obvious given the denotative equivalency of the two verbs, but slippery in their unequal connotations. In the literary French of the nineteenth century, "knowing the world" implies sexual experience, a certain fleshy materialism underfoot. This seems a far cry from Kant's anthropology, at a cold remove from carnal commerce. With this rendering Foucault inadvertently confounds the two modes. When he states that one mode has merely "understood the game" while the other has *joué le jeu*, it becomes difficult to separate "knowing" the world from "having" it. For as these notions are presented here, "knowing the world," the way, say, a dashing Flaubertian protagonist might, involves a fair amount of both knowledge and play. This encoded possibility of prior knowledge acquired through experience exceeds the binary initially established by Kant between aloof

comprehension alone and comprehension achieved in the moment through the added level of physical involvement. Has Foucault blurred this separation deliberately? Likely no, but he has provided a great occasion for considering the troublesome density of connotation added to the signifier awaiting translation.

Thus, as we reflect on how to accurately render these terms in English, we should look beyond the French elaboration of *Welt kennen* and return to the messy world of bodies and crowds that helps to make *avoir du monde* such an evocative stand-in for *Welt haben.* We seek a term that simultaneously indicates play, presence, and embodiment. Heidegger achieved this magisterially, with all of the permutations of *Dasein*, but what is a translator of Kant to do? Can one mash up Kant and Heidegger together?—in English, can one be in the world, and have it too?

In Kant's diglossia, *mundus* carries a primarily cosmological meaning (= *universitas mundi*), whereas *Welt* is more oriented toward an anthropological and existential sense (with man as a *Weltbürger*, "a citizen of the world")—the irony of the story lies in the fact that, as Kant himself observes, it is the *French usage* of *monde* (from the French used at court, in diplomacy, and in culture) that left its mark on the German *Welt*, which would in some sense adopt the same distance from that point on, from the Latin *mundus* up to its usage in scholastic French and the *monde* in the classical age of France.

> *Welt haben*, heißt Maximen haben und große Muster nachahmen. *Es kommt aus dem Französischen.*
>
> (*Having the world* means to have maxims and to imitate the great models. *It comes from the French.*)
>
> (Kowalevski, *Die philosophischen Hauptvorlesungen*, 71)

We will refrain from following Michel Foucault and Henry Corbin in translating *Welt haben* by "having the ways of the world" (Fr. *avoir les usages du monde*), since Kant himself has drawn our attention to the literal transfer of the French *avoir du monde* into the German *Welt haben* (for the equivalences of *avoir du monde*, *savoir son monde*, *savoir-vivre et se conduire dans le monde* ["how to behave in good society"], see RT: Littré, *Dictionnaire de la langue française*, 5: 372, esp. meaning 19 ["the society of men, or a part of this society"], which quotes Mme. de Sévigné, Molière, Saint-Simon, and Jean-Jacques Pauvert).

It is when "world" ceases to entail a totality, a role now taken on by the concept of "universe," that different "worlds" can be distinguished from one another and as ways of relating to this world:

> Mais de quoi jouissais-je enfin quand j'étais seul? de moi, de l'univers entier, de tout ce qui est, de tout ce qui peut être, de tout ce qu'a de beau le monde sensible, et d'imaginable le monde intellectuel.
>
> (But what did I enjoy in the end when I was alone? Myself, the entire universe, everything that is, everything that can be, everything beautiful about the sensible world, everything imaginable about the intellectual world.)
>
> (Rousseau, *Troisième Lettre à M. de Malesherbes*, quoted in RT: *Dictionnaire de la langue française*, meaning 3 [the physical world, the sensible world])

The plural form of the world is not without consequence for the very meaning of the concept of the world, which can no longer be defined as *universitas mundi* in the light of the plurality of worlds, even if only possible or imaginary worlds (Leibniz, Fontenelle). Only "knowing the world," "*die Welt kennen*," is to refuse to become involved, to draw back and look upon something transformed into a spectacle, a scene that one can withdraw from at will, according to the Baroque topos (Shakespeare, Corneille) of the world as theater—right up to Descartes: "*ego, hoc mundi theatrum conscencurus, in quo hactenus spectator ex-stiti* [as for me, I was getting ready to mount that world stage of which I had previously only been a spectator]" (*Cogitationes privatae,* 10: 212).

Whence comes the distinction that will be established in the *Critique of Pure Reason* (A840–B868) between philosophy according to the *Schulbegriff = in sensu scolastico,* or scholastic concept intended for certain arbitrary ends, and philosophy according to the *Weltbegriff = in sensu cosmico*, that is, "what is necessarily of interest to each and everybody."

V. "Welt" and "Welten": From the Noun to the Verb (Heidegger)

In Kant the discussion of *Welt* starts out from the French *monde* in its anthropological sense, and hence from the Latin *mundus*, especially in its Augustinian usage, and thus invites us to work our way back to the meaning of *kosmos* in the New Testament (especially John). This is the source of the equivalence posed or supposed by Heidegger, who proceeds in this connection to underscore the differences between the Greek *kosmos* in the Hellenistic sense, the Latin *mundus*, and the German *Welt*:

> Liegt das metaphysisch Wesentliche der mehr oder minder klar abgehobenen Bedeutung von κόσμος, *mundus*, *Welt* darin, daß sie auf die Auslegung des menschlichen Daseins *in seinem Bezug zum Seienden im Ganzen* abzielt.
>
> (Rather, what is metaphysically essential in the more or less clearly highlighted meaning of kosmos, *mundus,* world, lies in the fact that it is directed toward an interpretation of human existence [*Dasein*] *in its relation to beings as a whole.*)
>
> (Heidegger, "On the Essence of Ground," in *Pathmarks*, 121)

In the same text Heidegger will nonetheless adopt an unusual approach to the specificity of *Welt* and its connotations, and he prepares the reader through the discreet assonance of *walten/welten* ("to rule" / "to world")—i.e., to be deployed in the measure of a world [Fr. *se deployer à mesure d'un monde*]). "*Welt* ist *nie, sondern* weltet [World never *is*, but *worlds*]" (ibid., 126); Fr. "*le monde n'*est *jamais, le monde* se mondifie" (Fr. trans. H. Corbin, ibid., 142). The French comes close to Nerval (*Œuvres complètes*, Gallimard, "La Pléiade," 2: 848): "*Le monde amonde.*"

It was in fact in 1919 that Heidegger first took the risk of expressing *welten*, which in some way turns *Welt* into an un-word (Fr: *déverbal*).

3

Umwelt: From ecology to the commerce of being

Popularized by ecology in the sense of "environment" (through the contrast between the terms of *Umweltschutz/Umweltschmut-zung*: "environmental protection," "pollution"), *Umwelt* appears around 1800 in an ode of Baggasen, is then taken up by Campe (1811), and is borrowed from the German and transposed into the Danish *omverden* by Dahlerup

(1822); but it is Goethe's usage that sanctions the entry and adoption of the term in the German language. At that point its meaning is given as "*die den Menschen umgebende Welt* [the world around mankind]" (*Grimm,* s.v.): the prefix *um*, like the Latin *circum* or French *autour,* gives *Umwelt* the meaning of *umgebende Welt*, the world "around" (us).

But with Heidegger the prefix *um-* will take on intentional significance, in the locution *um zu*, "in order to," and will displace the meaningfulness of the world, insofar as we are "in cahoots" with it, into our daily commerce with being.

Outside of a specifically philosophical context, the term *Umwelt* can be taken up in German by the use of the French word *milieu*.

4

"Planetarity"

"Planetarity," as an English word, was first used in a paper I presented at Stiftung-Dialogik in Zurich, December 16, 1997, entitled "Imperatives to Re-Imagine the Planet," and later printed as *Imperatives to Re-Imagine the Planet/Imperative zur Neuerfindung des Planeten,* ed. Willi Goetschel, Vienna: Passagen, 1999. "Planetarity" was figured as a word set apart from notions of the planetary, the planet, the earth, the world, the globe, globalization, and the like in their common usage.

The untranslatability of "planetarity" rests on an old-fashioned argument. If we think dogmatically (to borrow Immanuel Kant's phrasing on the "dogmatic," in English translation) of "planetarity" as contained under another, prior concept of the object (the "planet"), which constitutes a principle of reason, and then determine it in conformity with this, we come up with contemporary planet-talk by way of environmentalism, referring usually, though not invariably, to an undivided "natural" space rather than a differentiated political space. This smoothly "translates" into the interest of globalization in the mode of the abstract as such. This environmental planet-speak is the planet as an alternate description of the globe, susceptible to nation-state geo-politics. It can accommodate the good policy of saving the resources of the planet.

My use of "planetarity," on the other hand, does not refer to any applicable methodology. It is different from a sense of being the custodians of our very own planet, although I have no objection to such a sense of accountability. (For that custodial sense a good epistemological preparation can be undertaken by way of Isabelle Stengers's *Cosmopolitics.*)

The sense of custodianship of our planet has led to a species of feudality without feudalism coupled with the method of "sustainability," keeping geology safe for good

imperialism, emphasizing capital's social productivity but not its irreducible subalternizing tendency. This is what translates and provides the alibi for *good* global capitalism.

On a different scale, Richard Dawkins–style DNA-ism is an attempt to translate planet-thought digitally. But "planetary" is bigger than "geological," where random means nothing, which no individual thought can weigh: "living organisms exist for the benefit of DNA rather than the other way around. . . . The messages that DNA molecules contain are all but eternal when seen against the time scale of individual lifetimes. The lifetimes of DNA messages (give or take a few mutations) are measured in units ranging from millions of years to hundreds of millions of years; or, in other words, ranging from 10,000 individual lifetimes to a trillion individual lifetimes. Each individual organism should be seen as a temporary vehicle, in which DNA messages spend a tiny fraction of their geological lifetimes" (Dawkins, *Blind Watchmaker*, 127). This, too, is a "dogmatic" thinking of planetarity.

If we think critically—via Kant again—only in reference to our cognitive faculties and consequently bound to the subjective conditions of envisioning planetarity, without undertaking to decide anything about its object, we discover that planetarity is not susceptible to the subject's grasp (see BEGRIFF). "The planet," I said in the original paper, "is in the species of *alterity*." I was iterating the older expression "in the species of eternity"—*sub specie aeternitatis*. The globe is on our computers. No one lives there. The "global" notion allows us to think that we can aim to control globality. The planet is in the species of alterity, belonging to another system; and yet we inhabit it, on loan. It is not really amenable to a neat contrast with the globe. I cannot say "the planet, on the other hand." When I invoke the planet,

I think of the effort required to figure the (im)possibility of this underived intuition. Since to be human may be to be intended toward the other, we provide for ourselves transcendental figurations ("translations?") of what we think is the origin of the animating gift of life: Mother, Nation, God, Nature. These are names (nicknames, putative synonyms) of alterity, some more radical than others.

If we think planet-thought in this mode of alterity, the thinking opens up to embrace an inexhaustible taxonomy of such names, including but not identical with the whole range of human universals: aboriginal animism as well as the spectral white mythology of postrational science. If we imagine ourselves as planetary subjects rather than global agents, planetary creatures rather than global entities, alterity remains underived from us; it is not our dialectical negation, it contains us as much as it flings us away—and thus to think of it is already to transgress, for, in spite of our forays into what we render through metaphor, differently, as outer and inner space, it remains that what is above and beyond our own reach is not continuous with us as it is not, indeed, specifically discontinuous.

We must persistently educate ourselves into the peculiar mindset of accepting the untranslatable, even as we are programmed to transgress that mindset by "translating" it into the mode of "acceptance."

Gayatri Chakravorty Spivak

BIBLIOGRAPHY

Dawkins, Richard. *The Blind Watchmaker*. New York: Norton, 1986.
Stengers, Isabelle. *Cosmopolitics*. Translated by Robert Bonono. Minneapolis: University of Minnesota Press, 2010.

In einer Umwelt lebend, bedeutet es mir überall und immer, es ist alles welthaft, "*es weltet*," was nicht zusammenfällt mit dem "*es wertet*."

(Living in an environment, it signifies to me everywhere and always, everything has the character of a world. It is everywhere the case that "*it worlds*" [*es weltet*], which is something different from "it values" [*es wertet*].)

(Heidegger, War Emergency Semester 1919, in *Definition of Philosophy, 58*)

As F.-W. von Herrman has noted (*Hermeneutik*, 43), *welten* is not properly speaking a neologism first used by Heidegger, for the verb, although no longer used, signified "leading the good life." Heidegger has thus not coined it but reinterpreted the verb and given it a much broader signification.

With *Being and Time*, *Welt*, "world," will become an existential, that is to say, an ontological structure of human existence. This is both a radicalization of the "anthropological" sense of the word (even though existential analysis would not consider itself to be a form of anthropology), such as it emerges in the New Testament and is separated out by Kant, and an emancipation of the concept of "world" in relation to that of "universe" as well. In a course from 1929/1930 (Heidegger, *Gesamtausgabe*, 29–30: §42, 261ff.), the stone is called *weltlos*, "without a world," the animal is *weltarm*, "poorly endowed with world," and the human being is *weltbildend*, "world image-making."

WELTANSCHAUUNG (GERMAN)

ENGLISH	worldview
FRENCH	*vision du monde, conception du monde*

➤ *WORLD* and AIÔN, ANSCHAULICHKEIT, *INTUITION*, LEIB, PERCEPTION, REPRÉSENTATION

The fact that *Weltanschauung* (Eng. "worldview," Fr. *vision du monde*) sometimes appears in untranslated form in French philosophical prose (as in Sartre's *L'Être et le néant* [Being and nothingness]) is an indication of this composite term's resistance to translation. The paternity of the term is sometimes attributed to Schelling ("Schelling, who was the first to coin the term *Weltanschauung*," Tilliette, *Schelling*, 1: 492) or to A. von Humboldt ("It seems that it was A. von Humboldt who . . . coined the term *Weltanschauung*," Brague, *La Sagesse du monde*, 294n76). Although these attributions are erroneous, they are nonetheless instructive, for they attest to the various uses of the term that range from the intuition of the world to its interpretation.

In actual fact it would seem to have been Kant himself who first proposed the term *Weltanschauung* in §26 of the *Critique of Judgment*:

Denn nur durch dieses [*Vermögen*] und dessen Idee eines Noumenons, welches selbst keine Anschauung verstattet, aber doch der Weltanschauung, *als bloßer Erscheinung*, zum Substrat untergelegt wird.

(For it is only through this faculty and its idea of a noumenon, which latter, while not itself admitting of any intuition, is yet introduced as a substrate underlying the intuition of the world as mere phenomenon.)

(Kant, *Critique of Judgment*, 103)

(En effet c'est seulement par cette faculté et son idée d'un noumène, qui lui-même n'autorise aucune intuition, mais qui est toutefois en tant que substrat mis au fondement de *l'intuition du monde* [*Weltanschauung*] comme simple phénomène.)

(Fr. trans. A. Philonenko, 94; Fr. trans. J. Gibelin, 87)

In the French translations, as in the English ones by Meredith and J. H. Bernard (Hafner Library of Classics), the translators balked at translating *Weltanschauung* as, respectively, *vision du monde* or "world view."

The translation problem is complicated by the fact that in Kant's writings *Weltanschauung* does not necessarily have the meanings that it will subsequently assume in the philosophical literature. In his Marburg lectures from the spring of 1927, Heidegger undertook a preliminary reconstruction of the history of the term:

This expression is not a translation from Greek, say, or Latin. There is no such expression as *kosmotheôria* [κοσμοθεωρία]. The word "*Weltanschauung*" is of *specifically German coinage* (italics added); it was in fact coined within philosophy [*das Wort ist eine spezifisch deutsche Prägung und zwar wurde es innerhalb der Philosophie geprägt*]. It first turns up in its natural meaning in Kant's *Critique of Judgment*—world-intuition in the sense of contemplation of the world given to the senses or, as Kant says, the *mundus sensibilis*. . . . Goethe and Alexander von Humboldt thereupon use the word this way. This usage dies out in the thirties of the last century under the influence of a new meaning given to the expression "*Weltanschauung*" by the Romantics and principally by Schelling. . . . Thus the word approaches the meaning we are familiar with today, a self-realized, productive as well as conscious way of apprehending and interpreting the universe of beings [*einer selbsvollzogenen, produktiven und dann auch bewußten Weise, das All des Seienden aufzufassen und zu deuten*].

(Heidegger, *The Basic Problems of Phenomenology*, trans., intro., and lexicon by Albert Hofstadter, §2, 4–5 [with modifications])

Actually, one does indeed come across the term *kosmothêoria* [κοσμοθεωρία] but in *modern* Greek—and this as a translation or transposition of *Weltanschauung*! Heidegger goes on to describe the salient outlines of the semantic trajectory of *Weltanschauung* through a series of references: Hegel, Görres, Ranke, Schleiermacher, Bismarck, and finally Jaspers. In a lecture course given in 1936, Heidegger notes the extent to which the waning and deracination of the term has turned it into a slogan of the utmost platitude, even though it derived from the heights of German Idealism:

Es wird hier die "Weltanschauung" des Schweinezüchters zum maßgebenden Typus der Weltanschauung überhaupt gemacht.

(The world vision of the pig farmer has become the type and measure of the world vision altogether.)

(Heidegger, *Schelling's Treatise*)

An annotation (j) on the same page specifies in reference to *Weltanschauung*: "*Das Wort ist nicht übersetzbar* [the term is untranslatable]." After 1936 Heidegger would engage in a ferocious critique of the confusion, abetted by the phraseology of the Third Reich, between philosophy and *Weltanschauung*, reserving the latter for what it had become: an ideology. The semantic trajectory of *Weltanschauung* goes from an intuition of the world (the universe) to an ideology. Victor Klemperer provides further testimony in his study of the *Lingua Tertii Imperii*:

"Philosophie" . . . wird totgeschwiegen, wird durchgängig ersetzt durch "Weltanschauung." . . . "Weltanschauung" schon vor dem Nazismus verbreitet, hat in der LTI als Ersatzwort für "Philosophie" alle Sonntäglichkeit verloren und Alltags—, Metierklang bekommen.

(As a substitute for philosophy, the word "*Weltanschauung*," already prevalent before National Socialism, lost its solemnity and acquired an everyday, business-like ring.)

(Klemperer, *Language*)

WERT / GELTUNG (GERMAN)

ENGLISH	worth, value
FRENCH	*valeur, validité*
LATIN	*valere*

➤ *VALUE* and DUTY, ECONOMY, ES GIBT, MACHT, MORALS, SOLLEN, UTILITY, *VIRTUE*, WILLKÜR

Wert traces back to the Latin *valere* as do the etymologically related English terms "worth" and "value," the French *valeur*, and the German *Gewalt*. Its substantive form derives from the adjective *wert*, itself close to the verbs *werdan* and *werden* (to become), placing *Wert* in the semantic orbit of the ought-to-be (cf. SOLLEN). *Gelten* comes from the Gothic and Old High German *geltan* (which means

"to pay tribute, to offer up as sacrifice"), as does *Geld* (money, cash; cf. gold, Fr. *l'or*). "*Es hat keinen Wert*" (it is of no value) refers back to a quality that is specific (or given) to the object being evaluated, while "*es gilt nicht*" signifies, for example, that a particular move in a game "does not count" or breaks the rules. Likewise the adjective *geltend* is used to describe legal tender or what is in effect (an act of jurisprudence, or a currency). *Geltung* can also signify the accepted use of a term or sign within a system of signification, and this "value" can also be given *Gültigkeit*, a pertinence or validity. The three terms *Wert*, *Geltung/Gelten*, and *Gültigkeit*, in their separate articulations, bring reflections on moral values into contact with ontology and the doctrine of judgment, in a configuration without equivalent in other languages.

In his polemical essay "Die Tyrannei der Werte" (The tyranny of values) Carl Schmitt considers the "philosophy of values" to be a "reaction to the crisis of nihilism of the nineteenth century" (46). This may well be the right dating and an accurate characterization of a reaction to the spread of positivism, but it does not address the philosophical reflection on value in a larger sense that entailed the problematization of *Wert* as critique of morality (even an axiology), as well as an analysis of what constitutes the validity (*Geltung, Gültigkeit*) of judgments in the form of a logical reflection. Schmitt sums up the essentials of the relation among *Wert, Geltung*, and *Gelten* in a way that is not without pertinence to philosophy, even if it falls short of qualifying as a truly philosophical definition: *Geltung* is the actualization of value (*Wert*), while *Gelten* is the process by which a value acquires its validity (52).

I. Nietzsche: The Evaluation of Values (*Werte*) and Their Validity (*Geltung*)

It was undoubtedly Nietzsche who introduced from the perspective of a critique of traditional morality and its foundations an incisive radicalization of the Kantian reflection on the limits of our instruments of knowledge. By reducing the entire rational process to a story in which one set of values replaces another, he implicitly stressed the importance of value:

> Skepticism regarding all moral values is a symptom of the fact that a new table of values [*Werttafel*] is in the process of emerging.
>
> (Die Skepsis an allen moralischen Werthen ist ein Symptom davon, daß eine neue moralische Werthtafel im Entstehen ist.)
>
> (Nietzsche, *Posthumous Fragments*, VIII 4 [56], Nov. 1882–Feb. 1883)

Values are, in effect, presented here as configurations that crystallize the developments to which they are consistently reduced:

> Pleasure and displeasure are the oldest symptoms of all judgments of value [*Werturteile*].
>
> (Lust und Unlust sind die ältesten Symptome aller Werthurtheile: nicht aber Ursachen der Werthurtheile!)
>
> (Ibid., VIII 1 [97], Autumn 1885)

The judgments themselves should be referred to more fundamental activities:

> Moral evaluation [*moralische Wertschätzen*] is an *exegesis*, a way of interpreting. The exegesis itself is a symptom of certain physiological conditions, likewise of a particular spiritual level of prevalent judgments: Who interprets?—Our affects.
>
> (*The Will to Power*, §254 [1885–1886], 148)

Moral values, he argues, compared to physiological evaluations, are false, as is the "metaphysical postulate" that leads us to establish a correlation between levels of value and levels of reality. The highest levels are no truer; they are simply the most symptomatic: "Whatever has proven itself useful [*nützlich*] from time immemorial is good: as a result, it may assert its validity [*Geltung*] as 'of the highest value,' as 'valuable in itself' [*wertvoll*]" (*Genealogy of Morals*, 14, First Essay, §3 *in fine*). The "utility" in question is part of the general economy of the will to power, that is to say, the permanent struggle among different affects, each seeking its maximum outpouring and release. Each affect is always "judging," constantly "evaluating" what it will accept and what it will refuse. From the ensemble of these conflicts, the state of our "health" can be seen as the psychophysiological result whose evanescent equilibrium can give us the illusion of a stability that we call "self," "identity," "value," and "truth." The only "truth" that we can attain is a state of health (or sickness) that enables us to affirm (or deny) our personal interpretation of the dynamic of drives, then taken as foundational of thought and cultural patterns. Values are thus nothing other than symptoms. Every belief is an illusion whose ends have nothing to do with morality. The successive scales of value thus take the form of a spiral, ascending or descending, necessarily finite in possibility—the form of the eternal return. The life of the emotional drives is completely "intellectual" in as much as it consists only of evaluations; it has no "foundation" outside itself. Consequently, the "conversion of all values" (*Umwertung aller Werte*) is not a "subversion of values" (*Umwälzung*) that leads to an ultimate unalienated life; it is simply a segment of the spiral of the eternal return. The "truth" of values is valid only as a function of the greater or smaller levels of risk assumed by the person that grants them this validity: the "giving virtue" (*die schenkende Tugend*) of the creator (in whichever system) lays claim to superiority by being the only one capable of achieving a balance between destruction and creation. Nietzsche does not abandon the field of values; in fact he postulates that it is impossible to even hope to escape it. The axiological horizon—which is also that of the "body"—is the only one given to us.

II. Lotze: *Bestehen* and *Gelten*, *Geltung* and *Gültigkeit*

In his lecture course from the summer semester of 1919, *Phänomenologie und transzendentale Wertphilosophie* (Phenomenology and transcendental philosophy of value), Martin Heidegger credits Hermann Lotze with having reacted in the

1

Mehrwert

It is in *Capital* that Marx develops his theory of *Mehrwert*, or "surplus value" (the French expression *plus-value* is an Anglicization and was more precisely rendered as *survaleur* by Henri Lefebvre). Surplus labor (*surtravail*) is a given fact of any more or less developed civilization. In these societies it is simply a fact that work of any sort produces an excess that sustains persons other than the direct producers, as a kind of stocking of provisions. But the capitalist system of production was the first to make surplus labor into the direct source of profit. "Surplus value" is the result of the difference among the productive work time that reimburses fixed capital investment, raw materials, and salaries, and work time that produces pure and simple profit. This theory of "surplus value" leads to the conception according to which in a capitalist system use-value (*Gebrauchswert*) tends to give way to exchange-value (*Tauschwert*), as well as to the contested prediction of a "tendency to reduce the profit margin" engendered primarily by competition.

Marx, Karl. *Capital: A Critique of Political Economy*. 3 vols. Translated by Ben Fowkes. New York: Vintage Books, 1977.

middle of the nineteenth century against the "absolute reification of the spirit promoted by naturalism" and "the reduction of all Being to corporeal matter, objectified events, matter and force" (Heidegger, *Towards the Definition of Philosophy*, 106–7). "His ubiquitous idea of the ought [*des Sollens*] and of value, and along these lines his interpretation of the Platonic ideas, which *are* not but instead *hold*, i.e., are valid as valuable, had a strong effect on the further development of philosophy, in the sense of a move away from naturalism and especially from psychologism" (ibid., 107). Heidegger sees a decisive motif in the development of modern value-philosophy in Lotze's doctrine of the primacy of practical Reason according to Fichte's interpretation, as "value-sensing" (*wertempfindenen*) (ibid). In his great work of 1864, *Mikrokosmos* (part 3, 500 and 510), Lotze had already introduced an opposition between *Bestehen* (to exist in the sense of "maintaining constancy") and *Gelten* (to have value in the sense of needing to be taken into account). In his *Logik* Lotze proceeds to make the following distinctions:

> For we call a thing Real which is, in contradistinction to another which is not; an event Real which occurs or has occurred; a relation Real which obtains [*besteht*], as opposed to one which does not obtain; lastly we call a proposition Really true which holds or is valid [*gilt*] as opposed to one of which the validity [*Geltung*] is still doubtful.

<div align="right">(Lotze, Logic, bk. 3, §316, 207)</div>

Here *Gelten* and *Geltung* refer back to *Gültigkeit*, but the formal validity of a proposition does not necessarily entail its objective validity; to confuse *geltend* and *gültig* is reductive. The only effective reality of a proposition lies in the fact that it is valid and that its contrary is not. Likewise, our thoughts and representations, which are always in a perpetual becoming and not in a stable form of being, "arrive" and take place like events, and their content does not have effective being either but is "valid" (*gilt*). Thus there are three fundamental concepts, none of which can be reduced to something derived from one another: being, taking place, and holding or being valid. Worth is interpreted by Lotze in the manner

that Plato understood the ideas: a validity of truths that are eternally identical to themselves, independent of the existence of objects in the phenomenal world to confirm their relevance or of minds to think them. This intervention of Lotze's will have a significant impact on posterity, for example in the Austrian school: Meinong, for instance, will oppose (effective) being (*Sein*) and the "constancy" (*Bestehen*) of the habitual objects of knowledge (identity, difference, etc.). Lotze's theory will survive also in the neo-Kantianism of Baden under its normal appellation as "theory of the two worlds." This latter approach developed the consequences of Lotze's reinterpretation of the Platonic theory of ideas in all their breadth and complexity.

■ See Box 2.

III. Rickert: *Wert* and *Sollen*, the Primacy of Practical Reason

Taking his starting point in Windelband's reflections on negative judgment, Rickert shows that a factor that lies outside representation comes into play in any judgment: it is indeed impossible to judge without taking a position, either as an affirmation or as a rejection, on the established relation between a state of affairs and a predicate; thus "to know is to accept or reject" (*Der Gegenstand der Erkenntnis*, 58). Since what holds for judgment also holds more generally for the processes of knowing, what becomes primary is not the taking of a position in relation to a state of factual affairs but in relation to a value: for a fact does not require one to take a position; it can be simply accepted as such: "in all knowledge . . . it is a value [*Wert*] that is recognized" (ibid., 57ff.). And further, value is acknowledged as something psychologically given, a feeling that intervenes to such an extent that "in each judgment, I know at the instant of judging that I recognize something as eternally valid [*gilt*]" (ibid., 60). What is accorded "validity" (*Geltung*) can thus only be a value and not a being that I know only through the bias of representations. For it is according to their connections that I pronounce judgment and not on a being to which they refer. It is according to their connections that I accept or reject a value and this process in its turn is not raised by an objective necessity but by an ought-to-be (*Sollen*): "When I hear notes

2

Wertfreiheit

➤ UNDERSTANDING

The Weberian notion of "value-neutral" fact-finding has been translated into French as "axiological neutrality" (*neutralité axiologique*). (Julien Freund explained his position on the topic in his edition of Weber's essays devoted to the theory of science. Weber himself explained what he understood by the concept in "The Meaning of Value Neutrality in the Social and Economic Sciences" [*Der Sinn der "Wertfreiheit" der soziologischen und ökonomischen Wissenschaften*] (1917). In explicit reference to Rickert, Weber defends both the methodological utility of "axiological neutrality" and the problematics linked to values.

> Es sei daher nur daran erinnert, daß der Ausdruck "Wertbeziehung" lediglich die philosophische Deutung desjenigen spezifisch wissenschaftlichen "Interesses" meint, welches die Auslese und Formung des Objektes einer empirischen Untersuchung beherrscht. Innerhalb der empirischen Untersuchung werden durch diesen rein logischen Sachverhalt jedenfalls keinerlei "praktische Wertungen" legitimiert. Wohl aber ergibt jener Sachverhalt in Übereinstimmung mit der geschichtlichen Erfahrung, daß Kultur—und das heißt: Wertinteressen es sind, welche auch der rein empirisch-wissenschaftlichen Arbeit die Richtung weisen. Es ist nun klar, daß diese Wertinteressen durch Wertdiskussionen in ihrer Kasuistik sich entfalten können. Diese können dem wissenschaftlich, insbesondere dem historisch arbeitenden, Forscher vor allem die Aufgabe der "Wertinterpretation": für ihn eine höchst wichtige Vorarbeit seiner eigentlich empirischen Arbeit, weitgehend abnehmen oder doch erleichtern.
>
> (Weber, "Der Sinn der 'Wertfreiheit' der soziologischen und ökonomischen Wissenschaften"; *Gesammelte Aufsätze zur Wissenschaftslehre*. Hrsg. von Johannes Winckelmann. Tübingen 61985, S. 540)

(It should only be recalled that the expression "relevance to values" refers simply to the philosophical interpretation of that specifically scientific "interest" which determines the selection of a given subject-matter and the problems of empirical analysis. In empirical investigation, no "practical evaluations" are legitimated by this strictly logical fact. But together with historical experience, it shows that cultural (i.e., evaluative) interests give purely empirical scientific work its direction. It is now clear that these evaluative interests can be made more explicit and differentiated by the analysis of value-judgments. These considerably reduce, or at any rate lighten, the task of "value-interpretation"—an extremely important preparation of empirical work—for the scientific investigator and especially the historian.)

> (Weber, "The Meaning of 'Ethical Neutrality' in Sociology and Economics," in *Methodology of the Social Sciences*, 22)

Scientific work that respects value-neutrality consists in the rational understanding of the point of view that gives direction to the actions of such-and-such social group or such-and-such historical individual, without engaging in judgment on the ethical validity of the point of view. But Weber never defines what value is; he limits himself to giving synonyms (ideal, ethical rule, etc.). As for the essentials, he adheres to the distinction made by Rickert in his work *Science of Nature and Science of Culture* between explaining (*erklären*) (the causes of a natural phenomenon) and understanding (*verstehen*) (the motives behind a cultural and historical event, the reasons for a human action).

I must necessarily judge that I hear notes, which means that I am given an obligation [*ein Sollen*] along with the notes, that calls for an eventual judgment" (Wenn ich Töne höre, so bin ich genöthigt, so zu urteilen, sagt, dass mir den Tönen ein Sollen gegeben ist, das von einem eventuellen Urteil Zustimmung fordert und Zustimmung erhält) (ibid., 63). Thus, the truth of a judgment is not a quality that it possesses and that I should recognize, but a judgment that is true because I recognize a value in it.

> We should therefore take care to distinguish between, on the one hand, the specific content of the judgment which is independent from all statements and psychical processes, and which we thus can call the "transcendental" logical sense, alongside the objective good which it clings to, and on the other hand, the subjective act of taking a position, with its own "immanent"

meaning. The content of the judgment must be examined in relation to logic as well as in relation to the Form and its content. By "Form" we refer to the moment of validation [*Geltungsmoment*] in its conceptual isolation whereby content, itself logically indifferent, is elevated to the logical sphere and transformed for the first time into a logically valid [*gültig*] element of meaning.

(Wir müssen daher von dem eigentlichen Urteilsgehalt, der unabhängig von allen Sätzen und psychischen Vorgängen gilt, und den wir deshalb auch den "transzendenten" logischen Sinn nennen können, einerseits das objektive Gut, an dem er haftet, und andererseits den subjektiven Akt der Stellungnahme mit dem ihm "immanenten" Sinn sorgfältig scheiden. Der Urteilsgehalt ist von der Logik dann mit Rücksicht auf seine Form und seinen Inhalt zu

untersuchen, wobei wir unter "Form" das theoretische Geltungsmoment in seiner begrifflichen Isolierung verstehen, durch welches der für sich logisch indifferente Inhalt in die logische Sphäre gehoben, also zum logisch gültigen Sinngebilde erst gemacht wird.)

(Rickert, "Über logische und ethische Geltung," in *Philosophische Zeitschrift*, Berlin, 1914)

Rickert reinterprets the "primacy of practical Reason" by making value (*Wert*) the *archi-lexeme* that includes moral values (*die Güter*, Fr. *les biens*) and the validity (*Geltung*) proper to all judgments on which knowledge depends. It is a "practical" procedure (*ein Sollen*) that recognizes a particular association of representations to be valid (*gilt*) and thus true. The ought-to-be must be understood before the "to be": "All our arguments depend on two statements: that judgment is not a representation and that 'being' gains meaning only as a component of a judgment" (Auf den beiden Sätzen, dass Urtheilen nicht Vorstellen ist, und dass das "Sein" nur einen Sinn gewinnt als Bestandtheil eines Urtheils, beruhen all unsere Ausfuhrungen) (ibid., 84). Values can be inflected by taking the form of a truth, norm, or law. In the end, however, the criterion that enables one to distinguish an "unreal" value from an actual being is negation. To deny something real results in nothingness, not its opposite, unreality. By contrast, to deny a value results in a negative value (false, ugly, etc.).

IV. Lask: *Wert* and *Geltung,* the Separation of Spheres

Emil Lask, a disciple of Rickert, caused his teacher to revise his own conception of value. Starting in 1908, Lask opposed what he called the "ethicization" (*Ethisierung*) of notions of knowledge and judgment:

We call for a concept of value [*Wertbegriff*] in knowledge that is not an ethical one [*nichtethisch*], and we would also clearly distinguish it from scientific *life*, where, of course, practical reason has priority. At the same time, we raise the objection that making ethical value [*der ethische Wert*] the immediate correlate of objective worth [*das objektive gelten*] would be to give it a systematic standing which does not belong to it.

(Lask, "Does a 'Primacy of Practical Reason' Exist in Logic?" [1908] in *Néokantismes et Théorie de la connaissance*, 304 [trans. from Fr.])

Here, the highest position in the conceptual universe is not that of objective being but that of objective validity (*Geltung*). Ethical value is not endowed with objective validity:

What is encountered by the moral will, in the form of a demanding ethical value, is not a demand [*das Fordern*] in the sense of objective validity, but always some action whose doing is endowed with value. . . . Knowing *is* a behavior commanded by the objective validity of truth [*Wahrheitsgelten*]; moral will *has as its object* a commanded action.

(Ibid. [trans. from Fr.])

Lask introduces the distinction between the knowing subject (*Erkenntnissubjekt*) and the person (*Persönlichkeit*)

(responsibleforanactionorderedbyamoralought-to-be).This amounts to a distinction between the subjective correlate of the objective validity of truth—knowledge—and the fact of devoting oneself to science, an act that comes from the ethical: "the subjective sphere of the 'processes of knowledge' is completely independent of the personal ethical sphere" (ibid., 307). In making these distinctions, Lask does not leave the field of value, but simply dissociates his two orientations from its meaning. This is why, without breaking their ties to *Wert*, the terms *Geltung* and *Gelten* appear in his reflections on logic and its categories, as well as in his arguments about judgment. The nonethical concept of value is related to objective validity (*Geltung*), and when Lask claims that a being is a *Gelten*, his intent is to stress that our access to the predicate of being is from within a judgment and not from the point of real being. Since the sphere of judgment is part of the unreal sphere of the world, that is to say, the world ruled by validity (*Geltung*), we are complete "prisoners" of the sphere of *gelten*, which our knowledge obeys. The same holds true a fortiori for the ethical sphere, even if discussions of values (*Werte*) are more common there. In both spheres, no matter what, one finds notions of value, of validity, of ought-to-be, and of norm, but their usage no longer stipulates recourse to practical Reason. Logical value and ethical value become equivalent.

V. Scheler: Value and Feeling

Taking up the Husserlian notion of the vision of essence, Scheler extracts from the flux of experience that presents itself to consciousness contents that have no direct signification but that are nonetheless intentional acts. Thus, it is possible to apprehend qualities (such as the good, the agreeable, or the beautiful) without having an idea of their signification. In fact, the significations—of beauty, the good, etc.—are posterior to those actions at the heart of which one experiences such qualities (the exception is the quality of redness, which is experienced at the same time as its signification). Scheler insists on the importance of the intentional *feeling* (*intentionales Gefühl*; see GEFÜHL) that is not the same as an affective state and that leads directly to a content without the intermediary of a thought or representation. This content is the "material" base of the values apprehended by pure feeling. The world of values is grasped through pure feeling, by what Scheler calls the "emotional function" (*emotionale Funktion*). In addition, values are not experienced in a merely indistinct manner for there is a specific intuition of their hierarchy that depends on two other emotional acts, preference and repugnance (*Abscheu*) (this is not a matter of an empirical preference that relies on mere taste or idiosyncrasy, but of a "pure" preference attached only to values—a preference, for example, for beauty over the sacred, etc.). At a higher level than these acts of preference/repugnance is the level of love and hate (*Liebe, Haß*). Love guides and precedes actions of preference and repugnance. When one loves a person, one sees in that person qualities that reveal themselves little by little, by virtue of the love that one devotes to him or her. These acts of love and hate delimit the field of values accessible to a subject. The fact that a person strikes us as sympathetic (*sympatisch*)—or antipathetic—from the start shows that value presents itself independent of direct

3

Werturteilstreit: Value and interest

The controversy over "value judgments" that emerges at the turn of the twentieth century in Vienna with Carnap's positivistic reaction to the philosophy of values breaks out again at the end of the 1960s between Adorno and Karl Popper. In the later instance it takes the form of a dispute among a (European) continental movement, the Frankfurt school, and critical positivism (of Viennese inspiration). Aside from the political affiliations that set partisans of "revolution" (those committed to Marxism in its revised iterations) against those who adhere to an empirical and liberal "reformism," the conflict's stakes concern the methodological grounding of the social sciences. The adversaries of hermeneutics (in its broadest sense) contest, as always, any possibility of articulating utterances that apply to being.

They disqualify any ought-to-be as a naturalist fallacy, insisting that one cannot derive *ought* from *is*. To support this position they rely on Hume's *Treatise on Human Nature*, III, i.1. The defenders of the Frankfurt school, for their part, claim that the scientific status of the human sciences should be recognized and not rejected out of hand on the basis of criteria that apply only to the domains of the "empirico-analytic" sciences (mathematics, physics, biology). J. Habermas (cf. *Knowledge and Human Interests* and *Technology and Science as "Ideology"*) has echoed this controversy by attempting to substitute the notion of *interest* (Ger. *Interesse*) for the notion of value. He treats interest as a kind of anthropological invariant: to *homo faber* there corresponds a "technical" interest derived from work and

to which the empirico-analytic sciences adhere; to *Homo loquax*, a "practical" interest, derived from language, which becomes a principle of the historico-hermeneutic sciences. In early Habermas there is also the concept of "emancipatory" (*emanzipatorisch*) interest derived from the impulse to strive for freedom against the constraints of nature, as well as distinct sociopolitical forms of coercion that have preoccupied the "critical sciences" (ideology critique, psychoanalysis, etc.).

Habermas, Jurgen. *Technik und Wissenschaft als "Ideologie."* Frankfurt am Main: Suhrkamp, 1968. Translation by J. Shapiro: "Technology and Science as 'Ideology.'" In *Toward a Rational Society*. Boston: Beacon Press, 1977.

support, yet not without "material." What this means is that we cannot confuse values with goods (*Werte* with *Güter*). Values are extratemporal essences that can be grasped though emotional intuition. Nor can one confuse values with goals or purposes (*Zwecke* with *Ziele*). The goal is an intellectual representation of a real good, and it is based on an end that is entirely independent of a representation or intellectual act. The end consists of the expression of a value and an image of this value. Values are thus independent of ends, and these in turn are independent of goals. Values (as in the case of altruism) establish ends (as in the case of helping one's neighbor) that are in turn the basis for goals (for example, creating a neighborhood aid association).

Since values depend on an emotional act, it follows that they become in some sense imbued with history (the histories of the subject and of various collectivities—sociopolitical, cultural, and religious—at the heart of which this subject is to be found). This historical condition reopens the question of how to establish their validity (*Geltung*) and their "valuability" (*Gültigkeit*):

It is therefore also possible that certain moral value-qualities will be comprehended for the first time in history, and that they will appear first, for example, in the feeling insight of a *single individual*. The evidential comprehension of such a quality and the fact that it represents a value higher than all those [values] known up to this point have nothing to do with the universality . . . of this comprehensibility or with the so-called "*universal validity*" of norms [*Normen*]. But it is necessary to distinguish three things: first, the factual *universal possession of dispositions to comprehend* certain values; second, what is morally valid [*gilt*] for a given group of people . . . ; third, those values whose recognition is universally "valid" [*gültig*] no

matter if they are factually "universally valid" [*geltend*] or not.

WHIG, TORY

FRENCH   *libéral/conservateur*

➤ LIBERAL, and CIVIL SOCIETY, LAW, LEX, *LIBERTY*, POLITICS

The terms "Whig" and "Tory" have been conventionally used, respectively, to designate liberal and conservative tendencies in British politics (before the rise of the Labor Party at the end of the nineteenth century, which resulted in a change to previous political divisions). But these words possess a meaning at the same time more general and very English, which distinguishes them from the French terms *libéral* and *conservateur*. A Whig is not simply a liberal, but also a self-conscious heir to the English constitutional tradition, to the Rule of Law, and to the rights of Parliament. Likewise, a Tory is a conservative attached to certain kinds of social relations in which the authority of the aristocracy (Fr. *notables*) cannot be separated from its protectionist role. Such relations are bound to a specific interpretation of Anglican religious tradition. In addition to these political divisions, one can also speak of a Whig manner of writing political or intellectual history, or of the Tory legacy in the political doctrines of the nineteenth and twentieth centuries. After reviewing selected moments in the historical development of the Whig/Tory opposition, we will examine the central role that these two notions play in Hume's writings and their general impact on English-language political philosophy. We will conclude with some reflections on the status of these terms as untranslatables of British political thought, with special reference to their influence on Enlightenment notions of liberty and their role as political terms in colonial America.

I. "Whig" and "Tory" in English Politics

The historical origins of the words "Whig" and "Tory" are disputed, but the context in which they gained currency is well known, as are the negative meanings they initially carried. The adjectives "whig" and "tory" appeared during the emergence of the modern English political system, and their use became widespread during the crisis that resulted from the attempts of radical Protestants to exclude James of York (the future James II) from ascending to the British throne because of his Catholic and French sympathies. The adjective "whig" had already been used during the English Civil War in reference to Cromwell's Scottish partisans. A pejorative term of Gaelic origin, it referred, according to its most likely etymology, to thieves of horse and cattle. It also connoted attachment to the Presbyterian form of Protestantism and, by implication, to a penchant for rebellion. The term was applied to those whose antipapist convictions led them to advocate passing over the legitimate heir to the throne. The term "tory" was originally no less insulting since it referred to the Catholic rebels (the Irish "papist bandits") and was applied to those who defended the rights and claims of James. His accession to the throne in 1685 was followed by the Glorious Revolution of 1688, which removed him from the throne and replaced him with William of Orange, thus bringing about a redefinition of partisan differences. Most of the Tories abandoned their defense of absolutist doctrines and to some extent accepted the Whig interpretation of the British political system as a limited monarchy. But they remained attached to the notion of royal prerogative (which allows the monarch under certain circumstances to go against the laws of Parliament) and to all those parts of the English political system that upheld traditional hierarchies. Tory became the party of the High Church and the provincial nobility, while Whig came to represent the more dynamic factions of the aristocracy allied with the middle classes to constitute a new dominant class, all the while relying on the support of the sensibilities of the most liberal currents of English Protestantism. The death of Queen Anne (1714) and the accession of George I to the throne marked the final ruin of the Stuarts and entailed the exile or discredit of those Tories who had remained faithful to them (the Jacobites). A long period of Whig supremacy in English politics ensued, a period in which Toryism was more of a sensibility than a true party (despite the presence of close to one hundred deputies in the House of Commons who identified themselves as Tories). The division Whig/Tory regained its importance at the end of the eighteenth century when William Pitt the Younger became the leader of a new Tory party, supported by both the gentry and the commercial classes. This led to the appearance of new Whigs with more progressive opinions who, under James Fox, set themselves up as the defenders of religious freedom and as advocates of various reforms of a quasi-democratic nature. The French Revolution provoked a rupture within the Whigs that was epitomized by the break between Edmund Burke and James Fox. While the English liberals siding with Fox saw the acts of the constitutional convention as the application of the principles of the Glorious Revolution (and as a way to inflect the English constitution in a more liberal direction), Burke saw the French Revolution as a radical subversion of tradition, and thus as something entirely hostile to Whig politics (which up until that point had been part of the continuous development of English freedoms). The conflict between England and revolutionary France led to a *rapprochement* of the more moderate Whigs and the new Tories around Pitt. What was left of the revolutionary heritage of the Whigs became absorbed into a new democratic culture that came in the wake of the French Revolution. After 1815 English politics increasingly took the bipartisan form with which we are familiar and which became dominant in the nineteenth century by virtue of the opposition between the liberal and conservative parties. These parties can legitimately be called the heirs of the Whigs and Tories (indeed the name "Tory" has remained in use for a long time to designate the conservative party).

II. "Court" and "Country"

The history of English politics cannot be completely accounted for by the story of the opposition between Whigs and Tories. Nor can the meanings of those two terms be reduced to a simple partisan division (just as the opposition between right and left in France can no more easily be reduced to the two sides of the parliamentary chamber). The long period of Whig supremacy, from 1714 to 1760, was in fact a period of fundamental transformation in the English political system, culminating in the Walpole ministry (1721–42). Intense controversies divided the Whiggery, many of them informed by Tory thinkers whose position could not be reduced to the simple defense of hierarchies. The Whig supremacy was in fact inseparable from the rise of a new figure, the prime minister, whose task it was to establish his position between the Houses of Parliament and the king. He could accomplish this

task only by winning the support of part of the assemblies, while at the same time presenting himself as the agent of the crown. The simplest means of playing this game was to buy the support of members of parliament in various ways, ranging from corruption pure and simple to the creation and distribution of positions for the defenders of the ministers of the king. Since this form of politics, carried out with virtuosity by Walpole, was accompanied by a stable and relatively small oligarchy, relying on complex electoral laws that bypassed the older gentry, it is understandable that the system seemed to certain Whigs to be a betrayal of their principles. Walpole Whiggery thus helped revive an older Whig/Tory tension between the party of Country or Commonwealth, and the party of the Court. During Stuart times, the defenders of the rights of Parliament against the "papist" attempts at the subversion of the English Constitution were often called the Country Party, and its influence at the court was condemned. The same opposition made it possible to denounce the power of the executive "wielding two great instruments of corruption, of which the first was parliamentary patronage and the second public credit" (Pocock, *Virtue, Commerce, and History*). But even this argument can be subject to Whig or Tory interpretation, and it plays a central role both before and after the birth of liberal politics in England.

The Whig version of the "Country problem" redounded to the Old Whigs, who denounced Walpole's politics as a betrayal of the ideals of the Glorious Revolution. They rejected the foreign policy of the new oligarchy, which was favorable to a politics of peace, supporting an alliance with absolutist, Catholic France. John Trenchard and Thomas Gordon were the most well-known representatives of these new Old Whigs. Their text, *Cato's Letters*, published between 1720 and 1723, emerged as the classic expression of a sensibility imbued with civic humanism. At once liberal and republican, they cast civic virtue—always threatened by corruption—as the only sure guarantor of liberty.

The Tory version of this position found its best defender in the person of Henry Bolingbroke (1678–1751), who, after describing the decrepitude of the old parties of Great Britain (*A Dissertation upon Parties*), defended the idea that under these circumstances only a "patriot king" could overcome the divisions between parties and restore to the country the rights usurped by the ministers and the oligarchs (*The Idea of the Patriot King*).

These thinkers contributed to a current of civic humanism inaugurated by Machiavelli and taken up in England by James Harrington. It ranged across diverse political, social, and even religious contexts: the Deist Bolingbroke, for example, was the ally of writers and apologists for the High Church, and even of papists such as Atterbury and Pope. Meanwhile the Country party was supported both by the urban middle classes and the rural gentry (on all of these points, see Pocock, *Virtue, Commerce, and History*). The opposition between court and country thus transcended the traditional divisions between Whigs and Tories. It became a sign of the difficulties encountered by the new liberal world in asserting itself in the face of older republican ideals, themselves weakened by the crisis of absolutism and religious tradition.

Hume's work is important here, because it illustrates a deliberate choice in favor of the emerging liberal society (and the abandonment of republican models founded solely on virtue). Hume gave new meaning to the split between Whig and Tory despite his criticism of the unilateral quality of the doctrines defended by each of the two parties.

III. Hume's Synthesis

In his *Essays*, as in his *History of England*, Hume showed himself to be equally distant from Whig orthodoxy as from the traditional prejudices of the Tories. If he were indulgent toward the Stuarts and critical of English Protestantism, and only too aware that the "old English Constitution" was in many respects similar to those of the continental monarchies, he nonetheless appreciated the merits of the English political system, seeing it as favorable to liberty and to the development of the sciences. In the same spirit, he attempted to define a philosophical position midway between the "whig" principle of an original contract (that cannot account for the nature of political association), and the "tory" principle of passive obedience (which is incompatible with the interests of society properly understood). This impartiality is itself founded on an original interpretation of the English system: for Hume, the divisions between the "parties of Great Britain" derived from an internal dualism of the English Constitution, which combined monarchical and republican features and thus naturally produced (even as it limited) partisan division. The opposition between Whigs and Tories becomes, then, part of a sequence that starts with the Cavaliers and the Roundheads during the Civil War and leads to the divisions in Hume's time between a party of the court and a party of the nation. This opposition does not in and of itself undermine the system, because it rests on a compromise acceptable to both parties on the basics of the system in question:

> A Tory . . . may be defined in a few words, to be a lover of monarchy, though without abandoning liberty; and a partisan of the family of STUART. As a Whig may be defined to be a lover of liberty though not without renouncing monarchy; and a friend to the settlement in the PROTESTANT line.
>
> (Hume, *Political Essays*)

The opposition between the two parties took on new and somewhat confused meaning after the Revolution of 1688: just as the Whigs had often "proceeded with measures that could become dangerous for liberty" in order to better assure the Protestant succession, the Tories were led to oppose the Crown and to act like republicans after the change in dynasty. In addition, the development of the English regime (which translates into a certain predominance of the principle of liberty) is more favorable to Whig philosophy, as is evident in the decline of the Tories, even after they had abandoned their most shocking doctrines (like that of passive obedience).

IV. The Future of an Opposition

The central importance of the English system in the formation of liberal politics has been such that the opposed terms of "Whig" and "Tory," along with their different connotations, have been recognized and faithfully

duplicated everywhere that there has been interest in the British experience.

The transformations of the British system since the end of the eighteenth century have, of course, modified the content of the notions of Whig and Tory. There is no longer room in the parliamentary government for a party that would support an active intervention by the monarch in the legislative process, and the executive power itself must remain in the hands of the prime minister at any given time. Even though one currently speaks more often of liberals and conservatives, the terms "Whig" and "Tory" have nonetheless been of use in interpreting new divisions in the traditional terms of English politics. One can call liberals with advanced and reformist ideas Whigs who are open to social reforms without being socialists properly speaking (in this sense, there was something "whiggish" about the New Labor party of Tony Blair). And "Tory" is a term with multiple meanings, suggesting a ruling class that is both guardian of tradition and protector of the weak, while remaining open to audacity and modernity. In literature, Coleridge's (1772–1834) romanticism tacks Tory, even if it includes radical elements. In the politics of the nineteenth century, the great man of the Tories was Benjamin Disraeli (1804–1881), who embodied a conservatism that both favored popular interests and supported the greatness of empire.

Beyond the play of politics and partisanship, the opposition between "Whig" and "Tory" (and the dissymmetry between the two notions) plays a certain role in the ways that political thought is framed in the English language. Political movements are classified according to distinctions whose origins lie in the English system of partisanship (liberal or conservative), and one often encounters in the best authors the idea that proper politics requires that there be a party of order and tradition and a party of progress and reform, and that their coexistence is a condition of a free political regime (see, for example, John Stuart Mill, *On Liberty*, chap. 2). The influence of Whig and Tory as modes of interpretation has been greatest on historical schools of thought. The dominant vision of English history (which stresses the continuity of English liberties since the mythical times of the "old constitution," and which sets up the limited monarchy of Great Britain and the Revolution of 1688 against absolute monarchy and the French Revolution) can be described as fundamentally Whig: it has inspired great historians, the most brilliant of whom is undoubtedly Thomas Macaulay (1800–1859). More generally, one can speak of a "whig interpretation of history," in the words of Herbert Butterfield, in reference to a history written from the point of view of the progress of the human spirit, which looks to the past for traces of the conflict between progressives and reactionaries in order to bring out the stages in that emancipation. In this sense, Whiggism is simply the English version of Enlightenment philosophy, which culminates in an interpretation of history whose continental equivalents could easily be found among authors such as Lessing or Condorcet. One should not be surprised to see that the endpoint of the Whig interpretation of history approximates versions of bourgeois progressivism. Marxism is both faithful to it (in its emphasis on the compatibility between political liberty and the interests of both the middle class and the market economy)

and unfaithful to it (in its critique of formal liberties). Contemporary authors tend to treat the ethnocentric character of Whig history with indulgent humor. In this spirit, J.G.A. Pocock, who has elucidated the subtleties of English politics better than anyone, estimates that there is no such thing as a pure Whig historian because his or her relation to the political paradigms holding sway in society is always a mixture of conservative and radical.

V. Translating "Whig" and "Tory" in France and the American Colonies

The terms "Whig" and "Tory" emerge as such quintessentially local terms for British politics that they stand as premier examples of national untranslatables. In France, one does not find the terms adopted in English very often, but their influence on definitions of liberty can be clearly discerned. Consider, for example, Voltaire's *Lettres philosophiques* (1734), which played a central role in France in the "invention" of English liberty as an alternative to the French regime. Despite what one might expect, Voltaire espoused an interpretation of the English regime that was not unlike Bolingbroke's, and thus rather clearly tory (see letter 8, in which he analyzes the sharing of power between parliament, the arbiter of the nation, and the umpire king). In *The Spirit of the Laws* (1748) Montesquieu hews closer to the classical whig theses, all the while showing in-depth how English liberty differs from that of the republics of antiquity. The Old Whigs, such as Trenchard and Gordon, had their own followers in France, where their implacable anti-Catholicism led the Baron d'Holbach to translate some of their writings. But it was arguably in America that whig politics came to have a truly creative influence on posterity, coming into its own as a political "translation" despite the fact that the English language remained the same. In the pre-Revolutionary period, the English colonies in America provided a highly receptive context for the republican problematic of the Old Whigs. As a consequence, their influence was determinative on the first phase of the Revolution (Bailyn, *The Ideological Origins of the American Revolution*; Pocock, *The Machiavellian Moment*) The epithet "Tory" was applied pejoratively to loyalists faithful to the British Crown, and, as a result, one of the great American parties adopted the name "Whig" before later becoming the Republican party of Lincoln.

| WHOLE

The French *tout* derives from the Latin *totus*, and applies to the object considered in relation to its extension and in its entirety, in the sense of *tout entier* (as a whole). Like *totus* on occasion, *tout* can be used in the distributive sense, in the sense of *chaque* (each), even though *omnis* has taken on that specialized function in Latin. The Greek language also has two ways of expressing the whole, *pas* [πᾶς] and *holos* [ὅλος], to which *omnis* and *totus* do not precisely correspond. *To holon* [τὸ ὅλον] like "the whole" in English, designates the integral and complete whole, but as something more than or other than just the sum of its parts: see WELT, Box 2.

The medieval Latin *totalis* (Nicole Oresme) refers to that which is complete, not lacking in anything, and thus opens the way to the translation of *to holon* as "totality." Totality (Ger. *Ganzheit, Gesamtheit, Allheit, Totalität*) is one of Kant's twelve categories and establishes the synthesis of unity and multiplicity: cf. *CATEGORY, JUSTICE.*

For the relationship among the words "world," "universe," and the "totality of the real," see WELT and OMNITUDO REALITATIS; see also MIR, NATURE, REALITY, SVET; cf. GOD.

On ways to think and express totality, see AUFHEBEN, COMBINATION AND CONCEPTUALIZATION, *CONCEPT,* HISTORIA UNIVERSALIS, MEMORY, STRUCTURE, UNIVERSALS.

| WILL

FRENCH   *volonté*
GREEK   *thelêsis* [θέλησις], *orexis* [ὄρεξις], *boulêsis* [βούλησις]
LATIN   *appetitus, voluntas*

➤ AGENCY, *DESIRE*, HERRSCHAFT, I/ME/MYSELF, INTELLECTUS, INTENTION, LAW, *LIBERTY*, LOGOS, OBJECT, PATHOS, PHRONÊSIS, *REASON*, SUBJECT, SVOBODA, WILLKÜR

"Philosophers," wrote Nietzsche in *Beyond Good and Evil*, "are accustomed to speaking of the will as if it were the best-known thing in the world." But "the Historian cannot forget that it took mankind some eleven centuries of reflection after Aristotle to invent 'the will'" (R. A. Gauthier). How did this lexical and philosophical invention occur, with its considerable implications for medieval and modern thought?

I. The Medieval Invention of a Third Faculty: *"Thelêsis sive Voluntas"*

In an attempt to answer this question, one should start by taking the finished concept of will and examining its

provenance. In *De fide orthodoxa*, John of Damascus gives a definition of *thelêsis* [θέλησις], which is translated as *voluntas* by Burgundio of Pisa and will subsequently serve to frame all of medieval thought on the will: the *thelêma*, or will, "is an appetite, both rational and vital, depending only on what is natural" (*De fide orthodoxa*, 2.22). Burgundio makes a choice of translation that will become an essential one and renders *thelêsis* by *voluntas*: "thelêsis, sive voluntas, est naturalis et vitalis et rationalis appetitus" (*thelêsis*, or will, is a natural, vital, and rational appetite). This definition will be taken up by medieval authors and become the authoritative version for Scholasticism: John of la Rochelle, Saint Bonaventure, and Thomas Aquinas will in turn define *voluntas* as an essentially rational appetite that naturally tends toward the Good. In this respect, will differs both from desire (*orexis* [ὄρεξις]) and from reason (*logos* [λόγος]), and designates a third faculty, an intermediate between the other two. Such a faculty was entirely lacking for the Greeks, as the German philologist Bruno Snell underscores:

> But the will, ever straining and champing at the bit, is a notion foreign to the Greeks; they do not even have a word for it. *Thelein* means "to be ready, to be prepared for something." *Boulesthai* is "to view something as (more) desirable." The former denotes a subjective preparedness, a kind of voluntary attitude devoid of specific commitment; the latter refers to a wish or plan (*boulê*) aimed at a particular object, i.e. a disposition closely related to the understanding and appreciation of a gain. But neither word expresses a realization of the will, the effective inclination of subject toward object.

(*The Discovery of the Mind*)

We should add the word *orexis* to this list, which refers to desire in its broadest sense, as well as the term coined by Aristotle to designate that state of mind that immediately precedes action: *proairesis* [προαίρεσις], "deliberate choice." None of these notions can be directly understood in terms of the medieval and modern concepts of *voluntas*.

But how does this concept emerge? What justifies its adoption? In which philosophical or theological context is it to be understood?

II. The Absence of a Problematics of Will in Aristotle and the Stoicism of Antiquity

The lack of an equivalent concept of will in ancient Greek thought can be established through a few examples. In Aristotle, the act of making a deliberate choice (*proairesis*) is not an indication of a power of self-determination analogous to the will, but refers to a judgment of the practical intellect that starts from a wish or recognition of a desired end (*boulêsis* [βούλησις]) and carries out a process of deliberation (*bouleusis* [βούλευσις]). It is a rational calculation of the means to achieve the end. Thus the choice itself is an act of the *nous* [νοῦς], which selects the means to that end, according to a rational process that yields a practical syllogism (*On the Movement of Animals*, 6.700b23). Many a misunderstanding has resulted from the translation of this doctrine in terms of will. Thus Thomas Aquinas, thinking he was following Aristotle, fixes on the *electio,* which chooses a modality of

voluntas whose objective is its end. The same applies to the point of departure, the *boulêsis* or wish. Aristotle defines it as a desire penetrated by reason (*logistikê orexis* [λογιστικὴ ὄρεξις]) (*Rhetorics*, 1.10.1369a2), suggesting that what we have here is a precursor of *voluntas* or a quintessentially rational form of desire. This argument, however, is misleading, for *boulêsis* designates a modality of desire "accidentally" subject to reason; as a result, it can diverge from reason. One can always wish for the impossible, affirms Aristotle (*Nicomachean Ethics*, 3.2.1111b22: *boulêsis d' esti <kai> tôn adunatôn* [βούλησις δ' ἐστὶ <καὶ> τῶν ἀδυνάτων]). Here, it becomes apparent, we are as far as it gets from the medieval and modern concept of the will.

Similar problems arise in relation to the understanding and interpretation of one of the central concepts of Stoicism in antiquity: the accordance of assent (*sugkatathesis* [συγκατάθεσις]). Giving assent is an act of reason (*logos*), the basis for establishing a radical difference between human and animal. In the animal, as soon as the presentation occurs (*phantasia* [φαντασία]), the impulse to act (*hormê* [ὁρμή]) immediately follows. But in human being, reason (*logos*) must give its assent to the presentation for the impulse to follow, and freedom resides in this assent, as a judgment applied to a presentation, as the privileged role of reason. So assent is not a property of the will, but of judgment alone. At this point one can see the distortion that results from the imposition of the vocabulary of *voluntas* on the doctrine of *sugkatathesis*: "to these presentations which are accepted by the senses, so to speak, he [Zeno] adds the assent of the soul, which he considers up to us and voluntary [*in nobis positam et voluntariam*]" (Cicero, *Academica posteriora*, 1.11.40–42). Similarly, the central idea of Stoicism in antiquity, "that which is up to us" (*eph' hêmin* [ἔφ' ἡμῖν]), constitutes the very idea of moral responsibility, which is expressed from Seneca on in terms of will: anger depends on us, which is to say it is voluntary, insofar as we assent to it. We give in to anger of our own volition, and thus we are responsible for it ("*est enim voluntarium animi vitium*") (*De ira*, 2.2.2).

Of course, one could still inquire into the notion of *logikê hormê* [λογικὴ ὁρμή] in ancient Stoicism: doesn't this rational impulse of man, set into motion by assent, prefigure the will as *appetitus rationalis*? In other words, by making reason itself into an "active" faculty, didn't the Stoics come very close to the later notion of *voluntas*? Yet to be able to properly discuss the will, one must presuppose the existence of a faculty of the soul "distinct" from thought (*dianoia* [διάνοια]), from the intellect (*nous*), and from reason (*logos*), an autonomous and independent faculty that can on occasion be in opposition to reason and elect to go against it—which specifically excludes the psychological monism of Chrysippus, according to whom the human soul is not made of parts, but consists entirely of *logos*. As a result, nothing can assume the role of "will" as an independent faculty.

Things would change somewhat in the middle phase of Stoicism, which abandoned the thesis of the unity of the soul. In fact, the main innovation of Panaetius was to dissociate the rational part (*logikê* [λογική]) of the soul from the impulse (*hormê*), which would become in both human and animal an irrational drive. This *hormê* no longer fundamentally differs from Aristotle's desire (*orexis*), which will be translated into

Latin as *appetitus*. The immediate principle of action, for Panaetius, is thus not assent, insofar as it determines the logical impulse (*logikê hormê*), but rather this irrational impulse, which simply follows assent. This impulse has the specific feature of being, like *voluntas,* independent of reason. But insofar as it follows from assent, it still finds its source of freedom in the judgment of reason, and it is thus neither free in and of itself nor rational in essence. It remains to interrogate the notion of *thelêsis* [θέλησις] in Epictetus: the word appears frequently in his work, along with the verb *thelein* [θέλειν], and is largely synonymous with *boulesthai* [βούλεσθαι], to the point that one can agree with Voelke's claim that "no other Stoic writing in Greek uses these verbs as frequently" (*L'idée de volonté dans l'ancien stoïcisme*). For example, Epictetus affirms that the single criterion of wisdom consists in the following: "Be willing at length to be approved by yourself (*thelêson aresai autos pote seautôi* [θέλησον ἀρέσαι αὐτός ποτε σεαυτῷ])," which is to say, "be willing to appear beautiful to God (*thelêson kalos phanêtai tôi theôi* [θέλησον καλὸς φανῆται τῷ θεῷ])" (*Discourses*, 2.18, Long trans.). Yet Voelke is forced to admit that "the will in Epictetus does not have a clearly defined and specific function" (*L'idée de volonté dans l'ancien stoïcisme*). In addition, for Epictetus, as for the Stoics of antiquity, there is no such thing as an independent notion of free will, for freedom is a determination of judgment, and is consequently completely intellectual. Epictetus even goes so far as to claim that "the soul of man is nothing else aside from his judgments" [ἀνθρώπου ψυχὴν οὐδὲν ἄλλο ἢ δόγματα] (*Discourses*, 4.5.26).

III. The Christian Problematic of the Will: Saint Augustine

Should one look then to the Christian tradition of the church fathers for the first appearance of the concept of "will" in its modern sense? Should one follow Hannah Arendt and see in Saint Augustine the "first philosopher of the will"? Nothing is less certain.

Just as one could speak of a "Roman voluntarism" (Pohlenz, *Die Stoa*, I) one could speak of Augustine's "voluntarism" since all activities, including perception and cognitive activity in general, are for him imbued with will. In order to see, he maintains, one must want to see, which is to say that the sensory organ of vision fixes upon a visible object through attention. This is also the case for rational knowledge: in this respect there is not a single motion of the soul that is not engendered by the will: "*voluntas est animi motus*" (*De duabus animabus*, 10.14). So can one still speak of a "primacy of the will" in Augustine, as is the case, for example, in Duns Scotus or Descartes? Undoubtedly not, insofar as the will for Augustine is not a distinct faculty independent of desire in general and love in particular: "*voluntatem nostram, vel amorem seu dilectionem quae valentior est volunta*" (our own will, or love, or affection, which is a stronger will) (*De Trinitate*, 15.21.41, Haddan trans.). Love, or the affection by which the soul takes joy and rejoices in God (*fruitio*), is only the will in all its power, which means that inversely, will is a weaker form of love or desire. This is why Augustine can compare love to the weight that strains the will and impels it toward its object, just as weight drags down bodies toward the center of the earth: "My love is my weight: wherever I go my love is what brings me there" (Augustine, *Confessions*,

book 13, 9, 10). And since the notion of affection is indissociable from the notion of love, one could also say that "*delectatio quasi pondus est animae*" (*De musica*, 6.11.29); such an affection is the union of the heart and its object, according to the saying of Matthew the Evangelist that Augustine likes to quote: "*ubi enim erit thesaurus tuus ibi erit et cor tuum*" (6.21). Thus will is not an abstract faculty, indeterminate as to its object, but is essentially determined as love by its *dilectio Dei*. It is love itself reaching toward God to rejoice, and reaching to the things of creation only to use them from the point of view of God himself. In that sense, sin does not stem from the will's desire for evil, since evil is nothing, but results from inverting the hierarchy of goods by "enjoying" the things of creation rather than simply *using* them in relation to the supreme and uncreated good, God himself. Thus for Augustine the will is only this capacity to be open to God and to take joy in him, to attain that point through love and beatitude where God fills the soul and leaves no room for anything else. This is why all precepts and commandments come down to a single one: to desire God, to join with him passionately, in other words to love him; any act that comes from this love of God is necessarily and infallibly good. Everything comes down to love: "*Dilige, et quod vis fac*" (love, and then what you will, do; *In Epistulam Johannis ad Parthos*, 7.8).

It is true that for Augustine, will is the deepest of the three human faculties. It puts memory and intellect to work and ultimately "unites them one to another," since it is thanks to the will that "these three elements are united [*coguntur*] in a single whole, and this union [*coactus*] endows that whole with the name of thought [*cogitatio*]" (*De Trinitate*, 10.2.6). But if the will is the deepest faculty of the soul, and since the fact that it unites the two others gives it its real name (Augustine derives *cogitatio* from *cogere*, "to collect or compress with force"), this is only because love holds them together. Since love is the universal bond, those united by love, writes Augustine, are "strangely wedded together by the bond of love" (*cohaerunt enim mirabiliter glutino amoris*) (10.8.20). And thus love, the true bond, is the best and proper name for the will.

It is difficult to see how this Augustinian doctrine of the will would prefigure a finished concept of the will as an essentially rational appetite (differing in this regard from the Thomistic problematic). Complicating things further is the fact that Augustine is also taken to be the "inventor" of the problematic of free will. He writes: "*nihil tam in nostra potestate quam ipsa voluntatas est*" (nothing is so much under our control than the very will itself), which allows him to conclude that "because it is within our power, it is free for us" (*De libero arbitrio*, 3.3.27). It is this doctrine of free will that will have the greatest philosophical traction, along with the problem of the reconciliation of free will and grace. Yet here too, we should stress Augustine's originality in relation to the Scholastic treatments of will. For the free will is nothing without freedom, that is to say, without restoring the integrity of the will divided against itself by sin (*Confessions*, 8.9.21), a restoration of integrity that results from grace. This unity of the will with itself, which results in the will not only wishing for the good but also being capable of effectively achieving the good, is none other, once again, than love. Only love frees. Only love confers integrity on the will rendered impotent by sin, and gives it its strength, its permanence,

and its "rest" (*De Trinitate*, 11.5.9). True freedom is thus none other than love itself.

IV. The Emergence of the "Completed" Concept of Will and the Controversy of Monothelism

If the concept of will in Saint Augustine still remains largely indeterminate (will "deserves the name of love, of concupiscence, of passion"; *De Trinitate*, 11.2.5) or underdetermined in relation to its "completed" version in Scholasticism—one could also say that it is overdetermined since the will for Augustine is but a modality of love. This leaves unanswered a number of questions that we are addressing: where does the canonical determination of the will as "*appetitio rationalis sive intellectualis*" make its first appearance? As part of what philosophical or theological debate? Within which intellectual context does the concept (which has since become classic) of the will as an autonomous faculty, equally independent of desire and the intellect, first emerge and find form?

In our attempt to answer such questions, we need to return to our point of departure. We had found in John of Damascus a first instance of the concept of the will that will become the classical notion from the twelfth and thirteenth centuries on, reaching Descartes, Malebranche, and Leibniz virtually unchanged. In fact, along with this canonical definition of the will, a definition of free will emerged (*autexousion* [αὐτεξούσιον]), traceable to John of Damascus and accorded an extended afterlife:

> In the case of creatures without reason, as soon as appetite [*orexis* (ὄρεξις)] is aroused for something, straightway there arises an impulse [*hormê* (ὁρμή)] to action. For irrationality is the tendency of creatures without reason who are ruled by their natural appetites [*phusikê orexis* (φυσικὴ ὄρεξις)]. Hence, neither the names of *thelêsis* nor *boulêsis* are applicable to the appetite of creatures without reason. For *thelêsis* is rational, free, and natural desire, and in the case of man, the natural appetite is under his rule [*autexousiôs* (αὐτεξουσίως)].
>
> John of Damascus, *De fide orthodoxa*, 945 b–f

The Latin translator Burgundio of Pisa will in fact translate *autexousiôs* as "free will." However, we still need to take further philological and historical steps if we are to understand the provenance of this concept of "will," and determine whether John of Damascus might himself have received his definition from elsewhere. Here it is compelling to follow the hypothesis put forward by R.-A. Gauthier in a relevant article ("Saint Maxime Confesseur et la psychologie de l'acte humain") that demonstrates how John of Damascus found direct and literal inspiration for his definitions from an author of the seventh century, Maximus the Confessor, specifically from his two texts *Dispute with Pyrrhus* (645) and the first *Letter to Martin* (645–646). This philological discovery is not simply a matter of historical interest; it allows us to identify the context in which the notion of the will may well have first come to light.

The context in question concerns the heresy of monothelism. It consists in the affirmation that Christ had only one (divine) will—that of God the Father—and that, as a consequence, when Christ at Gethsemane prays, "Father, all things

are possible unto thee; take away this cup from me" (King James Version), he is expressing the point of view of humankind and not his own. This thesis was condemned by the church insofar as it ignored the union of both human and divine natures in Christ. To counter the monothelist heresy, Maximus the Confessor proposed two complementary truths: (1) as a man, Christ possesses a human will that he expresses in the prayer quoted above; (2) nonetheless, this will is not capable of sin, as it is always in accordance with the will of God the Father. This is the basis for a distinction in Maximus between two types of will: natural will (*thelêma phusikon* [θέλημα φυσικόν]), corresponding to that human will that Christ must possess, and gnomic will (*thelêma gnômikon* [θέλημα γνωμικόν]), corresponding to that will capable of sinning that must be denied to him.

In this way, Maximus the Confessor "invents" a naturally righteous will, arrayed alongside a fallible will, one that is erratic, prone to sinning, capable of wishing for the good and then turning away from it. The righteous will, by contrast, is naturally and rationally directed only to the good. In Gautier's commentaries, "The *thelêsis* is no longer a desire that is subject to reason by accident, but a desire that is rational by nature, it is a faculty (*dunamis*) carried on its own *élan*, before any intervention by consciousness, in the direction of that same universal good of nature that consciousness is made for knowing." The choice between good and evil that belongs to the gnomic will is now no longer an intellectual act (as was decision [*proairesis*] in Aristotle), but an act of free will (*autexousion*), as Maximus had also affirmed.

We should emphasize two essential points: first of all, what is perhaps the first expression of the medieval and modern conception of the will is elaborated in a theological context, specifically in a Christological one. It is only insofar as humans are understood as "following God" or rather "following Christ" that a will as a rational power distinct from desire and ordered toward the good can be attributed to them. In other words, it is the notion of "God's will" that seems decisive in attributing to humans (through the intermediary of Christ) an appetite that is "rational in essence." Second, this "technical" concept of will (which will subsequently become the philosophical concept), although it is developed in a theological and Christological context, will become secularized bit by bit over time. By the beginning of the modern times, with Francis Bacon and Descartes, the will becomes this infinite capacity in man (if it is considered "formally in itself") that is not directed at any predetermined object, but can aim at any object in general. Entirely abstract, indeterminate in its object, the will can reach toward a possible object and thus become the ideal instrument in the service of science and technique in the light of a project of domination of the world, in which man considers himself "the lord and master of nature." This concept, theological in origin, will still serve in modern times to elaborate political concepts of sovereignty or of the general will.

This provenance is perhaps not without consequence for philosophy.

The emergence of a new vocabulary to describe the will

The contemporary philosophy of action has set out to address a number of problems left unsolved by the moderns, but the big question that remains is whether a unified field theory of action in humans and animals is desirable, or whether priority should be given to the reasons for action that give acts their meaning or that explain the causes of an action's appearance. The terms in play are largely determined by doctrinal positions, so we cannot avoid outlining their principal articulations. The "hermeneutic" approach (Ger. *hermeneutisch*, Fr. *herméneutique*) conceives of action as the direct expression of the will by an agent capable of practical reason (Ricoeur, *Philosophy of the Will*; Taylor, "What Is Human Agency?"). As for the "causal" approach (Ger. *kausal*, Fr. *causale*), it defines an action as a causal relation among mental states—beliefs and desires—and behavior (Davidson, *Essays on Action and Events*; Searle, *Intentionality*). The definitional stakes of the

vocabulary of action illustrate how current debates recall some of the issues that were at stake in the medieval debates, with the practical register taking the place of the religious. This is particularly clear with respect to the concept of desire. Should one distinguish between desire as a "non-motivated appetite" and desire as a "motivated pro-attitude," a state at which the subject arrives through decision and deliberation (Nagel, *The Possibility of Altruism*; Schueler, *Desire*; Dancy, *Practical Reality*)? (The category of "pro-attitudes" encompasses every form of conative thought, and includes desires, intentions, urges, and wishing along with moral views and aesthetic principles insofar as these are guides toward actions of a specific kind [Davidson].) Or would it not be better to introduce a category independent of "second-order desire" that enables the subject to hold to a set of preferences among desires of the first order (Frankfurt, "Freedom of the Will")?

The notion of will is at the heart of this debate. Does this term derive from the domain of judgment or from an autonomous faculty for forming and putting intentions to work? Some philosophers close to the Aristotelian tradition do not see a complete and separate faculty, but rather, the result of reasoning based on an ensemble of pro-attitudes and beliefs or propositional attitudes. Donald Davidson justifies his "rational and interpretive" conception of actions by their reasons, as well as by a "causal" conception in which a given cerebration yields a corresponding movement and its accompanying effects on the world. The "reason to act" formed from the desires and beliefs of the agent is normally a representation that tends to produce a behavior that realizes it. The principal difficulty of this perspective stems from the possibility of *akrasia* [ἀκρασία], which Aristotle had already tried to address, that is to say, the incontinence

(continued)

(*continued*)

or "weakness of the will." In this case, the subject acts contrary to what he thinks best. If, in the analysis proposed above, the intention of the subject coincides with his reasons to act, then how can he de facto form an intention that is incompatible with his rational judgment? Davidson addresses this difficulty by distinguishing between two types of judgment at work in action: the "prima facie" judgment relative to a group of objectives, and the "unconditional judgment" not subject to circumstance, which expresses the absolute preferences of the subject. The irrationality of the subject results from the non-coincidence between his reasons for action and the attitudes that in fact determine his behavior.

A second type of approach declares the independence of the will in relation to beliefs and desires, and makes intentions into an irreducible propositional attitude (Bratman, *Intentions, Plans, and Practical Reason*). This analysis aims at underscoring the difference between the existence of simple preferences (which determine desires) and the fact of deciding to act in some particular fashion, or to form a specific intention. It points out that the motivational characteristics of desire and of intention are not identical—and that they do not tally with the distinction between the two types of desire invoked above. While desire constitutes a premise of practical reason at best, the relation between intention and reasoning is a more complex one. It is formed after practical reasoning is finished and puts an end to further deliberations; but it can also be formed without prior practical reasoning at all. This is

the case of intentions that form themselves "in action"—and the term "intention in action" (Fr. *intention en action*) tends today to supplant the classical term of "volition" (Searle). Finally, intentions "on the future" constitute the element in which planning takes place. The notion of intention in this context takes on a clear "executive" meaning since the intention can cause a given behavior without any mediation from a primary reason for action.

This realist analysis of the will leads to the specification of intention in its double role as "guide" for behavior and "rational control" of action. The naturalist philosophers have drawn a specialized vocabulary and new themes of argument from the computational theories of *monitoring* and from the neurosciences. The ideas of "internal model," of "inverse model," and of "perceptual feedback" have been discussed in relation to philosophical problems like the anchoring of intentions in the environment and the justification of action in its motor accomplishments (Israel et al., "Executions, Motivations, and Accomplishments"; Pacherie, "The Content of Intentions"). These works have helped articulate the differences between multiple levels of consciousness and voluntary action (Proust, "Awareness of Agency").

Contemporary thinking about the will, according to the terms of Pierre Livet, is determined "to abandon neither the linguistic pole nor the motor pole" (Livet, "Modèles de la motricité et théorie de l'action"). What results from this constraint is a palpable lexical tension destined to simultaneously maintain the general comprehensibility of terms while inflecting them with innovative characteristics,

in expressions such as "non-conceptual content of action" or "motor representation."

WILLKÜR, FREIE WILLKÜR (GERMAN)

ENGLISH   free will, (free) choice, free power of choice
FRENCH   *arbitre, libre arbitre*
LATIN   *(liberum) arbitrium*

➤ *LIBERTY* [ELEUTHÊRIA], and *DESTINY*, DUTY, MORALS, *POWER*, SOLLEN, WILL

The cluster of terms used to translate the Kantian notion of *(freie) Willkür*—"(free) will, choice," "free power of choice"; *(libre) arbitre* (Fr.)—provides a remarkable example of what philosophical philology can contribute to the understanding of a concept operative within a given theory. In German there are strong morphological and semantic reasons for linking *die Willkür* to *der Wille* (the free choice and the will). There are also theoretical reasons for this link when this (free) choice is further qualified as explicitly "free" as *freie Willkür*. In Kantian terms *freie Willkür* (free power of choice) expresses the highest exercise of reasoning; the "freedom" associated in Kant with the highest "autonomy of the will." More generally, however, the German *Willkür* carries additional morphological and etymological applications. One important usage, distinct from its relation to free will and choice, is "arbitrariness" or "caprice," or *Willkür*, as linked to the "arbiter." This meaning complicates the translation of Kant's terminology. The problem arises of how to bring to another language what Kant manages in his own by linking *frei* (free/autonomous) to *Willkür* (both arbiter and free choice). The existing English translations of both Kant's *freie Willkür* and *Willkür/willkürlich* rarely make explicit the link between *Willkür* as morphologically/etymologically related to "caprice" and "arbitrariness." Often they opt for the highest form of free will indicated by the expression "free power of choice." This, however, entails relinquishing the philological richness of the German in which *freie Willkür* (free power of choice) retains its capricious potential (it is *liberum* but nonetheless an *arbitrium*).

It is only via other translations of Kant's *(freie) Willkür* that the other side of *Willkür* can again be recuperated. In French translation this recuperation is especially apparent. In this case, the concept is rendered not as freedom of the will but as *libre arbitre,* a free or independent arbitrator (which suggests the discretion of an arbiter and therefore an uncertain outcome, neither determined nor necessary). This said, the French translations of *Willkür* can also be problematic since they often use the expression *libre arbitre* for both *Willkür* and *freie Willkür*, thereby obscuring the way in which the Kantian doctrine of freedom distinguishes between an already free choice (*Willkür/arbitre*) and a free power of choice (*freie Willkür/libre arbitre*).

I. *Willkür* in French Translation: Terminological and Philosophical Problems

A. The problem of translation

The difficulty raised by the French translation of *Willkür* was pointed out as early as 1853, by J. Barni, who was faced with the need to translate it in his introduction to the French translation of Kant's *Metaphysics of Morals*. Barni wrote the following in a note:

The (French) word *arbitre*, which I use to translate the German word *Willkür*, is normally only used along with a qualifying adjective, such as *libre arbitre, franc arbitre,* etc.; but I cannot use *libre arbitre* here, for I will use it to translate *freie Willkür*, and so I am forced to use the word *arbitre* by itself. Any other expression would either not serve as well or is completely unavailable, because I need to hold all related words in reserve to render other distinctly defined Kantian expressions. Later, when I can do so without inconvenience, I will translate *Willkür* as *volonté* (will).

> (Barni, trans., in Kant, *Éléments métaphysiques de la doctrine du droit*)

Is it possible for the Kantian doctrine of freedom to hold up against the inevitable confusion that arises from the impossibility of differentiating the "freedom" of *Willkür* from the more pointed *freie Willkür*? Does one solve the problem by rigorously adhering to *arbitre* for *Willkür*, while retaining *libre arbitre* for *freie Willkür* (the rule adopted by J. and O. Masson in their edition of Kant's *Œuvre* as part of the Bibliothèque de la Pléiade)? The French attempts to render *Willkür* foist a long history of confrontations between Pelagius and Augustine, Erasmus and Luther, Molina and Jansenius, back onto Kant's understanding of the term. These confrontations inform subsequent philosophical debates pertaining to Cartesianism, including its critiques and modifications by Spinoza, Malebranche, and Leibniz. Ultimately they amount to imposing a doctrinal debate on Cartesianism that is extraneous to it, obscuring Kant's intentions and originality, especially the manner in which they were meant to be taken within his own doctrinal system.

The translation problem of *freie Willkür* that we encounter in Kant, namely how and when (in French) to apply the qualifier *arbitre* to *Willkür*, or for that matter how to mark the notion of *frei (libre,* free) in relation to *arbitre*, leads us back to a longstanding tension between philosophy and theology in the history of rationalism. The problem is one of understanding the freedom of individual choice in what is known as *liberum arbitrium* both in relation to the will and to understanding, judgment, reason, action, and God. To clarify this problem one must first restore the coherence of the Kantian doctrine to its French translation by relating *Willkür* to *Wille* through the element of freedom, and by drawing on *arbitre libre* to convery *freie Willkür*. The problem of translation, which at first might have seemed to be merely tangential, turns out to be of vital concern to the integrity of the concept itself. What is at stake is not just the validity of Kantian metaphysics but its value: that which animates it and makes it live. We are talking about the point where Kantian metaphysics seeks to justify itself, that is, in the two domains where the *arbitre* must be qualified as free: that of morals (law and virtue) and that of the relationship to evil. In both cases these justifications are made from the point of view of "practical reason."

B. Lexicography, etymology

1. The arbiter and the arbitrary (*l'arbitre* and *l'arbitraire*)

Let us dwell a bit longer on some of the insights into *l'arbitre* and *Willkür* that can be gleaned from major French-language dictionaries. From Émile Littré's RT: *Dictionnaire de la langue française* to the RT: *DHLF*, essentially two meanings come to the fore. The first, which would eventually become classic, appeared early in the seventeenth century as "the person

who judges when there is disagreement" (later this becomes "the authority whose decision is to be respected"). The second, which is specifically philosophical, even metaphysical (for Littré), from the thirteenth century onward, refers to "the power of the will to choose between several options without external influence." This sense is further defined as "the faculty of making a determination for oneself, with only the will for cause" (RT: *Dictionnaire de la langue française*), or as "the faculty of making a decision by the will alone, without constraint" (RT: *DHLF*). The philosopher will note the immediate politicization of the classical meaning: the arbiter as absolute master. The substantive form of the adjective, the "arbitrary," refers more to the pleasure of the prince than to his good will, drawing the *arbitre* more in the direction of the irrational and capricious (together with all the associations these terms entail), as well as toward despotism. In its more purely philosophical ascription, the term *arbitre* must first be determined as *franc* or *libre* (unfettered or free). Once it is, it will be detached from power and transferred to the faculty of the will, itself defined as a capacity for choice without external influence or any form of determinism. The source of the "metaphysical" dimension of the *arbitre* (as evoked by Littré) derives from the fact that it is free only by virtue of the will. It is then an eminently classical philosophy of the will (the predestined place of true freedom) that takes over the idea of *arbitre* in the notion of *libre arbitre*. And we are perhaps in a better position to address the following question enabled by close attention to *Willkür*: Was Kant in fact breaking with classical philosophy, particularly its culmination in Leibniz's comment in his *Critical Thoughts on the General Part of the Principles of Descartes* ("On Article 39"): "To ask whether our will is endowed with freedom is the same as to ask whether our will is endowed with will. Free and voluntary signify the same thing" (trans. Loemker in *Philosophical Papers and Letters*, 9).

2. *Willkür*

Dictionaries of current accepted usage underscore the emphasis in German on the sense of the arbiter as arbitrary or capricious (as in the expression *nach Willkür handeln* [to act according to a caprice of the will, or according to its freedom]). This sense dominates the meaning of the adjective *willkürlich* (shifting from "without external motives" to "despotic"), and does so even more explicitly in *Willkürherrschaft* (a tyrannical regime, despotic, subject to the whim and pleasure of the ruler). Furthermore—and this is essential to our discussion—from the *Grimm* to the *Duden* the lesson of the etymology of *Willkür* teaches that the doubling of the *Will* with *Kür* leads to a redundancy of meaning significant in itself. That aspect of free choice that is completed in a decision by the will (and that takes on pejorative meanings of the unmotivated and the despotic from the middle of the eighteenth century), becomes the dominant one. *Kür* refers back to the verb *kiesen* (in the past-tense *kor*, with the past participle *gekoren*), which has the same sense as *wählen* (to choose), a meaning that is still retained, for example, in the "free program" in gymnastics, which are in effect called *Kür*, as in the *Kurfürst*, who is the elector prince. The unity of meaning is fully achieved when, through further etymological study, one takes into account that *wollen* (to will) has not only the

same root as *wählen* but also the same root as *wohl* (see WERT), which is combined in so many German terms to mean the well and the good; fulfilled or in a state of contentment, and related feelings of pleasure. It is surely this same possession of the power to choose, linked to the gratifying experience of sensible pleasures or happiness, that finds expression in Kant's definition of *Willkür* in his introduction to the *Metaphysics of Morals*:

> The faculty of desire in accordance with concepts, insofar as the ground determining it to action [*Bestimmungsgrund*] lies within itself and not in its object, is called *a faculty to do or to refrain from doing* [*zu tun oder zu lassen*] *as one pleases* [*nach Belieben*]. Insofar as it is joined with one's consciousness of the ability to bring about its object by one's actions it is called *choice* [*Willkür*].
>
> (*The Metaphysics of Morals*, trans. M. J. Gregor [German added within text; emphasis added to English])

The specific feature of *Willkür* lies indeed in the decision to act (in the sense of being "free to . . . ," being—supposedly— "master of . . ."), *nach Belieben*, that is, according to one's will and desires in whatever way seems "good" to us, as one "pleases." These directives of the will (*arbitre*) are linked to the satisfaction of our senses and feelings. Let us return to our initial question: from what does the word *frei* liberate the *Willkür* when the latter comes to be defined within the term *freie Willkür*? A good way to gain access to this metaphysics of *Willkür* is to examine German grammar more closely, focusing on the full play of *Will* within *Willkür*.

C. Grammar: Freedom and temporality

1. *Ich will*, preterite-present

Grammatically speaking, *ich will* (I want) is the first-person present indicative of the verb *wollen* (to want) in its use as an auxiliary mode, characterized specifically by the *past* form of its *present* —what grammarians call the preterite-present. Germanic languages contain a whole family of preterite-presents; they form a small, anomalous group in which the present tense shows the form of the strong preterite (the preterite being actions completed in the past, as in the French *passé simple*). Preterite-present verbs signify completed actions situated in the nonpast that are temporalized as present tense.

In addition to *ich will* from *wollen*, the list of verbs with a similar temporal modal function include the following:

- *ich kann*, from *könne* ("power to do" in the sense of "being capable of" and thus of "knowing how to" ([Fr. *savoir-faire*]), which links it to *Kunst*, to art in all its forms;
- *ich darf*, from *dürfen* (still as the "power to do," but this time in the sense of "being authorized," of having permission within the framework and limits of a "right");
- *ich mag*, from *mögen* ("to like" or even "to love"), but in relation to another sense of power: *möglich* (the power of being possible) or *Möglichkeit* (having the possibility).

- *ich soll*, from *sollen* ("ought" in the sense of "ought-to-be"), which very generally relates to the register of order (to make happen), in particular to obligation, especially an obligation that comes from a *Schuld* (a debt to be repaid or a fault to be redeemed);
- *ich muß*, from *müssen* (here again an "obligation," but in the sense of "needing to," in the register of necessity, generally in submission to a constraint, of a "de-fault" [French wordplay on *dé-faut*], of a lack that must be filled, of a need);
- and finally, *ich weiß*, from *wissen* ("to know" in the sense of being acquainted with or knowing what something is [Fr. *connaître*]), which also brings us back to *können* (Fr. *savoir-faire*, see first entry in this list) by passing through its other form, *kennen.*

Preterite-present verbs share the fact that they are imbued with an awareness of time. They contain, implicitly, the recollection of the subject's essential temporality (of action, including the very act of knowing itself). As auxiliaries (see ASPECT and PRESENT), they open past determinations to future expectations (uncertainties, promises, hypothetical projections). This family of preterite-presents is the element in which Kant's reflections live and breathe. In his critical philosophy what he calls the "interest of reason" is constantly being articulated in terms of these modal verbs. They saturate both the letter and spirit of his German. Salient examples may be found in a series of questions posed in the *Critique of Pure Reason* that encapsulate Kant's philosophical anxiety: *was* kann *ich wissen*? (what *can* I know?), *was* soll *ich tun*? (what *should* I do?), *was* darf *ich hoffen*? (what hope am I *permitted*?) (*Critique of Pure Reason*, B 833).

What story would "*ich will*" tell us if we asked it to unpack everything contained in its past form of the present, which in fact stretches toward its future? *Ich will* in German extends to a sense of "out of my present-day desire." It refers to the decision to update or not to update positions as a result of sampling, tasting, testing, and comparing the multiple "objects" of experience, determining the pleasure or displeasure such objects afford. The Kantian "choice" in its typical usage is signified precisely as a choosing faculty defined in the context of a *Begehrungsvermögen* (power of desire). It connotes actions that are the result of a representation or that arise from expectation of either an anticipated pleasure or a dreaded displeasure. It also implies decision-making that takes place in the ambiguous space between "what one can do" and "what one ought to do."

2. The persistence of the past

What Kant seems to stress when he qualifies the will as *frei*, is the *wollen* of the *Will-kür*; the power to "choose" (*wählen* as reiterated in -*kür*), released from all experience, from all circumstances in which diverse impulses and stimuli constrain behavior. Will is thus freed from everything impinging on it from the outside, including the sense of exteriority as such and the succession of time, with its inexorable flow. In the final analysis, how could the will be free if it continued to be a choosing in the thrall of time's passage? If to be free is to be *dominos compos sui* (master of oneself, master of one's own mind), what power would the will have over itself if in the passage of time there were no present but only a past that imposes form and content? As Kant often reminds us, "that which belongs to time past is no longer within the power of the acting subject" (*AK*, 5:94–95, 97).

Under the semblance of a "freedom of choice," reinforced by the German sense of *freie Willkür*, we understand Kantian "freedom" in all its rigor. In the terms set out in the introduction to the *Critique of Pure Reason* (B 1–3), freedom of the will is none other than the return of the will to an a priori order. But before we turn to the doctrinal implications of this provisional conclusion, it is worth lingering one last moment on what might be the effect on that family of modal auxiliaries when *freie Willkür* is liberated as *frei* from its *wollen*, which is to say from its *wählen*, and thus as a correlative also frees the present of this *wollen-wählen* from all that is indicated and endures in the form of *ich will*: the persistence of the past, the marks of a legacy, the weight of an empirical history. A whole chain of effects follows from the way in which modalities of freedom are signified within the preterite-present. Especially important are those instances in which the Kantian lesson finds its most memorable articulation, that is, where Kant tell us (and thereby legitimizes the recognition of freedom and its purview), that man wants what he ought, and thus what he can do (cf. *Critique of Practical Reason*, in *AK*, 5:159: "that one *can* do it because our own reason recognizes this as its command and says one *ought* to do it"; or *Anthropology from a Pragmatic Point of View*, in *AK*, 7:148: "what [the human] wills *at the order of his morally commanding reason* he *ought* to do and consequently *can* do").

Here, in the most direct way, *Wollen, Sollen*, and *Können* are bound together in solidarity. It is a solidarity that reminds us that every choice made in the *Wollen*, which is in fact a *Wählen*, is inscribed within the framework set up by all the various modal auxiliaries, insofar as each of them, in its present indicative, expresses the conclusion of a past. When the *Wollen* is freed from choice as determined by the past, isn't the *Sollen* liberated as well? Isn't the weight of debt lifted from its own obligation (*ich soll* does in fact mean "I have incurred a debt")? Isn't *Sollen* then released from its obligation to reimburse or repay the legacy of a fault in the form of original sin? What we discover is a will no longer subject to the "legal clause" that refers it back to a reductive motivation that sustains the illusion that it is independent or "quits" with the obsession with acquittal. The same solidarity also implies that *Können* can now be liberated from the long, painstaking process that makes it a *Kunst* or a *Kennen* (*ich kann* does in fact mean "I have finished learning, and now I know how to do it"). "Power" is freed from the skill and measure required for *savoir-faire* in relation to things and to men. So now we have an *arbiter* freed from the pragmatic clause that makes "techno-practical" intelligence the determinant of will, autonomous only insofar as it is instructed and trained.

WISDOM

I. The Twofold Meaning of Wisdom

1. *Sapientia* translates the Greek *sophia* [σοφία] and retains that term's twofold practical and theoretical orientation: the *sophos* [σοφός] is first a clever man, an expert, before he is a scientist. He is a life-model before he is a master of the sciences: see ART, MÊTIS.

   This happy conjunction that characterizes both Greek *sophia* and Latin *sapientia* can malfunction: the distinction drawn by Plato, and clearly marked by Cicero, between the *sophistês* [σοφιστής], the "sophist" who claims to know everything, and the *philosophos* [φιλόσοφος], the "philosopher" who is a lover of wisdom, also marks the dividing line between theory and practice, *scientia* and *sapientia*: see PRAXIS; cf. SOPHISM. On the relation between wisdom and philosophy in the various traditions, see EUROPE.

   The characteristic of the sage, which is connected with the key role played by Stoicism (cf. LOGOS and GLÜCK), nonetheless remains the conjunction of the greatest possible wisdom in the epistemological sense (science, knowledge) and also in the practical-ethical sense (prudence and/or detachment). But modern languages generally distinguish between theoretical wisdom and practical wisdom and retain for wisdom only the practical-ethical meaning: see, in addition to GLÜCK and LOGOS, PHRONÊSIS, PRUDENTIAL, *SOUCI,* VERGÜENZA.

2. More broadly, on practical-ethical wisdom, see CONSCIOUSNESS, DUTY, MORALS, *VIRTUE* [VIRTÙ, WERT].

   On knowledge and science, see EPISTEMOLOGY, GEISTESWISSENSCHAFTEN, *REASON* (particularly GERMAN, INTELLECT, INTELLECTUS, UNDERSTANDING).

On the relation between wisdom and ordinary life, see CLAIM, COMMON SENSE, ENGLISH.

On the relation between human wisdom and divine wisdom, see *ALLIANCE,* DEVIL, *INTUITION,* LIGHT, LOGOS, SVET.

II. The French Terms *Sagesse* and *Goût*

The French word *sage* (wise, good) is derived from classical Latin *sapidus*, "that which has taste, tasty," formed from the verb *sapere*, which means "to have taste, sense," but also "to have intelligence or judgment, appreciate," and finally "to be acquainted with something, understand, know." *Sapientia* (*sagesse*, "wisdom") was thus initially connected with taste, with the ability to assess, with discernment—and Thomas Aquinas is still aware of the etymology: "Doctrina per studium acquiritur, sapientia autem per infusionem habetur" (Doctrine is acquired by study, but wisdom is acquired by infusion; *Summa theologica*, 1.1a6): see GOÛT, and cf. SENSE.

➤ *CROYANCE, CULTURE, EXPERIENCE*, MADNESS, MENSCHHEIT, PATHOS, TRUTH

WITTICISM

A witticism is an instantaneous linguistic invention that is linked to the specific occasion in which it is used (see MOMENT, II), and that both engages and at the same time eludes its author.

Every age and every linguistic region has its own means of determining the value and the relevant traits of a witticism. INGENIUM discusses the elements of a comparison among, in the first place, the Greco-Latin, classical, humanist, and baroque traditions, in which a witticism is above all the sign of a natural gift (*euphuia* [εὐφυΐα]); the French *esprit* in the second place (see also FRENCH); and finally the Anglo-Saxon tradition of "wit" and of the *Witz* (from *wissen* [to know]).

The first tradition privileges the rhetorical and political aspect of the witticism: for Greek and Latin, see COMPARISON (the Greek word for a witty remark is *asteion* [ἀστεῖον], from *astu* [ἄστυ], "the town"; cf. COMPARISON, Box 1 for a treatment of this metaphor), and, for witticism in Italian (and still hewing to this tradition), ARGUTEZZA, CONCETTO; cf. CIVILTÀ and SPREZZATURA. For the emphasis on invention and cunning, see MÊTIS and the play on words described by Ulysses (MÊTIS, Box 1). Likewise, in Arabic, see INGENIUM, Box 1; cf. TALAṬṬUF.

The second tradition stresses the break in logic, and the relation to nonsense; see NONSENSE and *ABSURD.* English is particularly rich in nuance: wit, humor, joke, pun (see INGENIUM, Box 2).

The contemporary thematization of witticisms is linked to Freud, for whom *Witz*, along with dreams, stands out as one of the privileged roads to the unconscious (see UNCONSCIOUS). The Freudian *Witz* is discussed both in INGENIUM, IV, and in NONSENSE, IV, and in its relation to the signifier when adopted by Lacan, under SIGNIFIER/SIGNIFIED, V.

ITALIAN	*parola*
LATIN	*vox, verbum, dictio, locutio, muttum, pars orationis, vocabulum*
PORTUGUESE	*palavra*
ROMANIAN	*cuvânt*
RUSSIAN	*slovo* [слово]
SPANISH	*palabra*

➤ HOMONYM, LANGUAGE, LOGOS, PRÉDICABLE, PREDICATION, PROPOSITION, SENSE, SIGN, SIGNIFIER/SIGNIFIED, SUBJECT, TERM, *THING*

All European languages have a term that refers to an element of the language felt spontaneously to be distinct, grammatically and/or semantically, and that corresponds to the English term "word": Italian *parola*, Spanish *palabra*, Portuguese *palavra*, French *mot*, German *Wort*, Russian *slovo* [слово], etc.

This pleasing unanimity glosses over several questions, however. The first is knowing whether the word is a universal category. It is not in fact certain that in all languages there is a signifying unit perceived as autonomous by its speakers. Furthermore, even if we confine ourselves to the Greco-Roman tradition, this unit was constituted for its speakers in a way that was not independent of the process of the formation of its grammar. Finally, the designation of such a unit has been the object of so many political and religious debates over the centuries that its modern form was not established until the end of the seventeenth century.

In addition to this, whether we distinguish the minimal unit that is a word on the basis of criteria that are grammatical (morphology, function) or semantic, different words to say "word" are related to, or in competition with, each other, not only from one language to another but also within the same language, to the extent that there is sometimes no generic term, or no longer any generic term, to designate a "word." Thus, in Aristotle's *De intepretatione*, the word is made up of the pair *onoma-rhêma* [ὄνομα-ῥῆμα], "noun-verb," which constitutes *logos* [λόγος], so that when medieval commentators introduce *dictio* (the "word") as a generic term covering both *nomen* and *verbum*, it appears as a distortion.

Moreover, the terms that are continually reinvested from within other perspectives are particularly difficult to translate, terms such as *onoma* (word/name), *verbum* (word/verb), and at the confluence of several different traditions, *lexis* [λέξις] (speech, style, expression, articulate vocal sound, word) or *vox* (voice, word).

I. A Linguistic Entity? The Word as a Result of Grammar Formation

In Greek and in Latin, everyday language did not contain a term devoted specifically and monosemically to a linguistic entity that corresponded to the word and that was endowed with its general properties (Fruyt and Reichler-Béguelin, "La notion"; Lallot, "Le mot"). It was the predominance of parts of speech in the process of forming a grammar that placed the segmentation into words at the center of how language was discussed (see Auroux, *Histoire des idées linguistiques*, vol. 2). In the Hellenic graphic tradition, the norm was the *scriptio continua*, and the regular separation of words by a space did

not appear until later in the Byzantine era. As for the designation "word," which since Plato had been confused with that of "name," *onoma* [ὄνομα], from the Hellenistic period onward it was expressed by the term *lexis* [λέξις]: "word" was understood at that time to mean "part of speech." It was only with the grammarians in the Alexandrine tradition that the word came to be characterized as an autonomous segment with a single stress and meaning (see Lallot, "Le mot"). For Latin, it would seem that it was Varro (1 BCE) who named the word *verbum* (whose etymology was *verum boare*, "to proclaim what is true") in his *De lingua latina*.

Nevertheless, the polysemy of the word *verbum* was omnipresent for this author, who assigned it several meanings (Di Pasquale, "La notion"). This polysemy (see below) was evident in the first French-Latin dictionary, Jean Nicot's *Thresor de la langue françoyse tant ancienne que moderne* (1606), where the entry "Mot: *dictio, verbum*" contains a list of expressions in which the occurrence of the word *mot* is translated alternately as *verbum*, *dictio*, *oratio*, *vox*, *vocabulum*, *tessera*: "haec vox dominus," "dictum breviter," "prisca vocabula," "oratio capitalis," "vigiliarum tesserae," "pervetusta verba." This polysemy, which is still very much present in modern dictionaries through collocations, is as much indicative of the questions linked to the designation of the word as it is of the difficulties of translating the different terms that name it.

■ See Box 1.

II. The Word in Greek, Grammatical and Semantic Issues

A. *Onoma/rhêma*: "Word," "noun," "verb"

In Greek grammatical terminology, *onoma* and *rhêma* [ῥῆμα] refer to the basic constituent elements of *logos* ("statement, phrase"; see LOGOS), the noun and the verb. These are the preferred terms of *merismos* [μερισμός], the separation of the sentence into functionally different constituent parts. But this pair has a history, and the terms *onoma* and *rhêma* preexist their conjunction.

1. *Onoma* and *rhêma*: Two possible designations for "word"

The term *onoma* is intimately associated with the oldest and most elementary awareness of the referential function of language: language gives names to things, it is a nomenclature that has the world as its referent. Even though at this stage it is still not a question of "parts of speech," the elements of nomenclature are prototypically *substantives*, that is, nominal types of words that are applied to concrete—"substantial"—objects around us: it is quite likely that in the first instance these are proper names of people (Socrates, Zeus—it is important to note the Greek use of the definite article, so they would say *ho Sôkratês* [ὁ Σωκράτης], literally "the Socrates" or "the Zeus"; see SUBJECT). During this roughly pre-Platonic stage, *onomata* [ὀνόματα] in the plural refers to the "vocabulary" of a language, and the singular, *onoma*, to a "word" (proper noun, common noun, adjective, or verb). As for the other kinds of "words" (articles, pronouns, conjunctions, prepositions, particles, etc.), we can see that for Aristotle, in any case (*Poetics*, 20), all of this "small matter" of the language is classified, like syllables, as *phônai asêmoi* [φωναὶ

1

The word is not a universal category

The word poses a problem as a universal category. We know that it is extremely difficult for Western grammarians to deal with agglutinative and polysynthetic languages from the vantage point of the Western model of the dictionary of words, which presupposes a segmentation into units. In the cases where grammars were constituted independently of the Western model, the system of writing played a fundamental role. So in languages with logographic writing, such as Chinese, the unit is iconic and does not always correspond to a fixed acoustic image (the number "5" can be expressed as "five," *cinq*, *fünf*, etc.). In Chinese, two ideograms correspond partially to the word: the ideogram that translates the notion of word or term, the character *ci*, was only recently imported (after 1920), whereas the unit of analysis remains the character *zi* (Alleton, "Terminologie de la grammaire chinoise"). In certain cases, two systems can coexist, such as when the parts of speech derived from the Greco-Latin model are superimposed on the traditional units. The Japanese tradition thus has two terms: *kotoba* in everyday language, and *tango* as a grammatical term. Japanese presents a duality of the basic units, at present visualized through notation: the referential part (called either *kotoba* or *shi*, depending on the era) is notated as an "ideogram," and the syntactic or enunciative part (*teniha* or *ji*, depending on the era) is notated using syllables. The grammatization of Japanese by Western languages, in this case by the translation of Dutch grammars from the beginning of the nineteenth century, produced terms for the parts of speech that reduplicated those of the Japanese tradition. The terms ending in *-shi* correspond to the parts of speech (*dôshi*, verb) and translate the Dutch *woord*: those containing the Chinese root *-go* correspond to the functional groups (*shugo*, subject). Moreover, *-go* refers to lexical units: *tango*, "simple word"; *fuku-go*, "complex word" (Tamba, "Approche du signe et du 'sens'").

In the Greco-Roman tradition, the word was finally accepted as a unit by grammarians, by theologians, and by everyday language during the first few centuries of the Common Era. This did not, however, resolve the problems of designating this unit. If we confine ourselves to the Romance languages, we notice that there are in fact three terms that contribute to the naming of the word: *mot*, *verbe*, and *parole*. Romanian is an exception, since it is the only Romance language that does not have an equivalent of *parole*, and the word for mot is *cuvânt*, which comes from the Latin *conventus*, "assembly." The semantic shift from "assembly" to "conversation" then to "word" is apparent in other Balkan languages, such as ancient Bulgarian, Albanian, and Serbian, in which *kuvent* means "assembly," "conversation." Romanian also uses (at a more stylistic and familiar level) the noun *vorb ā*, meaning "speech," "way of speaking." In modern Greek, there is a very common word, *kouventa* [κουβέντα], also derived from the Latin, which means both "conversation" and "spoken word," "word." *Mot*, *parole*, and *verbe* were all present in their Latin forms, *muttum*, *parabola*, and *verbum*, as names for a unit of language, and one of these terms, in a given vernacular, would become the established term meaning word. We should also mention here historical, political, or religious reasons, and one would have to make a detour through the various etymologies.

BIBLIOGRAPHY

Tamba, Irène. "Approche du signe et du 'sens' linguistique à travers les systèmes d'écriture japonais." *Langages* 82 (1986): 83–100.

ἄσημοι], "vocal sounds that have no meaning" and in this respect is quite distinct from *onoma*, the first vocal sound to be recognized as "signifying" (*sêmantikê* [σημαντική]) in the ascending hierarchy that goes from the phoneme to speech in general.

This generic meaning of *onoma* would continue in Greek, including in the writings of the grammarians, well beyond the grammatical specification of the term that we will go on to discuss (so we can find in Galen [17A], who was certainly aware of the grammar of his time, the second century CE, the expression, the "*onoma* '*illainein*'" [τὸ ἰλλαίνειν ὄνομα], which is remarkable once we understand that that *illainein* is a verb).

Alongside *onoma*, a synchronically unmotivated term inherited in its prototypical sense of "proper noun" from a distant Indo-European past, the Greek language in its ancient period came up with a postverbal derivation with a very clear formation, *rhêma*, first attested in the sixth century BCE. As an integral part of the family of *rhêtôr* [ῥήτωρ], "orator"; *rhêsis* [ῥῆσις], "speech"; etc., *rhêma* is the action noun with a *-ma* ending derived from a root **wera-/*wre-*, meaning "to speak," "to say" (see Gr. Ϝερέω, "I will say," Lat. *verbum*, Ger. *Wort*, Eng. "word," etc.). As its formation suggests, *rhêma* seems initially to have designated something "said," a complex expression or a simple word, no doubt noted first of all for its semantic range, and then, in a more banal sense, any "word" as an instrument used to say something (an expression such as *kata rhêma apaggeilai* [κατὰ ῥῆμα ἀπαγγεῖλαι], "to report word for word" [Aeschines, *Peri tês parapresbeias*, 2.122] illustrates well this aspect of the materiality of saying), so in this respect it is explicitly opposed to "acts" and to "truth." Plato uses *rhêma* widely and does so at times in this loose sense of an unspecialized linguistic indicator (see *Timaeus*, 49e, where he refers to the demonstrative *tode* [τόδε]), which is more or less equivalent to *onoma*, and with which he alternates freely in the same contexts (*Laws*, 906c 3; see also in this same free variation, the composite noun *prosrhêma* [πρόσρημα] [*Politics*, 276b 4, *Phaedrus*, 238b 3], which refers initially, no doubt, to a form of salutation; see *chaire* [χαῖρε], "salute" [*Charmides*, 164e 1]).

2. Platonic pairs

We might conclude from the above that in Plato's time the Greek language invented, by different routes, two interchangeable words for "word" as an instrument of linguistic expression: *onoma* and *rhêma*. Although it is not essentially incorrect, this conclusion does not do full justice to the semantic richness of the pair *onoma/rhêma*. It is precisely in Plato that we can observe how the two terms, far from sinking into banality and a lack of differentiation, each develop in opposition to one other (in the Saussurean sense) its own semantic potentiality and produce a very unusual pair.

We can distinguish three types of contexts in which the pair regularly appears with a formulaic regularity that deserves our attention:

A. Typically "Cratylian" contexts, in which *rhêma* is opposed to *onoma* as the "etymological expression" is opposed to the "name" it accounts for, formally and semantically. So *Dii philos* [Διΐ φίλος], "dear to Zeus," is the underlying *rhêma* of the *onoma Diphilos* [Δίφιλος], "Diphilus" (399b 7, 421 1). This feature appears as a local analysis of the opposition between *onoma* as name (a single term that designates) and *rhêma* as expression (a syntagm with a predicative content), an opposition that is clear in the *Republic*, 463e, where *onomata* are names of relations ("father," "mother," etc.), and *rhêma* is a time-honored expression, such as "things are going well."

B. Contexts that have a rhetorical connotation. Here, the pair *onomata te kai rhêmata* [ὀνόματα τε καὶ ῥήματα] (sometimes in inverse order) refers to the variety of forms of linguistic expression that the masters of spoken language, orators (*Apology*, 17c 1; *Symposium*, 198b 5, see 199b 4; *Theaetetus*, 184c 1, see 168c) or poets (*Republic*, 601a 5), are capable of exploiting to aesthetic ends, whereas Socrates, who had no technical training, is content to speak with the words (*onomata*) that he happens to have been provided with (*eikêi legomena tois epituchousin onomasin* [εἰκῇ λεγόμενα τοῖς ἐπιτυχοῦσιν ὀνόμασιν]; *Apology*, 17c 2). Influenced by what we observed in group A, translators readily translate the pair as "words and expressions." A plausible alternative would be to consider that in the contexts in group B, we are dealing with a more-or-less redundant expression of the kind, "ways and customs": Plato can be seen, then, to have freely exploited the combination of two terms of weakly contrasting values in order to create an expression that "imitates" in its very superfluity the use of language it attempts to describe.

C. Contexts in which the pair *onoma-rhêma* is closely associated with *logos*. We can probably distinguish between two varieties here:

1. Typical of this variety is the first definition of *logos* in *Theaetetus* (206d 2): "make one's thought [*dianoia* (διάνοια)] manifest with one's voice using *rhêmata* and *onomata*." Although there is no question in this passage of a rhetorical *logos*, and although the paired expression certainly has no aesthetic connotation here, we could be very close to group B (see LOGOS). We would place in this section the passage from *Letter* 7, 342b, where the noun (*onoma*) *kuklos* [κύκλος], "circle," is opposed to the *logos*, "definition" of the circle, "composed of *onomata* and *rhêmata*" (see 343b 4), namely "that of which the extremities are always equidistant from the centre." There is clearly no question here of aesthetics, but it would be no less risky, as regards the *logos* of "circle," to claim to be able to say precisely what is *onoma* and what is *rhêma*—the French translators of the Belles Lettres edition (A. Diès for the *Theaetetus* and J. Souilhé for the *Letter 7*) are certainly making a bold statement in translating them as "nouns" and "verbs."

2. Although it is similar to the two passages quoted in C1 in that the *logos* is said there to be "composed of *onomata* and *rhêmata*," the famous passage from the *Sophist* 262a–e is decisively different on one point: *onomata* and *rhêmata* each have their own distinct definition and exemplification. The sui generis combination that is a "first and minimal" *logos*, such as "man learns," owes its singularity to the fact that it connects an *onoma* that designates an agent (*prattôn* [πράττων]), for example, "lion," "stag," or "horse," to a *rhêma* that designates an action (*praxis* [πρᾶξις]), for example, "walks," "runs," or "sleeps." *Onoma* and *rhêma* each have here, without question, an inalienable specificity of minimal, noninterchangeable constituent elements of the predicative statement, and they are prototypically represented by what grammar will call, with the help of the very terms Plato uses, *onoma* and *rhêma*, a "noun" and a "verb." We have to stress that this in no way implies that in the *Sophist onoma* and *rhêma* refer exclusively to the grammatical categories of "noun" and "verb": the only thing we can say is that *onoma* here designates a propositional constituent, typically a noun that is liable to function as a subject, and *rhêma* designates a propositional constituent, typically a verb that is liable to function as a predicate. That being the case, no single word can provide a satisfactory translation of these two terms. This in itself matters little, but what is important is that Plato was able to analyze a simple affirmative proposition in terms of its two fundamental constituent elements and to find in his language two terms capable of designating each one of these. The innovation of the *Sophist* would prove to be exceptionally productive.

3. Nouns and verbs

a. The Aristotelian polarity

Aristotle, for whom the functional pair appears to be a successful outcome of the analysis of *logos* as a simple affirmative statement, enriches the definitions of the two constituent terms and makes their relationship more symmetrical. In the *Peri hermêneias* (16a 19), *onoma* is defined as "a vocal sound, which has a conventional meaning, without reference to time, and no part of which has any meaning when it is taken separately" [φωνὴ σημαντικὴ κατὰ συνθήκην ἄνευ χρόνου, ἧς μηδὲν μέρος ἐστὶ σημαντικὸν κεχωρισμένον]. In the following chapter (16b 6), *rhêma* is defined as "that which adds to its own meaning the meaning of time, and it always indicates something that is affirmed by something" [τὸ προσσημαῖνον χρόνον, οὗ μέρος οὐδὲν σημαίνει χωρίς, καί ἐστιν ἀεὶ τῶν καθ' ἑτέρου λεγομένων σημεῖον]. *Rhêma* is thus clearly identified as conveying a predicative function and is functionally opposed to the substratum, or subject (*hupokeimenon* [ὑποκείμενον]). The insistence on the nonsignifying nature of the parts that *onoma* and *rhêma* can be broken down into has the effect of not allowing these terms to be applied to segments of more than one word: in "the little horse is white," the constituent subject "the little horse" is not a noun nor is the constituent predicate "is white" a verb, since

they each can be broken down into separate signifying parts. What was only implicitly explained in the *Sophist* thus becomes an intrinsic part of the definition of each of the terms: *onoma* is a single word that can occupy the subject position, typically a substantive noun, and *rhêma* is a single word that can occupy the predicate position, typically a verb. The latter is distinguished from the former by its capacity to "signify time as well": clearly one thinks here of the system of verbal inflection, which produces, among other things, temporally specific forms. Even though Aristotle from his own logical perspective refines his analysis by further restricting the application of *rhêma* to the verbal forms of the present (see PARONYM, Box 2) and that of *onoma* to the nominal nominative (which effectively corresponds to the form that the noun takes in the subject position), it is clear that he laid the foundations of a specifically grammatical understanding of "noun" and "verb."

b. Parts of speech

Stoic dialectics undoes the self-evident nature of the polarity between *onoma* and *rhêma* as it was defined by Plato and Aristotle, since *onoma* and *rhêma* are now seen as two of the five parts of speech presented in place of the vocal sound (*topos peri phônês* [τόπος περὶ φωνῆς]) and form part of the investigation concerning the signifier (see SIGNIFIER/SIGNIFIED).

Rhêma is defined by Diogenes Laertius (*Lives of Eminent Philosophers,* 7.58) as "an element of speech which cannot be declined, signifying a non-composite predicate" [στοιχεῖον λόγου ἄπτωτον σημαῖνον ἀσύνθετον κατηγόρημα], or by others as "an element of speech which cannot be declined, signifying what can be formed with one or several subjects, for example: (I) write, (I) say" [στοιχεῖον λόγου ἄπτωτον, σημαῖνόν τι συντακτὸν περί τινος ἤ τινων, οἷον γράφω, λέγω] (ibid.). In accordance with how Aristotle characterizes it, *rhêma* is here clearly presented as signifying a predicate—in other words, a morphological entity that, having no case, is opposed to the noun and its satellites; more precisely, in relation to the composite predicate "eats the mouse," which includes an oblique case, *rhêma* signifies the noncomposite predicate "eats." *Rhêma* thus seems to be the part of speech that signifies *a part* of what enables complete predication. The verb, since we need to call it by its name, is understood here by its subtraction as the part that has no case of a composite predicate (its definition also allows it to include the case of an intransitive verb that would constitute a predicate by itself).

In the same context, *onoma* means "proper noun," which is defined as "a part of speech designating a particular quality, like *Diogenes, Socrates*" and is distinct from *prosêgoria* [προσηγορία], the "appellative," which for its part is defined as "a part of speech signifying a common quality, like *man, horse*" (Diogenes Laertius, ibid.). After the initiative taken by Chrysippus, there is in Stoic dialectics no longer any generic term meaning a noun, whether proper or common.

Among grammarians, and most particularly Apollonius Dyscolus, the noun and the verb are considered, of all eight parts of the sentence (*merê logou* [μέρη λόγου]), to be "the most essential," "the most important," or even, "the most lively." Without a noun or a verb, indeed, no phrase is "complete" ("*sugkleietai* [συγκλείεται]"; Apollonius Dyscolus, *Syntax*, 1.14).

The other parts of the sentence fulfill auxiliary functions and are all related to the functions that the noun and the verb perform.

In the ordered list of parts of the sentence, the noun precedes the verb. Following on from Apollonius Dyscolus (*Syntax*, 1.16), the Alexandrine grammatical tradition—for example, Dionysius of Halicarnassus (*De compositione verborum*, 5)—almost unanimously justifies the precedence of the noun over the verb by the physical primacy of the body over its dispositions or of a substance over its accidents.

Among grammarians, *onoma* and *rhêma* are given new technical definitions, but the symmetry of these definitions means that they preserve the memory of the pair invented by Plato and incorporate the criterion of time introduced by Aristotle. In the *Technê grammatikê* of Dionysius Thrax, *onoma* is defined (chap. 12) as a "part of the sentence that has a case, designating a concrete entity, for example 'stone', or abstract, for example, 'education,'" and *rhêma* (chap. 13) as a "word [*lexis*, see below] that has no case, which includes tense, person and number, and which expresses the active or the passive." The personal inflection of a verb, which has no case, corresponds to the inflection of a noun, which has a case, and the verb opposes its temporal variation and diathetic flexibility to the stability of the entities reflected by the nouns. In Alexandria, the Stoic legacy is partially rejected: *onoma* restores the generic value that Chrysippus had taken away from it—"the appellative [*prosêgoria*] is classed as a kind of noun [*onoma*]" (*Technê grammatikê*, chap. 11). On the other hand, Apollonius Dyscolus remains faithful to the Stoic definition of the noun in terms of quality (*poiotês* [ποιότης]) and not of substance (*ousia* [οὐσία]) (ibid., chap. 12).The pair quality-substance is used to contrast the noun to the pronoun; for him a noun and a pronoun do not have the same attributes; indeed, a noun does not involve *deixis* [δεῖξις] but instead signifies quality, whereas a pronoun does have *deixis* but only signifies substance. One could say, then, that strictly speaking pronouns are "substantives" par excellence, whereas nouns are "qualifiers." Whereas all that "I," "this," etc. do is to point to a substance without describing it, "Socrates," "man," "big," "Greek," etc. in their own way each give some qualitative indication, whether the quality in question is given as something "proper" to a substantial individual (Socrates), as "common" to a class of substantial individuals (man), or as predicating a substance of which it will designate an "added" attribute—*epitheton* [ἐπίθετον]—(large), etc.

By including predicable terms, we might be concerned that *onoma* comes dangerously close to *rhêma*. For a grammarian, the protection against this danger resides in morphology: defined by the case inflection and having nothing to do with personal inflection, the noun could in no way be confused with the verb, which is also endowed with personal inflection and has no case inflection. So, for better or worse, the meanings of the two terms that Plato was the first to join together as a pair become stabilized in grammatical theory, but their values are still multiple and fluid.

B. *Lexis*

1. The evolution of the meaning of *lexis*

The gains made in the reflection on language that gave the specia lized meanings of "noun" and "verb" to *onoma* and

rhêma paradoxically deprived Greek of two potential designations of "word." Even though *onoma*, as we mentioned, could on occasion continue to designate a word once it had been given its specialized meaning of "noun," we can legitimately ask whether or not Greek grammatical vocabulary produced a specific term for "word." The answer is yes: in grammatical texts, the word for "word" is *lexis*, and this perfectly stable term remains the designation for "word" in modern Greek (demotic, *lexi*).

But *lexis* has a singular history that should also be mentioned. As an action noun derived from the root *leg-*, "to say," this term refers in principle to saying, as opposed to doing (*praxis*), (for example, Plato, *Republic*, 396c), but also as opposed to "the said." This latter distinction is stipulated by Plato as well, for instance in *Republic* 392c, where *lexis* is opposed to *logos* as the form of a linguistic expression is opposed to the content expressed—or the style opposed to the thought, if one prefers. This semantic orientation is clearly confirmed by Aristotle, who makes a distinction between *dianoia*, "thought," or the "faculty of saying . . . the appropriate thing," and *lexis*, "expression," or "manifestation, interpretation [of the thought] by means of its being put into words" (*tên dia tês onomasias hermêneian* [τὴν διὰ τῆς ὀνομασίας ἑρμηνείαν]; *Poetics*, 6.1450b 14–15), whose "figures," *schêmata tês lexeôs* [σχήματα τῆς λέξεως], refer both to an actor's vocal schema for asking or demanding and to the varieties of an enthymeme or the morphology of an expression. This same opposition structures the argument of *Rhetoric*, which makes a distinction between "what is to be said," the *dianoia*, and "how it is to be said," the *lexis* (3.1.1403b 15). The meaning of *lexis* as "style" will continue in Greek well beyond the appearance of its meaning of "word": in the entire Alexandrine and Byzantine tradition, *lexis pezê* [λέξις πεζή], like its Latin calque *sermo pedestris*, will be the technical designation for prose, as opposed to metrical expression, *lexis emmetros* [λέξις ἔμμετρος].

In Aristotle, *On Sophistical Refutations* forces us to widen the meaning of the term, so it is closer to the Saussurean signifier than to style. Aristotle in fact makes a distinction between two tropes of refutation: those that are "*exô tês lexeôs* [ἔξω τῆς λέξεως]" (*extra dictionem*, "outside expression," "independent of speech"), which are designed to dispel the errors of reasoning produced in particular by the confusions between the different meanings of being; and those that are "*para tên lexin* [παρὰ τὴν λέξιν]" (*in dictio*, "tied to expression," "part of speech"), which are designed to dispel the confusions produced by the very materiality of language (homonymy and amphiboly, composition, separation, accentuation, morphology of expression: 4.165b 23–27). In the examples he uses to support his argument, we can see that what comes under *lexis* is what we would nowadays call the signifier, via the play of audible meanings in the sounds of the language (thus, *sigônta legein* [σιγῶντα λέγειν] is an amphiboly that can be understood both in the sense of 'to speak of mute things,' neuter plural, and 'to speak by being silent,' masculine singular: 4.166a 12–14; 10.17a 7–10.17b 2; 19.177a 20–26). But these illusions are highlighted in order to be dispelled with the aid of the tools of the categories and of grammar (see HOMONYM).

▪ See Box 2.

The Stoics, who invented the analysis of language in terms of signifier/signified/referent, thematize this relationship between *lexis* and signifier and define *lexis* as one of the three moments of the signifier that may or may not present a meaning (see SIGNIFIER/SIGNIFIED, and below, 2). Nothing is said, however, either by Aristotle or the Stoics, of the dimension of *lexis*, and articulate vocal sound could correspond equally to a syllable, a word, or a succession of words. It is not easy to explain precisely how, from there, the shift in meaning occurred that led grammarians to define *lexis* as referring to "the smallest part of the sentence constructed" (*meros elachiston tou kata suntaxin logou* [μέρος ἐλάχιστον τοῦ κατὰ σύνταξιν λόγου]; Dionysus Thrax, *Technê grammatikê*, chap. 11). It is possible, as Baratin has suggested ("Les origines stoïciennes"), that grammarians, while retaining the intermediary position that the Stoics had assigned to *lexis* (between an inarticulate sound and a statement as a site of meaning), also used the term to refer to an intermediary unit, the word, as a compound of syllables devoid of signification and as a unit in a signifying sentence. While remaining faithful in part to the Stoic analysis, this new meaning of *lexis* had the unquestionable advantage for the grammarians of Alexandria, philologists that they were, of finding a concrete application and a functional usefulness for this term in the field of textual studies. The word, as a minimal signifier resulting from the segmentation of *logos*, constituted a precious empirical entity that ancient grammar would make into its object par excellence. Its definition, even in the *Technê* of Dionysus mentioned earlier, explains that *lexis* (word) and *meros logou* (part of a sentence) are strictly interchangeable and alternate in free variation.

We can thus see how, after having allocated to the terms *onoma* and *rhêma* the designation of specific parts of speech that could, at least in some instances for the latter, refer to the word, the Greek language ended up taking *lexis* as a truly generic name for the word as a minimal signifying unit. It would later on derive the name for a collection of words from it, *lexikon* [λεξικὸν] (*biblion* [βιβλίον]), the ancestor of our "dictionary," which itself is derived from *dictio*, the Latin calque for *lexis*. The most ancient collections of words, simply entitled *Lexeis* [Λέξεις], "words," or *Glôssai* [Γλῶσσαι], "strange words," did not at all claim to be exhaustive but were lists of words that were, for one reason or another, marginal to the reference idiom (obsolete words, dialect words, etc.). (On *glôssa* [γλῶσσα], see Aristotle, *Poetics*, 1457b 4; *glôssarion* [γλώσσαριον], "glossary," is a late derivation.)

2. The tripartite Stoic division into *phônê, lexis,* and *logos* and the change of perspective in relation to Aristotle

We have to give a particular mention here to the Stoic reinvestment of Aristotelian terms, which are placed in a new order. This blurring, which is the sign of a doctrinal will, is the only way we can understand the terminological complexity of someone like Boethius, for example, who superimposes or assimilates these different usages.

For the Stoics, *lexis* is the second of the three stages of the signifier (see SIGNIFIER/SIGNIFIED; on this, see Diogenes Laertius, *Lives of Eminent Philosophers*, 7.56–57). The first stage is the *phônê*: it is both a generic term, since the signifier is

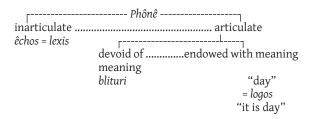
2

Schêma tês lexeôs and the schêma in grammar

► COMPARISON, *FORM*, *IDEA*, SPECIES, TROPE

Schêma [σχῆμα], documented in Greek from 5 BCE onward, is a nominal derivation constructed from the root σχε/ο- of the verb *echein* [ἔχειν], "to hold," "to have," and intransitively, "to stand," "to be in such and such a condition": semantically, *schêma* is related to the intransitive value of the verb and so refers primarily to the "way one stands." This basic meaning took on many more specific and diverse meanings during the fifth and sixth centuries: it is variously translated according to the context as "stature," "posture or pose," "look," "style," "configuration," "figure (including geometrical)," "form." *Schêma*, one of the Greek names for "form," refers usually to a complex configuration; in geometry, it is a closed figure.

In Aristotle, we see quite a wide variety of applications of *schêma* in the domain of language: configurations of the mouth allow the air to be shaped into distinct sounds, characteristic morphological features of certain classes of signifiers, the modulation of an utterance to assist modal differentiation, and syntactic and rhetorical configurations. Several of these meanings are conveyed by the syntagm *schêma tês lexeôs* [σχῆμα τῆς λέξεως], which can be translated literally as "figure of expression." Post-Aristotelian rhetoric would retain *schêma* to refer generically to any unusual turn of phrase: via the intermediate stage of the Latin translation *figura*, the *schêma* of Greek orators would become the *figure* of classical rhetoric.

Grammatical theory, which we can see being formed as of 2 BCE, would retain, alongside a diverse and loosely specified usage of *schêma* as the name for a form, three clearly technical kinds of usage:


– In inflectional morphology, *schêma* forms the basis of a family of words describing the phenomenon of the variation of meaning of inflected words: at the heart of this family, *metaschêmatismos* [μετασχηματισμός], literally "trans-formation," applies principally to the case variation of nominals and to the variation in person of verbs;
– In lexical morphology, *schêma*, "figure," refers to the *simple or compound* status of a word. Three *schêmata* can be distinguished: the simple (for example, *Memnôn* [Μέμνων]), the compound (for example, *Aga-memnôn* [Ἀγα-μέμνων]), and the derivation of a compound (for example, *Aga-mem-non-idês* [Ἀγα-μεμνον-ίδης]). Why *schêma* was applied to this particular type of morphological feature is not clear: commentators would later on (for want of a better reason?) suggest that the greater or lesser complexity of the word gives it the "look" of a type, comparable to the poses (*schêmata*) of a statue;
– In syntax, based on the rhetorical meaning of "figure" as an unusual turn of phrase, *schêma* would acquire the specialized meaning of "deviant turn of phrase in relation to the syntactic norm." As an anomalous turn of phrase that is in theory incorrect, *schêma* can, however, become an acceptable part of the language whenever an ennobling origin can be assigned to it, which can be found either in a dialect (an Attic figure, a Boeotian figure, etc.), or in a renowned author (a Pindaric figure, a Sophoclean figure, etc.). One commentator combines the defining characteristics of syntactic *schêma* in a striking expression: a *schêma* is, he says, an "excusable error."

studied in treatises *Peri phônês* (*On Sound*), and the basic signifier as a physical body, that is, air that is percussed as an effect of an animal impulse (*hormê* [ὁρμή]) or of a human reflection (*dianoia*), which goes from the sender to the receiver. Thus specified, the *phônê* is not as such articulate (it can be animal, and then it is an *êchos* [ἦχος], a "noise" that is not written), and it certainly does not carry meaning. The second stage is then the *lexis*, which is a *phônê eggrammatos* [φωνὴ ἐγγράμματος], a sound (this time, *phônê* tends to be translated as "voice") that lends itself to writing, and the "letters" that make it up (*stoicheia* [στοιχεῖα]) are a guarantee of articulation (*enarthron* [ἔναρθρον]; ibid., 7.57): for example *hêmera* [ἡμέρα], "day" (ibid., 7.56). It is *lexis* that is properly human, but it is quite remarkable that it should be defined as not necessarily carrying meaning (*asêmos* [ἄσημος]): *blituri* [βλίτυρι], an onomatopoeia imitating the sound of a vibrating string, is as much a "lexical item," or *lexie*, as "day." In fact, only the *logos*, the final stage of the "vocal sound endowed with meaning impelled by a reflection" (*phônê sêmantikê apo dianoias ekpempomenê* [φωνὴ σημαντικὴ ἀπὸ διανοίας ἐκπεμπομένη]; ibid.), is at once a voice that is articulate and that carries meaning; for example, *hêmera esti* [ἡμέρα ἐστι], the statement from a sentence implying, by means of a conjugation, something like an event, "it is day." The summary at the end is clear: "The *phônê* differs from the *lexis* in that the *phônê* can be a noise, whereas the *lexis* is always something articulate. The *lexis* differs from the *logos*, because the *logos* always has meaning (*aei sêmantikos* [ἀεὶ σημαντικός]), whereas the *lexis* can be devoid of meaning (*kai asêmos* [καὶ ἄσημος]), for example, *blituri*, but never the *logos* (ibid., 7.57). This can be illustrated by the following diagram:

```
┌---------------------- Phônê ------------------┐
inarticulate ................................................ articulate
êchos = lexis                              └-----------------------┐
                              ┌------------------------┘
                         devoid of ..............endowed with meaning
                         meaning
                         blituri                        "day"
                                                        = logos
                                                        "it is day"
```

Claude Imbert remarks that "the Stoic terms seem to have been deliberately chosen to contradict Aristotelian semantics" ("Théorie de la représentation"). It is not the word as such, whether a noun or a verb, that constitutes the signifying unit, as it does at the beginning of *De interpretatione*, but rather the statement—obviously an entirely different way of apprehending the world, in terms of events and not of substances or in terms of a narrative of action and not of predicative syntax; in short, an entirely different "phenomenology."

First of all, the Stoic *phônê* is not the Aristotelian *phônê*. Aristotle defines *phônê* in *De anima* as "a certain noise [*psophos* (ψόφος)] produced by an animate being" (2.8.420b 5; see *De historia animalium*, 1.1 and 4.9): this "noise" applies to man as well as to an animal, and the definition goes from noise to voice by means of a certain number of physical dichotomies, each determining a category of exemptions (the sound made by an animate being—not flutes; produced by a movement of the air inside—not fish, but dolphins; striking the trachea-artery—not a cough). This definition appears to be compatible initially with the Stoic definition until it intersects with another kind of prerequisite, presented as self-evident by means of a simple "and," which I will quote here for emphasis:

> Not all sound emitted by an animal is a voice, as we have said (since we can make a noise with our tongue or by coughing), but what strikes has to be animate and accompanied by a certain representation [*meta phantasias tinos* (μετὰ φαντασίας τινός)], since the voice is of course a semantic noise [*sêmantikos gar de tis psophos estin hê phônê* (σημαντικὸς γὰρ δέ τις ψόφος ἐστὶν ἡ φωνή)].

> (Aristotle, *De anima*, 420b 29–33)

The "voice" in Aristotle is a kind of noise that already involves articulation (it is said to be *dialekton* [διάλεκτον; 420b 18], with the same property, precisely the property of articulation, as the *lexis* of the Stoics) and meaning (it is said to be *hermêmeia* [ἑρμηνεία; 420b 19 ff.], having this time the same particularity, meaning, as their *logos*). So the three levels that the Stoics chose to keep distinct are collapsed here, three levels that in Aristotle gravitate toward, so to speak, this last one the "end" and the "good," which, beyond animal impulse, constitutes meaning for man: "A living being has . . . hearing so that meaning can be conveyed to him, and a tongue so that he can convey meaning to someone else" (ibid., 435b 19–25). We might say that all the Stoics did, in the end, was to move Aristotle's sequence forward a notch, giving the name *phônê*, "vocal sound," to what he had chosen to call *psophos*, "noise." What it involves, however, is a shift in the very direction of the hierarchies: noise can be, and even must be, envisaged independently of meaning. Whereas the Aristotelian *lexis*, particularly in *On Sophistical Refutations*, was at first an analytical tool and involved initially through the definition of homonymy in a relationship to the signified, the Stoic *logos* is conceived, conversely, in terms of the category of the signifier, as a particular kind of *lexis*. At the same time, the requirement of fullness of meaning that defines *logos* means that the most relevant unit has no longer to do with the word, whether it is *onoma* or *lexis*.

III. The Words Designating "Word" in Latin

A. *Dictio, locutio, pars orationis, verbum, vocabulum, vox*: Distinctions and polysemies

In Latin, the word is understood as form, as the combination of form and meaning, and, finally, as a linguistic category.

As form, the term for word is *vox*. This term, which originally meant "voice," "phonic matter" (and it retains this meaning at all times), becomes the object of all sorts of classifications, depending on whether the *vox* is *articulate* or *confused*, can or cannot be *written*, etc. When it applies to linguistic entities, *vox* is used to designate their form and, insofar as the word is the natural frame of reference for etymological, semantic, and morphological analysis, *vox* signifies the form of the word: so Varro contrasts the *vox* and the *significatio* of the word (*De lingua latina*, 9.38–39; 10.77), *vox* being "what is made up of syllables," "what is heard," as opposed to what the word means. *Vox* thus also refers at the same time to the different forms that appear as the variables of a same word or as the inflected forms of a declined or conjugated word: *Aemilius* is a word, but this form itself is the nominative and all of the oblique corresponding forms (*Aemiliu, Aemilii, Aemilio*, etc.) are *discrimina vocis*, variable forms of this word. Varro's text (ibid., 8.10) clearly suggests a dissociation between the notions of *word* and of *form*, insofar as a *single* word can have *several* forms if it is inflected. *Vox* is thus one of the forms of word, but at the same time refers, in the concrete reality of its realizations, to a particular word (*Aemilius*, or *Aemilium, Aemilii*, etc.).

Identified in this way with the word, and unlike its synonyms *forma* and *figura*, which are less determinate, *vox* is even used by Varro to signify the word in relation to the thing (ibid., 10.69 and 72). This use is also attested in Quintilian (*De institutione oratoria*, 1.5.2) and is occasionally found in the texts of the grammarians. However, it remains an exception in relation to the two original terms used to designate the word, *verbum* and *vocabulum*.

The first characteristic of *verbum* in Varro is that it is presented as being at the heart of a process of signification, between *vox*, which is the means by which the *verbum* signifies, and *res*, which is what the *verbum* signifies (*De lingua latina*, 10.77, and see 9.38–39, where *verbum* is defined as the combination of a *vox* and a *significatio*).

These two terms are polysemic at all times. *Verbum* in fact also signifies "verb," beginning with Varro and then constantly among grammarians. Another specialized use appears with Saint Augustine, in the *De dialectica*, with a very particular distinction between *verbum*, or a word "when it is spoken for itself," that is, when it "only refers to itself," and *dictio*, or a word when it is used "to signify something else."

■ See Box 3.

Vocabulum alternates in Varro's work with *verbum*, with no apparent nuance (see for example *De lingua latina*, 6.1 or 9.1), and pairs up with *res* in the contrast of the word and the thing. *Vocabulum* is itself also polysemic, but whereas *verbum* signifies the verb, *vocabulum* signifies the noun, exactly opposed to *verbum* (ibid., 8.11, 9.9). At the other end of the history of the Latin language, Priscian suggests moreover that *nomen*, a term normally used to signify a noun, could also be used as a generic term for "word." So there would have been a perfect parallelism between *vocabulum* and *nomen*, both able to correspond to both noun and word, but with *vocabulum* signifying primarily a word and secondarily a noun, and *nomen* the other way around (this use of *nomen* is, however, only documented by Priscian). Another specialized use of *vocabulum* appears in the texts of the grammarians, where this term is sometimes cited as representing a specialized category of common nouns, those which designate concrete objects, as opposed to abstract common nouns (see Dositheus

Verbum, dicibile, dictio, res: St. Augustine, *De Dialectica*, 5.8

Haec ergo quattuor distinct teneantur: verbum, dicibile, dictio, res. Quod dixi verbum, et verbum est et verbum significant. Quod dixit dicibile, verbum est, nec tamen verbum, sed quod in verbo intellegitur et animo continetur, significat. Quod dixi dictionem, verbum est, sed quod jam illa duo simul id est et ipsum verbum et quod fit in animo per verbum significat. Quod dixi rem, verbum est, quod praeter illa tria quae dicta sunt quidquid restat significat.

(These four terms must be kept distinct: *verbum*, *dicibile*, *dictio*, *res*. What I call *verbum* both is a word and means "word." What I call *dicibile* is a word but does not signify "word," but what is understood in the word and what is contained in the soul. What I call *dictio* is a word, but signifies together the two preceding meanings, that is, the word and what is produced in the soul by the word. What I call *res* is a word and signifies everything else, that is, everything not signified by the three preceding words.)

The young Augustine, in his *De dialectica*, introduces a four-term system: *verbum*, *dicibile*, *dictio*, *res*. The passage quoted makes clear the distance he takes in relation to Stoic dialectics: Augustine considers that it is the simple term, and not the statement, that is "the meeting point between the signifier and the signified." The *verbum* is a sign of a thing (*verba sunt signa rerum*), and the sign is what is offered to the senses and, in addition, shows something to the soul (*signum est quod se ipsum sensui, et praeter se aliquid animo ostendit*). The *verbum* is the word understood insofar as it refers to itself, thus independently of its relation of meaning to something else, and this sense becomes manifest in a metalinguistic context. The word "autonym" is sometimes used in this respect. This does indeed correspond to something of this kind, but on condition that one does not give too restricted a definition of the signified of autonym. Augustine's *verbum* corresponds to a use that is a mention; that is, it does have its signified but is not used to manifest this signified. This usage of *verbum* is not attested among grammarians. The *dicibile* is the mental content associated with the word, which Augustine sometimes says is anterior to the utterance of the word, sometimes simply contained within the word, and sometimes even what is given to be understood in the

mind or soul of the listener. The *dictio* is the word insofar as it is uttered to signify something: it is a *verbum* taken in its relation to a *dicibile*. The *res* is everything that is not yet either expressed by a word nor conceived by the mind, whether or not there is a word that can signify it. So if a grammar teacher takes the first word of the *Aeneid*—*arma*—and asks about its grammatical category, he takes it in itself as a *verbum*, whereas in the line by Virgil, it is a *dictio*, used to signify arms. These same arms, insofar as they were in fact borne, could be pointed at and are in that case neither *verba*, nor *dicibilia*, nor *dictiones*, but *res*. Augustine is keenly aware of the distinction between the linguistic level and the metalinguistic level: all of the terms—*verbum*, *dicibile*, *dictio* and *res*—are *verba* when they are part of statements that refer to themselves, but *dictiones* when they are understood in terms of their relation to the mental content that corresponds to them and things. The rest of *De dialectica* attempted to examine the value of words that are used in argumentation, either understood in and of themselves or in terms of their relation to what they signify. These relations can be seen from the original point at which they are established (the discussion about whether the nature of this connection is natural or not) or according to the way in which they work in synchrony, with all of the potential for discordance because of the equivocality and obscurity that can affect them.

One question for French translators is knowing whether to use *mot* for *verbum* or for *dictio*: Baratin and Desbordes (*L'analyse linguistique*) chose the first solution, even though in *De dialectica verbum* sometimes appears to be equivalent to the simple signifier: they translate *dictio* as *dit* [thing said] in order to keep the close connection with the mental content of *dictio*, the *dicibile*. It is not possible to translate *res* as "referent" because this term is relational: while *res* can be the *res* of a sign, it is not necessarily so. In the *De doctrina Christiana*, the term *res* gathers together all the elements of the world, with signs constituting a subset. Shortly before the passage cited earlier, Augustine defined the thing as "everything that is perceptible to the senses or to the intellect, or which escapes perception" (*Res est quidquid vel sentitur vel intelligitur vel latet*). In the passage cited, *res* are all the things which are not in some relation to a signifier— just like actual weapons if they are considered

as material objects, and not as things that can be signified by the word "arm" (whether this is understood as *verbum*, and does not refer to them in speech, or whether it is understood as *dictio*, and is used to signify these arms) or that can be the mental contents associated with this word. In the English translation, Darrell Jackson translates *verbum* as *word*, notably in the initial definition in chapter 5 ("verbum est uniuscujusque rei signum" [a word is a sign of any sort of thing]), but when it is a question of the four-term system, he keeps them in the Latin (which gives for the Latin sentence "Quod dixit verbum, et verbum est et verbum significat" [see above], and for the translation: " 'verbum' both is a word and signifies a word"). In his Italian translation, Mariano Baldassarri interprets the passage in light of Stoic dialectics, which introduces some confusion, since he makes *sêmainon* [σημαῖνον] correspond to both *signum* and *verbum* (equivalent to the signifier alone) but also posits *verbum* as equivalent to *phônê*; he interprets *dictio* as *lexis sêmantikê* [λέξις σημαντική], *dicibile* as *lekton* [λεκτόν], and *res* as *tughkanon* [τυγχάνον]. These problems of translation ultimately depend on the weight assigned to the Stoic influence in the writing of *De dialectica*.

Magister in RT: *Grammatici latini*, 7:390, l. 16), or inanimate objects (see Diomedes in RT: *Grammatici latini*, 1:320, l. 23).

Perhaps in order to clarify a terminology suffering from these phenomena of polysemy (this is Quintilian's interpretation, at least in relation to *verbum* [*De institutione oratoria*, 1.5.2]), these different terms were subsequently supplanted by *dictio*, which appears in the sense of "word" after Varro.

The fundamental characteristic of *dictio* is that it is made up, like *verbum*, of a signifier and a signified: Diomedes (ibid., 7:436, l. 10) defines this term as "vox articulate cum aliqua significatione" (an articulate vocal sound with a meaning). Similarly Priscian, while readily acknowledging that a *dictio* can have only one syllable, makes a careful distinction between the syllable, as a signifier without a signified, and the *dictio*, which has a signified (RT: *Grammatici latini*, 3:3, ll. 13–18). The use of *dictio* by St. Augustine in *De dialectica* is based on this same contrast.

Dictio can, however, also be contrasted with *sensus*, that is, to the signified alone: when it is a question of accounting for the phenomena of syllepsis (agreements with more than one meaning), for example, in the case where the subject of a plural verb is *pars* (part), a singular that we would call collective (in an expression such as "part of them are cutting out pieces . . ."), Priscian remarks that the verb "relates not to the *dictio*, but to the *sensus*, that is, to what we understand by the word in the singular" (RT: *Grammatici latini*, 3:201, ll. 22–23). To relate the verb to the *dictio* would have consisted in matching it to the form of the word *pars*, which is singular, to get to the signified "singular," whereas relating it to the *sensus* consists in starting with the meaning "part" and then inferring that it can apply to a plurality of persons, so it therefore contains the signified "plural."

There is a sort of parallelism between the disjunction of word and form in Varro, and the disjunction between a word and its sense in Priscian (a single word, but more than one sense, that which corresponds to the form and another).

Dictio, moreover, can be understood within a hierarchical perspective as the constituent part of a much larger whole. This is how Diomedes explains the relationship between the *dictio* and the *oratio* (statement)—by emphasizing that the statement is a construction of which the *dictio* is the unit ("*dictio . . . ex qua instruitur oratio et in quam resolvitur*" [the word . . . from which the statement is formed and in which this statement is resolved (that is, is analyzed)]; ibid., 1:436, l. 10). Priscian likewise notes that the *dictio* is the "pars minima orationis constructae" (the smallest part of the constructed statement).

The most frequent expression, however, for designating the word as a constituent of a much larger whole is *pars orationis*. The meaning of the whole that is referred to here, *oratio*, is not obvious. For Varro, *oratio* can apply to the language in its entirety (*De lingua latina*, 8.1 or 44, etc.), and in this sense, the *partes orationis* are the main divisions of the language, the "categories of words." But elsewhere *oratio* also means "statement," and it is indeed in this sense that Priscian, just like all the grammarians, understands the *partes orationis*, as the "constituent parts of the statement." However one understands it, *pars orationis* signifies the word as a set of traits (*accidentia*) such as gender, number, person, tense, etc. in a system in which each set of traits is in contrast to the others, just as the noun is in contrast to the verb or to the pronoun.

One last term appears as a way of saying word: *locutio*, already documented in Quintilian (*De institutione oratoria*, 1.5.2), but its uses in this sense are rare and isolated.

B. The double meaning of *vox* in the Middle Ages

1. The semantic understandings: Aristotle, the Stoics, Boethius

Vox is used among Latin grammarians, along with *verbum*, *vocabulum*, and *dictio*, to designate the word. All through the Middle Ages, the term *vox* will keep the two meanings Boethius gives to it, that is, "vocal matter" and "vocal sound endowed with signification," which for him are merged because of the two sources that are in the background of his commentaries on the *Peri hermêneias* (*Commentarii in librum*). The term *vox*, at the start of the second commentary, is defined on the one hand in Aristotelian terms: the *vox* is the result of the tongue striking the air and is produced with some intended meaning. But elsewhere, Boethius uses *vox* to translate *phônê* on the basis of the Stoic tripartite division *phônê*, *lexis*, *logos* (see above, II.B.2), which he renders as *vox*, *locutio*, *interpretatio*. The hiatus is clear: signification is present in the first definition, whereas in the economy of the Stoic system, signification does not take place at the level of the *phônê-vox*, rather only at the third level, with the second level, as we saw earlier, being one of articulation (the fact of being made up of letters or of discrete sounds: thus, *blituri* is a *lexis* but not a *logos*).

With Boethius, the problem resurfaces and becomes even more confused once we move on to the question of the parts. What he understands by the expression *partes locutionis*, because of the translation of the Stoic Greek *lexis* as *locutio*, is the *merê lexeôs* [μέρη λέξεως] of Aristotle's *Poetics* (elements, syllables, conjunctions, articles, nouns, cases, verbs, *orationes*), and by *partes interpretationis* (because of the equivalence of *logos* and *interpretatio*), the *merê logou* of Aristotle's *Peri hermêneias* (noun, verb, *oratio*), although he also talks about *partes orationis*, taking *oratio* in the stricter sense of "minimal statement" (noun, verb). Later tradition will generally leave this lack of precision aside and will focus on how Boethius uses these terms, not on his definitions. Indeed, in his commentaries on logic, Boethius uses *vox* to refer to any articulate expression, which can be meaningful or not and may, if it *is* significant, have been the object of an imposition and thus signify *ad placitum*, or may signify "naturally" (see SIGN). It is this term that forms part of the triad *vox*, *intellectus*, *res* in the first chapter of the *Peri hermêneias*. *Sermo* is sometimes used when it is a question of mentioning or talking about a word ("*hic sermo homo*," "*hic sermo lexis*"; Boethius, *Commentarii in librum*). Elsewhere, however, *vox* alternates with other terms, notably at the beginning of the commentary on the *Categories*, a work which, according to Boethius, deals with "*de primis vocibus* [the first *voces*]" (RT: *PL*, vol. 64, col. 161A), "*sermonibus prima rerum genera significantibus* [*sermones* signifying the first types of things]" (col. 162B), and in the same context we find the term *vocabula* (col. 162D).

■ See Box 4.

When *De anima* (2.8.420b 5ff.) began to be reread at the beginning of the thirteenth century, particularly with

4

Vocales and *Nominales*

The question of the origin of the term *Nominales*, used in the eleventh century, has given rise to an interesting debate. Were the *Nominales* partisans of a particular position on universals, which considered genera and species to be names (*nomina*), or were they defenders of the so-called theory of the *unita nominis*, the unity of the name? According to this latter theory, the three vocal expressions (*voces*) *albus*, *alba*, *album* constitute one and the same name (*nomen*), and based on this assertion, certain theologians have maintained that the three complex statements or expressions "Christ is going to be born," "Christ is born," "Christ will be born" correspond to one and the same enunciable (*enuntiabile*), which constitutes the eternal and sole object of faith (see DICTUM). The debate was not settled, nor was the question of knowing whether Abelard was dubbed the "prince of Nominals [*Princeps Nominalium*]" (Walter Map, 1181) by virtue of his position on universals. The interesting point regarding universals is that the *Nominales* are in reality the successors of the *Vocales*, and that strictly speaking, Roscelin de Compiègne and Abelard are *Vocales*, and indeed, for them, genera and species are *voces*. The first accounts of the existence of this current of thought, which appeared around 1060–70, show that it was originally concerned with a discussion about how to engage in dialectics, that is, how to read and interpret Porphyrius's *Isagoge* and Aristotle's *Categories*, and thus about the primary object of these texts and of dialectics: in other words, did Porphyrius and Aristotle aim to deal with vocal sounds or things (*de rebus de vocibus agere*) (see Iwakuma, "*Vocales* or Early Nominalists")? Boethius's position is not clear: in the *Categories* (RT: *PL*, vol. 64, col. 160A), he maintains that Aristotle's aim was to talk about *voces*, but he also describes the categories as "first names of things" (*de primis rerum nominibus*; col. 159C), and also says

that species "are in certain sense names of names" (*nomina nominum*; col. 176D). In the commentaries on the *Isagoge*, he agrees with *Porphyrius* in saying that predicables are *res*. Those who, like Roscelin, maintain that universals are *voces* (the *sententia vocum*) are until the middle of the twelfth century called *Vocales*. Abelard clearly seems uncomfortable with the imprecision of the term *vox*. He attempts to make a distinction between *vox* as physical matter, and *vox* as an expression that conveys meaning (*Super Porphyrium*) and will in the end keep the term *vox* in the first sense, and for the second use the term *sermo*: "there is another position on the universals, which is more in accordance with reason; it attributes community neither to things (*res*) nor to sounds (*voces*); according to its advocates, they are *sermones*, whether they are singular or universal" (*Logica "Nostrorum petitioni sociorum"*). In his French translation (*Abélard ou la philosophie dans le langage*), Jolivet translates *sermo* as *terme* (term), but in his commentary also uses *mot* (word) and *nom* (name), which is justified by certain passages in Abelard (*nomen sive sermo*, he says on the same page). It is perhaps out of concern for originality that he chose *sermo* rather than *nomen*, but perhaps also because he considered that other expressions than those which grammatically speaking are nouns, such as verbs, could be universals (*Super Porphyrium*). So it is no longer *voces* but *sermones* that are now universals, insofar as they are vocal expressions that convey meaning. It is likely that it is Abelard's critiques of the universal as *vox*, along with the alternation between *vox* and *nomina* in Boethius, that led to the term *nomen* being retained and that ultimately motivated the transition from *Vocales* to *Nominales* around the middle of the twelfth century (see Marenbon, "Vocalism, Nominalism"). Whatever the primary motivation was for using the term *Nominales*, it is clear

that the theses attributed to the *Nominales* are not restricted to a position on universals (in logic) or on the *unita nominis* (in theology) but concern other questions as well, on propositions, on the relationship of the parts to the whole, and so on. Theologians from the middle of the thirteenth century will remember the *Nominales* exclusively as the defenders of the theory of the unity of the enunciable. Only Albert the Great will talk about the *Nominales* as supporting a thesis about universals, according to which they exist within the intellect, and this transition constitutes an essential link between the *Nominales* of the twelfth century, and those of the fourteenth to fifteenth centuries, a period in which the term refers unequivocally to Nominalists (see Kaluza, *Les querelles doctrinales à Paris*).

Avicenna's commentary, the questions that arose centered immediately on the imprecision of the terms *vox* and *vocare*. Given that *vox* is both the "vocal" sound made by animals that have lungs, a trachea, etc. and the same sound inasmuch as it is associated with a representation ("*cum imaginatione aliqua*"; 420b 29) (it is a sound that signifies, *sonus significativus*), the question of knowing whether animals *vocant* (this is glossed by *habent vocem*) or whether this activity is particular to man is literally untranslatable, since the verb refers to the two meanings of the noun (according to the classical

etymology: *vox a vocando dicitur* [*vox* is the term for what is expressed with a voice]). The answer to the question also depends on the status of the *imaginatio* for animals and on the role that the *imaginatio* plays in the vocals sounds made by animals in relation to instinct (see PHANTASIA and LANGUAGE). Along with Avicenna, some consider that the emission of *voces* (Avicenna's Latin text has *soni*) is confused for animals, in the sense that even if two vocal productions are numerically distinct, they are specifically distinct—in other words, all dogs bark, but each bark does not correspond

to an individual mental *imago* (see the *Quaestio de voce* by Albert the Great). For Dante, when Ovid in the *Metamorphoses* talks about fish "that speak [*loquentibus*]," he is talking figuratively, since the act of fish or birds is not in fact a language (*locutio*) but rather an "imitation of the sound of our voice" (*imitatio soni nostre vocis*), "an imitation in the sense that we make sounds, and not in the sense that we speak" (*vel quod nituntur imitari nos in quantum sonamus, sed non in quantum loquimur*; *De vulgari eloquentia*, 2). So for him, the answer is clear: man alone was endowed with the ability to speak (*loqui*) ("*Et sic patet soli homini datur fuisse loqui*"; ibid.). It is worth noting again the terms *locutio* and *interpretatio* in the translation of *De anima*: "*Jam enim respiranti congruit natura in duo opera, sicut lingua in gustum et locutionem, quorum quidem gustus necessarium est, unde et pluribus inest, interpretatio autem est propter bene esse*" (For here nature uses the air that is inhaled for two purposes, just as it uses the tongue for tasting and for speech, the former use, for tasting, being indispensable, and therefore more widely found, while expression of thought is a means to well-being; Aristotle, *De anima*, 420b 16–20). *Locutio*, according to an anonymous commentator, is what allows man to "express what is within him by means of his speech [*sermo*]" (*Lectura in librum "De anima"*). He then posits an equivalence, glossing the second part of the sentence, between *interpretatio*, *sermo*, and *loquutio* (*sic*), to which he attributes this same definition. This distinction exists, however, in Greek, *intepretatio* translating *hermêneia*, a faculty that is not specific to man and that certain birds have, according to *De partibus animalium* (2.17.660a 35-b 1). This passage from *De anima* will become an oft-cited adage in universities (see LANGUAGE).

Medieval logicians were in general agreement about a minimal system in terms of a hierarchy that starts with *sonus* and to which successive differences are applied. The *sonus* (sound) is simply what is perceived by the ear. It can be vocal (*vox*) or not (*non vox*). The *vox* can be meaningful or not. The meaningful vocal sound can signify *ad placitum* or *naturaliter* (see SIGN, Box 3). The *dictio* is a *vox significativa ad placitum*, no part of which can signify separately, as opposed to the *oratio*, whose parts are meaningful. In the *Peri hermêneias*, Aristotle opposed the noun and the verb, on the one hand, with the *logos*, on the other, using a single criterion: the former have parts that are not meaningful, and the latter is made up of parts that are meaningful. The Latin authors later introduced the generic term *dictio* as a means of joining together the noun and the verb and distinguishing them from *oratio*, which allows them to oppose a simple signifying unit to a "complex" signifying unit. In practice, however, *vox* will be synonymous with *dictio* in the sense of "simple word." It is worth noting that *vox*, unlike *dictio* but like *nomen*, can be constructed with a genitive and thus becomes a relative term (see for example Roger Bacon, *De signis*, §148: "*rebus corruptis utimur vocibus illarum significative*" [when things are destroyed, we use (lit.) the vocal sounds of these things (that is, the ones which refer to them) in a way which signifies]). The *terminus* is a word insofar as it fulfills a function in a proposition, and "categorematic terms" are distinguished from "syncategorematic" terms, leading to the two types of treatises that constitute the so-called terminist logic, or *logica modernorum* (see TERM).

2. *Dictio* within speculative grammar

While *dictio* and *vox* were used almost interchangeably, as we have seen, to signify a word, the Modists, or *Modistae*, philosopher grammarians of the second half of the thirteenth century, proposed an original theory that articulates these two terms in a precise way on the basis of a double articulation of language. In this sense, no term in our modern languages can translate exactly what *dictio* meant for the Modists.

The theory of the Modists is based on a reflection on the process of the imposition of words, which is conceived in two stages. The process begins with *vox*, sound matter. Since it is endowed with a property that confers upon it an aptitude to signify (*ratio significandi*), at the end of the process of the first imposition *vox* becomes *dictio*. In a second stage, *dictio* is endowed with a property that confers upon it an aptitude to consignify (*ratio consignificandi*), and at the end of this process of second imposition, or articulation, *dictio* becomes *pars orationis* or *constructibile*. Strictly speaking, *dictio* is the signifier (matter) in that it is associated with the signified (form) that corresponds to the things as it is conceived, then signified (*res significata*). All of these terms correspond to the same *res* and are thus the same *dictio* (for example, "to suffer," "suffering," "ouch," etc.). In this context, *dictio* is untranslatable and corresponds to a sort of arch-word, or lexeme, or signifying unit that conveys a signified, although it would be difficult to imagine a single "vocal" vehicle that could carry the identical meaning that all of these expressions have. It is only once it is specified as a grammatical category (for example, as a verb) with its own grammatical properties, the means by which it can signify, that the linguistic unit is complete and able to be part of a statement: only then is it *constructibile*. The distinction between the two processes of imposition is justified on both an ontological and a psychological level. For the first time, and rather ephemerally as it happens, the two types of properties of the linguistic unit—the semantic properties and the morphosyntactic properties—are distinguished in this way: *dictio* corresponds only to the first, and *constructibile* to the second (See SENSE, III.B.3, and Box 3).

The notion of word as a minimal unit of meaning and of construction seems unavoidable and was not challenged until the nineteenth century. It was with comparative grammar that the idea of signifying units that are less than a word was first introduced, some expressing a meaning (*roots*, *semantemes*, Ger. *Bedeutungslaute*), others expressing a relationship (*morphemes*, Ger. *Beziehungslaute*), which are themselves separated into inflections and affixes. Realizing that this distinction is not valid for all language, linguists preferred to use a single term for all of the signifying units making up a word (Eng. "morpheme," "formative"; Fr. *morphème*, *formant*, or even, in Martinet, *monème*), which correspond, depending on the theory, either to *signifiers* (physical entities) or to *signs*. Moreover, the problem, which Aristotle and his commentators had already confronted with examples such as *tragelaphus* (goat-stag) or *respublica*, was that of the minimal signifying units which appear to be greater than the word, since they are made up of other minimal signifying units, and the consequent difficulty of separating them out from the sentence. One solution was proposed based on the notion of choice: for the speaker, *tragelaphus* or "pineapple," say, each

correspond, just as "table" does, to one single choice and not to several consecutive choices. In the same way, the syntagm has been recognized as a minimal unit of construction after breaking the sentence down, since a syntagm can be made up of several words of morphemes that do not necessarily appear to be joined together in the linear chain of speech. In the same way again, the prospect of translation becoming an automatic process led French structuralist linguists at the beginning of the 1960s to define the units of segmentation of the written chain, which could also be units of translation. They therefore had to coin new terms to define syntactic units that are greater than the word being understood, not only from the point of view of their internal mode of construction, but also in terms of their relationship to the rest of the statement. All of these new names introduced (*lexies* in Bernard Pottier, *synapsies* in Émile Benveniste, *synthèmes* in André Martinet, and so on) reflect an unprecedented questioning of the criteria of identification, of construction, and of classification of minimal units and are based on precise theoretical choices (see Léon, "Conceptions du mot"). Attempts to eliminate the word and to treat it as one syntagm among others, in order to assimilate the different processes of combination, have ultimately been called into question. In recent linguistics, attention has turned once again to the word, and to its specificities as a unit (that is, as the site of realization of phonological or morphological phenomena), which is distinct from the sentence (the constrained, non-motivated, non-free nature of the combination of its constituent elements, and so on). What is more, the segmentation into words remains, in the Western tradition, inseparably bound up with certain practical ends: teaching, classifying, translating, and making dictionaries.

IV. The Terms for "Word" in French

A. *Mot*

Latin (RT: Du Cange, *Glossarium mediæ et infimæ latinitatis*) and etymological dictionaries (RT: Ménage, *Dictionnaire etymologique, ov Origines de la langue françoise*; RT: Ernout and Meillet, *Dictionnaire étymologique de la langue latine*; RT: von Wartburg, *Französisches etymologisches Wörterbuch*) all agree that the word *mot* comes from the Low Latin *muttum* (word, grunt), derived from the verb *muttire* meaning "to say *mu*," that is, both (a) to make a grunt, or an inarticulate sound like cattle, or humans deprived of the power of speech (*mute*, *mutus*), and (b) to breath a word, to make an articulate statement. This etymology, which might seem paradoxical, is, however, part of the tradition in that it accumulates two types of etymology anticipated by Isidore of Seville: onomatopoeia and antiphrasis. The recourse to onomatopoeia in etymology was a common practice from the Middle Ages to the Renaissance (see Buridan, *L'étymologie*). It constituted the privileged site and example of the principle of a fit between designation and signification, insofar as the signification reduplicated the designation, and motivated it by giving it a meaning. Moreover, the contradictory meaning of "to say *mu*," both an inarticulate sound and an articulate statement, can be compared to the etymology by antiphrasis, or opposition, that the ancients were fond of: so, for example, *lucus* (wood) was said to be derived from *lucendo* (light), because

there is no light in a wood (*lucus a non lucendo* [a clearing because one cannot see clearly]).

If we postulate more simply that *muttum* means "sound emitted" (RT: Bloch and von Wartburg, *Dictionnaire étymologique de la langue française*; RT: *DHLF*), we see that, in Low Latin, the first attested uses of the word *mot* were always negative, meaning "not to make a sound": *ne muttum quidem audet dicere* (he does not dare say a word); *ne mu quidem audere facere* (to not even dare to say *mu*). This is also true of the first attested uses of the word *mot* in Old French, in the *Song of Roland* in the eleventh century: "N'i ad paien qui un sul mot respondet" (Not one pagan replied with a single word), or "N'i a celui qui mot sont ne mot tint" (There was no-one who made the sound or the ring of a word). We might also think of the French exclamation *motus*, urging someone to remain silent (in present-day French one also says *ne mot dire* (not to say a word). *Mot* is said to have evolved into its meaning of *parole* (spoken word) through its contact with verbs such as *dire* (to say), *sonner* (to sound), *tinter* (to ring), *respondre* (to reply), and *mot* became the signifying unit we use today through the expression *mot à mot* (word for word), suggesting as early as the twelfth century a segmentation of language.

B. *Verbe*

Verbe comes from the Latin *verbum*, which shares the same Indo-European root with terms from a dialect region of Indo-European.

Compared to the Latin *verbum*, which has three meanings, the meaning of *verbe* in French is more restricted. Firmin Le Ver's first Latin-French dictionary (RT: *Firmini Verris dictionarius*) thus contains three entries for *verbum*: (1) a conversation among several people, (2) the son of God, the second person of the Holy Trinity, and (3) a part of speech that has tense and mood. The last two meanings of *verbe* are attested in French from the twelfth century as a part of speech, *tel fist personel del verbe impersonal*, and as the word of God, *Deu verbe* (1120), which will become *le Verbe* (the Word), the second person of the Trinity, God incarnate, from the sixteenth century.

C. *Parole*

Parole comes from the Greek *parabolê* [παραβολή], which Latin borrows as *parabola*, documented since Seneca. It was when the Septuagint was being written (the first Hebrew-to-Greek translation of the Old Testament) that its translators gave two meanings to *parabolê*: "comparison" and "allegory," using the Greek *parabolê* to translate the Hebrew *mashal* [מָשָׁל], which did have these two meanings. This double meaning was adopted by the Christian Latin writers Tertullian and Jerome, and the term *parabola*, as well as its derivations, would spread throughout the everyday language of Christianity between the fifth and eighth centuries, with the meaning "fable," "tale" and would then finally assume the meaning of "speech," "way of speaking." In almost all Romance languages it therefore replaced the Latin *verbum* as a term designating the word; *verbum* would remain in these languages, but it would be reserved for technical, theological, and grammatical uses.

D. *Verbe/parole*

The Low Latin *parabola* was used to designate the word in Romance languages (with the exception of Romanian) because of

how frequently this term was used in sermons and also because people were loath to use *verbum*, which was reserved for *Verbe*, the translation of the Greek *Logos* [Λόγος], the Word of God in John's Gospel (see LOGOS). In French, *parole* was used until the sixteenth century in a nonreligious sense. But as a result of the wars of Religion and the advent of French as the national language with the creation of the Académie française in 1635, *Parole* began to compete with *Verbe* as a translation of the incarnation of God in religious texts during the sixteenth and seventeenth centuries. In the Geneva Bible of 1669 we thus find the following commentary: "the Greek *ho Logos*, which in vulgar language is called *le Verbe*, and which is more conveniently translated as *la Parole*." But it was the term *Verbe*, first used in the *Œuvres chrestiennes* of Desportes (around 1600), that would replace *Parole*, first in religious literature and then gradually in the translations of the Bible (Le Maistre de Sacy, 1678), where it would finally become the accepted term.

This was a transitional period from a linguistic and religious point of view. In the sixteenth century, French prevailed over Latin as a means of expression in literature and theology. The debate was complicated by the religious disputes between Protestants and Catholics, who supported opposing positions. Protestants called for the use of French as the ecclesiastical language, and Catholics firmly held on to Latin in the liturgy and the translations of the Bible. In the sixteenth century, *parole* became a word that was appropriated by Protestants, who called their ministers *ministres de la Parole de Dieu* (ministers of the Word of God). *La Parole* was even used to refer to Protestantism ("The king . . . has proclaimed a general abolition whereby the prisons have been opened for all those who were prisoners for the word [*parole*]. This is the term we use instead of saying religion"; É. Pasquier, *Lettres*, 4.5). For Calvin, the Word (*Parole*) was the incarnation of God: "Therefore, as all revelations from heaven are duly designated by the title of the word of God, so the highest place must be assigned to that substantial Word, the source of all inspiration, which, as being liable to no variation, remains for ever one and the same with God, and is God" (*Institutes of the Christian Religion*, 71); "Christ is that Word become incarnate" (ibid.). It was thus no surprise that it was *Verbe* that would prevail during the Counter-Reformation.

The transition was apparent in the first monolingual dictionaries of the seventeenth century. *Verbe* was thus defined as *Parole* in the Richelet dictionary, RT: *Dictionnaire françois* (1680): "This word is used in terms of *Theology and Holy Scripture*, and means *Jesus-Christ*, the second person of the Trinity. It also means *la parole*"; see also the RT: *Dictionnaire de l'Académie française* (1694): "Jesus-Christ is called *la parole éternelle, la parole incréée, la parole incarnée* [the eternal word, the unbegotten word, the word incarnate] although one more commonly says *le Verbe*." The Word of God (*Verbum Dei*) refers in both dictionaries to the Holy Scripture.

E. *Mot/Parole*

In the seventeenth century, as a result of the establishment of French as the language of the state and the national language (see Collinot and Mazière, *Un prêt-à-parler*), the production of the Port-Royal *Grammaire générale et raisonnée* (1660), and the appearance of the first monolingual dictionaries, French came of age as a language and as a rival to Latin.

Parole was the scientific term referring to the faculty of language. It was the only entry in the *Dictionnaire des arts et des sciences de l'Académie française* (1694) to the exclusion of *mot* and *verbe*: "The articulation that the sound produced by the air passing through the trachea receives from the tongue and the throat," a definition copied from the way Aristotle defined *phônê* [φωνή], the "voice," that is, the noise produced by an animate being (*De anima*, 2.8.420b 5–29; see above, *vox*, III.A).

In the first monolingual dictionaries, even though *mot* and *parole* were defined the one by the other—"*Mot: parole* of one or more syllables. *Parole*: articulated *mot* of one or more syllables" (RT: Furetière, *Dictionnaire universel*)—*mot* became the unit of language, and *parole* the unit of speech.

So, following Furetière's definition, *mot* was clearly defined as a linguistic unit required by the dictionary and by the grammars that classified words as parts of speech. As for *parole*, it referred more generally to the language "used to explain thought, and that man alone is capable of speaking" (ibid.). Likewise, in the RT: *Dictionnaire de l'Académie française*, the first collocations referred to *mot* as a unit of language—"French word, Latin word, Greek word, Barbarian word"—whereas *parole* was a unit of speech: "mot prononcé" (spoken word). Finally, in RT: Richelet (*Dictionnaire françois*), it is the unit of language as a *distinct* unit that is foregrounded for *mot*: "Everything that is spoken and written separately . . . To transcribe word for word [*mot pour mot*]"; while *parole* was defined as "speech and explanation of thought by using sound and voice."

Nonetheless, the norm advocated during the seventeenth century by no means dispelled the different meanings of *mot* and *parole*, and present-day dictionaries retain many traces of this historically determined polysemy (see also LANGUAGE).

WORD ORDER

➤ ASPECT, COMBINATION AND CONCEPTUALIZATION, *DISCOURSE*, EUROPE, FRENCH, LOGOS, PREDICATION, PROPOSITION, SIGN, SIGNIFIER/SIGNIFIED, SPEECH ACT, WORD

Terms and word order are part of ordinary language. They are used in the informal description of languages and in particular serve to identify differences among languages. Thus German differs from French in its vocabulary (its words) and in the word order in utterances. Grammar and then linguistics have provided concepts to characterize the formal nature of what they designate. Here we will provide an analysis of the phenomena grouped under the rubric "word order," presented as a rational reconstruction (I. Lakatos, *Proofs and Refutations*).

We will first review the problematics that emerges from grammatical reflection on the phenomenological diversity of languages when we consider the placement of functional constituents in the sentence. Then we will set forth a few elements for the critique of this problematics, which contemporaries see as a kind of vulgate. Finally, we will abandon the notion of word order and propose the concept of construction, as it is defined in one of the contemporary schools of the generative paradigm (construction grammars) to analyze the pertinence of the placement of constituents in the utterance.

From this point of view, it can be maintained that the lexical unit (the concept making it possible to analyze what the term "word" designates) and construction are entities of the same type, signs (lexical signs and syntagmatic signs, according to the terminology of the grammatical framework of Head-driven Phrase Structure Grammar [HPSG]), which allows us to extend the notion of arbitrariness, in Saussure's sense, to the architecture of the utterance, and to overdetermination, in Lacan's sense. The linguistic analysis completed, we conclude that, if word order gives rise to an untranslatable, this untranslatable has the same etiology as the one to which words may give rise.

I. The Vulgate on Word Order

A. The fixed order of French

Word order seems at first to be what distinguishes French from Latin. Sentence (1) has the same meaning, that is, the same propositional content, as sentences (2):

(1) *Le père aime le fils*

(2) (a) *Pater filium amat*
     (b) *Amat pater filium*
     (c) *Filium pater amat*
     (d) *Pater amat filium*
     (e) *Amat filium pater*
     (f) *Filium amat pater*

We say that the order is "fixed" in French because (1) can be translated by (2) in Latin, but also because (1) is not equivalent to (3):

(3) *Le fils aime le père*

and because the order of (1) is not open to any variation, which is shown by the agrammaticality (signaled in the examples by the asterisk *) of the sentences in (4):

(4) (a) **Le père le fils aime*
     (b) **Aime le père le fils*
     (c) **Aime le fils le père*
     (d) **Le fils le père aime*

Moreover, the possibility of varying the order of the constituents in Latin is further increased if we take into consideration two facts: the order of a noun and its determinant can vary within the noun group (henceforth NG); and the members of a given group cannot form a continuous sequence. In (5), the determinant (*suum*) is to the left or the right of the determined noun (*filium*); in (6), the determinant is separated from the noun that it determines by constituents that do not belong to the NG that they constitute (they are separated, in this case, by the NG subject *pater*):

(5) (a) *Pater suum filium amat*
     (b) *Pater filium suum amat*
(6) *Suum pater* filium *amat*

We synthesize the observation by saying that French is a fixed-order language and Latin a free-order language. We have succeeded, after long controversies, in explaining this differential. It is because French does not have a case-based morphological system that it resorts to a fixed word order: French exploits the opposition between preverbal placement and postverbal placement to identify the nominal terms fulfilling the functions of subject and object. On the other hand, the reason that several word orders are available in Latin is that this language has an inflectional system of morphology that marks cases: thus in (2), the NGs *filium* and *pater*, whatever place they occupy in relation to *amat*, are identified as forms bearing, respectively, the affixed marks of the accusative and the nominative, and thus as terms performing distinct functions. From this analysis we draw the following proportion: word order is to French as case is to Latin. If case-based inflection is a system of marks, then word order is a system of marks. They are grammatical functions that are marked, in one case by morphological means, and in the other by means of a relative order.

■ See Box 1.

B. The free word order of Latin

We have to return to this notion of Latin's "free" word order. Latin permits six orders realized in the sentences in (2). But it is acknowledged that among these six orders, one is unmarked: the order SOV (Subject Object Verb, to adopt the vocabulary of modern typologies), illustrated by the following sentence:

(7) *Pater filium amat*

In particular, we maintain that this order is pragmatically neutral. The latter analysis assumes that if the six sentences of (2) share the same propositional content, they differ in their pragmatic value. The orders exhibited by the other five sentences are associated with values that have long been known as expressivity, emphasis, or insistence. We can render these values by means of glosses that, in French, appeal precisely to constructions of the utterance that are distinct from the one that presides over the canonical sentence proposed in (1):

(8) (a)   *Amat pater filium*
     (a') *Il l'aime, le père, son fils*
     (b)   *Filium pater amat*

(b') *Son fils, le père l'aime*
(b") *C'est son fils que le père aime*
(b"') *C'est son fils qu'aime le père*

The word order in Latin is free, that is, not constrained insofar as the marking of functions in the syntactical dimension is concerned, but it is neither aleatory nor without meaning. We can synthesize the observation by positing the following generalization, which condenses the content of a vulgate shared by the grammatical and stylistic traditions:

(9) The order of words constitutes a mark. Depending on the languages, it has a role as a syntactical mark or a role as a pragmatic mark.

C. The division of labor

If we project generalization (9) into a grammatical apparatus, we are led to understand that the different dimensions of organization distinguished in languages can enter into relationships of equivalence. What morphology marks in language A is marked by word order in language B. What is marked syntactically in language C is marked by intonation in language D. For example, contemporary theories acknowledge that whether or not the subject NG (the fact that the grammatical subject NG is also the logical subject) has a thematic character is marked in Italian by word order, in English by intonation, and in Japanese by morphology.

Thus in (10), the grammatical subject NG is not a logical subject: it is postverbal in Italian, accent-bearing (with correlative disaccentuation of the verbal group) in English, and marked by the particle *ga* (which is opposed to a "thematic" particle *wa*) in Japanese:

(10) (a) *Mi si è rotta la macchina*
     (b) *My car broke down*
     (c) *Watashino kuruma ga   koshoo   sheiteimas*
          (I   car   particle breakdown verb)

This image of grammar is now common in linguistics, particularly in grammatical approaches that include the pragmatic dimension (cf., for example, K. Lambrecht, *Information Structure and Sentence Form*), but also in reflections on translation. Foucault bases his (enthusiastic) critical assessment of Klossowski's translation of the *Aeneid* on the following premise:

The Latin sentence . . . can be governed simultaneously by two prescriptions: that of syntax, which declinations

---

1

A "Natural and Perfect Order"

In Simone Delesalle and Jean-Claude Chevalier's book *La linguistique, la grammaire et l'école*, we find a synthetic presentation of the debate that brings out the problematics of word order in the seventeenth and eighteenth centuries. We can also consult Ulrich Ricken, *Grammaire et Philosophie au siècle des Lumières* (1978), which identifies two central points in this debate: (a) the relation between word order and thought, and (b) the evaluation of languages in relation to each other, the French order being considered perfect because it is natural. In the initial analyses of Claude Lancelot's *Port-Royal Grammar* (1975), language is compared with "thought," which is supposed to constitute the reference: "The natural order, in conformity with the natural expression of our thoughts, consists in a judgment expressed with regard to a concept, the substantive subject coming first" (S. Delesalle and J.-C. Chevalier, *La Linguistique*, 40), because the substance has to precede the accident. "We can say that at this stage of the analysis [at Port-Royal] the resemblance between the order of French and the natural order of thought is itself so natural and so integrated that it does not need to be explained, much less justified" (ibid., 4).

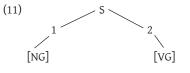
make sensible; and another, purely plastic one that is revealed by a word order that is always free but never gratuitous. . . . Whereas in French syntax prescribes the order and the sequence of words reveals the precise architecture of the system.

("Les mots qui saignent," 425)

D. The terms and content of the relation of order

The term "word" in "word order" covers two types of units: lexical units considered in the constitution of groups, and groups considered in the constitution of the utterance. When we speak of "word order" we are thus speaking about the order of the constituents in the different groups and about the order of the groups in the utterance.

Furthermore, the notion of order covers three types of phenomena. The first is constituted by the relations of placement relative to a term: for example, the French subject NG is preverbal (to the left of the inflected verb). If it appears to the right of the verb, then we speak of "inversion." The second is constituted by the fixed placement of certain constituents. For example, the subordinating word necessarily appears at the head of the subordinate clause in Latin; Latin has, from this point of view, at least one rule of fixed order. Finally, the third phenomenon groups together relations of adjacency. In a language like French, the parts of a given group are adjacent; one cannot mix the parts of several syntagmas in the sequence, as one can in Latin; in (6), the subject NG is interpolated between the two parts of the object NG. In French, the relation of adjacency brings together terms that enter into a relation of grammatical dependency that contemporary linguistics has constructed under the name of "syntagma." It is not true that in all languages the relations of dependency coincide with relations of adjacency in the sequence.

II. Critique of the Vulgate


In relation to the details of the organization of languages, neither generalization (9) nor the relationships of equivalence between the means of expression that it produces are empirically correct. These propositions are defective mainly because of the idealization they presuppose and because, by immediately constituting word order as a mark, they cannot envisage recognizing in it a purely formal type of organization. In the following we will limit ourselves to the syntactical dimension (reduced to the coding of functional relations between the verbal head and its arguments) and the pragmatic dimension; we will leave completely aside the semantic and prosodic dimensions.

■ See Box 2.

A. The accumulation of values

According to generalization (9), word order is used to mark either grammatical functions or pragmatic distinctions. If the analysis we have given of the contrast between (1) and (2) is correct, we might expect word order not to be available in French to mark pragmatic distinctions, because it is used to mark grammatical functions. But that is not what we see. In French, the order of constituents in the utterance also serves as a support for the expression of pragmatic values.

We have seen that utterance (1) (*Le père aime son fils*) exhibits the sole possible order in the sentence, namely the SVO order. This order characterizes the canonical construction of the sentence. We can schematize the spatial organization, or, to adopt a terminology traditional in the linguistics of Germanic languages, the topological organization of construction by a tree-representation (11), in which the order among groups is explicitly represented:

(11)

```
              S
        1           2
      [NG]        [VG]
```

2

Weil's thesis: Syntax, word order, and the order of thought

The thesis that Henri Weil published in 1844 and that was republished by M. Bréal in 1869 marks a break with the problematics inherited from the eighteenth century and introduces a certain number of ideas that prefigure those that we take as the basis of our analysis. A synthetic presentation of this thesis will be found in Simone Delesalle and Jean-Claude Chevalier, *La linguistique, la grammaire et l'école* (37–90, 179–94), and it is put into a contemporary perspective in Françoise Kerleroux, "Discordances d'une langue à une autre, d'une langue à elle-même."

a. According to Weil, syntax and word order constitute distinct orders. We find the same principle of partitioning in contemporary grammars that treat relations of constituence and relations of dependency (which cover functional relations) as a module of rules (or constraints) distinct from the module bringing together the rules that govern the linearization of constituents (rules or constraints of "linear precedence"). Gerald Gazdar et al., *Generalized Phrase Structure Grammar*, is the standard reference work.

b. Weil posits, alongside the development of syntax, a development of thought (*marche de la pensée*) in which the notion of *thought* refers to a pragmatic-enunciative dimension, and which he conceives as a universal organization. In this organization he distinguishes the "initial element" and the "end" of the sentence. This conception is still alive in contemporary functionalist approaches (cf., for example, P. Downing and M. Noonan, eds., *Word Order in Discourse*). There are thus two principles of order: a purely syntactical principle and a pragmatic-enunciative principle.

c. Weil relates the order that we observe in actual utterances to a "mutual relationship" between the different developments. We make the same distinction between two principles of order in what we will call "construction": we will distinguish between the topological organization of the utterance, and constraints of a pragmatic-discursive nature bearing on the places (or fields) defined by topology.

The construction figured by the tree in (11) is far from being neutral from the pragmatic point of view. We see, in fact, that the NG that appears under branch 1 (or the left field of the sentence, by opposition to branch 2, which describes the right field) is, in an actual utterance, rarely an NG that introduces a new referent of discourse, that is, a referent that does not belong to the shared universe of discourse and that the content of the utterance makes it possible to identify. We can show this fact by contrasting the answers to a question of the following type:

(12) *Qu'est-ce qui se passe?*

This type of question calls for an answer bearing on a situation whose characteristics are completely new, in particular the participants. We see that an utterance belonging to the canonical construction, like (13a), is not the most appropriate form of answer; in ordinary usage, one would answer with the utterances (13b) or (13c):

(13) *[Qu'est-ce qui se passe?]*
    (a) *Un chien aboie*
    (b) *Il y a un chien qui aboie*
    (c) *C'est un chien qui aboie*

The utterance (13a) is well formed syntactically: no syntactical constraint prevents an indefinite NG from appearing in the left field of the sentence or from being a grammatical subject. If (13a) is not appropriate in the context defined by question (12), we have to seek the reason in the pragmatic value attached to the canonical construction in general and to its left field in particular.

The existence of turns of phrase like (13b) or (13c) (two split constructions that are called "presentational") and their appropriate character in the context of (12) constitute another indication that (11) is not pragmatically neutral. For an NG that introduces a new referent of discourse, the right field of the sentence is favored. It is the "genius" of the two presentational constructions (split into *il y a . . . qui*, and *c'est . . . qui*) to make the NG, a dog (*chien*), which introduces a completely new referent, appear in the right field of the matrix sentence (*il y a un chien* or *c'est un chien*): we note that the main informational content of the utterance is provided by the subordinate clause *qui aboie*. In other words, the cleavage uses for discursive ends not so much the fixed nature of the grammatical order SVO as the rigidity of the matching between a pragmatic value and a field in the construction of the sentence of which (11) describes the topological organization.

We can analytically dissociate grammatical distinction (the expression of functions) and pragmatic distinction (the expression of the informational value of an NG), but the support for this double system of values is one and the same. It is the topological organization figured by the tree in (11) that constitutes this support. Thus the word order in actual utterances can accumulate a double system of values. That is the case in French: the order of constituents is simultaneously syntactical and pragmatic.

B. Morphology and the value of word order

According to the view of grammar that underlies generalization (9), morphology and word order are in a relationship of complementarity: if one language has a rich morphology (used to distinguish grammatical functions), we would expect word order, freed of the responsibility of marking functions, to be available for the expression of pragmatic distinctions. However, German constitutes a clear counterexample for this expectation. German is a language that includes both a rich case-morphology and phenomena of strict fixation in word order. Moreover, this fixity is not associated with the expression of any value in any interpretive dimension (semantic or pragmatic).

Three kinds of order are characteristic of the German sentence. The untensed verb (participle, infinitive) occupies the final position in the sentence; (14) illustrates the rule with a past participle (*gesehen*):

(14) Adam saw a rose
    (a) *Adam hat eine Rose gesehen*
    (b) **Adam hat gesehen eine Rose*

The tensed form of the verb (in the examples above, the auxiliary *hat*) can occupy only two places: either the absolutely final position in a subordinate clause (15), or the second position in an independent clause (16):

(15) I believe that Adam saw a rose
    (a) *Ich glaube, dass Adam eine Rose gesehen hat*
    (b) **Ich glaube, dass Adam hat eine Rose gesehen*

(16) Adam saw a rose
    (a) *Eine Rose hat Adam gesehen*
    (b) **Eine Rose Adam gesehen hat*

Finally, the initial field (which German grammarians call the *Vorfeld*) can be occupied by only one constituent:

(17) Adam saw a rose yesterday, or, Yesterday, Adam saw a rose
    (a) *Eine Rose hat Adam gestern gesehen*
    (b) *Gestern hat Adam eine Rose gesehen*
    (c) **Gestern eine Rose hat Adam gesehen*

This constituent can be any element dependent on the verb, whatever its function and category (18a, b), but it can also be a conjunction (18c, d), as is shown by these two verses by Goethe (in "Erlkönig"), which we have segmented into sentences:

(18) (a) *Ich liebe dich*
    (b) *Mich reizt deine schöne Gestalt*
    (c) *Und bist du nicht willig*
    (d) *So brauche ich Gewalt*
       (I love you, / your fair face pleases me / and if you're not willing / then I'll use force)

Thus we must dissociate the two characteristics of fixed word order and the "richness" of case morphology: the existence of a rich morphology does not necessarily imply a free order of the constituents. The only generalization that a language like German allows us to make is that a rich morphological repertory, when it is used to mark functional distinctions, can enable dependent elements to avoid subjection to fixed placement, either among themselves or in relation to the constituent on which they depend.

The three rules of word order in German are associated neither with functional marking nor with the expression of a

given semantic or pragmatic value. Their only value is to create demarcations in the topological space itself: they delimit distinct fields in the utterance.

C. Word order is arbitrary

The fact of appearing to the left or the right of another term is in itself an insignificant characteristic. For example, the fact that the object is placed to the right or to the left of the verb plays no role in the definition of what the grammatical function of the object of the verb is. The same goes for all grammatical functions (subject, complement, addition) or semantic functions (argument, modifier, determinant). The fact of occupying a fixed place in the utterance and even the fact that two constituents must necessarily be contiguous are also in themselves insignificant. For example, appearing at the beginning, in the middle, or at the end of a sentence in no way affects the functioning of the French possessive determinant in relation to its Latin equivalent, which is not subject to this constraint [cf. (5) above]. In other words, there is nothing natural about word order. This point is important, because it constitutes word order as an arbitrary characteristic of languages. This outcome is commonly recognized by specialists in syntax. Among typologists inspired by functionalism, there is still some debate as to whether the chronology of psycholinguistic processes of encoding and decoding might constitute a factor determining word order, at least at the level of the utterance.

Many languages, in fact, allow us to make the following observation:

(19) Thematic constituents precede rhematic constituents.

A thematic constituent is one that refers to the referent about which it provides information; a rhematic constituent is one that conveys new information.

In languages that have the notion of a subject, the subject is generally thematic and the verb (and its dependencies) is rhematic. For example, the distribution of pragmatic values in the canonical construction of French [cf. (11) above] falls under this generalization. The same seems to be partially true of German: the utterances in (17) can be analyzed as illustrating the generalization formulated in (19), but not those in (18c, d), because the initial field is occupied by constituents that have no descriptive content. Thus the hypothesis has been put forward that (19) could be the effect of a cognitive principle according to which it is natural to present the theme of the discourse first, so that it functions as an anchor-point for information or elaborations conveyed by discourse. In other words, the linearization of the informational constituents might reflect the chronology of psycholinguistic operations.

However, experiments on encoding and decoding have provided no decisive empirical support for this hypothesis. Moreover, there is a direct counterexample: some languages have the inverse order—the rhematic constituents precede the thematic constituents. This is the case for languages like Ojibwa, Nandi, or Toba Batak (Amerindian, Afro-Asiatic, and Austronesian languages, respectively). These are languages in which the verb appears in the first position in the sentence (so-called VSO languages). This correlation suggests that the relative order between theme and rheme is not determined by an external principle that prevails in the language. In other words, a generalization like (19) cannot be considered proof of the motivation of the order of constituents by an external process, but rather as the effect of the coding, by the grammars of languages, of pragmatic distinctions. Word order is thus arbitrary in the same sense and on the same grounds as the relationship between signifier and signified in the morpheme: it is not motivated by any external principle. In section III we will examine more closely this comparison between word order and morphemes.

D. Critique of the founding paradigm of the vulgate

The vulgate regarding word order is essentially based on the comparison between Latin and French illustrated above by the contrast between (1) and (2). It has given rise to a series of variants using other pairs of languages (Russian and English, English and Finnish, etc.), to the point of becoming a cliché in contemporary linguistic arguments. But this contrast is deceptive: in fact, it draws attention exclusively to the fact that the dependent elements are not subject to placement constraints with regard to each other or to the constituent on which they depend. We have just seen that the placement of elements depending on the verb (which constitutes the major syntactical phenomenon in many languages) is distinct from the placement of constituents in the utterance. From a contrast like (1)-(2) we can therefore draw no conclusion regarding the order of constituents in the utterance in general.

III. Word Order and Construction

Word order is a reflection, in utterances, of the topological organization of the language. Figure (11) offers a representation of the topology of the phrastic field; figure (21) below situates the phrastic field within the topological organization of the utterance. Recently it has been discovered that the value attached to each field is variable. It varies depending on the construction. Thus a single field can be associated with distinct values. We will illustrate this point by considering the pragmatic values associated with the prephrastic field. Here we will grant, in accord with theories of the informational component (K. Lambrecht, *Information Structure and Sentence Form*), that there are two types of pragmatic value to be distinguished: the old (pragmatically presupposed) or new (asserted) nature of a bit of information, on the one hand, and the degree of accessibility of the referents of discourse (generally introduced by an NG), on the other hand.

■ See Box 3.

A. A single topological organization and two pragmatic values

French has two constructions that are designated by the conventional names of "left dislocation" (*dislocation gauche*) and "topicalization." Several properties distinguish them from each other; the most obvious is the fact that the prephrastic constituent is repeated by a pronoun in the case of dislocation, and that there is no repetition in topicalization:

(20) (Dislocation)
    (a) *Marie, (je pense que) je l'ai vue*
        [The constituent "Marie" is repeated by the anaphoric pronoun "l"]
        (Topicalization)

3

How should we deal with the order of constituents?

In grammars that make use of the notion of construction, there are three ways of dealing with the order of constituents: (a) by orderly trees, (b) by the constraints of linear precedence, or (c) by positing a topological organization (O. Bonami, "DI/DP, linéarisation, arbres polychromes").

For the defense and illustration of the topological approach, see, among others, Andreas Kathol, *Linear Syntax*, and Jean-Marie Marandin, "Sites et constructions dans la théorie de la syntaxe," and the references cited therein. For a presentation of the concept of construction,

see Charles Fillmore, Paul Kay, and Mary C. O'Connor, "Regularity and Idiomaticity in Grammatical Constructions," *Language* 64, no. 3 (1988): 501–38, and Arnold M. Zwicky, "Dealing Out Meaning: Fundamentals of Syntactic Constructions," *Berkeley Linguistic Society*, 20 (1994): 611–25.

(b) *À Marie, (je pense que) je répondrai par la négative*
[The constituent "Marie" is not repeated in any way]

It has been shown, and we will accept here, that the two constructions make use of the same topological organization, which we can schematize as follows:

(21)   Utterance
         (1)   (2)
   Prephrastic Field   Phrastic field

Even though the word order is identical, the pragmatic value attached to the constituent that occupies the prephrastic field is different in the dislocated construction (20a) from what it is in the topicalized construction (20b).

The prephrastic constituent of left dislocation introduces a referent that must already be identified (in particular, the information contributed by the sentence cannot serve to identify it) and that necessarily functions as a theme. This constraint has an impact on the type of NG that can appear in this prephrastic field. It can be neither an NG reduced to a bare quantifier (22a) nor an indefinite NG with a specific or existential interpretation (22b):

(22) (a) **Beaucoup, je les vois*
     (b) **Un chien, je le vois*

If an indefinite NG is possible, it can be interpreted only in a generic way:

(23) (a) *Un enfant, ça se soigne*
     (b) *Q: As-tu vu des enfants sur ta route ?*
         A: Des enfants, je n'en ai vu aucun

The constraint is quite different for topicalization, as is shown by the fact that the NG reduced to a bare quantifier and the indefinite NG with an existential interpretation are permissible in the prephrastic field:

(24) (a) *À beaucoup, on a donné de mauvais conseils*
     (b) *À un clochard, Pierre a même donné cent francs*

The prephrastic constituent of the topicalized construction is not subject to any constraint of identifiability external to the utterance and it is not necessarily a theme.

In (20), the constituents *Marie* and *à Marie* occupy the same field, but they are not associated with the same pragmatic values. Neither the lexicon nor the placement in the sentence varies; what varies is the complex of properties that allow a constituent to appear at a greater or lesser distance

from the verb with which it is interpreted. It is this complex that contemporary modelings call a construction. A construction is the given of a matching between several dimensions: syntactical, semantic, pragmatic, and topological. If the matching is arbitrary, we might expect that it will differ from one language to another. That is confirmed by the comparison with English.

B. Left dislocation and topicalization in English

It happens that English has two constructions almost identical with those that we have just defined for French, whose names we retain. Their syntactical and topological properties are identical, as is shown by the two sentences below:

(25) (a) Mary, (I think) I saw her
     (b) *To Mary, (I think) I'll say no*

We would expect each of these constructions to assign a different value to the prephrastic constituents, as in French. And that is the case. But what is remarkable is that these values are different from those in French. The prephrastic constituent of the topicalized English construction must introduce an identifiable and thematic referent of discourse, unlike the constituent in the corresponding French construction, which is neither thematic nor necessarily identified, as is shown by the contrast between (26) and (27). In (26), the group "in London" can be (pragmatically) inferred from "in England":

(26) Q: Are you planning to settle in England?
     A: Yes, in London, I've bought a studio.

(27) Q: *Tu penses t'installer en Angleterre?*
     A: **Oui, à Londres, j'ai acheté un studio.*

On the other hand, the prephrastic constituent in the English dislocated construction is thematic and identifiable, as in French. But the same resources of identifiability cannot be mobilized in both languages. The constituent of the English sentence can be identified thanks to a relation of the part-whole (metonymic) type, with a theme belonging to the universe of discourse, which is not the case in French:

(28) (a) Mary made three groups. The first one, she gave them algebra. The two others, she gave them permission to leave.
     (b) **Marie a fait trois groupes. Le premier, elle leur a fait faire des exercices d'algèbre. Les deux autres, elle leur a donné quartier libre.*

Inversely, in French the identification of a referent of discourse by means of a metonymic relation is possible in the context of a topicalized construction:

(29) *Marie a fait trois groupes. Au premier, elle a donné des exercices d'algèbre. Aux deux autres, elle a donné quartier libre.*

C. The singularity of constructions

We have gradually abandoned the notion of word order. Under this rubric, tradition designates a set of relations that are definable in the sequence (relative placement, fixity, adjacency), as we have shown in the previous sections. But the crucial relations of order are the ones that constitute the topological organization of the language. We have just seen that it is a given field that is the support for a given value, syntactical or pragmatic, and that the association of a value with a field is carried out in the context of a construction. It follows that the notion of word order has a limited descriptive and theoretical pertinence. What constitutes the pertinent entity is the construction.

At the same time, a parallelism between word and construction has taken shape. Words and constructions are entities that associate several dimensions belonging to either the signifier or the signified. The signifier of construction implements a topological organization. The specific character of a construction is to associate a syntactical, semantic, or pragmatic value with the fields that it distinguishes. We have just seen that the association of a given value (in our example, a pragmatic value) with a field is arbitrary. We were able to show that this association is oppositive: the two French split constructions, *il y a un NG qui V* or *c'est un NG qui V*, do not assign the same pragmatic values to the NG (K. Lambrecht, *Information Structure and Sentence Form*). In other words, what characterizes the word insofar as it is a sign also characterizes the construction. This common character can be explained by borrowing a generalization formulated by Jacques Lacan:

> Every linguistic symbol that can be easily isolated is not only inseparable from the whole, but is intersected and constituted by a whole series of incoming elements, oppositional overdeterminations that situate it in several registers simultaneously.

> (*Le Séminaire*, Book I, *Les Écrits techniques de Freud*)

Construction appears as a linguistic individual, and like all individuals, it has general characteristics that make it "inseparable from the whole" and irreducibly specific characteristics. In one or in several languages, constructions share common ways of functioning; topicalization shares with relativization the same mechanism of distancing. It is the same mechanism in English and in French. The same goes for words: the way a verb functions transitively is identical in French and English. The irreducibly specific character of constructions can be seen in the fact that there are no synonymous constructions, just as there are no synonymous words.

IV. Word Order and Translation

We can now come to the question of the untranslatable and characterize the untranslatable that arises from "word order" in relation to the untranslatable that arises from words.

According to the hypothesis put forward by construction grammars, the grammar of a language is composed of two repertories: a lexical repertory (infinite) and a repertory of constructions (finite). The elements of these two repertories are of the same type: they are signs marked by arbitrariness, in the sense in which the principle of matching the different dimensions that constitute them does not refer to an external principle. From this we can conclude that the untranslatable arising from word order is of the same nature as that arising from words. Just as a word in a language A has no exact equivalent in a language B, we predict that a construction in a language A has no exact equivalent in a language B. If that view is correct, it allows us to understand that there is no place for a study of a phenomenon such as word order by comparing language A and language B, because this phenomenon cannot be detached and isolated from the instance of each of its constructions.

If constructions, like words, are multidimensional entities subject to arbitrariness and overdetermination, the problem of the translation of constructions is posed in the same terms as that of the translation of words. If the translation of words is "abridging and partial" (Cassin, "Présentation: Quand lire, c'est faire"), the translation of constructions is as well, and for the same reason: the unique assemblage that characterizes a construction in language A (its internal constitution and its place in the grammatical system) is destroyed and must be reconstructed in language B.

Beyond the referential equivalence, every choice regarding the translation of a word has consequences for the metaphorical sequences, the models of assonance, and the morphological figures into which it may enter in language A and into which its equivalents can enter in language B. Similarly, every choice regarding the translation of a construction has consequences for the network of discursive relations and the rhetorical arrangement that constitute the text in which it occurs. Each time, we have to choose, not a word order, but a construction, that is, a set of constraints connected with a form of utterance, constraints that bear on the expression of a content and on the type of relation that the utterance can entertain with other utterances in the text (for an example, see F. Kerleroux and J.-M. Marandin, "L'ordre des mots").

WORK

FRENCH	*travail, œuvre*
GERMAN	*Arbeit, Werk*
GREEK	*ponos* [πόνος], *ergon* [ἔργον]
LATIN	*labor, opus*

➤ ART, BERUF, *CULTURE*, ECONOMY, ENTREPRENEUR, ESSENCE, *PERFORMANCE*, PLASTICITY, STRADANIE, *THING*, UTILITY, *VOCATION*

The human activity that falls under the category of "work," at least in some of its uses, is linked to pain (the French word *travail* derives from the Latin word for an instrument of torture), to labor (Lat. *labor* [the load], Eng. "labor"), and to accomplishment, to the notion of putting to work (Gr. *ergazomai* [ἐργάζομαι], Lat. *opus,* Fr. *mise en œuvre*, Eng. "work," Ger. *Werk*), which is not necessarily the opposite of leisure but can be its partner. With Hegel, work (Ger. *Arbeit*) becomes a philosophical concept, but it designates self-realization

(whether the course of history or the life of God) rather than a reality that is exclusively or even primarily anthropological.

That form of human activity that is specifically human can be designated from two distinct points of view: stress is placed either on the tedious, "laborious," or even painful, or else on accomplishment. The first sense of "labor" reverts to the Indo-European term for agricultural laborer (*laboratores*), and was used in opposition to the warrior (the *bellatores*) or the preacher (*oratores*). These three terms have their structural analogy in Roman mythology, with the Capitoline triad of Jupiter-Mars-Quirinius.

The tedious character of work, its "negativity" in the analysis of philosophers such as Hegel and Marx, comes out clearly in the French word *travail*, from the vulgate Latin *tripalium* (first documented in the year 578 as *trepalium*), which was a "torture instrument formed from three stakes whose purpose was to immobilize recalcitrant animals" (as in the "travail" of the horse smithy) or to torment slaves. *Travailler* is to take pains to do something (from the Greek *ponos* [πόνος], which designates all fatiguing exercises, in the plural, as in the example of the labors of Hercules). It is this sense that is underscored in a verse from La Fontaine's fable "Le Laboureur et ses enfants" (The Laborer and his children): "Travaillez, prenez de la peine" (Work, and take pains to do it). This usage entered the French language to such an extent that it became the preferred expression for designating the exhausting activity of turning over the soil. The biblical heritage is felt in the notion of working "with the sweat of one's brow." "Labor" also refers to the pains of childbirth. These last two uses are linked in the Bible (Gen. 3:16–19).

It is only with Hegel, in the preface to the *Phenomenology of the Spirit* (1807) that work becomes a philosophical concept, which is at first not anthropological (since it is applied to the "life of God") in the expression "the work of negativity" (*Arbeit des Negativen*), itself picking up "the serious, pain, and patience." Nonetheless, the German *Arbeit* points toward an entirely different area of meaning, related to the Greek *orphanos* [ὀρφανός], the Latin *orbus* (deprived of), the German *Erbe* (inheritance), as well as *Armut* (poverty). To be an orphan is to be a child subject to harsh physical activity in order to provide for one's own needs. This is the source of the reluctance of Ernst Jünger, author of *Der Arbeiter,* to have his work translated into French:

If I was reluctant for so long to have *Der Arbeiter* (Fr. *Le Travailleur*) translated into French, it stems in the first place from a pure problem of etymology. *Arbeiter* comes from *arbeo,* the gothic word "inheritance." *Travailleur* comes from *tripalium*, an "instrument of torture." *From the outset, there is a risk of a fundamental contradiction which could only increase in the translation.*

(Hervier, *The Details of Time*: *Interviews with Ernst Jünger* [emphasis added])

The meaning of this human activity is nonetheless not exhausted by reference to its painful character. At least in some of its aspects, it can be seen as the accomplishment, the institution of a work (Gr. *ergon* [ἔργον], Lat. *opus*, Fr. *œuvre*, Ger. *Werk*). In his *Second Treatise on Civil Government* (chap. 5), Locke distinguishes between the "labor" of his body and the

1

"Labor," "work" / *Arbeit*

"Labor" and "work" form one of the many pairs of English words whose origins lie in the Norman Conquest. "Labor" derives from the Norman French and refers back to the exercise of mental or corporal faculties, especially when it is difficult or painful. "Work" is more humble. It derives from the Anglo-Saxon and simply designates everything one does or the act of doing it. "Labor" has been employed in Marxist discourse because it connotes suffering and difficulty. In America, the pragmatists adopted the happier word "work" in their discussions.

As in French, the German language does not make this distinction. *Arbeiten*, like *travailler*, refers equally to labor and to work. In a lecture on "Hegel's Legacy," given at Northwestern University in 1998, Jürgen Habermas developed an argument first published in English in 1973 under the title *Labor and Interaction*. But in the changed circumstances of 1998, *Arbeit* would now be translated as "work," such that Habermas's discourse, instead of sounding like that of a European Marxist, comes more into line with contemporary American pragmatism.

2

Œuvre: A complex network of terms

Œuvre is part of a vast family of words connected with the Indo-European root **op-*, "productive activity." In Latin, for example, we find, alongside *ops, opis* ("abundance," whence *copia* [resources, wealth], which yields French *copie* [large quantity, reproduction]; see MIMÊSIS), *opus, operis* (to designate "work" and its product, the "œuvre" [whence *opifex* (worker, craftsman)] and *officium* [function, office, duty]), and the feminine *opera* (activity, care).

Another noun root, **werg*, designates action, whence the Greek words *ergon* [ἔργον] (task, work), *energeia* [ἐνέργεια] (action, activity)—see PRAXIS, Box 1, and FORCE, Box 1—*organon* [ὄργανον] (tool, organ), and the Germanic *werk* (Eng. "work," Ger. *Werk*). We must add two heterogeneous families of Latin words around *labo*: *labare* (to slip, collapse; cf. Fr. *lapsus*), whence *labor* (work as a "load" under which one bends) and *tripalium* (from *palus* [pillory, post]), which connotes our work as torment.

I. *ŒUVRE* AND WORK OF ART

Modern uses of *œuvre* link the term to artistic and literary production. In this sense, a literary *œuvre* is the result of a "doing" or "making," as in a Greek *poiein* [ποιεῖν] (see DICHTUNG, ERZÄHLEN, *POETRY*; cf. SPEECH ACT). *Œuvre* is also used in the critical and technical discourses around the creation of art and the nature of art and artists, see ART, BEAUTY, MIMÊSIS, TABLEAU; cf. AESTHETICS, LOGOS.

II. *ŒUVRE*, ACT, THING

An *œuvre* can also be seen as an exercise of power or will, a coalescence of forces. This vein opens onto the ontological dimension of implementation, power, and act (*dunamis* [δύναμις], *ergon* [ἔργον], *energeia* [ἐνέργεια]), explored in *ACT, I,* and additionally in FORCE and PRAXIS, ESSENCE, and SPECIES; cf. NATURE, WELT. Thinking in these terms raises the question of work as the result of human practice(s), explored in *ACT, II,* as well as in PRAXIS and ACTOR, BERUF ; cf. ENTREPRENEUR, MORALS. In counterpoint, the notion of God's work is addressed in *GRÂCE,* II. A final consideration, that of the work as physical embodiment, as a "thing" itself, is examined in RES, in particular RES, Box 1.

➤ *FACT, FICTION, IL Y A,* OBJECT, REALITY, *THING,* VORHANDEN

"work" of his hands, as properly belonging to each man as his own, but without clearly thematizing the distinction, and within the context of an analysis that paradoxically tends to erase rather than accentuate it insofar as the word "labor" becomes a generic term absorbing the distinction.

In *The Human Condition*, Hannah Arendt takes up this distinction, but in the opposite sense from Locke's analyses, as being "somewhat reminiscent" of the classical Greek distinction between *ponein* [πονεῖν] (to take pains to, to make the effort to) and *ergazesthai* [ἐργάζεσθαι] (to accomplish, to set to work; *mise en œuvre*), which is also used to distinguish slaves from artisans. The free man, on the other hand, is defined by his leisure, Greek *scholê* [σχολή] (whence the English word "school"), Latin *otium*, whose *neg-otium* (cf. Fr. *négoce*) is a privation. One should be careful not to confuse leisure (*otium*) with idleness (Lat. *otiositas*), or even with simple "free time" that corresponds to a "chronometric leisure" that Valéry opposes to "interior leisure" (*The Outlook for Intelligence*).

WORLD

The term refers to a totality of belonging, a set of objects that have the same mode of being (the "world of the senses," the "intelligible world," the "sublunar world"), unlike a simple "summa" of objects. In Greek, as well as in Latin, it can have a "laudatory" meaning, that of a well-organized totality (see WELT, Box 1 on the meaning of *kosmos*). The Russian constellation, where "world" is always only one of a number of possible meanings, linked to "light" or to "peace," is explored under MIR and SVET; cf. PRAVDA, RUSSIAN, SOBORNOST'.

The German WELT is the point of departure that introduces the division, particularly apparent in Kant, between a cosmological sense (*mundus* as "universe") and an anthropological sense.

Finer distinctions can be made among the following:

1. A cosmological sense; see also NATURE.
2. An ontological sense, linked to the representation of the whole and of totality; see WELT, Box 2; see also OMNITUDO REALITATIS; cf. *WHOLE.*
3. A theological sense (*mundus, saeculum*; cf. the scriptural expressions: "to come into the world, to leave the world"); see OLAM, SECULARIZATION.
4. A chronological sense (*aiôn* [αἰών]), as in *Weltalter* (historical time or period); see AIÔN, and *TIME*; cf. HISTORIA UNIVERSALIS.
5. A sociological and anthropological sense, as in *Umwelt* (world, environment, milieu); see WELT, Box 3.
6. An existential sense, as in the world of experience, mundanity (*Weltlichkeit*, *in-der-Welt-sein*); see DASEIN, LEIB, Box 1, WELTANSCHAUUNG.

WUNSCH (GERMAN)

ENGLISH   wish
FRENCH   *désir, souhait*

➤ *DESIRE* and CONSCIOUSNESS, DRIVE, ES, I/ME/MYSELF, INTENTION, LOVE, *MALAISE*, PLEASURE, SEHNSUCHT, UNCONSCIOUS, WILL

The German term *Wunsch* is, like *Trieb* (drive, instinct), at the heart of Freudian conceptualization, as it designates the fulfillment of desire (which is literally "filled," *erfüllt*) by the formations of the unconscious (dream, fantasy, symptom, lapsus, etc.). While the English "wish" is a near relative to *Wunsch*, close in meaning and deriving from the same root (the Sanskrit *wunskjan*), the French language has no obvious equivalent. The two words closest in meaning are *souhait*, which is a weaker term than *wunsch*, and *désir*, which is both stronger and more active and has the additional disadvantage of being used to translate a number of other terms that regularly surface in Freud's writings with different meanings. The French reception of Freud has been marked by the decision to adopt *désir* as the standard translation, obscuring the automatic quality of the mechanism described by Freud. This translation has also masked

the wealth of terms that Freud used to account for multiple facets of human desire. There is nothing in Freud's writings that resembles the theory of desire that Lacan believes he can find in them, even if he does so through the intermediary of Hegel as interpreted by Kojève and the latter's readings of Heidegger. Lacan's *désir* is much closer to Hegel's *Begierde* (contentiously translated as "recognition," "appetite," or "desire," and assumed to refer to a conscious state) than to the Freudian notion of *Wunsch* (assumed to refer to an unconscious psychic mechanism).

I. The Meaning of *Wunsch* in Freud

The particular conceptual meaning Freud gives to *Wunsch* can be traced back to his *Project for a Scientific Psychology* (1895) and especially to *The Interpretation of Dreams* [*Die Traumdeutung*, 1899], whose most celebrated thesis is the definition of the dream as a *Wunscherfüllung*, translated into English as "wish-fulfillment," but into French as "*réalisation de désir*" or as "*accomplissement de souhait.*" The difficulty is a double one: establishing the precise meaning of *Wunsch* and addressing the multiplicity of terms in Freud's work that can all be translated by *désir* in French: *Begierde* (appetite, recognition, desire, conscience), *Begehren* (to desire, to crave, to covet), *Begehrung* (longing), *Lust* (lust, pleasure, delight, inclination), *Gelüste* (hankering, longing), *Sehnsucht* (longing, yearning, desire), *Gier* (avarice, craving), *Verlangen* (to demand, to call, to want).

In Freud *Wunsch* refers to an unconscious and automatic psychological mechanism linked to the necessities of living. It is to be understood in relation to an *experience of satisfaction.* In the chapter of *Die Traumdeutung* specifically called "Zur Wunscherfüllung" (on wish-fulfillment, Fr. *sur la réalisation du désir*), Freud clearly explains the link between the experience of satisfaction and desire. He makes a hypothesis about a "psychic apparatus" whose purely reflexive functioning becomes more complicated as a result of a "necessity of life" that imposes its own requirements on the organism:

> A hungry baby screams or kicks helplessly. But the situation remains unaltered, for the excitation arising from an internal need is not due to a force producing a *momentary* impact but to one which is in continuous operation. A change can only come about if in some way or other (in the case of the baby, through outside help) an "experience of satisfaction" can be achieved which puts an end to the internal stimulus. An essential component of this experience of satisfaction is a particular perception (that of nourishment, in our example) the mnemic image of which remains associated thenceforward with the memory trace of the excitation produced by the need. As a result of the link that has thus been established, the next time this need arises a psychical impulse will at once emerge which will seek to re-cathect the mnemic image of the perception and to re-evoke the perception itself, that is to say, to re-establish the situation of the original satisfaction. An impulse of this kind is what we call a wish; the reappearance of the perception is the fulfillment of the wish; and the shortest path to the fulfillment of the wish is a path leading

direct from the excitation produced by the need to a complete cathexis of the perception.

(Freud, *Interpretation of Dreams, in Standard Edition*, 5: 565–66)

We see how *Wunsch*, like *Trieb*, has a technical meaning in Freud. The psychological mechanism to which the two terms refer are for that matter very close to each other. Freud mentions repeatedly that desire is the driving force (*Triebkraft*) without which the dream would not take form. At issue is *Wunsch* as the "sole psychical motive force for the construction of dreams" (*einziger psychischer Triebkraft für den Traum*) (*Gesammelte Werke*, 2–3: 574, *Standard Edition*, 5: 568). Freud, however, defines *Wunsch*, as we saw in the passage above, as an "excitation arising from an internal need [that] is not due to a force producing a *momentary* impact but to one which is in continuous operation." *The Interpretation of Dreams* takes up the formulae from the *Project for a Scientific Psychology* and also anticipates the later definition of the drive. Thus, we can see *Wunsch* as an instinctual mechanism with its own specific characteristics: the hallucinatory reliving of an experience of satisfaction. Insofar as what is proper to desire lies in its link to a perception, one can understand how the study of dreams would permit a better understanding of its nature. But above all, it is the unconscious dimension of desire that needs to be taken into account. How does one apply the wish-fulfillment rule of desire to painful dreams or nightmares? The answer derives from the division of psychic life into two agencies: one (the unconscious) seeks to obtain pleasure through the fulfillment of a desire that is subsequently experienced as painful in the second agency (the preconscious-conscious). Thus nothing could be further from the Freudian *Wunsch* than an ontological model of desire, whose origin would be found in the Platonic *erôs* and whose tracks could be followed in the Augustinian *amor Dei*: that is to say, a force inscribed in the being of man that leads him, if he knows how to follow it, toward an object that would offset his essential lack. Here desire becomes a mark of human imperfection and a trace of the perfection that man aspires to. But Freudian desire is based on an unconscious mechanism over which man has no mastery. What is more, this desire translates the fundamental maladjustment of the human psychic process: unconscious desire is indestructible and always follows the "shortest path," the most dangerous one, since it concentrates all of its energies on simple perception.

II. The Translation of *Wunsch* into French

Is it correct to translate *Wunsch* as *désir* in French? Here questions of terminology and the weight of the Lacanian theory of desire converge. This was the standard translation right up until the team of the *Œuvres complètes de Freud/Psychanalyse* (*OCF/P*) made its own determination (cf. Bourguignon et al., *Traduire Freud*). In an attempt to take into account the diversity of Freudian terms that touch upon the domain of desire, and in an effort to establish a precise and systematic language, the *OCF/P* chose to translate *Wunsch* by *souhait* (and reserved *désir* for *Begierde*). But *Wunsch* means something stronger than *souhait*. Whereas *souhait* translates the Latin *votum*, *Wunsch* is mentioned in the

sixteenth century (cf. Johann Fries, *Novum dictionariolum puerorum latinogermanicum*, Zurich, Froschover, 1556) as a translation of *appetitio* (along with *Begird*), *desideratio* (with *Begird* and *Verlangen*), and *desiderium* (with *Lust*, *Begird*, and *Verlangen*). And this meaning has not become any weaker over time. When Goethe writes, "*In deinem Herzen muß eben der Wunsch keimen*," he clearly wants to say that "desire must stir in your heart" and not some weaker wish or *souhait*. Furthermore, the idea of an unconscious *souhait* seems harder to accept than an unconscious desire. A *souhait* presumes the active participation of the person who wishes. It would be difficult to think of oneself as the plaything of a *souhait* the way one can be subject to a desire. So there can be some justification in translating *Wunsch* as "desire."

III. Multiple Desires in the Freudian Text

Freud makes full use of the wealth of the German lexicon to account for the different levels of human desire: *Begierde* (or *Begehren*), *Lust*, *Gelüste*, *Verlangen*, and *Sehnsucht*. *Verlangen* (which literally means "extending out an arm to reach" or more colloquially "at arm's reach") is the most general term, the form of "desire" par excellence. Freud uses the term *Gelüste* (formed from *Lust*, but retaining only its meaning of desire, not of pleasure) for the strong longings that made it necessary to erect the two fundamental totemic interdictions: do not kill the totem animal and do not have sexual intercourse with members of the totem clan. As Freud wrote, parricide and incest "must be the oldest and most powerful human desires [*Gelüste*]" (*Totem und Tabu, in Gesammelte Werke*, 9: 42). Can neurosis, the essential object of Freudian theory, be understood as the cultural transformation of *Gelüste* into *Wunsch*, or of *desire* into *wish*, by means of the effect of repression? In interpreting dreams, then, we would recover the unconquerable power of desire behind the mechanism of wish.

We find the same mechanism at work in *Sehnsucht*, a term deemed untranslatable into French that contains the sense of a violent, painful desire for a distant or unattainable object. In *The Interpretation of Dreams* this is the term used for the longing to go to Rome, a desire so strong, and an object so distant, that for a long time it could only be expressed as the *Wunsch* of a dream. Freud writes: "In another case I note the fact that although the wish that excites the dream is a contemporary wish it is nevertheless greatly reinforced by memories of childhood. I refer to a series of dreams which are based on the longing [*Sehnsucht*] to go to Rome" (*Traumdeutung, in Gesammelte Werke*, 2–3, p. 199).

The fact remains that only *Wunsch* was subject to rigorous definition and thus raised to the status of concept: so it is in relation to this core meaning that the other terms are deployed, terms that have retained meanings closer to common usage and the literary tradition. It is in this sense that Lacan thought it legitimate to show that the work of Freud was much more a theory of desire than an anthropology of desires that would entail, as Kant established, precise definitions of the multiple terms afforded by the German language:

Desire [*Begierde*] (*appetitio*) is the self-determination of a subject's power through the representation of something in the future as an effect of this representation. . . .

Desiring without exercising power to produce the object is *wish* [*Wunsch*]. Wish can be directed toward objects that the subject feels incapable of producing, and then it is an *empty* (idle) wish [*leerer Wunsch*]. The empty wish to be able to annihilate the time between the desire [*Begehrten*] and the acquisition of the desired object is *longing* [*Sehnsucht*].

> (Kant, *Anthropology from a Pragmatic Point of View*, Bk. 3, § 73, R. B. Louden, ed. Cambridge Texts in the History of Philosophy, 149 [German added])

"Desire" according to Jacques Lacan

➤ AUFHEBEN, DASEIN

Lacan's interpretation of desire according to Freud leads him to make a rigorous distinction between *Wunsch* and *désir*: "Il faut s'arrêter à ces vocables de *Wunsch*, et de *Wish* qui le rend en anglais pour les distinguer du désir. . . . Ce sont des vœux" (We must pause at the term *Wunsch* and its English translation "wish" to distinguish them from the French *désir* [desire]. . . . Their French equivalent is *vœu*) (Lacan, *Écrits*). Whereas Freud makes *Wunsch* a special case of *Trieb*, Lacan makes desire into a general structure of the drives (Fr. *pulsions*): "This desire, in which it is literally verified that the desire of man is alienated in the desire of the other, structures in fact the drives discovered in the analysis." But this interpretation reproduces on Freud the very operation that A. Kojève had already carried out on Hegel during his celebrated seminars at the *École pratique des hautes études* from 1933 to 1939, which were faithfully attended by Lacan. In his commentary "Autonomy and Dependence of Self-Consciousness: Mastery and Slavery" (IV § A), Kojève gives desire a scope it does not have in Hegel. For Kojève, desire (with a capital D in Queneau's compilation) is at the heart of the process of subjectivation: "The (conscious) Desire of a being is what constitutes that being as a 'myself.' . . . The very being of man, the self-conscious being, therefore, implies and presupposes Desire." But, Kojève specifies, "by itself, this Desire only constitutes the sentiment of self" (*Reading of Hegel*, 3–4). How does one pass on to the specifically human stage of self-consciousness? By the desire of desire: "For there to be Self-Consciousness, Desire must be directed toward a non-natural object, toward something that goes beyond given reality. Now, the only thing that goes beyond given reality is Desire itself" (ibid., 5). From this comes Kojève's interpretation of the "struggle for recognition," which is for him a "desire for recognition": "Man's humanity 'comes to light' only in risking his life to satisfy his human Desire—that is, his Desire directed toward another Desire. Now, to desire a Desire is to want to substitute oneself for the value desired by this Desire" (ibid., 7).

How does Hegel address this? "Desire" is the translation of the German word *Begierde* in Hegel's text, a term that clearly implies a relation to an object. But which object? For Hegel it is life that is at issue: life presents itself as the other of consciousness: "self-consciousness is thus only assured of itself through sublating [*aufheben*] this other, which is presented to self-consciousness as an independent life; self-consciousness is Desire [*Begierde*]" (*Phänomenologie des Geistes*, 174). The satisfaction of desire in the object (cast not as *Wunscherfüllung* but as *Befriedigung der Begierde*) does not cancel the desire but instead reproduces it. For Hegel, consciousness can only be satisfied in an object that does not cancel it, that is to say, in an object that "effects the negation"—in other words, in another self-consciousness. "Self-consciousness attains its satisfaction only in another self-consciousness" (ibid., 175). But it would seem that in the course of this analysis, and contrary to Kojève's interpretation, "desire" never goes beyond the sphere of "life," of the immediate, of independence, of the "object," whereas the "I" [*Ich*] that is according to Hegel the "object of its own notion [of self-consciousness], is in point of fact not 'object'" ("Ich, das der Gegenstand seines Begriffs ist, ist in der Tat nicht Gegenstand"; ibid., 177). The struggle for recognition, the dialectic of master and slave, entails a stage superior to that of life (with its implication of a death-risk) and thus superior also to desire itself.

If Freud's *Wunsch* may be translated as a *vœu* (promise, vow, wish), there is no term in Freud that corresponds to this ontological desire fabricated by Lacan, who used Heideggerian *Dasein* to interpret Hegel.
