To tease the members of this group apart, we should begin by pointing out that *beschreiben* does not originally mean *describe* in the sense of "to make a description," but *inscribe*, "to put down on paper." We still find this meaning today in everyday language when we say, for example, *ein Blatt beschreiben* to mean "cover a page with writing" (the Grimms give *vollschreiben* and *implere paginam* as equivalents for this meaning). On that basis *beschreiben* in geometry means "to draw geometrical figures." The same usage exists in English—no untranslatable here: descriptive geometry is called *beschreibende Geometrie*. In its adjectival use *beschreibend*, "descriptive," corresponds in poetics to the usage of the epithet *descriptif*: *beschreibende Poesie* = "descriptive poetry." Let us also note that although the term *Beschreiber*, the German calque of the Latin *scriptor*, has survived up to the present day in the sense of someone who describes an object or event by a narrative (someone who recounts a journey is a *Reisebeschreiber*, someone who recounts a life is a *Lebensbeschreiber*), the *scriptor* has not been *der Beschreiber* in German since the sixteenth century (Luther uses it in this sense), but rather *der Schriftsteller*. The word was invented by analogy with *Briefsteller* (hence the public writer, who composes [*stellt*] letters [*Briefe*] for others).

If *Beschreibung* is *mimêsis* [μίμησις] by (in)scription, *Schilderung* "thinks" of it as painting. In the seventeenth and eighteenth centuries, the word *Schilderei*, imported from the Dutch, was the equivalent of *Gemälde* and indicated a painting. In his *Geschichten* (Strasbourg, 1677) Philander von Sittewald (Johannes Michael Moscherosch) writes: "Also hat Horatius die picturam der poesi, die Schilderei der Poeterey vorziehen wollen (Horace thus wished to give preference to *pictura* over poetry, to painting over *Poeterey* [which could be translated by 'literature'])." As equivalents for *Schilderei*, the Grimms give *bildliche Darstellung* (imagistic representation), *Gemälde* (painting), *tabula picta, imago, simulacrum, effigies. Schilderei* is the *ut pictura poiesis*. In the eighteenth century the word cedes its place to *Schilderung*, which has kept it to the present day. The Grimms note in the nineteenth century that the proper sense of *peinture*, a painting, was forgotten and that the image of description as image-painting had actually been lost "lately." But this was only partly true. Adelung still noted that *Schilderung* was "lebhafte Beschreibung eines Dinges

nach allen seinen Teilen, ein rednerisches oder poetisches Bild [living description (*Beschreibung*) of an object according to all its parts, the image of the orator or the poet]," simply transposing the rhetorical imperative of *hypotypose* and *ekphrasis* (*ut ante oculos videatur*) into the domain of literature. And although the meaning of *tableau* in the proper sense disappeared with the arrival of *Schilderung* in the eighteenth century, it remains the case that *Schilderung*, unlike *Beschreibung*, always retained the trace of this lost origin. It is remarkable, for example, that toward the end of the nineteenth century, that is, when German social democracy began to become aware of its power, a large number of titles appeared such as *Schilderung des sozialen Elends* (Painting of social poverty), *Schilderung des Aufstandes der Arbeiter von Paris vom 23. bis zum 26. Juni 1848* (*Schilderung* of the uprising of Parisian workers . . .), *Schilderung des vom preußischen Parlament und vom Zentrum gegen die Bergarbeiter ausgeübten Verrats* (*Schilderung* of Prussian parliament's betrayal of the workers . . .), etc. just as, in the middle of the nineteenth century, we find titles like *Schilderung der in Berns Umgebung sichtbaren Gebirge* (Description of mountains around Bern, 1852). From creating an image of the picturesque Alps to giving a true recounting of the class struggle, *Schilderung* could not mean "description," but rather, in the case of the Alps, "picturesque tableau" and, in the case of political conflicts or poverty, "lively and truthful reconstruction." Whether it is a matter of romantic picturesqueness or political enthusiasm, *Schilderung* is the heir to the figures of *ekphrasis* [ἔκφρασις] and hypotypose (see DESCRIPTION, Box 1). In the vocabulary of narrative technique, it is thus not a simple technical term related to the structuring of the plot or the paradoxes of the relation between narration and description, but the survivor of the power of the imagination in fiction.

But if that is the case, why does Gero von Wilpert need, in his definition of *Beschreibung*, to add to the equivalent *Schilderung* the criterion of *ausmalen*—which comes, like *Schilderung*, from painting rather than writing? *Ausmalen* is not only *depingere*, but to do so in detail. Whence the assimilation of the term to the rhetorical figures of *amplificatio* and *ornatus* and its extension toward two poles. For *ausmalen* is either to lift up by means of more color (in the most concrete sense, of repainting a facade with more lively colors) or to intensify the vivacity of the fictional image by adding details to the narration.

B. From the painting to the image: *Schilderung* and *Bild*

What relationship is there between the fictional tableau and the philosophical status of the word *Bild*? A fictional tableau is not a *Bild* but rather *Abbild*. It is not the schematization of the world but its living tableau. And when romanticism led its crusade against classical imitation, it was by extending the Fichtean view of the imagination as a limitless expansion of the "I" 's powers of self-invention (cf. Walter Benjamin's analyses in his study of German romanticism)—moving from reflection (*Nachahmung, Wiedergabe*) to the absolute reflection of the imagination in its images, both speculative and in competition with the theoretical. It was thus possible to conceive of the imagination, *Einbildungskraft*, as an originating power, and of the work as its product and its origin at the same time. However, the *Schilderei* of the descriptive artifact does not derive from a notion of an originative absolute. It remains,

in the Aristotelian tradition, the procedure of *inscription-image*, whose goal is not to rival the universality of the idea but rather to return to the living of the real its "truth"—after a mimetic detour. This is indeed what Aristotle says about *mimêsis* and its power: "the reason of the delight in seeing the picture is that one is at the same time learning—gathering the meaning of things, e.g., that the man there is so-and-so" (*Poetics*, 4, 1448 b 15). This faculty of giving the truth back its images, the Aristotelian *apeikazein* [ἀπεικάζειν], is not the production of an ideal object as with Plato. Transcendental idealism, which in Germany exerted such pressure on poetic discourse, continues to cast its shadow—that of an inverted Platonic *mimêsis*, one that perdures through the romantic collusion between the Subject and the *Bild*. For Heidegger the *Bild* (*Kant-Buch*, §20) still remains "*Versinnlichung von Begriffen* (a making perceptible of concepts)": from the schema of Kantian representation to the *Anblick*, in viewing the world, the image remains a power of the mind, even though in the end it is kept in its Otherness, like the existence of a painting of the world, in front of the eyes of the mind.

If the vocabularies of narratological instances and mimetic structure still have so much difficulty in freeing themselves from their metaphysical cast, it is precisely because romanticism countered transcendental Idealism with a literary absolute for which the infinite freedom of the mind remains that of the writing or imagining *subject*. As long as the schematization of language remains short-circuited by the absolute of the "I," *poiêsis* [ποίησις] can only be conceived as an infinite power of image production, one that is all the more free as the figures of its infinity are freed from any linguistic categorization (Frederick Schlegel baptizes them *unendliche Fülle* [infinite plenitude] or *Arabeske*). Diametrically opposed, if the infinite will is all that remains for "overthrowing Platonism," as for Nietzsche, the "*Schematisierung der Welt* (schematization of the world)" is indeed the imposition on the world of a *Kunstwerk* that is only the form of the will transformed into a possible world—and real at the same time—beyond the Platonic cleavage between image and truth, and whose infinite Wagnerian melody was for Nietzsche at one time the proof, confirming that the schema and the anti-schema of form are only one single thing as long as the form is not structured "like a language," but free as the song of the Kantian nightingale.

The overthrow of Platonism in the vocabulary of the literary imagination is barely underway in Germany, and the need for it is still far from being perceived in all its domains.

ES, ICH, ÜBER-ICH

ENGLISH   id; I, me, self; super-ego
FRENCH   id; ça; je, moi; surmoi
GREEK   egô [ἐγώ]
LATIN   id; ego

➤ CONSCIOUSNESS, DRIVE, ES GIBT, I/ME/MYSELF, *IL Y A, PERSON,* ROMANTIC, SELBST, SUBJECT, UNCONSCIOUS

The first topography developed by Freud starting with *The Interpretation of Dreams* (1900) and that includes the conscious, the preconscious, and the unconscious is based on the classical vocabulary of philosophy and psychology. The only innovation here from the linguistic point of view is the introduction of the preconscious (*das Vorbewusste*). That model thus does not pose any particular problem of translation. It is entirely otherwise with the second topography, which, beginning with the publication in 1923 of the essay "Das Ich und das Es" (The Ego and the Id), uses a vocabulary that is entirely specific to the German language, in order to define the psychological as a complex system in which are confronted, balanced, and dissolved what we might call psychic "figures," bearers of "personality" (the Ego and the Superego), with the latter two deriving their energy from the reservoir of drives that is the Id. Thus, we may say that the Ego is the "center" of the personality and that it tries to find a balance among the threefold demands of reality, of the Superego (which bears the ideal and prohibitions), and of the Id, that is, archaic desires. However, far from being an autonomous being supporting the transparent identity of a subject, the Ego itself is the product of a series of identifications. To give a lively representation of what he calls the "decomposition of the psychic personality," Freud chooses to use substantival pronouns (*Ich*, the personal pronoun of the first-person singular; *Id*, the neuter pronoun of the third-person singular), which he finds in the philosophical and psychological traditions (*das Ich*), among recent authors (*das Es*), or which he invents (*das Über-Ich*).

The difficulty of translating these terms into English or French thus rests both on the difference between the systems of pronouns in the two languages and on the "classical" translations of the substantival *Ich*. Finally, the interpretations themselves of this new topic, and especially of the meaning of *Ich*, help orient the translations, and lead Lacan to reintroduce, following Edouard Pichon, a distinction between *moi* (me) and *je* (I).

I. The Pronoun *Ich*

Ich, the personal pronoun in the first-person singular, corresponds to the Greek *ego* [ἐγώ], the Latin *ego*, the French *je*, and the English "I." German does not have an equivalent of the French *moi*, that is, to a "tonic form" of "I," or as Littré defines it, a "pronoun . . . whose primary role is to serve as an object, but which is also used as a subject when a nonenclitic form, such as *je* and *me*, is required" (RT: *Dictionnaire de la langue française*). In the sixteenth century *je* was felt to be enclitic (we still find in Scarron, *Le Virgile travesti*, "je qui chantai jadis Typhon d'un style que l'on trouvera bouffon"). In German, *Ich* is both the strong and the weak form: *Ich, Ich = moi, je*; *Ich, der = moi qui*, and so on. Thus the famous phrase "Et in Arcadia ego" is translated into French as "Moi aussi, j'ai vécu en Arcadie," and in German (by Schiller, *Thalia*) as "Auch Ich war in Arcadia geboren."

This reinforced form was, reasonably, nominalized in French. It thus represents the I that is the object of psychology:

> Moi, en tant que pensant (*Ich, als denkend*), je suis un object du sense interne et je m'appelle une âme (*und heisse Seele*). Si bien que l'expression: moi (*der Ausdruck: Ich*), en tant qu'être pensant, désigne déja l'objet de la psychologie.
>
> (Kant, *Kritik der reinen Vernunft*)

The Fichtean distinction between *Ich* and *Nicht-Ich* thus becomes that of the I and the not-I, and *moi transcendental* naturally translates Husserl's *tranzendentale Ich*:

> Par l'ἐποχή phénoménologique, je réduis mon moi humain naturel (*mein naturalisches menschliches Ich*) et ma vie psychique—domaine de l'expérience de soi psychologique (*meiner psychologischen Selbsterfahrung*)—à mon moi (*Ich*) transcendental et phénoménologique, domaine de l'expérience de soi (*Selbsterfahrung*) transcendentale et phénoménologique.
>
> (Husserl, *Cartesianische Meditationen*)

We may therefore put the question thus: is the Freudian *Ich* a strong or weak subject? This question seems abruptly to reduce a theoretical question to a grammatical one: however, grammatical considerations are essential for understanding the debates that have animated French psychoanalysis.

■ See Box 1.

II. The Neuter Pronoun *Es*

The translation of *Es* by *ça* in French was not established without difficulty. The group that gathered on 31 May 1927 did indeed adopt *ça* as proposed by Édouard Pichon, against the opinion of Angelo Hesnard, but when Freud apparently voiced disapproval, *soi* was chosen in the end on 20 July 1928. We find a remarkable trace of these difficulties of translation in a note by Hesnard, added to the translation of Freud's *Le moi et le ça* by S. Jankélévitch:

> The Freudian *Es*, neuter pronoun in German, is untranslatable into French. It was suggested that we translate

1

Je and *moi*, from Pichon to Lacan

Founded in 1926, the Société psychanalytique de Paris (SPP) counted among its members the grammarian Édouard Pichon, co-author with Jacques Damourette of the *Essai de grammaire de la langue française*. He started a linguistic commission for the unification of French psychoanalytic vocabulary. At its meeting of 29 May 1927, Pichon was the only one opposed to the translation of *Ich* by *moi*:

> M. Pichon explains why the translation of *Ich* by "moi" seems wrong to him. "Moi" is opposed to not-"Moi"; it contains everything in the subject's psyche; it answers just as well to *das Es* as to *das Ich*: what is proper to *Ich* in his view is the ability to be the subject of conscious thought: this is why he suggests *ego* as a translation, or *je*, terms which are as it happens the least inexact correlates for *Ich*.

> (*Revue française de psychanalyse* 2 (1927): 404–5)

Moi won by four votes to one.

Despite his curious assimilation of *Ich* with consciousness, did Pichon anticipate, on the basis of purely grammatical considerations, Lacan's splitting of *Ich* into *je* and *moi*? One might think so on the basis of an article entitled "La personne et la personnalité vues à la lumière de la pensée idiomatique française," dedicated precisely to distinguishing *je* and *moi*, but in a sense rather far away from Lacan's (which Roudinesco does not seem to make clear in *Histoire de la psychanalyse en France*). For Lacan, the distinction between *je* and *moi* corresponds to two fundamentally different psychic functions. The *je* is the subject of the unconscious, the subject of the signifier; yet, the subject, in the "circle of the signifier," cannot "count itself and only act as an absence." Where, then, does the *moi* come from? From the need to overcome this absence, or "the invisible mark that the subject has from the signifier," which "alienates him … in the primary identification which forms the ideal of the *moi*" ("Subversion du sujet et dialectique du désir"). In any case, we will see below whether the Lacanian distinction between *je* and *moi* is necessarily located "inside" the *Ich*.

In the above-cited article, however, Pichon, on the basis of grammar, distinguishes the *je-me* as "thin personality" with the *moi* as "thick personality." It is true that the *je*, however thin, represents the unchangeable part, and the *moi* the changeable, notably by means of the cure: one thus helps a patient "by explaining to him that destroying one part of his *moi* may temporarily cause suffering to his *je-me*, but not mutilate it. . . . And the patient will feel that his new *moi*, that is, the new thickness of his person, fits better than the old one with his *je-me*." Pichon does not show how the *moi* is produced from the *je*. Further, nothing is more foreign to Lacan than this doctrine of thicknesses: how can we be sure of not being taken in by a new narcissistic mirage, by identifying with the analyst? The Lacanian cure is more of a procedure of paring down the *moi*, and grammar should not mask the meaning of psychic functions:

> analyzing whether and how the *je* and the *moi* are distinct and how they overlap in each particular subject is not a matter of the grammatical conception of the functions in which they appear.

> (Lacan, "La chose freudienne")

it by the Latin *Id*. Usage favored the term *ça* (or *cela*). Many psychoanalysts keep the German term *Es*, contrasted with *Ich* (Moi) and *Über-Ich* (Sur-Moi).

In German, *Es* is a neuter pronoun that is used in a large number of expressions translated in French by *ça* or *il* (e.g., *es regnet*, *il pleut*; *es geht*, *ça va*; see ES GIBT). Its nominalization in Freud's writing is the consequence in German of a whole train of thought (philosophy of nature, Romantic medicine, vitalism), which, over the course of the nineteenth century, used the impersonal *Es* to refer to activities that cannot be controlled by the will or consciousness (cf. Staewen-Haas, "Le terme 'es' ['ça']"; "Zur Genealogie des 'Es'").

In what is called in French *Le moi et le ça*, Freud claims to be borrowing the term, in its nominalized form, from Groddeck, and further back, from Nietzsche:

> I propose to take it into account, by proposing to call *das Ich* that which comes from the system of *perception* and which is at first *preconscious*, and to call the other psychic element, into which the *Ich* extends and which behaves like the *unconscious*, the *Es*, following Groddeck's usage.

Freud clarifies in a note: "Groddeck probably followed Nietzsche, who frequently uses this grammatical expression to refer to that part of our being which is impersonal and thus subject to natural necessity [*Naturnotwendig*]."

It remains the case that neither Nietzsche nor any of his predecessors (e.g., Georg Lichtenberg and Eduard von Hartmann) construct a real concept of the *Es*. The claim of paragraph 17 of *Jenseits von Gut und Böse* (*Beyond Good and Evil*) is certainly not to replace the Cartesian "I think" with "it thinks," but to show that, in both cases, what remains is the belief in a subject of thought, even if it is impersonal:

> It thinks (*Es denkt*): but that with this "it" (*dies "es"*) we should in fact be dealing with the ancient and celebrated "I" (*"Ich"*) is only, to speak politely, an assumption. . . . . But we still do too much with this "it thinks" (*"es denkt"*): this "it" (*dies "es"*) already contains an interpretation of the process, and does not belong to the process itself.

Nietzsche is thus critiquing Romantic and especially Neo-Romantic usage (note that he preserves the lowercase: he is interested in a grammatical function). This usage is precisely the same as Groddeck's, who gives the expression its nominalizing turn. Freud is able to take over the phrase and to give it a role and a rigorous definition, while still recognizing its fundamentally irrational nature. While not everything dissolves into the *Es*, everything does come out of it.

III. The English Translation: "Ego and Id"

As with other Freudian terms, the English translation took a scholarly direction early on (beginning in 1927 with the translation of *The Ego and the Id* by Joan Riviere): the use of Latin terms, even though English of course possesses an array of pronouns ("I" and "it"), as well as "me," an equivalent of the French *moi* (*c'est moi*, "it's me"—in German, *Ich bin es*). Unlike in France, the choice did not occasion much discussion. It corresponds fully with the medical orientation of psychoanalysis in the Anglo-Saxon world. It must be noted, however, that "ego" was used from the middle of the nineteenth century in psychology to refer to the psychic function corresponding to the pronoun "I": nominalizing this pronoun for psychoanalytic usage would have been a genuine terminological invention. Bruno Bettelheim, in *Freud and Man's Soul*, shows just how much the English translation introduces abstractions where Freud attempts to anchor his second topic in the most everyday language.

English can also, however, use its own resources for creating terms: this is the case, for example, with Winnicott, who creates, alongside the ego, a distinct notion: the "self." Here is how he defines it, in a letter addressed to the translator of one of his articles, who is having difficulty with the translation of "self": "For me the self, which is not the ego, is the person who is me, who is only me, who has a totality based on the operation of the maturational process" (letter of 19 January 1971). However, the French tradition of translating German terms also leads to the rejection of the solutions offered by the French language. In translating "self" by *moi*, the translator of the article in question fears no longer having this term available to translate "ego": whence the preservation, in the translation, of the term "self," declared untranslatable. As we see, the problem does not reside at all in the absence of resources of the target language. But, with the "self" having been declared untranslatable by Winnicott's translators, and without *je* being brought into play, here is the authorized translation: "Pour moi, le *self*, qui n'est pas le moi, est la personne qui est moi."

■ See Box 2.

In conclusion, we may see that the choices of translation are not unrelated to the question of the scientific status of psychoanalysis. The second topic represents Freud's desire to break with abstract character of the first (unconscious, preconscious, conscious) and its roots in the vocabulary of psychology and philosophy. Whatever Freud's declarations

about the scientific character of his invention, the second topic is more in line with Freud's place in German Romantic literature. Though both French and English translators are aware of this aspect of Freud, the latter did everything possible to hide it and thus give themselves a way of preserving continuity in Freud's work. The former are more hesitant, which is partly due to the absence of a theoretical unity in the French psychoanalytic movement (logic would have required the *moi* and the *soi* or the *je* and the *ça*). Lacan did try to exemplify this unity, but his *je* was not adopted. This was not only because of linguistic inertia: rather, it is because, by splitting Freud's *Ich* into *moi* and *je*, he seems to clarify some aspects of Freud's text at the cost of a formalism that seems excessive. As a Romantic, Freud was no doubt attached to the ambiguity of his notions, which thus reinforces their power of metamorphosis.

The Phrase: "Wo Es war, soll Ich werden"

What is perhaps Freud's most famous phrase, used at the end of his lecture on "The Dissection of the Psychical Personality" (included in the *New Introductory Lectures on Psycho-Analysis*, vol. 22 of the *Standard Edition*), presents a particular translation difficulty that results from the use of nominalized pronouns. The

difficulty is compounded by the fact that Freud seems to re-establish the pronominal use (without the articles) while maintaining the nominalized dimension (by writing the pronouns with capitals): "Wo Es war, soll Ich werden" (*Neue Folge der Vorlesungen zur Einführung in die Psychoanalyse*). Word for word,

this yields: "Where That was, I should be," or "Where It was, I should be" (Strachey translates it: "Where id was, there ego shall be," thus eliminating the capitalized pronouns).

No translation can preserve the extreme subtlety with which Freud keeps the nouns

in writing, even while eliminating them in speech. There are thus two directions:

1. That of the published translations, which do not worry about these subtleties and simply choose to treat *Es* and *Ich* as nouns. The first French translation, by Anne Berman in 1936 (which was the only one available until 1984), even adds a verb that was not in the text: "Le moi doit déloger le ça." The two recent translations, published by Gallimard (1984) and by Presses Universitaires de France (1993), are very close: "Là où était du ça, doit advenir du moi" (Gallimard), and "Là où était du ça, du moi doit advenir" (Presses Universitaires de France). The choice of treating *Es* and *Ich* as partitive is based on the grammatical logic of German: we might miss the pronominal resonance, but the partitive corresponds equally well to the context. Freud, in the immediately preceding sentence, claims in effect that the goal of psychoanalysis is "to strengthen the ego, to make it more independent of the super-ego, to widen its field of perception and enlarge its organization, so that it can appropriate fresh portions of the id" ("The Dissection of the Psychical Personality," *New Introductory Lectures*, vol. 22, *Standard Edition*, and *Gesammelte Werke*, vol. 15).

2. The other direction, one taken by Lacan, grandly ignores this context. Of the several translations that he gives of this Freudian passage, the simplest is no doubt from "La science et la vérité": "Là où c'était, là comme sujet dois-je advenir." This translation, both literal and interpretive at the same time, adds some precision ("comme sujet"), which is completely absent from Freud's text. But the Lacanian interpretation of the second topic is what is at issue here. For Freud, it is clear that the *moi* must conquer territory belonging to the *je*, which is precisely what he calls "cultural work" (*Kulturarbeit*): it is, in fact, the contribution of psychoanalysis to culture at large. Lacan interprets the *Es* in the phrase not as an "uncultivated" part, but as the very location of the subject of the unconscious: in other words, the *moi* must, by entering the location of the subject, become the subject, hence *je*. And the lack of an article does not, for Lacan, make the pronouns into partitives, but rather allows him to leave substantialism behind in order finally to speak the language of ontology:

it appears here that it is into a place: *Wo*, where *Es*, a subject without any *das* or other objectival article, *war*, was, it is a matter of the place of a being, and that in this place: *soll . . .*, *Ich*, I, there must I (as we said: this I-am [*suis-je*], before it is said, is me [*moi*]), *werden*, to become, that is, . . . to come to light from this very place insofar as it is a place of being.

The distinction between *je* and *moi* thus only enters into the *Ich* with regard to the place of the *Es*, that is, for Lacan, of the S: but is Lacan's homophonic trick for moving from one language to another comparable to the game that allows Freud to write one sentence and mean another?

ES GIBT (GERMAN)

DANISH	*der er*
ENGLISH	there is
FRENCH	*il y a*

➤ ESTI, *IL Y A*, HÁ, and COMBINATION AND CONCEPTUALIZATION, DASEIN, EREIGNIS, ES, FICAR, LIGHT, LOGOS, OBJECT, SEIN, SUBJECT, *TO BE*, VORHANDEN

Unlike other Germanic languages (Eng. "there is"; Dan. *der er*), German expresses the Gallicism *il y a* by the phrase *es gibt*—literally "he/it gives" (+ accusative), by combining the impersonal pronoun *es* with the verb *geben*, "to give." There thus seems to be a predisposition in the German language to think of what exists under the aspect of being given and to think of its origins as impersonal. This entry investigates that predisposition by following the ways in which German thought exploits and orchestrates the two components of the phrase *es gibt*.

I. From *Datur* to *Es Gibt*

No doubt we should not exaggerate the idiomatic, even specifically Germanic aspect of the phrase *es gibt*, whose strange (*seltsam*) character was noted by the Grimms themselves, while nonetheless underlining its relationship, at least in scholarly language, to the use of the Latin *dare* ("to give") in the passive, hence, *dari*. The Grimms refer to Spinoza (*Ethics*, II, 49): in mente nulla datur absoluta facultas volendi et nolendi ("There is in the mind no absolute faculty of positive or negative volition"). They comment: *datur gleich es gibt*, "*datur* being here equivalent to *es gibt*." We still speak in this sense of the "givens in a problem," the "immediate givens of consciousness" (Bergson), of *sense data* (Wittgenstein).

What exists, what presents itself to our thought (intuition, etc.), without the latter's doing anything is a *datum*, a *Gegebenes*. German philosophy, from Kant to Husserl, explores this route, following the vocabulary of giving (and hence receiving), in the expression *es gibt*. Another route, carved out by Heidegger, instead underlines the strangeness of the impersonal *es* in *es gibt.* The numerous variations in German philosophy that derive from the simple phrase *es gibt* oscillate between the appearance created by the giving itself and that of which or by which the giving takes place (though it is fair to ask: the giving of what, exactly?).

■ See Box 1.

II. From *Es Gibt* to *Gegebenheit*: Kant and Husserl

Intuition takes place only insofar as the object is given to us (*gegeben wird*); "by the intermediary of sensation, objects are given to us (*gegeben*), and it alone brings us intuitions": the whole beginning of the "Transcendental Aesthetic" of Kant's *Critique of Pure Reason* is directed by the distinction between what is given and what is thought (*gegeben/gedacht*), where the priority of the former is recognized. In shifting from a

1

A personal construction of the impersonal

In certain dialects of Thuringia and Hesse, etc., we find this same turn of phrase (*es gibt*) governed by the nominative, as in the example given by the Grimms: "es gibt ein tüchtiger Regen heute" ("there's going to be a lot of rain today," "that's quite some rain we're going to have today"), the meaning of "give" being erased and the object becoming the subject (grammatically: in the nominative), where *es gibt* = *es ist, es kommt* ("it is," "there is going to be"). The documented passage from the accusative to the nominative indicates that the very idea of giving may no longer have been felt in the very turn of phrase *es gibt*. We also find (notably in Luther), as a variant of *es gibt*: *es ist gegeben* ("it is given").

Latin to a German terminology, Kant is the witness and the privileged agent in the transposition from the Latin *dari* in the vocabulary of receptivity. In effect, the *Dissertation of 1770* can claim (II, §10): "Intellectualium non datur (homini) Intuitus [There is no *intuition* of intelligibles (for man)]" or again (II, §5): "dantur conceptus [concepts are given]"! The Latin *dari*, which, in Spinoza and up until the pre-Critical Kant, kept the thoroughly geometrical aspect of the given in a problem, will find itself explicitly thematized and transformed.

The modality of what is given to us (= what is presented to intuition) is fixed by Husserl in the term *Gegebenheit* (which Kant had not yet ventured), thus nominalizing the past participle of the verb *geben* (to give) in favor of an extension of the sphere of intuition and of the shift from a receptive intuition to a "giving" intuition" (*gebende Anschauung*, in *Idées directrices pour une phénoménologie Husserliana*, vol. 2).

Would these variations, Kantian or Husserlian, have seen the light of day if they had not been stimulated by the familiar *es gibt* of everyday conversation? An emphatic use of *es gibt*, in fact, begins to appear in Husserl: "es gibt also . . . Bedeutungen [There are meanings]" (*Recherches logiques*, II, §36).

III. *Es Gibt, Es Gilt, Es Gibt Nicht*: Meinong

The exploration of *Gegebenheit* is not, however, restricted to Husserlian phenomenological research. Natorp, Lask, and Meinong all made use of the concept at more or less the same time. In section 3 of his *Gegenstandstheorie*, Meinong writes:

Es gibt Gegenstände, von denen gilt, daß es dergleichen Gegenstände nicht gibt.

(*There are* objects about which it is valid to say *that they do not exist* [about which the proposition according to which they do not exist is valid].)

This is not a crude contradiction, but we should point out that there is some subtle play within *es gibt*: for certain objects we must say that they can only be envisaged as not existing and incapable of existing. This play is redoubled with the assonance between *es gibt* and *es gilt* ("it is valid"). The *es gibt*, for Meinong, applies no less for the unreal. *Es gibt* here is practically equivalent to an "it so happens": it so happens that some objects are nowhere. "What, then, does 'es gibt' mean?"

IV. From Being to Words, Heidegger's *Es Gibt*

This is the question asked by Heidegger in the 1919 lecture at Freiburg titled *Zur Bestimmung der Philosophie.* Three stages may be distinguished in the Heideggerian meditation on *es gibt*:

1. the discussions prior to *Sein und Zeit*,
2. the 1927 treatise, *Sein und Zeit*,
3. the reappraisal of this question in the "Letter on Humanism" (1946), then in *Zeit und Sein* (1962).

1. What, then, does *es gibt* mean?

Es gibt Zahlen, es gibt Dreiecke, es gibt Bilder von Rembrandt, es gibt U-Boote; ich sage: Es gibt heute noch Regen, es gibt morgen Kalbsbraten. Mannigfache "es gibt," und jeweils hat es einen anderen Sinn und doch auch jedes wieder ein in jedem antreffbares identisches Bedeutungsmoment. Auch dieses ganz abgeblaßte, bestimmter Bedeutungen gleichsam entleerte bloße "es gibt" hat gerade wegen seiner Einfachheit seine mannigfachen Rätsel. Wo liegt das sinnhafte Motiv für den Sinn des "es gibt"?

(There are numbers, there are triangles, there are paintings by Rembrandt, and there are submarines; I say: there will be more rain today, there will be roast veal tomorrow [cf. RT: Deutsches Wörterbuch, sense II, 17, e, b, s.v. *geben*]. So many *es gibt*s, each one having a different sense, even though each one of these senses contains an identical moment of meaning. And yet this simple *es gibt*, so dull, emptied of precise meanings in a way, contains, in virtue of its very simplicity, numerous riddles. Where does the sense-bearing pattern (*Motiv*) lie for the sense of *es gibt*?)

(Heidegger, *Zur Bestimmung*)

Heidegger thus underlines the multivocity of *es gibt*, its unsuspected richness, and the unity of the generative sense of such a plurality.

2. The occurrences of *es gibt* that we find in *Being and Time*, beginning with section 2, deal either with the world (*Sein und Zeit*), with truth, or with being. The phrase *es gibt* generally occurs in quotation marks, indicating a problematization of the everyday expression, which is thus picked out and questioned. Leibniz asked, "Why *there is* something rather than nothing?" (*Principes de la nature et de la grâce fondés en raison*, §7). For Heidegger, who often came back to Leibniz's declaration, what there is is only something inasmuch as it is not anything, as this something is not equivalent to anything in existence. *There is the there is* (D. Panis).

3. However, it is before *Time and Being*, in the "Letter on Humanism" that *es gibt* is directly addressed, notably with the phrase "*Es gibt Sein* [There is Being]":

In "S. u. Z." (S. 212) is mit Absicht und Vorsicht gesagt: il y a l'Être: "es gibt" das Sein. Das il y a übersetzt das "es gibt" ungenau. Denn das "es," was hier "gibt," ist das Sein selbst.

(In *Being and Time* (p. 212), *il y a* [*es gibt*] Being is said with design and caution. The *il y a* only approximately translates *es gibt*. For the *cela* [*es*] that *donne* [*gibt*] is Being itself.)

(Heidegger, "Letter on Humanism")

Heidegger interprets the "giving" of *es gibt* immediately afterward as a *gewähren*, "to accord," "to grant." More disturbing is the remark that follows: "Doch über dieses *il y a* kann man nicht geradezu und ohne Anhalt spekulieren [But one cannot speculate straightaway and without reserve on this *il y a*]."

No doubt we should see this as refusing to dissociate *il y a* from Being, since this *il y a* is above all aiming, in this context, to say that Being is not in the same manner in which entities are. This does not prevent Heidegger from coming back to this point in *Time and Being*: "Das in der Rede 'Es gibt Sein,' 'Es gibt Zeit' gesagte 'Es' nennt vermutlich etwas Ausgezeichnetes [There is reason to presume that the 'It' said in 'There is being,' 'There is time' names something typical and exceptional]" (*Time and Being*).

Heidegger clarifies the *es* of *es gibt* in the direction of *Ereignis* (see EREIGNIS). In the *Summary of a Seminar on the Lecture "Time and Being*," finally, Heidegger declares after citing a passage from Rimbaud's *Illuminations* ("*Enfances*," III): "The French *il y a* (cf. the idiomatic phrase particular to southern Germany, *es hat*) corresponds to the German *es gibt* but has a greater extension. The exactly parallel translation of Rimbaud's *Il y a* would, in German, be *es ist* (*il est*)" (*Questions IV*).

There remains the question of what separates *il y a* from *es gibt*. The phrase's firm accent on giving—certainly literally indicated, but usually inaudible—may have led J.-L. Marion to overtranslate it by the rendering *cela donne* ("that gives"):

The standard translation of *il y a*, certainly admissible in everyday language, is no longer justified if we desire conceptual precision. It effectively masks the entire semantics of giving that nevertheless structures *es gibt*. We really do not understand F. Fédier's reverse argument: "Every time, then, in translation, *es gibt* is developed in the direction of a *giving*, the translation goes a little too far" (note in *Questions IV*, Paris, 1976, p. 49). Why? Can such a brutal denial be accepted without the slightest justification?

(Marion, *Étant donné*)

"Conceptual precision" is certainly not the aim of the Heideggerian understanding of the everyday expression *es gibt*: rather than setting up an operational conceptual tool, the point is to listen to the language and its unsuspected resources. F. Fédier's resistance to developing *es gibt* "in the direction of a giving" is nevertheless far from lacking "the slightest justification" if we look carefully at the cited passage:

We should remember that *geben* is the Germanic development of the Indo-European root *ghabh*—, which yielded the Latin *habere*. . . . It is necessary to try to hear the Latin *habere* in accord with *geben* to perceive what *avoir* means in *il y a*—and which is no doubt closer to *tenir* [to hold] than to *posséder* [to possess].

Etymologically, *es gibt* is thus closer to *il y a* than it seems at first blush: it derives from an *avoir* whose meaning, in *il y a*, is surely still worth thinking about. At the same time, this indicates the direction in which *es gibt* must still be examined, both in its proximity to and its difference from *il y a*: in its relationship with the deployment of the word, as Heidegger indicates in *Unterwegs zur Sprache*:

We are familiar with the expression *es gibt* in many usages, such as *es gibt an der sonnigen Halde Erdbeeren* (there are strawberries on the sunny hillside); *il y a, es gibt*, there are, strawberries; we can find them as something that is there on the slope. In our present reflection *es gibt* is used differently. We do not mean "there is the word"—we mean "by virtue of the gift of the word there is, the word gives." The whole spook about the "givenness" of things, which many people justly fear, is blown away.

(Heidegger, *On the Way to Language*)

When made to refer to words being used, the phrase *es gibt* thus no longer means that there is a word (or words), but that it, the word, gives (*es gibt das Wort = es, das Wort, gibt*). Speech is the domain in which "there is that which gives," as always giving, never given. A final transformation of *es gibt* in Heidegger's thought: the word (*das Wort*) *gibt* (*das Sein*), the word gives being in the domain in which "there is that which gives."

ESSENCE, SUBSTANCE, SUBSISTANCE, EXISTENCE

GREEK	*ousia* [οὐσία], *hupostasis* [ὑπόστασις], *ousiôsis* [οὐσίωσις], *huparxis* [ὕπαρξις]
LATIN	*essentia, substantia, subsistentia, existentia; esse essentiae, esse existentiae*

➤ *ACT, CATEGORY, ESTI, EUROPE, IL Y A, PERSON, RES, SPECIES, SUBJECT, Box 4, TO BE, TO TI ÊN EINAI, TO TRANSLATE*

The most scholarly and most technical vocabulary with regard to being, now as in the past, does not usually give rise to problems of translation since it often consists in artificial forms that may easily be transposed, with equal violence to the language. It is thus that the Greek *ontotês* [ὀντότης] is immediately translated as *essentitas* (Marius Victorinus), and that from it is derived the series entity, *Seiendheit*, even *étantité*, without difficulty. However, things are not the same when what we take to be the fundamental ontological vocabulary derives in reality from multiple sedimentations, reappropriations, and reinterpretations of the most common words of the language. Plato did not "invent" *ousia* [οὐσία] any more than Seneca or Quintilian did *substantia*. Encroachment from other domains is added to this depth of certain key terms of ontology, related to their prephilosophical history—which justifies reappropriations, reversals, new hierarchies: as, notably, when the translation of the Septuagint, or Jerome's translation, the Vulgate, reintroduces terms that are already philosophically charged (this is notably the case with *hupostasis* [ὑπόστασις] in the Scripture, which progressively imposes its own exegetical methods, or in conciliar dogma). The model of transposing *verbum e verbo* or the use of a calque, even if it initially seems obvious *(hupo-stasis, sub-stantia)*, immediately shows itself to be inadequate.

To pursue the geological metaphor for a moment: the sedimentation of layers, which we must attempt to analyze stratigraphically (on a prephilosophical base level, we discover successively Platonic, Aristotelian, Stoic, Philonian, Plotinian, and Neoplatonist usages), is itself profoundly altered by a series of landslides or powerful geographic constraints, especially when we move from an Aristotelian or Stoic ontology to Neoplatonic theology or that of the church fathers, when the laborious formulations of Trinitarian dogma are superimposed on philosophical distinctions.

The twofold hypothesis that we will illustrate below concerns (1) the anchoring of fundamental ontological concepts in language, and the additional translational constraint that demands that we recognize the semantically rich prephilosophical features of language (like the Lat. *substantiam habere*, *substantiam capere*); and (2) the new doctrinal framework that makes it possible to create new terms (*essentia* is no doubt the most apposite example), or to reappropriate old ones (such as *existentia*) and give them a new career.

At the level of fundamental ontological concepts, the plays made are all the more complicated because the end result is very limited: more or less the same cards are redistributed, but at each round new rules and constraints are imposed. By this we mean that the very idea of "retroversion" can only have a limited application, and that we do not return from *existentia* to *huparxis* [ὕπαρξις] or to the Aristotelian question "*ei esti?* [εἰ ἐστι ;]" without disturbing the conceptual and dialectical context.

I. The Multiple Meanings of "Is" in Most Languages

A. Predication or existence

In his *System of Logic* (1843), John Stuart Mill warned of the "double meaning" of the verb "to be" ("is"), which is used both as a "sign of predication" (see PREDICATION, V) and as a "sign of existence":

> Many volumes might be filled with the frivolous speculations concerning the nature of Being (τὸ ὄν, οὐσία, Ens, Entitas, Essentia, and the like) which have arisen from overlooking this double meaning of the word *to be*; from supposing that when it signifies *to exist*, and when it signifies to *be* some specified thing, as to *be* a man, to *be* Socrates, to *be* seen or spoken of, to *be* a phantom, even to *be* a nonentity, it must still, at bottom, answer to the same idea; and that a meaning must be found for it which shall suit all these cases. The fog which rose from this narrow spot diffused itself at an early period over the whole surface of metaphysics. Yet it becomes us not to triumph over the great intellects of Plato and Aristotle because we are now able to preserve ourselves from many errors into which they, perhaps inevitably, fell. . . . The Greeks seldom knew any language but their own. This rendered it far more difficult for them than it is for us to acquire a readiness in detecting ambiguities. One of the advantages of having accurately studied a plurality of languages, especially of those languages which eminent thinkers have used as the vehicle of their thoughts, is the practical lesson we learn respecting the ambiguities of words, by finding that the same word in one language corresponds, on different occasions, to different words in another. Without this exercise, even the strongest minds will find it hard to believe that things that have the same name do not have the same nature. Yet it becomes us not to expend much labour very unprofitably (as was frequently done by the two philosophers just mentioned) in vain attempts to discover in what this common nature consists.

B. A terrible ambiguity

In *The Principles of Mathematics*, Bertrand Russell laid out the ambiguity of the verb "to be" much more precisely:

> The word *is* is terribly ambiguous, and great care is necessary in order not to confound its various meanings. We have (1) the sense in which it asserts Being, as in

"A is"; (2) the sense of identity; (3) the sense of predication, in "A is human"; (4) the sense of "A is a man" . . . which is very like identity. In addition to these there are less common uses, as "to be good is to be happy," where a relation of assertions is meant, that relation, in fact, which, where it exists, gives rise to formal implication.

No one would deny this "terrible" ambiguity of being or "is" in European philosophical languages; however, we may:

1. with Charles Kahn, ask whether this ambiguity, through the various conceptual analyses, assisted by attempts at translation, did not in fact constitute one of the driving forces of the logical, ontological, and theological development of Western philosophy:

> I do not intend to do battle here against a general thesis of linguistic relativism, and I shall certainly not deny that the union of predicative, locative, existential and veridical functions in a single verb is a striking peculiarity of Indo-European. . . . On the contrary, I want to suggest that the absence of a separate verb "to exist" and the expression of existence and truth (plus reality) by a verb whose primary function is predicative will have provided an unusually favorable and fruitful starting-point for philosophical reflection on the concept of truth and the nature of reality as an object for knowledge.

> ("Retrospect on the Verb 'To Be'")

2. with Jaakko Hintikka, question the dominance of the Fregean and Russellian distinctions, and denounce not only the anachronistic character of the retrospective application of them to classical authors (starting with Plato and Aristotle), but again, more seriously, the vagueness it introduces into both the analyses of those notions and their summaries and translations, whether intra- or interlinguistic. Hintikka goes so far as to denounce "the modern myth that there is a distinction between the *is* of identity, the *is* of predication, the *is* of existence, and the *is* of generic implication" (*Logic of Being*).

We may also note that, if it is a matter of uncovering and clarifying the grammars (philosophical, logical, theological) of the word "to be," etymology is of no help, for the simple reason that no philosophical European language contains a single, unitary, homogeneous verb "to be." And what goes for being, taken grammatically as a "verb," also goes for the rest of the ontological vocabulary, which—as we can see with terms like "essence," "substance," "existence," "subsistence," and so on—are not developed in the first instance on the basis of some "etymon" (*es*, *bhû*, *wes*), but rather on the basis of the resources of the language, in its multiple uses (see ESTI).

C. Being-essence and act of being—*actus essendi*

Jacques Maritain, in his *Preface to Metaphysics*, calls attention to a different "ambiguity":

> Observe that being presents two aspects. One of these is its aspect as *essence* which corresponds particularly to the first operation of the mind. For we form concepts primarily in order to apprehend, though in many cases blindly, essences—which are positive capacities of existence. The other is the aspect existence, the *esse* in the strict sense, which is the end in which things attain their achievement, their act, their "energy" par excellence, the supreme actuality of whatever is.

Étienne Gilson echoes this in *L'être et l'essence*, also emphasizing this "existence aspect" of being that Thomas Aquinas clarified for the first time and without ambiguity:

> Whether we say *it is*, *it exists*, or *there is*, the meaning remains the same. All of these phrases signify the primary action that a subject can exercise. It is primary, in effect, because without it there would be no subject.

It is there as a fact of language (Gilson refers here to Brunot, *La pensée et le langage*), from which he cleverly extracts the logical and metaphysical grammar: the verb *est* is not a copula, but signifies "the primary act in virtue of which a being exists, and the principal function of verbs is thus to signify, not attributes, but actions." By this, Gilson recovers Priscian's canonical definition:

> Verbum est pars orationis cum temporibus et modis, sine casu, agendi vel patienti significativum.

> (The verb is that part of speech which signifies, with times and modes, but without cases of declension, action or passion.)

> (*Institutiones grammaticae*, 8.1.1)

However, Gilson also recovers an old piece of Scholastic terminology, which perhaps secretly served as a guide for him from the beginning. Being understood as an "action verb," of "this primary action that a subject can exercise," signifies existence as an "act"—*actus exercitus*: "we must admit," he notes, "the presence, at the very heart of the real, of what were once called 'primary acts,' that is, these acts of existing in virtue of which each being is, and from which each one unfurls in a more or less rich multiplicity of 'secondary acts,' which are its operations" (*L'être et l'essence*) (see *ACT,* and *energeia* [ἐνέϱγεια], under FORCE, Box 1, and under PRAXIS, Box 1). Thus existence, in the full sense, is always existence "*ut exercita*, that is, as actualized by a subject" (Maritain, *Preface to Metaphysics*; cf. also: "To exist is to *maintain oneself and to be maintained* outside nothingness; *esse* is an act, a perfection, indeed the final perfection, a splendid flower in which objects affirm themselves").

Thus understood as an "act," or better, as an "exercised act," being is *actus essendi* (act of being): the deepest and most intimate aspect of anything (Thomas Aquinas, *Summa theologica*, Ia, qu. 8, a. 1, ad 4m: "esse autem est illud quod est magis intimum, et quod profundius omnibus est, cum sit formale respectu omnium quae in re sunt" (being is what is the most intimate and profound thing in every thing, since it is the formal element in relation to all things which really are).

On the other hand, what neither Maritain nor Gilson grasped in the least was that this "existentialist" interpretation of being for which they generously credited Thomism derives from a long history, woven from translations, transpositions, and reversals, in which Neoplatonism played a decisive role.

II. "To Be," "To Exist," *Existo*

Existo is one of several compounds of *sisto*, "to stop, to arrest; to present oneself, to appear, to subpoena (before a court)," such as *absisto*, "to distance oneself," *desisto*, "to abandon, to cease," *obsisto*, "to stop in front of, to oppose," *insisto*, "to lean on, to press." *Exsisto* (*existo*), in its classic meaning, thus signifies "to stand up out of, to rise up, come out of the earth, to spring up."

Cicero uses it in this sense in *On Duties* (1.30.107): "Ut in corporibus magnae dissimilitudines sunt, sic in animis existunt majores etiam varietates" (even greater differences are found [are met with] in minds). Or again Lucretius, in *De rerum natura* (2.871): "Quippe videre licet vivos existere vermes/stercore de taetro" (Why, you may see worms arise all alive from stinking dung).

A. *Existentia* as *ex-sistere*

In the twelfth century, in Richard of Saint-Victor's canonical distinction (*De Trinitate* [1148], 4.12.937C–983) we find the echo, amplified and transposed onto a metaphysical and theological level, of this first concrete meaning of the Latin verb *exsisto*:

> Possumus autem sub nomine exsistentiae utramque considerationem subintelligere, tam illam scilicet quae pertinet ad rationem essentiae, quam scilicet illam quae pertinet ad rationem obtinentiae. Tam illam, inquam, in qua quaeritur quale sit de quolibet exsistenti, quam illam in quae quaeritur unde habeat esse. Nomen exsistentiae trahitur verbo quod est exsistere. In verbo sistere notari potest quod pertinent ad considerationem unam; similiter per adjunctam praepositionem ex notari potest quod pertinet ad aliam. Per id quod dicitur aliquid sistere, primum removentur ea quae non tam habent in se esse quam alicui inesse, non tam sistere, ut sic dicam, quam insistere, hoc est alicui subjecto inhaerere. Quod autem sistere dicitur, ad utrumque se habere videtur et ad id quod aliquo modo et ad id quod nullo modo habet subsistere; tam ad id videlicet quod oportet quam ad id quod omnino non oportet subjectum esse. Unum enim est creatae, alterum increatae naturae. Nam quod increatum est sic consistit in seipso ut nihil ei insit velut in subjecto. Quod igitur dicitur sistere tam se habet ad rationem creatae quam increatae essentiae. Quod autem dicitur exsistere, subintelligitur non solum quod habeat esse, sed etiam aliunde, hoc est ex aliquo habet esse. Hoc enim intelligi datur in verbo composito ex adjuncta sibi praepositione. Quid est enim exsistere nisi ex aliquo sistere, hoc est substantialiter ex aliquo esse. In uno itaque hoc verbo exsistere, vel sub uno nomine exsistentiae, datur subintelligi posse et illam considerationem, quae pertinet ad rei qualitatem et illam quae pertinent ad rei originem.

> (Now, with the term "existence" we can refer to both [of these] considerations: one concerning the essence's nature and another concerning the nature of obtaining [it]. I mean, [we can refer to] both [the consideration] in which [every being] seeks that which it is in itself and [the consideration] in which every being tries to know

from where it derives its being. The word "existence" comes from the [Latin] verb *existere.* We observe that the term *sistere* refers to the first consideration. Equally, we can notice that by adding the preposition *ex* [the word] refers [in meaning] to the second consideration. When we say that something exists—(in the meaning of *sistere*)—those realities, which do not derive their being from themselves but have it from someone [else], are immediately excluded. [These realities] do not really "*ex*-ist"—so to speak—but they rather "*in*-sist," that is, they are joined to some [other] subject. The term *sistere*, however, seems to be appropriate to both of them: both to that which subsists in some way, [and] to that which cannot subsist in any way; both to that which is necessarily subordinated and to that which cannot be [subordinated] in any way. In effect, the first condition is proper to the created nature, the second to the uncreated nature, since that which is not created subsists in itself in such a way that nothing in it can be found, as [if it were its own operating] subject. For this reason, the word *sistere* can refer to both the created and uncreated nature. The term *ex-sistere*, on its part, not only expresses the possession of being, but also the [being's] coming from outside. [It expresses] the fact that one possesses its being because of someone [else]. Indeed, this is shown in the compounded verb, by the preposition that is added to it. What does *existere* mean, in fact, if not *sistere* "from" (= *ex*) someone? That is, [what does it mean if not] receiving one's own substantial being from someone [else]? Consequently, with this single verb *existere*—or with the single noun "existence"—we can intend both that which has to do with the object's nature and that which refers to its own origin.)

B. *Existentia, existentialitas*

We must obviously wait for Candidus the Arian (known by Marius Victorinus, ca. 281/291–361) for the appearance of the feminine singular *existentia*, along with the abstract *existentialitas*, whereas in Chalcidius, in his translation and commentary of the *Timaeus*, *existentia* is still a neuter plural that refers to *onta* [ὄντα]: "*tria . . . auta onta* [τρία . . . αὐτὰ ὄντα]."

It is thus only rather late (the second half of the fourth century), and after a series of translations, that the term acquires its status of philosophical nobility, in the Latin context of Trinitarian theology: in Marius Victorinus, the term is used in effect as a translation of *huparxis* [ὕπαρξις], unlike *substantia*, which translates *ousia* [οὐσία], while *subsistentia* is reserved for the translation of *hupostasis* [ὑπόστασις].

The fundamental difference in the meanings for being is thus that which is drawn, echoing the Greek *huparxis-ousia*, between *existentia* and *substantia*:

> Multo magis autem differt existentia a substantia, quoniam existentia ipsum esse est, et solum est, et non in alio non esse, sed ipsum unum et solum esse; substantia vero non solum habet esse, sed et quale et aliquid esse.

> (Much more, however, does existence differ from substance, since existence is "to be" itself, "to be" which is neither in another nor subject of another but solely "to

be" itself, whereas substance has not only "to be" but also has a "to be" something qualified.)

(Marius Victorinus, *Candidi epistola*, 1.2.18–22, in *Theological Treatises on the Trinity*, trans. Clark)

C. *Quid—Quod* (*was—daß*)

We would be wrong to see this as a simple translation, capable of opening a possibility of "retroversion," such as the "well-known" distinction between essence and existence, and we must refrain, pace Suzanne Mansion ("Le rôle de la connaissance de l'existence dans la science aristotélicienne"), from unreflectively projecting the "well-known distinction" onto the Aristotelian questions "*ti esti? ei esti?*" [τί ἐστι ? εἰ ἐστι ?].

In effect, it is one thing to know of something "*to ti esti*" [τὸ τί ἐστι], the "what it is," or better, "*to ti ên einai*" [τὸ τί ἦν εἶναι], the "what it is to be for *x*," the "quiddity" (see TO TI ÊN EINAI), but it is something else to know that it is ("*hoti estin*" [ὅτι ἔστιν]), that it is the case (*daß*), the "quoddity":

Ἀυάγκη γὰρ τὸ εἰδότα τὸ τί ἐστιν ἄνθρωπος ἢ ἄλλο ὁτιοῦν, εἰδέναι καὶ ὅτι ἔστι (τὸ γὰρ μὴ ὂν οὐδεὶς οἶδεν ὅ τι ἐστίν, ἀλλὰ τί μὲν σημαίνει ᾳ; λόγος ἢ τὸ ὄνομα, ὅταν εἴπω τραγέλαφος, τί δ' ἐστὶ τραγέλαφος ἀδύνατον εἰδέναι) . . . τὸ δὲ τί ἐστιν ἄνθρωπος καὶ τὸ εἶναι ἄνθρωπον ἄλλο.

(It is necessary for someone who is to know, whether it is of a man or something else, what it is, which he knows in addition to knowing that it is (in effect, of what is not, no one can know that it is—at most we may know what the definition or the word means, when I say "goat-stag," but what a goat-stag is, is impossible to know) . . . the "what it is, a man," and the human being are different.)

(*Posterior Analytics*, 2.7.92b4–11)

D. *Huparxis-ousia*

The first author, it seems, to use the noun *huparxis*, attested in the Septuagint, is Philo of Alexandria (ca. 20 BCE–41 CE): after having noted in *De opificio mundi* (§170–71) that Moses, by his account of the creation, taught us "that the divinity is and exists" (*hoti esti to theion kai huparchei* [ὅτι ἔστι τὸ θεῖον καὶ ὑπάρχει]), Philo clarifies the importance of this teaching, which was transmitted to us "on account of the godless, some of whom are in doubt and incline in two directions concerning his existence."

As John Glucker rightly points out ("Origin of ὑπάρχω and ὕπαρξις"), Philo's invention presupposes a firm distinction between *ousia*, the essence of something, what it is—or better, "what it is to be *x*"—and *huparxis*. In terms of God or the divine, it is clear that his "essence" is inaccessible to man (*akatalêptos anthrôpôi* [ἀκατάληπτος ἀνθρώπῳ]): the latter can only, at best, recognize his might or his "powers" (*dunameis* [δυνάμεις]), which reveal his providence and his "existence" (*huparxis*).

Leaving aside the dense discussions that concern the interpretations of the terms *huparxis-huparchein* [ὑπάρχειν], or better, the distinction between the two modes of being defined respectively by *huparchein* and *huphestêkenai* [ὑφεστηκέναι] (cf. Hadot, "Zur Vorgeschichte des Begriffs 'Existenz' "), we will restrict ourselves to the well-established

Neoplatonist distinction since, in addition, that is the one that directs the principal translational decisions at issue here: the distinction between *huparxis*, "existence," associated with being purely and simply (*to einai monon* [τὸ εἶναι μόνον]), on one hand, and *ousia-substantia* (*to on* [τὸ ὄν]) on the other.

E. Existence as *"ipsum et solum esse"*

It is in this context that, for Marius Victorinus, *existencia* as a translation of *huparxis* designates being without determination, which is still neither subject nor predicate, unlike determined being (*Adversus Arium*, 1.30.21–26; *Candidi Epistola I*, 2.19–24).

As Pierre Hadot rightly notes (*Porphyre et Victorinus*): "For Victorinus and in the letter of Candidus, existence is the still undetermined being, pure being, taken without qualification, without a subject and without a predicate; substance, on the contrary, is qualified and determined being, the being of something and which is something."

Exsistentiam quidem et exsistentialitatem, praeexsistentem subsistentiam sine accidentibus, puris et solis ipsis quae sunt in eo quod est solum esse, quod subsistunt; substantiam autem, subjectum cum his omnibus quae sunt accidentia in ipsa inseparabiliter existentibus.

([The sages and ancients] define existence and existentiality as preexisting subsistence without accidents because they subsist purely and only in that which is only "to be"; but they define substance as a subject with all its accidents inseparably existing within it.)

(Marius Victorinus, *Adversus Arium*, 1A.30.21, in *Theological Treatises on the Trinity*, trans. Clark)

Exsistentia ipsum esse est et solum esse, et non in alio esse aut subjectum alterius, sed unum et solum ipsum esse, substantia autem non esse solum habet, sed et quale aliquid esse. Subjacet enim in se positis qualitatibus et idcirco dicitur subjectum.

(Existence differ[s] from substance, since existence is "to be" itself, "to be" which is neither in another nor subject of another but solely "to be" itself, whereas substance has not only "to be" but also has a "to be" something qualified. For it is subject to the qualities within it and on that account is called subject.)

(Marius Victorinus, *Candidi epistola*, 1.2.19–23, in *Theological Treatises on the Trinity*, trans. Clark)

F. The *"bare entity"*

It should be noted that the author (Scipio Dupleix [1569–1661]) who apparently first introduced the word *existence* in its technical usage into French also referred, if not to *esse solum* (*to einai monon*), at least to "naked entity":

It is thus certain that there is a notable difference between the existence and the essence of things. But in order to hear it best we must observe that in our French language we do not have a term which responds energetically to the Latin *existentia*, which signifies the bare

entity, the simple and bare being of things, without considering any order or rank which they hold among others. But the word *essentia*, for which we might well use *essence*, marks the nature of the thing, and by it the order or rank it must hold among the other things. For example, when I say that man is, this is as much to say that he has his act, that he is, I say, actually: and in this I do not mark anything other than his bare entity and simple existence. But when I say that man is a rational animal, I deploy and manifest his whole essence and nature, and attributing to him his whole kind and his difference it is easy to see that his is in the order of the category of substance under the genus animal.

(Scipio Dupleix, *La métaphysique*)

■ See Box 1.

G. "To exist": To be outside one's causes and from nothing—to be created

Rigorously speaking, existence is never referred back to God—even if Anselm (1033–1109) has the idea of concluding chapter 2 of his *Proslogion* this way: "Existit ergo procul dubio aliquid quo magis cogitari non valet, et in intellectu et in re" (Therefore there is absolutely no doubt that something-than-which-a-greater-cannot-be-thought exists both in the mind and in reality)—but rather to the creature, of which it is more or less redundant to affirm that it exists. Before existing, it only has an essential being (*esse essentiae*), which derives from the possible and betrays, more or less, an *aptitudo ad existendum,* a "demand for existence." The latter is thus clearly, as Giles of Rome (1247–1316) pointed out well before Christian Wolff (1679–1754), the very same thing that, after Aquinas, introduces for the first time the deliberate distinction between essence and existence—a "complement" of essence (cf. on this point the "dossier" by Alain de Libera and Cyrille Michon in *L'être et l'essence: Le vocabulaire médiéval de l'ontologie*).

Quaelibet res est ens per essentiam suam; tamen quia essentia rei creatae non dicit actum completum sed est in potentia ad esse, ideo non sufficit essentia ad hoc quod res actu existat nisi ei superaddatur aliquod esse quod est essentiae actus et complementum. Existunt ergo res per esse superadditum essentiae vel naturae. Patet itaque quomodo differat ens per se acceptum et existens.

(Every thing is being by reason of its essence, nevertheless, because a created essence is not a completed act but is in potency to existence, it is, therefore, not enough that a thing has essence to be actually existing, but existence, which is the act and the completion of an essence, must be added to it. Therefore, things exist by reason of an existence which is added to the essence or nature. From this it is clear how being and existence differ.)

(*Theoremata de esse et essentia*, 13)

What exists therefore ex-sists, referred back to an origin as indicated by Richard of Saint-Victor, to an *ex. . . .* What exists, as Thomas of Vio (Cajetan) (1469–1534) and Suárez

(1548–1617) will repeat at every opportunity, exists "*extra suas causas et extra nihilum* [beyond its causes and beyond nothingness]" ("*id quod realiter existit extra causas suas est ens reale* [what exists really beyond its causes is a real being]"; Cajetan, *De ente et essentia*; Suárez, *Disputationes metaphysicae*). This is why we may also say with Leibniz, who invents the term, that God is *existentificans*, and of the possible essences, we will say that they comprise an *existurire*, an existence that is to come and will be confirmed. The possible contains its own futurity:

Est ergo causa cur Existentia praevalet Non-Existentiae, seu Ens necessarium est EXISTENTIFICANS. — Sed quae causa facit ut aliquid existat, seu ut possibilitas exigat existentiam, facit etiam ut omne possibile habeat conatum ad Existentiam, cum ratio restrictionis ad certa possibilia in universali reperiri non possit. — Itaque dici potest Omne possibile EXISITURIRE, prout scilicet fundatur in Ente necessario actu existente, sine quo nulla est via qua possibile perveniret ad actum.

(There is, therefore, a cause for which existence prevails over non-existence; in other words, God [the necessary Being] is *existencing*. — But this cause which brings about the existence of things, or in whose possibility existence is demanded, is also such that everything possible has a tendency towards existence, since we cannot find, generally speaking, a reason to restrain this tendency to only certain possibles. — This is why we can say that each and every possible is a future "*existing,*" naturally insofar as all *existings* are founded within God [the necessary Being] existing indeed, without which there would be no means of realizing any possibles.)

(Leibniz, *Vingt-quatre thèses métaphysiques,* in *Recherches générales sur l'analyse des notions et des verities*)

III. *Essentia, Ousia-Essentia-Substantiva*: "Essence," "Entity," *Entitas, Entité, Seiendheit, Étance, E(s)tance, Étantité*

A. An *ousia-essentia* calque?

Charles Kahn has established, from rich documentary sources, that the term *ousia*, attested from the time of Herodotus, always refers to *parousia-apousia* [παρουσία-ἀπουσία]—"presence-absence"—compounds. We may add that it is this fundamentally temporal meaning that constitutes the unity of the term, to designate, in its standard meaning, "goods," "property," "wealth" (cf. Ger. *Anwesen*), and, in its philosophical meaning, the "essence" of something, that is, "what-the-thing-is" and "the-thing-which-is." Compare this with *Phaedo*, 78c–d, where *ousia* is clearly that of which there is a *logos*, that of which we must give an account as such, but also being (*to on*), or even the class of beings (*pasê ousia*; *Republic*, 486a), and that which is a thing really is (*auto hekaston ho esti* [αὐτὸ ἕκαστον ὅ ἐστι]), each thing that is, in itself, beyond its multiple aspects and appearances—beyond the different affections (*pathê* [πάθη]) that it may undergo, as from outside.

1. Aristotle distinguishes, as is well known, at the beginning of the *Categories*, two meanings of *ousia*: primary

1

Porphyry's "metaphysics": Being-acting without a subject

➤ PRINCIPLE

This same *huparxis-ousia* distinction also corresponds to Damascius's (462–538) usage. Damascius understands *huparxis* [ὕπαρξις], playing on the etymology, as "first beginning, presupposition, foundation of substance":

ἡ ὕπαρξις, ὡς δηλοῖ τὸ ὄνομα, τὴν πρώτην ἀρχὴν δηλοῖ τῆς ὑποστάσεως ἑκάστης, οἷόν τινα θεμέλιον ἢ οἷον ἔδαφος προϋποτιθέμενον τῆς ὅλης καὶ πάσης οἰκοδομήσεως.

(*Huparxis*, as its name indicates, refers to the first principle of each *hupostasis*; it is like a seat or foundation laid down beforehand under the whole of the superstructure and under any superstructure.)

(*Dubitationes et solutiones*, §121)

As clearly noted by Pierre Hadot, we should speak here of "pre-existence" rather than *huparxis* or "existence." *Huparxis*, in its simplicity, refers to the One, prior to the composition of the "substance."

Such is the claim indeed that clarifies the definition of existence given by Victorinus: *praeexistens subsistentia* (*Adversus Arium*, 1.30.22)—what Pierre Hadot translates by "*fondement initial préexistant à la chose elle-même*" (initial foundation existing before the thing itself). Retroversion is called for here: *prouparchousa hupostasis* [προϋπάρχουσα ὑπόσασις] (*Dubitationes et solutiones*, §34). Hadot comments: "It is the 'one' of each thing, its existence, the state according to which substance is still pure being, undetermined and undeployed" (*Porphyre et Victorinus*). "We may say that substance pre-exists itself in existence, which is its state of unity and transcendental simplicity." To understand the emergence and the success of the translations that have become standard—existence/essence-substance—we must thus hypothesize a complete reversal, brought about by Neoplatonism in general, and more particularly by Porphyry's "metaphysics," of the Stoic distinction and hierarchy: for the Stoics, being, *to on* [τὸ ὄν], *to einai* [τὸ εἶναι] (conventionally translated "existence," "to exist"), refers to the ontological plenitude of what is really present, like a body, while *huparxis*, *huphistanai* [ὑφιστάναι] (conventionally translated "subsistence," "to subsist") only designates a secondary reality, which comes from the incorporeal, characteristic of predicates, of temporality, of events (cf. Hadot, *Porphyre et Victorinus*).

Thus Porphyry's originality, not so much with respect to Plotinus as with respect to Stoicism, consists on the ontological level of eliminating the distinction between *einai* and *huphistanai*, and of identifying *huparxis* with "being pure and simple [εἶναι μόνον]"; which also comes, against Aristotle this time, to treating the verb "to be" as a fully signifying verb—not just "co-signifying," in its function as a copula but as an essentially active verb, which purely and properly expresses the activity of "being," *ousia-energeia* [ἐνέργεια], that of pure essence, taken at its most indeterminate. The reversal is complete with regard to the Aristotelian claim from *De interpretatione*:

οὐ γὰρ τὸ εἶναι ἢ μὴ εἶναι σημεῖόν ἐστι τοῦ πράγματος, οὐδ' ἐὰν τὸ ὂν εἴπῃς ψιλόν. αὐτὸ μὲν γὰρ οὐδέν ἐστιν, προσσημαίνει σύνθεσίν τινα.

(Indeed "to be" and "not to be" are not signs of anything, and no more so when one utters the term "being" by itself; for in itself, it is nothing, but it co-signifies a certain synthesis.)

(16b22–24)

Compare also *Posterior Analytics*, B 7.92b13–14: "τὸ δ' εἶναι οὐκ οὐσία οὐδενί" (being is not the property, the essence, of anything; our translation). Notice—and this point is instructive concerning the changes of meaning in Greek terms—that Michael Psellos (eleventh century) paraphrases the first passage cited thus: "οὐδὲ γὰρ σημεῖά ἐστι τοῦ πράγματος τὰ ῥήματα τοῦ ὑπάρχειν, ἢ μὴ ὑπάρχειν" (indeed, the verbs "to be/to exist," "not-to-be/ not-to-exist" are not signs for a thing) (*Paraphrasis*, fol. M. II^ᵛ, 13, cited in Aristotle, *Peri hermeneias*).

This is why Hadot can still note by way of synthesis: "There is not, in the Porphyrian ontology, a distinction between existence and essence. Being is indissolubly action and idea. The fundamental contrast is here that which is established between being, to act without a subject, and existence, which is the primary subject, the primary form resulting from being" (*Porphyre et Victorinus*).

If we accept, as here, the attribution to Porphyry (232–301) of the "Turin fragment" edited for the first time by Kroll in 1892 and considered by Hadot to be a commentary on the *Parmenides* (cf. "Fragments d'un commentaire de Porphyre sur le *Parménide*," in Hadot, *Plotin, Porphyre*: *Études néoplatoniciennes*), we must indeed emphasize the boldness of the author, who clearly takes a non-Plotinian position in identifying the One purely One with being. This identification is surely inadmissible for Plotinus (204–70), but also entails a profound redefinition of being (*to einai* [τὸ εἶναι] = *to energein* [τὸ ἐνεργεῖν]), taken in an active sense, and rigorously distinguished from what exists. Recall the key passage of the fragment:

Ὅρα δὲ μὴ καὶ αἰνισσομένῳ ἔοικεν ὁ Πλάτων, ὅτι τὸ ἓν τὸ ἐπέκεινα οὐσίας καὶ ὄντος ὂν μὲν οὐκ ἔστιν οὐδὲ οὐσία οὐδὲ ἐνέργεια, ἐνεργεῖ δὲ μᾶλλον καὶ αὐτὸ τὸ ἐνεργεῖν καθαρόν, ὥστε καὶ αὐτὸ τὸ εἶναι τὸ πρὸ τοῦ ὄντος· οὗ μετασχὸν τὸ ἓν ἄλλο ἐξ αὐτοῦ ἔχει ἐκκλινόμενον τὸ εἶναι, ὅπερ ἐστὶ μετέχειν ὄντος. Ὥστε διττὸν τὸ εἶναι, τὸ μὲν προϋπάρχει τοῦ ὄντος, τὸ δὲ ὃ ἐπάγεται ἐκ τοῦ ὄντος τοῦ ἐπέκεινα ἑνὸς τοῦ εἶναι ὄντος τὸ ἀπόλυτον καὶ ὥσπερ ἰδέα τοῦ ὄντος, οὗ μετασχὸν ἄλλο τι ἓν γέγονεν, ᾧ σύζυγον τὸ ἀπ' αὐτοῦ ἐπιφερόμενον εἶναι· ὡς εἰ νοήσειας λευκὸν εἶναι.

(Look then whether Plato does not also seem like someone who intimates a hidden teaching: for the One, which is beyond substance and Existence, is neither Existence, nor substance, nor act, but rather it acts and is itself pure action, such that he is himself Being who is before Existence. It is in participating in this Being that the second One receives a derived being from this Being: that is "participating in Existence." Thus being is twofold: the first pre-exists existence, the second is that which is produced by the One, who is beyond Existence, and who is himself Being, in the absolute sense, and in a way the idea of Existence. It is by participating in this Being that another One was engendered to which the being produced by this Being is paired. It is as though one were thinking "being-white.")

(Hadot, *Porphyre et Victorinus*)

essence as "individual" (*tode ti* [τόδε τι]) ("essence said in the most fundamental, primary, and principal sense, is what is neither said of nor in a subject, for example, a certain man or a certain horse") and secondary essence such as "species" or "genera" ("we call secondary essences the species to which the essences said in the primary sense belong, these species as well as the genera of these species"; on the definition of *ousia prôte*, see SUBJECT, Box 1). One of the classic difficulties of Aristotelian exegesis, which will not delay us here, comes from the fact that in the other parts of the *corpus*, and in particular in book Z of the *Metaphysics*, chapter 3, Aristotle eliminates as "insufficient" the identification of *ousia* with the *substrate* (*hupokeimenon*: "that of which all the other [determinations] are said"), and that he defines primary essence in terms of form (*morphê* [μορφή], *eidos* [εἶδος]): "εἶδος δὲ λέγω τὸ τί ἦν εἶναι καὶ τὴν πρώτην οὐσίαν" (I call *eidos* [species, form] the "quiddity," that is, the primary essence)" (see *QUIDDITY,* SPECIES).

2. If the Romans were to look for a scholarly calque to render the Greek *ousia*, one would think that *essentia* or *entia* (not attested) would have spontaneously come to mind. This hypothesis is confirmed in fact by a letter of Seneca's (2–66 CE) (*Letters*, 58.6), crediting Cicero (106–43 BCE) as the source of the term. This attribution creates problems, however, not only because the term is nowhere to be found in extant texts by Cicero—not even in the fragments of his translation of the *Timaeus*, where the Platonic *ousia* is rendered in multiple ways, but never by *essentia*—but especially because it is contradicted by two other important sources, Quintilian (35–100 CE) and Augustine (354–430).

a. Quintilian in effect attributes the creation of the term to Sergius Plautus, a relatively unknown author from the Stoic school, around the first century CE (*De institutione oratoria*, 2.14.1–2). Quintilian refers in this passage to the different translations that were suggested for the Greek *rhêtorikê* [ῥητορική] (*oratoria, oratrix*), then follows up with a more general remark:

> Quos equidem non fraudaverim debita laude quod copiam Romani sermonis augere temptarint. Sed non omina nos ducentes ex Graeco secuntur, sicut ne illos quidem quotiens utique suis verbis signare nostra voluerunt. Et haec interpretatio non minus dura est quam illa Plauti essentia et queentia, sed ne propria quidem.

> (I would not for the world deprive the translators of the praise which is their due for attempting to increase the vocabulary of our native tongue; but translations from Greek into Latin are not always satisfactory, just as the attempt to represent Latin words in a Greek dress is sometimes equally unsuccessful. And the translations in question are fully as harsh as the essentia and queentia of Plautus, and have not even the merit of being exact.)

> With regard to this last term, the relatively obscure *queentia*, we note that one may be tempted

to follow the correction given in one manuscript: *atque entia.* Compare also *De institutione oratoria* (3.6.23): "Ac primum Aristoteles elementa decem constituit . . . οὐσίαν quam Plautus 'essentiam' vocat" (Aristotle lays down that there are ten categories. . . . First there is *ousia,* which Plautus calls *essentia*).

b. Saint Augustine, who definitively introduces the term *essentia* into Latin usage at the end of the fourth century, never fails to remind us that it is a new term (*novo quidem nomine*), still unknown in older authors (cf. *De moribus Manichaeorum*, 2.2.2; *De civitate Dei*, 12.2). We may certainly find a few occurrences in the texts that have been preserved between Quintilian and Saint Augustine. In any case, however, the meaning of the term remains largely indeterminate in them, which is shown by the more or less constant shifting between *substantia* and *essentia,* though sometimes indicating more or less clearly a tendency toward the specifically Augustinian sense of the term, to which we will return.

B. *Essentia* and/or *substantia*? The body of substance

1. A complex vocabulary (Apuleius)

The word *essentia* appears notably with Apuleius (second half of the second century), in whom we find *essentia* and *substantia* used, interchangeably it seems, to translate the Platonic *ousia*. In reality, however, things are more complex: in his *De Platone*, for example, Apuleius explicitly asks the question of the equivalence between *ousia* and *essentia*: "οὐσίας, quas essentias dicimus"; but this is in order to substitute *substantia* for it beginning with the following paragraph. Apuleius proposes his translation of *ousiai* [οὐσίαι] by *essentiae* in a development where, following the most classic Platonist distinction, he contrasts two types of different reality and two corresponding modes of being: "two aspects of beings" (*duo eidê tôn ontôn* [δύο εἴδη τῶν ὄντων]) (*Phaedo*, 79a6)—essence strictly speaking, as it presents itself to the pure vision of the mind and may be conceived by *cogitatio* alone, and the sensible reality that is only its shadow and image (*umbra et imago*).

> Οὐσίας, quas essentias dicimus, duas esse ait, per quas cuncta gignantur mundusque ipse; quarum una cogitatione sola concipitur, altera sensibus subjici potest. Sed illa, quae mentis oculis conprehenditur, semper et eodem modo et sui par ac similis invenitur, ut quae vere sit; at enim altera opinione sensibili et irrationabili aestimanda est, quam nasci et interire ait. Et sicut superior vere esse memoratur, hanc non esse vere possumus dicere.

> (According to Plato there are two *ousiai*—we call them essences—which create all things and the world itself. One is conceived by thought alone; the other may be grasped by the senses. The first, however, which is only grasped by the eyes of the mind, is always and in the same way equal to itself, as what truly is; the other, on the contrary, of which he says that it is generated and destroyed, must be evaluated by sensible and irrational opinions. And just as he reminds us that the first is truly, we may also affirm that the second is not truly.)

> (*De Platone et ejus dogmate*)

The central contrast is here that between a *vere esse* and a *non esse vere*, and only intelligible "essence" fully deserves the title *essentia* because of its identity and its permanence: "semper et eodem modo et sui par ac similis . . . ut quae vere sit" (like what is properly speaking).

In such a context, the translation of *ousia* by *essentia* was obvious and practically necessary. Translating by *substantia* would require saying in effect that what cannot offer itself to the senses as a subject (*sensibue subjici potest*) is not properly or truly a substance, which would manifestly go against the very spirit of the language. Apuleius, however, does not hesitate to fall back on the vocabulary of substantiality once he attempts to clarify exactly what the "essentiality" of this intelligible essence *really is*. The slide takes place first in the examination of the second type of *ousia*. When Apuleius approaches this "essence" that is not really—the reality that may be offered to the senses—the term of *substantia* in effect comes to complete *essentia*, and then to replace it:

> Et primae substantiae vel essentiae primum deum esse et mentem formasque rerum et animam; secundas substantias, omnia quae ab substantiae superioris exemplo originem ducunt, quae mutari et converti possunt, labentia et ad instar fluminum profuga.
>
> (Of the primary essence or substance, is the primary God, the mind, the "forms" of things, and the soul; of the second, whatever is enformed, whatever is born and has its origin in the model of the superior substance, whatever may change and be transformed, slipping and flowing like running water.)

> (Ibid.)

Several paragraphs earlier, Apuleius had summarized the teaching of the *Timaeus* concerning matter: it is what precedes the first principles and the simplest elements (water, fire, etc.) for the title of prime matter:

> Materiam vero inprocreabilem incorruptamque commemorat, non ignem neque aquam nec aliud de principiis et absolutis elementis esse, sed ex omnibus primam, figurarum capacem, fictionique subjectam.
>
> (For matter, he points out that it can be neither created nor destroyed, that it is neither fire nor water, nor any of the other principles or simple elements; but the first of all the realities capable of receiving forms, and able to be fashioned as a subject.)

> (Ibid.)

Matter precedes all the rest, insofar as it is capable, paradigmatically, of receiving shapes. It is practically nothing, not even a body, but nor is it incorporeal: "sine corpore vero esse non potest dicere, quod nihil incorporale corpus exhibeat" (nor does [Plato] wish to say that it is without body, since nothing of what is incorporeal exhibits a body [= can make a body manifest]). The status of matter is thus essentially ambiguous since, while it does not have the identifying evidence of the body and is not at all evident, nor is it among the number of things that are only grasped by thought (*ea cogitationibus videri*), that is, among the things that do not have the subsistence, solidity, or stability proper to bodies (*quae*

substantiam non habent corporum). The connection between *substantia* and *corpus* is of capital importance here.

Thus, when Apuleius wishes to emphasize the relations between *ousia* and *einai*, he speaks of *essentia*—what really is—but when he understands the Greek term as referring to the mode of being (privileged in a different sense) of what is corporeal or sensible, the concept of substance naturally comes into play. To be, in this case, can only be understood univocally as *substantiam habere*, "to have substance," that is, to have a body, to be solid and stable. It is in this same perspective that Apuleius can suggest the thesis that remains in place as guiding the rest: "Quod nullam substantiam habet, non est" (What is lacking in all substance is not) (*De philosophia liber*).

We can compare this passage from the *De Platone*, dedicated to matter, with the distinction established by Cicero in his *Topics* between the things that are and those that are only cognized ("*earum rerum quae sunt . . . earum quae intelliguntur*"):

> Esse ea dico quae cerni tangive possunt, ut fundum, aedes, parietem, stillicidium, mancipium, pecudem, suppellectilem, penus et cetera. . . . Non esse rursus ea dico quae tangi demonstrarive non possunt, cerni tamen animo atque intelligi possunt, ut si ususcapionem, si tutelam, si gentem, si agnationem definias, quarum rerum nullum subest corpus, est tamen quaedam conformatio insita et impressa intelligentia, quam notionem voco.
>
> (The things which I call existing are those which can be seen or touched; as a farm, a house, a wall, a gutter, a slave, an ox, furniture, provisions, and so on; of which kind of things some require at times to be defined by us. Those things, again, I say have no existence, which are incapable of being touched or proved, but which can be perceived by the mind and understood; as if you were to define usucaption, guardianship, nationality, or relationship; all, things which have no body, but which nevertheless have a certain conformation plainly marked out and impressed upon the mind, which I call the notion of them.)

> (*Topics*, 5.27)

"Real" being is clearly defined here as "substantial" being, in the manner of one's land, property or "residence," "means of subsistence"—in contrast with what lacks such a corporeal substrate, that is, a *subesse* proper to the body, in contrast therefore with those things "*quae substantiam non habent corporum*" (which do not have the substance of bodies), as Apuleius puts it, fully developing the logic of the expression.

2. "*Substantia a substare*" (Seneca)

The Latin *substantia*, created from *substare* (a well-attested verb), appears for the first time in the writings of Seneca. This relatively late appearance is in itself surprising, if we think, for example, about the plurality of compounds using *-antia* created from *stare* (*circumstantia, constantia, distantia, instantia, praestantia,* etc.). We cannot, however, argue on the basis of this silence that it is a creation of Seneca, and in fact, when he uses the word, unlike *essentia*, it never requires explications or particular justifications. The term is clearly part of everyday usage, even if it appears in very determinate contexts in Seneca, where it is generally easy to uncover an underlying

Stoic conception. We read, for example, in the *Quaestiones naturales*, regarding the rainbow:

> Non est propria in ista nube substantia nec corpus est, sed mendacium sine re similitudo.

> (There is neither proper substance nor body in this cloud, but illusion and appearance lacking reality.)

<div align="right">(Quaestiones naturales, 1.6.4)</div>

We can easily recognize, through the contrast initiated by Seneca between *propria substantia* and *mendacium*, or again between *res* and *similituo*, the two terms of *hupostasis* and *emphasis* [ἔμφασις] (reality/appearance), which we find in an exactly parallel context in the pseudo-Aristotelian treatise *De mundo*, for example, and which become standard in this opposition beginning especially with Posidonius. There we read:

> [Τῶν ἐν ἀέρι φαντασμάτων τὰ μὲν ἐστι κατ' ἔμφασιν, τὰ δὲ καθ' ὑπόστασιν.]

> (Among celestial phenomena, some are only apparent, others real.)

<div align="right">(De mundo, 395a28)</div>

We must, however, put aside the question of whether the contrast established by Seneca takes up the underlying Stoic distinction in an exact way, or whether the word *substantia* by itself bears a more specifically Latin meaning, allowing it to correspond in the present case to the Stoic construction. Let us examine in this vein another passage from Seneca, where we again seem to find the contrast "simple" and "received": *substantia/imago*. This is the famous letter 58 to Lucilius, already cited, since it is in the same text that Seneca suggested, relying on Cicero's authority, the neologism *essentia* to translate *ousia*, with the latter term in addition being, unusually, clarified as follows:

> Quomodo dicetur οὐσία—res necessaria, natura continens fundamentum omnium?

> (How shall we render the concept of *ousia*, necessary reality, substance where the foundation of all things resides?)

<div align="right">(Letters, 58.6, in Sénèque, entretiens, lettres à Lucilius,
translated by H. Noblot)</div>

(N.B.: we cannot resist this translation, which reintroduces at its core the term "substance" which Seneca avoids!)

After this first attempt at translation, to which in fact Seneca does not feel tied down, he attempts an exposition that is in fact rather muddled since he mixes Platonic *diairesis* [διαίρεσις], Aristotle's categorial analysis, and the scrutiny of the Stoic categories. His goal in any case is to go in search of the primary, of the supreme genus under which lie all the other species:

> Nunc autem primum illud genus quaerimus, ex quo ceterae species suspensae sunt, a quo nascitur omnis divisio, quo universa conprensa sunt.

> (For the moment, we are seeking this primary genus to which all the species are subordinate, from which all divisions emanate, which contains the universality of things.)

<div align="right">(Ibid., 58.8)</div>

This primary genus ("*genus primum et antiquissimum*"; 58.12) is first defined as "being" (*to on* = *quod est*—that which is). "Being" thus construed lies beyond the body ("*aliquid superius quam corpus*"); the *quod est*—that which is—is thus able to appear as either corporeal or incorporeal. This is why, Seneca adds, the Stoics wished to apply another supreme genus to the *quod est* (RT: *SVF*, III, s.v. *genikôtaton genos* [γενικώτατον γένος]; cf. also Alexander of Aphrodisias, *In Topica*, 4), one that is prior or more of a principle ("*aliud genus magis principale*"), the *quid* (= *ti* [τι]). Then Seneca clarifies the ultimate reasons for the Stoic decision thus:

> In rerum, inquiunt, natura quaedam sunt, quaedam non sunt, et haec autem, quae non sunt, rerum natura complectitur, quae animo succurrunt, tanquam Centauri, Gigantes, et quicquid aliud falsa cogitatione formatum habere aliquid imaginem coepit, quamvis non habet substantiam.

> (In nature, they say, there are the things which are, and things which are not. Yet nature embraces the very things which are not and come to mind, like centaurs, giants; products of false concepts, already feigning an image, and yet lacking substance.)

<div align="right">(Ibid., 58.15)</div>

We may conclude from this brief passage that the "things which are" (*to on* vs. *to huphestos* [τὸ ὑφεστός]) are precisely because they "have substance." "To have substance" (*substantiam habere*) may and without any doubt must be understood here as a translation or explication of what is meant by "to be" (*esse*). To be implies truth, not only of being a substance, of being substantially or in the manner of substance, but in fact "to have substance" or "to take substance" ("*substantiam capere*"; Boethius), that is, to be able to be based in a corporal reality defined by its stability and solidity.

3. *Substantiam habere*—*substantiam capere*
("to have," "to take substance")

We may remark straightaway, taking account of the stereotypical character of the unitary Latin expression *substantiam habere*, that it refers, at least in the passage cited, more probably to the Greek verb *huphistanai* than to the strict concept of *hupostasis*. Nonetheless, it is clear that Seneca means substantiality, proper to what exists in the full sense, as the fact of having a support, a substrate, or a basis guaranteeing consistency and stability.

In this way, "having-substance" always requires or presupposes a body; the body here refers in general to the foundation on which everything must rest in order to be. If being implies having-substance, it is because the fact of having-substance implies the possession of a solid substrate, whose property is precisely the guarantee of consistency and permanence.

After having taken up, as we have seen, the classical contrast between *hupostasis* and *emphasis* in the passage

cited above, taken from the *Quaestiones naturales*, Seneca adds:

> Nobis non placet in arcu aut corona subesse aliquid corporis certi.

> (We are not of the opinion that there is at bottom, in the rainbow or luminous halo, anything corporeal.)

> (*Quaestiones naturales, 1.6.4*)

4. *Substantia—corpus*

One might think that an expression like *subesse corpus* (a body that is at the basis, at the foundation) must have played a determining role in the appearance of the term *substantia* in philosophical contexts. To clarify this convergence, we must quickly go back: we have seen how Cicero, in *De oratore* (5.27), distinguished two types of "things" (*res*) in his analysis of definition: things that are, things that are cognized (*res quae sunt, res quae intelliguntur*). Only concrete beings really are, Cicero affirms, unlike abstract entities that lack material reality: "*quibus nullum subest corpus.*" In the same way, in the *De natura deorum* (1.38), concerning the thesis according to which the "form of god" can only be grasped in thought and not in sensation, and is lacking in all consistency ("*speciem dei percipi coginatione non sensu, nec esse in ea ullam soliditatem*"), Cicero asks:

> Nam si tantum modo ad cogitationem valent nec habent ullam soliditatem nec eminentiam, quid interest utrum de hippocentauro an de deo cogitemus ?

> (For if [deities] exist only in thought, and have no solidity nor substance, what difference can there be between thinking of a hippocentaur, and thinking of a deity?)

Not having solidity, not having body (we naturally expect a *substantiam habere* here), means not being, in the sense in which the hippocentaur is the very example of inexistence or irreality (*anuparxias paradeigma* [ἀνυπαρξίας παράδειγμα]) (Sextus Empiricus, *Outlines of Scepticism*, 1.162).

It thus looks as though the term *substantia*, whose meaning comes out most fully in composite expressions like *substantiam habere*, was designed to express an immediate understanding of being as corporeity, solidity, ground(s). *Substantia* is thus properly speaking what is at the foundation—*id quod substat*—the reality that stands beneath and that one may use as a foundation, the basis that guarantees being with its subsistence by giving it ontological support. Seneca repeats, clarifying substantiality in the sense of "having substance," which still implies the having of a proper and determinate body (*proprium, certum*):

> Aliquid per se numerabitur cum per se stabit.

> (Only what stands by itself is counted by itself.)

> (*Letters*, 113.5)

From its first "philosophical" uses, the Latin term thus seems to have a specific understanding, its own coloring, which by itself is sufficient to cast doubt on the hypothesis of a pure and simple scholarly calque from *hupostasis*. The pretheoretical notions implied by *substantia* appear even more clearly if we examine the nontechnical uses of the word. We must note again, against the "calque" hypothesis, the numerous uses of *substantia* in very modest, concrete, and material senses among jurists of the second and third centuries, where the term retains its ancient meaning of owned property, inheritance, resources, means of subsistence.

In the *De institutione oratoria*, Quintilian suggests for the first time, in a thematic way, that *ousia* be translated by *substantia*. The subject is the figures and the ornaments that they provide for speeches, as well as the dangers of their overuse; he writes:

> There are some who pay no consideration to the weight of their matter or the force of their thoughts and think themselves supreme artists, if only they succeed in forcing even the emptiest of words into *figurative* form, with the result that they are never tired of stringing *figures* together, despite the fact that it is as ridiculous to hunt for *figures* without reference to the matter as it is to discuss dress and gesture without reference to the body.

> (*De institutione oratoria,* 9.3.100)

Quintilian mentions elsewhere the questions that can arise in certain trials, not as to the reality of an alleged fact at all, but as to the actual identity of an individual, otherwise well-known:

> ut est quaesitum contra Urbiniae heredes, is quis tanquam filius petebat bona, Figulus esset an Sosipater. Nam et substantiaeius sub oculos venit, ut non possit quaeri, an sit . . . nee quid sit nee quale sit.

> ([It] may be illustrated by the action brought against the heirs of Urbinia, where the question was whether the man who claimed the property as being the son of the deceased, was Figulus or Sosipater. In this case the actual person was before the eyes of the court [*nam et substantia ejus sub oculos venit*], so that there could be no question whether he existed [*ut non possit quaeri an sit*] . . . nor what he was nor of what kind.)

> (Ibid., 7.2.5)

To be manifest (*sub oculos venire*) is precisely what is proper to "substance," proper to that to which a body underlies, proper to that which "has substance" (*substantiam habere*).

We may then demand whether *substantia* would have ever "translated" the Greek *ousia*, *hupostasis*, or rather if, thanks to some overdetermined translations, it laid the groundwork for new ontological determinations—the very ones that would be inherited by all of *Romania*, without quite knowing it.

5. The notion of substance in Marius Victorinus

In his *Liber de definitionibus*, Marius Victorinus presents a critical summary of the Ciceronian doctrine of the two kinds of definition. Cicero's distinction rests on the Stoic contrast between corporeals and incorporeals (*Topics*, 5.26–27), and it tends to declare unreal anything that does not derive ultimately from a corporeal foundation ("*subesse corpus—ta ontôs huphestôta*" [τὰ ὄντως ὑφεστῶτα], according to Stoic terminology). To overturn—and to confirm—Cicero's account, Victorinus need only introduce the term *substantia*, foreign to Cicero's text, and to expand relation that grounds

substantiality beyond pure and simple corporeity. From that point on, the body is only a special case, even if it is empirically privileged, of what can provide a foundation in the manner of a subject or substrate:

> Quamquam Tullius aliter in eodem libro Topicorum ait esse duo genera definitionum: primum, cum enim id quod est definitur; secundo, cum id quod sui substantiam non habet, hoc est quod non est; et hoc partitionis genus in his quae supra dixi clausit et extenuavit. Sed alia esse voluit quae esse dicebat, alia quae non esse. Esse enim dicit ea quorum subest corpus, ut cum definimus quid sit aqua, quid ignis; non autem esse illa intelligi voluit quibus nulla corporalis videtur esse substantia, ut sunt pietas, virtus, libertas. Sed non omnia ista, vel quae sunt cum corpore vel quae sunt sine corpore, si in eo accipiuntur ut aut per se esse aut in alio esse videantur in uno genere numeranda dicimus: ut ista omnia esse intelligantur quibus omnibus sua potest esse substantia, sive illae corporales sive, ut certissimum est et recto nomine appellari possunt, qualitates.

> (In book V of the *Topics* Cicero suggests that there are two kinds of definition: the first in which one defines what is; the second when one defines what does not have proper substance, in other words what is not; and he attempts to circumscribe this kind of definition *a partibus*, and to limit its extension. . . . He wishes to distinguish between the things which he says exist, and those which he says do not exist. He posits that the things to which a body is subjacent are; when we define for example what water is or fire; on the other hand, he wishes us to consider as not being the things which seem to have no bodily substance, like piety, virtue, liberty. We say on the contrary that all these things, whether with or without body, should be classed under the single generic head [that of being, i.e., substantiality], as long as we grasp them insofar as they appear to be by themselves or in another. We must therefore understand that all these things which may always have a proper substance are, either because they are body, or because they are qualities, since that is certainly determined, fully authorizing that determination.)

(Marius Victorinus, *Liber de definitionibus*)

After having introduced the term *substantia* as needing no further explanation in his account of the Ciceronian analysis, Victorinus's efforts focus entirely on dissociating corporeity and substantiality. For us, he states, as we consider all things "insofar as they appear to be by themselves or to be in another," we must place them under a single head, namely, substance. These are properly speaking all the things for which there may be substance, or better, "proper substance." It does not matter that substance relates from the start to *substare* and the *subesse* of the body, or secondarily the substrate on which a "quality" always comes to belong. "Being-by-itself" is being substance, "being-in-another" is being quality in a substance, which then becomes for the quality in question like its body, its proper substance. This is the usage of *substare* that we find in Boethius (480–524), in *Contra Eutychen et Nestorium*, chapter 3, which we

may gloss in the sense of "to procure a subject for everything else considered as accidents, so that they may be," to "support" their "being in a subject" (cf. Libera, *L'art des généralités*):

> "Substance" [*substat*] is that which gathers as underpinning [*subministrat*] for other accidents [*i.e.* to all the rest considered as accidents] some subject [*subjectum*], so that they may exist [*ut esse valeant*]; indeed it supports them [*sub illis enim stat*], since it is subjected to accidents [*subjectum est accidentibus*].

Suárez doubtless remembers these formulations when he notes, referring to the "etymology" of *substantia*: "Substare enim idem est quod aliis subesse tanquam eorum sustentaculum et fundamentum, vel subjectum" (to be substance is in effect the same thing as to underlie other things as a support, foundation, or subject) (*Disputationes metaphysicae* 33, §1).

▪ See Box 2.

C. *Essentia ab esse*: Essence

The term *essentia* only becomes established with Augustine, even though we may find some occurrences, beginning with Apuleius, in other authors influenced by Neoplatonism, like Macrobius or Chalcidius. As we have seen, in its first occurrences, the sense of the word remains unstable and almost inevitably slips onto the side of "substance." The term is, we might say, so unclear that it constantly requires explication in terms of *substantia*. Augustine's work marks a signal reversal in this regard. In his eyes, as we have already noted, *essentia* appears as a recently created term, still rarely used but destined to replace *substantia*, at least in some of the latter's previous senses. Augustine writes, for example, in this early text, the *De moribus manichaeorum*:

> Nam et ipsa natura nihil est aliud quam id quod intelligitur in suo genere aliquid esse. Itaque, ut nos jam novo nomine ab eo quod est esse vocamus essentiam, quam plerumque substantiam etiam nominamus, ita veteres qui haec nomina non habebant pro essentia et substantia naturam vocabant.

> (Indeed nature itself is nothing other than what one cognizes that it is something of this kind. This is why, just as we name it "essence," using a neologism based on "to be," so the ancients, lacking these terms, used "nature" for "essence" and "substance.")

(*De moribus manichaeorum,* 2.2)

Or again:

> Essentiam dico quae οὐσία graece dicitur, quam usitatius substantiam vocamus.

> (I call *essentia* what is called *ousia* in Greek, and what we more commonly call *substantia*.)

(*De Trinitate*, 5.8.9–10)

We might even go so far as to suppose that over the course of Augustine's life, and certainly thanks to him, the term must have spread so as to become standard, since in a late work like *City of God* he can write:

2

"Existence" and "subsistence": The Stoic strategy

➤ HOMONYM, SEIN, SENSE, SIGNIFIER/SIGNIFIED, WORD

Following the Stoics, Cicero contrasts in his *Topics* the true (substantial) being of bodies with the "fictive" being ("*to huphestos, kat' epinoian psilên huphistasthai*" [τὸ ὑφεστός, κατ᾽ ἐπίνοιαν ψιλὴν ὑφίστασθαι]) of notions (*ennoêmata* [ἐννοήματα]): "ἐννόημα δέ ἐστι φάντασμα διανοίας, οὔτε τι ὂν οὔτε ποιόν, ὡσανεὶ δέ τι καὶ ὡσανεὶ ποιόν (a concept is a phantasm of thought, which is neither something, nor something qualified, but quasi-something and quasi-something qualified) (Diogenes Laertius, *Lives of Eminent Philosophers*, 7.61; RT: *SVF*, vol. 1, n. 65, p. 19;

Long and Sedley, *Hellenistic Philosophers*; and equally the specification by Libera in Porphyre, *Isagoge*).

Against this doctrine, Marius Victorinus thinks it necessary to appeal to Aristotle, but on the basis of an interpretation of the *ousia* of the *Categories*, and of the distinction between *ousia prôtê* [οὐσία πρώτη] and *ousia deutera* [οὐσία δεύτερα], which has already conceded the only decisive point: the substantial implications of *ousia*. Even when *ousia* is not present strictly speaking, as is paradigmatically the case in corporeal

beings, it may at least be apprehended as a subject of accidents or qualities, which thus find their *substantia propria*.

---

ab eo quod est esse vocatur essentia, novo quidem nomine quo usi veteres non sunt latini sermonis auctores, sed jam nostris temporibus usitato, ne deesset etiam linguae nostrae, quod Graeci appellant οὐσίαν.

(so from "to be" [*esse*] comes "being" [*essentia*]: a new word, indeed, which was not used in the Latin speech of old, but which has come into use in our own day so that our language should not lack a word for what the Greeks call *ousia*; for this is expressed very exactly by *essentia*.)

(*De civitate Dei*, 12.2)

The term would thus be recently created in order to respond literally ("*hoc enim verbum e verbo expressum est, ut diceretur essentia*") to the Greek *ousia*. Clearly, the term *essentia* is designed, by its very formation, to "translate" *ousia*, but can only appear as such with a new comprehension of being different from that which guided it (*esse* in the sense of "having body," "having substance"). In other words, again, *essentia* can only establish itself as a "translation" of *ousia* when the latter is resolutely interpreted on the basis of the verb *einai*, reinterpreted in the perspective of Porphyrean Neoplatonism. Saint Augustine is perfectly explicit as to the meaning of this derivation, to which he returns again and again:

Sicut enim ab eo quod est sapere dicta est sapientia et ab eo quod est scire dicta est scientia, sic ab eo quod est esse vocatur essential.

(For just as wisdom is so called from being wise, and knowledge is so called from knowing, so essence is so called from being [*esse*].)

(*De Trinitate*, 5.2.3)

Essence must first be understood *ab esse*, or better *ab eo quod est esse*—on the basis of what the verb "to be" expresses, or the act of being.

We can follow rather precisely the upheavals wrought by this new "translation" in a remarkable passage of *De immortalitate animae*: it provides, it seems, the first occurrence of the

term *essentia* in Augustine's writing, but he also proposes a Platonizing reinterpretation of Aristotle. The central Augustinian thesis is formulated thus:

Illa omnia quae quoquo modo sunt ab ea Essentia sunt, quae summe maximeque est.

(Everything which exists in any way derives from that being which is the highest and greatest.)

(*De immortalitate animae*, 11.18)

We must surely read here, we believe, *Essentia* (capitalized). Essence as such, Essence pure and simple, must be understood as a Divine Name. It even names God properly speaking, as the Essence par excellence, that is, as *causa essendi* (*De diversis quaestionibus*, 83, q. 21): the being in virtue of which exist all things that are in one manner or another. The Aristotelian "definition" of *ousia prôtê* is clearly indicated, but in order to be entirely theologized. "*Ousia* in the fundamental, primary, and principal sense" (*hê kuriôtata te kai prôtôs kai malista legomenê* [ἡ κυριώτατά τε καὶ πρώτως καὶ μάλιστα λεγομένη]) is henceforth understood as *Essentia . . . quae summe maxime que est,* that is, God. Nothing is, nothing is existent except through being in him, by his *essentia* ("*omnis essentia . . . non ob aliud essentia est, nisi quia est*").

■ See Box 3.

The term "essence," we believe, can thus only be established in Latin if it contains the echo of what *esse* (*to einai*) expresses verbally. Thus, *essentia* does not simply replace *substantia*, but rather opens up a new understanding of being. It is thus no accident that the term is only fully deployed when it comes to refer primarily to the one who *summe est*, he who, Augustine goes so far as to say, *est est*: "*Est enim est sicut bonorum bonum est*" (he is indeed "is," as [he] is the good of goods) (*Enarrationes en Psalmos*, 134, RT: *PL*, vol. 37, col. 1741; cf. also *In evangelium Johannis tractatus*, 39.8.9: *Est quod est* [he is what is]; *Confessions*, 12.31.46: "*quidquid aliquo modo est, sed est est*" [everything which is in some way anything is in virtue of he who is not in just any way but is is]).

3

The Augustinian reinterpretation of Aristotle

➤ I/ME/MYSELF

It is this fundamental thesis that leads Augustine to adopt the Aristotelian doctrine according to which *ousiai* do not have contraries—at the cost of a complete reversal of the hierarchy of *ousia prôtê*–*ousia deutera* since "primary essence" is no longer the singular thing as here (*tode ti*), but rather God. The Augustinian transposition of this doctrine singularly clarifies the new understanding of being that is expressed through the translation of *essentia*. Here is the canonical passage from Aristotle:

Ὑπάρχει δὲ ταῖς οὐσίαις καὶ τὸ μηδὲν αὐταῖς ἐναντίον εἶναι. Τῇ γὰρ πρώτῃ οὐσίᾳ τί ἂν εἴη ἐναντίον ; οἷον τῷ τινι ἀνθρώπῳ οὐδέν ἐστι ἐναντίον, οὐδέ γε τῷ ἀνθρώπῳ ἤ τῷ ζῴῳ οὐδέν ἐστι ἐναντίον.

(Another characteristic of substances is that there is nothing contrary to them. For what would be contrary to a primary substance? For example, there is nothing contrary to an individual man, nor yet is there anything contrary to man or to animal.)

(*Categories*, 5.3b24f.)

Aristotle's aim is not here to contrast being and non-being as principles. Rather, it is simply to show, taking account of the determined "essence" as such or such, that it is *dektikê tôn enantiôn* [δεκτικὴ τῶν ἐναντίων] (such as to receive contraries), making room that contraries can occupy and respond to one another, developing in this way a single configuration ("*kai gar tôn enantiôn tropon tina to auto eidos*" [καὶ γὰρ τῶν ἐναντίων τρόπον τινα τὸ αὐτὸ εἶδος]; *Metaphysics* Z7, 1032b2–3).

In the rather different framework of a demonstration of the immortality of the soul Augustine is led to rely on this passage from Aristotle, attributing to it a new ontological meaning. In the course of his demonstration, and on the basis of an identification of being and truth, Augustine must respond to the objection according to which the soul, turning away from truth, would accordingly lose its very being. The Augustinian response rests on the distinction between the *conversio* and the *aversio*, and especially—and this is the point that interests us—on the claim that the soul, having its being from the very thing that has no contrary, and which *is* paradigmatically—*Essentia*—could not lose it.

The Aristotelian doctrine according to which *ousia* does not have a contrary thus acquires a peculiar illustration, when it becomes a matter of the *Essentia* by which all things exist that are of such or such a sort ("*illa omnia quae quodmodo sunt*"):

Nam si nulla essentia in quantum essentia est, aliquid habet contrarium, multo minus habet contrarium prima illa essentia, quae dicitur veritas, in quantum essentia est.

(If no independent reality has a contrary, insofar as it is an independent reality, much less does that first reality which is called truth have a contrary insofar as it is an independent reality.)

(*De immortalitate animae*, 12.19)

Essence as such ("*essentia in quantum essentia est*") does not have a contrary because it is said *ab eo quod est esse*: from that which is being. But being (*esse*) has no contrary, except precisely non-being, or nothing. Being has nothing as a contrary; being does not have anything as a contrary: "Esse autem non habet contrarium, nisi non esse; unde nihil est essentiae contrarium" (*De immortalitate animae*, 12.19; cf. also *De moribus manichaeorum*, 2.1.1). Thus the Aristotelian doctrine comes paradoxically to the aid of the thesis of the primacy of the "Essentia quae summe maximeque est," and the treatise of the *Categories* is henceforth pressed into the service of a Porphyrean metaphysics of *einai*. And Augustine can even go so far as to conclude the movement of thought we are examining in this way:

Nullo modo igitur res ulla potest esse contrario illi substantiae, quae maxime ac primitus est.

(In no way, then, can anything be contrary to that reality which exists in the greatest and most fundamental way.)

(*De immortalitate animae*, 12.19; Fr. transl. mod.)

Augustine can reintroduce the term "substance" here (to accentuate the reference to *Categories*, 5): we can see clearly that the word no longer has a guiding role, and it is to be understood only on the basis of the prior determination of essentiality. It is a diametrically opposed gesture to that of Apuleius in his *De Platone*.

No doubt the Neoplatonic reference does not suffice on its own to clarify this new Augustinian understanding of being (which is precisely not "essentialist"), establishing a career for *essentia*. Without engaging in questions raised by the so-called metaphysics of the Exodus, we must nevertheless note that the interpretation of the mystical Name of God revealed to Moses on Mount Sinai constitutes the focal point of Augustinian meditation. *Essentia* can be understood as a Divine Name, since it expresses that which brings into existence everything that *is*. Essence can even be properly predicated of God: "Quis magis est [essentia] quam ille qui dixit famulo suo Moysi: ego sum qui sum, et: dices filiis Israel: Qui est misit me ad vos?" (And who possesses being in a higher degree than he, who said to his servant Moses: "I am who am," and to the sons of Israel, "He who is, has sent me to you"?) (*De Trinitate*, 5.2.3). God is properly called essence, he has the Name *Essentia*, since only he is *ipsum esse* ("*cui profecto ipsum esse . . . maxime ac verissime competit*").

In other words, again, it is first as a Divine Name that *essentia* can be established to express properly the being of he who says of himself: "*sic sum quod sum, sic sum epsum esse*" (as I am what is, so I am Being itself) (*Sermones*, 7.7). It is because he is apprehended as the one who "primarily and pre-eminently" is that God become *ousia prôtê*, that is, now and necessarily: *Essentia*. God does not have attributes, but above all he could not be the subject of attributes: "But it is wrong to assert that God subsists and is the subject of His own goodness [*ut sub-sistat et sub-sit Deus bonitati suae*], and that goodness is not a substance, or rather not an essence, that God Himself is not His own goodness, and that it inheres in Him as in its subject" (*De Trinitate*, 7.5.10).

ESTI [ἐστι], EINAI [εἶναι]

ENGLISH   there is, there exists, it is possible that, it is the case that, it is, exists, is; to be, to exist, to be identical to, to be the case

➤ *IL Y A* [ES GIBT, HÁ, SEIN, *TO BE*], and ANALOGY, *CATEGORY*, DASEIN, ESSENCE, HOMONYM, NATURE, *NEGATION*, *NOTHING*, OBJECT, PRÉDICABLE, PREDICATION, REALITY, SPECIES, SUBJECT, *THING* [RES], TO TI ÊN EINAI, TRUTH

Even the verb "to be," which Schleiermacher calls "the original verb," is "illuminated and colored by language" ("Über die verschiedenen Methoden des Übersetzens"). The Greek *einai* [εἶναι] has or may have a number of semantic and and syntactic characteristics capable of giving rise to philosophy as the thought of being, in particular, the collusion among the function of the copula, the existential meaning, and the veridical meaning. It is thus, Heidegger emphasizes, that the Greek language "is philosophical, i.e. not that Greek is loaded with philosophical terminology, but that it philosophizes in its basic structure and formation (*Sprachgestaltung*)" (*Essence of Human Freedom*, §7). Yet, this dictionary's project is in part to attempt to make distinctions among linguistic realities, the idiomatic impact of fundamental philosophical works, and what Jean-Pierre Lefebvre calls "ontological nationalism"—in this case, the projection of a sort of Germany onto a sort of Greece.

Parmenides's *Poem* is fundamental both for Greek thought and for the Greek language. The form *esti* [ἐστι], "is," third-person singular indicative present, which is the name of the route of investigation of the *Poem*, is even more remarkable since at the beginning of a sentence it can mean not only "there is" (see ES GIBT, HÁ), but also "it is possible." Finally, a series of key words and expressions for ontology arise over the course of the works of Parmenides, Plato, and Aristotle simply as derivatives of *einai*: *to on* [τὸ ὄν], "what is"; *to ontôs on* [τὸ ὄντως ὄν], "what really is, that is, true, authentic being"; *ousia* [οὐσία], "being-hood," "essence," "substance"; *to on hêi on* [τὸ ὂν ᾗ ὄν], "being insofar as it is being"; *to ti ên einai* [τὸ τί ἦν εἶναι], the "what it was to be," "quiddity," the "essential of the essence."

Finally, the question of the "is not" and of "what" is not is related to the question of being from Parmenides on. It requires taking account of two possible expressions of negation, prohibitive and subjective (particle *mê*), or factual and objective (particle *ou*), mirroring the difference between "negation" in the strict sense (Gr. *mê*; *to mê on*, "what cannot be," "nothingness") and "privation" (Gr. *ou*; *to ouk on*, "that which as it happens is not [such]"), as well as the various combinations of the negations, which can complement or reinforce each other. These peculiarities of Greek, which Sophists and philosophers take advantage of, in turn shed light on the specific features of the vernaculars that are used to translate them.

I. Greek, the Language of Being?

"Tout ce qu'on veut montrer ici est que la structure linguistique du Grec prédisposait la notion 'd'être' à une vocation philosophique" (all we wish to show here is that the linguistic structure of Greek predisposed the notion of "being" to a philosophic vocation) (Benveniste, *Problems in General Linguistics*). "The fact that the development of Western grammar began with Greek meditation on the *Greek* language gives this process its whole meaning. For along with the German language, Greek (in regard to the possibilities of thinking) is at once the most powerful and the most spiritual of languages" (Heidegger, *Introduction to Metaphysics*, ¶43). The normally contrary views of Heidegger the philosopher and Benveniste the linguist are in agreement for once, in describing the privilege of *einai* [εἶναι], "to be," in Greek, which is otherwise reckoned to be the source of meaning (Heidegger) or of confusions and mistakes (Benveniste), whether inevitable or accidental. Like any verb, "to be" has a "syntactic function" (Benveniste) related to its "grammar" (Heidegger) and a "lexical sense" (Benveniste) related to its "etymology" (Heidegger). Jacques Derrida analyzes this peculiarity of Greek in terms of the function between the grammatical and lexical functions of the verb "to be": "Although always uneasy and worked upon from within, the fusion of the grammatical and the lexical functions of 'to be' surely has an essential link with the history of metaphysics and everything that is coordinated with it in the West" ("The Supplement of Copula").

A. Lexical function: The semantics of *einai*

Benveniste, in order to measure the semantic peculiarity of the verb "to be" in Greek and in our "philosophical" languages, takes as the counter-example the Ewe language, where, except for the strict identity of subject and predicate marked by *nye*, which is "curiously" transitive, what we indicate by "to be" is expressed on the one hand by *le* (God exists, he is here) or *no* (he remains there), on the other hand by *wo* (it is sandy), *du* (he is king), or *di* (he is thin), with verbs whose only relations to one another are the ones that we, starting from our own mother tongues, project onto them (Benveniste, *Problems in General Linguistics*). Heidegger suggests something analogous in an etymological mode, when he brings up the three Indo-European and Germanic roots at work in the uses of the verb "to be": *es*, in Sanskrit *asus*, "life, the living" (which yields the Gr. *esti* [ἐστι], Fr. *est*, Ger. *ist*, Eng. "is"); *bhû*, *bheu*, "to grow, to flourish," perhaps "to appear" like *phusis* [φύσις], "nature," in Greek, and perhaps the Gr. *phaineshtai* [φαίνεσθαι], "to seem," which yields the Lat. *fui*, Fr. *il fut*, Ger. *bin*); finally *wes*, Sanskrit *wasami*, "to live, to reside, to remain" (like the Gr. *astu* [ἄστυ], "the city," and *Vesta*, *vestibule*, which yields the Ger. *war*, *wesen*, or Eng. "was" and "were"). "From the three stems we derive three initial and vividly definite meanings: living, emerging, abiding," meanings that we place at the level of the "existential" sense of "to be" (Heidegger, *Introduction to Metaphysics*; Benveniste, *Problems in General Linguistics*) (see NATURE, Box 1 for *phusis*; LIGHT, Box 1 for *phainesthei*).

B. Grammatical function: The syntax of *einai*

Alongside this exceptionally syncretic semantics, the verb *einai* possesses a grammatical function that is no less peculiar.

1. Cohesive function and copula

Every verb has a cohesive function, allowing it to structure the relation between members of a proposition ("Socrates drinks the hemlock"). But "to be" has this function pre-eminently. It has it first as the copula, guaranteeing the link between subject and predicate, whether as a matter of identity ("Socrates is Socrates") or inclusion ("Socrates is mortal"). It has it a second time—whence its pre-eminence—since this copulative liaison may be substituted for any other one: the copula, as long as we use an

appropriate predicate, can replace any verb ("Socrates is drinking-the-hemlock" is equivalent to "Socrates drinks the hemlock"). From Aristotle to Port-Royal, this analysis structures predicate logic (see PREDICATION, WORD):

> [The verb, including even *to be* and *not to be*] is nothing by itself (*ouden esti* [οὐδὲν ἐστι]), but signifies in an additional way a putting into relation (*prossêmainei*, which the medievals translate by "co-signify," *sunthesin tina* [προσσημαίνει σύνθεσίν τινα]), which cannot be conceived without its components.
>
> (*De interpretatione*, 4.16b23–25)

> The verb itself should not have uses other than to mark the link which we make in our minds between the two terms of a proposition; but only the verb *to be*, which we call a substantive, kept this simplicity.
>
> (*Grammar*)

2. Assertive function and veridical sense

"A la relation grammaticale qui unit les membres de l'énoncé s'ajoute implicitement un 'cela est' qui relie l'agencement linguistique au système de la réalité" (to the grammatical relation that links the members of the utterance an implicit "that is" is added that connects the linguistic arrangement to the system of reality) (*Problems in General Linguistics*). A "that is" would accompany all of our sentences, at least the declarative ones, just as a Kantian "I think" would accompany all of our representations. Once again, "to be" has this function pre-eminently. For on the one hand, "Socrates is mortal" asserts that Socrates is mortal, just as "Socrates drinks" asserts that Socrates drinks. But on the other hand, "is," as attested by the "that is" written by Benveniste, or the English "isn't it?"—the French *n'est-ce pas?* but the German *nicht wahr?*—is equivalent to a declaration of this declarative force, a doubling-up or a second degree, while it also functions as a substitute for any affirmation, hence a general equivalent that is as universal with regard to assertion as the copula is with regard to cohesion.

This second function, called the "veridical usage," was recently foregrounded by Charles Kahn as characteristic par excellence of the Greek *einai*: thus, *legein ta onta* [λέγειν τὰ ὄντα] standardly means "to call things as they are," "to say the truth" (cf. Thucydides, 7.8.2, cited by Kahn, *Logic of Being*). As such, it was able to provide the groundwork for the Parmenidean starting point all by itself. Thus, for Pierre Aubenque, Parmenides "confuses" the veridical, universal function ("to be" means "it is the case, it is true," and is contrasted with opinion) and the lexical, particular meaning ("to be" means "to be permanent" and is contrasted with becoming). With the "paralogism" that consists in universalizing the lexical particular meaning in the name of the universality of the syntactic function, thus making the two opposites, "becoming" and "seeming," coincide, we arrive at the *prôton pseudos* (first lie/first error), "foundational to metaphysics" ("Syntaxe et sémantique de l'être"; cf. "Onto-logique").

This assertoric function, which leads to the veridical meaning, is surely intertwined with the existential meaning

(to name *ta onta* is to name existent reality, *Wirklichkeit*), as well as the copulative function ("Socrates is mortal" claims that Socrates is indeed mortal). It is in fact nothing other than a symptom of the "pretension of being outside of language" (the expression is Derrida's, "Le supplément de copule"), or, in other terms, the specifically ontological transference of *logos*. The grammatical characteristic of *einai*, so rightly called a substantive, is thus to be able to take the place of all the others to link them and to declare, in language, in the world or toward the world, and in our thought. "To be" is, alone, the matrix or grammatical projection of this "trinity unity" be-think-speak of which Parmenides's *Poem* is the first manifestation (Hoffmann, *Die Sprache und die archaische Logik*).

To evaluate this fusion or confusion between the function and characteristic meaning of *einai*, we of course have two possibilities: we may declare it an accidental homonymy and a linguistic obstacle to rational intelligibility, or a historic feat and a mark of "the Greek conception of the essence of being [*Wesen des Seins*, the being-hood of being]" (Heidegger, *Introduction to Metaphysics*, trans. ¶70) as opening. Either way, no one denies that it is a fact of language. (See ESSENCE, I, where Mill's comparatist position may be, *mutatis mutandis*, placed alongside Benveniste's, and Hintikka's historicizing, or even "historializing," position alongside that of Heidegger.)

■ See Box 1.

II. *Esti*: The Third-Person Singular

A. The route "que esti"

Parmenides's *Poem*, *On Nature or on Being*, is always referred to as a foundational text of ontology. "These few words stand there like archaic Greek statues. What we still possess of Parmenides' didactic poem fits into one slim volume, one that discredits the presumed necessity of entire libraries of philosophical literature. Anyone today who is acquainted with the standards of such a thinking discourse must lose all desire to write books" (Heidegger, *Introduction to Metaphysics*, ¶74). It is the paradigmatic text where this fusion may be deciphered.

This is what the divinity says to the young man:

> Εἰ δ' ἄγ' ἐγὼν ἐρέω, κόμισαι δὲ σὺ μῦθον ἀκούσας, αἵπερ ὁδοὶ μοῦναι διζήσιός εἰσι νοῆσαι· ἡ μὲν ὅπως ἔστιν τε καὶ ὡς οὐκ ἔστι μὴ εἶναι, πειθοῦς ἐστι κέλευθος, ἀληθείῃ γὰρ ὀπηδεῖ, [5] ἡ δ' ὡς οὐκ ἔστιν τε καὶ ὡς χρεών ἐστι μὴ εἶναι, τὴν δή τοι φράζω παναπευθέα ἔμμεν ἀταρπόν· οὔτε γὰρ ἂν γνοίης τό γε μὴ ἐὸν, οὐ γὰρ ἀνυστόν, οὔτε φράσαις.

> (Come now, and I will tell you (and you must carry my account away with you when you have heard it) the only ways of enquiry that are to be thought of. The one, that [it] is and that it is impossible for [it] not to be, is the path of Persuasion (for she attends upon Truth); [5] the other, that [it] is not and that it is needful that [it] not be, that I declare to you is an altogether indiscernible track: for you could not know what is not—that cannot be done—nor indicate it.)
>
> (II.1–8; *Presocratic Philosophers*, §291)

1

The status of the Aristotelian distinctions

➤ ANALOGY, *CATEGORY*, HOMONYM, *SOPHISM*

Aristotle uses, like any Greek speaker, the verb *einai* in the full range of its meanings. As a philosopher, however, in the *Metaphysics*, he discusses the variety of senses of being and stigmatizes, in the *Sophistical Refutations*, for example, the errors of reasoning and the sophisms that can be attributed to confusion with regard to them. Whether or not he is aware, as Benveniste is, of the relations between categories of thought and of language (*Problems in General Linguistics*), Aristotle proposes ontologically foundational distinctions and constantly makes use of modern distinctions, sometimes "unconsciously," including those that constitute, by way of the "ontologies" of computer science, the structure of the semantic web.

Being (*to einai*), or reality (*to on* [τό ὄν]), is *pollachôs legomenon* [πολλαχῶς λεγόμενον]: it is said in many ways, very precisely differentiated from homonymy (the multiplicity of senses is stated several times in the *Metaphysics*, Δ 7; E2; Θ 10). In one sense, which covers and even defines the copulative function, it is said "according to accident" (*to kata sumbebêkos* [τὸ κατὰ συμβεβηκός]): "when one says 'this is that,' it means that 'that is an accident of this'" (Δ 7.1017a12–13). In a second sense, which covers the veridical sense, being is said "as true (*hôs alêthes* [ὡς ἀληθές]), and non-being as false" (E2.1026a34–35). Further, there are the "figures of the categories" or "heads of predication" (*schêmata tês katêgorias* [σχήματα τῆς κατηγορίας], 36; see WORD, Box 2), a finite and practically invariant list of angles of attack, of imputations (what is may be: "essence, quantity, quality, relative, in a place, at a time"; it may "be in a position, having, acting, suffering," to take the canonical list of chap. 4 of the *Categories*). The first category, however, *ousia* [οὐσία], a noun derived from the participle *on* and translated by "essence" or "substance" (see ESSENCE and SUBJECT, I), is the one that determines the consistency and the subsistence of the subject of predication: it thus picks out the existential sense of *einai*, and unifies the other categories that are only said with regard to the "unique principle" that it constitutes (Γ 2.1003b5–10; see HOMONYM, II). There remains a final sense: that of "in potentiality and in actuality" (*dunamei kai energeiai* [δυνάμει καὶ ἐνεργείᾳ]) (E 2.1026b1–2), which modern linguistics has not taken advantage of (see ASPECT), unlike modern ontology (see *ACT*). This is the most enigmatic one for us, as we do not really distinguish physics (see FORCE, Box 1), praxis (see PRAXIS), and semantics.

Between the two routes of inquiry capable of being conceived, the only one that we may know and express, that of the persuasion that accompanies truth, is called: *esti*, "it is," third-person singular of the present of the verb "to be" (*hê men* [*hodos*] *hopôs estin*, the first [route], that it is, 2.3, repeated in 8.1, *muthos odoio . . . hôs estin* [μῦθος ὁδοῖο . . . ὡς ἔστιν],"the word of the path/the account of the route, that it is").

If *einai* is not just any verb, *esti* is not just any form of it. "The definite and particular verb form 'is,' the *third person singular of the present indicative*, has a priority here. We do not understand 'Being' with regard to the 'thou art,' 'you are,' 'I am,' or 'they would be'" (Heidegger, *Introduction to Metaphysics*). *Esti* implies its own mode (the "indicative": it is there, it is the case, it is true—or always already there), a time (the "present": it is now, simultaneous with the utterance—or outside of time), a number (a "singular": it is one, unique—or without number), and a person (the "third": it is the other, exteriority—or impersonal, open).

Of course, as in Latin and unlike in French or English, the indication of a person (third-person singular) is sufficient in Greek for the expression of the subject: "is" just means "is," but *esti*, without a pronoun, may be "is," but also "he (or "she" in the feminine, or "it" in the neuter) is." Normally, of course, when the subject is not expressed, this is because it just was or it is easy to deduce ("Socrates arrives; [he, not expressed in Greek] is ugly").

There are thus two types of translation for *esti*:

a. Those that presuppose a subject ("to suppose" and "subject" would be expressed by the same word if we took up that theme, *hupokeisthai* [ὑποκεῖσθαι], *hupokeimenon* [ὑποκείμενον]; see SUBJECT). The subjects envisioned have been either the closest noun, namely, the route itself, or a name or pronoun contained in the Greek ("being," "reality," "something," "he," "it"), which was then loaded with a more or less heavy metaphysical, physical, or epistemological sense (reality, the true, the object of knowledge). Thus, J. Barnes translates lines 3 and 5 by both "that it is" and "that it is not"—"it" being the object of inquiry (*Presocratic Philosophers*; "Let us take a student, *a*, and an object of study, O; and suppose that *a* is studying O"). G. S. Kirk, J. E. Raven, and M. Schofield do the same, and comment: "What is the '[it]' which our translation has supplied as grammatical subject to Parmenides' verb *estin*? Presumably, any subject of enquiry whatever—in any enquiry you must assume either that your subject is or that it is not" (*Presocratic Philosophers*).

b. Those that understand in the verb only the verb. It is here that the possibility of *esti*'s being an "impersonal" arises (see on this point the different classifications in RT: *Dictionnaire grec française* and LSJ). In Greek, the relation between so-called personal and impersonal forms is all the more noticeable since *esti* (or the pl. *eisi* [εἰσί]) at the beginning of a sentence commonly means "there is." It can even take a modal sense when followed by an infinitive, "it is possible that": thus, in verse 3 of fragment 2, "*kai hôs ouk esti mê einai*" may be translated "and that it is not possible not to be" (cf. 6.1, *esti gar einai* [ἔστι γὰρ εἶναι], "it is possible to be"). We must note that all of our languages, unlike Greek, require an apparent or grammatical subject, whereas *esti* in Greek, or the plural *eisi*, at the beginning of a sentence, is often followed by the "real" subject (not, as in the poem by Rimbaud, which Heidegger liked to cite to explicate the giving of *es gibt*: "au bois, *il* y a un nid de bêtes blanches [in the woods, there is a nest of white animals], but "*esti*

un nid de bêtes blanches"). Further, neither French nor German is as fortunate as English in this matter since they ("il y a," "es gibt") cannot reproduce the same as the same ("there is" in English) (see ES GIBT, HÁ).

To understand and translate the *esti* of this route, we must start with the characteristic fusion in Greek of assertion, copula, existence, givenness, and not restrict it to one part or dimension of itself, and hence reject any partial translations, especially those that presuppose or invent a subject, thus blocking a whole series of possible meanings. They have all, however, been proposed or embraced, their proponents sometimes venturing that their choice contains all the others: besides "it is" (Barnes; Kirk, Raven, and Schofield), we find "it is the case" (Kahn's veridical use), —is— (A. Mourelatos's provisional copula), il y a (M. Conche's givenness). But no one offers the complete freedom of translation by *est* (is), which would allow the poem to take advantage of the combined "is," and to thus establish philosophy as a fact of language.

▪ See Box 2.

B. From *esti* (is) to *to eon* (reality)

The reason we should not assume a subject for this first *esti* is that, in a way, the whole poem consists in an effort to construct it. And the reason it is essential to translate *esti* by "is" is that we must be able to perform the nominal development

---

2

The accentuation of *esti*

The Greek texts are initially given to us in the form of *scriptio continua*, in uncial script (letters resembling uppercase), without separations between words, without punctuation, without accents. Their progression to the form in which we publish them, which requires among other things expanding a variety of abbreviations and knowing different forms of ligatures between letters, is obviously a source of mistakes. To "emend" a text, to judge the plausibility of a confusion and hence a correction, we must always pay attention to the conditions of the transmission of manuscripts.

Accentuation was codified not only late, but according to different criteria. As regards *esti*, accents distinguish the type of use being made of the verb: most modern authors write enclitic *esti* as (ἐστι) to indicate the copulative, predicative, or identity uses, and orthotonic *esti* (ἔστι) to indicate existential and potential uses. This rule completes the oldest rule of simple position, with *esti* (ἔστι) accentuated when it is at the beginning (or after words like *alla, ei, kai, hopôs, ouk, hôs*)— actually the two rules overlap each other since an *esti* at the beginning of the sentence or verse is likely to be a strong, "accentuated" *esti*, with the sense of "there is," "there exists," "it is possible."

This late codification, which governs the distinction between the existential and copulative senses, nevertheless is in danger of impeding the free play of the breadth of *esti*, irreducibly semantic and functional, a complete fact of language, and of requiring overdetermined choices with regard to a state of the language, and the work on the language that is being done. This is the case especially in Parmenides's *Poem* and Gorgias's *Treatise on Non-being*. In any case, it marks choices in the Greek of the interpreters. Thus, in Parmenides, 7.34, with the same accentuation, we may understand *esti* as a verb of existence (Simplicius, Beaufret), or as autonymous (Aubenque, O'Brien, Conche, or Cassin; see Aubenque, "Syntaxe et sémantique de l'être"). But depending on how we accent verse 35, we will understand it as autonymous or as a simple copula. There are thus two possible accentuations, and three types of translation:

ταὐτὸν δ' ἐστὶ νοεῖν τε καὶ
οὕνεκεν ἔστι νόημα
οὐ γὰρ ἄνευ τοῦ ἐόντος, ἐν ᾧ
πεφατισμένον ἐστίν
εὑρήσεις τὸ νοεῖν·

(Or c'est le même, penser et ce à dessein de quoi il y a pensée [Yet thinking and that about which there is thought are the same].)
(Car sans l'être où il est devenu parole, tu ne trouveras le penser [For without the being in which it has become word, you will not find the thought].)

(Beaufret, Parménide)

ταὐτὸν δ' ἐστὶ νοεῖν τε καὶ
οὕνεκεν ἔστι νόημα
οὐ γὰρ ἄνευ τοῦ ἐόντος, ἐν ᾧ
πεφατισμένον ἐστίν
εὑρήσεις τὸ νοεῖν·

(C'est une même chose que penser et la pensée < affirmant > : « est », car

tu ne trouveras pas le penser sans l'être, dans lequel < le penser > est exprimé [Thinking and the <affirming> thought are the same thing: "is," for you will not find the thinking without the being, in which <the thinking> is expressed].)

(O'Brien, Le Poème de Parménide)

ταὐτὸν δ' ἐστὶ νοεῖν τε καὶ
οὕνεκεν ἔστι νόημα
οὐ γὰρ ἄνευ τοῦ ἐόντος, ἐν ᾧ
πεφατισμένον ἐστίν,
εὑρήσεις τὸ νοεῖν·

(C'est la même chose penser et la pensée que « est » [Thinking and the thought that "is" are the same thing] car sans l'étant dans lequel « est » se trouve formulé, tu ne trouveras pas le penser [for without the being in which "is" is formulated, you will not find the thinking].)

(Cassin, Parménide)

of *to eon* [τὸ ἔον], "being," from or on the basis of this "is"—to create the first subject from the first verb.

The different stages all correspond to grammatical forms: from *esti*, "is," comes the participle *eon*, "being," in its verbal form, that is, without an article. This is made possible by a prior transformation, whose priority is indicated by an "indeed": from "is," we first see the infinitive "to be" come to the fore:

Χρὴ τὸ λέγειν τε νοεῖν τ' ἐὸν ἔμμεναι· ἔστι γὰρ εἶναι (*Chrê to legein te noein t' eon emmenai; esti gar einai*).>

(It is necessary to say this and think this: [it is] in being [that] is; is in effect to be.)

(6.1)

(Regarding the variety of constructions and possible translations of this sentence, see Cassin, *Parménides*; to get an idea of the breadth of the variations, consider: "What is for saying and for thinking of must be; for it is for being" [Barnes, *Presocratic Philosophers*]; "What is there to be said and thought must needs be: for it is there for being"[Kirk, Raven, and Schofield, *Presocratic Philosophers*].)

Finally, in 8.32, the nominalization of the participle yields its definitive fullness of a subject: *to eon*, "being." We must emphasize the role of the article, *ho, hê, to*, descended from the Homeric demonstrative, which confers the consistency of a proper noun (in Greek: *ho Sôkratês* [ὁ Σωκράτης], "the Socrates"; see WORD, II.A), of a subject-substance (the difference between subject and predicate is marked in Greek not by the order of the words but by the presence or absence of the article). The deictic article enters thus into the formation of the third-person personal pronoun, *autos* [αὐτός], "himself," *ipse*, which becomes Platonic terminology for the status of the idea *kath' auto* [καθ' αὐτό], "in itself." Preceded by the article, *ho autos*, it means *idem* and marks in the *Poem* the expression of the self-identity of being (see I/ME/MYSELF, Box 2):

Ταὐτόν τ' ἐν ταὐτῷ τε μένον καθ' ἑαυτό τε κεῖται χοὕτως ἔμπεον αὖθι μένει·κρατερὴ γὰρ' Ἀνάγκη πείρατος ἐν δεσμοῖσιν ἔχει, τό μιν ἀμφὶς ἐέργει, οὕνεκεν οὐκ ἀτελεύτητον τὸ ἐὸν θέμις εἶναι.

(Remaining the same and in the same place it lies on its own and thus fixed it will remain. For strong Necessity holds it within the bonds of a limit, which keeps it in on every side. Therefore it is right that what is should not be imperfect.)

(8.29–32)

Thus, at the end of the route of *esti* lies the sphere of *to eon*, with the very words used to name Ulysses in his heroic identity when he is sung to by the Sirens (Homer, *Odyssey*, 12.158–64; see Cassin, *Parménide*).

III. Greek Ontological Terminology:
to ontôs on, ousia, to on hê on, to ti ên einai

"We may remark that it is one thing to give a report in which we tell about *entities*, but another to grasp entities in their *Being*. For the latter task we lack not only most of the words but, above all, the 'grammar.' If we may allude to some earlier researches on the analysis of Being, incomparable on

their own level, we may compare the ontological sections of Plato's *Parmenides* or the fourth chapter of the seventh book of Aristotle's *Metaphysics* with a narrative section from Thucydides; we can then see the altogether unprecedented character of those formulations that were imposed upon the Greeks by their philosophers" (Heidegger, *Being and Time*, §7). As it happens, philosophers have never stopped creating technical terms, ever more expressions to express more and more intimately the par excellence nature of *to on* as it arises here, exploiting the semantic resources offered by the most common Greek, thus revealing the play of these resources as a possibility for thought.

Thus, the adverb *ontôs* [ὄντως] (made from the participle *on*), which means "really, truly, authentically," confirming the link between the existential and veridical senses. It is used in this sense by Euripides (*Héraclès*, 610: "Did you truly [*ontôs*] go to Hades?") and Aristophanes (*The Clouds*, 86: "If you really [*ontôs*] love me"). Plato uses it in turn like everyone else, correlated with *alêthos* [ἀληθῶς], for example, despite emphasizing its literalness in context ("then it definitely seems that false speech really and truly arises from that kind of putting together of verbs and names"; *ontôs te kai alêthos gignesthai logos pseudês* [ὄντως τε καὶ ἀληθῶς γίγνεσθαι λόγος ψευδής]; *Sophist*, 263d). The Stranger can then play with Sophistical panache on the fact that non-being, as an image or seeming (*eidôlon* [εἴδωλον]), is not "really/authentically" (see REALITY) non-being.

STRANGER: Meaning by *true, really being* (*ontôs on* [ὄντως ὄν]) ?

THEAETETUS: —Yes. . . .

S.: So you're saying that *that which is like* is not really *that which is*, if you speak of it as *not true* (*ouk ontôs ouk on* [οὐκ ὄντως οὐκ ὄν]).

T.: But it *is*, in a way (*esti pôs* [ἔστι πως]).

S.: But not truly (*oukoun alêthôs* [οὔκουν ἀληθῶς]), you say.

T.: No, except that it really is a likeness (*eikôn ontôs* [εἰκὼν ὄντως]).

S.: So it's not really *what is*, but it really is what we call a likeness (*ouk on ara ouk ontôs estin ontôs hên legomen eikona* [οὐκ ὄν ἄρα οὐκ ὄντως ἐστὶν ὄντως ἢν λέγομεν εἰκόνα])?

(*Sophist*, 240b3–13; see MIMÊSIS, I)

Simply put, an image is not really non-being, but the reader is supposed to lose his footing in these matters, and cannot count on the translator (thus Cordero: "That which we say is really a copy does not really exist").

In any case, it is clear that Plato makes the adverb *ontôs* into a technical term by nominalizing the phrase *to ontôs on* [τὸ ὄντως ὄν], which is often translated as "authentic being." For the "friends of the forms" (*tous tôn eidôn philous* [44]), *ontôs on* and *ontôs ousia* [ὄντως οὐσία] refer to real being and real, unchanging, existence, which is the province of reasoning and the soul, in contrast with becoming, which is the province of perception and the body: it refers to the *eidê* themselves (*Sophist*, 248a11; cf. *Phaedrus*, 247c7, e3; cf. also *Republic*, 10.597d1–2, where the god, unlike the carpenter and the painter, wishes "to be really the creator of

the bed which really is"; *einai ontôn klinês poiêtês ontôs ousês* [εἶναι ὄντως κλίνης ποιητῆς ὄντως οὔσης]," that is, the idea, *to eidos* [τὸ εἶδος], of "what bed is"; *ho esti klinê* [ὃ ἔστι κλίνη] [597a1]).

These constructions become even more and differently complex, with Neoplatonism, which intermingles the expressions of the *Sophist* and *Parmenides* with Aristotelian and especially Stoic distinctions to yield, by way of *ontôs onta* and *mê ontôs mê onta*, "truly/really existents" and "not-truly/not-really non-existents" a *mê on huper to on* [μὴ ὂν ὑπὲρ τὸ ὄν], a "non-being above being," which contrasts with an "absolute non-being," "pure and simple," *haplôs mê on* [ἁπλῶς μὴ ὄν], and allows us to solve the problem of the definition of God (Hadot, *Porphyre et Victorinus*).

The same philosophical investment of common language is found at the purely semantic level. We know that *ousia* has its standard meaning, coming from the law, of "property, fortune," which implies belonging and possession as well as actual and visible presence (we thus read in Euripides's *Helen* the following dialogue: "Theoclymenus: Tell me, how do you bury those who have been drowned at sea? —Menelaus: As lavishly as a man's substance lets him do (*hôs an parousês ousias* [ὡς ἂν παρούσης οὐσίας])," ll. 1252–53, Eng. trans. R. Lattimore; see ESSENCE, III). This is the word, however, that Aristotle subsequently uses to refer "chiefly and primarily and almost exclusively" to his object of inquiry: "And indeed the question which, both now and of old, has always been raised, and always been the subject of doubt, viz. what being is, is just the question, what is substance?" (*ti to on, touto esti tis hê ousia* [τί τὸ ὄν, τοῦτο ἐστὶ τίς ἡ οὐσία]) (*Metaphysics* Z.1.1028b1–7). Later, with Epicurus and Plotinus, we find *ousiotês* [οὐσιότης] to mean "substantiality" (*Corpus hermeticum*, 12.1), and the adjective *ousiôdes* [οὐσιῶδης] to indicate an aggregate (Epicurus, *De rerum natura*, 14.1).

The nominalization linked to repetition remains the key for philosophical technique. It is thus with *to on hêi on* [τὸ ὂν ᾗ ὄν], "being insofar as it is being," or "being qua being," "and not qua numbers, lines or fire," of which the beginning of book *Gamma* of the *Metaphysics* claims there is a science, the inquiry into which is the work of the philosopher (1.1003a21; 2.1003b15–19 and 1004b5–6). Similarly for the enigmatic *to ti ên einai* [τὸ τί ἦν εἶναι], which duplicates the question, also nominalized, of *to ti esti* [τὸ τί ἔστι] (the "what it is," the "essence," as it is translated), to refer to something like the heart of the heart of being—"the essential of the essence" (see TO TI ÊN EINAI).

IV. *Ouk Esti*: Non-Being, Void, Nothing

A. The two kinds of negation, *ou* and *mê*

1. *Esti*, *ouk esti* and *to on, to ouk on, to mê on*

Parmenides's *Poem* offers two routes of inquiry, which, since they are contradictory, are apparently symmetrical: *esti* and *ouk esti*, "is" and "is not" (2.3 and 5). The complexity of the meaning of *esti* indeed goes both for its use in affirmation as well as negation: "is," "it is," "there exists," "it is possible that," "it is the case"/"is not," "it is not," "there is no," "it is not possible that, it is not the case" (see above, I and II.A).

But the expression of negation adds another kind of problem since Greek has two ways of negating. One is by *ou* (*ouk, ouch*) [οὐ]: it is a factual, "objective" negation, which is applied to a real fact or one that is presented as such. The other is by *mê* [μή]: this covers both "subjective" and "prohibitive" negation, which implies a will and a supposition of the mind (see, e.g., Meillet and Mendryes, *Traité de grammaire comparé des langues classiques*, §882–83). We find the latter mainly in modes other than the indicative, related in fact to "modality" (subjunctive, optative), to express all the nuances of prohibition, deliberation, wish and regret, eventuality, or virtuality. Similarly, one may distinguish *ouk on* [οὐκ ὄν] and *mê on* [μὴ ὄν], "not being," distributing all the nuances that can come with a participle, whether more factual and causal ones (*ouk on* [x], "insofar as, because, it is not [x]") or more adversative, concessive, hypothetical (*mê on* [y], "although, given that, even though, it is not [y]").

The contrast is maintained, of course, when the participle is nominalized. Thus, *ho ouk on, hoi ouk ontes*, in the masculine, is Thucydides's way of referring to the dead (2.44 and 45). Similarly, *to ouk on* is used to refer to a possible passage between being and non-being; for example, Melissus, a student of Parmenides, denies becoming in these terms: "for it would be in pain in virtue of something's passing from it or being added to it, and it would no longer be alike. Nor could what is healthy be in pain, for then what is (*to eon*) would perish and what is not (*to de ouk eon*) would come into being" (30 B 7, §533). In contrast, *to mê on* is what is not, not because it is not, but because it cannot or must not be. *To ouk on* and *to mê on* are thus two distinctive ways of signifying "non-being," contrasting with the unitary *to on*.

In the *Poem*, however, once we advance along the route of "is not," *ouk esti*, we come upon the *mê* rather than the *ouk*, so much so that on this route, unlike that of "is," the verb does not give rise to any subject. *To mê on*, a nominalized participle, refers to non-being insofar as it is not simply non-existent, but prohibited, impossible (2.6–7: "for you could not know what is not—that cannot be done [*to ge mê on*, literally, "the in any case non-being"]—nor indicate it"). The choice of this negation implies that there is neither passage nor commensurability between being and non-being, and that the route of "is not" is a dead end.

However, if we stick to the logic of prohibitive negation, as the Stranger emphasizes in Plato's *Sophist*, there can be no "right speaking about non-being" (239b): to utter *to mê on* is already, from the fact of uttering it, to confer a kind of existence on non-being (the non-*being*); in addition, it grants it, by way of the form of the utterance, a kind of unity (*the* non-being)—two ways of going against the proper meaning of the prohibitive expression whether we like it or not (237a–239b). Whence the philosophical choice of reinterpreting this negation and making it only the mark of otherness, a distinction, a difference, rather than of a contradiction or a prohibition. "Each time we say *to mê on*, it seems, we say not the opposite of *on*, but simply another" (*ouk enantion ti . . . all' heteron monon*, 257b). In this case, against the background of the participation of Ideas in each other, the negation *mê* is brought back to the negation *ou*, and both are brought back to affirmation—not that every determination is negation, as Spinoza would say, but every negation is determination:

So we won't agree with somebody who says that denial signifies a contrary. We'll only admit this much: when "not" (*mê*) and "non-" (*ou*) are prefixed to names that follow them, they indicate something *other* than the names, or rather, other than the things to which the names following the negation are applied.

(*Sophist*, 257b–c)

Plato, following Gorgias, can catch Parmenides in his own trap by stating that to utter non-being is already to make it be. The Parmenidean orthodoxy, on the other hand, would be justified in reducing the move in the *Sophist*, assimilating non-being and otherness, to a pure and simple engagement in the way of *doxa*, this too human way of mortals who do not know how to distinguish "is" and "is not" ("race which does not distinguish, for which to exist and not to be (*to pelein*— archaic form of *einai*—*te kai ouk einai* [τὸ πέλειν τε καὶ οὐκ εἶναι]) are reckoned same and not-same"; 6.9–10; see DOXA).

■ See Box 3.

2. Negation and privation

The difference between "these two particles of negation which the Greek language likely understood before all the others" (Schelling, *Historical-Critical Introduction*) subtly realigns the difference between negation and privation.

Aristotle discusses this difference between "negation" and "privation." They are two of the four ways of "being opposite" (*antikeisthai* [ἀντικεῖσθαι]):

Things are said to be opposed to one another in four ways: as relatives [*ta pros ti*] or as contraries [*ta enantia*] or as privation and possession [*sterêsis kai hexis*] or as affirmation and negation [*kataphasis kai apophasis*]. Examples of things thus opposed (to give a rough idea) are: as relatives, the double and the half; as contraries, the good and the bad; as privation and possession, blindness and sight [*tuphlotês kai opsis*]; as affirmation and negation, he is sitting—he is not sitting [*kathêtai-ou kathêtai*].

(*Categories*, 10.11b17–23; trans. Barnes)

Two kinds of phenomenon, often badly distinguished, arise here. Negation (*apophasis* [ἀπόφασις], from *apo-*, "far from," and *phainô*, "to show"), like affirmation (*kataphasis* [κατάφασις], where *kata*, "on," "about," refers to "saying," i.e., predication), is in the first instance a fact of syntax (see SUBJECT, I). Affirmation and negation are contradictory

---

3

The "Treatises on non-being," or how non-being is non-being

There is no correct expression of non-being. That means that to utter non-being, *to mê on*, contradicts its existence, once we suppose with Parmenides that being, thinking, and saying all belong to one another. The statement contradicts the proposition (see SPEECH ACT).

This also implies that any proposition about it, first and foremost the one asserting its identity, "non-being is non-being," is self-contradictory. As for "to be," semantics is inseparable from syntax. This is Gorgias's position in any case, and it initiates a long series—*Peri tou mê ontos* [Περὶ τοῦ μὴ ὄντος], *De nihilo, Elogio del nulla*, and *Glorie del niente* (see Ossola, *Le antiche Memorie del Nulla*), showing for the first time how non-being in a language, Greek in this case, is an exception analogous to that of being—but much more interesting as only it can reveal the exceptional surreptitiousness of being and the proposition asserting the identity of being, without which there would be no ontology.

Εἰ μὲν γὰρ τὸ μὴ εἶναι ἔστι μὴ εἶναι, οὐδὲν ἂν ἧττον τὸ μὴ ὂν τοῦ ὄντος εἴη. Τό τε γὰρ μὴ ὄν ἐστι μὴ ὄν, καὶ τὸ ὂν ὄν, ὥστε οὐδὲν μᾶλλον ἢ εἶναι ἢ οὐκ εἶναι τὰ πράγματα. Εἰ δ' ὅμως τὸ μὴ εἶναι ἔστι, τὸ εἶναι, φησίν, οὐκ ἔστι, τὸ ἀντικείμενον. Εἰ γὰρ τὸ μὴ εἶναί ἐστι,

τὸ εἶναι μὴ εἶναι προσήκει. Ὥστε οὐκ ἂν οὕτως . . . οὐδὲν ἂν εἴη, εἰ μὴ ταὐτόν ἐστιν εἶναί τε καὶ μὴ εἶναι. Εἰ δὲ ταὐτό, καὶ οὕτως οὐκ ἂν εἴη οὐδέν· τό τε γὰρ μὴ ὂν οὐκ ἔστι καὶ τὸ ὄν, ἐπείπερ γε ταὐτὸ τῷ μὴ ὄντι.

(For if not to be is not to be, non-being would be no less than being: indeed, non-being is non-being just as being is being; such that these things are no less than they are not. But if, however, not to be is, it follows that to be is not. Such that in this case . . . nothing would be, as long as to be and not to be are not the same thing. But if they are the same thing, in this case nothing would be: indeed non-being is not, just as being, if indeed it is the same thing as non-being.)

(Gorgias, *On Melissus, Xenophanes, and Gorgias*, 979a25–34)

If we follow the argument, what is genuinely impossible is to make a distinction (the *krisis* of Parmenides's *Poem*) between the series "not to be, non-being, non-existence" (*to mê einai, mê einai, to mê on, mê on*) and "to be, being, existence" (*to einai, einai, to on, on*). As Hegel notes at the beginning of the *Theorie Werkausgabe*, "Those who insist on the difference between being and nothingness must *say* what that difference consists

in." Indeed, in order to make a distinction we must be able to identify, and that is precisely what does not work with non-being. In the identity statement "non-being is non-being" (to mê einai esti mê einai), non-being is not self-identical since everything has changed from one occurrence to the next ("it is as though there were two beings"; Gorgias, *On Melissus, Xenophanes, and Gorgias*, 979a39). This is especially true in Greek: since the order of the words is not rule-bound, the predicate is only known by the absence of an article. The required article before the subject is the mark of its consistency or substantiality. It indicates that any assertion of a subject in an identity statement presupposes existence, or again that to say that "non-being is non-being" we must already have admitted that "non-being is" (see I and Box 2, and cf. WORD ORDER).

Far from refusing to distinguish between the different meanings of the *pollachôs legomenon* "to be," as Aristotle asserts, Gorgias in fact makes it clear that the problem, the equivocity, in a word the sophism are the philosopher's fault, since they cleave to "is" and its ontological understanding. With "being is being" the difference between subject and predicate remains imperceptible since the two sequences "being is" and "being is being" confirm one another and even become intertwined, just like the existential and copulative meanings of "is." The traditional identity

statement exploits and hides the equivocity of "is" and turns it into a rule. Only the case of non-being makes it possible to become aware of the difference usually written into the statement of identity: the "is not" must become the rule of "is." And it is speech all by itself that, in its constitutive linearity related to its temporality, cannot help producing this catastrophe, which the Sophist aims to make heard.

These statements about the identity of non-being are of course difficult to translate and sources of error. In every treatise on non-being, whether Sophistical and/or apologetic in its aims, pure and simple non-being or non-being beyond being, the difficulties are idiomatic and inventive, related to the syntax of negation, to the grammatical possibilities of moving from a verb to a noun and the other way around (*Il niente annientato* is, for example, the name of a treatise by Raimondo Vidal [1634]) and to the names of non-being. A good example is Charles de Bovelles's *De nihilo* (1509), which attempts to deal with the problems of the Creator, the creature, and creation. It begins with the statement of identity "Nihil nihil est," "Le Néant n'est rien" (Nothingness is nothing), and then extracts two lessons from it:

hujusque orationis que insit nichil esse nichil, gemina sit intelligentia, negativa una, altera assertiva et positiva.

(from this proposition "Nothingness is nothing" there are two readings,

one negative and one affirmative and positive.)

(*Le livre du néant*)

One cannot help but notice the distance between the *incipit* "Nihil nihil est" and its translation "Le néant n'est rien," which, besides the inevitable word order, makes the statement of identity invisible. Perhaps French requires something like a "portmanteau translation" to retain the affirmative character of the sentence: "le néant est néant" and the negative extenuation "le rien n'est rien"—each an equally acceptable translation of the attempted identification.

The most recent treatise on non-being is no doubt the one written by Heidegger in German, over the course of his work, from *Was ist Metaphysik?* and *Vom Wesen des Grundes* (1929) where Nothingness appears as the origin of negation, and not the reverse. No doubt this is the inheritance passed down along a "me-ontological" tradition, which mixes with mysticism and deploys the "annihilating" activity of nothingness, the "nichtende Nicht des Nichts" in which we hear under the aegis of the verb, first the adverb *nicht*, then its nominalization *Nicht*, then the noun *das Nichts*; see Taubes, "Von Adverb 'Nichts'"). Non-being thus becomes, as Gorgias wished, though against his critical intentions, the measure of being—that is, the being of existence:

Jenes nichtende Nicht des Nichts und dieses nichtende Nicht der Differenz sind

zwar nicht einerlei, aber das Selbe im Sinne dessen, was im Wesenden des Seins des Seienden zusammen gehört.

(That nihilative "not" of the nothing and this nihilative "not" of the difference are indeed not identical, yet they are the Same in the sense of belonging together in the essential prevailing of the being of beings.)

(Preface to the 3rd ed. of *Vom Wesen des Grundes*)

propositions that cannot be simultaneously true (see PRINCIPLE, I.B). From this point of view, *ou* and *mê* are on the same level: they are both adverbs of negation that may affect the whole proposition, most often by way of the verb (*ouk esti leukon* could be translated "it is not white," or "it is not true that"—in contemporary jargon, "it is not the case that—it is white"), even though the choice of one negation or the other, as we have seen, is not insignificant. On the other hand, privation (*sterêsis* [στέρησις], from *steromai*, "to lack, to lose," from the same family as the German *stehlen*, "to steal"), which is often expressed by the aptly named alpha privative, affects only the predicate, and is thus entirely different grammatically. However, insofar as it "deprives" something of a predicate, it implies that the subject is concerned with this predicate at least as a possibility, and thus contains a certain sort of affirmation: *akinêton esti* means that something is immobile, but capable of movement—this is why it is strictly speaking said of man, but not plants (which by definition grow but do not move). Here, then, the alpha privative and factual negation by *ou* are on the same side with regard to negation in terms of impossibility or prohibition as *mê*: what is *akinêton*, im-mobile, can move (even though it is not moving actually, *ou kineitai*), and it is not true to say of it the *mê kinêton einai*, that it is "non-mobile."

The difference between negation and privation is, in any case, a question of perspective. A stone, which has no eyes, is obviously "lacking sight," "not seeing" (*mê* negation, as it lies outside the sphere of the predicate). But for a mole, it depends: if we consider it as an animal with eyes, thus by its kind, it is "deprived of sight," "badly seeing" (*tuphlos*: Greek here says affirmatively what French says privatively: *a-veugle*, *ou* negation), since in general animals see. On the other hand, if we consider a mole with regard to the mole species, it is "non-seeing" just like the stone, since no moles see (*Metaphysics*, 4.2.1004a10–16 and 5.22; cf. Cassin and Narcy's commentary in *La décision du sens*).

In any case, the characteristic of privation is to be, according to the phrase of the *Physics* (2.1.193b19–20), *eidos pôs* [εἶδος πώς]: "in a way form." And Heidegger comments in the following way on this "negation," this privation (*sterêsis zur Anwesung*, absencing *for* presencing), which may be linked with the great privation that is *alêtheia* (see TRUTH, I.B):

Sterêsis as absencing is not simply absentness; rather, it is a *presencing*, namely, that kind in which the *absencing* but not the absent thing) is present.

(Heidegger, "On the Essence and Concept of *Physis* in Aristotle's *Physics* B, 1)

"Remarks like this may seem subtle," notes Schelling with regard to negation and privation, "but since they relate to effective nuances of thought, they cannot be dispensed with." Different languages, of course, use different marks for them:

> The German language has difficulty distinguishing them and can only rely on the accent—if it refuses to make do with Latin expressions. Indeed, it is impossible to be confused as to the difference between *est indoctus*, *est non-doctus*, and *non est doctus*. We can say of a newborn neither the first, *indoctus*, since he has not yet had the possibility, nor the second, *est non-doctus*, since he does not find himself in an altogether impossible condition, but we will concede the third, *non est doctus*, indeed, since it only denies the actuality, but poses the possibility.
>
> (*Historical-Critical Introduction*)

B. The names of non-being:
from *mêden*, "nothing," to *den*, "less than nothing"

What does not exist has several names (see *NOTHING*). We find, starting with Parmenides's *Poem*, two ways of referring to it: *to mê on*, negative symmetric of *on*, "being" (for you will not be able to know *to ge mê on*, the [in any case and certainly] non-being [2.7]), and *mêden*, which is usually translated by "nothing," *rien, nichts, nada* (*mêden d'ouk esti* [6.2]: nothing is not; see Cassin, *Parménide*). This second designation, and its translations, deserve some attention.

Mêden [μηδέν] is in the first instance a negative term, constituted like *mê on*: a *mê* negation (*mêde* [μηδέ], in this case, "not at all") followed by a positive term, *hen* [ἕν], "one" (which would not surprise a Parmenidean, for whom being and one are one, *convertuntur*). The etymology is obvious: the Plato of the *Sophist*, for example, makes it clear to drive home the point about performative self-contradiction; when one says *mêden*, "nothing," one says *mê ti* [μή τι], "not something," that is, *hen ge ti* [ἕν γε τι], "something one" (237e1–2 and 237d7); *mêden* thus means *mêd'hen*, "not even one." However, unlike *to mê on*, here we have a single word, and not a composite expression: *mêden*, like *ouden*, in a single word, is the neuter pronoun we find even in Homer. With *mêden*, negation becomes an affirmed, even a positive entity, like "nothing" or "no one."

In this regard, the difference between Greek and French is enlightening: in French, *rien*, like *personne*, is positive from the start. *Rien* comes indeed from the Latin accusative *rem*, "thing," and Littré explains that: "1) The etymological and proper meaning of *rien* is thing. 2) With the negation *ne*, *rien* by negating any thing is equivalent to the Latin *nihil*." From the twelfth century on, as shown by expressions such as "pour rien," "de rien," "mieux que rien," or "moins que rien" (RT: *DHLF*), the indefinite pronoun is used in the negative sense with the *ne* dropped out. We may then attempt to taxonomize the names of what does not exist according to whether they are in the first instance negations (*mêden, nihil, néant, niente,* "nothing," *Nichts*) or affirmations: the French *rien*, but also the Spanish *nada* (from the Lat. [*res*] *nata*, "[thing] born"). Above all, we may excuse the wavering mind of a French translator or reader faced with a basic sentence of Greek physics such as *mêden ek mêdenos* [μηδὲν ἐκ μηδενός], source of the Latin adage *nihil ex nihilo*, since the evolution of his language allows him to hear something like "rien (ne) provient de rien," that is, "everything comes from something/nothingness comes from nothingness" (see Boxes 3 and 4). As a side note, we should also forgive translators of Jean-Paul Sartre for not finding the words, in German, for example—even though Sartre does work "like" Heidegger and reformulates his German—to render the difference between *rien*, or *le rien*, and *néant*, or *le néant* (Hans Schöneberg and Traugott König are reduced to distinguishing them by lowercase *nichts* and uppercase *Nichts* [*Das Sein und das Nichts*]; cf. *NOTHING*).

■ See Box 4.

Let us take up again the difference between *mê on/mêden*. Two consequences of very different kinds follow.

1. A syntactic blurring:
Mêden is a composite negation, unlike simple negations such as *mê* (similarly, *ouden* differs from *ou*). We then face the question of the meaning of the successive negations. We cannot say that in Greek two negations are simply worth one affirmation. Indeed, everything changes depending on whether we are dealing with simple or composite negations, and according to their order in the sentence. The grammatical rule is all the more tentative as it must take account of the subject of the negation, whether it is a whole phrase or a word, which cannot be precisely determined by applying a rule. Here is how a well-known grammar book treats the question:

> Greek had at its disposal, besides simple negations (*ou* and *mê*), composite forms (*oute/mête, oude/mêde, oudeis/mêdeis,* etc.): following the order according to which they are placed, the negative value of the phrase is either reinforced or destroyed. We gladly teach that a **simple** negation, followed by one or more **composite** negations, yields a *negative reinforcement*, whereas a composite negation, followed by a **simple** negation yields the *unreserved destruction of the negation*, that is, *a total affirmation*. This rule works only very broadly: in particular, it takes no account of the following consideration: is the *first negation*, whether simple or composite, applied really to the *whole sentence*, or only to a *word*?
>
> (Humbert, *Syntaxe grecque*; the bold and italics are in the text)

We may understand the Greek vacillation with regard to such simple successions as: *mêden ouk esti* (composite + simple) and *ouk esti mêden* (simple + composite), which would mean things as different as "there is certainly being" and "certainly, there is absolutely nothing at all." On its own authority, it would rather mean in both cases: "nothing is," "no, nothing is," that is, something analogous to the simple propositions *mêden esti* and *ouk esti*, "nothing is," which only a Gorgias, coming after Parmenides, could varyingly decipher as "no subject for *is*" and "not even the verb *is*."

2. A new semantic adventure:
Mêden is, we have seen, a negative characterization by design. But it becomes a positive entity capable of

4
The French *ne expletive*, a vestige of *mê*

➤ MÊTIS, Box 1, VERNEINUNG

Unlike Old French, which used simple negation with *ne*, modern French uses compound negation. With few exceptions, (je *ne* puis . . ., je *ne* samurais . . .), the absence of "forclusifs" (*pas, mie, goutte, point, plus, rien*, which originally denoted positive entities—including *rien*, from the Latin accusative *rem*, something) gives the sentence a positive value. Thus, in the statement "Je crains que Pierre ne vienne," the omission of *ne* does not change the meaning of the sentence, which expresses fear at the idea that Pierre should come. This statement is distinguished from the statement "Je crains que Pierre ne vienne pas," which expresses the idea that Pierre might not come. In the first, the *ne* has no negating force. Whence the use of the term "expletive," which, according to Littré (RT: *Dictionnaire de la langue française*), describes a word "which does not contribute to the meaning of the sentence and is not required by syntax." The expletive *ne* would thus be an empty sign. Grévisse (RT: *Le bon usage. Grammaire française*) looks forward to the imminent disappearance of this "parasitic particle" (ed. 1969, §877b), also called "redundant" or "abusive" (ed. 1993, §983).

However, the use of the expletive *ne* is governed by strict grammatical rules. In subordinate phrases, it appears after verbs of fearing, prevention, or doubt, or after conjunctions like *à moins que* (unless), *avant que* (before), and *sans que* (without) and in comparisons of inequality. French usage is thus continuous with the Latin usage "timeo ne, timeo ne non," and the Greek "dedoika mê, dedoika mê ouk" "je crains que . . . ne," "je crains que . . . pas," where, to borrow an expression from Humbert, "there is an obstacle in the principal phrase which so to speak sends out its negative reflection" onto the subordinate phrase (RT: *Syntaxe grecque*, §654). In other words, the expletive *ne* in the completive retains or accentuates the negative idea expressed by the main verb (*je crains* qu'il ne vienne) and the positive content of the subordinate phrase (je pense *qu'il viendra*); this is precisely what the inventive Damourette and Pichon, later taken up by Jacques Lacan, call the "discordantiel" (RT: *Des mots à la pensée*, vol. VI, chap. 4), a nuance that only French can still express.

**Marco Basachera
Barbara Cassin**

nominalization, "the *mêden*, the nothing." *Mêden* as a positive term (and no doubt also as a word or signifier) is involved in a different history than *mê on*. Democritus indeed creates on its basis a word that does not exist, *den* [δέν] and which the RT: LSJ describes as "*abstracted from oudeis*" (we find it once in Alcaeus, 320 L. P "in a doubtful and obscure text," Chantraine clarifies, "where we translate *denos* by 'nothing' or rather by 'something' (*sic*), and there is "no relationship to the modern Greek *den*, 'nothing'"; RT: *Dictionnaire étymologique de la langue grecque*). Democritus affirms, according to Plutarch, that:

μὴ ἄλλον τὸ δὲν ἤ τὸ μῆδεν εἶναι.

(*den* is nothing other than *mêden*.)

(Fragment 68 B 156 DK)

The doxographers who transmitted the phrase all offer an intra-linguistic translation. For Plutarch, the source of the fragment, *den* names the "body" (Galen says specifically the "atoms"; A 49 DK; see also Simplicius, A 37 DK, tangled up with the Aristotelian translations), and *mêden*, the "void." We can understand the intent: Democritus needs something that is not an *on*, a "being," which is not even a *ti*, a "something" (a term the Stoics fall back on to avoid Platonic-Aristotelian *ousia*): a "less than nothing," therefore, to define this body conceived of as not resembling any body in nature, conceived even to escape the physical, that is, atoms, indivisible. *Den* is a pure signifier, created from a mistaken cut (a manifestation of indivisibility?) on *mêden* or *ouden*, mistaken since the etymology, which can still be heard (*med'hen* or *oud'hen*, not even one), implies that we cut at *hen*, "one." *Den* suits the atoms since like them it is a pure artifact. It is not even a word in the language, it is an *ad hoc* invention, a meaningful play. Lacan sees this very clearly, and returns several times to this joke by Democritus, "who somehow required a clinamen," and who thus invented the word *den* to say neither *mêden* (against a "pure function of negativity"), nor *hen* ("to avoid speaking of the *one*" [*Le séminaire*]). "Given which, *den* was indeed the clandestine passenger whose silence is now our destiny. In this he is no more materialist than any reasonable person" ("L'Étourdit").

Nothing is harder than to translate a witticism. Dumont (RT: *Les Présocratiques*) suggests: "*Den* [being] is nothing more than *Mêden* [the void]," and the meaning of the invention is immediately lost. Diels and Kranz are lucky enough to be able to rely on a similar invention, a mis-cut on *Nichts* made by Meister Eckhart, where we hear the *iht*, invented to be opposed to *niht* (sermons 57 and 58), and thus translate: "Das Nichts existiert ebenso sehr wie das Ichts."

It is not unfitting that the paths of "Is" and "Is not" leave us with this kind of impasse, alternative, and invention.

ETERNITY

Eternity is generally defined as what escapes becoming and time, whether it is a matter of indefinite duration or of being entirely outside of time. However, the very word "eternity" indicates that it is first a question of the duration of a life (Lat. *aevum*, Gr. *aiôn* [αἰών]). Between these two poles, across languages and doctrines, the modulations can be considerable.

I. Eternity: Duration/Time

"Eternity" comes from the Latin *aeternitas*, and was perhaps created by Cicero to refer to a duration with neither beginning nor end. The term goes back to *aevum*, *aiôn* in Greek, which refers, like *aetas* (cf. age), to the duration of a life, and implies an "animated" conception of duration (RT: Ernout and Meillet, *Dictionnaire étymologique de la langue latine*).

This grouping is distinct from another way of thinking and speaking about time, *tempus* in Latin, *chronos* [χρόνος] in Greek, that considers it as determined (a cut, a fraction, a period—the Latin *tempus* has been compared to the Greek *temnô* [τέμνω], "to cut"), and thus capable of being quantified, in particular, as "the number of motion according to before and after" (Aquinas).

See AIÔN for the main difficulties derived from this distinction, the history of which notably intersects with that of the translations of the Bible (*saeculum*, not *aevum*, is used to render *aiôn*, which yields very subtle distinctions and terminological inventions).

On the relationship between time and lifetime, cf. DASEIN, ERLEBEN, *LIFE*. For the relation between time and movement, see FORCE; cf. FORCE, Box 1, on the Aristotelian definition of movement, and NATURE, *WORLD*.

The linguistic and grammatical expression of duration, in its relation to the aspect of verbs and their tenses, is examined under ASPECT.

More generally, see PRESENT and *TIME*.

II. Eternity and Instant

Eternity outside of time is related to the instant (from the Latin *instans*, "present," and "pressing, menacing"), conceived not as a unit of time but, on the contrary, as an exception to the counting, something impossible to measure. The Greeks termed it *kairos* [καιρός], the possibility of an occasion distinct from duration and time: see MOMENT (esp. II), as well as AIÔN. Christian theology uses the instant as *tota simul*, "everything at once," to conceive of divine eternity: see AIÔN II and GOD.

For the relationship between divine eternity and ethical subjectivity, and its expression in Kierkegaard's Danish, see EVIGHED; cf. CONTINUITET, PLUDSELIGHED.

More generally, see *INSTANT*.

III. Procedures of Eternity

Regarding the way in which people attempt to escape from the order of time and enter that of eternity, see BOGOČELOVEČESTVO, HISTORY, JETZTZEIT, MEMORY; cf. LOGOS, LIGHT, Box 1, SVET, *WISDOM*.

EUROPE

The Languages and Traditions That Constitute Philosophy

➤ ESSENCE, GERMAN, GREEK, LOGOS, SIGNIFIER/SIGNIFIED, TO TRANSLATE, WISDOM

Philosophy came from Greece, as both its partisans and detractors remind us. Among the former, the Muslim philosopher al-Fārābī reminds us that true philosophy came from Plato and Aristotle (*Attainment of Happiness*). And the rabbi, who is one of the characters in the *Kuzari* by Judah ha-Levi, explains that since the philosophers were Greeks, they were not able to benefit from any divine illumination: "There is an excuse for the Philosophers. Being Grecians, science and religion did not come to them as inheritances. They belong to the descendants of Japheth, who inhabited the north, whilst that knowledge coming from Adam, and supported by the divine influence, is only to be found among the progeny of Shem, who represented the successors of Noah and constituted, as it were, his essence. This knowledge has always been connected with this essence, and will always remain so. The Greeks only received it when they became powerful, from Persia. The Persians had it from the Chaldaeans. It was only then that the famous [Greek] Philosophers arose, but as soon as Rome assumed political leadership they produced no philosopher worthy of the name" (*Kuzari*, pt. 1, question/ response 63).

I. Translations

Everyone inherited something from the Greeks, but not everyone inherited the same thing, and not everyone inherited it in the same way. The legacy was transmitted differently according to the geographical region of inheritance: the Arab world embraced almost all of the "philosophy" (including science), but not the "literature." The Byzantine Christians of Syria did not translate Greek literature either. In Arabic, Homer is to be found in only a few anthologies of moral sayings. The Greek tragedies were unknown, which helps explain the absence of the drama in classical Arabic literature.

Europe alone inherited works in Latin, and in particular its poetry (Virgil, Ovid, etc.). Nothing was translated from Latin into Arabic, with the exception of Paulus Orosius's history. Roman law continued to be studied in Latin for a long time in the Christian Middle East, before giving way to the legal traditions of the "barbarians," and then it resurfaced in the eleventh century, notably in Bologna. It was long believed that some part of Roman law passed into Muslim law (*fiqh*); in fact, it now seems that this was only a provincial (foreign) version of Muslim law.

Medieval Europe, on the other hand, was acquainted with only a few texts of Greek philosophy: for example, the start of Plato's *Timaeus*, translated by Cicero, and the start of Aristotle's *Organon*, translated by Boethius. The Arab world knew almost all of Aristotle's work by the ninth century, and knew Plato through summaries, but Europe had to wait until the thirteenth century to have the complete works of Aristotle available. Plato's *Meno* and *Phaedo* were translated into Latin in the thirteenth century but not widely disseminated. Europe had to wait for the other dialogues until Marsilio Ficino in the fifteenth century.

The transmission of knowledge was often understood as a *translatio studiorum*, a purely local displacement, rather like moving house. In reality it never happened that way. Figuratively speaking, as if in accordance with a sort of hydraulic law of connecting vessels, culture tended to level itself out through the transmission of the most advanced civilization toward others that were less well-off culturally. Translations presume a potential public, and that public demand precedes its satisfaction. In Europe, the movement of translations responded to a growing need for a set of intellectual tools set in train by the Papal Revolution at the end of the eleventh century, following the Investiture Controversy, and the revival of juridical studies that accompanied it.

However, works that could not really be used were either not translated at all or were translated but not widely disseminated. So the Arab world knew all of Aristotle, except the *Politics*, which indeed seemed like a set of instructions for an elite political machine. Likewise, Aristotle's *Poetics* was translated but remained almost incomprehensible during the Arab Middle Ages, just as it did during the Latin Middle Ages.

The problem posed by the different linguistic levels was not formulated in the same way in the northern and in the southern Mediterranean. The Arab world did not have the problem of the transition from a scholarly language to a vulgar tongue, as was the case in Europe. This transition simply did not happen, or if it did, it was unconscious: classical Arabic, supposedly the language of the Book of God, was set in an immutable form. In practice, Christians and Jews wrote a form of Arabic freed from its Qur'ānic constraints, known as Middle Arabic, which contained certain simplifications of morphology of syntax. In Europe, Latin was the language of the Roman Empire and of the Vulgate. In the Middle Ages, it remained the language of liturgy and the means of communication between intellectuals, but it was not a holy language, a "language of God."

II. Europe

Europe was conscious of having received its share of the inheritance from people who spoke in other languages. So the Franciscan Roger Bacon appealed to the pope in 1265 to support his plan to set up schools of Greek and Oriental language: "[T]he wisdom of the Latins is drawn from foreign languages: in fact, the entire sacred text and all of philosophy come from outside languages" (*Letter to Clement IV*). The Bible is really itself only in Hebrew (the *hebraica veritas* of Saint Jerome, and before him, Origen): Aristotle's philosophy is really itself only in Greek. Translation involves the sense of a loss with respect to the original. Bacon lamented this situation and compared a text read through several levels of translation to a wine decanted several times losing its flavor (*Moralis philosophia*, 6.4). Translation is necessary, and there is a lot of it. But it is only a last resort in relation to reading the original.

So this is how the problem of translation is posed. In the West it was made necessary by the almost total eradication of knowledge of Greek after Boethius. Greek was forgotten fairly quickly, except in Ireland, whose geographical distance had protected it from barbarian invasions. Among

the exceptions, it is worth noting Hilduin, a noble from Lorraine who became a Benedictine monk and abbot of Saint-Denis. He knew enough Greek to be entrusted with the translation of the corpus of works by Pseudo-Dionysius presented to Louis the Pious by Michael III, the Amorian. John Scotus Erigena was able to translate Gregory of Nyssa, Nemesius, and Pseudo-Dionysius.

Yet not many philosophers took the trouble of learning languages other than the language of the dominant culture. In the medieval West, Erigena and the Englishman Robert Grosseteste, the translator of the *Nicomachean Ethics*, are the exceptions rather than the rule. Roger Bacon himself had only a superficial knowledge of Greek and Hebrew. Ramon Llull learned Arabic mainly in order to write and preach in the language rather than to read the works of Muslim philosophers.

In Islamic lands, those who learned the language of a non-Muslim people were extremely rare. Al-Bīrūnī, who learned Sanskrit to undertake an impartial study of Indian religions, was the one brilliant exception. No Muslim seems to have learned Greek and, even less so, Latin. Translators were Christians whose mother tongue or culture was Syriac and for whom Greek was sometimes a family tradition.

III. The Central Untranslated Term: *Philosophia*

In this history of translations, one paradox awaits us at the outset: the word itself that designates philosophy was never translated, literally speaking, into European languages. It is the untranslatable par excellence, or at any rate, an untranslated term. "Philosophy" remained transcribed rather than translated into languages other than Greek. Only the Dutch language coined a word, *Wijsbegeerde*, which was a calque of the etymology of *philosophia* [φιλοσοφία]. In the eighteenth century, the German language had ventured *Weltweisheit*, "wisdom of the world," in the sense of profane wisdom. The word had the honor of being used by Kant in his 1763 text on negative greatness, but it was unable to establish itself in current usage. Fichte remarked on the word *Philosophie* in a text that admittedly was intended to arouse nationalist sentiments (1805): "We have to refer to it by its foreign name, since Germans have not accepted the German name that was proposed a long time ago" (*Address to the German Nation*).

In Islam, *falsafa* [الفلسفة] was perceived as a Greek word from the beginning and has continued to be. The word was broken down and explicated by al-Fārābī, correctly as it turns out, in a fragment devoted to the origin of philosophy, which was cited by the medical biographer Ibn Abī Uṣeybīa in his note on al-Fārābī. This was still true of the historian Ibn Khaldūn in the fifteenth century. The choice of the most authentically Semitic word, *ḥikma* [الحكمة] (wisdom), bears witness to a desire to assume a certain distance with respect to foreign sciences. It was preferred whenever there was a concern to ensure continuity between the disciplines native to Islam and their intellectual elaboration in a synthesis in which Aristotelian elements were juxtaposed with apologetics (*Kalām*) [الكلام] and/or mysticism. We can find the same sense of strangeness in Jewish authors who wrote in Arabic. So in the glossary of difficult terms that he added as an appendix around 1213 to his translation of Maimonides's *Guide for the Perplexed*, which was finished in 1204, Judah Ibn Tibbon still wrote: "*pilosofia*, Greek word."

The continuity of the word did not, however, prevent a semantic evolution that took it far away from its original meaning. This was true even within the Greek language. Since late antiquity, *philosophia* had referred to a way of living as much as to a way of knowing. This fact, which Nietzsche had already discerned, was extensively documented by Pierre Hadot. In Christianity, *philosophia* usually referred to the monastic life, and in Byzantium, as well as in the meaning it normally has for us, the word "philosopher" also referred to a monk. In the eleventh century, in an extraordinary text, Michael Constantine Psellus defined philosophy in a way that was the exact opposite of its "pagan" self-definition: "I call 'philosophers' not those who contemplate the nature of beings, nor those who, seeking the principles of the world, neglect the principles of their own salvation, but rather those whose who scorn the world, and live with supra-worldly 'beings'" (*Chronographia*, bk. 4 ["Michael IV"], chap. 34). The word came to refer to a cultivated man, with a social connotation of belonging to the dominant class, which was not well looked upon by ordinary people. Thus, in animal epics, in the style of the "Roman de Renart," it was the fox who was described as *philosophos.*

The content of European philosophical vocabulary was marked most decisively by Latin, either directly for the Romance languages that emerged out of it, or indirectly for the other languages that had to translate from Latin; so the fact of Latin is fairly pervasive. But Latin itself went through a process that would enable it to translate Greek, which is the native language of philosophy. If we use a Greek word to refer to it, it is because the thing itself was invented by the Greeks.

IV. Greek

The Greek language thus presents us with a unique case: it was in Greek, and only in Greek, that the language had to work on itself, and solely within itself, in order to produce the necessary technical terms. Most of the time these were obtained by modifying the meaning of words already present within the lexicon. So, for example, *ousia* [οὐσία], "fundamental property," took on the meaning of "substance"; *dunamis* [δύναμις], "force," took on the meaning of "potentiality"; *eidos* [εἶδος], "aspect," referred to the Platonic "idea"; *katêgoria* [κατηγορία], "accusation," was used by Aristotle for his "categories," or families of predicates; *aretê* [ἀρετή], the "excellence" of a thing or an animal, denoted moral or intellectual virtue. Other words made a noun from an idiomatic usage of a verb. So, from the verb *echein* [ἔχειν] + adverb, "to be in a determinate state," the noun *hexis* [ἕξις], "habitus," was formed. We might also note a small number of words that were simply invented, such as the two terms Aristotle had to coin to express the full development of a reality: *energeia* [ἐνέργεια] and *entelecheia* [ἐντελέχεια]. This created a certain amount of unease for the man in the street and led Aristophanes, for example, to make fun of all the technical terms ending in *-ikos* (*The Knights*, 1375–81).

It was indispensable for the Greek language to work on itself. It was not enough simply to go with what was already in the language. One might have thought that metaphysics was almost preformed within the structure of the Greek

language. Some of its particularities indeed lend themselves to the expression of abstract thought, such as the ease with which it can substantivize whatever it likes with the help of an article. Adolf Trendelenburg argued that the doctrine of the categories was modeled on the grammatical structure of Greek, as did Émile Benveniste. We of course need to nuance this: the impeccable form of the question *ti to kalon* [τί τὸ καλόν], for example, did not stop Hippias from not understanding it (Plato, *Hippias Major*, 287d).

Greek has evolved from Linear B to the present day. In the Byzantine world, there was no recognized continuity between the Greek of the Neoplatonic commentators and that of the Byzantines, which, moreover, was artificial. The Greek of Plethon (fifteenth century), for example, was largely the same as that of the great philosophers of the fourth century BCE, but we might well ask who understood him. Written Greek grew further and further apart from spoken Greek, which corresponds to the increasing isolation of a small layer of intellectuals from the people. It is worth noting, in this respect, the paradox of the translations that were intended explicitly not to be disseminated, such as those of Simeon Metaphrastes (ninth century), who rewrote the popular lives of saints in a more elevated language. The problem is still very much alive in modern-day Greece in the split between popular language (*dhimotiki*) and refined language (*katharevousa*), with their social and political overdeterminations. Byzantine philosophers invented several technical words by using the suffixes *-ikos* or *-otès*, such as *ontotês*, "beingness." In the main, though, the vocabulary has remained the same.

V. Latin

The first attempts to write in Latin about philosophy go back to the first centuries BCE and CE, with Lucretius, Cicero, then Seneca. All lament the poverty of Latin (Lucretius, *De natura rerum*, 1.139 and 1.832; Cicero, *De finibus*, 3.2.5; Seneca, *Ad Lucilium*, 58.1; Pliny the Younger, *Epistulae*, 4.18). Cicero, being the lawyer he was, says in the same place that Latin has no reason to be envious of Greek, but did he believe it for a moment? In any event, when he adapted Stoic treatises, Cicero proposed Latin equivalents for Greek technical terms. Most often, a single Latin word translates a single Greek word, but sometimes they have to be broken down: *euthumia* [εὐθυμία] is translated as *animi tranquillitas* (*De finibus*, 5.5.23). The words thereby coined very often remain our own.

One can see certain inflections in these translations. First of all, a shift from the objective to the subjective. Thus *telos* [τέλος], "the end point of a reality," becomes *ultimum*, "the furthest point (that one can reach)" (ibid., 1.12.42 and 2.7.26). An emblematic translation is that of *axian echon* [ἀξίαν ἔχον], "that which has weight," by *aestimabilis*, "worthy of being valued as expensive" (ibid., 2.6.20); *paradoxos* [παράδοξος], "contrary to expectation," becomes *admirabilis*, "worthy of contemplation" (ibid., 4.27.74). One notices a certain psychologization of tendencies: *hormê* [ὁρμή], "impulse," becomes *appetitus*, "effort to look for" (ibid., 2.7.23, for example). Elsewhere, one can observe a shift from the inner to the outer: *êthikos* [ἠθικός], "having to do with character," becomes *moralis*, "having to do with behavior" (Cicero, *On fate*, 1.1, followed by Seneca, *Ad Lucilium*, 14.89.9, and Quintilian, *Instituto oratoria*, 12.2.15).

The attempt to make philosophy speak Latin was at first not a success, and even Greek philosophers who were settled in Rome, like Epictetus or Plotinus, wrote in their mother tongue. The first of the Romans, the emperor Marcus Aurelius, wrote a very intimate work, his spiritual exercises, in Greek. On the other hand, Apuleius and Aulus Gellius wrote in Latin. A second attempt was more successful, both with Christian writers like Tertullian and Saint Augustine, who seems to have only known a few words of Greek. Thereafter, for negative rather than positive reasons—the retreat of Greek in the West—Latin was used almost exclusively. This was true of the pagans Macrobius and Martianus Capella (early fifth century) as well as of the Christian Chalcidius.

The Latins did not so much translate, strictly speaking, as adapt. The first true translations are those of Gaius Marius Victorinus, who rendered passages by Plotinus into Latin. Saint Augustine may possibly have read some of these. Boethius, who was from a cultured family of patricians, had planned to translate all of Plato and Aristotle into Latin but was prevented from doing so because of his execution in 524 CE. He was nonetheless able to translate into Latin the start of the *Organon*, Porphyry's *Isagoge*, the *Categories*, and *On interpretation*. We are indebted to him for the equivalents of the fundamental concepts of Aristotelian logic: *genus*, *species*, *differentia*, *proprium*, *individuum*. He was also the one who took the profoundly influential decision to translate *ousia* by *substantia*, thereby reducing it to one of its dimensions, that of the subjacent (*hupokeimenon* [ὑποκείμενον]), which Aristotle, however, said was insufficient (*Metaphysics*, 7.3).

The Latin of the church fathers needed to be able to express the subtle nuances of the terminology that had been developed by the Greeks in relation to the doctrines of the Trinity or of Christology. Latin often lagged behind Greek. To the question, in the Trinity there are three what? Greek replies with *hupostasis* [ὑπόστασις] and Latin with *persona* (Tertullian, *Against Praxeas*, 11).

Medieval Latin was enriched by the addition of technical terms made necessary by the constant refinement of different problematics. In order to do this, it borrowed words from Greek, such as *categorematicus*, or produced others by working upon the language, such as *compossibilitas, actuositas, immutatio, suppositio, conceptus*.

Certain Greek texts were retranslated into Latin after the Scholastic period and often in reaction to its language, which was judged to be grating to a Ciceronian ear. So, Leonardo Bruni, for example, retranslated the *Nicomachean Ethics*, and Bessarion retranslated the remainder of Aristotle. Latin stayed creative right to the end. The Italian humanist Ermolao Barbaro proposed *perfectihabia* to translate, for better or for worse, Aristotle's *enthelecheia*. Leibniz had no hesitation in fabricating *existentificans* and *existiturire*.

Latin often creates words composed of Greek roots, rendering terms that appear to hark to Greek usages but are, in fact, modern. This is the true of *cosmologia*, adopted as a title by Christian Wolff (1731), and then in French by Maupertuis (1750); of *ontologia*, catalogued in the philosophical dictionary of Rudolph Goclenius (1613); and of *psychologia* (Johannes Thomas Freigius, 1579).

It is amusing that certain technical terms of the Scholastics have unwittingly entered into everyday language. So, for

example, the common English word "contraption" comes directly from the noun for the logical operation of *contraposito*.

VI. Arabic

The Greek scientific legacy was translated into Arabic beginning in the ninth century. This was the work of generations of Christian translators, who had to create a language designed to translate philosophical concepts. Unlike the translations into Syriac, words are truly translated; there are very few transliterations. One might cite *usṭuqus* [الأسطقس] for *stoicheion* [στοιχεῖον], "element," and *hayūlā* [الهيولى] for *hulê* [ὕλη], "matter." Even then, these words are in competition with terms that are more in keeping with the genius of the language, like *'unṣur* [العنصر] or *mādda* [مادّة], the substantivized feminine participle of the verb "to extend," which corresponds quite well to Descartes's "extended substance." Translators often feel their way before finding an equivalent that becomes established, which is why there are several terms for translating the same original. When two terms coexist, they each tend to take on a specialized meaning. So *hayūlā* tends to refer rather to primary matter, and *mādda* to the matter of a concrete compound. Or, in the register of causality, *sabab* [السبب], which originally meant the circumstances of an event, refers, rather, to the immediate cause; *'illa* [العلة], which originally meant an illness that excused one's absence in combat (analogous to the Lat. *causa*), refers instead to a distant cause. Arabic sometimes has had recourse to Persian. So the word for "substance" is the Persian *ğawhar* [الجوهر], which originally meant "jewel": the most precious aspect of a thing is its "substance," in the same way that in French the word *essence* is used to designate the refined state of a chemical body, for both perfumes and gasoline.

Vocabulary choices slightly inflect the meaning of a concept. So the Arabic-Persian translation *jawhar* loses the association with the verb "to be," which is immediately apparent in the Greek *ousia*. The Greek verb *einai* [εἶναι], both in its existential sense and as a copula, has no equivalent in Arabic. For the existential meaning, translators have chosen the verb "find" in the passive: what exists is indeed what "is found" (*mawğūd* [موجود]). This choice was reflected by al-Fārābī (*Book of Letters*, vol. 1, letter 80). Curiously, the same form is sometimes used as a substitute for the copula in examples of syllogisms. For "nature," *ṭab'* [طبع] or *ṭabīa* [طبيح] removes the idea of plant growth that the Greeks perceived (no doubt wrongly) in the word *phusis* [φύσις], replacing it with that of "imprint," "mark left by a seal."

The language of philosophy seemed "barbaric" in the eyes of grammarians. This can be seen in the celebrated controversy between the Christian philosopher and translator Abū Bishr Mattā ibn Yunūs and the Muslim grammarian Abū Saʿīd al-Sirāfī, which took place in 932 and was reported by Abū Hayyān al-Tawḥīdī in the eighth night of his *al-Imtā' wa 'l-mu'ānasa* [الإمتاع و المؤانسة]. There is still an echo of this in al-Fārābī (*Book of Letters*, vol. 2, pt. 25, letter 156), where he reminds us that some people would rather that philosophy be expressed in purely Arabic terms. For grammarians, logic was nothing more than the grammar of a particular language, the Greek language. There is no longer any need to be reminded of the importance of Arabic in the development of the scientific vocabulary of Latin or vernacular-speaking

medieval and modern Europe: in mathematics (*algebra*), astronomy (*azimuth*), chemistry (*ammonia*). The title of Ptolemy's works on astronomy kept the Greek preceded by the Arabic article: *Almagest*, from *al-Megistè*. Terms that came from philosophy, however, in the narrow sense this word has assumed in modern times, are for the most part Latin or Greek in origin. At best we can cite the famous *helyatin*, which gave commentators of the *Liber de causis* (chap. 9) such a hard time and which is the Arabic *kulliyya* [كلية], translating *holotês* [ὁλότης] from the Greek of Proclus. A problematic that was developed in the *falsafa*, such as that of the possible "conjunction" of the human intellect and the agent intellect, imported the word *conjunctio* itself, a calque of the Arabic *ittiṣāl* [الاتصال], into Latin Scholastics, something Schelling was still aware of (*Introduction to the Philosophy of Mythology*, 20th lesson). One might also note that the Latin *intentio* was influenced by the Arabic *maʿnā* [المعنى], "meaning" (see INTENTION).

VII. Hebrew

In the Middle Ages, Jews living in Islamic lands used Hebrew for religious purposes. This included the liturgy, but also religious "law," such as the literature of the *responsa*. For everyday life and also for philosophy, they used Arabic. So Maimonides wrote the *Mishneh Torah* in Hebrew but the *Guide for the Perplexed* in Arabic. The first to write philosophy in Hebrew was Abraham bar Hiyya Savasorda, a Spanish philosopher and astronomer, with the *Hégyon ha-Nefesh* (the full title of which is "Contemplation of the saddened soul which knocks at the door of repentance"). He invented a whole vocabulary, of which certain elements have survived. In the first book of the *Mishneh Torah*, the *Book of Knowledge*, written around 1180, Maimonides presented a summary of the vision of the world of Arabic Aristotelian philosophy for which he needed new words. He gave to the word *dë'āh* [דֵּעָה], "thought," the new meaning of "intellect," including the intellect of the soul of the spheres.

Philosophical Hebrew, however, developed only to the point where it attained its classical form after the translations from the Arabic by the Ibn Tibbon family. Three generations of this family, driven out of Spain by the Almohads (1148), successively translated texts of Jewish spirituality, then Jewish philosophy, then simply philosophy (Aristotle, Averroës). They modeled Hebrew sentences on the syntax of Arabic to such an extent that they appeared quite strange, even barbaric, so it is hardly surprising that these translations were not immediately accepted. The poet Judah ben Solomon Harizi therefore undertook to write a countertranslation of the *Guide for the Perplexed* in order to give the second Ibn Tibbon a lesson in "beautiful language." But Harizi's philosophical competence was rather limited, and he mistranslated a number of terms, which Ibn Tibbon took satisfaction in enumerating in the preface that he added to the reedition of his own translation. We still have Harizi's translation, but only a single manuscript, whereas Ibn Tibbon's has been very widely disseminated.

Medieval Jewish thinkers had no direct access to Greek and knew only Aristotle and his commentators through Arabic translations. The new words they coined were often borrowed directly from Arabic. Thus Abraham bar Hiyya

Savasorda hebraicizes the Arabic *markaz* [مرکز] as *mèrkāz* [מֶרְכָּז], "center," and borrows *ṣūrā* [צוּרָה], from *ṣūra* [صورة]), "form." Other words are modeled on Arabic, such as when *mawğūd* is translated as *nimṣā* [נִמְצָה]. But other words are obtained by working on the Hebrew itself. So for "substance," Hebrew reuses the biblical word '*èṣèm* [עֶצֶם], which usually means "bone." For "accident" in the philosophical sense of *sumbebêkos* [συμβεβηκός], he uses *miqrèh* [מִקְרֶה], which has the meaning, as does the Latin *accidens*, of "what happens," "incident."

VIII. Modern Languages

It is only fairly recently that the vernacular languages of modern Europe have been used as a medium for philosophy. Latin was still the language of Descartes and Leibniz. Kant often explained his still hesitant German terminology with a Latin word in parentheses, and his *Critique of Pure Reason* was also translated into Latin. Hegel and Schilling wrote their theses, and Bergson his complementary thesis (1888), in Latin. Several scattered philosophical concepts began to appear in the second part of the *Roman de la rose* (Jean de Meun), where there is a translated passage from the *Timaeus* (vs. 19083–19110 = 41a 7b 6), and in Chaucer.

But the first philosophical works in the vernacular date from the thirteenth century. The first "modern" language used in philosophy was Catalan, by Ramon Llull, which was because of Llull's personal history. Originally secular, he was torn from his worldly life in 1263 following an illumination. He became a Franciscan monk, received his university training much later than normal, and thus never knew Latin very well. The *Libre de contemplació en Déu* (1273–74?) was perhaps the first philosophical work in the vernacular in Europe.

German followed soon after. When the Dominican Meister Eckhart preached to nuns who did not know Latin but who were learned enough to be able to write down sermons, he had to transpose Latin concepts into the dialect of the time. He had to translate Scholastic terms quite literally, and the other mystics from the Rhineland did likewise. So *Wesen* for *essentia*, *Zufall* for *accidens*, and so on, explained terms that functioned, in Latin (or English), as ideograms. This practice continued in the seventeenth and eighteenth centuries, when the word *Einbildungskraft* (*vis imaginationis*) was created for "imagination," *Gegenstand* (*objectum*) for "object," *Vorurteil* (*praejudicium*) (seventeenth century) for "prejudice," and *Begriff* (*conceptus*) for "concept" (Christian Wolff).

These transpositions give philosophical German a particular style. The words do not sound strange and even have popular meanings that their equivalents in other languages rarely have. After having said the name of the street he is looking for, a German will ask, "Ist das für Sie ein Begriff?"—literally, "Is that a concept for you?"—where English would say, "Does that mean anything to you?" and the French would ask, "Ça vous dit quelque chose?" The convoluted French expressions *en soi* (in itself) and *pour soi* (for itself), considered rather pedantic, come from a single German expression *an und für sich*, meaning "basically." Before the 1930s, Heidegger liked to use as conceptual terms expressions that were very idiomatic, even commonplace (*Ein Bewandtnis haben, bewenden lassen, vorhanden sein*, etc.), which translators are forced to turn into gibberish. So *Zeug*, "thing for . . ." or "thing

against . . ." (*Regenzeug*, for example, is "something to use in case it rains," an umbrella, a raincoat, etc.), becomes in French, *outil*, "tool" (Emmanuel Martineau), and even *util* (François Vezin).

What is more, the Germanic languages (German, and especially English) often have two parallel terms for one single idea, a learned word borrowed from Latin or from a Romance language, and a native word. The originally synonymous terms tend to diverge in meaning and to support two nuances that can become mutually exclusive. In German, words of Latin origin often have a pejorative nuance, such as *räsonnieren*, and they are rejected by purists. Such purists are often accused of associating the pursuit of linguistic purity with the xenophobic pursuit of racial purity. Conversely, authors such as Adorno take a malicious pleasure in replacing worn-out German words with forced germanizations of non-German words, and for saying, for example, *camouflieren* where the German has *tarnen* or *vertuschen*.

It is only recently that fundamental German terms have appeared that are not translations or transpositions of Latin or Greek terms. Heidegger remarked that it was only with the central word of the late period of his thinking, *Ereignis*, that philosophy truly stopped speaking Greek: "It would be impossible to think *Ereignis . . .* with the help of Greek (which we are concerned precisely to 'go beyond'). . . . *Ereignis* is no longer Greek at all; and the most fantastic thing here is that Greek continues to retain its essential meaning and at the same time can no longer manage to speak as a language at all" (*Four Seminars*; see EREIGNIS).

The other Romance languages have found it harder to disengage from Latin because of their very proximity to it. Italian became a medium for philosophy with Dante. His *Convivio*, written around 1304–7, contains a summary of Scholastic philosophy. After this, the two languages continued to intertwine, combine, and be apportioned differently depending not only on the works of the writers concerned, but also on the milieu in which they were originally written. Dante justified the poetic use of the vernacular, but he did this in Latin, in *De vulgari eloquentia* (ca. 1305). Leonardo da Vinci used Italian because he did not know Latin. Machiavelli wrote only in Italian but gave Latin titles to the chapter of *The Prince*. Petrarch and Vico wrote in both languages. Giacomo Leopardi, whose training was philological, wrote in an archaic Italian that was close to Latin. French was used by Nicole Oresme in his translations of Aristotle and by Christine de Pizan in passages of the *Livre des fais et bonnes meurs du sage roy Charles V*.

The vernacular languages have constantly interacted with each other, and still do. Translations from one to the other constrain the target languages to give completely new meanings to certain words. The dominance of French in Europe during the classical age led to other languages borrowing terms from it. German, for example, transposed *progrès* (progress) as *Fortschritt*, and *point de vue* (point of view) as *Gesichtspunkt*. The present dominance of American English, when it does not involve pure and simple loan words, produces new meanings in other languages. Thus in French, the term *équité*, selected—for want of a better term—to translate the untranslatable "fairness" of John Rawls, has added this meaning to that of *epieikeia* (see FAIR; THEMIS, IV). Certain ideas make a full

circle, enriching themselves with new connotations along the way. So, for example, the English "moral sciences," chosen by John Stuart Mill to translate the French *sciences morales*, produced *Geisteswissenschaften* in the German translation, which was retranslated into French as *sciences humaines* (see GEISTESWISSENSCHAFTEN).

The Arabic for "dictionary" is *qāmūs* [قاموس], which comes from the Greek *Ôkeanos* [Ὠκεανός], in the original sense of the liquid expanse covering all of the lands that have emerged, enabling their circumnavigation. Languages are in the same way the locus of a constant movement of exchange in time and place. But words only rarely retain the exotic flavor of their origin. Most of the time they are so well accommodated that we forget the work that was needed to bring them into a new language, to create them, or to adapt them to their new context. So we need a second context in order to restore the murmured sounds of the distances crossed.

| EVENT

The word "event," from the Latin *evenire* (to come out of, to have a result, to arrive, to come due, to happen; whence *eventus* [issue, success] and *eventum*, especially in the plural *eventa* [events, accidents]), refers to a fact or phenomenon insofar as it corresponds to a change or makes a mark.

I. Event and Being

"Event" is the most frequently used word for translating the German *Ereignis*, which Heidegger relates to appropriation (*Ereignung*, see PROPERTY) and revelation (*Eräugnis*): see EREIGNIS and cf. *APPROPRIATION*. See also ES GIBT, COMBINATION AND CONCEPTUALIZATION, Box 1, GESCHICHTLICH, and TATSACHE, Box 1; cf. VORHANDEN.

More generally, on the ontology of events, the relationship between event and accident, and the difference with being, see CHANCE, *DESTINY*, ESSENCE, SUBJECT, *TO BE.*

On the "event" of the Incarnation, see BOGOČELOVEČESTVO, LOGOS, III.B, OIKONOMIA.

II. Event, Temporality, and Works of Art

On the temporality of events, see ASPECT, HISTORY, *INSTANT,* JETZTZEIT, MOMENT (esp. MOMENT, II).

On putting events into words, see ERZÄHLEN, HISTORY; cf. *RÉCIT.*

More precisely, for the relation of "event" to works of art, see IN SITU.

EVIGHED (DANISH)

ENGLISH   eternity
GERMAN   *Ewigkeit*

➤ *ETERNITY* and AIÔN, CONSCIOUSNESS, CONTINUITET, I/ME/MYSELF, MOMENT, *PERSON*, PLUDSELIGHED, PRESENT, *TIME*, TRUTH

The majestic eternal moment freezes movement, in contrast with the eternality of the ethical Self. The abstract eternity of the idea, the object of recollection, contrasts with the concrete eternity passionately lived by the existing being stretched toward the eternal as if to the future. The central concept of Christianity, what St. Paul in Galatians 4.4 calls "the fulness of time," /AA requires the idea of an eternity that continuously penetrates into time and of a time that constantly reaches out to grasp eternity for itself. In this ever-present tension—equivalent to that which, without *Aufhebung*, joins the finite and the infinite—the eternal operates in the present both as past and as future (see MOMENT, Box 4).

The multiple senses that Kierkegaard attributes to the concept of *Evighed* correspond to the variations of those of *Continuitet-Continuerlighed.*

1. In the immediacy of the moment of pleasure, the person (the aesthetic self) is as though diffused in affective tonality (*Personligheden doemrer i Stemningen*, vol. 4). The power of the soul to dive completely into "such an instant" allows it to suspend time in a way, to be rescued from the essential fleetingness of the ephemeral, thus to ascend to a kind of eternity.

2. At the other extreme, the choice of self gives the person "his eternal value." Echoing Fichte's formulation (*The Vocation of Man*, in *Popular Works*, ed. William Smith, Nabu Press, 2010, 172), Kierkegaard has the ethical self say: "I cannot become conscious of myself in an ethical way without becoming conscious of my eternal I" (4: 242). This "eternity" is becoming oneself in one's permanence, which comes from progress. By means of ethics, man "becomes what he becomes" (4: 162; see a similar phrase in Fichte, *op. cit.*, 209).

3. "Eternity is the continuity of consciousness, which makes for the depth and the thinking of the Socratic" (7: 91). "For thought, the eternal is the present" (7: 186). The function of reminiscence is "to maintain eternal continuity in the life of man" (9: 10). Despite what separates Socrates from Plato, this thesis (and thus the appeal to abstract eternity) "belongs to both" (10: 192).

Kierkegaard situates Christianity with regard to these three types of eternity. Because of its historical beginning, it is an event that is thus different from Socratism. It posits the instant of access to truth as absolutely decisive. This *punctum* concerns neither pure thought, nor mythology, nor history alone. It essentially affects the existent and thus the existing subjective thinker. If the eternal arises in any ethical decision, continuity is nevertheless always interrupted by new decisions (see PLUDSELIGHED). "For the existent, decision and repetition are the goal of movement. The eternal is the continuity of movement, but an abstract eternity is outside of movement, and a concrete eternity in the existent is the height of passion" (11: 12). "The passionate anticipation of

the eternal is nevertheless not, for an existent, an absolute continuity, [it is] the possibility of approaching the unique truth which there may be for an existent" (11: 12–13). Eternity, as the *telos* given in every instant, is only able to be infinitely approximated. Concrete eternity thus has the form of a future. "The future is this incognito where the eternal, insofar as it is incommensurable with time, nevertheless wishes to preserve its commerce with it" (7: 189).

Every existent has its time, receives it rather, for "the eternal wishes to make time its own" (13: 15). Dissolving into abstract existence is the person for whom "existential decisions are only a shadow play floating on the background of what is eternally decided" (10: 210).

| EXIGENCY

"Exigency" comes from the Latin *exigere*, literally "to push (*agere*) outside (*ex*)," which means "lead to its end," and "to claim, demand." The term is given here such as one of the possible translations of the English "claim": it does not have a pejorative tone (unlike *prétention*), but, unlike the German *Anspruch*, it struggles to express a demand (with its linguistic and spoken dimension of expression) with its (moral or legal) justification, such that the demand itself constitutes the justification. See CLAIM, and cf. *VOICE.*

The English notion of "claim" is inseparable from the distinction, also a difficult one for translators, between *droit*-law and *droit*-right, which relates to the legitimacy of the demand: see LAW, RIGHT/JUST/GOOD, and more generally *DROIT*, DUTY, SOLLEN; cf. *OBLIGATION.*

On the relation between this "exigency," which is more specifically a claim of knowledge, and Anglo-Saxon ordinary language philosophy, see ENGLISH, cf. COMMON SENSE, LANGUAGE, MATTER OF FACT, SENSE, SPEECH ACT.

➤ EPISTEMOLOGY, *REASON*

| EXPERIENCE

"Experience" comes from the Latin *experientia*, "attempt, test, practice, experiment," the same family as *periculum*, "test, risk," or *peritus*, "clever, expert," and from the same vast root **per-* (which means something like "go forward, penetrate") as the Greek *empeiria* [ἐμπειρία], "experience," *peira* [πεῖρα], "attempt, experience," or *peras* [πέρας], "limit" (cf. in French *pore*, *port*, and *porte*). The word thus connotes both a breaking-through and an advancement into the world, a gain of knowledge and acquired expertise. The semantic complex yields terminological distinctions peculiar to various languages.

I. Internal Experience

1. The German term *Erleben* refers precisely to the experience and the ordeal of life. See ERLEBEN, and cf. DASEIN, LEIB, *LIFE.*

2. More generally, on the experience of self, see CONSCIOUSNESS, I/ME/MYSELF, SUBJECT; on the difficulties between affect and history or the history of being, see ANXIETY, *MALAISE,* PATHOS (cf. *PASSION*).

3. On the relation between this experience and wisdom or morality, see PHRONÈSIS, *WISDOM;* cf. GLÜCK, OIKEIÔSIS; more generally, for moral experience, including that of moral law, see MORALS, WILLKÜR.

II. Experience and Objective Knowledge

The recurrent philosophical problem is that of the impact of a subject on the object or the phenomenon observed in experience, through the conditions of experience in experimentation as well as the a priori forms of experience in Kantian *Erfahrung.*

1. We have followed the pair *experiment/experience*, in play in Anglo-Saxon empiricism, which does not precisely track the difference between the French *expérience/expérimentation*: see EXPERIMENT; cf. ENGLISH and UTILITY.

2. More generally, on experience as knowledge, and the procedures of constructing its objects, see ABSTRACTION, EPISTEMOLOGY, EPOCHÊ, *INTUITION*, PERCEPTION, REPRÉSENTATION; cf. AFFORDANCE. On the object itself, see GEGENSTAND, ERSCHEINUNG, OBJECT, and cf. PHÉNOMÈNE.

III. Experience and Practice

1. On the manner in which *empeiria* is related to *technê* [τέχνη], to craft, which is defined as being between experience and science, see AESTHETICS, ART, MIMÊSIS.

2. On the relation between practice and conduct, see AGENCY, BEHAVIOR, MORALS, PLEASURE, PRAXIS, WORK; cf. above, I.3.

➤ NATURE, *REASON,* SECULARIZATION, TATSACHE, *WORLD*

| EXPERIMENT / EXPERIENCE

➤ CHANCE, ERLEBEN, PATHOS, PERCEPTION

The French translator is tempted to render automatically the English words "experience" and "experiment" as *expérience* and *expérimentation*, conferring a larger share of passivity on "experience" and of activity on "experiment." However, things do not allow such a simplification, especially not in eighteenth-century English. Furthermore, English preserves at the level of the verbs the same distinction as at the level of the nouns (even when completing the words with the ending "-ing": "experiencing," "experimenting"), whereas French has only *expérimenter*, and the verb unites what the nouns keep separate; if one decides therefore to render "to experiment" as *expérimenter* and "to experience" as *éprouver* (to experience in the sense of "feel" or "perceive"), *éprouver* connotes a difficulty that does not exist in "to experience" (cf. the French noun *épreuve*, "proof" or "test"). This asymmetry between French and English makes impossible a shared approach to the distinction, one more notional than real, between empiricism and rationalism. In French, which has only *expérimenter*, empiricism can only be rationalism in hiding, because, after all, there is no experience except that which is active. The English "experiencing" is from the start less framed by rational activity;

one can use the verb "to experience" when this framing is difficult or even impossible.

Furthermore, these nouns are used in close proximity to the terms "case" and "instance," which we must be careful not to render as *cas* and *exemple.* An "instance" is very often the singular fact, the particular occurrence, to which one accedes only by an *expérience* in the French sense; the "instance" becomes a "case" only when the idea of "experiment" is "transferred" to it (Hume, *A Treatise of Human Nature*). The English "case" supposes that a common ground, "a common footing," allows us to refer a registered event to other events judged to be similar or differing only by a decisive element in similar circumstances, so that one can say that it has appeared or has not appeared when one makes a "trial" of it, when one tries it out.

I. The Classical "Experiment": A Phantasm of Activity

One may have the impression that the word "experiment" implies an intervention on the part of the person who observes the phenomena and who works with them to understand or modify the mechanisms: "we make experiments" (Hume, *A Treatise of Human Nature*); while "experience" would be more passive and would concern objects or events that it would be difficult, even impossible, to change directly: "Relation is frequently experienced to have no effect" (ibid.). However, this impression—which is well founded when one reads *The Logic of Scientific Discovery* by Karl Popper, where "experiment" is synonymous with theory testing or falsifying—is much less reliable when one consults eighteenth-century authors.

As an instrument of analysis, the experiment gives rise to phantasms of activity not realizable within the realm of facts. When Hume reread the second book of Aristotle's *Rhetoric* in order, through a play on the constitutive parameters of passional structures, to review the limits of the passions in relation to each other and to their functions, his mode of action was purely linguistic: we could not make or complete the experiments that he prescribes, and that have the air of descriptions, in any other way than by working, by means of writing, on the imagination of the reader. It is on the basis of this symbolic game and its imaginary practices that the experiment can give rise to an inventory of contrary cases and of balanced cases (*A Treatise of Human Nature*). The experiment is real only when, and because, it is first of all symbolically devised.

Whether or not it gives rise to a feeling, it remains deprived of sense unless it is read, written, or made "singular" in a way that allows it to enter a calculation as a unit. Thus the question of knowing whether we can make experiments in the domain of passions, economics, and history is settled: it is obvious that we can (even though it is no easier to modify feelings than movements in the heavens), because the experiment is essentially symbolic, even when it allows for, as is often the case in physics, material manipulation. Price, reflecting on Bayes's rule and taking his examples equally from physics or the study of human nature, speaks of our possibility of determining "what conclusion to draw from a given number of *experiments* that are not countered by *contrary experiments*" (Bayes, *An Essay*). The experiment has the currency of chance: "chance or experiment," Hume says (*A Treatise of Human Nature*).

II. The Ambiguity of "Experience"

"Experience" presents an impressive range of meanings. One of them is very close to "experiment," when a more or less regular set of experiments may give rise to a more or less perfect experience (*A Treatise of Human Nature*), or conversely when "experience" becomes essentialized and autonomous in order to form a past experience or an element of past experience likely to enter into an experiment. Another meaning, in contrast, is very far removed from "experiment," even opposed to it: "experience" can in effect designate that which irreducibly resists explication; discussing the complications of sympathy Hume writes, just before the conclusion of the *Treatise of Human Nature*: "There is something very inexplicable in this variation of our impressions; but it is what we have the experience of with regard to all our passions and sentiments."

Generally, "experience" for Hume is rather that which one finds, which one encounters as a limit, which permits a discovery, which teaches, which permits an inference or a derivation, which proves, which returns, which is repeated (Price speaks of the "returns of an event" or of the "recurrency of events" [Bayes, *An Essay*]), or which can be stored or accumulated, either in the habits of life or by particular observation, in order to lead us to draw conclusions (*A Treatise of Human Nature*).

But if it may be false (ibid.), if it may regulate our judgment (ibid.), it is not possible for it to think in our place or to substitute for an explanation, which can be obtained only by, from, on experience. Whether we create experience through repetition or leave it to itself, whether we consult experience, infer existence through it, or put pressure on it, one way or another it is linked to the making of decisions: the decision to validate ideas, for example, only insofar as they are connected to experience, or the decision not to go beyond the limits of experience (as when Hume recommends that we should not extend the influence of relation beyond experience). It is up to us to render experience "undoubted" (ibid.), so that experience is always invoked in an unavoidable ambiguity: it is convincing on condition that it is not forced, yet it has meaning only when it is provoked and tends toward experiment: "We have happily attained experiments in the artificial virtues," Hume says in conclusion to the second part of the third book on morals of the *Treatise.*

However interwoven it may be with experience, the basic idea of the experiment rests on an artificial simplification of the phenomenon or sequence of events that one seeks to isolate, at least symbolically, in order to maintain greater control of its articulation with other phenomena or its combination with other sequences. Thus, experience is the taking into account of phenomena that cannot be grasped in the simplifying play of the experiment and of events in skeins of sequences or caught up in open systems subject to indefinite complication.

The traditional opposition between rationalism and empiricism no longer appears so clear-cut once one examines in detail the linguistic operations that constitute the dialectical play of experience, experiment, and their authority (ibid). That ideas derive from experience is a principle only if it is understood solely as a methodological rule. Empiricism, in

the end, is a philosophy of decision-making, even if it always presents the will as a sentiment or denounces it as a fiction: one has to decide to accept as valid only a proposition that has, in one form or another, the guarantee of experience, and this decision is no less a priori than the categories and principles of rationalism. One passes therefore from empiricism to rationalism by a simple displacement, and the confrontation of these two doctrines is merely imaginary.

FACT

"Fact" derives from the Latin *factum*, the neuter nominalized participle of *facere*, "to make, to do" (from the same root as the Greek *tithêmi* [τίθημι], "to put, to place"). Facts are distinguished by their positive character, independent of fiction or norms.

I. Fact/Fiction

The term "fact" refers first to what is given, especially in experience as a phenomenon, or in history as an event, and is thus distinguished from the illusory or fictional. We have chosen to study and compare two particular networks: the English network, which we look at on the basis of its idiomatic expressions—see MATTER OF FACT, cf. ENGLISH; and German terminology, which is built up in translation of and in counterpoint to English empiricism: see TATSACHE. TATSACHE, Box 1, examines the study of existential reinvestment of the Kantian *Faktum*, by way of Kierkegaard's Danish.

More generally, on the objective status of facts, see APPEARANCE, *PHÉNOMÈNE,* [ERSCHEINUNG, GEGENSTAND, OBJECT, REALITY, RES], *THING*.

On the language to which it gives rise, see *FALSE, FICTION* [ERZÄHLEN, HISTORY], TRUTH. On facts as statements of a present (*infectum*) by contrast with a "perfect" (*perfectum*), see ASPECT; cf. PRESENT.

II. Fact/Law

The order of facts is contrasted with the order of law. Facts deal with the empirical and the contingent, in accordance with nature or culture, in contrast with logico-mathematical necessity and the norms of practice and law. The intricate relations between the truth of facts and practical and legal norms is especially salient in Russian: see PRAVDA. The relations between truth value (validity) and moral value (value) are especially visible in German: see WERT.

On the relationship to knowledge, see, besides ISTINA and TRUTH, EPISTEMOLOGY, GEISTESWISSENSCHAFTEN.

FAIR / FAIRNESS / EQUITY

➤ *JUSTICE,* LAW [LEX], PHRONÊSIS, PRUDENTIAL, RIGHT/JUST/GOOD, UTILITY, VERGÜENZA

The untranslatable "fairness" is of renewed contemporary interest thanks to the original use made of it by the American philosopher John Rawls. In the French translation of his work *A Theory of Justice*, "fairness" was translated as *équité*. Rawls seeks to establish a contrast between a moral "deontological" conception, like his own, in which respect for individual rights and fair treatment are of primary importance, and a teleological conception, in which rights and justice may be sacrificed for the realization of the supreme Good, the ultimate *telos*, as in utilitarian philosophy. Above all, he makes justice the result of an agreement between the parties to a social contract on the model of Hobbes, Locke, and Rousseau. He completely rejects the idea that justice may be the object of an intellectual intuition as held by intuitionist doctrines. This is why the expression "procedural justice" is often associated with this representation of justice as fairness. But the English term "fairness" combines several semantic fields in such a peculiar way that some languages, like German, have opted to take over the term as such without translating it. French, indeed, has adopted the expression "fair play" but must otherwise be content with near equivalents, none of which articulates the central ideas of honesty, impartiality, justice, and equity in the same way as "fairness."

I. Common Uses

In nonphilosophical language, "fair" intersects with several distinct fields. The oldest is that of color, in which "fair" refers to whatever is light, agreeable, or bodes well, as opposed to "foul," which refers to the dark, ugly, and what bodes ill. Thus, in Shakespeare, the "fair maiden" is a pretty girl with blond hair and a light complexion. Similarly, today, "fair weather" is pleasant. In a second semantic field, "fair" refers to what is morally untarnished, honest and without stain, and irreproachable, as when we speak of a clear conscience. Third, a more recent sense, which goes beyond the individual, his character, or his consciousness, characterizes action, conduct, and the general rules of action; "fair" thus lays the emphasis on the absence of fraud and dishonesty,

whence the expression "fair play," which refers to a respect for the rules of the game. It is at this level that the notions of honesty and impartiality meet. An action, a method, or a kind of reasoning is fair if it rejects arbitrary preferences, undue favor, or partiality and if it does not aim to win out by dishonest means or by force. Thus, in a fourth sense, the term "fairness" becomes an essential component of the idea of justice: the result of its procedures, methods, reasoning, or decisions is itself fair, that is, justified and deserved, when we take its conditions into account. It is just in the sense that it satisfies the formula "to each his due." The final sense of "fairness" is one according to which, alongside the impartiality of a procedure, a treatment, a decision, and the conformity of their results with justice, we find the idea of measure, of a quantity that is moderate but sufficient.

II. "Fairness" and "Equity"

In philosophical language, the translation of "fairness" by a cognate of "equity" is problematic since in English the term "equity" already exists, coming from the Latin *aequitas* as a translation for Aristotelian "equity," and has been preserved in technical language, kept relatively apart from the semantic field of fairness. Indeed, the term used by Aristotle refers to a different idea—that of a conflict between the letter and the spirit of the law: "the equitable is just but not the legally just but a correction of legal justice" (Aristotle, *Nicomachean Ethics*, 5.10.1137b; see THEMIS, IV). There is thus a jurisdiction in English law (the equity jurisdiction) whose task is to justify exceptions where the law is faulty or too rigid—what legal vocabulary calls "cases of equity" (cf. Rawls, *Theory of Justice*, §38). This worry about equity in the Aristotelian sense lies behind the tradition of common law and the latitude it gives to judges in their interpretation of laws. We thus see how Aristotelian "equity" and Rawlsian "fairness" could come to be opposed to one another.

III. "Fairness" and Impartiality: The Duty of Fair Play

While equity may correct justice, fairness is at the heart of it insofar as it requires impartial treatment of people. This contemporary philosophical meaning goes back to Henry Sidgwick and his attempt to synthesize Kant and utilitarianism, and it stipulates that

> it cannot be right for A to treat B in a manner in which it would be wrong for B to treat A, merely on the ground that they are two different individuals, and without there being any differences between the natures or the circumstances of the two which can be stated as a reasonable ground for difference of treatment. . . . The principle just discussed, which seems to be more or less clearly implied in the common notion of "fairness" or "equity," is obtained by considering the similarity of the individuals that make up a Logical Whole or Genus.

(Sidgwick, *Methods of Ethics*, bk. 3, chap. 13, §3)

What is original is Sidgwick's extension of the term, which prefigures Rawls's account of fairness. He interprets it in an intersubjective sense as the principle that consists in treating equally "all parts of our conscious life": "I ought not prefer a present lesser good to a future greater good"

(ibid.). By the same reasoning, he extends it intersubjectively to the principle of universal benevolence (ibid.), the utilitarian principle that demands that we maximize the general happiness

> by considering the relation of the integrant parts to the whole and to each other, I obtain the self-evident principle that the good of any one individual is of no more importance, from the point of view (if I may say so) of the Universe, than the good of any other; unless, that is, there are special grounds for believing that more good is likely to be realised in the one case than in the other. And it is evident to me that as a rational being I am bound to aim at good generally,—so far as it is attainable by my efforts.

IV. "Fairness" and Justice

For Sidgwick, the term "fairness" comes to encapsulate a general theory not only of justice but also of rightness, of moral duty. This development reaches maturity in Rawls's account, in which "justice" is defined as fairness in the sense of an equal respect to which all rational beings have a right, that is, in the sense of the Kantian categorical imperative: "the principles of justice are . . . analogous to the categorical imperative" (Rawls, *Theory of Justice*, §40). As with Kant, but for other reasons, this conception of justice is procedural—it applies first to processes, not to an atemporal order. First, it characterizes a certain way of acting toward other humans and living beings in general. Second, it is itself a result of procedures; it does not exist "in itself" or by conformity with an external criterion:

> One must give up the conception of justice as an executive decision altogether and refer to the notion of justice as fairness: that participants in a common practice be regarded as having an original and equal liberty and that their common practices be considered unjust unless they accord with principles which persons so circumscribed and related could freely acknowledge before one another, and so could accept as fair. Once the emphasis is put upon the concept of the mutual recognition of principles by participants in a common practice the rules of which are to define their several relations and give form to their claims on one another, then it is clear that the granting of a claim the principle of which could not be acknowledged by each in the general position (that is, in the position in which the parties propose and acknowledge principles before one another) is not a reason for adopting a practice.

(Rawls, "Justice as Fairness")

Thus, when we examine distributive justice or social justice in the economic domain of exchanges, contracts, salaries, and prices of the market, the term "fairness" takes its meaning as justice in distribution, in pricing, in salaries; these are not just "in themselves" as Aristotle says, but the most just in relation to the special conditions of competition:

> [I]ncome and wages will be just once a (workably) competitive price system is properly organized and embedded in a just basic structure. . . . The distribution that

results is a case of background justice on the analogy with the outcome of a fair game.

(Rawls, *Theory of Justice*, §47)

Thus, when philosophers wish to think about justice, they have two registers in which they may work: the first is that of fairness and procedural justice, that is, impartiality and honesty, as well as equity in decisions, procedures, exchanges, distributions, contracts, and so on, without independent criteria for evaluating the results. The other is that of just and right, which imply conformity with an external and independent criterion, obligation, and moral and legal duty, with reference to an ideal of objectivity and truth. In philosophical usage, "justice" tends to be applied more to the results of procedural fairness (Barry, *Theories of Justice*). But the differences are often simply a question of use.

We can thus understand why, if we wish to construct an entirely conventional account of justice, as in Hume, which would nevertheless not be arbitrary, the term "fairness" and its anthropocentric aspects may be a legitimate choice. By way of the associated theory, the philosophical meaning retains the reference to human situations in which rational partners attempt to resolve their differences, as in the signature of a contract, without appealing to independent criteria. Rawls's theory is especially interesting from this point of view, since it attempts to achieve equality and social justice on the basis of a procedure rather than imposing them as independent criteria, as is almost always the case. Rawls often uses the terms "just" and "fair" interchangeably, which we may see as resulting from a desire to dispense with all moral realism and to discover principles of justice in the dialectic of interests and passions alone. Indeed, Rawls compares the theory of justice with the pure theory of prices or market equilibrium in such a way that his conception of the first is fully contractualist, in the same sense as for Rousseau—namely, that the just is a result of universal suffrage, that is, from the contract each person has with everyone else. The equitable and the just do not exist in themselves; they result, rather, from an agreement on the conditions of liberty, equality, and impartiality collected under the metaphor of the "veil of ignorance." Any intervention inspired by an external criterion, whether from the threat of force or from an ideology such as equality, would make the decision come out wrong.

V. "Fairness" and Equality

We see, then, that unlike in the second register of just and right, "fairness" does refer to justice, but without the idea of equality playing a role as an independent criterion. In a theory of justice that is itself egalitarian, inequalities may be justified or fair if and only if they are the result of conditions or principles which are themselves fair (Rawls's second principle). Equality is thus indeed a component of justice, but as a result of the procedure rather than as a condition imposed a priori. In his use of "fairness," Rawls announces that it is no longer possible to speak of justice independently of human judgment and procedure. "Fairness" combines impartiality of the conditions of choice, honesty of procedure, and equity with regard to those entering contracts and

thus makes it possible to construct a theory of justice that is purely procedural.

| FAITH

Faith comes from the Latin *fides*, which refers to the confidence one inspires (the "credit" or "credibility" of a speech) and that which one grants, taking its entire extension from the language of law: "solemn engagement, guarantee, oath" (cf. *foedus*, "treaty"), "good faith, fidelity." The same Indo-European root **bheidh-*, "to rely upon, persuade," is found in the Greek *peithomai* [πείθομαι], "to obey," and in the active *peithô* [πείθω], "to persuade." Christian Latin makes the term more specialized, using it as a noun for *credo*, "to believe," in the sense of trust in God.

Different modern languages do not all separate in the same way the legal, rhetorical, and logical network on the one hand—credit and credibility, confidence and belief—and the religious network of "faith," properly speaking, on the other. German, in particular, with *der Glaube*, translated by "faith" or "belief," does not offer this distinction: see BELIEF, GLAUBE, *CROYANCE*.

More generally, for the relationships to the logical network, see ISTINA and TRUTH, PRAVDA, but also *CERTITUDE*, DUTY, EIDÔLON, Box 1, *FICTION*, INTENTION, *PROBABILITY*.

For the religious network, see especially PIETAS, *RELIGION*; cf. *ALLIANCE, DESTINY*, LEX.

➤ SECULARIZATION

| FAKTURA [факту́ра] (RUSSIAN)

ENGLISH	workmanship, texture
LATIN	*factura*

➤ *FACTURE*, and ART, MANIERA, PLASTICITY, *STYLE*

In the traditional sense of the term—which is derived from the Latin *factura* (manufacture)—*faktura* is the combination of characteristics of paintings or sculptures that relate to the ways in which the material has been worked by the artist and that constitutes the concrete element of style. It is thus a nonnegligible result, but one whose value remains secondary. Nevertheless, in the 1910s and 1920s in Russia, the term *faktura* [факту́ра], which is normally translated as "facture" or "texture," acquired unprecedented conceptual and ideological importance.

Zaoum (Russ. *zaum* [заум])—a poetic form that refuses submission to meaning in order to give priority to the qualities of the verbal material itself—and the possibilities opened up by pictorial abstraction prompted intense reflection on the role of the components of a work. Thus, different typologies of the "plastic elements" appeared. In the Russian context, especially among the constructivists, adepts of a substantial materialism, the "culture of materials" took on a decisive importance. Vladimir Markov was one of the pioneers of this new attention being given to workmanship (*faktura* [фактура]) with reference to the material: "The love of material is an incitement for man. To ornament it and work it yields the possibility of obtaining all the forms that belong to it, the 'resonances' that we call *faktura*" ("Principes de la création").

Several years later, Nicolas Tarabukin made *faktura* autonomous, and hence a plastic element in its own right:

> All of the originality of the textural aspect of contemporary painting comes from what has been detached from the ensemble of pictorial problems and transformed into a particular problem, thus creating a whole school of texturalists.
>
> ("Pour une théorie de la peinture")

Plastic experimentation with various materials in effect led Tatlin and some other Russian artists to create pictorial reliefs or three-dimensional constructions, such as counter-reliefs, which prompt the viewer to dissociate the "texture" (*faktura*) from the other elements with which it is presented, especially, in the case of painting, color. If, as Tarabukin claims, "it is the material that dictates the form to the artist and not the reverse" (ibid.), the study of the material being put to work—that is, the study of texture—opens up new possibilities: when the material and the form remain fixed entities, the texture creates a dynamic link between them. Coming from the flow, it displays and records the enlivening energy of a dialectic in action.

| FALSE

"False," like "fault," comes from the Latin *fallo*, which means "to deceive" and, in the passive, "to be deceived" (*falsus* [false, deceptive, someone deceived], probably from the same etymology as the Greek *sphallô* [σφάλλω], meaning "I cause to fall"; see PARDON, II). The false, like the true, involves two registers, linguistic and ontological, and the distinction between the two leads into ethics. The reader will find under TRUTH, IV a note on the evolution of the antonyms of "true," by way of Greek (*pseudês* [ψευδής], "false" and "deceptive") to Latin (*fallax*, "false"/*mendax*, "lying"). In a general way, each characterization of the truth comprises a characterization of its antonym: see ISTINA, PRAVDA.

I. Logic: False, Proposition, Speech

1. To speak falsely is to say things as they are not. From the point of view of traditional logic, an isolated word cannot be true or false as such, but rather requires "composition": see under PROPOSITION the exploration of the terminology for what is capable of being true and false. See also DICTUM, PRÉDICABLE, PREDICATION, and SUBJECT. For a comparison with the minimal unit, which is the correlate of meaning but not of the true or the false, see SIGN, WORD, and cf. SIGNIFIER/SIGNIFIED. And with the all-encompassing unit of speech, see LANGUAGE, LOGOS.

2. On the content of propositions, their "import" and the object of judgment, see SACHVERHALT; cf. TATSACHE; on what makes a proposition true or false, see SPEECH ACT.

3. The difference between what is false and what lacks meaning altogether is discussed in the context of the English word NONSENSE; see also SENSE.

4. On the logical principles, especially the principle of noncontradiction, which govern truth and error, see PRINCIPLE; cf. HOMONYM.

5. On the validity of demonstrations and their value, see IMPLICATION.

II. Ontology: The False and the Real

1. To speak falsely is also, more radically, to say things that are not. The false is not just a logical issue, but an ontological one as well. The problem of the false thus cuts across that of appearances, as opposed to reality and its objects: see *APPEARANCE* [DOXA, ERSCHEINUNG], *PHÉNOMÈNE*, *NOTHING*. Some languages combine the veridical with the perceptual, thus the German *Wahrnehmung* (PERCEPTION, Box 3); cf. REPRÉSENTATION.

2. We are thus referred to the objectivity of the object, to the reality of the real; see especially ESSENCE, GEGENSTAND, *IL Y A*, OBJECT, REALITY, *THING*, *TO BE*.

3. We are also led to the problems of images and imagination, and the ambiguous value of aesthetic illusion: see *IMAGE* [BILD, EIDÔLON], *IMAGINATION* [FANCY, PHANTASIA], MIMÊSIS.

III. Ethics: The False and Fault

1. The direct relationship in some languages between the "false" and "fault" is studied under DUTY, III.

2. The difference between "being deceived" and "deceiving" comes, not in what is said, but in the use made of what is said and the intentions behind it. The Greek *pseudês* does not distinguish them, unlike the nonfixed Latin pair *fallax/mendax* (see TRUTH, IV). On the complexity of intention, see INTENTION, and WILL, WILLKÜR; cf. *DESTINY, LIBERTY*, MORALS. See also *LIE*.

3. Further, we may speak of things that do not exist without the intention of deceiving, see SENSE; cf. HOMONYM.

We then find the problem for speech of aesthetic illusion (see section II.3 above), which deals with the network of fiction: see *DECEPTION*, TRUTH, Box 3, and DESENGAÑO, *FICTION,* HISTORY, SPEECH ACT.

4. Finally, it is possible not to speak while speaking; see in particular VERNEINUNG, cf. *NEGATION*; and, for German words that indicate privation or failure, see COMBINATION AND CONCEPTUALIZATION.

FANCY / IMAGINATION

➤ *IMAGINATION*[PHANTASIA], and BILDUNG, ERSCHEINUNG, FEELING, GENIUS, *IMAGE*[BILD], MADNESS, MIMÊSIS, SUBLIME

At the beginning of chapter 4 of the *Salon of 1859*, "Le gouvernement de l'imagination," Baudelaire cites in English and immediately translates into French a text by Catherine Crow that he sees as confirming one of his own ideas but in which it is also possible to discern a distinction already long at work in English theoretical texts: "By imagination, I do not simply mean to convey the common notion implied by that much abused word, which is only fancy, but the constructive imagination, which is a much higher function, and which, in as much as man is made in the likeness of God, bears a distant relation to that sublime power by which the Creator projects, creates and upholds his universe" (*Œuvres complètes*, 2:623–24). Though he does not specify which edition he looked at—it may be that of 1848 or 1853—Baudelaire explicitly refers to *The Night Side of Nature*, which was first published in London.

This distinction appealed to by Baudelaire goes back to the middle of the fifteenth century, when "fancy" was formed as a contraction of "fantasy" (see RT: *Dictionarium Britanicum*, 1730). It was thus in use for a long time among those English-speaking authors who were sensitive to their language and careful about thinking. It corresponds to two etymologies, one Greek and one Latin "fancy," from *phantasia* [φαντασία] and "imagination" (*imaginatio*), the former referring to the creative force of appearance and the latter to reproduction and images. We thus find in English the same kind of pair as in German (see BILD). The words "imagination" and "fancy" thus only appear to cover the same idea, and we can see their difference by looking at some important texts of the eighteenth century. Nevertheless, this awareness of an imperfect synonymy, which may go as far as complete opposition, does not at all help us to resolve problems of translation.

▪ See Box 1.

The distinction between "fancy" and "imagination" is often rendered in French by the contrast between *fantaisie* and *imagination*. It is not always wrong to translate "fancy" as *fantaisie*. We find in Bentham, for example, the expression "principle of caprice or groundless fancy" (*principe du caprice ou de la chimère sans fondement*; this translation by *chimère* could equally well be given by *fantaisie*; *Deontology*, §304). However, even if we wish to relate *fantaisie* with its Greek sense and set aside the more peculiar sense of "more or less unhinged improvisation," which it has acquired, we must note that this distinction almost never captures the sense of the English pair.

I. Imagination and Fancy: The Commonalities

Whether we call the process "imagination" or "fancy," the commonalities are clear once we understand imagination not so much as a faculty but instead as the ideological resolution of conflicts that are naturally or socially impossible to live with or feel. "Imagination," like "fancy," seems to suggest a solution, but this suggestion is already, in a way, a solution. Thus Hume often sprinkles his remarks about the origins of an institution or power with a phrase like "This is founded on a very singular quality of our thought and imagination" (*A Treatise of Human Nature*). Imagination is thus indeed a "mistress of error"—as long as we note, as Pascal did with great subtlety, that this is "all the more deceitful as it is not always so." Imagination is accused of "error" (ibid.) as often as fancy. When Hume writes: "'Tis natural for one, that does not examine objects with a strict philosophical eye, to imagine that those objects of the mind are entirely the same, which produce not a different sensation, and are not immediately distinguishable to the feeling and perception" (*A Treatise of Human Nature*); "to imagine" has the clear sense of "conceive falsely." The same is the case when he writes, concerning the symbolic import of a key, a stone, a handful of earth or wheat, that "the suppos'd resemblance of the actions, and the presence of this sensible delivery, deceive the mind and make it fancy that it conceives the mysterious transition of the property" (ibid.). On both sides, the relation with the passions is treated symmetrically. Something may "satisfy the fancy," just—and just as often—as it may be "agreeable to the imagination" (ibid.).

If imagination and fancy conceive wrongly, however, this implies that they are both capable of conceiving: Hume speaks of the conception of fancy and offers as equivalent "imagination or understanding, call it which you please" (ibid.).

II. The Game of Alliances: The Topics of "Imagination" and the Dynamics of "Fancy"

Where, then, are the differences, when they exist? The words "and" and "or" have the philosophical function of weaving alliances between notions into a shifting whole, since an alliance at one point and from one perspective will not necessarily be the same at another point and perspective. The game of alliances is the following.

Statistically—although the argument cannot be ignored in a philosophy whose method consists more in enumerating and weighing cases than in the use of the critical scalpel— "fancy" tends to involve the more fantastical aspects of the imagination. *Je me figure telle chose* would be rendered by "I fancy" rather than by "I imagine." The chimerical and system-building philosophers are the ones who, attacking the feminine virtues of modesty and chastity with great vehemence, "fancy that they have gone very far in detecting popular errors" (*A Treatise of Human Nature*). Alexander, wherever he saw men "fancied he had found subjects" (ibid.). This should not lead us to underestimate the "frivolous" dimension of the imagination: "imagination of the more frivolous properties of our thought" (ibid.). However, we would certainly have more difficulty in assimilating "fancy" to "judgment" than to "imagination," as Hume does. The less intellectual connotation of "fancy" relative to "imagination"

1

Fancy

Before Samuel Taylor Coleridge intervened, aesthetic theory tended to synonymize "fancy" and "imagination" to denote either a residual image from the decay of sense (Hobbes, *Leviathan*, chap. 2) or, more positively, the mind's inventive play. Appealing to the Greek *phantasia*, in distinction to the Latin *imaginatio*, Coleridge delimited "fancy" to productions shaped by accidents and contingencies of sense data. In *Biographia Literaria* (1817, chap. 4), he cites Lear's exclamation to a bedraggled beggar on the stormy heath as "Imagination": "What! have his daughters brought him to this pass?" (*King Lear*, 3.4). This is a totalized traumatic psychology—misery can have no other cause for Lear. What may be "contra-distinguished as *fancy*" (Coleridge, *Biographia Literaria*) is a delirium from Thomas Otway's *Venice Preserved*: "[l]utes, lobsters, seas of milk, and ships of amber"—a disarray of sense-data and normal referents. Coleridge returns to his distinction at the end of chapter 13. Where Imagination "dissolves, diffuses, dissipates, in order to re-create, . . . to idealize and unify," fancy plays with the ready-made "fixities and definites" of memory "emancipated from the order of time and space."

Coleridge focuses on the process; Wordsworth ponders the affective impression. If imagination is "the faculty which produces impressive effects out of simple elements," fancy is "the power by which pleasure and surprize are excited by sudden varieties of situation and by accumulated imagery" (note in *Lyrical Ballads*, 1800). Leigh Hunt's *Imagination and Fancy* (1845) preferred an affective scale: fancy is "a lighter play of imagination, or the feeling of analogy coming short of seriousness, in order that it may laugh with what it loves, and show how it can decorate it with fairy ornament." With his painter's eye, John Ruskin distinguished in terms of detail: fancy renders "a portrait of the outside, clear, brilliant, and full of detail. The imagination sees the heart and inner nature, and makes them felt, but is often obscure, mysterious, and interrupted, in . . . outer detail" (*Modern Painters*, vol. 2, 1851).

John Keats's last lifetime volume (*Poems*) joins the traditions of fancy as superficial play to charged feminine personifications: Fancy, the charming cheat. While his iconic poem *Fancy* exhorts, "Ever let the Fancy roam, / Pleasure never is at home" (1–2), the poet of *Lamia* speaks of unlocking "Fancy's casket" for "rich gifts" (1.19–20)—a store with a hint of Pandoran peril. In *The Eve of St. Agnes*, superstitious Madeline is "hoodwink'd with faery fancy; all amort" to the dangerous world around her (8). In *Ode to a Nightingale*, Keats bid a determined, if wistful, adieu to the charm: "the fancy cannot cheat so well / As she is fam'd to do, deceiving elf" (8). In his copy of *Paradise Lost*, he underscored the verse in which Adam explains this she-trickery to a dream-disturbed Eve. While in daylight, "Fansie" may serve "Reason" by forming "Imaginations Aerie shapes" into "knowledge or opinion," in dream-retreat from nature, she merely mimics, while subverting, Reason: "misjoyning shapes, / Wilde work produces . . . / Ill matching words and deeds" (5.102–13).

is also seen in the comparison of "fancy" with "taste," which we often find in the *Treatise*.

Finally, there is a second statistical means of distinguishing the two terms, which becomes fixed in philosophical English in the eighteenth and nineteenth centuries through the joint effects of the development of probability theory and dynamic conceptions of mind. "Imagination" refers to the act by which, from a present situation that we are to consider either with respect to its eventual effects or as the result of concurrent causes, we make a list of situations, in the direction of either the past or the future. Imagination performs a sort of abstraction of the dimensions of time, considered as objective points of reference. Imagination thus takes on a topical sense and refers to the ability of our mind to recognize its current situation among others of a greater or lesser number. Imagination implies a kind of tracking that is often as systematic as that of the understanding, even though it may be cursory, less reliable, and less rapid: imagination "conceives" (ibid.).

"Fancy" is less systematic and refers rather to the particular act of referring to a situation in which one does not actually find oneself. This is why we speak of laws or of "principles of the imagination" (ibid.), which may be said almost without irony to govern men rather than the "laws of fancy," an expression whose unbearable contradiction is immediately obvious. No doubt it is often a question,

for Hume, of the "force" of the imagination, of the effect of events on it, of the flow that carries imagination and fancy both; no doubt "imagination moves" (ibid.). However, "imagination" is more phoronomic than dynamic. By contrast, "fancy" more readily and more consciously calls psychic forces to mind; it implies that a furrow has been dug in a given direction: "'Tis certain that the tendency of bodies, continually operating upon our senses, must produce, from custom, a like tendency in the fancy" (ibid.). Further, the contrast between "imagination" and "fancy" is clear and distinct when Hume writes in the *Treatise*:

> [E]very thing, which invigorates and inlivens the soul, whether by touching the passions or imagination, naturally conveys to the fancy this inclination for ascent, and determines it to run against the natural stream of its thoughts and conceptions.

In conformity with their etymologies, we may thus prefer to speak of imagination when we are concerned with images and their reciprocal relations in space and time, and of fancy with regard to dynamic imagination, which is the springing up of images rather than the images themselves. Fancy does not stop at any particular image; that is precisely where we find its whimsical and "fantastical" aspect, which misleads us if we use it as a starting point. However, it borrows from belief and reality a sort of vividness that imagination does

not have. Curiously, imagination, supposedly less fantastical than fancy, is the less credible of the two, precisely because, being closer to understanding, it is also more easily scrutinized in relation to the true and hence appears more false than fancy, which deals with a logic of fiction escaping the domain of both truth and falsity.

| FATHERLAND

The Latin *patria*, like the Greek *hê patris* [ἡ πατρίς], means "the land of the father"; cf. PIETAS and RELIGIO. More broadly, see PEOPLE, with the terminological networks that imply soil and blood in contradistinction to those that imply language, culture, politics, and cf. *COMMUNITY*, *STATE*.

The German doublet of *Vaterland*, *Heimat*, has other connotations, particularly as used by Heidegger; see HEIMAT. On the way the political community in ancient Greece is designated, see POLIS. On the relationship to *oikos* [οἶκος], the "specific," the "familiar," see, on the one hand, ECONOMY, OIKONOMIA, and on the other, OIKEIÔSIS, a moral conception characteristic of Stoicism, which is rendered by "appropriation" (cf. *APPROPRIATION*).

➤ ANXIETY, GENDER, *LIBERTY*, LOVE, PROPERTY

| FEELING / PASSION / EMOTION / SENTIMENT / SENSATION / AFFECTION / SENSE

FRENCH   *sentir, passion, émotion, sentiment, sensation, impression, affection, sens*

➤ COMMON SENSE, CONSCIOUSNESS, ENGLISH, GEFÜHL, *IMAGINATION* [FANCY, PHANTASIA], MORAL SENSE, PATHOS, PERCEPTION, SENSE, STIMMUNG

There is a very complex relationship between the English term "feeling," a word of Saxon origin, and its counterparts in Romance languages. In French, the substantival infinitive *le sentir* is sometimes used, but with little conviction that it can be a consistently used equivalent. For French translators, moreover, the whole cluster of terms around feeling—"passion," "emotion," "sentiment," "sensation," "affection," "sense"—has posed such serious challenges that they sometimes prefer either to leave the English words in parentheses or to create verbal overlays like *passion, émotion, sentiment,*

sensation, impression, affection, or *sens*. The untranslatability of "feeling" in French reveals the peculiarities of a philosophy of affectivity or, at the least, a way of philosophizing, in English.

I. The Distribution of the English Terms

The definitions that seem to fix the meanings of terms do not refer to stable objects. Thus, Hume contrasts "impressions of sensation" with "impressions of reflection." The former, or original impressions "are such as without any antecedent perception arise in the soul, from the constitution of the body, from the animal spirits, or from the application of objects to the external organs." The latter, or secondary impressions, "are such as proceed from some of these original ones, either immediately or by the interposition of an idea" (*A Treatise of Human Nature*). But no sooner has Hume made these distinctions than he calls, without compunction, "sensation" what he has just picked out as "reflexion" and seems to enter into a relativist spiral that gives no term a chance to stand still. In addition, the connotation of the English terms does not coincide at all in this domain with the French terms. The situation thus contains a twofold discrepancy, one between the signs and their referents, and the other between the system of signs in French and that in English.

The place of "feeling" in the company of "sensation," "sentiment," "passion," "emotion," "affection," and "sense" causes problems precisely because French has no analogue for it and thus requires a different delimitation of the homologous terms. The gap that separates "feeling" from the other words clearly derives from its etymology, which owes nothing to Latin but is derived from the Old Saxon *folian* and Old High German, which gives us *fühlen*. The Old English *felan* initially meant "to perceive," "to touch," "to grasp." It is clear that its meaning derived much from "touch" by way of the affective domain. However, we would be wrong to believe that "feeling" took its place among the other terms of affect by filling in an empty space alongside them. We would be equally wrong to expect, moving from English to French, a simply different distribution of the territory of affect, as though affect could be considered a homogenous object with sensations on one side and sentiments on the other, as well as emotions, passions, and sense, the last of which is more normative than any of the others. The words display different attitudes in the understanding of affect rather than different territories. Hence, nothing in itself is referred to by "sensation," any more than by "sentiment," "feeling," or "sense."

The main divisions in English-language philosophies of the passions that make use of them as of a code are along the following lines: structural meanings versus those that come from an instantaneous and event-related affect; normative meanings versus factual ones; finally, meanings that imply a cognitive grasping versus those that do not.

II. Structure and Event

A. "Sensation" and "feeling" / "passion" and "sentiment"

We may speak, in English or in French, with regard to the sense organs, of sensation (*sensation*) of red or green, of heat or dryness, of hunger or sexual desire. However, English also allows for speaking, especially in Hume's idiom, of the "sensation" of one or another passion, to refer to the

latter not by its structure but as a felt event, by its own particular experienced quality of pleasure and/or pain. The sensation of a passion is distinguished from sentiment, which is the systematic framework of passion, composed of an object, a subject, qualities, causes, a context, of a trajectory of development and a sort of destiny. This structural or structuring character is clearly seen in phrases like: "These are the sentiments of my spleen and indolence" (*A Treatise of Human Nature*), where we understand that "spleen" and "indolence" are less sentiments than something under which sentiments lie (the sentence should probably be translated: "Tels sont les sentiments qui sous-tendent ma mélancolie et mon indolence"). We may conceive and even establish, according to Hume's turn of phrase, a system of sentiment or of passion ("constant and established passion"; ibid.); there could not be one for sensation or feeling. One sentiment can oppose another, be contrary to another, but a sensation is only indirectly contrary to another sensation, by the contrariety of the sentiment of which it is the momentary and intermittent experience. So much so that sentiment may well remain unconscious, insensate, and only become experienced at certain phases which make its presence known. Hume notes, for example, that "the passage from one moment to another is scarce felt" (ibid.).

Similarly, while passion is structured by the twofold association of impressions and ideas, it is not always obvious that we are "sensible of it" (ibid.), even if the passion is violent. In this sense, the noun "sensation" remains close in English to the adjective "sensible," which is often correctly rendered into French as *conscient*.

While the terms "sentiment," "affection," and "passion" clearly have a structural connotation, the word "feeling" on the other hand is, along with "sensation," no less clearly on the side of lived experience ("feeling or experience" and "feeling and experience"; ibid.). Thus Hume can speak in his essay *Of the Standard of Taste*, without any redundancy, though to the despair of translators, of "feelings of sentiment." M. Malherbe speaks of "ce qui s'éprouve par sentiment"; R. Bouveresse, of "impressions du sentiment"; G. Robel of "émotions du sentiment." None of these solutions is convincing, but is there any way to solve the problem?

B. "Sensation" and "feeling" distinguished by the status of their object

"Sensation" and "feeling" cannot however be substituted for one another indifferently. Unlike Latin or French, English has no verb that, like *sentir*, corresponds to "sensation." Thus the word effects a sort of transcendence of lived experience much more fully than does "feeling," whose proximity to "feel" gives us a simple verbal mode. "Sensation" detaches its object, like a conclusion is detached from its reasoning—which allows Hume to treat "probable reasoning" as "a species of sensation" (*A Treatise of Human Nature*). "Feeling" does not posit its object the way "sensation" does. We can even "feel a reverse sensation from the happiness and misery of others" (ibid.). "Feeling" barely has any consistency independent of what it feels, since it has no means of conceiving, imagining, or representing. "To feel" marks a collaboration in a process; it plays along either in an immanent or an adherent way, unlike sensation, which is more instantaneous

and event-like—so much so that "to feel" is often expressed in the passive, without indicating what is doing the feeling. "Something felt" is said in English, instead of *quelque chose de senti*, as it must be said in French. Hume goes so far as to say that "[a]n idea assented to feels different from a fictitious idea" (ibid.).

The impossibility for "feeling" to have an object in the same way that "sensation" has is not without consequences. "Feeling" cannot have truth like "sensation," if only because sensations can still be *felt*. If it has truth, it cannot be a truth in conformity with an object, but rather the rightness of an internal relation, which Hume calls "reflexion." The objects of "feeling" do not necessarily have reality and are usually fictions such as what we call our self, a force, a passage, an inclination, a propensity, a virtuality ("I feel I should be a loser in point of pleasure"; ibid.), a probability, a difference (of social condition), and so on, and one must learn to be on guard against their apparent reality. I feel an inclination in the way I say I feel my mind ("I feel my mind . . . and am naturally inclin'd"; ibid.); that is, as I feel something happening inside it, where the expression "in it" does not have a direct representational value.

III. The Normative Aspect: "Sense"

However, when it does not mean a sense organ, it is the word "sense" that attracts the collection of normative characteristics of an internal impression (*A Treatise of Human Nature*). One speaks of a sense of beauty, a sense of sympathy, or a moral sense, even at the cost of showing at the same time that there is no moral sense (see MORAL SENSE). We even sometimes use "sense" with the meaning of "good sense" or "reason" (see COMMON SENSE). The term "sense" implies a dimension of appreciation that does not necessarily fit with feeling or sensation. When Hume, in *Of the Standard of Taste*, gives the floor to the skeptic, the latter's argument maintains that sentiment, sensation, or feeling are always true as long as they are really felt; Hume's response consists in distinguishing truth from reality and emphasizing that "sense" implies an internal normativity: "Though this axiom [there is no arguing with taste], by passing into a proverb, seems to have attained the sanction of common sense; there is certainly a species of common sense which opposes it, at least serves to modify and restrain it."

IV. The Cognitive Aspect: "Sentiment," "Sense"/"Feeling," "Sensation"

There remains a final semantic gap with regard to affect in English. In relation to cognition, "sentiment" is clearly close to "sense," unlike "feeling," and certainly unlike "sensation."

Sensations are what they are; they are real but not necessarily true for all that: "All sensations are felt by the mind, such as they really are" (*A Treatise of Human Nature*). To attribute truth to them solely by virtue of their existence is to commit an error, confusing truth with reality.

On the other hand, "sentiment" is often equivalent to "opinion" and "judgment" (ibid.). At least, in the combination of the two concepts that Hume advances so often in his philosophy, "sentiment" frequently shows up near words that impute cognitive character to it. And while "sentiment" is not always equivalent to "opinion," it is in any case

an intellectual posture or attitude, an inclination to opine. The essay *Of the Standard of Taste*, which distinguishes sentiment from opinion, nevertheless points out that sentiment is capable of being right, while distinguishing, as against "a species of philosophy, which . . . represents the impossibility of ever attaining any standard of taste," its *rightness* from its reality, as though it were enough for it to be right (see GOÛT and RIGHT/JUST/GOOD).

Some notions that strongly resemble one another when looked at in one perspective can differ dramatically when looked at from another, no less pertinent one with regard to affect. Hume, who gladly joins notions together, comes up with every possible grouping ("feeling or sentiment" [*A Treatise of Human Nature*]; "impression or feeling" [ibid.]), not to mark their equivalence, but rather to show in each case what they contrast with as a pair.

Such a system could never be ontologically stable. Notions are distributed differently depending on the perspective adopted. Thus Hume can write "imagination feels that . . . ," or "fancy feels that . . . ," "judgement feels that . . . ," or "the spirit feels that . . . " (*A Treatise of Human Nature*). He thinks he can express laws with ontological weight concerning affect by emphasizing, like Bowlby in *Attachment and Loss*, that "*being felt . . . is a phase of the process itself*" (S. Langer, quoted by Bowlby; italics in original), whereas in fact he only manages to make the semantic tricks of his language work properly, or, at most, to explain them.

FICAR

ENGLISH   to stay, to be, to become

The Iberian verbs *ser* and *estar* have important nuances in their copulative use with respect to the condition of the relation between subject and attribute, whether permanent or transitory, essential or accidental, abstract or concrete, etc. Portuguese adds yet another difference since it has an additional verb for expressing the relation of subject and attribute: the verb *ficar*, which implants and fixes the attributes onto the subject.

I. The Concrete Origin of the Copula in *Ficar*

We rarely feel the concrete verbal meaning of a copulative verb, no doubt because of the semantic force of the attributes that tend to hide it or place it in the role of a simple articulation, even though the metaphysical consequences may be considerable. For the Portuguese verb *ficar* this concrete sense is easier to see. This is in part because of its rather clear etymology and the coexistence alongside it of a non-copulative meaning.

Ficar comes from the Latin *figicare* or *fixicare*, frequentative of *figere*, "to drive down," "to implant," "to fix," as in this expression of the irrevocability of speech: "Fixum et statutum est" (It is fixed and stabilized) (Cicero, *Pro L. Murena*, 62). In this sense it appears as a suffix in some French or English words, such as "crucifix," *crucifier*, "crucify." The use of *ficar*, which is translated as "to remain," more or less retains this sense of a verb of state: "There, well beyond the mouth of the river, . . . she remained (*ficou*), full of fear" (Guimarães Rosa, *Magma*). When the sense of remaining or fixing is transposed from the subject to the relation between the subject and its qualities, we have an attributive phrase. In the preceding example, we may simply remove the comma between the verb "remained" (*ficou*) and the complement "full of fear" to perform the transformation. The referent changes, obviously, since the attribute becomes the more important element of the predication: "*ela ficou cheia de medo [elle était remplie de crainte]*" (she remained full of fear). It is as though the attributes were affixed to the subject in a very concrete movement of being hooked onto it. Or rather, as though the subject froze momentarily in certain conditions, qualities, etc. We thus can understand the perfective aspect of the attribution, which results from this fixing.

II. The Aspectual Differences between *Ser*, *Estar*, and *Ficar*

H. Santos Dias da Silva speaks of the "concretizing necessity possessed by the Portuguese mind" (*Expressão linguística da realidade e da potencialidade;* cited in Quadros, "Da lingua portuguesa"):

> *Deus é bom* [God is good]: this is the only admissible phrase since God is an eternal subject independent of space and time, that is, non-limited; if we change the subject, and pick a limitable one or one in space or time, with a conditioned existence, the copula may be expressed by verbs other than *ser* [to be]: a) *o homem é bom*; b) *o homem está bom*; c) *o homem fica bom*.

By comparing the different ways of attributing the adjective "good" to the subject "man," we may see how the different verbs used for the copula transform the meaning of the sentence by their aspectual modulation:

A. *Ser*: "O homem é bom"

There is no problem translating it as "the man is good." This means that he is morally good, that he acts honestly, or that his flesh is tasty. His essence, his soul, or his consistency, his flesh—whatever pertains to him specifically, or universally if we speak of man as such—that is good. The verb *ser* in Portuguese expresses this idea of essential attribution.

B. *Estar*: "O homem está bom"

The verb *estar*, by contrast, denotes an instantaneous and momentary aspect, or an imperfect (*infectum*) one, especially

if we add gerundives to make verbal phrases that are common and very concrete, such as *estar sendo*, "to be in the course of being." Translation requires a context in order to reconstruct the aspectual information. If the man in question was sick or convalescent, for example, we would translate *está bom* by "he is well." If we used "the man is good" for "o homem está bom" or "o homem está sendo bom," this would be because he is doing an action well, such as his work. If we wish to specify that he is good now, but that no one knows how he will be tomorrow, we may translate "he is keeping well" or "he is holding up." But this translation is not always accurate, as in the famous case of the minister and philosopher E. Portela, who, asked about his selection as the Brazilian minister of culture, declared: "*Eu não sou ministro, estou ministro.*" The concision of the reply is untranslatable since to specify the aspect we would have to add two adverbial phrases: "I am not a minister eternally, I am only the minister at the moment," where this expression does not connote any political weakness.

With *estar*, it is rare to have a universal attribute. The verb *estar* can only speak of universals if it is a matter of conditions, with circumstantial complements, or adjectives determining dispositions, as if they were the circumstances of mind: "*O homem é um vivente que está sempre atento à própria morte*" (Man is a living being whose condition is to be constantly attentive to his own death). This does not prevent the verb, then, from paradoxically expressing the universal condition of the completion of each particularity, the existential condition of a being that is never completed as long as it is there—*está*—of a being at the moment of circumstance. Whence the importance of the verb *estar* in discussing the problems of existence in Iberian languages.

C. *Ficar*: "O homem fica bom"

Here the attribution has a perfective aspect. If the verb were in the perfect, *ficou bom* (he has been good), we would be back at the previous case: the verb *ficar* replaces the verb *estar* in the perfect without a problem. There would in addition be an idea of completed transformation, of becoming, which in French would either require a noncopulative verb: "*O homem ficou bom,*" "*L'homme a recouvré la santé*" (The man regained his health); or a present perfect: "*Et moi, de penser à tout cela, j'ai été* [fiquei] *encore une fois moins heureux. . . . J'ai été* [fiquei] *sombre et malade et saturnien comme un jour où toute la journée le tonnerre se prépare mais n'arrive même pas le soir*" (And I, thinking about all that, I have been [fiquei] again less happy. . . . I have been [fiquei] somber and sick and saturnine like a day where thunder is being readied all day but never arrives even at night" (Pessoa, *Poemas*). But in Portuguese, if the sentence with *ficar* is in the present, it still seems incomplete—it requires circumstantial complements as mentioned above: Portuguese requires that the circumstances be precise since *ficar* can only perform its copulative task in a precise, definite, and concrete environment. Where, when, how? The categories of time, place, cause, manner, and so on must structure the circumstance of the attribution: "*O homem fica bom*" (the man is good) . . . "*quando educado*" (when he is well brought-up), . . . "*se está só*" (if he is alone) . . .

"*durante o verão*" (in the summer). We may see even more clearly the circumstantial and perfective aspect in the common expression "*ficar com alguém,*" literally, "to have been with someone," which indicates a quick sexual affair, usually consisting of a single meeting.

FICTION

"Fiction" comes from *fingo* (in the supine, *fictum*), whose proper meaning is "to model in clay," like the Greek *plassô* [πλάσσω], which also refers to the activity of inventing fiction, as opposed to writing history. Fiction and plasticity are thus semantically linked: see ART, Box 2, HISTORY, Box 3, and PLASTICITY.

In addition, the proximity of *factum*, "fact" (from the Latin *facere*, "to make," Indo-European root **dhē-*, like the Greek *tithêmi* [τίθημι], "to place," which yields, for example, *faktura* [φακτυρα]; see FAKTURA), and *fictum* (from the Latin *fingo*, Indo-European root **dheig'h-*, which yields, for example, *figura*), consistently evokes the relation between fact and fiction, human fabrication (on the relation to Vico, see DICHTUNG, Box 1; Lacan, for example, in *L'étourdit* [in *Autres écrits* (Paris: Éditions du Seuil, 2001)], suggests the portmanteau spelling *fixion*). See also the Portuguese FICAR, which fixes predicates onto subjects.

I. Fiction, Language, and Truth

On the discursive status of fiction, see *DECEPTION*, DESCRIPTION, DICHTUNG (and as a complement, PRAXIS, on the singularity of Greek *poiêsis* [ποίησις] as the poet's "fabrication"; see POETRY), ERZÄHLEN, HISTORY. See also *RÉCIT* and *STYLE*.

More generally, for the relation to human practice, see *ACT*, PRAXIS, SPEECH ACT.

For the relation to truth and the real, see DOXA, ERSCHEINUNG, REALITY, RES, TRUTH; cf. *FALSE*, INTENTION, *LIE, THING*.

II. Fiction, Image, and Art

Fiction is related to images and the faculty of imagination; see IMAGE [BILD, BILDUNG, EIDÔLON], *IMAGINATION* [FANCY, PHANTASIA], MIMÊSIS.

For its relationships to artistic activity, see ART, BEAUTY; and regarding its invention, see ARGUTEZZA, CONCETTO, GENIUS, INGENIUM.

➤ GENDER, PEOPLE, SEX

FLESH

"Flesh" translates the French word *chair*, which comes from the Latin *caro*, *carnis*, which is connected with the Indo-European root **(s)ker-*, "to cut or share" (cf. Gr. *sarx* [σάρξ], "flesh," and *keirô* [κείρω], "I cut") and originally meant "piece of meat."

"Flesh" is one of the possible translations of German *Leib*, insofar as it is coupled not only with *Seele* (soul) but also with *Körper* (inert body). But unlike *Fleisch*, whose literal meaning is "flesh" in the sense of "meat," *Leib* is connected with *Leben*, "life." In the entry LEIB is found a study of the Latin, Greek, and Hebrew systems that constitute the matrices of this set and the meaning of their phenomenological reinvestment. To complete the German system, see ERLEBEN and GESCHLECHT. For the phenomenological and existentialist side, see DASEIN, EPOCHÊ, INTENTION. See also, on incarnation, BILD, BOGOČELOVEČESTVO, and OIKONOMIA.

➤ ANIMAL, GOD, *HUMANITY*, *LIFE*, SOUL

FORCE / ENERGY

FRENCH	*force*, *énergie*
GERMAN	*Kraft*, *Energie*, *Wirkung*
GREEK	*dunamis* [δύναμις], *energeia* [ἐνέργεια], *entelecheia* [ἐντελέχεια]
LATIN	*vis*, *virtus*

➤ *ACT*, EPISTEMOLOGY, MACHT, MOMENT, *POWER*, REALITY, STRENGTH, *VIRTUE*

In every European language, the word "force" (English) / *force* (French) / *Kraft* (German) underwent an abrupt transformation with the publication in 1847 of the dissertation "Über die Erhaltung der Kraft" [On the conservation of force] by Hermann von Helmholtz. More precisely, whereas in its vernacular usage, the word remained synonymous with power in the vague sense of the term (as in the expressions "having the force of law," "la forza del destino"), its conceptual usage, which until then had been just as vague, was suddenly, "by the force of mathematics," radicalized. After 1847 the word may have two translations: "force"/*force*/*Kraft* (directed action producing or tending to produce movement, in conformity with the laws of Newtonian dynamics), and "energy"/*énergie*/*Energie* (scalar, that is, nondirected, magnitude obeying a metaphysical principle of conservation, just like "matter"). The different manners of referring in German to the conservation of energy ("die Erhaltung der Kraft" / "die Konstanz der Energie" / "Energiesatz") are traces left by the difficult development of this notion.

I. "Force," "Energy," and "Conservation" in German-Language Physics

The word "energy" followed an evolution that was the reverse of the evolution of "force." It is derived from the Greek *energeia* [ἐνέργεια]; we know that Aristotle, in his study of movement, contrasts energy with potentiality and that this duality deeply marked the development of European philosophy and science until the beginning of the eighteenth century, when the word "energy" came to be used only in literature, "force" having supplanted it in discussions of the natural world.

■ See Box 1.

Nevertheless, this eclipse was of short duration: a century later, "energy" makes a noticeable comeback, in the precise physico-mathematical context of rational mechanics. In 1807, Thomas Young writes: "The term energy may be applied, with great propriety, to the product of the mass or weight of a body, into the square of the numbers expressing its velocity" (*A Course of Lectures*,1:59). The word acquires its definitive theoretical status with Helmholtz's 1847 essay "Über die Erhaltung der Kraft," in which it did not appear, but which nevertheless established its current definition. For an isolated system, it is the quantity that maintains a constant value throughout the physical processes taking place within. The meaning of the word in vernacular speech then expands, and it acquires a vague technical sense—even, in the last thirty years, a technocratic one. It is amusing to note that in this register of language that claims scientific exactitude, the sense of the word is completely denatured—as in the expression "energy economizing," which, strictly speaking, is a contradiction, since a quantity that by definition is "conserved" cannot be "economized."

This failure to abide by the basic rules of logic has the virtue of revealing a theoretical difficulty: the idea of conservation is one that is just as erudite as, if not more than, that of energy, and as such, it is inevitably misused by common language. The idea that energy might (and indeed must) be economized in the same way as water, money, or food, as though there were a risk of one day running out of it, is much more natural (and in agreement with the economic morality of the day) than that of a magnitude that is conserved, come what may. The comparison with commonly used French expressions such as "être à bout de force" (to have run out of strength) or "économiser ses forces" (to save up one's strength) shows that the interplay between *force* and *énergie* is actually a three-word game, the rules of which are set by *conservation*. It would not be possible to study the pair of *force*/*énergie* (or *Kraft*/*Energie*) independent of each word's constitutive relation to the word *conservation* (*Erhaltung*). Once this is established, a significant difference immediately appears between English and French on the one hand (along with the other Latin-based languages), and German on the other: although the word *conservation* was not affected by Helmholtz's 1847 article, the word *Erhaltung*, usually translated in French and English as "conservation," fell out of use (as a scientific term), replaced by *Konstanz* by Helmholtz himself in 1881, in the edition of his *Wissenschaftliche Abhandlungen*. The completely German expression "die Erhaltung der Kraft" was changed by its own author into one that he judged to be better upon reflection. We may assess the difficulty presented by the idea of conservation/constancy in German by the fact that today, what the other languages call "conservation of energy" is simply called *Energiesatz* or *Energieprinzip* (law or principle of energy), a surgical way of resolving the question.

We may hypothesize, then, that the difficulties faced by the German language in speaking of "conservation of energy" come from the fact that the historical development of this notion was effected by German-speaking physicists: basically Gottfried Leibniz, who laid the foundation, and Helmholtz, who brought it to a conclusion that today seems as though it must be definitive. Because the conceptual difficulties posed by this notion were first expressed by Germans in their own

1

Dunamis, energeia, entelecheia, and the Aristotelian definition of motion

➤ ART, GOD, NATURE, PRAXIS, PRINCIPLE, TO TI ÊN EINAI, VIRTÙ

We find a common translation in dictionaries for *dunamis* [δύναμις] and *energeia* [ἐνέργεια], namely, "force": *dunamis* is rendered by "power, force" and *energeia* by "force in action, action, act" (both may be said, for example, of the force of a speech; cf. RT: Bailly, *Dictionnaire grec français*, s.v. *dunamis*, III, and s.v. *energeia*, II.2). The difference between these two "forces" is nevertheless a cornerstone of Aristotle's physical (*Physics*, esp. book 3) and metaphysical (*Metaphysics* Θ) terminology:

> The object of his inquiry is *dunamis* and *energeia*, *potentia* and *actus* in the Latin translation, *Vermögen* and *Verwirklichung* (power and realization) in the German, or also *Möglichkeit* and *Wirklichkeit* (possibility and reality).
>
> (Heidegger, *Aristotle's* Metaphysics Θ *1–3*, trans. Brogan and Warnek, 13)

Aristotle bases the study of physics as a science (*epistêmê theôrêtikê* [ἐπιστήμη θεωρητική], "theoretical science," *Metaphysics* E.1, 1025b18–28) on a few fundamental principles and definitions. Strangely, some remain obvious for us, whereas others, even canonical ones such as that of movement, have become literally unintelligible.

Nature, *phusis* [φύσις], with which the *Physics* is concerned, is defined by movement. All natural beings (*ta phusei onta panta* [τὰ φύσει ὄντα πάντα]), says Aristotle, have in themselves immediately and essentially a principle of movement and fixity (*archên kinêseôs kai staseôs* [ἀρχὴν κινήσεως καὶ στάσεως], *Physics* 2.1, 192b13–14): a tree grows, unlike the products of crafts like a bed or a coat (see ART)—it is a "self-mover." Self-motion in the Aristotelian sense does not necessarily imply, as it does for us, locomotion: *kinêsis*, namely, *kata topon* [κατὰ τόπον], according to the *pou* [ποῦ], the "where," is only for Aristotle a species of the genus *kinêsis* [κίνησις], movement in the wide sense (a genus that, in a very Aristotelian way, is named after the most important species). This movement (*kinêsis*) he also calls change, *metabolê* [μεταβολή], formed from *ballô* [βάλλω], "to throw," and *meta*, indicating a further place or time. Thus, as Heidegger says, "Umschlag von etwas zu etwas" (a change from something into something, in "On the Essence and Concept of Φύσις," trans. Sheehan, 191), movement or change includes, besides displacement:

> —generation and destruction, *genesis kai phthora* [γένεσις καὶ φθορά], or

movement according to *ousia* [οὐσία], the "essence";

> —alteration, *alloiôsis* [ἀλλοίωσις], movement according to *poion* [ποῖον], the "what";
>
> —growth or diminution, *auxêsis kai phthisis* [αὔξησις καὶ φθίσις], movement according to *poson* [ποσόν], the "how much" (*Physics* 2, 192b14–16; 7.7, 261a27–36).

It is with the general definition of movement, given at the beginning of book 3, that we come across energy and potentiality, or, more literally, entelechy, *entelecheia* [ἐντελέχεια], and power, *dunamis*. Here is the celebrated definition, subject to so many glosses and such close scrutiny:

> *hê tou dunamei ontos entelecheia hêi toiouton kinêsis estin* [ἡ τοῦ δυνάμει ὄντος ἐντελέχεια ᾗ τοιοῦτον κίνησίς ἐστιν].
>
> We have distinguished in respect of each class between what is in fulfillment and what is potentially; thus the fulfillment of what is potentially, as such, is motion.
>
> (*Physics* 3.1, 201a10–11, ed. Barnes, 1:343)

We must weigh the ontological freight of this pair, potency and act. It constitutes in effect one of the four senses of being:

> "Being" has several meanings, of which one was seen to be the accidental, and another the true ("nonbeing" being the false), while besides these there are the figures of predication (e.g., the "what," quality, quantity, place, time, and any similar meanings which "being" may have), and again besides all these there is that which "is" potentially or actually.
>
> (*Metaphysics* E.2, 1026a32–b2, trans. Barnes)

Aristotle's physics is thus from the start metaphysical through and through. The first example of movement makes it possible to measure the distance with our kinetics:

> When what is buildable, insofar as we call it such, is in fulfillment, it is being built, and that is building.
>
> (*Physics* 3.1, 201a16–18)

It is the transition from power to act, the energy of the potency that deploys itself throughout the time of the actualization ("neither before nor after," 201b7), that constitutes motion, thus neither pure and inactive potentiality ("When there is a house [οἰκία], there is no

longer the buildable [οὐκέτ' οἰκοδομητόν]," 201b11).

Movement is thus *energeia atelês* [ἐνέργεια ἀτελής], a putting to work that has not achieved its goal ("an act, but incomplete" or "imperfect," *Physics* 3.2, 201b32; cf. *Metaphysics* Θ.6, 1048b29) or *entelecheia atelês* [ἐντελέχεια ἀτελής], an incomplete fulfillment (*Physics* 8.5, 257b8–9). Aristotle thus uses the terms *energeia* (from *ergon* [ἔργον], "work," and its product, a faculty and its exercise; see PRAXIS) and *entelecheia* (from *telos* [τέλος], the "end" and goal; see PRINCIPLE) to refer to this progressive attainment of the end, the realization of self, which leads to rest. As noted at *Metaphysics* Θ.8, 1050a21–23:

> The *ergon* is the *telos*, and the *energeia* is the *ergon*; this is why the word *energeia* is made from *ergon* and tends to mean *entelecheia*.

J. Tricot translates:

> L'œuvre est la fin, et l'acte est l'œuvre; de ce fait aussi le mot *acte*, qui est dérivé d'*œuvre*, tend vers le sens d'*entéléchie*.

And Bonitz comments (RT: *Index aristotelicus*, s.v. *entelecheia*):

> Whereas *energeia* is the action by which something is led from possibility to the full and perfect essence, *entelecheia* refers to this perfection itself.

By contrast with physical substances (*hai phusikai ousiai* [αἱ φυσικαὶ οὐσίαι]), God, whose substance is only act or energy (*hê ousia energeia* [ἡ οὐσία ἐνέργεια]) (*Metaphysics* Λ.6, 1071b20)—more precisely, "energy of mind (*hê nou energeia* [ἡ νοῦ ἐνέργεια])" and hence "the best and eternal life" (b26–28; see UNDERSTANDING, Box 1)—is necessarily immobile: as the prime mover, he is "that which moves without being moved [*ho ou kinoumenon kinei* (ὃ οὐ κινούμενον κινεῖ)]" (1072a25).

For the same reason, in our sublunary world, *dunamis* is a sovereign and complex notion. It refers first, as early as Homer, to *potestas*, physical or moral force, the power of men or gods, political power. The term can also apply to the value of a word, the power of a number that is squared, armed forces, and then refers to what we could call an effective reality. But *dunamis* also means *potentia*, that is, a "not yet," a pure virtuality, this "potential Hermes that the

sculptor perceives in the wood" (*Metaphysics* Θ.6, 1048a32–33), and *virtus*, a faculty ("when we call scientific even one who does not speculate if he has the faculty of speculation [*kai ton mê theôrounta an dunatos êi theôrêsai* (καὶ τὸν μὴ θεωροῦντα ἂν δυνατὸς ᾖ θεωρῆσαι)]," 1048a34–35), which Aristotle discusses by way of its pairing with activity. *Potentia* thus touches *possibilitas*, the logical concept opposed to *adunaton* [ἀδύνατον], to impossibility in the sense of contradictory.

> That which is in actuality capable, however, is that for which nothing more is unattainable once it sets itself to work as that for which it is claimed to be well equipped.
>
> (*Metaphysics* Θ.3, 1047a24–26; see also, for analysis of the senses of *dunamis*, *Metaphysics* Δ.12)

The connection between physics, metaphysics, and logic at work in all aspects of human life, from politics to art, rests on this dynamic. But this dynamic is only itself dynamic, in motion, because *energeia* or *entelecheia* is *proteron* [πρότερον], "prior" to potentiality, or "first" with respect to it (*Metaphysics* Θ.8, 1049b5): in Aristotle, as Heidegger points out, we do not move from *potentia* to *actualitas*; according to the proposition that becomes possible with Latinization, "in order for something to be *real* . . . it must first be *possible*" (*Die Physis bei Aristoteles*).

On the contrary, the energy or the act must be already present to attract the power or the force; energy is more *ousia* than potentiality, just as God is with regard to the other beings—or the *morphê* [μορφή], "form," with regard to *hulê* [ὕλη], "matter," within the composite substance (*Physics* 2.1, 193b7–9).

This complex terminology, so subtly developed, related to a cosmology destroyed by modernity, nevertheless continues to evolve, notably through Leibnizian dynamics, coming to encode our new universe as well.

Barbara Cassin

language, in words that necessarily were not scientific in origin, but borrowed from everyday language, they only remained truly meaningful in that language. The other European languages had to be satisfied with conventional translations—to which they were all the more entitled, as the mathematical formulation of the law of "conservation of energy" is itself utterly unambiguous. We may try to verify this hypothesis by showing that the focus on *Kraft* and *Erhaltung* gives rise, from the words' very usage in ordinary German, to peculiarities that the confrontation between "force" and "conservation" cannot suggest in English, let alone French. Thus, the ambiguities of the word *Kraft* are not, and never will be, rigorously the same as those pertaining to the French and English word "force."

II. The Indeterminacies of Physical Definitions of Force in the Mechanistic Tradition: Internal/External Conservation/Change

In the mechanistic tradition of the eighteenth and early nineteenth centuries, the meaning of the word "force" was subject to an indeterminacy of which physicists before 1847 were fully aware without being able to specify its exact nature (unlike us who were brought up under a strict distinction between the concepts of force and energy). It is particularly flagrant in the 1760 *Letters to a German Princess*, which Leonhard Euler devotes to the question of force (note that the author is a German writing in French, the language of scientific communication at the time):

> The sun and all the planets *are endowed with a* similar *virtue* of attraction by which all bodies are attracted. . . . If the body of the Earth were larger or smaller, the gravity or weight of bodies would also be greater or smaller. From which we understand that all the other large bodies in the Universe, like the sun, the planets, and the moon, *are endowed with a* similar attractive *force*, but one which is greater or lesser depending on whether they are themselves larger or smaller.
>
> Le soleil et toutes les planètes *sont doués d'une* semblable *vertu* d'attraction par laquelle tous les corps sont attirés. . . . Si le corps de la terre était plus grand ou plus petit, la gravité ou la pesanteur des corps serait aussi plus grande ou plus petite. D'où l'on comprend que tous les autres grands corps de l'univers, comme le soleil, les planètes et la lune, *sont doués d'une force* attractive semblable, mais plus ou moins grande suivant qu'ils sont eux-mêmes plus ou moins grands.
>
> (Letters 53 and 55, trans. Hunter [emphasis added])

Force is thus a virtue, a property of bodies, a power that they possess because of their bodily nature itself. Force is thus a property of matter.

The question therefore arises of what the nature of this power possessed by matter is, how it is exercised, how it is manifested, what its effect is, how it is expressed. Note first of all the confusion of the French language, which stutters and is at a loss for words on this point. It would not be the same in German, where the word *Kraft* is unmistakably associated with *wirken*, *Wirkung* (simply look at the corresponding entries in any German dictionary: *Kraft* defines *Wirkung* and *Wirkung* defines *Kraft*). In other words, the German language has a word for referring to the actualization of a power, a force, and this word is lacking in Latin-based languages. The response given by Euler to the question of the determination of the power that must be associated with the word "force" ("a term in common use, although many by whom it is employed have but a very imperfect idea of it") is simple (Letter 76, trans. Hunter): "We understand by the word force whatever is capable of changing the state of a body." (Euler is not clear in this passage, but the state at

issue is that of motion, in conformity with the Newtonian doctrine he is promulgating.) We need not seek far: the important word here is "change." "Change," which is the opposite of . . . conservation.

However, to conserve, "conserve itself in the same state, whether rest or motion," is another quality of bodies (unless it is the same one, a question that is only dealt with in 1916 with the theory of general relativity), also related to their bodily natures, which is called "inertia," but which, for Euler, cannot be identified with force without violating language, since it is "rather the contrary," by virtue of the earlier definition of force. Moreover, inertia exists in the body itself (it is *insita*, according to Isaac Newton's adjective), whereas force, as Euler understands it (what Newton calls *vis impressa*), is necessarily external to the body whose state it changes:

> Each time a state of a body is changed, we must never seek the cause in the body itself; it always exists outside the body, and that is the correct idea we must have of a force.

> Toutes les fois que l'état d'un corps est changé, il n'en faut jamais chercher la cause dans le corps même; elle existe toujours hors du corps, et c'est la juste idée qu'on doit se former d'une force.

> (Letter 74, trans. Hunter)

It is plain that the concept of force described by Euler, a defender of Newtonian ideas, is much more complex than what the simplified teaching of Newtonian mechanics suggests: it is first and foremost a power of bodies, which they exercise on other bodies. It is certainly important that this power is directional, and thus that force in this case is mathematically represented by a vector, but this is secondary, in the sense that this is not part of the definition—it results from Newton's second law, which establishes that the power in question has the effect of modifying the quantity of movement, a directed magnitude.

Let us return to Euler and the "correct idea" that must be formed of a force, in virtue of which he is against Leibniz and the system of monads:

> It is false that the elements of matter, or monads, if there are any, are endowed with a force for changing *their* state. It is rather the opposite which is true, that they have the quality of conserving themselves in the same state.

> Il est faux que les éléments de matière, ou les monades, s'il y en a, soient pourvues d'une force de changer *leur* état. Le contraire est plutôt vrai, qu'elles ont la qualité de se conserver dans le même état.

> (Letter 76, trans. Hunter)

The controversy between Newtonians and Leibnizians is thus over the effect of "force," not its existence as a power of bodies. The question is whether a force is capable of changing the state of the body possessing it, or only that of other bodies to which it is external.

> I say therefore something which will seem strange, that the same faculty of bodies by which they attempt to conserve themselves in the same state is capable of providing forces which change the states of others.

> Je dis donc ce qui paraîtra bien étrange, que la même faculté des corps par laquelle ils s'efforcent de se conserver dans le même état est capable de fournir des forces qui changent l'état des autres.

> (Letter 76, trans. Hunter)

The question is thus twofold, or repeated, dealing with two pairs of opposites: internal/external and conservation/change.

Should we, then, like Euler, suppose that the causes of changes of states in bodies are external to them, and thus consider only forces that are necessarily external? (Newton also does so to some extent; though he does not hesitate to speak of *vis insita* with regard to inertia, he nevertheless specifies that a body only exercises this internal force if another external force, *vis impressa*, attempts to make it change its state of motion.) This conception held sway for two centuries, despite the logical difficulties that Euler modestly characterizes as strange, and that are the source of its demise. We know that the strangeness in question disappears once we admit that, as in general relativity, inertia and gravitation are two aspects of a single phenomenon: the interaction of bodies in a space that is itself considered a physical entity. For a modern physicist, after 1916, "force" is synonymous with "correlation." As Hermann Weyl writes, "Force is the expression of an independent power that connects the bodies according to their inner nature and their relative position and motion" (*Philosophy of Mathematics and Natural Science*, trans. Helmer, 149).

Or, should we think with Leibniz that bodies can change their state as the effect of an internal cause, to which it would also be fitting to apply the concept of "force"? The fact that this conception, that of monads, is closer to the modern notion of force—insofar as it implies that a body only exists to the extent that it is related to others, and that it does not exempt itself from space—does not make it superior with regard to what concerns us here, namely the evolution of the word "force"/*force/Kraft*. It is interesting rather because it leads naturally to the question of conservation, which we said earlier was intrinsically related to that of force. Indeed, in a conception where the change by which the effect of force is measured affects the state of all bodies, it becomes crucial to look for what remains constant in all this change. Before going further into the examination of what meaning must be given to the word "conservation," we should note that it does not appear explicitly in Newton. The question of whether the idea is there implicitly, hidden in the consequences of the "third law of motion," which states that to every action there corresponds an opposite reaction, is still debated today. We shall stick here, for once, to the "facts": the word does not appear in Newton. We shall restrict ourselves then to examining its meaning where it does appear, namely in the Leibnizian tradition.

III. The Leibnizian Metaphysics of Force: Force and Substance

A. *Vis* or *virtus* and act

"Force" is not subject in Leibniz to the same type of definition as that given by Newton or Euler. The word does not refer to a physical phenomenon characterizing "bodies," but

to a metaphysical concept, aimed at clarifying the metaphysical notion of "substance":

> I will say for the present that the concept of forces or powers [*vis* or *virtus*], which the Germans call *Kraft* and the French *la force*, and for whose explanation I have set up a distinct science of *Dynamics*, brings the strongest light to bear upon our understanding of the true concept of substance.
>
> Je dirai que la notion de *vis* ou *virtus* (que les Allemands appellent *Kraft*, les Français *la force*), à laquelle je destine pour l'expliquer la science particulière de la *Dynamique*, apporte beaucoup de lumière à la vraie notion de substance.
>
> ("De la réforme de la philosophie première et de la notion de substance" [1694], trans. Loemker)

Because it is so intimately related to "substance" (etymologically, what lies beneath, what is preserved), force is related to the notion of conservation from the start. However, nothing proves that this conservation is of the same sort as that which, according to Newton, characterizes the state of motion of a body in which no external force is being exercised. In any case, this conservation is not static at all; it is not an inertia, a passive resistance (which is only active if a *vis impressa* is opposed to it). Force, for Leibniz, is above all and essentially active: "It contains a certain act or entelechy and is intermediate between the faculty of acting and action itself." It is a "power of acting," inherent to any substance, such that "some act is always coming from it." This is where, as already noted, an essential difference with force in the Newtonian sense lies (besides the fact that force is related to "bodies" for Newton, but to "substances" for Leibniz).

B. Force and action, *Wirkung*

The word "act" appears in Leibniz as indissociable from the notion of force. It is clearly borrowed from the scholastic tradition. However, it is noticeable that, in this text as in others, Leibniz makes a free use of it, playing with its cognates: *action*, *agir*, terms borrowed from ordinary language. It is thus not surprising to see a notion (destined for great things in mathematical physics) appear under the name of *action* over the course of the development of Leibnizian dynamics—as, for example, in the title of an opuscule in 1692: "Essai de dynamique sur les lois du mouvement, où il est montré qu'il ne se conserve pas la même quantité du mouvement, mais la même force absolue, ou bien la même quantité de l'action motrice" [Essay in dynamics on the laws of motion, in which it is shown that the same quantity of motion is not conserved, but rather the same absolute force, or the same quantity of moving action]. *Action*, however, is the translation of *Wirkung*. The translation is necessarily imperfect, since there is no strict equivalent of *Wirkung* in French, but it does have the merit, for a German-speaking philosopher writing in French, of introducing the concept of action as "naturally" related to that of force. It goes without saying that this link between the words *Kraft* and *Wirkung*, insofar as it rests on an implication, a translation of undertones, is not in the least obvious for a French-speaking reader. Subsequent generations of French-speaking mathematical physicists wondered

why *action* (appearing in technical expressions such as the principle of least action, quantum of action, and so on) bears this name, and accepted it as a convention. This lack of obviousness of the link between *action* and *force* (being strong, *fort*, is neither necessary nor sufficient for acting) is probably due to the fact that French has only one word, *force*, where German—and English, thanks to its joint Latin and Saxon origins—has *Kraft* and *Stärke* ("force" and "strength"), which allows it to distinguish between power and vigor (see STRENGTH).

Nevertheless, action (or moving action) is defined by Leibniz as a double product: product of the "formal [or essential] effect" of movement—which itself "consists in what is changed . . . that is, in the quantity of mass that has been displaced and in the space, or the length by which this mass was transferred"—and the speed with which the change takes place. Leibniz has no trouble justifying the fact that the formal effect is not by itself sufficient for characterizing the action (in the sense of *Wirkung*) of the absolute force on the basis of everyday language (French this time, however): "It is clear that that which produces the same formal effect in less time acts more." As to why the action is what gives the measure of absolute force, bringing in speed and even dynamics, rather than the formal effect, which is outside of time, purely static, Leibniz, appealing to the argument he has used countless times according to which matter is not reducible to its extension, explains it thus: "The formal effect consists in the body in motion, taken by itself, and does not consume the force at all." Without entering into the details of this argument, which would require saying more about Leibnizian dynamics, let us simply note the verb used here: *consumer*, to consume—the force is consumed. And Leibniz continues: the action, unlike the formal effect, consumes force—in perfect conformity with the association suggested in German between *Kraft* and *Wirkung*.

C. Maintaining force

Here is where an "axiom of higher philosophy" comes in, which "cannot be geometrically demonstrated," and which, for this reason, would today naturally be described as "metaphysical": "The effect is always equal in force to its cause, or, what is the same thing, the same force is always conserved" (Leibniz, *Theodicy* [1710], 3.346). This is an expression of the principle of congruity, "that is, the choice of wisdom." Let us make this choice, and remember that force is consumed. In order for it to be preserved, it must, like a flame, be maintained. It must be watched over (as in the ritual expression "Gott erhält die Welt"), as an obligation ("Die Selbsterhaltung als Pflicht" [Schiller]), and we must contribute to its maintenance, as we would a dancer or a gigolo; we must conserve it in the same sense as museum curators; in sum, we must act, be active, inject enough action into it. In order for force to be conserved, there must, as Leibniz says, "be during this hour as much motive action in the universe or in given bodies, acting only on each other, as there would be during any other hour we might choose."

Passing by way of action thus makes it possible to specify what we must understand by *conservation* in Leibniz; it is simply the translation of *Erhaltung* in French; *entretien* (maintenance) would probably have been better.

IV. *Die Erhaltung der Kraft*: From Conservation to Constancy and from Force to Energy

When the young Helmholtz (he was 26, not long finished with his studies) uses the word *Erhaltung* in 1847, he places himself, knowingly or not, willingly or not, directly in line with the Leibnizian tradition. Not that he was Leibnizian: like all of his contemporaries, he was firmly convinced of the validity of the Newtonian conception of movement and the operational character of Newton's laws. However, according to Max Planck (*Das Prinzip der Erhaltung der Energie*), the idea—Cartesian in origin but amply used and illustrated by Leibniz—that there is a fundamental entity preserved in all physical processes, from which all movement may be derived, was a commonplace in the German mechanistic tradition:

> As long as there was no clear notion connected with the word "Kraft" any dispute over the quantity of this "Kraft" was without a proper theme. Yet it must be admitted that this dispute had a much deeper content at its foundation; for, the parties to the dispute were to some extent united, even if they did not express this very clearly and often, as to what they wanted to understand under the word "Kraft." Descartes as well as Leibniz, had certainly some, even if not very precise, notion about a principle, which expresses the unchangeability and indestructibility of that from which all motion and action in the world emanates.

> (Cited by Elkana, *Discovery of the Conservation of Energy*, 98)

In sum, the idea of conservation (in the sense of *Erhaltung*) was tucked away in everyone's minds, even when the reference to Leibniz (or René Descartes) had been forgotten. In these conditions, it is not surprising that Helmholtz titled his dissertation "Über die Erhaltung der Kraft"—especially since, despite his young age, Helmholtz had already worked for seven years in the domain of physiology, where the idea of an entity from which the mechanical powers of a living organism are derived, as well as what we may call its vital heat, was defended, among others, by Justus von Liebig. The even vaster idea that the phenomena of nature could all be reduced to a single "force," an idea developed by Kant in the *Metaphysical Foundations of Natural Science*, though not rigorously synonymous with that of conservation, is nevertheless close to it, insofar as both presuppose a unity of the physical world that would be confirmed by the existence of a conserved quantity.

Helmholtz, whose ambition was thus to show that the phenomena known at his time could be unified under the aegis of a conserved entity, proceeds in order from the simplest to the most complex. It is therefore utterly natural that he titles the first section (of six) of his essay "Conservation of Living Force [*lebendige Kraft*]." This magnitude, as everyone knew indeed since Leibniz, is conserved in elastic collisions between bodies, which may be considered the simplest case of a physical phenomenon. Helmholtz then proceeds, in section 2, to a generalization of the first section and shows that, in the more complicated case of a body that moves from one position to another in the course of its movement, it is

possible to establish an equivalence between the variation of what we call today its kinetic energy (product of the mass by the square of the velocity) and another magnitude Helmholtz calls "the sum of the forces of tension [*Spannkräfte*] between these two positions." More precisely, the variation of kinetic energy is equal to the *opposite* of the sum of the forces of tension, where that "sum" (today we would say "the definite integral") can itself be expressed differentially, and hence as a change in a certain magnitude. It goes without saying that this "force" of tension does not have the dimension of a Newtonian force, since it has the status of what we would now call "work," which is itself the product of a Newtonian force by a displacement. This hardly bothers Helmholtz, as, like his contemporaries, he is used to giving the word *Kraft*, in a general context, the sense of power, a quantity that is poorly defined but scalar in nature, and in a Newtonian context, the sense of a directed action, hence vectorial in nature.

The important point here is that the equation derived does not deal with two magnitudes but with their variations between a certain initial state and a certain final state; and these variations have opposite signs. Yet, if two magnitudes undergo in a certain process equal changes of opposite sign, this is because their sum does not vary; it remains constant. Helmholtz gives this sum the name *Kraft*, which is fully justified by the procedure of generalization from *lebendige Kraft*, to which he has just appealed. However, can we call this second section *Erhaltung der Kraft*, as he does, without twisting the meaning of *Erhaltung*? The entity that he has just identified as *Kraft* is not conserved, in the sense of being maintained; it is or remains constant, in the sense that it undergoes no variation, which is not the same. Helmholtz's force, from this point of view, is closer to matter, which remains self-identical even when it undergoes transformations, than it is to Leibnizian living force, for which the word *Erhaltung* was perfectly adequate. This comparison with matter that takes various forms (solid, liquid, gas) while remaining basically constant is in fact pursued by Helmholtz in the last four sections of his essay, where he studies in succession the "force-equivalent" of heat, electrical processes, magnetism, and electromagnetism, before concluding with a few words concerning physiological processes. Throughout this part of the 1847 essay, the governing idea is that of conversion—conversion of one form of energy into another—which the word *Erhaltung* does not convey at all. It is thus appropriate that in 1881, Helmholtz replaces it with *Konstanz*, doubtless more exact.

We might think that, on the other hand, the simultaneous transformation of *Kraft* into *Energie* does not correspond to any correction of meaning, and that it is purely conventional. After all, Helmholtz is only giving a different name to the magnitude whose conservation he had demonstrated in 1847 in order to avoid the confusion of two different magnitudes: the scalar magnitude updated by Helmholtz, and Newtonian force, a vectorial magnitude. It is not certain that this name change only follows considerations of convenience. Perhaps we might think that the peculiar construction of the German language in fact plays an essential role. This construction is indeed such that in *Erhaltung* we clearly hear *halten*, which is why Helmholtz could not keep it to refer to the process by which a certain magnitude keeps the same value. However,

it is just as impossible, given the almost cliché expression of *Erhaltung der Kraft*, to reserve *Kraft* to refer to this new magnitude that remains constant. *Kraft* is inevitably associated in Helmholtz's mind, and in those of his contemporaries, with *Erhaltung*, and it was impossible for him to speak of the constancy of force (*Konstanz der Kraft*). *Kraft* had to disappear along with *Erhaltung*.

| FORM

"Form" comes from the Latin *forma*, itself possibly borrowed, by way of Etruscan, from the Greek *morphê* [μορφή], which means "form, beautiful form" and concretely refers both to the mold and to the shape of the resulting object, whether the word concerns arts and techniques (the form of a shoe, the plan of a house, the frame of a painting), norms (a legal formula, the imprint on a coin), or speech (a grammatical form, a stylistic device). The term is especially plastic in French, as in Latin, since it was able to serve to translate the Greek words *eidos* [εἶδος], "idea" (in contrast to *eidôlon* [εἴδωλον], "image") or "form" (in contrast to *hulê* [ὕλη], "matter"); *morphê* [μορφή], "aspect, contour"; *schêma* [σχῆμα], "shape, manner of being"; *ousia* [οὐσία], "essence"; *to ti esti* [τὸ τί ἔστι] and even *to ti ên einai* [τὸ τί ἦν εἶναι], "quiddity"; *paradeigma* [παράδειγμα], "model"; or *charaktêr* [χαρακτήρ], "mark, distinctive sign."

I. Physical and Metaphysical Aspects

The article SPECIES compares the collection of Latin and Greek networks related to "form." Complementary consideration appears under ESTI and TO TI ÊN EINAI, regarding the more Aristotelian terminology of ontology (see also FORCE, Box 1).

On the relation between form, substance, and subject, see SUBJECT.

On "formal ontology," see INTENTION, REALITY, RES, and SACHVERHALT; cf. MERKMAL.

On the relation between form and phenomenon, see ERSCHEINUNG, cf. AESTHETICS, PERCEPTION, REPRÉSENTATION, SUBLIME.

II. Aesthetic Aspects

For the relation, essential to Platonic ontology, between form-model and image-copy, see EIDÔLON (see *IMAGE*) and MIMÊSIS.

Besides SPECIES, see also CONCETTO, Box 1, DISEGNO, PLASTICITY; cf. ART.

III. Forms and Formalism

For the notion of "form" in grammar, see WORD, II.B and Box 2); for "form" in rhetoric, see *STYLE, I*.

On logical formalism, see especially IMPLICATION.
On legal formalism, see especially LAW and RULE OF LAW.
On moral formalism, see SOLLEN; cf. MORALS, WILLKÜR.

FRENCH

Language Stripped Bare by Its Philosophers

➤ CIVIL SOCIETY, COMBINATION AND CONCEPTUALIZATION, COMMON SENSE, ENGLISH, ERZÄHLEN, EUROPE, GERMAN, GREEK, ITALIAN, LOGOS, PEOPLE, POLITICS, PORTUGUESE, *REASON,* RUSSIAN, SEX, *TO BE,* WORD ORDER

The establishment of thought in the French language took on a political meaning from the start: the privilege given to French does not derive from any intrinsic character of the language, but instead from the possibility of a universal and democratic philosophical communication. A language of women and the working class rather than of scientists, philosophical French relies on the belief that the act of thinking is open to everyone; its intimate relation with literary writing has no other reason behind it. Against a fascination with words and etymology, that is, with origin and substance, French sets the primacy of syntax, that is, of relation and assertion. This is why, once again, philosophy in French is political: between axioms and sentences, against consensus and ambiguity, French plants its certainty and its authority, which are also the source of its persuasive beauty.

In 1637 Descartes published *Discours de la méthode* in French anonymously. This was four years earlier than the publication of *Meditationes de prima philosophia* (*Meditations*), which was in Latin. Descartes never translated the *Discours* into Latin (that was done by Étienne de Courcelles in 1644), but neither did he persist in defending the Latin of the *Meditations*. He consistently said that the French translation by the Duke of Luynes, followed by that of the *Objections and*

Responses by Clerselier, which he thoroughly reviewed, could serve as a reference, or as Baillet said later, that it gave *un grand relief* of his thought (made it stand out clearly) and that it was extremely important to support reading by those who, "lacking the use of scientific language, would not fail to have a love and a disposition for philosophy" (*Vie de Monsieur Descartes*).

Descartes' linguistic strategy is unambiguous. It gives primacy to French, while nonetheless demonstrating to "Messieurs the deans and doctors of the sacred faculty of theology of Paris," the addressees of the prudent and defensive preface of the *Meditations*, that he knows his way around the official scientific language and that he can, like everyone else, praise the authority of the "name of Sorbonne" in decadent Latin.

Similarly, in the twentieth century, the major creative figures in philosophy in French—Bergson, Sartre, Deleuze, Lacan—all claimed the right to write in their native language, in sum the right to *freedom* of language, despite seeking at the same time to show the academy their technical competence. It says much about the strength of this initial intention, which established philosophy in accordance with an undisguised desire to write freely in the mother tongue without seeking an anarchistic break with scholarly institutions.

The problem is understanding what, for Descartes and his successors, the properly philosophical stake of this initiation of thought in the French language was, which was also the beginning of an openly declared equivocation, at the risk of being cursed and cast out by the learned, between the status of philosopher and that of a writer.

I. The Politics of French: The Democratic Communication of Philosophy

The whole point, however, whose consequences are still with us today, is that *the privilege given to French had nothing to do with the language as such.* Unlike what happened little by little—much later—with German and what had taken place in antiquity with Greek, the connection between philosophical technicality and the French language was not accompanied by any speculation about the philosophical characteristics of French. Even better: Descartes was profoundly convinced that the force of thought has nothing to do either with language or with rhetoric:

> Those with the strongest reasoning and the most skill at ordering their thoughts so as to make them clear and intelligible are always the most persuasive, even if they speak only low Breton.

> (*Discourse on Method*, part 1, in *Philosophical Writings*, vol. 1)

In other words, the transmission of thought is indifferent to language. It had, for Descartes, three extralinguistic criteria:

1. Reasoning—the ability to string together thoughts on the basis of indubitable axioms, the paradigm of which is geometrical writing, travels across languages universally.
2. The internalization (the "digestion") of ideas, which is their intimate clarification (Boileau's "that which is well-conceived") and whose utterance is only a consequence. But internal thinking, which is the intuition of immanent ideas, is nonlinguistic.
3. Clear and intelligible transcription, which, if criteria 1 and 2 are satisfied, may proceed in any dialect (Low Breton, for example) and persuade any mind.

This last item is of great importance. One of the reasons why, in Descartes's eyes, it would be disastrous to have to scrutinize the singularities of language reflects a principled universalism. No linguistic condition may be attached to the formation of true thoughts, nor to their transmission, nor to their reception. This is one of the meanings of the famous axiom about good sense, that it is "the most equitably shared thing in the world." This is in effect a universalist egalitarian axiom, as Descartes was careful to make clear: "[T]he power of judging well and distinguishing the true from the false . . . is naturally equal in all men," and as for reason, it is "whole in each person" (*Discourse on Method*).

The desire to express philosophy in French is thus related not to a consideration of an appropriation by French of the adequate expression of thoughts, let alone a speculative national doctrine concerning the coincidence of Being and language (German, Greek), but rather to a conclusion that is democratic in origin and concerns the formation and destination of thought. It is a matter of speaking the same language as "everyone"—in France, French—not that it will have special benefits either for concepts (which are themselves indifferent to language) or for the language itself (since French would not acquire any special privileges).

What is more, a point that seems empirical, though we have reasons to believe that it is not at all so, beginning with Descartes and linked to the choice of French, the conviction arose that philosophical discourse must be addressed to women, that the conversation of intelligent women is a means of approval or validation that is much more important that all the decrees of the learned. As Descartes marveled, "Such a varied and complete knowledge of all is to be found not in some aged pedant who has spent many years in contemplation but in a young princess whose beauty and youth call to mind one of the Graces rather than gray-eyed Minerva or any of the Muses" (Dedication to *Principles of Philosophy*, in *Philosophical Writings*, vol. 1). This moment of princesses is in reality a basic democratic intention that turns philosophical discourse toward discussion and seduction, toward Venus rather than Minerva, moving it as far away as possible from academic or scientific entrenchment. This intention will be repeated by all the notable French philosophers, who comprise a significant anthology: Rousseau, and also in his own way Auguste Comte, and then Sartre, as well as Lacan. All of them wished to be heard and admired by women and knew that they must be courted neither in Latin nor in the language of pedants.

We may say that, once philosophy in France became linguistically "nationalized," it followed the path of sociability, ease, and immediate universalism, rather than considering the materiality or the history of languages. It was neither a matter of their being rooted in some mode of original speech that had more or less been forgotten (traditional logic), nor of what rhetoric had imposed in terms of cadence or forms necessary for the deployment of thought (sophistic logic).

The thesis may be put simply: the reason philosophers, starting with Descartes, began writing in French is one that was in their eyes *political in nature.* It is only a matter of answering two questions: Where does philosophy come from? and Who is it for? The answer to the first is that philosophy has no particular single source and may come from anywhere by a free act of which any mind is capable; and to the second, that philosophy is aimed at everyone, which in the end means, as Comte says "systematically" (faithful here to Descartes and Rousseau and anticipating Sartre and Deleuze), at women and the working class.

To whom, further, is philosophy *not* addressed? To the learned, to the Sorbonne. Just writing in French is not enough to prove this. One must write this "modern" French, this writer's French, this literary French, which is distinguished from the "academized," or "correct," French transmitted in universities. Even a philosopher as calm as Bergson established himself with a style that, while certainly fluid and relaxed, was also loaded with comparisons, caught up in an imperious movement, and in the end resonant with the "artistic" language of the end of the nineteenth century. Nor did the learned fail to make fun of the beautiful ladies in furs hurrying to hear his lectures at the Collège de France. Compare more modern work: Lacan's Mallarméan prose, Sartre's novels, Deleuze's scintillation. And earlier, Diderot's dynamic force and Rousseau's invention of the Romantic sentence. And even earlier, Pascal's aphorisms. This is proof that fulfilling the democratic calling of philosophy requires placing thought into literary French, even into the written language "of the day." This carries a risk as well: that by a dialectical reversal familiar to French democracy, philosophy could become an especially aristocratic discipline, or at least snobbish. This is a risk to which the learned have always said that French philosophy would absolutely succumb, even if it meant, in order to excommunicate the "jargon" of a Derrida or a Lacan, claiming for oneself a Cartesian clarity—which is in reality only the foundation of a national link between philosophical exposition and literary writing, one to which Lacan and Derrida are attempting to be faithful as well.

II. Syntax versus Substance: French as a Thin Language

The real question concerns the consequences for philosophy of its being placed in the language of writers, which is itself a paradoxical effect of a choice that was democratic in spirit.

We have already said that a result of this choice was a sort of royal indifference to the philosophical particularities of the national dialect. Despite the most vehement importunities, nothing managed to impel philosophy in France toward the hard German labor of opening words up, deriving their Indo-European roots, entreating them to mean "being" or "community." Nothing ever *destined* the language to anything other than its immediate savor on the tongue and finally, to the bewitching ease, even when sophisticated, of its style. The principal rule, as Corneille said of the theater, is to please and not to ensure, with a slightly priestly gravity, that one's language is indeed the transcendent of thought's promise or the chosen medium of a shattering truth. France always laughed at what Paulhan called "proof by etymology."

Its pride does not take it in the direction of believing that French is philosophically evoked by its origins, but rather toward the idea, also in a way a national one though very different, that a language in the hands of a writer can say exactly what it wishes and, in addition, by its charm seduce and rally those to whom it is addressed. It is true—and even the most tortured French prose (Mallarmé, Lacan, the drugged Sartre of the *Critique de la raison dialectique*) is no exception (on the contrary)—that what is at stake is a transparency to the Idea, and not depth, or a complicity between the thickness of the language and its content.

This is because the latent universalism of any use of French, from Descartes to the present, rests entirely on the belief that the *essence of language is syntax.* Classical French, as it developed after Montaigne or Rabelais and was smoothed out and "compacted" by the joint efforts of policing by the precious salons and the centralized state, is a language that leaves little room for semantic ambiguity, since it subordinates everything to the most energetic, shortest, and most cadenced syntactic placement. This language—whose heart is in La Rochefoucauld's or Pascal's aphorisms, on one hand, and Racine's alexandrines on the other—presents itself to the philosopher as incredibly concentrated around verbs and liaisons, or successions. Unlike English, it is not a language of the phenomenon, of nuance, of descriptive subtlety. Its semantic field is narrow; abstraction is natural to it. Accordingly, neither empiricism nor even phenomenology suit it. It is a language of decision, of principle and consequence. Neither is it a language of hesitation, repentance, of the slow questioning ascent toward the dark and saturated point of origins. In truth, it is a language made impatient by questions that hastens toward affirmation, solution, the end of the analysis.

The perfect order that the (French) adherents of intuition, the perceptual life of creative disorder, imposed on their writings is notable. When Bergson rails against the discontinuous and abstract side of linguistic or scientific intelligence (but accurately; in fact, he is speaking about characteristics of French—its discretion, its abstraction), when he praises immediate data, the continuous élan, or unseparated intuition, he does so in a language exemplary in its transparency and order, where well-defined phrases abound and where all the distinctions, all the binary oppositions, are displayed with unique clarity. And conversely, when Lacan or Mallarmé seem to bring logical rationalism toward a staccato language that is violently discontinuous and whose meaning must be reconstructed, it is decisively the spirit of the maxim that wins out when it concentrates ("la Femme n'existe pas" [Woman does not exist; Lacan] or "toute pensée émet un coup de dés" [every thought sends out a throw of the dice; Mallarmé]) what was first submitted to the test of allusive syntax.

In the end, whether one accepts the vital continuum or semantic discretion, French imposes the syntactic primacy of relations over substances, of composite phrases over terms. No one escapes the order of reasons, since language itself conforms to it. Or at least that is the natural tendency, such that one who wishes to descend into vital intuition must persuade us in the opposite element of symmetrical constructions and grammatical subordinations.

French leads to the hollowing out of all substantiality. For, even if it pauses over the density of a noun (as may be the case for *morceau de cire* [piece of wax], or *racine de marronnier* [root of a chestnut tree], or *prolétaire* [proletarian]), it is in each case only to reduce, bit by bit, its visible singularity in a predicational and relational network so invasive that in the end the initial noun is only an example, easily replaceable, of a conceptual place. Thus Descartes reduces the piece of wax to geometrical extension; Sartre turns the root of the chestnut into the pure surging of a being-in-itself without qualities; and Comte's proletarian may just as well, if accompanied by the epithet "systematic," refer to any philosopher. Even for a thinker oriented toward singularity as much as Deleuze is, the pack of hounds is only a rhizome in motion, and the rhizome is a conceptual placeholder for any multiple, "horizontal" agency removed from the form of binary arborescence.

The rule of syntax in French does not really authorize descriptive delectation or the unsoundable becoming of the Absolute. It is a thin language whose saturation requires a long range of phrases supported by powerful propositional connections.

None perceived and practiced this better than Auguste Comte, no doubt because he wrote an extremely articulated and somewhat pompous language that schoolteachers later imposed on country folk for decades: a precise language no doubt, but one so brutishly declarative that it is always, like an acceptance speech for an awards ceremony, at the edges of ridicule. It is moving, as well, since it attempts (as is already Descartes's goal) to do literary justice to the speaker as well as to what is said. It is a language, in sum, that juxtaposes in philosophemes the speech of the flesh and that of the confession, an improbable bastard of Bossuet and Fénelon; for example, Comte writes:

Il serait certes superflu d'indiquer ici expressément que je ne devrai jamais attendre que d'actives persécutions, d'ailleurs patentes ou secrètes, de la part du parti théologique, avec lequel, quelque complète justice que j'aie sincèrement rendu à son antique prépondérance, ma philosophie ne comporte réellement aucune conciliation essentielle, à moins d'une entière transformation sacerdotale, sur laquelle il ne faut pas compter.

 (It would no doubt be superfluous to indicate expressly here that I should never expect anything but active persecutions, obvious or secret, from the theological party, with which, despite my sincerely doing however complete a justice to its ancient predominance as I have, my philosophy in reality contains no essential conciliation, unless there should be a complete transformation of the priesthood, which we must not count on.)

(*Positive Philosophy*, preface)

It is essential for a philosopher writing in French to persuade the reader that he is coming face-to-face with a certainty of such compactness that it would be impossible to doubt what is being said without harming the subject, except (but then we would know that we are dealing with a *political* opposition) by rejecting the whole without examination. Philosophical French is a language of ideological

conflict much more than of attentive descriptions, sophistical refutations, or infinite speculations. This is why Comte flanks every noun with an adjective that consolidates it, which is like its subjective bodyguard, just as he rigs out the sentence with robust adverbial padding (*expressément, sincèrement, réellement*), which is to the verbal edifice what the Doric columns are to a temple.

We would be wrong to believe that these are singularities exclusive to the half-mad Comte. When Sartre attempts, in the *Critique de la raison dialectique*, to explore the category of dynamic totality, and thus the apprehension of the movement of totalization and detotalization—when he must, in sum, return to the language what he calls "detotalized totality"—he spontaneously picks up the long, didactic, many-jointed sentences of positivism, given his need, he says, to express the dialectical components of the process all at once. Syntactic heaviness comes to unify semantic contraries at the risk of losing sight of the substantial or empirical singularity and of imposing a uniform rhythm on dialectic that bit by bit drains the historicity of the examples of their color and prosodic amplitude, leaving only, at a distance, the recognizable stamp of verbs and their sequences. To take a phrase from among a thousand (one concerning the workers' riots against Réveillon in April 1789):

Even if, from the depths of the initial and contagional march, negative unity as a future totality was already occasioning *being-together* [*être-ensemble*] (that is to say, everyone's non-serial relation to the group as a *milieu of freedom*) as a possibility which was perceived in seriality and which presented itself as the negation of seriality, the *objective* of the march was still indeterminate: it appeared both as seriality itself as a reaction to the situation, and as an equally serial attempt at *display*.

(*Critique of Dialectical Reason*, vol. 1)

There is in the language an almost heroic effort to make the trumpet of history sound again in the very midst of the conceptual tangle. And the pathos Comte gives for this purpose to adverbs and adjectives, as much as to the syntactic riveting, is here clearly accomplished by a vertiginous stretching of the verbal "dough," in the midst of which we hope that the reader will notice the illicit punctuation provided in the form of the italicized words. However, it is not true that this phrasing—bizarrely similar to continuous Wagnerian melody—pursues different goals from those to which Descartes assigned the philosophical use of French at the beginning. The point here is, again, an instrumental (and not a thematic) use of the language, whose unique purpose is to extract agreement from the readers as a result of their having seen the thought create and expose itself completely, according to its proper declarative force. What is more contrary in appearance to Sartrian totalization than Althusser's grand style, the militant chivalry of the pure concept placed under the ideal of science? And yet:

To speak plainly, it was only possible to pose to the practical political analyses Lenin gives us of the conditions for the revolutionary explosion of 1917 the question of the *specificity* of the Marxist dialectic on the basis of an *answer* which lacked the proximity of its *question*, an

answer situated *at another place* in the Marxist works at our disposal, precisely the *answer* in which Marx declared that he had "*inverted*" the Hegelian dialectic.

(Althusser and Balabar, *Reading Capital*)

How we recognize the lengthening of the sentence, ordered to gather up the components of belief all at once, and the italics, blinking beacons for a navigation-reading that is utterly prescribed! How Althusser's clarity carries with it the same insistence as the Sartrian dialectic!

III. The Politics of French, Again: The Authority of the Language

Is this "Marxist" style, then? Political totalization? Let us say, rather, that in French *syntax politicizes every philosophical statement*, including ones that are at the furthest remove from any explicit politicization, including those that (Lacan) locate their crafty charm between puns (an important national tradition, aimed at mocking and discrediting semantic equivocation, which the French loathe) and Mallarméan formulas. Witness how the authority of speech, its foundational political desire, runs through this type of broken melody, even into the usage of one of the most unique resources of French, the imperious interrogative—the question that strikes down its opponent, after which, so far has the subject gone in the earthquake of his speech, there is nothing more to say. And it is not for nothing that this French is appealed to straightaway and as such in the sentence (in order to "translate" Freud's dictum: "Wo Es war, soll Ich werden" [Where the id was, the ego shall be]):

But the French translation says: "*là où c'était. . . .*" Let us take advantage of the distinct imperfect it provides. Where it was just now, where it was for a short while, between an extinction that is still glowing and an opening up that stumbles, the I can [*peut*] come into being by disappearing from my statement [*dit*].

An enunciation that denounces itself, a statement that renounces itself, an ignorance that sweeps itself away, an opportunity that self-destructs—what remains here if not the trace of what really must be in order to fall away from being?

(Lacan, *Écrits*)

How beautiful that all is! It is persuasive beauty, which is more important for any French writer-philosopher than exactitude. Or rather, it is a secondary exactitude, which must be reconstructed inside the beauty and guided by it yet leave it behind, as one must comply with syntactic constraint in order to achieve, just at the end, the release of the Idea. Stylistic commonality often wins out over doctrinal or personal antipathy, as we see in the way Deleuze's vitalism is accentuated in the same way as its psychoanalytic adversary and in the way the same effervescent language is used to say that desire is a lack (Lacan) and that desire lacks nothing (the anti-Oedipal Deleuze–Guattari), since the aim is still, as with Sartre before, to hold opposite predications together in a grammatical formula, to make one fade into the next:

. . . objets partiels qui entrent dans des synthèses ou interactions indirectes, puisqu'ils ne sont pas partiels

au sens de parties extensives, mais plutôt "partiaux" comme les intensités sous lesquelles une matière remplit toujours l'espace à des degrés divers (l'œil, la bouche, l'anus comme degrés de matière); pures multiplicités positives où tout est possible, sans exclusive ni négation, synthèses opérant sans plan, où les connexions sont transversales, les disjonctions incluses, les conjonctions polyvoques, indifférentes à leur support, puisque cette matière qui leur sert précisément de support n'est spécifiée sous aucune unité structurale ni personnelle, mais apparaît comme le corps sans organe qui remplit l'espace chaque fois qu'une intensité le remplit. . . .

(. . . partial objects that enter into indirect syntheses or interactions, since they are not partial [*partiels*] in the sense of extensive parts, but rather partial ["*partiaux*"] like the intensities under which a unit of matter always fills space in varying degrees (the eye, the mouth, the anus as degrees of matter); pure positive multiplicities where everything is possible, without exclusiveness or negation, syntheses operating without a plan, where the connections are transverse, the disjunctions included, the conjunctions polyvocal, indifferent to their underlying support, since this matter that serves them precisely as a support receives no specificity from any structural or personal unity, but appears as the body without organs that fills the space each time an intensity fills it. . . .)

(Deleuze and Guattari, *L'anti-Œdipe*)

There is an obvious consonance between the *énonciation qui se renonce* (the enuciation that is a renunciation) and the *disjonction incluse* (an inclusive disjunction), between the *conjonction polyvoque* (the polyvocal conjunction) and the *l'extinction qui luit encore* (the extinction that still gleams), as though the slope of language upon hitting an oxymoron to make the thought pivot won out over the taking up of a position. It is as though, lying in ambush behind the concept, an invariable La Rochefoucauld had the idea to fuse the aphorism and to *stretch* the electric arc of the thought between poles distributed ahead of time by syntactic precision in the recognizable symmetry of French-style gardens.

And it is not as though the French all think the same. Philosophy in French is the most violently polemical of all, ignoring consensus and even making little fuss over rational discussion, for, still opposed to the academy, it speaks (politically) to the public and not to colleagues. But this is because the French *really* speak the same language, which means that we appeal to the same artifices to give (public) power to our claims. And this identity is even stronger given that classical French, the only one that philosophy manages to speak despite the consistently abortive efforts to make it flow more wildly, only offers a restricted assortment of effects, all held in the primacy of syntax and univocity over semantics and polysemy.

Someone philosophizing in French is forced to place the concept and its heirs onto the procrustean bed of a sort of sub-Latin. One thing will be said after another, and

there will be no verbal exchanges except those authorized by the grammar of sequences and the regulation of univocities.

We know of course (and this is a primary theme of this dictionary) that nothing peremptory can be said about languages that will not be disproven by some writer or poem or other. It is thus that rightly or wrongly we sometimes envy the power of German to lay out in an idolatrous semantics the depths offered by infinite exegesis. We also sometimes wish for the descriptive and ironic resources of English—this marvelous texture of the surface, the argumentation always circumscribed—which does not totalize anything since the grammar is never that of the here and now. And even the branching of Italian—when we stop thinking that it muddles everything at will and is running thirty different conversations at once, all erudite and mimetic, we admire its velocity and that when it affirms something, it keeps a clear eye on the other possible affirmation that a simple repentance over the sentence may bring to mind.

But this is not the style of French. We could show how Heidegger, despite the sometimes pious style of his interpreters and translators, becomes, in French, invincibly clear and almost monotonous; how the empirical sensitivity of English turns inevitably flat if the translator is not creative; and how the quicksilver web of Italian prose becomes nothing more than a discouraging chatter.

What French offers philosophy that is universal in character is always in the form of somewhat stiff maxims or badly nuanced derivations. Again, the latent style is that of a speech that aims to make an assembly, seduced, vote for someone without examining the details too much. One must accept this strength, or weakness. It enters into the composition of eternal philosophy, like that which, from the Greek source, retains mathematics rather than mythology, litigation rather than elegy, sophistical argumentation rather than prophetic utterance, democratic politics rather than tragic caesura.

It will always be said in French that "l'homme est une passion inutile" (man is a useless passion; Sartre), that "l'inconscient est structuré comme un langage" (the unconscious is structured like a language; Lacan), that "la schize ne vient à l'existence que par un désir sans but et sans cause qui la trace et l'épouse" (the *schize* only comes into existence through desire without a goal or cause which traces and espouses it; Deleuze and Guattari), or that "la philosophie est ce lieu étrange où il ne se passe rien, rien que cette *répétition* du rien" (philosophy is that strange place where nothing happens, nothing but this *repetition* of nothing; Althusser). And there will be no end to the examination of the consequences of these maxims, or to the presentation, before captive audiences, of other axioms and other syntactic networks.

Axiomatizing, deriving, and thereby even emptying speech of any individuality that sparkles too much, of any predication that is too colorful; purifying this speech, these excessive turns of phrase like repentances and uncertainties—these are the very acts of philosophy itself, once it orders its Idea in this material *place* that grasps it, runs through it: a language, *this* language, French.

GEFÜHL (GERMAN)

ENGLISH	feeling, sensation, sentiment, opinion
FRENCH	*sentiment, sensation*

➤ SENSE [FEELING], and AESTHETICS, BEGRIFF, COMMON SENSE, CONSCIOUSNESS, GOÛT, *INTUITION*, MORAL SENSE, *PASSION* [PATHOS], PERCEPTION

The German pair *Gefühl/Empfindung* is not parallel to the traditional distinction between *sentiment* and *sensation.* Today the use of *Gefühl* is mostly reserved for the sphere of feelings and emotions, more or less corresponding to the use of the English "feeling," whereas its companion, *Empfindung*, refers to both physiological sensation and feeling. This instability is no longer the source of any major philosophical difficulty. By contrast, analyzing the way in which the two terms were placed front and center, contrasted and debated in the eighteenth century, gives us a sort of X-ray of the vocabulary of the subject and of consciousness, from Wolff and Kant and his heirs through the writings of Johann Nicolaus Tetens. The philosophical stakes were at that time far greater than those pertaining to their English and French equivalents. From the theory of perception to that of moral sentiment, by way of the doctrines of consciousness as a feeling of self, the terms *Gefühl* and *Empfindung*, placed at the junction of the various anthropological, aesthetic, and psychological discourses, affect the whole of philosophical study.

I. *Gefühl/Empfindung, Sensation/Sentiment,* "Opinion," "Feeling"/"Sensation"/"Sentiment": The Specificity of the German Pair

Certain terms in French, English, and German, both common and philosophical, that express the difference between feeling and sensation, have, based on the variety of their uses, been highly unstable since the beginning of the modern period. In the case of contemporary French, the terms *sensation* and *sentiment* no longer overlap in meaning, as was the case in the classical period, when *sentiment* meant sensation, feeling, and opinion. Alongside this threefold division in meaning, there was also a properly philosophical usage of the term, both in Malebranche (in the sense of "internal sentiment") and in Pascal, in the sense of intuitive synthetic vision (to prophesize is to speak of God, not by external proof, but by internal and immediate *sentiment*, cf. *Pensées*, Lafuma 328). This usage is clearly laid out in the eighteenth century in the *Encyclopédie*'s article "*Sentiment*": it is the "intimate sentiment that each of us has of his own existence, and of what he feels in himself." *Sentiment* is "the first source and first principle of truth available to us," nor is it "in any way more immediate for us to say that the object of our thought exists with as much reality as our thought itself, since this object and this thought, and the intimate sentiment we have in ourselves, are really only ourselves thinking, existing, and having the feeling."

As for English, we find the same threefold division with "sentiment." Found in English since Chaucer, the word was also used as synonymous with "feeling," "sensation," and "opinion." On the other hand, the term's untranslatability in English comes mainly from the overdetermination of the word "sense," which runs from perception to feeling, reason, reasonableness, and meaning, and from which the concepts, through Hutcheson, Shaftesbury, and Hume through Bentham, of "inner sense," "internal sense," "inward sense," "common sense," and "moral sense" are derived. Coste, the translator into French of Locke's *Essay on Human Understanding*, did not run into any particular trouble over the translation of the English terms "sensation" and "sentiment." In the first case the term is identical in the two languages, and in the second we can go easily from the English "sentiment" in the sense of "mental feeling" to the French *sentiment.* Coste thus translates "due sentiments of Wisdom and Goodness" (bk. I, chap. 7, § 6) by "justes *sentiments* de la sagesse et de la bonté," and in bk. IV, chap. 1, § 4, "the first act of the Mind, when it has any sentiments of Ideas at all" by "le premier acte de l'esprit, lorsqu'il a quelque *sentiment* ou quelque idée." Similarly, Coste finds a parallel usage in English to the specialized philosophical (or metaphysical) usage in French. When Locke writes, for example, "I do not say there is no Soul in a Man because he is *not sensible of it* in his sleep" (bk. II, chap. 1, § 10), Coste translates this as "Je ne dis pas qu'il n'y ait point d'âme dans l'homme parce que durant le sommeil l'homme *n'en a aucun sentiment.*"

In philosophical German the essence of these issues was concentrated on the pair *Gefühl/Empfindung*, whose differentiation was the object of a long conceptual inquiry set against a background of ambivalence. The two terms cannot be translated except on a case-by-case basis and respecting what is untranslatable about them, that is, taking account of the redistribution of their relations, which itself depends on the way in which the different German philosophical discourses used them, strategically, to mark out differences with regard to the common uses of words.

Indeed, as shown by Adelung's dictionary or Eberhard's *Versuch einer allgemeinen deutschen Synonymik* (Essay of general German synonymy), 1795, in the eighteenth century *Gefühl* and *Empfindung* were commonly considered synonyms and used more to refer to the perceptual immediacy of a representation. The two words were defined as "intuitive (*anschauend*) representations that participate in our sensibility (*Sinnlichkeit*) to a certain degree" (Eberhard, *Synonymik*, 1:119). And Johann Nicolaus Tetens notes in 1777 in his *Philosophische Versuche über die menschliche Natur und ihre Entwicklung* that "the words *Gefühl* and *fühlen* henceforth have a range of meaning almost as wide as that of the words *Empfindung* and *empfinden*" (1:167ff.). In doing so, he places emphasis simultaneously on the omnipresence of the two pairs of terms, on the

difficulty of distinguishing them, and on the confusion reigning in their use.

Similarly, in his *Allgemeine Theorie der schönen Künste* (General theory of the fine arts), J. A. Sulzer begins the article "Sinnlich" in these terms:

> In fact, we call sensory (*sinnlich*) what we feel (*empfinden*) by the intervention of the senses external to the body; *but we have extended the meaning of the term* to what we feel (*empfinden*) in our bare interiority (*bloß innerlich*) without the action of the bodily senses, as for example in the case of desire, love, etc.
>
> (Sulzer, *Allgemeine Theorie*, 408)

This admission of instability continuously accompanied the philosophical division of the two notions. Even in the most decisive works we still find many inconsistencies. It seems, for example, that from the start the terms *Gefühl* and *Empfindung* originate, philosophically speaking, in the field of *sensus*, whereas the related term *Rührung* (feeling, emotion), which in the eighteenth century was used commonly in both everyday and philosophical language, comes from the field of *tactus*, since *anrühren* and *berühen* both mean "to touch." Yet Baumgarten, for example, suggests translating *tactus* by *Gefühl* (*Metaphysica*, § 536) and not by its literal (and standard) translation of *Tastsinn*—sense of touch—whereas he himself uses *Tastsinn* and *Gefühl* indifferently for *tactus*. In any case, it is clear that the internalization of *Gefühl*, or its derivation from the intimate sphere of subjectivity, only comes later, thanks to a need for terminological clarification.

II. *Gefühl* and *Empfindung*: The Near Side of the Division between Receptivity and Reflexivity

A. The twofold meaning of *Empfindung* in the Wolffian system

In Christian Wolff's philosophical system the notions of experience and knowledge interact and complement each other against a Leibnizian background of preestablished harmony, insofar as Wolff does not distinguish between a logical system of knowledge based on the a priori metaphysics of scholastic origin and the principles of an empiricist reading of the world. In this framework *Empfindung* is the very source of experience and hence of knowledge; in order to have access to the true being of things, it is therefore enough simply to be attentive. The thesis of *Deutsche Logik* (chap. 5, § 1), according to which "it is by paying attention to our *Empfindungen* that we have experience of everything that we know [Wir erfahren alles dasjenige, was wir erkennen, wenn wir auf unsere empfindungen acht haben]," is mirrored in the *Deutsche Metaphysik* (§ 325): "The knowledge we achieve when we pay attention to our *Empfindungen* and to the modifications of the soul, we customarily call experience." If *Empfindung* is really untranslatable here, it is not because Wolff does not give equivalents; rather, it is because it refers to two philosophically sacred pairs: sentiment/sensation on one hand and sensation/perception on the other. Wolff thus writes in his *Anmerkungen zu den vernünftigen Gedanken von Gott, der Welt und der Seele des Menschen, auch allen Dingen überhaupt*:

> I have explained here [§ 220] what I mean by the word *Empfindung*, namely the kind of *perceptionum* [*sic*] that

is called *sensationes* in Latin. And insofar as we consider these *sensationes* as modifications of the soul by which we are conscious of things that act on our *organa sensoria* [*sic*], we can call them in Latin *ideas rerum materialium praesentium*.

> (Wolff, *Anmerkungen*, § 65)

The equivalence between idea and sensation becomes explicit here by way of Latin. The sensation caused by things comes to be confused with the act of consciousness; sensation is simply a thought:

> Thoughts that have their causes in the modifications of the organs of our body and that are excited by bodily things outside of us, we call *Empfindungen*.
>
> (Wolff, *Deutsche Metaphysik*, § 220)

Wolff does not hesitate to establish the following inferences: having a thought is the becoming aware of a modification of the soul. Thus, becoming conscious of an effect of things external to the soul is a thought; thus sensations are thoughts. And he adds: thoughts of objects insofar as they are present to our soul. There is thus no difference between feeling and knowing, between *empfinden* in the sense of feeling and *erkennen* in the sense of knowing, and it is on this basis that Baumgarten is able to develop his aesthetics, conceived as a science of knowledge (*cognitio sensitiva*, see AESTHETICS). Wolff insists especially on the coincidence between modifications of things and those of the soul, on which point he considers himself in agreement with Aristotle, Descartes, and Leibniz, defending himself again and again against the accusations of Spinozism leveled at him. The syncretism between a form of empiricism and an abstract system assured of the absolute pertinence of logically derived truths leads him to give the name *Empfindung* to the widest philosophical extension: the same term can thus mean the natural irreducibility of sensation (our hearing cannot be affected by the noise of thunder, etc.: cf. *Anmerkungen*, § 69), a modification of the soul, and the fact that it is perceptible to us, thus conscious. *Empfindung* is thus the hinge between soul and world, and makes possible the distinction between *innerliche Empfindung* (internal *Empfindung*), when we consider *Empfindung* as it occurs in the soul, and *aüßere Empfindung* (external *Empfindung*), when we consider *Empfindung* as caused by external objects (cf. Johann Friedrich Stiebritz, *Erläuterungen der Wolffischen vernünftigen Gedancken von den Kräften des Menschenverstandes* [Explanation of Wolff's "Reasonable Thoughts" on the forces of human understanding], § 101).

B. The truth of feeling

For Sulzer, who aims to reconcile theoretical and aesthetic thought, the division is no longer, as it is for Wolff, between internal and external *Empfindung*, but between *empfinden* and *erkennen*. Baumgarten's premise in favor of equal dignity for aesthetic or "sensible" knowledge and intellectual knowledge is radicalized in the form of a distinction between *empfinden* and *erkennen*, which is no longer a hierarchy but rather a division of labor. Whereas for Wolff *Empfindung* is a hinge between the I and the world, for Sulzer *empfinden* refers to the capacity to be affected by agreeable or disagreeable

feelings and hence comes closer to emotion (*Rührung*). *Empfinden* thus falls unambiguously on the side of subjective knowledge and is contrasted with the objective pole of knowledge (*erkennen*). The article "*Sinnlich (Schöne Künste)*" of the *Allgemeine Theorie der schönen Künste* (1786) presents this topic well:

> We say that we know (*erkennen*), that we grasp (*fassen*), or that we understand (*begreifen*) something when we have the clear perception (*Wahrnehmung*) of its nature (*Beschaffenheit*), and we have a clear knowledge of the things we are capable of explaining, or whose natures we can describe to others. In the state of knowledge, there is something that comes to place itself before our minds (*Beym Erkennen schwebt also unserem Geist etwas vor*), or we are conscious of something that we consider different from ourselves, that is, from our power of acting, and we call this thing an object of knowledge. Conversely, we say that we feel (*empfinden*) something when we are aware of a modification within our power itself.

(Sulzer, *Allgemeine Theorie*)

The goal of the argument is in fact to show by and with the terminology of knowledge that there is thought in feeling. In order to affirm the dignity of aesthetic thought established by Baumgarten, then, *Empfindung* must be distinguished, as feeling of oneself by oneself, from the constitution of an object of knowledge, which can only take place if we are "spectators of what takes place" (*Zuschauer dessen, was vorgeht*), whereas "in feeling we are ourselves the object in which the change takes place [beym Empfinden sind wir selbst das Ding, mit dem etwas veränderliches vorgeht]" (ibid.). This feeling of oneself by oneself will enter not only into the vocabulary of perception but into that of consciousness as well: "Every time we feel something, we are conscious of a change in ourselves [bey jeder neuen Empfindung sind wir uns einer Veränderung in uns selbst bewußt]" (ibid.). The radical difference established by Sulzer between feeling (*empfinden*), as a resonance of oneself in oneself, and knowledge (*erkennen*), as separation of the observing consciousness from the objects of knowledge, leads then to the construction of two spheres of equal dignity. In feeling perception "thinks." There is thus a "perceptual thought," a "thought of the senses" (*sinnliches Denken*, ibid.), contrasting with "speculative thought" (*das spekulative Denken*, ibid.). From the point of view of the distinction between *Gefühl* and *empfinden*, the novelty introduced by the problem of perceptual consciousness is that "sensible" thought (which Sulzer is careful to distinguish from that which, in feeling, is only the feeling of feeling) becomes in his terminology the "full feeling" (*das volle Gefühl*) of feeling (*Empfindung*). There is, therefore, at the same time, on the basis of the newly constituted aesthetics, a promotion of feeling to the dignity of knowledge and the persistence of a "mirror" conception of reflection and perception. Thought is found in the folds of feeling.

We may go further and elevate the dignity of this thought-in-feeling, to the point of affirming that it is a cogito. This is indeed what G. E. Schulze does when he speaks in his *Grundriss der philosophischen Wissenschaft* of a *Gefühl der Existenz*, which he numbers among the "*Gefühle des inneren Sinnes*" (feelings of an internal sense), and which he conceives of as an equivalent to the cogito (*Grundriss*, vol. 1).

This equivalence between feeling and knowledge is found again in Herder, who appeals to Wolff in his *Kritische Wälder* to define aesthetics as a "science of the feeling of beauty, that is, of sensible knowledge [eine Wissenschaft des Gefühls des Schönen, oder nach der Wolffischen Sprache, der sinnlichen Erkenntnis]." Radicalizing the Wolffian claim in a new way, Herder does not balk at the notion of a "feeling of mind" (*geistige Empfindung*) or at erasing any distinction between *Empfindung* and knowledge, as well as between *Empfindung* and *Gefühl*:

> No knowledge is possible without *Empfindung*, that is without a feeling (*Gefühl*) of good and evil. . . . The knowledge of the soul is thus unthinkable without the feeling of well-being or doing badly, without the deeply intimate and intellectual sensation of the truth and of goodness.

(Herder, "Vom Erkennen," 236ff.)

III. From Tetens to Kant: The Filtering of the Differences between *Gefühl* and *Empfindung* through the Theory of Faculties

In the philosophy of Johann Nikolaus Tetens and in Kantian critical philosophy, the link between empiricism and abstraction is called into question, making possible a reflection on the difference between *Gefühl* and *Empfindung*. Tetens, relying, it seems, on sensualist principles of Lockean origin, filters *Gefühl* and *Empfindung* by emphasizing that the impingement of the external world on sensation is only ever a starting point and that we must therefore draw a distinction between the primary matter of sensation and its becoming-representation. To say that our ideas come from sensations for him means only that "sensations (*Empfindungen*) are the primary matter (*Grundstoff*) that is available to reason for representation, thinking, and ideas, the matter from which the activity of thought makes them come forward" (*Über die allgemeine spekulative Philosophie*, 49). Similarly, Kant says in the *Critique of Pure Reason* that sensations are the "matter of our senses" (B 286/A 233–34), the effect of the object on the representational capacity (ibid., "Transcendental aesthetic"), and as such, "the matter of the phenomenon" (ibid., § 8; B 60/A 42–43). What distinguishes waking and dreaming despite their common source in sensations, Tetens argues, is that in the waking state "the capacity for thinking (*Denkkraft*) develops representations from sensations (*Empfindungen*)" (*Über die allgemeine spekulative Philosophie*). He adds, however, that even in the state of receptivity, the soul is never truly passive and that attention is already itself an activity of the soul. The contradiction between subject and object is thus resolved, insofar as the modifications of the soul that define *Empfindung* for Wolff or Sulzer presuppose a faculty (*Vermögen*) of the soul to be modified. If *Empfindung* is an effect (*Wirkung*) on the soul, "the capacities [of the soul] to be modified are, insofar as they are seated in the soul, participative faculties (*mitwirkende Vermögen*), and they have their source in those which are active" (*Philosophische Versuche*, vol. 1). It is the capacity of soul to animate itself that makes

reality accessible. But insofar as knowledge develops or works upon the material of sensation, it "expels it from the soul" and "places it in front of it" (ibid., vol. 1).

Against this background Tetens seeks to remedy the linguistic confusion he perceives in the usage of *Empfindung* and *Gefühl*, reserving the active meaning for the latter (*Gefühl* is the act of feeling) and the connotation of a signal for the former: perception has indicative value with regard to its source. Thus:

> The words *Gefühl* and *fühlen* have a range of meaning almost as large as that of the words *Empfindung* and *empfinden*. And yet, it seems that we must admit a clear difference between them. Feeling (*Fühlen*) relates rather to the act of feeling (*Aktus des Empfindens*) than to the object itself; and insofar as we distinguish them from sensations (*Empfindungen*), there are feelings (*Gefühle*) when we feel a change in ourselves or exerted on us, without this impression permitting us to have knowledge of the object that caused it. To feel (*empfinden*) makes a sign toward an object (*zeiget auf einen Gegenstand hin*) that we feel (*fühlen*) in ourselves by the medium of the sensible impression and that we discover so to speak as a given.
>
> (Ibid., 1:167ff.)

Like Tetens, Kant distinguishes *Empfindung* and *Gefühl* by submitting the relation between feeling and sensation to a rigorous analysis. In section 3 of part 1 of the *Critique of Judgment*, Kant, like Tetens, suggests bringing order to the vocabulary. The passage begins thus: "This at once affords a convenient opportunity for condemning and directing particular attention to a prevalent confusion of the double meaning of which the word 'sensation' is capable." Of course, the context is no longer the same one as for Tetens, since here Kant wishes to contrast aesthetic pleasure that is free of all interest with the interested relation of hedonism toward the object of pleasure. However, the implications intersect:

> When a modification of the feeling (*Gefühl*) of pleasure or displeasure is termed sensation (*Empfindung*), this expression is given quite a different meaning to that which it bears when I call the representation (*Vorstellung*) of a thing (through sense as a receptivity pertaining to the faculty of knowledge) sensation. For in the latter case the representation is referred to the Object, but in the former it is referred solely to the Subject and is not available for any cognition, not even for that by which the Subject *cognizes* itself. Now, in the above definition the word sensation (*Empfindung*) is used to denote an objective representation of sense (*eine objektive Vorstellung der Sinne*); and, to avoid continually running the risk of misinterpretation, we shall call that which must always remain purely subjective, and is absolutely incapable of forming a representation of an object, by the familiar name of feeling (*Gefühl*). The green color of the meadows belongs to *objective* sensation (*gehört zur objektiven Empfindung*), as the perception of an object of sense (*Wahrnehmung eines Gegenstandes des Sinnes*); but its agreeableness to *subjective* sensation, by which no object is represented.
>
> (Kant, *Critique of Judgment*, § 3)

The contrast established here relies on the general notion of "representation" (*Vorstellung*), which acts as a middle term between *Gefühl* and *Empfindung* and presupposes among other things an equivalence between "objective sensation" (*Empfindung*) and what is usually translated as "perception," *Wahrnehmung* (see PERCEPTION). *Gefühl*, understood as simply subjective feeling without a representation of the object (Kant's theme in this part of the *Critique of Judgment*), corresponds nicely with the understanding of *Gefühl* as feeling a change in the soul without knowing its cause, as Tetens defines it in the passage from the *Philosophische Versuche* cited earlier, and which he sometimes calls *Empfindnis* precisely to distinguish it from *Empfindung*. But to say, as Kant does, that the color of a prairie is an "objective sensation" does not amount to saying that the materiality of a color is ignored, as objective reality, by any subjective determination, nor that sensation, insofar as it takes place in the subject, is only relative and arbitrary. The term "objective" here is the product of a break, that of the transcendental aesthetic, which Tetens had not made. For Kant, colors are not physical realities but modifications of our senses. They are "subjective" for this reason. But what affects the subject does not for all that belong to him, any more than space and time belong to him as a priori conditions of sensation—and in this respect they are, like *Empfindung*, "objective." Thus, if it is permissible to split the term for sensation along the two axes of subject and object, it is just as necessary to distinguish clearly *Empfindung*, as what provides the hinge between the world and the individual, from *Gefühl*, as an internal subjective resonance and a signal from the subject to himself. If Tetens does not go so far in defining the principles of sensation (*Sinnlichkeit*) as Kant does in his *Transcendental Aesthetic*, where he designates them as formal a priori conditions of time and space, it is because for Tetens the philosophy of representation still falls under psychological analysis.

IV. The Avatars of Moral Sentiment: *Gefühl, Empfindsamkeit*

It is precisely this break that allows Kant to bring the term *Gefühl* into the moral domain, thus to transcend feeling, but without running the risk of erasing the difference between ethics and aesthetics: respect then becomes the unique "sentiment" (*Gefühl*) of practical reason. This usage of the term *Gefühl* is not in contradiction with the habit of the time. Almost all of the examples that Adelung's dictionary provides for the use of the term *Gefühl* suggest ethical values (love of country, creator, feeling of happiness felt in the presence of a good friend), and they culminate in the following equivalence: "*das moralische Gefühl, die Empfindung dessen, was gut und böse ist* [moral sentiment (*Gefühl*), the feeling (*Empfindung*) of what is good and bad]."

We may contrast with this sense of *empfindend* as "capable of moral sentiment" the term *empfindsam* and the question of *Empfindsamkeit*, whose history comes entirely from the domain of literature and which was institutionalized in German starting from some of Lessing's remarks about the translation of Sterne's *Sentimental Journey* by J. J. Boder (*Empfindsame Reise*, 1768). This sense of *empfindsam* in the eighteenth century meant "capable of emotion" (*Rührung*). Adelung defines it as "*fähig, leicht gerührt zu werden*" ("ability to be easily

moved"), whereas Campe speaks of the ability to feel pleasure in emotive participation. For Kant and others *Empfindsamkeit* is denounced as whininess (*Empfindelei, Empfindsamelei*). But the term remains entirely bound to this period, and starting with the nineteenth century only *Sentimentalität* is spoken of.

By thus mixing moral sentiment and the effusion of participation, we get the conceptual hybrid of the *Mit-Gefühl*, that is, a moral feeling of participation in a community, whose uses may be pedagogical (as in Herder, *Ideen zur Philosophischen Geschichte der Menschheit*, 1784–95: the foundation of the community is familial *Mit-Gefühl*), or political—especially with the concept of *Freiheitsgefühl* in Schubart (*Deutsche Chronik*, 1775) or in Schiller's *Fiesko* (1783). Friedrich von Schlegel gave the term an emphatic and conservative tone, attributing to the German character an innate feeling of freedom related to an intuitive feeling of legal justice (*Rechtlichkeit*), based on respect for morality and religion (F. von Schlegel, *Europa*), to which Heinrich Heine soon responded in the preface to the second edition of the *Reisebilder* (1831), contrasting a more French and Jacobin vision of politics with this communitarian conservatism of a "*katholische Harmonie des Gefühls* (Catholic harmony of feeling)."

As for the philosopher of feeling par excellence in the so-called dispute over pantheism, Friedrich Heinrich Jacobi, for him an objective and pure *Gefühl* is the basis of a philosophy conceived of as transcendental. This pure totality indissociable from *Gefühl* obliterates the boundaries between imagination and speech, literature and philosophy. Herder, Bouterwerk, Goethe, and Jacobi—all are in agreement as regards the absoluteness of feeling. For Goethe in particular, *Gefühl* is at the source of any discovery and any truth. It is similar, then, to the immediacy of *Anschauung*, of "intuition"—which is, even more, the dimension of genius. The absoluteness of *Gefühl* is similarly to be found in Schleiermacher, for whom the essence of religion is neither thought nor action, but "*Anschauung und Gefühl*" (*Über die Religion*, 120ff.). The literary absolute of the Romantics and of Hölderlin makes it the source of all *poiêsis*, all invention, and in the end all culture. Greek poetry, founded on the simplicity and purity of an originating *Gefühl*, becomes the mind's holy site, against which the Hegelian dialectic eventually leads its antiparticularist crusade in the name of *Vernünftigkeit*—rationality.

GEGENSTAND (GERMAN)

➤ OBJECT, and EPOCHÊ, ERSCHEINUNG, ESSENCE, GEFÜHL, INTENTION, PERCEPTION, REALITY, REPRÉSENTATION, RES, SACHVERHALT, SENSE, SUBJECT, *THING*, TRUTH, WERT

Difficulties of translation with regard to objectivity arise most of all in so-called transcendental philosophies, which treat objective sense or objects as acts of the subject. They insist for the most part on the distinction of levels of objectification, that is, on the distinction of stages in the production of objective meaning, which leads to a veritable lexical proliferation, difficult to translate into any language. We may nonetheless note two distinctions within this approach: on one hand, Kant's splitting of the object into "phenomenon" (*Erscheinung*) and "thing in itself" (*Ding an sich*) divides the vocabulary of objectivity in two, whereas Husserl's rejection of the notion of a thing in itself makes this duality disappear. On the other hand, the levels of objectification are, for Kant, relative to the doctrine of faculties and of synthetic functions (the table of categories), hence to the structure of the subject, whereas Husserl, rejecting the Copernican revolution and the doctrine of faculties, makes them relative only to the stratification of objective sense revealed by the intuition of essence (*Wesenschau*).

I. Kant: *Objekt* and *Gegenstand*, between Phenomenon (*Erscheinung*) and Thing in Itself (*Ding an Sich*)

The shift to Critical idealism, with regard to the theme of objectivity, was an etymological awakening. *Gegenstand* and *Objekt* were introduced to translate the Latin *objectum*, which comes from *objicio*, "to throw forward," "to expose." The German *gegen* adds to this idea of manifestation that of direction-toward and that of resistance (*entgegenstehen*, the noun corresponding to which is *Gegestand*, which initially meant *oppositum esse*, and in Old High German *gaganstentida* had the sense of *obstacula*), and *Stand* (=*stans*), "that which stands," then "that which persists, lasts." The philosophical term *Gegenstand* is thus the product of three registers: *das Gegenüberstehende*, "that which stands in front of me," "that which is op-posed to me"; the *terminus ad quem* of a faculty ("*Gegenstand der Empfindung, der Wahrnehmung*": object of perception); and subsistence or substantiality. In the pre-Critical period, Kant, in the wake of classical thought, covers the register of op-position (phenomenality) by that of subsistence (reality in itself). The turn to transcendental idealism consists in bringing the first two senses of the term *Gegenstand* on this side of the sense of "object subsisting in itself" and to think of them within the bounds of a unified system: the object is the "vis-à-vis" constituted by acts of objectification originating in the faculties (perception, imagination, understanding) and their functions, but the thing in itself remains its unknowable ontological foundation.

A. The split between phenomenon and thing in itself

In the Latin of Kant's *Dissertatio* of 1770, we find two series of opposed ontological equations: *objectivum=reale=intelligibile= subjecto irrelativum, subjectivum=ideale=sensibile=subjecto relativum*. *Objectivum* is contrasted with *subjectivum*, what resides in or is relative to the subject, and is thus identified with the intelligible (which by contrast with the perceptual does not vary depending on the subject) and with *realitas* (contrasted with *idealitas*, which describes ideas or subjective representations but not existing objects). Thus Kant contrasts *lex subjective*, *lex quaedam menti insita*, or again the *conditiones subjecto propriae* ("subjective law," "situated in the mind," "conditions proper to the subject": space and time, § 29), to *conditio objectiva*, for example, the "*forma objectiva sive substantiarum coordinatio* [the objective condition or objective form as coordination of substances]." Similarly, he refuses to grant space and time the status of "*objectivum aliquid et reale* [something objective, i.e., real]" (§ 14–15) but rather treats them as "*coordinatio idealis et subjecti* [an ideal, i.e., subjective, coordination]." Whence there results the double meaning of *objectum*, corresponding to the two etymological registers: on one side *res*, "*existens in se*," "*objectum intellectus*," thing in itself and intelligible cause of perceptual affections; on the other side the *phaenomenon*, "*objectum sensuum*":

> Phaenomena ceu causata testantur de praesentia objecti, quod contra Idealismum.
>
> (In so far as [Phenomena] are sensory concepts or apprehensions, they are, as things caused, witnesses to the presence of an object, and this is opposed to idealism. [NB: *praesentia* has, in this refutation of idealism, the meaning of *existentia* and not that of manifestation.])
>
> (Kant, *De mundi sensibilis atque intelligibilis forma et principiis*, § 11; *Form and Principles*, 389)
>
> Quaecunque ad sensus nostros referuntur ut objecta, sunt Phaenomena.
>
> (Whatever, as object, relates to our senses is a phenomenon.)
>
> (Kant, *De mundi*, § 12; *Form and Principles*, 390)

Despite this amphibology the term *objectum* already tends to be reserved for the appearing object and to be separate from the register of existence in itself: thus section 4, which deals with the formal principle of the intelligible world (with objects in themselves, in consequence), substitutes the terms *res, substantia, aliquid, omnia* for *objectum*. This is why, in the last cited passage, it is best to avoid translating *quaecunque* by "everything which" ("toutes les choses qui," Fr. trans. P. Mouy, Vrin), which implies a reification of the phenomenon, and to reserve "thing" (*chose*) for *res intelligibilis*.

This amphibology is reaffirmed in the Critical period, but with a decisive shift. The object of course retains its twofold meaning, that of thing in itself (referred to as *Ding an sich, Objekt an sich, Gegenstand an sich, Noumenon, das Erscheinende*, that is, "thing in itself," "object in itself," "noumenon," "the

appearing thing") and of phenomenon (referred to as *Objekt, Gegenstand, Erscheinung*). But the shift to transcendental idealism gives rise to a crucial displacement: things in themselves are unknowable for the finite subject, even for his understanding. The object in itself thus no longer indicates purely intellectual reality in contrast with sensible reality; rather, it refers now to what is relative neither to perception nor to understanding. In Critical idealism, the phenomenon confiscates the meaning of objectivity for any finite subject, and sensible intuition, by becoming the minimal condition of possibility of experience, becomes as well the minimal condition of possibility of all objective validity and all denotation:

> Also beziehen sich alle Begriffe und mit ihnen alle Grundsätze . . . auf empirische Anschauungen, d. i. auf Data zur möglichen Erfahrung. Ohne dieses haben sie gar keine objektive Gültigkeit.

> (Thus all concepts and with them all principles . . . are nevertheless related to empirical intuitions, i.e., to *data* for possible experience. Without this they have no objective validity at all. [Objective validity is here the equivalent to meaning, signification, or relation to the object; that is, in Fregean language, to denotation (see SENSE)].)

> (Kant, *Kritik der reinen Vernunft*, A 239, B 298)

Objectivity thus recovers the etymological sense of "a manifestation to," as the appearance to perception by way of the affections: *Objectum=Gegen-stand=phaenomenon= ob-jectum=Dawider=*vis-à-vis for the "*intuitus derivatus.*"

■ See Box 1.

B. The different concepts of objectivity in itself

Is this to say that the phenomenon seizes all senses of objectivity for itself? No, since the concept of the thing in itself, even though it does not refer to any knowable object, retains several essential functions in transcendental idealism. The concept is in fact a deceptive one, since the "in itself" of "concept of the thing in itself" suggests the exclusion of all relation, whereas Kant, far from thinking of it only as ontological subsistence, defines "thing in itself" as a "*terminus ad quem*" of faculties (infinite intuition, understanding, pure reason, practical reason) whose eventual "correlation" is made possible by the Copernican revolution that Kant envisions for philosophy—and this definition as a result multiplies the concept's meanings.

— The first concept of an object in itself corresponds to the positive sense of noumenon, understood as a pure object of understanding, given to an intellectual intuition or an *intuitus originarius* that creates its object:

> Wenn ich aber Dinge annehme, die bloß Gegenstände des Verstandes sind, und gleichwohl, als solche, einer

Translating *Gegenstand/Objekt* in Kant

A famous difficulty encountered by Kant's translators concerns his use of the terminological couple *Gegenstand/Objekt*. Existing translations fold the two terms onto each other by translating them both uniformly as "object." Would it be preferable—even necessary—to underscore terminologically the distinction between the apparent object and the thing in itself? And does this distinction line up with the distinction between *Gegenstand* and *Objekt* in Kant's text? Martineau brings the problem to the fore in his preface to the French translation of Heidegger's course on the *Critique of Pure Reason*. Here Martineau suggests adopting *ob-jet* as a translation for the phenomenon (the embedded dash rendering the hint of a separation from intuition by separating the prefix *ob-*), and *objet* as a translation for the thing in itself. The difficulty, noted by the French translators of Eisler's *Kant-Lexikon* (under *objet*), is that Kant frequently uses the two terms interchangeably, making both of them designate either the phenomenon or the thing in itself. One thus finds, manifestly employed synonymously, the expressions *tranzendentaler*

Gegenstand and *tranzendentales Objekt*, *Gegenstand in sich* and *Objekt in sich*, and so on. And yet Kant also commonly employs the two terms simultaneously to produce a contrast—as when, in section 19 of the *Prolegomena to any Future Metaphysics*, he writes: "*Das Objekt bleibt an sich selbst immer unbekannt* [The object in itself remains forever unknown]," but when the relation of sensible representations is determined by the categories, "*so wird der Gegenstand durch dieses Verhältnis bestimmt* [then the ob-ject is determined by this relation]." The pair ob-ject/object would then have to be used without forcing it into a strict correspondence with the pair *Gegenstand/Objekt,* but rather according to the context. In general, the difficulty posed by the pair derives from the fact that Kant at times uses *Gegenstand* to designate the genus covering the two species "phenomenon" and "thing in itself," as signally in the passage that Martineau uses to exemplify the distinction between *Gegenstand* and *Objekt*:

> Die Transzendentalphilosophie betrachtet nur den Verstand, und Vernunft

selbst in einem System aller Begriffe und Grundsätze, die sich auf Gegenstände überhaupt beziehen, ohne Objekte anzunehmen, die gegeben wären (Ontologia); die Physiologie der reinen Vernunft betrachtet die Natur, d. i. den Inbegriff gegebener Gegenstände (sie mögen nun den Sinnen, oder, wenn man will, einer anderen Art von Anschauung gegeben sein).

> (Metaphysics in this narrower meaning of the term consists of *transcendental philosophy* and the *physiology* of pure reason. Transcendental philosophy (*ontologia*) contemplates only our *understanding* and reason themselves in a system of all concepts and principles referring to objects as such, without assuming objects that are *given*. The physiology of pure reason contemplates *nature*, i.e., the sum of given objects (whether given to the senses or, for that matter, to some other kind of intuition).

> (Kant, *Critique of Pure Reason,* A 845, B 873)

Anschauung, obgleich nicht der sinnlichen (als *coram intuitu intellectuali*), gegeben werden können; so würden dergleichen Dinge Noumena (*Intelligibilia*) heißen.

(If, however, I suppose there to be things that are merely objects of the understanding and that, nevertheless, can be given to an intuition, although not to sensible intuition (as *coram intuitu intellectuali*), then such things would be called *noumena* (*Intelligibilia*).)

(Ibid., A 249)

Noumenon and phenomenon are thus defined according to each concept's relation to intuition, inasmuch as this intuition is infinite (noumenon) rather than finite (phenomenon), creative (again, noumenon) rather than receptive (phenomenon), primitive rather than derived. Heidegger, playing on the opposition between the particles *ent-* and *gegen-*, characterizes the two terms as *Entstand* (existent-arising-from-originary-intuition) and *Gegen-stand* or *Dawider* (existent opposed to derived intuition) (cf. Heidegger, *Kant and the Problem of Metaphysics*, § 16). As we have only sensible intuition and cannot show the possibility of an intellectual intuition, such a concept has no objective reality, that is, neither denotation nor content.

— The second is the negative conception of the noumenon, to which the terms "transcendental object (*tranzendentales Objekt*), "object in general" (*Gegenstand überhaupt*), and "something in general" (*Etwas überhaupt*) correspond. We cannot know the noumenon in any way; but if we wish to avoid Berkleyan idealism, we must attribute to phenomena, as simple representations, the relation to something that is not representation but an ontological cause of intuitions. This "object" has the twofold function of limiting the claims of perception to give us objects in themselves (thus to ensure the transcendental ideality of phenomena) and to guarantee the denotation or empirical reality of the latter:

Da Erscheinungen nichts als Vorstellungen sind, so bezieht sie der Verstand auf ein Etwas, als den Gegenstand der sinnlichen Anschauung: aber dieses Etwas ist insofern nur das transzendentale Objekt. Dieses bedeutet aber ein Etwas = x, wovon wir gar nichts wissen.

(Since appearances are nothing but representations, the understanding relates them to a something, as the object of sensible intuition; but this something is to that extent only the transcendental object. This signifies, however, a something = X, of which we know nothing at all.)

(Kant, *Kritik der reinen Vernunft*, A 250)

This object is defined elsewhere as "*die bloß intelligible Ursache der Erscheinungen überhaupt* [the merely intelligible cause of appearances in general]" (ibid., A 494, B 522), and "*das, was in allen unseren empirischen Begriffen überhaupt Beziehung auf einen Gegenstand, d. i. objektive Realität verschaffen kann* [that which in all our empirical concepts in general can provide relations to an object, i.e., objective reality]."

Insofar as no category can be applied to it in order to determine it, this transcendental object is precisely not a defined "object." It is a pure X, "the concept of an object in general

[*der Begriff eines Gegenstandes überhaupt*]" (ibid., A 251), "the completely undetermined thought of something in general [*der gänzlich unbestimmte Gedanke von Etwas überhaupt*]" (ibid., A 253). It is the *ob-* in the object that guarantees the unitary denotation of our representations, which is correlative to transcendental apperception as the formal unity of self-consciousness.

— The third concept is that of the idea of reason: the "purely intelligible object" or "object of pure thought" ("*bloß intelligibler Gegenstand*," "*Gegenstand des reinen Denkens*," ibid., A 286–87f., B 342–43), that is, the suprasensible object of "*metaphysica specialis*" (the soul, the world, God) as reason claims to determine it using the categories alone, in the absence of any sensible data. As sensibility is the condition of the relation to an object, the categories as pure forms of thought therefore define only "*entia rationis*," "*leere Begriffe ohne Gegenstand*" ("empty concepts without objects," ibid., A 292, B 348), "*hyperbolische Objekte*," "*reine Verstandeswesen (besser: Gedankenwesen)*)" ("hyperbolic objects," "pure beings of understanding (or better, thought)," *Prolegomena* § 45), that is, suprasensible objects without objective reality, without denotation.

— The last concept of the object in itself is correlative to practical reason. Suprasensible ideas have no denotation for speculative reason but do for practical reason, as necessary conditions for following the moral law. The immortality of the soul, freedom, and the existence of God are thus an "objective reality"; they are "objects" in the sense of necessary correlates of rational faith, even though no intuition ensures this objective reality:

Nun bekommen sie durch ein apodiktisches praktisches Gesetz als notwendige Bedingungen der Möglichkeit dessen, was dieses sich zum Objekte zu machen gebietet, objektive Realität, d. i. wir werden durch jenes angewiesen, daß sie Objekte haben, ohne doch, wie sich ihr Begriff auf ein Objekt bezieht, anzeigen zu können.

(Now, through an apodeictic practical law, as necessary conditions of the possibility of what this law commands one *to make one's object*, they acquire objective reality; i.e., we are instructed by this law that *they have objects*, yet without being able to indicate how their concept refers to an object.)

(Kant, *Kritik der praktischen Vernunft*, 135;
Critique of Practical Reason, 171)

"Objectivity" and "objective reality" signify, of course, the independent subsistence of our knowledge but as necessary correlates of practical reason, which postulates them.

C. The degrees of phenomenal objectivity

The object as phenomenon is thought of as a correlate of the objectivizing functions of thought. In a general way the central problem of critical philosophy is that of the objective validity of our knowledge, that is, the movement from simple subjective representations, valid only for me (*bloß subjektive*), to a representation having both a relation to an object (*Gegeständlichkeit, Beziehung auf ein Objekt*) and objective validity for everyone (*Objektivität*). The uniform translation of all three stages by "objectivity" masks this distinction, as

well as the Kantian solution, which is to assimilate *Gegenständlichkeit* (which we might translate as "objectuality") with *Objektivität* (for which we would reserve "objectivity"), understood as necessary (*notwendige Gültigkeit*) and universal validity (*Allgemeingültigkeit*):

> Es sind daher objektive Gültigkeit und notwendige Allgemeingültigkeit (für jedermann) Wechselbegriffe, und ob wir gleich das Objekt an sich nicht kennen, so ist doch, wenn wir ein Urteil als gemeingültig und mithin notwendig ansehen, eben darunter die objektive Gültigkeit verstanden.

> (Objective validity and necessary universal validity (for everyone) are therefore interchangeable concepts, and although we do not know the object in itself, nonetheless, if we regard a judgment as universally valid and hence necessary, objective validity is understood to be included.)

> (Kant, *Prolegomena*, § 19)

Objectivity thus no longer contrasts with subjectivity but only with the "simple subjectivity" (*bloße Subjektivität*), the "purely subjective validity" (*bloß subjektive Gültigkeit*) of sensible modifications of the subject. It is identified with that which is a priori in the subject, namely pure intuitions and categories, which provide the relationship to the ob-ject:

> Daß es a priori erkannt werden kann, bedeutet: daß es ein Objekt habe und nicht bloß subjektive Modifikation sei.

> (That it can be cognized a priori means: that it has an objectand is not merely a subjective modification.)

> (Kant, *Reflexionen*, 5216, trans. Guyer, 111)

However, the concept of object is a generic one whose meaning multiplies as a function of the levels of objectivization that ensure the denotation, universality, and necessity of the phenomenon. It follows that the concept of "objective reality" (*objektive Realität*) is multivocal, and may be divided into levels related to the transcendental conditions (formal, material, general) defining the modalities (possible, actual, necessary) and corresponding to the different scholastic-Cartesian concepts of "reality" (*quidditas* or *realitas objectiva*, *quodditas* or *realitas actualis*, *necessitas* or *ens causatum*). Each level achieves a successive elimination of that which is simply subjective (*bloß subjektiv*): the quality of pertaining to the senses; *ens imaginarium*; and contingency.

— *Realitas objectiva* (*essentia*, *possibilitas*) at the mathematical level is not, however, the possible object, that is, the object simply present in front of us (*da-seiendes*), stripped of its secondary qualities and constituted by primary qualities alone (magnitudes), the conditions of construction in space and time. Rather, *realitas objectiva* is the sense of the object (*gegenständlicher Sinn*), which is contrasted with the *nihil negativum*, the empty object without a concept (*leerer Gegestand ohne Begriff*) (Kant, *Kritik der reinen Vernunft*, A 292, B 348):

> [Die] Bedingungen des Raumes und der Bestimmung desselben . . . haben ihre objektive Realität, d. i. sie

gehen auf mögliche Dinge, weil sie die Form der Erfahrung überhaupt a priori enthalten.

> ([The] conditions of space and of its determinations . . . have their objective reality, i.e., they pertain to possible things, because they contain in themselves a priori the form of experience in general.)

> (Ibid., A 221, B 268)

Realitas actualis existentia, at the dynamic level, is actuality (*Wirklichkeit*), the perceptually given object with a perceptible matter that guarantees its empirical reality or denotation (*Gegenständlichkeit*, *Beziehung auf einen Gegenstand*), which is contrasted with *ens rationis* and *ens imaginarium*, intuitions or concepts empty without objects (ibid., A 292):

> [Wir müssen] immer eine Anschauung bei der Hand haben, um . . . die objektive Realität des reinen Verstandesbegriff darzulegen.

> ([We must] always have available an intuition for it to display the objective reality of the pure concept of the understanding.)

> (Ibid., B 288)

Finally the *ens creatum sive causatum*, purged of all theological content, corresponds to the "material necessity in existence" (*materiale Notwendigkeit im Dasein*), that is, submission to the principle of causality and to the rule of understanding necessary in the apprehension of phenomena:

> Dasjenige an der Erscheinung, was die Bedingung dieser notwendigen Regel der Apprehension enthält, ist das Objekt.

> (That in the appearance which contains the condition of this necessary rule of apprehension is the object.)

> (Ibid., A 191, B 236)

The idea of a causal order of time prescribes a rule to the subjective succession of apprehension and makes it possible to move from the subjective succession of representations to the representation of an objective succession, from *Erscheinung* to *Objekt*. The object in this sense does not simply denote the existing object but that which has universal and necessary validity. Objectivity as objective validity is thus not completely identical with denotation but adds a further requirement to it, that of the principle of reason or causality, which inserts every object in the necessary order of causation of phenomena and makes it possible for the natural sciences to construct reality, nature being identical for every subject (*allgemeingültig*). We should not confuse this intersubjective validity with the simple claim to subjective universality that characterizes the judgment of taste (Kant, *Kritik der Urteilskraft*, § 8, 5:213–16), since that is only the idea of a universal assent lacking a concept, and hence also lacking objectivity.

— A final concept of objectivity appears on the practical level, where the critical question concerning the objectivity of our principles of action is posed. There are indeed phenomenal objects of practice, namely objects of desire constituted as realizations of the will. But if the principle of

determination of an action is an empirical object, namely the feeling of pleasure or pain or the distinction between good and bad, then the action is deprived of its objective validity since its object is an a posteriori matter (Kant, *Kritik der praktischen Vernunft*, 5:21, *Object=Materie*), and thus simply subjective. For it to have objective validity, the practical object must be a *necessary* object of the faculty of desire, whose intersubjective validity is ensured by its formal, a priori character, namely the form of the law, the principle of distinction between good and evil (*Gut* and *Böse*). As in the case of pure reason, we must therefore distinguish between *Gegenständlichkeit* and *Objektivität*, objectuality and objectivity, the latter being guaranteed by its a prioricity, that is, its necessity and universality:

> Unter einem Begriffe eines Gegenstandes der praktischen Vernunft verstehe ich die Vorstellung eines Objekts als einer möglichen Wirkung durch Freiheit.
>
> (By a concept of an object of practical reason, I mean the presentation of an object as an effect possible through freedom.)
>
> (Kant, *Critique of Practical Reason*, 77)

> Die alleinigen Objekte einer praktischen Vernunft sind also die vom Guten und Bösen. Denn durch das erstere versteht man einen notwendigen Gegenstand des Begehrungs, durch das zweite des Verabscheuungsvermögens, beides aber nach einem Prinzip der Vernunft.
>
> (The sole objects of a practical reason are, therefore, those of the *good* and the *evil*. For by the first one means a necessary object of our power of desire, by the second, of our power of loathing, but both according to a principle of reason.)
>
> (Ibid., 78)

II. Husserl: From the Object to *Gegeständlichkeit*

The terminology of objectivity in Husserl presents the same kind of difficulties that we find in Kant, insofar as it is technically extended and complicated by the distinction of types of object and objectification. However, Husserl's deployment of the concept of *epochê* [ἐποχή] also serves to simplify the treatment of objectivity (in comparison to Kant's treatment), for *epochê* serves to remove the dissociation of the object into phenomenon and thing in itself, and brings the object back to the phenomenon alone.

A. Multiplying the kinds of object

The key phrase for Husserl is the "*Rückgang auf die Sache selbst*," translated as "return to things themselves." However, "*Sachen sind nicht ohne weiteres Natursachen*" [*things* are not simply mere things belonging to Nature] (*Ideen* I, § 19, Hua III/1, p. 42; *Ideas pertaining to a Pure Phenomenology*, Eng. trans. F. Kersten, 36); they are, rather, everything that may be ascribed to intuitive self-givenness (*Selbstgegebenheit*) in contrast with what is simply indicated (*bloß vermeint*). There is, as a consequence, a proliferation of types of thematic objects. These Husserl designates by the term *Gegenständlichkeit*, which is better translated into French as "objectity"

(S. Bachelard, Élie-Kelkek-Schérer) than as "objectivity" (Ricoeur), to avoid confusion with the character of what has objective validity (*Objektivität*, see below):

> Ich wähle öfters den unbestimmteren Ausdruck Gegenständlichkeit, weil es sich hier überall nicht bloß um Gegenstände im engeren Sinn, sondern auch um Sachverhalte, Merkmale, um unselbständige reale oder kategoriale Formen u. dgl. handelt.
>
> (I often make use of the vaguer expression "objective correlate" [*Gegenständlichkeit*] since we are here never limited to objects in the narrower sense but have also to do with states of affairs, properties, and nonindependent forms, etc., whether real or categorial.)
>
> (Husserl, *Logical Investigations*, First Investigation, § 9, 1:281)

Thus, a number, a value, a nation are "objectities" in the same way a tree is. Let us analyze these complexities in the vocabulary of objects.

1. Things of nature and grounded "objectities"

Objectities may be forms of object that are grounded on the infrastructure of material nature and possess layers of superstructural meaning. They are "new types of objectity of a higher order [*neuartige Gegenständlichkeiten höherer Ordnung*]" (*Ideen*, I, § 152, Hua III/1, p. 354), which Husserl refers to by the terms *Gegenstand, Objekt, Gegeständlichkeit, Objektität* (ibid., § 95, Hua III/1, p. 221): animate beings (*Animalien*), objects of value (*Wertobjekte* or *Wertobjektitäten*, see WERT), objects of use (*praktische Objekte* or *Gebrauchsobjekte*), cultural formations (*konkrete Kulturgebilde*: state, law, morality, etc.). The difficulty derives from the distinction between natural infrastructure (that which has value, *werter Gegenstand*), the abstract layer grounded in it (*das Wert*, value as the correlate of an evaluation, *objectified value*), and the concrete objectity resulting from their fusion (*Wertgegenstand*, where the *Naturobjekt* and *Wert* are combined, the *object with value*):

> Wir sprechen von der bloßen "Sache," die werte ist, die Wertcharakter, Wertheit hat; demgegenüber vom konkreten Werte selbst oder der Wertobjektität.
>
> (We shall speak of the mere "thing" that is valuable, that has a value-characteristic, that has *value-quality;* in contradistinction, we speak of *concrete value* itself or the *value-Objectiveness.*)
>
> (Husserl, *Ideen*, Volume I, § 95, Hua III/1, 221; *Ideas pertaining to a Pure Phenomenology*, Eng. trans. F. Kersten, 232)

Let us take an example. In a museum, I perceive a primitive object first as simply a thing; then, understanding its practical value (*Gebrauchssinn*), I incorporate that to it and perceive the object as an object of use (*Gebrauchsobjekt*). French does not have the ease of German, with its compound words, of rendering the nature of this fusion: "objet-valeur" risks introducing a confusion with objectified (that is, abstract) value, "object having value" (Ricoeur), and thus of suggesting a split between object and value; the expression "chose-évaluée" better suggests the sort of fusion Husserl describes.

Generally speaking, the different levels of objectification and the distinction between abstract and concrete objectities create problems for French.

2. Singular objects and essence

Husserl also widens the domain of objectities by admitting, alongside singular objects, essences as objects of specific intuition:

> Das Wesen (Eidos) ist ein neuartiger Gegenstand. . . . Auch Wesenerschauung ist eben Anschauung, *wie eidetischer Gegenstand eben Gegenstand ist.*

> (The essence [Eidos] is a new sort of object. . . . Seeing an essence is also precisely intuition, *just as an eidetic object is precisely an object.*)

> (Ibid., § 3, Hua III/1, 14; *Ideas pertaining to a Pure Phenomenology*, Eng. trans. F. Kersten, 9)

The difficulty here is not one of translation but of understanding the term *Gegenstand.* If we render it by "object," we must keep in mind "the generalization of the concepts of intuition and of object" ("*Verallgemeinerung der Begriffe 'Anschauung' und 'Gegenstand'*"). In Husserl this "generalization" is not an analogy taking essences on the model of perceptual objects but the understanding of singular objects and essences as species of the genus "any object whatever," of the "universal concept of object, of object as any *something* whatever [*des allgemeinen Gegenstandsbegriffs, des Gegenstands als irgend etwas*]" (*Ideen* . . . I, § 22, Hua III/1, p. 47). Husserl generalizes the fact of being an object (*Objektheit*) to fields other than singularities, even while denouncing any confusion between real and ideal objectities:

> Besagt *Gegenstand* und *Reales*, *Wirklichkeit* und *reale Wirklichkeit* ein und dasselbe, dann ist die Auffassung von Ideen als Gegenständen und Wirklichkeiten allerdings verkehrte "platonische Hypostasierung."

> (If *object* and *something real*, actuality and real actuality, have one and the same sense, then the conception of ideas as objects and actualities is indeed a perverse "Platonic hypostatization.")

> (Ibid., § 22, Hua III/1, 47; *Ideas pertaining to a Pure Phenomenology*, Eng. trans. F. Kersten, 41)

The term *Wirklichkeiten*, corresponding to the generalized concept of object, does not refer to "realities" (as Ricoeur argues) in the sense of "natural realities" but to anything that has the characteristic of actuality (*Wirklichsein*) and contains different types of ideality (*vielerlei Ideales*: the spectrum of sounds, the number 2, the circle, a proposition, etc.).

3. Syntactic objectities

In the domain of essences, the idea of formal ontology extends the notion of objectivity to the syntactic domain. Material ontologies consider the genera of concrete objects (thing, animal, man, etc.); formal ontology considers the "formal region" (*formale Region*) of any object whatever, "the empty form of region in general" ("*die leere Form von Region überhaupt*," ibid., I, § 10, Hua III/1, 26). Taken in the logical sense, as designating any possible subject of predication, "objects" are not restricted to concrete individuals like proto-objecticities (*Urgegenständlichkeiten*) or ultimate substrates ("*letzte Substrate*"), but contain "syntactic or categorial objectities [*syntaktische oder kategoriale Gegenständlichkeiten*]" (ibid., I, § 11, Hua III/1, 28–29) derived from these by syntactic construction:

> "Gegenstand" ist ein Titel für mancherlei, aber zusammengehörige Gestaltungen, z. B. "Ding," "Eigenschaft," "Relation," "Sachverhalt," "Menge," "Ordnung" usw., die . . . auf eine Art Gegenständlichkeit, die sozusagen den Vorzug der Urgegenständlichkeit hat, zurückweisen.

> ("Object" is a name for various formations which nonetheless belong together—for example, "physical thing," "property," "relationship," "predicatively formed affair-complex," "aggregate," "ordered set." Obviously they are not on a par with one another but rather in every case point back to one kind of objectivity that, so to speak, takes precedence as the *primal objectivity*.)

> (Ibid., I, § 10, Hua III/1, 25; *Ideas pertaining to a Pure Phenomenology*, Eng. trans. F. Kersten, 20)

"Objects" of this sort are purely logical, fundamental concepts; the formal determination of the object as a "something in general" ("*ein irgend Etwas*") taken as the substrate of a statement; objects of a higher order inasmuch as they are derived from the ultimate substrates, the perceptual objects. Thus the state-of-affairs or state-of-things, the *Sachverhalt* "the snow is white," is an object just as much as the snow is, but of a higher order, since it implies the consciousness of the substrate, of the property, and of their combination all at once: it is a compound object of polythetic consciousness ("*Gesamt-Gegenstand polythetischer Bewußtseins*"). The French translation of *Sachverhalt* (see SACHVERHALT) by *état-des-choses* is inaccurate, since the thing is not a thing of nature (*Naturding*) but rather any logical subject of any level; the English "predicatively formed affair-complex," even better than the more common "state of affairs," renders its predicative origin and its much broader reach and common character.

B. Elimination of the object in itself and layers of meaning of the intentional object

The Kantian amphibology of the object (*Erscheinung* and "*Ding an sich*") is eliminated by *epochê*, since placing the natural thesis on the sidelines (*ausschalten*) means bracketing (*einklammern*) any object posited by it, hence any existent in itself, and making the object appear as "intentional object" or *Noema*, terms that refer to the objectival sense sought and constituted by consciousness:

> Ähnlich wie die Wahrnehmung hat jedes intentionale Erlebnis . . . sein "intentionales Objekt," d. i. seinen gegenständlichen Sinn.

> (Like perception, *every* intentive mental process . . . has its "intentional Object," i.e., its objective sense.)

> (Ibid., I, § 90, Hua III/1, 206; *Ideas pertaining to a Pure Phenomenology*, Eng. trans. F. Kersten, 217)

The intentional object is an object not in the sense of being self-subsistent but in the sense in which one speaks of an object of attention, that is, as a correlate or "*terminus*

ad quem" (*Worauf*, toward-which, Heidegger will say) of an activity. Not the existing thing ("*das wirkliche Ding*"), but the being-sense (*Seinsinn*) constituted by the giving of meaning by consciousness—noematic trees do not burn! The term *gegenständlich* refers to the relationship to an object and is translated by "objectival" or "objectual" to distinguish it from the term *objektiv*, which refers to what has intersubjective validity. In this way any object being reducible to a being-sense correlative to a target of consciousness, a noema correlative to a noesis, we can—in the same way that a noema may be decomposed into a series of partial goals or intentions—distinguish in the noema different layers of objectival sense corresponding to different degrees of objectification. Thus we come, as in Kant, to a stratification of meanings of the object and objectivity that return us to the constitutive operations of the transcendental subject.

1. The twofold sense of the concept of reality: "reell" and "real"

This reduction of objectivity to the intentional object should not hide the division of the concept of "reality" into two senses: the "reality" of being is referred to by the adjectives *reelle* and *real*, or *immanent* and *transzendent*. What is *reell* refers to what has the mode of being of consciousness and is absolutely given, while what is *real* is what has a material nature (*Naturding*) given by its outlines. The perceived tree is *real*, but my perception of the tree is *reell*, not included in material nature but included in consciousness and in this way *ir-real*. Indifferently translating *real* and *reell* by "real" would gloss over this essential distinction of the modes of being and consciousness of the object, of experience (*Erlebnis*) and the thing (*Ding*), "*des reellen Bestands der Wahrnehmung*" ("the concrete, really inherent composition of perception itself") and "*des transzendenten Objekts*" ("utterly transcendent object") (ibid., I, § 41, Hua III/1, p. 83; *Ideas pertaining to a Pure Phenomenology*, Eng. trans. Kersten, 86). The translation of *irreal* by "unreal" would be inaccurate as well, suggesting that experiences are fictions when in fact they are the absolute given; *ir-real* refers to whatever does not have the mode of being of a worldly thing. Husserl thus takes up terminology inherited from German idealism, in which *Realphilosophie* referred to the philosophy of work, nature, and family (cf. Hegel, *Realphilosophie* of Jena), and in which *real* contrasts with whatever is metaphysical and deals with the philosophy of mind. He extends the concept of *real* to whatever belongs to the world, contrasting it only with ideal and syntactic objectities (see TRUTH).

2. Immanent objectities

While terminology for objects becomes complicated at the top end by the admission of objects of a higher order, it is also complicated at the bottom, when we examine the abstract component of concrete objects. These are "immanent objectities," that is, units identified by consciousness and not objects situated in the world. The time of consciousness is not, therefore, unformed or Heraclitean, but already shaped by permanent units:

Das Erlebnis, die wir jetzt erleben, wird uns in der unmittelbaren Reflexion gegenständlich, und es stellt sich

in ihm immerfort dasselbe Gegenständliche dar: derselbe Ton.

(The mental process which we are now undergoing becomes objective to us in immediate reflection, and thenceforth it displays in reflection the same objectivity: the self-same tone which has just existed as an actual "now" remains henceforth the same tone.)

(Husserl, *Die Idee der Phänomenologie*, Hua II, 67; *Idea of Phenomenology*, Eng. trans. Alston and Nakhnikian, 52)

This sound is, of course, an "object" in the sense of a unit apprehended by consciousness, but not an object of nature (*Reales, Naturgegenstand*). Whence the difficulty we encounter in translating the expressions for these immanent "objects," like *Zeitobjekt*:

In der Wahrnehmung mit ihrer Retention konstituiert sich das ursprüngliche Zeitobjekt.

(The *primary temporal object* is constituted in perception, along with the retention of consciousness of what is perceived.)

(Ibid., Hua II, 71; *Idea of Phenomenology*, Lecture 5, Eng. trans. Alston and Nakhnikian, 56)

In French *Zeitobjekt* must therefore be translated by "tempo-object" (Granel) or *objet de temps*, "object of time," and not *objet temporel* or "temporal object" (as Dussort and Lowit do) since, although any object of nature is "temporal" insofar as it is situated in objective time, a melody as an immanent given of consciousness is a "tempo-object," a pure thing-of-duration without spatial or causal character. The same holds for the abstract layer of spatiality, which defines "objects" that are concrete relative to itself but abstract relative to the natural thing: *res extensae*. Here again, we must translate *res extensa* by spatio-object or spatial-thing (with a hyphen) rather than by "extended thing" or "spatial thing," since while every *Naturding* is extended, *res extensa* is only extension, its materiality having been abstracted away, as well as its placement in the causal order of nature: a ghost, a rainbow as pure apparitions. These layers separate out again into new, more abstract layers, such as the *res extensa* in "things" relative to each sense modality (*Sinnendinge: Sehdinge, Tastdinge*, etc.), which are not *choses sensibles* or *choses sensorielles* (Ricoeur), "sensory things" or "things of sense" (Boyce Gibson, Eng. tr. of *Ideen* I)—since every *Naturding* is sensible—but "things pertaining to the senses" (Cairns), things-of-the-senses or things relating to each sense (*choses-des-sens* in French), which we might translate by the Latin *sensualia* (Escoubas, Fr. tr. of *Ideen* II). Thus *Sehding* could be rendered with the help of Latin as *visuale* (Escoubas), or again "visual-thing" or "thing-of-sight," but not by "visual thing" or "visible thing" (Ricoeur), since every *Naturding* is visible (but also tangible, audible, and so on), whereas a *Sehding* is a pure thing-of-sight having only visual properties (e.g., a patch of red color that I see when closing my eyes).

3. Object "pure and simple" and complete object

The analysis of intentional objects and the ways in which they are given allows us to distinguish between a narrow

and a wide sense of noema: the central core or pure objectival sense, or the central noematic moment ("*zentraler Kern*," "*purer gegeständlicher Sinn*," "*zentrales noematisches Moment*") is contrasted with the complete intentional object in the manner of its modes of being given ("*volles intentionales Objekt*," "*Gegenstand im Wie seiner Gegebenheitsweisen*"). The same tree may be perceived from different angles, at different seasons, and change predicates (color, shape) while remaining identical; it may be perceived, remembered, imagined, named: this "same" is the minimal objectival sense ("*gegenständlicher Sinn*"). From this "same" of the tree have been eliminated, by abstraction, the acts of apprehension (perception, memory, etc.) that give the tree its *Aktcharaktere* (characters of act) of "perceived," "remembered," etc.; this minimal objectival sense is contrasted with the "*Objekt im Wie*," which is the perceived-tree, the remembered-tree, and so on:

> Daß verschiedene Begriffe von *unmodifizierten Objektivitäten* unterscheidbar sein müssen, von denen der "Gegenstand schlechthin," nämlich das Identische, das einmal wahrgenommen, das andere Mal direkt vergegenwärtigt, das dritte Mal in einem Gemälde bildlich dargestellt ist u. dgl., nur einen zentralen Begriff andeutet.

> (We must distinguish different concepts of *unmodified objectivities,* of which the "object simpliciter," namely the something identical which is perceived at one time, another time directly presentiated, a third time presented pictorially in a painting, and the like, only indicates *one* central concept.)

(Ibid., I, § 91, Hua III/1, 211; *Ideas pertaining to a Pure Phenomenology*, Eng. trans. F. Kersten, 222)

The expressions "pure objectival sense" ("*purer gegenständlicher Sinn*"), "noematic core" ("*noematischer Kern*"), and "of central core" ("*zentraler Kern*") thus refer to a layer of meaning of the complete object, namely that which we obtain by abstraction of the determinations inherent to the "how" of subjective directedness. The concept of "objectivity" thus has here the sense of the absence of subjective modification, and that of "pure object," the sense of a correlate prior to any changes of meaning related to the character of acts.

4. The distinction between noematic sense and determinable "object"

We said earlier that the Husserlian sense of objectivity reduces to the intentional or noematic sense, at the expense of the thing in itself, and that in this noematic sense the specifically "objective" moment was the core, obtained by eliminating the characters that inhere in the how of subjective directedness (remembered, imagined, and so on). However, the truly foundational sense of object in Husserl does not reduce either to the noematic sense or the noematic core, but to a final noematic layer, that of the "object" as a pure X, a pure "something," pure identical substrate of variable determinations:

> Es scheidet sich als zentrales noematisches Moment aus: der "Gegenstand," das "Objekt," das "Identische," das "bestimmbare Subjekt seiner möglichen Prädikate"—das pure X in Abstraktion von allen Prädikaten—und es scheidet sich . . . von den Prädikatnoemen. . . . derart,

daß der charakterisierte Kern ein wandelbarer und der "Gegenstand," das pure Subjekt der Prädikate, eben ein identisches ist. . . . Kein "Sinn" ohne das "etwas" und wieder ohne "bestimmenden Inhalt."

> (The identical intentional "object" becomes evidently distinguished from the changing and alterable "predicates." It becomes separated as central noematic moment: the "object," the "Object," the "*Identical*," the "determinable subject of its possible predicates"—*the pure X in abstraction from all predicates*—and it becomes separated *from* these predicates or, more precisely, from the predicate-noemas . . . such that the characterized core is a changeable one and the "object," the pure subject of the predicating, is precisely an identical one. . . . No "sense" without the "*something*" and, again, without "*determining content.*")

(Ibid., I, § 131, Hua III/1, 302-3; *Ideas pertaining to a Pure Phenomenology*, Eng. trans. F. Kersten, 313–15)

What may we say about this sense of the concept of object, manifested in general by the quotation marks? How is it different from the standard concept of intentional object, as well as the concepts of object "pure and simple" and of the noematic core? The noetico-noematic parallelism allows us to understand it: just as at the analytic level any grasp of an object may be decomposed into partial intentions, the noematic sense is broken down into layers of partial senses, the fundamental one being the sense of the noematic core (e.g., a church, abstracted away from knowing whether it is perceived, remembered, etc.) and, more profoundly, the object "pure and simple" (the same church as a material thing, abstracted away from its spiritual predicates). Inversely, however, any directed act, at the synthetic level, no matter what changes affect the object, is not limited to aiming at such or such a state of the object but remains directed at the *same* object (if the church is destroyed or the tree burns, the rubble or ash are indeed the remains of that very object, even though it is unrecognizable). As a result, any grasping of a concrete object involves, at its foundation, the minimal grasp of a pure permanent substrate, the guarantor of the identity of the object. This is the concept of "object": pure *hupokeimenon* [ὑποκειμένον], pure "that-there" or "something," prior to any determination, defined only by permanence and determinability. We find here the function of the Kantian concepts of a transcendental object or *Objekt überhaupt*, or of the category of substance: in the absence of the transcendent existence of the object, grounding the identity of the objective correlate in the permanence of an empty grasping. That there is no sense without the "something" means that the indeterminate relation to the object X (indeed that is the title of the first chapter of the fourth section of the *Ideen* I: "The noematic sense and the relation to the object") precedes any relationship to a determined object, and hence that formal ontology, the theory of the pure "something," has a foundational status for material ontologies. Thus one should, strictly speaking, as in Kant, translate this occurrence of the concept of "object" by "ob-ject," to distinguish it from the object provided with a determined noematic sense, meaning by this the permanence of a correlate for consciousness.

5. The twofold sense of "objectivity":
Objektivität and *Gegenständlichkeit*

Finally the concept of *Objektivität*, which we translate by "objectivity," does not refer like *Gegenständlichkeit* to the relation to an objectity, but to the highest level of objectification, namely intersubjective validity. The objective thing ("*objectives Ding*") is the "intersubjectively identical physical thing" ("*das intersubjektiv identische Ding*," *Ideen* I §151, Hua III/1, 352; *Ideas pertaining to a Pure Phenomenology*, Eng. trans. Kersten, 363), which is a unit constitutive of a higher order ("*eine konstitutive Einheit höherer Ordnung*") insofar as it derives from an intersubjective constitution, related to an indefinite plurality of subjects linked by a reciprocal comprehension "for which *one* physical thing is to be intersubjectively given and identified as the same objective actuality [*für welche ein Ding als dasselbe objektiv Wirkliche intersubjektiv zu geben und zu identifizieren ist*]" (ibid., § 135, Hua III/1, 310–11; Eng. trans. Kersten, 323). In this regard the highest-level objectivity, related to an indefinitely open community, is the "true thing" (*das wahre Ding*), which Husserl calls *das physikalische Ding*, and which is not simply the "*chose physique*" (ibid., § 41, Hua III/1, 83—Ricoeur, or "physical thing," Boyce Gibson), but the thing-of-physical-thought (i.e., as conceived in physics), just as *das physikalische Wahre* refers not to "physical truth" but to the truth sought by physical science, which strips nature of its subjective-relative qualities. The "true thing" is not the thing in itself as intelligible cause of all apprehension but the superstructure built up by mathematical thought on the world of appearing objects.

GEISTESWISSENSCHAFTEN (GERMAN)

ENGLISH	human sciences, moral sciences, social sciences, humanities, human studies
FRENCH	*sciences humaines, sciences de l'esprit*
ITALIAN	*scienze umane, scienze morali, scienze dello spirito*
POLISH	*nauki humanistyczne*

➤ BILDUNG, EPISTEMOLOGY, HISTORIA UNIVERSALIS, *HUMANITY*, LIGHT, MORALS, SOUL

The expression *Geisteswissenschaften* refers to an object or constellation of objects of experience: man and his actions in the world, by contrast with *Naturwissenschaften*, sciences of nature. This distinction is accompanied by a difference in method summed up by Wilhelm Dilthey in the distinction between "to explain" (*erklären*) and "to understand" (*verstehen*). The translation of *Geisteswissenschaft* gave rise to the formulation of a number of terms that intersect one or the other German meanings, without, however, completely exhausting its sense. Thus one is confronted each time with at least a pair of terms: in English, humanities / moral (social) sciences; in French *sciences de l'esprit / sciences humaines*; in Italian *scienze umane / scienze morali*. As a result, the choice of translation must come from a more or less clearly embraced decision as to what is understood by the very idea of science.

I. Dividing Science: *Geisteswissenschaften* and Its Translations

A. Emergence: Germany-England

Geisteswissenschaft, in the singular, appears toward the end of the eighteenth century in relation to a *Pneumatologie oder*

Geisteslehre (doctrine of the mind), a study of the intellectual and moral faculties of man. The plural *Geisteswissenschaften*, today firmly established, is used by Johann Gustav Droysen in his *Geschichte des Hellenismus* (1843, vol. 2, preface). The irony, however, is that the term starts spreading only in 1849—as a translation of the English "moral sciences." Dilthey is the one who, in 1883 (*Einleitung in die Geisteswissenschaften*), gives it its canonical usage and its conceptual dimension to refer to hermeneutic knowledge of cultural works and of mental objects throughout history.

- See Box 1.

B. "Moral sciences," "social sciences," "humanities"—France-Germany-England

The original expression "moral sciences" is used by John Stuart Mill in the sixth and last book of his *System of Logic, Ratiocinative and Inductive* (1843). But the new sense given to the word by Dilthey to its German translation, *Geisteswissenschaften*, explains, in reverse, the problems faced by the English translators of the *Einleitung in die Geisteswissenschaften*. Yet these latter difficulties are especially significant when one sets about defining and translating *Geisteswissenschaften*. The translation of *Geist* by "mind" does not seem wholly right, inasmuch as "mind" appears to refer primarily to the mental life of the individual; but "mind" may nonetheless also refer to a collection: thus the title of Dilthey's *Geschichte des deutschen Geistes* was translated as *Studies concerning the History of the German Mind*, such that R. G. Collingwood translated *Geisteswissenschaften* as *Sciences of Mind*. However, even though Dilthey refers explicitly to the Hegelian concept of *Geist*, neither "mind" nor "spirit," the two most likely candidates as translations for *Geisteswissenschaften*, prevailed when Hegel's *Phänomenologie des Geistes* was rendered into English. Two other terms were used instead: "moral sciences" and "social sciences."

1. "Moral sciences" and *Geisteswissenschaften*

In French and English, the expressions "moral sciences" and "moral and political sciences," which for a long time were used to translate *Geisteswissenschaften* (see B. Groethuysen, "Dilthey and His School" of 1912, as well as André Lalande's RT: *Vocabulaire technique et critique de la philosophie* of 1938 and its entry for "science," or Raymond Aron's use of these expressions interchangeably with *sciences de l'esprit* in 1935), fell out of use, and were progressively replaced by "human sciences," *scienze umane*, and *sciences humaines* (see the English and French translations of Dilthey's *Einleitung*, in 1988 and 1942 respectively). With their indeterminate connotations, these more recent expressions blur the line between two conceptions of science—the first inductive or mathematized, like economics and some sectors of sociology, the second comprehensive, such as history. This is clearly seen by looking, in contrast, at what Mill means by "moral sciences," namely, essentially political science, sociology, and political economy, underwritten by a science of the laws of mental life.

2. *Geisteswissenschaften* and "social sciences"

In fact, the phrase "social sciences" has an equally valid claim as does "moral sciences" to serve as the description for these pursuits. At first glance, it does not seem illegitimate to defend this claim even as a translation of Dilthey, who, after all, judges it necessary to give as the subtitle of his *Introduction,* "Versuch einer Grundlegung der Gesellschaft und der Geschichte"—"An Attempt to Lay a Foundation for the Study of Society and History," in Betanzos's translation. Nevertheless, the concept of *Geisteswissenschaften* remains irreducible to Mill's project, for, far from wishing to establish the autonomy of the sciences of mind, Mill wishes on the contrary to widen the field of application of the inductive method to the "sciences of Ethics and Politics" or "moral and social sciences," or again to the "sciences of human nature and society." Book VI of Mill's *System of Logic, Ratiocinative and Inductive*, devoted to the moral sciences, is thus only a "kind of supplement or appendix" (2:478) to the rest of the system.

It is thus significant that the epigraph of Mill's book is a quotation from Condorcet's *Esquisse d'un tableau historique des progrès de l'esprit humain* (1793). Why Condorcet, rather than someone like Hume?

The goal of Hume's *Treatise of Human Nature; being an attempt to introduce the experimental method of reasoning into moral subjects* (1793) is in fact literally identical with Mill's, especially since this "science of man" must be completed by the "examination of morals, politics, and criticism." However, Condorcet, though using the expressions *sciences humaines*, *sciences morales et politiques,* and *sciences métaphysiques et sociales* indifferently, deploys social mathematics in an explicit and systematic way, of which Fourierist calculus is a kind of caricature and in relation to which Auguste Comte remains far in the background.

Despite the idea of a science of human "nature" and the ambiguity of the normative connotation of "moral sciences," the way in which Mill conceives of these sciences, whose certainty is uncontestable insofar as they concern "the character and collective conduct of masses" (*System of Logic,* 2:495), explains in advance the future decline of this expression in favor of "social sciences," that is, of "behavioral sciences" (see BEHAVIOR). Whereas the political, cultural, and national sense of Dilthey's project is to restore the "unity of the German vision of the world," the social aim of these sciences is to rationalize society, and, for Condorcet, to reduce inequalities by conceiving of, for example, a system of retirement and life insurance.

To compensate, the subjects that are most resistant to such a treatment—for example, art history as compared to economics—seem doomed to subsist under the name "humanities," with the term "moral" withdrawing of its own accord in deference to the new division between the *natural* and *social* sciences. In this context, "humanities" hardly corresponds to what social sciences covers, in particular because of the connotation of the word "science," whose extension is much narrower than that of *Wissenschaft.* Its choice in 1961 as the translation of Ernst Cassirer's *Logik der Kulturwissenschaft* (cf. also Rudolf Makkreel, who devotes a work to Dilthey in 1975: *Dilthey: Philosopher of the Human Studies*), is in fact much closer in spirit to what Dilthey means. Unlike "humanities" and like the Polish *nauki haumanistyczne*, in which the term means both human and humanist,

1

The structuring of a term: Dilthey's antitheses

With Dilthey, the science of *Geist* (mind) is no longer the knowledge of man in general, his faculties, his critical or moral reason, but rather a bundle of disciplines and empirical sciences whose objects are determined by the different historical manifestations of *Geist*. At the same time, the differences in method within the sciences of nature are no longer limited to a simple partition between two groups of disciplines within the universe of science.

The same year (1883) in which Dilthey published his essay on *Geisteswissenschaften*, Wilhelm Windelband introduced a distinction between what he termed monothetic (*monothetisch*) and idiographic (*idiographisch*) sciences, and applied the distinction to the domains that Dilthey had sought to characterize. The first, monothetic sciences, are those, like the natural sciences, that aim to give order to diverse phenomena by building a system of concepts or laws having the most general possible validity. The second, idiographic sciences, are those that, like the historical sciences, deal with events in their concrete singularity and their individual becoming. In reality, as concerns Dilthey, this distinction is relative not to the object of study but to the method. If the object itself were at issue, it would not be *Geist* but *Kultur*, in the sense understood by Heinrich Rickert, who, in the wake of Windelband, criticizes the concept of *Geist*.

This situation yields two major consequences:

1. On the one hand, *Geisteswissenschaften* become, with their plurality, empirical disciplines, which leads to the translation into French not as *sciences morales* but as *sciences humaines*. By this transformation, the term *Geisteswissenschaften* no longer covers the rigorously scientific sense of a moral or philosophical reflection; rather, it leads to a separation with philosophy, which is thenceforth placed on a higher level of abstraction.
2. On the other hand, and in consequence, this situation yields a definitive fusion of the determinations of method and content in a single term, *Geisteswissenschaften*, which does not take place in other languages. To the contrary: in other languages this situation provokes a proliferation of terminology that the synthetic character of the German term prevents.

These phenomena are perfectly summed up by Dilthey in the following lines:

Besides the natural sciences, a group of conceptual cognitive results emerged naturally from the tasks of life itself.

These results are linked to one another by their common object. [Neben den Naturwissenschaften hat sich eine Gruppe von Erkenntnissen entwickelt, naturwüchsig, aus den Aufgaben des Lebens selbst, welche durch die Gemeinsamkeit des Gegenstandes miteinander verbunden sind.] History, political economy, the sciences of law and of the state, the study of religion, literature, poetry, architecture, music, of philosophical world-views and systems, and finally, psychology are such sciences. All these sciences refer to the same grand fact: the human race [Alle diese Wissenschaften beziehen sich auf dieselbe große Tatsache : das Menschengeschlecht] which they describe, narrate, and judge, and about which they form concepts and theories.

What one customarily separates as physical and psychical is undivided in this fact of the human sciences. It contains the living nexus of both. We ourselves belong to nature, and nature is at work in us, unconsciously, in dark drives. States of consciousness are constantly expressed in gestures, looks, and words; and they have their objectivity in institutions, states, churches, and scientific institutes. History operates in these very contexts.

Of course, this does not exclude the possibility that the human sciences employ the distinction between the physical and the psychical whenever their purposes require it. But then they must remain conscious that they are working with abstractions, not with entities, and that these abstractions are valid only within the limits of the point of view within which they are projected. . . .

For it is clear that the human sciences and natural sciences cannot be logically divided into two classes by means of two spheres of facts formed by them. Physiology also deals with an aspect of man, and it is a natural science. Consequently, the basis for distinguishing the two classes cannot be found in the facts taken on their own. The human sciences must be related differently to the physical and to the psychical aspects of man. And that is in fact the case [Denn es ist klar, daß die Geisteswissenschaften und die Naturwissenschaften nicht logisch korrekt als zwei Klassen gesondert werden können durch zwei Tatsachenkreise, die sie bilden. . . . Die Geisteswissenschaften müssen sich zu der physischen Seite der Menschen

anders verhalten als zur psychischen. Und so ist es in der Tat].

(*The Formation of the Historical World in the Human Sciences*, 101–2; *Die Aufbau der geschichtlichen Welt in den Geisteswissenschaften*, in *Gesammelte Schriften*, 7:91–92)

There is a measurable difference between these later theses and Dilthey's earlier suggestions, in the *Einleitung* of 1883, which still attached the *Geisteswissenschaften* to the domain of particular objects:

All the disciplines that have socio-historical reality as their subject matter [*welche die geschichtlich-gesellschaftliche Wirklichkeit zu ihren Gegenstände haben*] are encompassed in this work under the name "human sciences" [*Geisteswissenschaften*].

(*Introduction to the Human Sciences*, 1:56; *Einleitung in die Geisteswissenschaften*, in *Gesammelte Schriften*, 1:4)

Nonetheless, the plurality of sciences referred to as *Geistwissenschaften* seem capable of being brought under a certain unity, that of *Geist*. While the nature of this unity is made increasingly difficult to grasp by Dilthey's evolution, its effects make themselves felt nonetheless. The plasticity of the notion of *Geist*, its semantic richness, meant that German did not feel the need to vary its expressions and add to its lexicon in this regard. Thus, a plurality of terms in other languages is required to correspond to the multivocal German word.

"human studies," used from the nineteenth century on, has the particularity of incorporating the social sciences.

■ See Box 2.

II. Conceiving the Science of Man: The Philological and Historical Model

At bottom what determines the gap between *Geisteswissenschaften* and the social sciences is the way in which each conceives of history and the knowledge it is possible to have of it. Already in 1876, Dilthey considered the isolation in which the science of history was confined as responsible for the inability of *Geisteswissenschaften* to constitute themselves as autonomous, and he countered Comte and Mill with the "German spirit of historiography." The "sciences of mind" are, he argues, the result of the process by which philology and the literary humanities of the Renaissance humanists transform themselves into a comparative study of the productions of the mind. In still other words, two factors are decisive for the birth or acceptance of the idea of *Geisteswissenschaften*: a philological tradition and the appearance of historical consciousness.

In this respect, Dilthey is partially anticipated in both the theses and the terminology of Ernest Renan's *L'Avenir de la science* (chap. 8, written in 1848–49, published in 1890). Educated in the German tradition, Renan contrasts the sciences of nature with the "sciences of humanity," that is, the philological and historical sciences, even while anticipating

Geisteswissenschaften: French and Italian solutions

When the expression *sciences de l'esprit* is adopted in France after the publication in 1883 of Dilthey's *Einleitung in die Geisteswissenschaften*, it does not appear to take root except in this technical sense, and its use remains limited to it. And even though Renan speaks of *sciences des faits de l'esprit* (sciences of the activities of mind), founded essentially on philology, the French philosophical tradition remains faithful to the expression *sciences morales*, used in the wide sense of the study of human intellectual faculties. This meaning was already to be found in the names of pedagogical institutions, and, since 1795, in that of the Académie des Sciences Morales et Politiques.

The integration into French usage of the constellation of disciplines that Dilthey addresses takes place by way of the notion of *sciences humaines*. These disciplines are distinguished, especially in ordinary usage, from the *sciences sociales*, which often rely on formal methods. In addition, the twofold character of sociological studies, which deal with human problems but in a quantified form, often resisted various attempts to classify this discipline with the human sciences. In order to truly encompass all the disciplines corresponding to Dilthey's *Geisteswissenschaften*, whose work was translated only in 1942 under the title *Introduction à l'étude des sciences humaines* (before the Faculties of Letters became, in 1958, the *facultés des lettres et sciences humaines*), French today tends to use the expression *sciences de l'homme*, which covers the range of studies concerning the human condition, as well as our individual and collective actions, but thoroughly independently of the methods of investigation used. Thus, before taking up his post at the Collège de France, in 1952, Maurice Merleau-Ponty devoted his course at the Sorbonne to the "Sciences de l'homme dans leur rapport à la phénoménologie," grouping together psychology, sociology, and history. Regarding this question of the field's name and its content, Fernand Braudel points out in *Les Ambitions de l'histoire* that the commonalities and the differences between a human science, history, and the *sciences du social*. These, he writes, are

> more scientific than history, more articulated than it with regard to the mass of social facts. . . . [T]hey are—another difference—deliberately focused on the actual, that is, on life, and they all work on what can be seen, measured, touched . . . . Our methods are not the same as theirs, but our problems [certainly] are . . . . And though there is dependency, and enriching dependency, of the historian with regard to the social sciences, he maintains a position outside them.
>
> (*On History* [translation modified])

We may note, finally, that a new edition of the French translation of Dilthey's *Einleitung* was published in 1992 under the title *Introduction aux sciences de l'esprit*, as though it was judged preferable to return to a literal translation rather than use the various equivalents that had previously been offered.

Parallel to the moral sciences, which betrays an aspiration of submitting the study of the human mind (moral philosophy) to rules of analysis as precise as those governing the study of nature, we must also mention the notion of *Moralwissenschaft* introduced by Georg Simmel (*Einleitung in die Moralwissenschaft*, 1892) to distinguish it from *Geisteswissenschaften* understood in Dilthey's sense, which Italian rationalism develops under the name of *scienza della morale*, a variation on *filosofia della morale*, whose meaning is different from *filosofia morale* (cf. Banfi, "Rendiconti del Regio Istituto Lombardo di Scienze e Lettere") The distinction becomes less trivial once Italian begins widely using the notion of *scienze morali* in the same sense as the French *sciences morales*, and the expression *scienze dello spirito* to translate the idealist connotation of *Geisteswissenschaften*. Italian thus appeals to a lexical plurality very much like that of French to satisfy the different connotations of the German expression. Though we may gather together under the notion of *scienze umane* the collection of disciplines defined by Dilthey, they are not all included in *scienze morali*. Antonio Banfi thus points out in his polemic against Benedetto Croce that, "for the rest, . . . in Germany they continue to speak of *Geisteswissenschaft* and *Geisteswissenschaften* in a sense that is comparable to, but wider than, that which the *scienze morali* had for us, and they remember that the position and function of philosophy with regard to these disciplines are still of some interest" ("Discussioni").

the reasons for the limited character of his own reception. Clearly inspired by the use of the term "philology" in Germany, at a time when it was used to describe German studies and the studies of literature, art, and religion, which are structured on the model of studies of antiquity, Renan emphasizes philology as an "*exact science* of the things of the mind" or "science of the products of the human mind," and thus defines the general orientation of the sciences of humanity, rather closely in line with the future Diltheyan conception of *Geisteswissenschaften* (chap. 8).

If we inquire, not what is particularly German about *Geisteswissenschaften*, but rather what in French resists the literal translation of "sciences of the mind," Renan indicates first the absence of philology, which would explain the simplicity and the violence of Auguste Comte's apprehension of history. Renan thinks that the latter's conception of it is "the narrowest" and his method "the coarsest." The model is no longer Comte's ("Comte understands nothing of the sciences of humanity, since he is not a philologist," Renan writes to Mill, 21 October 1844), but rather that of Vico: the history of humanity is deciphered in the history of language. And Condorcet's project of setting up "a universal language" is just as much at the opposite extreme from the philologist's love of language. Deploring the "withering of the scientific spirit" due to the system "of public instruction which makes science a simple means of education and not an end in itself," Renan is in the end targeting what he calls a typical characteristic of the French mind: "a whole petty manner of saying 'bah' to the qualities of the scientist in order to raise oneself up by those of the man of sense and the man of wit . . . and which Mme de Staël so rightly called the 'pedantry of trifling [*pédantisme de la légèreté*]' " (1995, chap. 6).

The Italian reception of Dilthey's project and the acceptance of *scienze dello spirito* is by contrast much easier, given that Benedetto Croce contributes to a revival of interest in Vico, in whom he saw a precursor of Hegel. This reception also, however, has as a background the philological tradition of the Renaissance humanists. The expression of "human sciences," a clear calque of *studia humanitatis*, which the Florentine chancellor Coluccio Salutati, a disciple of Petrarch, distinguished from *studia divinitatis*, appears in French in the seventeenth century with the same meaning (Wartburg, *Französisches etymologisches Wörterbuch*, 11:308), that is, before acquiring its modern meaning. But the idea of the thing had in fact existed before the imposition of the current nomenclature: Vico studies institutions, myths, and language relying on the philology of Lorenzo Valla, and defends the specificity of the philological method and the certainty of its sorts of knowledge relative to the *mondo civile*. We can understand why Renan and Dilthey refer to him, as their respective projects of an "embryogeny" of the human mind and of comparative psychology are inscribed in the tradition of *La Scienza nuova* (1744).

The translations of *Geisteswissenschaften* thus fall on one side or the other of a fault line between two conceptions of the "human sciences," which correspond more or less to the division separating Anglo-Saxon and Continental philosophies. The expression "social sciences," replacing *sciences morales*, refers to a rationality that implies quantification and prediction: the "humanities" are then merely what remains after the social sciences have gone about the tasks of quantification and prediction. By contrast, expressions like *sciences de l'esprit*, "human studies," and *Geisteswissenschaften* have as their background the philological and historical, that is, the interpretive conception of the human sciences.

Between *Sciences Humaines* and the "Human Sciences"

➤ BEHAVIOR, EPISTEMOLOGY, LIGHT, MORALS, PRAXIS, STRUCTURE

The expression *sciences humaines* (human sciences) is specific to French culture, situated in a philosophical discourse (which claims to engage in an "epistemology of the human sciences") and in institutional arrangements (the Département des Sciences de l'Homme et de la Société at the CNRS, the Maison des Sciences de l'Homme). It originated in the reversal of a theological opposition: after contrasting "science of man" with "science of God" (which means that human capacity for knowledge of the world is finite compared with an infinite divine capacity), "science of man" was contrasted with "science of nature." The origins of this reversal can be found particularly in Malebranche (préface to *La Recherche de la Vérité*, 1674). What is fundamentally involved is the articulation of the biological, psychological, and sociological dimensions of the "human phenomenon." The term "anthropology" (until recently always accompanied in French by an adjective: *anthropologie physique, culturelle, sociale, philosophique*, and so on) thus acquired an architectonic function only in the titles of individual works, as a doctrinal position taken and not as an institutional norm. See HISTORIA UNIVERSALIS; cf. CULTURE, HUMANITY.

Things are indeed different in German, where the term *Geisteswissenschaften* bears the stamp of a philosophical conception of the "objective spirit," with or without the methodological opposition between "understanding" (*Verstehen*) and "explanation" (*Erklären*). They also differ in British and American usage, where "anthropology" is common and universal, "social science" is oriented toward practical applications of sociological and economic knowledge, and "human sciences" (by contrast with the humanities, a set of "literary" disciplines) is clearly oriented toward the study of living human beings in their medical and environmental aspects; or in Italian, where *scienze umanese* are distinguished from the *scienze morali*. GEMÜT (GERMAN)

ENGLISH	mind, mood
FRENCH	*âme*, *cœur*, *sentiments*, *affectivité*, *esprit*
GREEK	*thumos* [θυμός]
LATIN	*mens*, *animus*

➤ HEART, SOUL, *TO SENSE*, and CONSCIOUSNESS, FEELING, GEFÜHL, GENIUS, GOGO, INGENIUM, PATHOS

Gemüth (today written *Gemüt*) is one of those terms that has no substitute, that refers to the register of the soul/mind without any of these equivalents being satisfactory. At the same time, it is one of the oldest philosophical terms in the German language, present from Eckhart to phenomenology. In *Gemüth*, the prefix *ge-* indicates a gathering, a unity. The word is formed from *Muth*, the mind of the man, the state of the soul, courage, humor—its meanings cover the range from the Greek *thumos* [θυμός] to the English "mood," but it also acquires some highly specific senses, such as *Anmuth* (grace) and *Demuth* (humility). Because of its difference from the soul, *Seele*, it is perceived as the equivalent of the Latin *animus* in relation to

anima. But W. T. Krug notes precisely that "since the French do not have a special word for *Gemüth*, they translate it by *âme* [*Seele*]," which in turn has repercussions for *Gemüt* (RT: *Allgemeines Handwörterbuch*, 2:185–87).

In the strict sense, *Gemüt* is most often an internal principle that animates the mind and its affections. Its purview is sometimes limited to the affective part when it is in competition with *Geist*, but not always—especially in its Kantian use. From the heights of mysticism, the word moves progressively, starting in the nineteenth century, into the bourgeois register of comfort and well-being through its adjectivization into *gemütlich*, which, in common language, took on the sense of "nice"—the French colloquial *sympa* is in the end a rather faithful translation. But this banalization cannot completely hide the exploitation of *Gemüt* and of the associated register of terms referring to irrational powers in the pre-Nazi and Nazi years, the 1920s and 1930s, going hand in hand with the exploitation of a tradition of "Germanic" profundity that invoked Eckhart, Cusanus, and Paracelsus: the term *Gemüt* itself was sufficient to call up the superiority of the German language, rooted in archaic depths.

I. The Mystic Soul

The first conceptual determination of *Gemüt* comes from German mysticism, where it refers to the whole of a man's internal world, the interior of representations and ideas: "There is a force in the soul which is called *gemüete*" (Ein kraft ist in der sêle, diu heizet daz gemüete). A "free spirit" is "ein ledic gemüete" (*Die rede der unterscheidunge*, in Eckhart, *Die deutschen Werke*, 5:190.9), but *gemüete* refers to something deeper than the mind, as suggested by the expression "your depth and your mind" (dînen grunt und dîn gemüete, ibid., 5:255.8). Sermon 83 (ibid., 3:437.4–8) establishes the coherence between *geiste*, *mens*, and *gemüete*, referring both to Saint Paul (Eph. 4:34) and to Augustine, which makes it possible to specify that *mens* or *gemüete* refers to the superior part of the soul, *selen* ("caput animae": *Enarratio in Psalmum*, 3.3; RT: *PL* 36:73). In the sixteenth century, *Grund* and *Gemüth* are still narrowly associated with Paracelsus, where *Gemüth* refers to the "very depths of ourselves," the place "where we find ourselves entirely reunited" (Braun, *Paracelse*, 187):

> The *Gemüth* of men is something so considerable that no one can express it. And like God himself, *Prima Materia*, and heaven, which are all three eternal and immovable, such is the *Gemüth* of man. It is thus that man is happy by and with his *Gemüth*, that is, he lives eternally and no longer dies.

> (Paracelsus, *Liber de imaginibus*)

It goes without saying that the investment of the notion of *Gemüth* in this tradition is significant, and also includes Jakob Böhme (*Of the Three Principles*, 10.37), who leaves his own mark on the nascent philosophical vocabulary, as we can see in Gottfried Leibniz.

This determination is massively reaffirmed in German romanticism, in particular in Friedrich Schleiermacher's *Discourses on Religion* (twenty-four occurrences), where he defends the idea that the seat of religiosity is "a province in the soul [*eine Provinz im Gemüt*]" (from the "Apologie," *Reden*), and in Novalis, in particular *Heinrich von Ofterdingen* (1.6).

II. The Transcendental Faculty

One of the most spectacular deletions in the translation of Kant's works into other languages is the systematic disappearance of the term *Gemüt* in favor of "spirit" or "mind." Yet Kant, unlike the idealist philosophers who follow him, does not, in the *Critique of Pure Reason*, use *Geist*, and he uses it in alternation with *Gemüt* in the *Critique of Judgment*. Vittorio Mathieu, the Italian "reviser" (1974) of Giovanni Gentile's translation (1909) of the *Critique of Pure Reason*, sees Gentile's use of *spirito* for *Gemüth* as a "traduzione tipicamente gentiliana"—in other words, an idealist corruption of Kant's sense, which he corrects by substituting for it the word *animo*.

■ See Box 1.

For Kant, *Gemüt* is presented from the start as a collection of transcendental powers, their foundation and their source at the same time. The *Transcendental Logic* invokes it at the beginning:

> Our cognition arises from two fundamental sources in the mind, the first of which is the reception of representations (the receptivity of impressions), the second the faculty for cognizing an object by means of these representations (spontaneity of concepts).
>
> (*Critique of Pure Reason,* A50/B74, trans. Guyer and Wood)

In the *Critique of Judgment*, *Gemüt* functions as the framework within which the faculties work reciprocally, without being at any moment positively determined, transcendentally or anthropologically. In §49, Kant even defines the *Geist* (mind) at the heart of *Gemüt* as "its vivifying power." This does not make him a mystic, but rather inscribes him in a search for the formulation of a vocabulary of feeling, one of the decisive issues of moral and aesthetic thought in the eighteenth century. In the continuity of the neutral space between passivity and activity linked by sentiment, Kant dissociates *Gemüt* from the practical meaning that the term commonly held before him, in the tradition of Leibnizianism, in works by Christian Wolff, Friedrich Meier, and Moses Mendelssohn. In his 1808 dictionary, Adelung gives a standard account of the word's eighteenth-century meaning, as expressing "the soul" (*Seele*) related to desires and will, by contrast with the theorizing "mind" (*Geist*) (RT: *Versuch eines vollständingen*, s.v.). The term, which thus means for Kant "the set of the transcendental faculties," drifts progressively into the domains of psychology and ordinary language, whereas German Idealism, in its theological inspiration, gives primacy to the term *Geist*. The *Geistesgeschichte* of the beginning of the twentieth century, a sort of history of ideas in a metaphysical mode, reintroduces *Gemüt* forcefully among the irreducibly "Germanic" notions of the mind, opening the way for Nazi exploitation of the term. A characteristic of a certain literary romanticism, *Gemüt* retains, even in its ambiguity, a

---

Gemüt in the *Critique of Pure Reason*

The term *Gemüt* is especially frequent in *Transcendental Aesthetic.* In section 1.A.19, intuition is only possible if the object is given to us. That, in turn, necessarily presupposes "dadurch . . . daß er das Gemüt auf gewisse Weise affiziere": in various translations, "if it affects the mind [*das Gemüth*] in a certain way" (Guyer and Wood); "à la condition que si l'objet affecte d'une certaine manière notre esprit [*das Gemüth*]" (Kant, *Critique of Pure Reason*, French translation by Tremesaygues and Pacaud); "si l'objet affecte d'une certaine manière notre esprit" (Barni and Marty); "parce que l'objet affecte l'esprit sur un certain mode" (Renaut, with a note); "in quanto modifichi, in certo modo, lo spirito" (Gentile and Mathieu). The translation of *Gemüth* by *esprit* and *spirito* continues with the word's second occurrence in A.20: "la forme pure des intuitions sensibles en général se trouvera a priori dans l'esprit" (Tremesaygues and Pacaud); "la forme pure des intuitions sensibles en général . . . se trouvera a priori dans l'esprit" (Barni and Marty); "laquelle réside a priori dans l'esprit" (Renaut); "la forma pura delle intuizioni sensibili in generale . . . si troverà a priori nello spirito [*Gemüth*]" (Gentile and Mathieu).

Section 2 of the *Critique of Pure Reason* makes manifest the implications of translating the term when these difficulties are *not* taken into account. Thus we read A.22/B.37, "Der innere Sinn, vermittelst dessen das Gemüt sich selbst, oder seinen inneren Zustand anschauet, gibt zwar keine Anschauung von der Seele selbst, als einem Objekt." For "vermittelst dessen das Gemüt sich selbst," Guyer and Wood translate "the mind intuits itself." Barni and Marty render Kant's phrase as, "Le sens interne, par le moyen duquel l'esprit s'intuitionne lui-même, ou intuitionne son état intérieur, ne nous donne aucune intuition de l'âme elle-même comme d'un objet." In Renaut, we find, "Le sens interne, par l'intermédiaire duquel l'esprit s'intuitionne lui-même, intuitionne son état intérieur, ne fournit certes pas d'intuition de l'âme elle-même comme objet." Gentile and Mathieu give, "Il senso interno, mediante il quale lo spirito intuisce se stesso, o un suo stato interno, non ci dà invero nessuna intuizione dell'anima stessa, come di oggetto." Only Tremesaygues and Pacaud even call our attention to the specificity of Kant's use of *Gemüt*, thus: "Le sens interne, au moyen duquel l'esprit [*das Gemüth*] s'intuitionne lui-même ou intuitionne aussi son état interne, ne donne pas, sans doute, d'intuition de l'âme elle-même comme d'un objet [*Objekt*]."

All of these translations, even the one by Tremesaygues and Pacaud, have the defect of collapsing *Gemüt* into "mind," losing the contrast between *mens*, *spiritus*, and *animus*, and leading to a backward projection of the German-idealist *Geist* or the spiritualist mind into the Kantian text. Even when it is a matter of translating a passage in which Kant explicitly distinguishes *Gemüt* from *Seele* as *animus* and *anima* (see again A.22/B.37, "Der innere Sinn, vermittelst dessen das Gemüt sich selbst, oder seinen inneren Zustand anschauet, gibt zwar keine Anschauung von der Seele selbst, als einem Objekt," where a distinction is drawn in Kant's German between *Gemüt* and *Seele*; or the note to "Concerning Sömmering's Work on the Soul," AA.13.33), the French translator of the Pléiade edition, Luc Ferry, renders *Gemüt* by *esprit*. Such translations thus integrate Kant into German Idealism, separating him by the same stroke from the tradition of empirical psychology.

descriptive virtue that Husserl's and above all Scheler's phenomenology would turn to advantage.

GENDER

FRENCH   *différence des sexes, identité sexuelle, genre*
GERMAN   *Geschlecht*
ITALIAN   *genere*
SPANISH   *género*

➤ GENRE, GESCHLECHT, SEX, and BEHAVIOR, DRIVE, NATURE, PEOPLE, PLEASURE

After the end of the 1960s, when biologists, sociologists, psychoanalysts, and philosophers studying sexuality began to take into account what Anglo-Saxon authors refer to as "gender," the debate reached the fields of other European languages, without there being a decision to use, for example, *genre* in French, *genere* in

Italian, *género* in Spanish, or *Geschlecht* in German, as translations of gender. This sort of dodge is explained by the meaning Anglo-Saxon authors, in particular American feminists, gave to "gender" with regard to what goes by the name "sex" in English and *sexualité* in French.

The debate on the differences of the sexes (male and female) began with Robert Stoller's book *Sex and Gender* (1968). In the preface to the 1978 French edition, Stoller defines "the aspects of sexuality which we call gender" as being "essentially determined by culture, that is, learned after birth," whereas what is properly called "sexual" is characterized by anatomical and physiological factors, insofar as they determine "whether one is male or female." If "gender" is a term considered untranslatable, this is because it does not have the same extension as sexuality, *sexualité*. Indeed, sexuality, as understood by psychoanalysis, disappears in the distinction established by these American authors between biological sex and the social construction of masculine and feminine identities. This is a distinction that many adherents are beginning to reinterpret, and that contemporary psychoanalysis can only, and more radically, call into question.

I. The Distinction between "Sex" and "Gender" and Its Reinterpretations

The English term "sex" can reasonably be translated by *sexe* in French, as both languages define sexuality as "the collection of psychological and physiological notions" that characterize it. However, it is sometimes inaccurate to translate "sex" by *sexe*, given that in English "sex" is in many circumstances contrasted with "gender," which is not the case in French. The distinction between "sex" and "gender," which was laid out by Stoller in 1968 and adopted by feminist thought in the early 1970s (see, in particular, Ann Oakley's *Sex, Gender, and Society*), represents for this movement a political and sociological argument in the name of which we must distinguish the physiological and the psychological aspects of sex, without which we would land in a biological essentialism with normative import regarding sexual identity.

The specific attempts to separate the respective contributions of nature and culture in this regard proliferated in the last third of the twentieth century. However, the reliance on a distinction between sex and gender remained unique to English terminology. The *Oxford English Dictionary* mentions, regarding "gender," Oakley's usage ("Sex differences may be 'natural,' but gender differences have their source in culture"). It also refers to feminist usage of the term as representing one of its major uses. The *OED* second edition (1989) defines the term in this way: "[i]n mod. (esp. feminist) use, a euphemism for the sex of a human being, often intended to emphasize the social and cultural, as opposed to the biological, distinctions between the sexes." The most recent online version (June 2011), however, updates the entry to read:

> The state of being male or female as expressed by social or cultural distinctions and differences, rather than biological ones; the collective attributes or traits associated with a particular sex, or determined as a result of one's sex. Also: a (male or female) group characterized in this way.

In this context, psychoanalysis, and the meaning it gives to the difference between the sexes, did not have as decisive

an influence in the English-speaking world as it did in France. In the Anglo-Saxon world, behaviorism was dominant during the period in which the distinction between sex and gender was established, a dominance that was especially maintained by British psychology and philosophy. This distinction was thus in line with a climate of confidence regarding the possibilities of modifying behavior relative to the sexual roles previously subordinate to normative criteria. Suddenly, it appeared unnecessary that female behavior should be in step with female sex, biologically understood.

After the 1990s, the term "gender" became more and more common, and passed into general use where "sex" had been used previously. It follows that the psychologists or feminists who currently refer to gender are not assumed to be following strictly the distinction between sex and gender. In addition, feminist theory has in large part rejected the distinction for the following reasons:

1. It is difficult to distinguish what derives from "sex" and what from "gender."
2. The idea that " 'gender' as a cultural construct which is imposed upon the surface of matter, understood either as 'the body' or its given sex" has been rejected (Butler, *Bodies That Matter*). This rejection is based on the argument that sex cannot be considered a neutral tabula rasa (see Gatens, "A Critic of the Sex/Gender Distinction").
3. The American feminist Judith Butler often maintains that sex is retrospectively materialized as "primary," as a result of the fact that our approach to gender sees culture as "secondary." She describes "the ritualized repetition by which [gender] norms produce and stabilize not only the effects of gender but the materiality of sex." Her work presupposes that "the construal of 'sex' [is framed] no longer as a bodily given on which the construct of gender is artificially imposed, but as a cultural norm which governs the materialization of bodies" (Butler, *Bodies That Matter*).
4. Some theorists interpret sex itself as a cultural construction. This is the perspective adopted by Thomas Laqueur in *Making Sex*, when he declares:

   It seems perfectly obvious that biology defines the sexes: what else could sex mean? . . . [N]o particular understanding of sexual difference historically follows from undisputed facts about bodies. . . . Organs that had been seen as interior versions of what the male had outside—the vagina as penis, the uterus as scrotum—were by the eighteenth century construed as of an entirely different nature.

   The author explains that he is attempting, in this work, to retrace "a history of the way in which sex, as well as gender, is created."

5. Feminists and other theorists who rely on the term "gender" today do not necessarily adhere to the primitive distinction between sex and gender, especially since the term "gender" has become a euphemism for "sex." Similarly, when a theorist uses "sex," the word is not understood as referring to a notion that, unlike "gender," is universal, abstracted away from history and culture.

Thomas Laqueur's argument has had a profound effect in this regard.

▪ See Box 1.

II. The Notion of "Gender" through the Lens of Psychoanalysis

If "gender" is untranslatable in many languages, it is because the term is related to a history of two different problems that were developed in parallel, encroaching on one another without ever meeting. Yet, with regard to Stoller's distinction between biological sex and the social construction of male and female identities, psychoanalysis sees in sexuality a combination of psychological and physiological factors. However, when the problems raised by Stoller and the American feminists reached France, the reevaluation there of the fundamental concepts of psychoanalysis showed that it was necessary to give up the dualism of psychology and physiology to arrive at an understanding of drives and fantasies, as the terrain on which sexual identity is formed. When Freud defines the erogenous body in 1905 (in the *Three Essays on the Theory of Sexuality*) and in 1915 (in *Instincts and Their Vicissitudes*) clarifies out of which heterogeneous elements the drives are constituted—impetus, aim, source, and object—he introduces the idea that these drives have a destiny, which makes them rather different from psychological or physiological givens. The terrain on which it is decided whether a given person identifies as male or female concerns the destinies of these drives, the links they have with scenarios of sexual climax in which the subject is in relation to figures of otherness, taken in part from the details of early interaction with adults. Sexuation thus takes place in the domain of the formation of pleasure, displeasure, and anxiety, from which are woven the experiences and thoughts of infants immersed in an adult world that supports them, threatens them, carries them, even while also being intrusive and alien.

From the point of view of psychoanalysis, the social determinations of gender are one of the materials by which fantasies and drives are created. The physiological givens of sex are one of the other materials in this affair, but they are not on the same level as the others: societies always give a content to the difference of the sexes. This difference, as anthropologists have shown, structures all the activities of exchange, rituals, divisions of space, subsistence, circuits of permitted and forbidden marriages, and so on. Since gender is nothing but the system of the division of social activities, it acquires, depending on the society, different contents. The common point among anthropologists, psychoanalysts, and some theorists of gender is that human sexuation is anything but natural, that it has no content that is commanded by an essence or by nature, even if that nature is determined by the different roles of men and women in procreation. But the agreement between these different approaches stops at this negative point.

To give an account of sexuation, psychoanalysis uses other notions besides the physiological and the psychological. This is why Robert Stoller, like many other psychoanalysts, contributed to a confusion regarding the sexual in the psychoanalytic sense. And gender theories have inherited this confusion. Sexuality is neither physiological

1

Gender and gender trouble

➤ GESCHLECHT, SEX

The term "gender" first assumed its meaning as part of a narrative sequence in feminist theory. First there was "sex" understood as a biological given, and then came "gender," which interpreted or constructed that biological given into a social category. This story was, at least, the one that held sway as feminist anthropologists (Ortner, Rubin) sought to distinguish between an order of nature and an order of culture. Nature was understood to come first, even though no one thought one could identify the scene of nature apart from its cultural articulation. Its "firstness" was then ambiguously temporal and logical. The formulation helped to make sense of important feminist propositions such as the one made by Beauvoir in *The Second Sex*: "One is not born, but rather becomes a woman." If one is not born a woman, then one is born something else, and "sex" is the name for that something else we are prior to what we become. For "gender" to name a mode of becoming had theoretical consequences, since it meant that regardless of what gender is assigned at birth, gender still has to be culturally assumed, embodied, articulated, and made. Moreover, if sex names what is biologically given, and if gender belongs to another order, then there is nothing in one's sex that destines one for any particular kind of position in life; there are no social tasks or cultural meanings that can be derived exclusively or causally from one's sex. One can, for instance, be born with reproductive organs but never give birth. And even if certain forms of heterosexual intercourse are physically possible, that does not mean that it is psychically possible or desirable. In other words, sex does not operate a causal effect on behavior, social role, or task, and so, with the sex/gender distinction in place, feminists actively argued against the formulation that "biology is destiny."

It became clear, though, that if one only understood gender as the cultural meanings that sex acquires in any given social context, then gender was still linked with sex, and could not be conceptualized without it. Some feminists such as Elizabeth Grosz argued that if gender is the cultural interpretation of sex, then sex is treated as a given, and there is no way then to ask how "sex" is made or what various cultural forms "sex" may assume in different contexts. Indeed, if one started to talk about the cultural meanings of "sex," it appeared that one was talking rather about gender. This position became even more difficult to maintain as feminist scholars of science insisted not only that

nature has a history (Haraway), but that even the definition of "sex" is a contested zone in the history of science (Laqueur, Longino). If "sex" has a history, and a conflicted one at that, then how do we understand "gender"? Is it then necessary to take gender out of the narrative sequence in which first there is "sex," which belongs to a putatively ahistorical nature, and only after there is "gender," understood as endowing that natural fact with meaning?

Upending the sex/gender distinction involved taking distance from both structural linguistics and cultural anthropology. But it became all the more important once it was conceded that both sex and gender have histories, and that these histories differ, depending on the linguistic contexts in which they operate. So, for example, the very term "gender" was throughout the 1980s and 1990s nearly impossible to translate into any romance language. There was *le genre* in French and *el género* in Spanish, but these were considered to be grammatical categories and to have no bearing on the concrete bodily existence of those who were alternately referred to as "he" or "she." But experimental writers such as Monique Wittig and Jeannette Winterson contested the idea that grammar was actually separable from bodily experience. Wittig's *Les guérillères* and Winterson's *Written on the Body* became provocative texts that never allowed their readers to settle on the gender of the figures and characters being described. Moreover, they suggested that the way we see and feel gender is directly related to the kinds of grammatical constructions that pose as ordinary or inevitable. By either combining, confusing, or erasing grammatical gender, they sought to loosen the hold that binary gender systems have on how we read, feel, think, and know ourselves and others. Their grammatical idealism proved to be exciting as experimental fiction. And yet, the institutions of gender seemed to march along, even when brave souls refused to give their infants genders at birth, with the idea that such acts might bring to a halt the institution of gender difference.

The translation of "gender" into German was more difficult, since the word *Geschlecht* operates as both biological sex and social gender. This term enforced a strong cultural presumption that the various cultural expressions of gender not only followed causally and necessarily from an original sex, but that gender was in some ways mired in sex, indissociable from it, bound up with it as a single unity. The term for gender in Chinese

carries many of these meanings that are variously expressed by the conjunction of phonemes and numbers: "gender" is *xing(4) bie(2)*. The numbers denote "tones," and there are four of them for each of the two terms. Thus, *xing(2)* means something different from *xing(4)*. Indeed, this roman system is already a translation of Chinese characters, so makes something of a grid out of a graphic sign. *Xing(4)* is a term meaning "category or kind," but it also means "sex" and so sustains a relation with those languages that link sex to species. Only at the beginning of the twentieth century did the term begin to mean "gender," so in order to distinguish gender from sex, some feminist scholars in China put the expression meaning "social"—*she(4) hui(4)*—before the term *xing(4)bie(2)*. *Bie(2)* means "difference," and thus links with those formulations of gender as sexual difference.

Like *genus* in Swedish, which implies species-being, so *Geschlecht* in German implied not only a natural kind, but a mode of natural ordering that served the purposes of the reproduction of the species. That the first German translators of *Gender Trouble* chose to translate "gender" as *Geschlechtsidentität* (sexual identity) may have been an effort to move away from species discourse, or perhaps it was a way of responding to those emerging queer arguments that claimed that binary sex was understood to serve the purposes of reproducing compulsory heterosexuality (Rubin, Butler). The problem with that choice, however, was that it confused gender with sexual orientation or disposition. And part of the analytic work of understanding gender apart from biological causality and functionalism was precisely to hold open for the possibility that gender appearance may not correspond to sexual disposition or orientation in predictable ways. Thus, if the biologically mired conception of sex implies that women and men desire only one another, and that the end result of that attraction is biological reproduction, the queer critique relied on analytic distinctions between morphology, biology, psychology, cultural assignment and interpretation, social function, and possibility. If "gender" named this very constellation of problems, then it sought, in Foucault's language, to undo the "fictitious unity of sex" (*History of Sexuality*, vol. 1) in which drive, desire, and expression formed a single object that became the condition and object for sexual regulation.

(*continued*)

For the French, the term "gender" was at first incomprehensible, since *genre* clearly referred exclusively to grammar and literary form. When *Gender Trouble* was first proposed to a French press, the publisher proclaimed that it was *inassimilable*, suggesting that it was a kind of foreign substance or unwanted immigrant that must be kept outside the French borders. Clearly, it was considered an American term, possibly the intellectual equivalent of McDonald's. Although the term did enter the language through conferences, seminars, the titles of books, and even a newly established field (*études de genre*), its culturalism was somehow associated with its Americanism, and some French intellectuals feared that it was a term meant to deny sexual difference, the body, seduction, and Frenchness itself.

For some feminist historians who worked between French and Anglo-American frameworks, gender became importantly bound up with the question of sexual difference. Joan Scott argued that one should not only consider gender as an attribute of a body, or as a way of endowing biological bodies with cultural meaning. In her view, gender is a "category of analysis" which helps us understand how the basic terms by which we describe social life are themselves internally differentiated. For instance, Scott can analyze terms such as "labor," "equality," or even "universality" using gender as a critical category. As a result, we can criticize how the public sphere and labor are often conceptualized as masculine spheres. The very way in which the sphere is delimited not only valorizes certain modes of labor, and laborers of the masculine gender, but it also reproduces the categories of gender. In Scott's work, those categories do not always adhere to a set of bodies, though sometimes they do. They also provide the implicit scheme by which valuable and nonvaluable work is described, forms of political participation are differentially valorized, and versions of universality are articulated with a masculine presumption and bias.

Scott is one of many feminist theorists who would dispute the absolute difference between sexual difference and gender (cf. Braidotti, Irigaray, and Schor and Weed). "Sexual difference" is not a term that marks an exclusively biological beginning and then becomes transformed in the course of a subsequent and separable cultural and historical articulation. Rather, sexual difference is precisely that which, whether in the biological or the cultural sciences, occasions a set of shifting articulations. Following Lacan, one might say that sexual difference is precisely the site where biology and culture converge,

although not in any causal way (thus, eluding from another direction the "biology is destiny" formulation). For Scott, no one cultural articulation of sexual difference exhausts its meaning, because even though we never find this difference outside of a specific articulation, it eludes any capture or seizure that would fix its meaning for all time. Moreover, sexual difference is as much articulated by forms of power as it is a matrix for actively articulating such modes of power. We are not only talking about sexual difference as a "constructed" difference (though some do that), but in Scott's work, sexual difference is a matrix through which and by which certain kinds of articulation take place. If that seems like a conundrum, it probably is; it is what Scott refers to as one of the paradoxes she has to offer.

Although some feminists sharply contrasted the discourse on "gender" with that of "sexual difference," they usually associated gender with a theory of cultural construction, though that no longer seems to be the case. "Gender" is now the name for a set of debates on how to think about the biological, chromosomal, psychological, cultural, and socioeconomic dimensions of a lived bodily reality. Consider, for instance, the international athletic debate about Caster Semenya, an athlete who was suspected of being more male than female, but who ran as a qualified woman in international athletic competitions. The International Association of Athletics Federations finally adjudicated the case and confirmed that she qualified to run as a woman, without saying whether she "really" was one. For this organization, gender was established by a set of measures and norms that required the expertise of lawyers, biologists, psychologists, geneticists, and endocrinologists. In other words, Semenya's "gender qualifications" were decided by an interdisciplinary committee, and not by a single standard imposed by a single science. Those experts not only had to learn each other's languages, but they had to translate each field into their own to come to an understanding of how best to name gender in this instance. Her gender qualifications were the result of a negotiated conclusion.

Those who debate matters of sexual difference and gender tend to conjecture what happens at the very beginning of life, how infants are perceived and named, and how sexual difference is discovered or installed. The psychoanalyst Jean Laplanche argued that it was not possible to reduce the question of gender to an expression of biological drives, understood as separable from cultural content. To understand gender, we must first understand drives (see Freud, "Triebe und Triebschicksale"). For Laplanche, gender assignment happens at the very beginning of life, but like all powerful

words of interpellation, it is first encountered as so much "noise" to an infant who does not yet have linguistic competence to discern what is being said. In this way, gender assignment arrives on the scene of infantile helplessness. To be called a gender is to be given an enigmatic and overwhelming signifier; it is also to be incited in ways that remain in part fully unconscious. To be called a gender is to be subject to a certain demand, a certain impingement and seduction, and not to know fully what the terms of that demand might be. Indeed, in being gendered, the infant is put in a situation *of having to make a translation*.

Laplanche's first point follows from a correction of a translation error. The "instinct" (a term that Strachey uses too often to translate *Trieb*) makes the drive possible, but the drive institutes a life of fantasy that is qualitatively new, and that is not constrained by the teleologies of biological life. What is endogenous and exogenous converge at the drive, but when something new emerges, it is a sign that the drive has veered away from its instinctual basis. This only happens once biological processes have been intervened upon by the adult world, by forms of address, words, and forms of physical proximity and dependency. Something enigmatic is communicated from that adult world, and it enters into the life of the drive. It is precisely because of this interruption that the infant's emerging sense of his or her body (or a body outside of clear gender categories) is not the result of a biological teleology or necessity.

The literary critic John Fletcher asks, in "The Letter in the Unconscious," how are we to rethink "the psychic constitution and inscription of a sexually and genitally differentiated body image (the repression and symbolization of what enigmatic signifiers?) [as] the ground or, at least, terrain for the formation of gendered identities." In other words, Fletcher, drawing on Laplanche, asks whether the most fundamental sense of our bodies, what Merleau-Ponty would call a "body-image" is in some ways the result of having to translate and negotiate enigmatic and overwhelming adult "signifiers"—terms that relay the psychic demands of the adult to the child.

As we have seen, the term "gender" in English-language contexts usually refers to a cultural meaning assumed by a body in the context of its socialization or acculturation, and so it often makes use of a distinction between a natural and cultural body in order to secure a definition for gender as an emphatically cultural production. But these last positions lead us to ask another question: what is the mechanism of that production? If we start with the naming of the infant, we start to understand gender as a social assignment,

but how precisely does that assignment work?

To answer this question, we have to move away from the notion that gender is simply an attribute of a person (Scott has already shown us that). Or, rather, if it is an attribute, we have to consider that it is attributed, and we have yet to understand the means and mechanism of that attribution or more generalized assignment. For Laplanche, gender is resituated as part of the terrain of the enigmatic signifier itself. In other words, gender is not so much a singular message, but a surrounding and impinging discourse, already circulating, and mobilized for the purposes of address prior to the formation of any speaking and desiring subject. In this sense, gender is a problem of translating the drive of the other into one's own bodily schema.

In other words, one is not born into the world only then to happen upon a set of gender options; rather, gender operates as part of the generalized discursive conditions that are "addressed" enigmatically and overwhelmingly to an infant and child and that continue to be addressed throughout the embodied life of the person. Laplanche argues that gender *precedes* sex and so suggests that gender—understood as that bundle of enigmatic meanings that is addressed to the infant and so imposed as part of a discursive intervention in the life of the infant—precedes the emergence of the "sexually and genitally differentiated body image."

This last view is counterintuitive to the extent that we might want to argue that sexual differentiation is, for the most part, there from the start (although recent research on intersex has called this presumption into question throughout the biological and social sciences). But are there conditions under which "sex," understood as sexually differentiated morphology, comes to appear as a "given" of experience, something we might take for granted, a material point of departure for any further investigation and for any further understanding of gender acquisition? Consider that the sequence that we use to describe how gender emerges only after sex, or gender is something superadded to sex, fails to see that gender is, as it were, already operating, seizing upon, and infiltrating somatic life prior to any conscious or reflexive determination of gender. And if gender is relayed, traumatically, through the generalized scene of seduction, then gender is part of the very assignment that forms and incites the life of the drive, sexuality itself, that makes us scramble for words to translate a set of effects that emerge from one domain only to be relayed into another. We might ask, which gender? Or gender in what

sense? But that is already to move ahead too quickly. If gender is relayed through the overwhelming language and gestures of the adult, then it arrives first as a kind of noise, indecipherable, and in demand of translation. For now, it is most important to note that the assignment of gender arrives through the enigmatic desire of the other, a desire by which somatic life is infiltrated and that, in turn, or simultaneously, incites a set of displacements and translations that constitute the specific life of the drive or, sexual desire. Is somatic life determinable outside this scene of assignment? To the extent that bodily "sex" appears as primary, this very primariness is achieved as a consequence of a repression (*refoulement*) of gender itself. Indeed, gender is in part constituted by unconscious wishes conveyed through the enigmatic assignment of gender, so that one might say that gender emerges, from early on, as an enigma for the child. And the question may well not be, "what gender am I?" but rather, "what does gender want of me?" or even, "whose desire is being carried through the assignment of gender that I have received and how can I possibly respond? Quick—give me a way to translate!"

GENIUS

FRENCH	*génie*
GERMAN	*Genie, Geist, Naturell, natürlich Fähigkeit, Witz*
LATIN	*genus, genius*

➤ AESTHETICS, ART, CONCETTO, DAIMÔN, DUENDE, GEMÜT, GOÛT, *IMAGINATION*, INGENIUM, MADNESS, MANIERA, MIMÊSIS, PLASTICITY, SOUL, SUBLIME, TALENT

Toward the end of the eighteenth century, La Harpe writes in the introduction to his work *Lycée ou cours de littérature ancienne et moderne*: "But what may be surprising is that these two words, genius and taste, taken abstractly, are never found in Boileau's verses, nor in Racine's prose, nor in Corneille's dissertations, nor in Molière's plays. This manner of speaking . . . is from our century." How did an old word, as rich in diverse and vague meanings as the word "genius" is, come to occupy the center of aesthetic and philosophical discussion in the Enlightenment, in England, France, and Germany? What remains of these debates today?

I. Confusion or Semantic Richness

Concerning the word *genius*, Ernst Cassirer warns in his *Philosophy of the Enlightenment*, in the chapter concerning "the fundamental problem of aesthetics," against "attempting to interpret the developments of thoughts and ideas simply on the basis of the history of a word." Thus, he adds, Shaftesbury "did not coin the word 'genius'; he adopted it from common aesthetic terminology. He is the first to rescue the term from the confusion and ambiguity that had previously attached to it and to give it a fruitful and specifically philosophical meaning."

Although this analysis is correct, and Shaftesbury was indeed the author of this philosophical "stroke of genius," it remains the case that the history of the word "genius," like that of any word (but in this case especially), will help us clarify what Cassirer calls "confusion" and "ambiguity," which may only be inexhaustible semantic richness.

The word "genius," in its various romance forms, is related to Latin, and hence shares an Indo-European origin common to several languages (**gn*, "to be born," "to engender"). *Gigno, gignere*, thus means "to engender," "to produce," "to cause." Several nouns are derived from it. *Genus* is birth, race, and, in an abstract way, class (see PEOPLE). *Genius* is initially the divinity presiding over an individual's birth, and then each person's guardian divinity, with which the first becomes confused, so much so that *genius* comes to mean one's natural inclinations, appetites, the intellectual and moral qualities peculiar to each individual. In this last sense, the word duplicates the compound word *ingenium*, another derivative of *gigno* (see INGENIUM).

II. From *Ingenium* to *Génie*

When the word *génie*, a calque of *genius*, appears in French in the sixteenth century (François Rabelais, 1532), it manifests the richness of meaning derived from its Latin origins. It refers in general to natural tendencies, character, an innate disposition for an activity or art. It becomes more specific later, referring to a superior mental aptitude (before 1674), and finally, by metonymy, to a superior individual, a *génie* (1686).

Concurrently, however, in the sixteenth century, *génie* takes up the Latin sense of "divinity" and thus comes to mean a "spirit," good or bad, which influences our destiny (hence, eventually, René Descartes's "evil genius," the *malin génie* we find in his *Meditations* of 1641), then, by extension, an allegorical being personifying an abstract idea and its representation, and finally, in fantastical writings, a supernatural being endowed with magical powers (definitions taken from RT: *DHLF*).

These two series of meanings, seemingly very distinct, are in fact intimately related. To be a genius is to have a part of the creative faculty of a god, thus to participate in something external and superior to oneself. To be a genius is to be considered, or to consider oneself to be, a creative source like a god. A certain hubris thus underlies this notion, which is clearly confirmed in the romantic conception of genius (on hubris, cf. VERGÜENZA, II).

It is a peculiarity of French that it did not create a word directly calqued on *ingenium* (except *ingénieur*, "engineer"). However, this Latin word, which we find in the Italian *ingegno* and the Spanish *ingenio*, and which is commonly used in philosophical terminology in the classical period (cf. Descartes's *Rules for the Direction of the Mind* of ca. 1622), refers both to a certain penetration of the mind and to a synthetic faculty for comparing ideas that are distant from one another, and thus to "find" in the sense of "invent." In this sense we may contrast, as Giambattista Vico does in particular, the creativity and inventiveness of "ingenious" thought with

the sterility of analytic thought, which remains content with mechanically deriving consequences from premises given at the start. It is admitted, however, in the sixteenth and seventeenth centuries, that *ingenium*, translated into French as *génie*, is at work (to different degrees, to be sure) in all individuals and in all spheres of activity, although the manifestations are especially visible in the cases of poets and artists.

It is in the eighteenth century that the notion of genius takes on a new meaning and becomes throughout Europe an object of reflection in the domain of aesthetics and, more widely, of philosophy (hence claims for the "birth of genius" in the eighteenth century). In earlier centuries it was admitted that a work of art was born on the one hand from the conjunction of knowledge and craft proper to a given art and capable of being acquired, and on the other hand from a quality peculiar to the individual, a natural gift called "genius." During and after the eighteenth century, however, the latter quality acquires a greater importance, even an overblown one, almost to the point of causing the other factors to be forgotten. Genius becomes a power of creation ex nihilo, irreducible to any rule and impossible to analyze rationally. At the same time, whereas classical aesthetics rested on the notion of imitation, genius would come to be characterized by the absolute originality of its productions, by their inimitable character.

Although this new meaning given to the notion of genius is a European phenomenon, it is interesting to note that it is not uniform—there are national differences in the definition of what is given by "genius," in the importance accorded to it, in the interpretation to which it is subject. In this sense, we may speak of an "untranslatability" between the notions of genius that appeared in the literature devoted to it in England, Germany, and France.

III. English "Enthusiasm" and French "Rationalism"

It is generally agreed that Shaftesbury had a decisive influence on the way in which the question of genius was posed in the eighteenth century, by popularizing the notion of "enthusiasm" (*Letter concerning Enthusiasm* [1708]). Enthusiasm comes from the artist's agreement with nature, where the latter is considered the "sovereign artist," "universal plastic nature." The enthusiasm of the artist is a "disinterested pleasure," provoked by the presence within him of a divine inspiration, "genius," which makes him the near kin to, and the equal of, the genius of the world. The artist feels living within him his consubstantiality with the creative act, and Shaftesbury writes that "such a poet is indeed a second *Maker*; a just Prometheus under Jove" ("Soliloquy, or Advice to an Author" [1710], in *Characteristics of Men*, 111). The artist is not content with imitating the products of nature, but rather participates in the act of production itself. His work, which is the giving of form, creation from an internal model, only makes manifest the presence of the infinite in the finite.

Shaftesbury's "enthusiastic" conception of genius was not taken up immediately or without hesitation in France. In fact, most French authors who discuss genius in the first half of the eighteenth century do so in a much more traditional, "rationalist" manner. Their approach to genius is less metaphysical, and more a search for its "natural" and "moral" causes. Thus for Jean-Baptiste Dubos, in his *Réflexions critiques*

sur la poésie et la peinture (1719) (Critical Reflections on Poetry and Painting):

> On appelle génie l'aptitude qu'un homme a reçue de la nature pour faire bien et facilement certaines choses que les autres ne sauraient faire que très mal, même en prenant beaucoup de peine.

> (We call genius the aptitude that a man receives from nature to do certain things well and easily, that others can only do badly, even with great effort.)

In this sense, genius, which concerns all human activity, does not differ much from talent, and Dubos seeks its natural causes in "a happy arrangement of the organs of the brain," the influence of the land and climate, education, and the frequent company of artists and philosophers. No matter what, the natural gift must be developed by training and work: "The happiest genius can only be perfected by long study."

Charles Batteux, in the first part of his highly influential treatise *Les Beaux-Arts réduits à un même principe* (The Beaux-Arts reduced to a single principle [1746]), himself defines genius as

> une raison active qui s'exerce avec art, qui en recherche industrieusement toutes les faces réelles, tous les possibles, qui en dissèque minutieusement les parties les plus fines, en mesure les rapports les plus éloignés; c'est un instrument éclairé qui fouille, qui creuse, qui perce sourdement.

> (an active reason that is exercised with art, that industriously seeks out all its real aspects, all the possible ones, that meticulously dissects its smallest parts, measuring its most distant relations; it is an enlightened instrument that digs, delves, and dully penetrates.)

Genius is thus assimilated into a higher reason, and not into a mysterious power granted to certain men. The imitation of nature remains the supreme law of all arts, but the artist may discover things that have escaped others. Poetic enthusiasm is explained by Batteux in purely psychological terms:

> Ils [les poètes] excitent eux-mêmes leur imagination jusqu'à ce qu'ils se sentent émus, saisis, effrayés; alors *Deus ecce Deus*, qu'ils chantent, qu'ils peignent, c'est un Dieu qui les inspire.

> (They [the poets] excite their imaginations themselves until they feel moved, seized, frightened; then *Deus ecce Deus*, they sing, they paint, it is a God that inspires them.)

It may be Helvetius, in book 5 of his *De l'esprit*, who does the most to reduce the share of mystery and originality of genius. According to him, genius in artists, but also in philosophers and scientists, consists in "inventing," but invention is only possible thanks to favorable conditions, and is facilitated by the environment, the tendencies of the period, and sometimes luck. There is a diffuse mass of genius in the world that only a few lucky people manage to express.

We thus see a typically French resistance (the origin of which we might find in Cartesian mistrust of imagination) to an exaltation of the creative genius that would make the artist a rival of God. Voltaire, in the article "Génie" in *Questions*

sur l'Encyclopédie (1772), asks: "But fundamentally is genius anything other than talent? What is talent, except the disposition to succeed at an art?" And for Buffon, genius, if it must imitate nature, must follow its slow, laborious, and obstinate step. It must exhibit more reason than heat, since for Buffon, genius is essentially, according to the remark loaned to him by Hérault de Séchelles, "nothing but a greater aptitude for patience" ("*qu'une plus grande aptitude à la patience*," Séchelles, *Voyages*, 11).

It is this mistrust, this critical and reductive will that aims to submit genius to the laws of reason, even if they are the laws of "sublime reason," that those influenced by Shaftesbury oppose. For them, the presence of genius in a work of art is manifested with brutal clarity; it can only be felt, not analyzed, since indeed it deprives the witness of his critical faculties. This is what Jean-Jacques Rousseau expresses, in his *Dictionnaire de musique* (1768), in the article "Génie":

> Ne cherche point, jeune artiste, ce que c'est que le génie. En as-tu: tu le sens en toi-même. N'en as-tu pas: tu ne le connaîtras jamais. . . . Veux-tu savoir si quelque étincelle de ce feu dévorant t'anime ? Cours, vole à Naples écouter les chefs-d'œuvre de Leo, de Durante, de Jommelli, de Pergolèse. Si tes yeux s'emplissent de larmes, si tu sens ton cœur palpiter, si des tressaillements t'agitent, si l'oppression te suffoque dans tes transports, prend le Métastase et travaille. . . . Mais si les charmes de ce grand art te laissent tranquille, si tu n'as ni délire, ni ravissement, si tu ne trouves que beau ce qui transporte, oses-tu demander ce qu'est le génie ? Homme vulgaire, ne profane point ce nom sublime.

> (Young artist, do not seek out what genius is. If you have it: you feel it in yourself. If you do not have it: you will never know it. . . . Do you wish to know whether some spark of this consuming fire animates you? Run, fly to Naples and listen to the masterpieces of Leo, Durante, Jommelli, Pergolese. If your eyes fill with tears, if you feel your heart palpitate, if you are overcome with trembling, if you feel suffocated in your raptures, take hold of your collected Metastasio, and get to work. . . . But if the charms of this grand art leave you peaceful, if you have neither delirium nor ravishment, if you find merely beautiful that which is transporting, do you dare to ask what genius is? Vulgar man, do not profane this sublime name.)

> (Rousseau, *Œuvres complètes*, 5:837–38)

IV. Diderot and Genius as "Release of Nature"

Denis Diderot, Shaftesbury's translator, goes the farthest in France in deepening the analysis of genius in Shaftesbury's direction. He takes up the idea that the mystery of genius is that of creation, but he makes the source of creative genius not God or gods, but rather nature as a general power. For him, genius is a release or expression of nature ("*ressort de la nature*"), and thus has a biological foundation. As such, it is infallible, like the instincts of animals. This is why, in poetry, it tends to be manifested among those who remain close to nature, like children, women, or primitives ("Poetry wants something enormous, barbarian and savage," *Discourse on*

Dramatic Poetry [1758], in Diderot, *Œuvres complètes*, 3:483). The manifestions of the creative power of nature in the artist of genius can only be on the order of the bodily, the perceptual, the affective, the imaginative, and the words *fureur*, *ivresse*, *mouvements du cœur* ("furor," "intoxication," "movements of the heart") are used again and again by Diderot and those who follow him, especially in the *Encyclopédie* (RT: *Encyclopédie ou Dictionnaire*).

Thus, in the article "Génie" in the *Encyclopédie* (RT: *Encyclopédie ou Dictionnaire*), written by Jean-François de Saint-Lambert, but to which Diderot seems to have contributed (as suggested by Voltaire in his own article "Génie" in the *Questions sur l'Encyclopédie*), the natural state of genius is *movement*: "More often than not, this movement produces storms," and genius is "carried away by a torrent of ideas." Thus understood, genius is not the special province of artists; philosophy, too, has its geniuses, "whose systems we admire as we would poems, and who construct daring edifices that reason alone does not know how to inhabit." In philosophy, as in art, "the true and the false are not at all the distinctive features of genius," and thus "there are very few errors in Locke and too few truths in Lord Shaftesbury: the former, however, is nothing but an extended mind, penetrating and accurate, and the latter is a genius of the first rank."

Like Diderot in his "*Encyclopédie*" and his *Discourse on Dramatic Poetry*, Saint-Lambert in "Génie" insists on the contrast between taste (*goût*) and genius (*génie*), a question that remains at the center of the problem of genius through Immanuel Kant and even later. "Taste is often distinguished from genius. Genius is a pure gift of nature; what it produces is the work of a moment; taste is the work of study and time. . . . Genius and the sublime shine in Shakespeare like lightning in a long night." (Throughout the eighteenth century, Shakespeare is the paradigm of genius, insofar as he is irreducible to reason, rules, or taste.) Saint-Lambert adds that the rules of taste are constantly transgressed in works of genius, since "strength, abundance, a certain rudeness, irregularity, sublimity, pathos—these are the characteristics of genius in art."

Though the nature of genius remains impenetrable in the final analysis, it is nonetheless possible to study the conditions that favor or disfavor its manifestation. In this regard, what Diderot says about poetic genius in *Discourse on Dramatic Poetry* is of general value. There are times, mores, circumstances that are more poetic, more appropriate for creation than others: "In general, the more civilized and polite a people is, the less their habits are poetic: everything is weakened by becoming gentler." (Vico had already said the same thing in his *Scienza nuova* [1725–44], while giving the notion of poetry a much wider sense, since for him primitive peoples "create" their own world by means of poetry.) Diderot also calls into question the particular conditions—social, political, economic—that may prevent the genius of an individual from manifesting itself, and he shows in the article "Éclectism" in the *Encyclopédie* how men can frustrate the designs of nature. This marks the appearance of the romantic theme of the misunderstood genius, the exceptional man condemned to die of hunger, with the concomitant call that the government should subsidize unknown artists. At the same time, interest begins to shift

from the abstract notion of genius to the concrete one, obtained by metonymy, of the "man of genius," who takes up a place in ideal human typology, alongside the saint and the hero.

V. How Germany Takes over the French Word, in Order to Make Genius Its Own

The word *Genie*, borrowed from French, appears in the German vocabulary with Johann Adolf Schlegel's translation in 1751 of Batteux's treatise on the Beaux-Arts. (Batteux's other translators had translated *génie* by *Geist*, *Naturell*, *natürliche Fähigkeit*, and above all *Witz*.) Beginning in the eighteenth century, the notion of genius acquires more and more importance in Germany in discussions of art, language, and the history of peoples, especially when the Sturm und Drang literary movement (with political overtones) appears in the 1770s. These discussions obviously reach their full significance in the period in which Germany begins vigorously to affirm itself in literature, philosophy, and politics.

The first German authors of treatises on genius recognized that "the French prompted [them] to think about this concept with care," but very early on their reflection distances itself from its French sources (except Diderot and Rousseau), leading them in new directions. This process happens in stages. Johann Georg Sulzer, with his idea of the "reasonable genius," Moses Mendelssohn, and even Gotthold Ephraim Lessing, so opposed to French influence, attempt to preserve what they can of the "rationalist" critique, notably in the demands of rules and taste, while recognizing that genius, as an expression of nature and creative originality, had its own inalienable rights. With Johann Georg Hamann, the break becomes radical and violent, and the superior rights of genius in art and life are imperiously demanded. Influenced by Rousseau, but especially by the English poet Edward Young—author of the celebrated *Night Thoughts* (1742–45), in which he insists on the absolutely "original" and inimitable character of works of genius, which cannot be discussed but only admired—Hamann adds mystical overtones to these thoughts on genius. Faith has nothing to do with reason, and what faith is in life, genius is in art. His *Socratic Memorabilia* (1760) applies the Socratic method to the notion of genius, which we may see or feel, but never understand. Genius embraces the past and future, and only poetry is capable of capturing its visions.

For Hamann, who goes farther in this sense than Diderot, genius cannot be known by contemporaries. The man who has it is above the crowd, misunderstood and mocked by it, since he is often close to madness, and sometimes there are "incidents at the border between genius and madness." It is not Apollo but Bacchus who governs the arts. Genius has two faces: one denies and holds reason in contempt, the other affirms, creates, and produces: "My crude imagination has always forbade me from imagining a creative genius deprived of *genitalia*" (letter to Herder, 1760).

Johann Gottfried Herder extends Hamann's ideas in the direction of literary nationalism, a notion that flourishes in Germany, and then in the whole of Europe. In many writings, he comes back to the theme of genius, which, for him as well, is indefinable:

It is with genius as with other delicate and complex concepts: we may, in individual cases, grasp them by intuition, but they are nowhere exactly delimited and without mixture. They give as much trouble to philosophers seeking a general, clear and precise idea, as Proteus gave Ulysses when he tried to pin him.

(Cited by Grappin, *La théorie du génie*, 224–25)

However, Herder insists above all on the idea that the genius of an artist is not a purely individual phenomenon, but only expresses the "mind" or, if you like, the "genius" of a people, and is only manifested when the time is right to receive it. Its forms also vary with the times; from this comes the interest in the study of chants and popular traditions that modern poets must nevertheless not simply parrot, pretending to be "Germanic bards," but whose authentic inspiration they must recover, as Friedrich Gottlieb Klopstock and Johann Wolfgang von Goethe did.

VI. Genius According to Kant

We cannot understand the famous pages Kant devotes to the subject of genius in the *Critique of Judgment* (1790) without taking into account the discussions in Germany since the middle of the eighteenth century, of which we have just seen a few examples. Kant effects a balanced synthesis of these writings and gives them in addition the proper philosophical foundation that was lacking. He thus escapes the reductive rationalism of the French tradition and the mysticism of the *Schwärmerei*.

This balance is shown in the definition Kant gives of genius (§46):

Genius is the talent (natural endowment) which gives the rule to art. Since talent, as an innate productive faculty of the artist, belongs itself to Nature, we may put it this way: *Genius* is the innate mental aptitude [*ingenium*] *through which* Nature gives the rule to Art.

(*Critique of Judgment*, trans. Meredith, 168)

Kant thus does not fear using two terms repudiated by the apologists of genius, but for him, nevertheless, the rules ("the beautiful pleases without concepts") are given in works of art not by reason but by nature. We find here the idea that dominates the thought of the eighteenth century since Shaftesbury. For Shaftesbury, nature "gives the rule to art in the subject" by the "agreement of the faculties." Imagination and understanding constitute, by their union, genius, which consists in a "happy relation, which science cannot teach nor industry learn, enabling one to find out ideas for a given concept, and, besides, to hit upon the *expression* for them—the expression by means of which the subjective mental condition induced by the ideas as the concomitant of a concept may be to others" (*Critique of Judgment*, §49, trans. Meredith, 179–80). The proportion and the disposition of these faculties cannot be produced by the rules of science or imitation; those who have the natural gift by which they manage to do so are "favored by nature," and their works have an absolutely original character.

One of the most important characteristics of this definition is Kant's limitation of the notion of genius to artistic creation:

Nature prescribes the rule through genius not to science but to art, and this also only in so far as it is to be fine art.

(*Critique of Judgment*, §46, trans. Meredith, 168)

We must not confuse genius with "powerful brain": Newton can clarify and teach his methods; Homer or Wieland cannot.

In his *Anthropology* (1798), Kant returns to the question of genius, "this mystical name," and seems to widen the term to spheres other than the fine arts, identifying it as the "exemplary originality of talent [*Talent*]": thus Leonardo da Vinci is "a vast genius [*Genie*] in many domains," but we may consider that these "many domains" relate to the "arts" in general, not science, so that there is no real contradiction with what is said in the *Critique of Judgment.* We also find, in *Anthropology*, a remark at the linguistic level whose "nationalist" character is revealing about German sensibilities of the time regarding genius: "We Germans let ourselves be persuaded that the French have a word for this in their own language, while we have no word in ours but must borrow one from the French. But the French have themselves borrowed it from Latin (*genius*), where it means nothing other than an 'individual spirit' [*eigentümlicher Geist*]" (Kant, *Anthropology*, §57, trans. Gregor, 93–94).

Finally, Kant asks whether the world profits from great geniuses because they often cut new paths and open up new perspectives, or whether "mechanical minds" that lean on "canes and crutches to the understanding" have not contributed more to the growth of sciences and the arts. He does not answer the question, saying only that we must be careful of "men called geniuses," who are often only charlatans.

VII. The Twilight of Genius

With romanticism, we witness an apotheosis of genius, corresponding to a veritable "sacralization of art in bourgeois society," as Hans-Georg Gadamer writes in *Truth and Method.* Today, we still speak of the "genius" of an artist, but the notion is hardly an object of theoretical reflection, and we may say, again with Gadamer, that we are witnessing the "twilight of genius." Paul Valéry, in *Introduction à la méthode de Léonard de Vinci*, reacts against the idea that a sleepwalking unconsciousness, quasi divine, mysteriously inspiring, presides over artistic creation. That is, in effect, the "observer's" point of view. If we ask the artist, he is much more down-to-earth about it; he speaks of his technique, not his genius.

| GENRE

"Genre" is caught up in several different networks, all derived from the Greek *genos* [γένος] (from *gignesthai* [γίγνεσθαι], "to be born, become") and its Latin calque *genus.* These networks are constantly interfering with one another.

I. Biology and Classification

The biological network is the starting point, as witnessed by the Homeric sense of *genos*: "race, line." It is discussed by Aristotle, in particular in his zoological classifications, in contraposition to *eidos* [εἶδος], "genus/species." See PEOPLE.

This network of classifications, in which "genre" takes the meaning of "category, type, species," is notably used in the theory of literature, with the question of "literary genres" (Ger. *Gattung*). See ERZÄHLEN and HISTORY. Cf. *FICTION, RÉCIT, STYLE.*

II. Ontological and Logical Networks

The more philosophically pertinent network is nonetheless that of ontology, as in the case of *eidos*: see *IDEA* and, in particular, SPECIES. *Genos* may thus designate kinds, that is to say also the senses, of being. See PEOPLE / RACE / NATION, Box 5; see also ANALOGY, HOMONYM, *TO BE,* and the explanation of the notion of "category" in ESTI, Box 1.

The ontological network is thus related to the logical network, as we may see in the terms "generic" and "general," as opposed to the singular and the universal: see PROPERTY, UNIVERSALS.

III. The Contemporary Debate over "Gender" and "Sex"

The biological sense of "engenderment" cuts across debates on sexual identity (male or female), which take up the grammatical debates about the "gender" of nouns (masculine, feminine, neuter): see SEX, Box 1. The English "gender" is an example; its translation into French as *genre* understood in the sense of sexuation is clumsy, whereas the German *Geschlecht* easily refers not only to line, generation, people, nation, race, but also to sexual difference: see, besides GENDER and GESCHLECHT, SEX, and *HUMANITY* (esp. MENSCHHEIT).

GERMAN

Syntax and Semantics in Modern Philosophical German: Hegel and Kant

➤ AUFHEBEN, COMBINATION AND CONCEPTUALIZATION, DASEIN, ERSCHEINUNG, LOGOS, SEIN, WORD ORDER

Philosophical German appears comparatively late, alongside a persistent and influential Latin idiom. This double circumstance informs the history of efforts to translate into and from philosophy written in German, and in particular it explains the fetishism that attaches to substantives that are supposed to be "untranslatable" (and are in fact largely left untranslated: *Dasein*, *Aufhebung*, etc.), to the detriment of syntax and context. Hegel's German, which was very early criticized for being unreadable, illustrates the problem in a concentrated form. Confronted by the regular architectonics of Kant's prose, Hegel advocates a different syntax characterized by its economy, by its expansion of the philosophical lexicon, and by transitions and entailments wrought through by negations—and disconcerting for this reason to the translator. However, a detailed study of Hegel's texts, in which a return to ordinary languages is associated with a rigorous effort of conceptualization, shows that these features provide a major point of entry into the Hegelian universe. At the same time the peculiarity and flexibility of Hegelian syntax influence a philosophical terminology that forces the translator to engage in a difficult process of arbitration in order to follow its movement.

I. Semantic Phantoms and Syntactical Energy: What Kind of Esotericism?

Until the end of the eighteenth century, there was little German philosophy in the German language. With a few exceptions—which are not, moreover, particularly noteworthy (Plouquet, Knutzen, Thomasins)—German philosophers wrote in Latin or in French: thus, up to 1770, Althusius, Weigel, Kepler, Agrippa, Sebastian Franck, Paracelsus, Leibniz, and Kant. At the same time, since the beginning of the sixteenth century, religious discourse had been establishing itself in the language of the people (that is the meaning of the adjective *deutsch*), and from the twelfth century forward there had been a literature in German that had assimilated foreign traditions—Latin,

French, Italian, Spanish, etc. This late attempt at devising a properly philosophical discourse from within the language of others bore fruit massively and quickly. Philosophical German takes shape over the course of about three decades, with an explosive force that was to last more than a century, and is in certain respects still not finished: many concepts of today's universal philosophical discourse are rooted in (and sometimes even make direct use of) the philosophical German of the nineteenth and twentieth centuries.

This historical peculiarity was also manifested in philosophical literature in German. There are, for instance, only a few incursions of German into Leibniz's French (his use of the comma, for instance), but traces of Latin abound in the German of philosophers: not only a general rhetoric and a syntax dominated by centuries of scholastic training, but also a lexicon that is often directly transposed—though sometimes varying from author to author—into the new theoretical idiom. Latin phantoms often continue to haunt new German semantic developments, in parentheses, in italics, etc. A tenacious habit is formed, an embarrassing academic tic that is no longer mocked by the laughter of great comedians: a mania for the concept cited in a foreign language, first in Latin, notably in German texts, and now in German, quoted, for example, in French texts.

Thus the reception of German philosophers, in France preponderantly but elsewhere as well, has been marked by a pathology (in the Kantian sense of the term) that goes hand in hand with defeatism and renunciations in the work of translation: a typical (often magical) response to alterity, which we see less among the English, Italians, and others than among the French translators of German philosophy, and still less in French translations of texts in English, Italian, and so on. The respectful, even timid approach to which this has led ends up constructing jetties or breakwaters concentrating difficulties in interpretation around specific notions, usually in the substantival form, and the constant practice in German of nominalization has encouraged this fetishism. We owe to this attitude particular linguistic gestures: a contrite resort to neologisms, a mortified preservation of the German term in French, and to an extent in other languages as well (e.g., *Dasein*). These fixations on the paradigm revive in philosophy the Byzantine debates about words conceived as markers composed of piled-up stones to which everything can be attached: ex-votos, scrolls full of glosses, tresses of exegeses.

These fixed points, veritable intersections of glosses, are so many occasions to depart from the continuous flow of another's discourse to sing the praises of one's own text. But this almost structural reflex long remained blind to the risks it involved: the notions in question are semantic tumuli in which political, ideological, and in general conflictual stakes are constantly appearing and overlapping, thus dividing readers in their own country.

One philosopher concentrates several dimensions of this spreading syndrome: Hegel. On the one hand, he seems to have a vague awareness of it and to try to escape it by practicing an autonomous, relatively new, and innovative language, at the risk of being accused of obscurity. But on the other hand, the very success of his attempt, along with the difficulty of translating and commenting on his discourse,

has encouraged the reproduction and return of the very behavior he was opposing. This was also a way of confining his philosophy to his own field and protecting his successors against it: the most Hegelian of these successors, Marx, also played the card of criticizing Hegelian discourse qua discourse. Today, this philosophical language seems to have had its day. Only Heidegger followed its tradition of adopting the linguistic backdrop and foundation of human experience, with consequences that are at once related and very different. Philosophical German seems to have fallen back on an ordinary, translatable, clear discourse that can be put into English. But the subterranean influence of Hegel's philosophical language on modern theoretical discourses in history, psychoanalysis, and anthropology in the broad sense remains considerable and deserves close examination insofar as it has created a new relationship between the totality of the elements of discourse and thought about what is. It exhibits a kind of general relativity that disturbs the previously accepted space-time of speech: the relationship between void and plenitude in discourse is inverted, and syntactical energy alone deploys the conceptual formations that are inconceivable outside this movement of positing and negating. The ordinary, iconic base-10 numeral system collapses and along with it the pantheon of neo-theological concepts: accounting is carried out on the binary basis of what is and what is not; language tends toward the base 2 of identity and difference or, to put it another way, toward the logic (the speech) of being.

This inversion has cast Hegel's writings into a kind of dark night. Hegel is one of the philosophers about whom the question of readability is almost immediately raised: and since this question is practically never posed in connection with other German philosophers of the period, including Fichte and Schelling, who can also sometimes be "hard to follow," it seems that this difficulty constitutes the peculiarity of Hegel without necessarily being conceived as an effect of the singularity of his thought. To it we can oppose (and this opposition also has to do with him and constitutes the essence of his problem) the great clarity of Jacobi, Reinhold, Schopenhauer, Feuerbach, Marx, and other writers and pose the question the other way around: Is it not, according to Hegel, precisely the clarity of a philosopher's writing that reveals that the truth is not displayed, but simulated, play-acted—or even outmoded, old, familiar?

Not only are Hegel's works—if we set aside the notes on his lectures made by students and posthumous publishers—all difficult to read, but they seem to say that it cannot be otherwise. The difficulty of reading them is part of the experience of the truth, of the pain and effort of work. The dressing gown of the do-nothing philosopher mentioned at the end of Hegel's preface to the *Phenomenology of Mind* includes, a contrario, an allusion to the "clarity and distinctness" of Dutch windows and the comfort of the familiarity of the Cartesian "stove-heated room." Finally, the very form of some of his texts shows them to be based on the necessity of an initial obscurity: the *paragraphs* dictated in their rigorous form are then commented upon in the author's explanatory *Remarks*, and then re-commented upon and elucidated in clearer language by the editors, in the form of *additions.*

Today, we can adopt this scheme for reading Hegel at the outset (moreover, in the *Phenomenology of Mind* Hegel analyzes this "advantage" enjoyed by the later reader), but Hegel's contemporaries and first readers did not see things that way. Schelling complained explicitly of the headaches that reading the *Phenomenology* gave him (though these might also have been caused by the book's anti-Schelling polemics). Goethe and Schiller concocted a pedagogical plan that was supposed to allow Hegel, by assiduously consulting a mentor in clarity, to achieve transparency in his discourse (this did not work). As for contemporary reviews, they all deplore "the repetition of formulas and the monotone aspect." In other words everyone at least acted as if the difficulty of Hegel's work had to do with his manner (people fell back on his Swabian origins, his religious training, and the influence of the esotericism of the mystics) and not with the very essence of his philosophy, even though in several places Hegel himself takes up the question of legibility and denounces the esotericism of philosophies of the intuition of the absolute, their obscurity and their elitism. This paradox frames the whole question of Hegel's language. Heine, followed in this by the left-wing Hegelians, proposed a practico-rational response to this paradox: Hegel did not want to be understood "immediately"; he was working for the long term and had first to overcome the barrier of censorship. That, Heine says, is why Hegel's language is *verklausuliert,* hard to understand, en-claused or perhaps "claused-off"—it is not a pathological "manner" from which his prose suffers, imposed and ultimately external, but the objective, strategic effect of a political decision: a mode of the freedom of thought.

The question seems not to have been treated in itself. For instance, Koyré's study, which in theory deals with it, drifts into fragmentary expositions of the system and ultimately proves disappointing. Inversely, Hegel's language is often discussed in more general books, notably in connection with a gloss on this or that term—which is a way of not entering into Hegel's way of expressing himself. However, we can mention a work in recent French philosophical literature that is very interesting from this point of view: Cathérine Malabou's *L'Avenir de Hegel*, which investigates the notion of plasticity in connection with Hegel's way of expressing himself and studies in depth the relationship between the predicative proposition and the speculative proposition.

II. Modern Philosophical Language: The Kantian Model and Its Hegelian Critique

We must first return briefly to the origin of this difficult language and look into Hegel's linguistic culture. The allusion to Hegel's "Swabian speech" (in contrast to that of Berlin, the Rhineland, etc.) connotes a general practice of discourse oriented toward the inner and a weakness of dialogic effort (which Swabian poets compensated by the power of an affective movement toward the other), in short, a kind of regional psychology that is redolent of the Pietist stable and that is supposed to manifest itself also in Hölderlin, Hegel's friend and interlocutor. Robert Minder's study of the Swabian Fathers goes in this direction by emphasizing the influence of religious training and the practice of using a secret code. But there is no lack of counterexamples, beginning with other Swabians like Schelling and Schiller.

Nonetheless, this idiosyncrasy plays a role in a general philosophical language that had been created not long before and had already imposed itself: that of Wolff, Kant, and Fichte, revised by Bardili and Reinhold. But if Kant was quite early on considered the creator of the German (indeed, European) philosophical language, it was especially as the founder of a technical vocabulary that some contemporary commentators already judged to be unfamiliar, esoteric, and obscure.

What characterizes this modern philosophical language?

In the first place the abundance of vocabulary and its specialization, running counter to its ordinary meanings and its ordinary forms: in their great dictionary, the Grimm brothers expressed their astonishment at the philosophical meaning that Kant gave to the word *Anschauung*, which goes back to the traditional *intuitio* with all its ambiguities. Then the extreme length of the sentences and the production of heavily loaded phrases, to which, however, the reader quickly grows accustomed and which are explained in a way by the recourse to an unproblematic syntax, persistent rhetorical procedures, and regular reference points, which are themselves situated in the ground plan of an architecture that is already self-explanatory. Kant's language can thus be approached in an "optical" manner, through geographical intuition: the massiveness of the load implies the simplicity of the articulations. The critical continents each have their own vocabulary, their axes. Only a little practice is required to get one's bearings, and in the end one also discovers many of the characteristics of Latin style.

It is thus a kind of writing that translates well, provided that an effort is made not to forget anything, that one places the commas correctly, and that one has correctly understood the order of modifiers in the German sentence—in order to avoid, for example, making the traditional and in fact rather stupefying error made by French translators who render *reine praktische Vernunft* as *raison pure pratique* (practical pure reason), which is a kind of contradiction, whereas the German phrase means "pure practical reason," as opposed to impure practical reason, that is, to technical reason. This constitutes a double, ongoing offense against the German language and against Kant's thought. If there is somewhere in his work the hypothesis of a practical pure reason (as opposed to what? Certainly not to a *pure* pure reason!), it could be called, hypothetically, nothing other than *praktische reine Vernunft*. The reason for this error has to do with the conditions under which the first translators were working: they were not true speakers of the original language; they translated German as if it were Latin and thus reproduced the modifiers in the order in which they occur in the German phrase.

In addition, this writing justifies the recourse to *lexicons*: even during Kant's lifetime, as early as 1786, lexicalization had begun. Carl Christian Ehrhart Schmid had undertaken to redistribute the Kantian system alphabetically by listing in order the meanings of technical expressions. Kant himself, moreover, did not hesitate to engage in operations of self-lexicalization and definition for which he often provided the Latin equivalent, an attitude virtually nonexistent in Hegel, who was fundamentally hostile to specialized onomastics.

Not only did Kantian discourse translate rather well, but it was good for certain philosophical temperaments: Kant's general ground plan, the reliability of his definitions, the modesty of the critical ambition, all exhibit a set of reassuring reference points. This quality strongly contributed, for example, to the consolidation of the Kantian moment in the pair of thinkers that provided the foundation for teaching philosophy in French schools: Descartes and Kant. At the beginning of the nineteenth century, Kant's language established itself: everyone spoke it, reworked it, adapted it. Everyone except Hegel, who was very familiar with it, but rejected most of it, while at the same time benefiting from the reworking that Fichte was the first to subject it to.

Confronted by this language, Hegel developed, mainly during his stay in Jena, an apparently obscure, even oneiric idiom whose functioning is completely different and presents, among other characteristics, two symptoms. The first of these is the nonexistence, indeed the impossibility, of a *Hegel-Lexikon* comparable to the *Kant-Lexikon*. In this case there are only lists of the occurrences of terms, heavily overloaded by the proliferation of the latter, detailed in the order of the volumes of Hegel's complete works. The notions and concepts of Hegel's philosophy cannot be detailed. They exist meaningfully only in the totality of the text; dictionary classifications break down precisely the moment they are found. Or again: Hegel's notions and concepts exist practically only in syntagmatic expressions. The philosophical reader used to rigorous codes is frustrated: the lack of this tool elicits a malaise that was sufficiently foreseeable for Hegel to warn the reader about it in his preface to the *Phenomenology of Mind*, for instance.

The second symptom—which is no doubt connected with the first, but not for practical reasons—is the Hegelian corpus's resistance to translation. Historically (so far as French is concerned), translation began with a work that was not written by Hegel, the *Aesthetics*, translated by Charles Bénard in the early 1840s, and finished with what was the most "completely his," the *Phenomenology of Mind* and the *Principles of the Philosophy of Right*, with translations appearing almost into the second half of the twentieth century. The *Encyclopedia*, translated by Vera in the second half of the nineteenth century, represents an intermediate linguistic state insofar as it was published with Hegel's explanatory remarks and additions written by the editor after Hegel's death.

We might add to these symptoms a comparative analysis of the different "Hegelian idioms" constructed in French to translate Hegel. While Hegel did not have an opportunity to really consider these symptoms (even though he was the first philosopher to practice what Althusser would call a "symptomatic reading," or *lecture symptomale*, to psychoanalyze his time and to conceive moments and figures as situations), he did think about his difference from other philosophical languages. His is a language that knows it is different, that wishes to be different, that shapes and elaborates its difference, and if necessary exhibits it brutally: Hegel writes against Kant, against Kant's "barbarous" lingo and his dogmatism of subjectivity, which overthrew, to be sure, the dogmatism of objectivity (roughly speaking, eighteenth-century rationalism) but which in a way still speaks the latter's language, insofar

as it dogmatically mimes—even in the arrangement of the table of contents—objectivity.

In the same way but more politically, Hegel repeatedly declares his opposition to special languages like "the language spoken by Molière's physicians": that of German jurists and Kantian philosophers. To explain, he uses a democratic argument that may now seem comic when we realize how narrow his own informed readership is. But his criticism of the esotericism of Schelling's absolute knowledge is not based on a criticism of Schelling's discourse (which he long spoke—and created—*with* Schelling, to the point that we cannot always tell who wrote some of the articles in their *Kritisches Journal der Philosophie*).

Hegel's hostility to Kantian discourse ends up taking an extremely aggressive form. A good illustration of this is found in the chapter on Kant in *Lectures on the History of Philosophy* (*Werke*, 20:330ff.). At the beginning of the paragraph devoted to the term "transcendental," Hegel calls such expressions "barbarous." A little later, commenting on the expression "transcendental aesthetics," he almost criticizes Kant's recourse to the etymological meaning of "aesthetic" by contrasting it with the modern sense: "Nowadays aesthetics means the knowledge of the beautiful." A few lines further on, he quotes Kant's statement regarding space: "Space is no empirical Notion which has been derived from outward experiences," and he comments, "But the Notion is never really anything empiric: it is in barbarous forms like this that Kant, however, always expresses himself."

A whole series of such annoyed asides might be collected in Hegel's works. Here is one more, which occurs not long after the ones already cited: "The ego is therefore the empty, transcendental subject of our thoughts, that moreover becomes known only through its thoughts; but of what it is in itself we cannot gather the least idea. (A horrible distinction! For thought is nothing more or less than the 'in-itself.')"

This criticism does not bear solely on Kant's language. Basically, it is aimed at Kant's way of doing philosophy, presenting it as a simple translation of the metaphysics of the Understanding (the Enlightenment) into subjective dogmatism. Kant describes Reason, all right, but in an unreflected, empirical way. His philosophy lacks concept (*Begriff*), and he uses only "thoughts of the Understanding" (*Gedanken*). As a result, and contrary to appearances, Kantianism lacks philosophical abstraction, it "threshes out" ordinary logic: its abstraction is no more than the dead abstraction of already existing concepts; it is not work, effectiveness, creation. Which explains why in other circumstances Hegel is capable, paradoxically, of reproaching Kant for his abstract discourse.

III. Hegel's Language: A Mutation of the Economy of the Syntagma and the Paradigm

Confronted by this situation, Hegel writes a philosophical prose that he considers nondogmatic (neither formal nor mythical), nonabstract, substantial, and well expressed, but which we, on the other hand, often find very abstract, confusing, cryptic, coded, and poorly expressed.

How should we describe this language? Before characterizing it in any way, we must repeat that the specifically Hegelian language is not uniformly distributed. Not only have we seen that his work has several strata, but also we find

in a single work of his whole pages that are not *stricto sensu* "Hegelian," particularly in the prefaces and introductions. But precisely these "protected" pages are also the site of a struggle between discourses: even in the phases of presentation, ordinary language is rapidly enveloped and invested by phenomenological or speculative discourse, and this is shown by the ruptures, anacolutha, and other anomalies that rapidly increase, to the confusion of the reader.

In sum, what characterizes Hegel's language is superficially a certain vocabulary but more profoundly a mutation of the economy of the syntagma and the paradigm in three major aspects.

1. The invasion of the lexical by the syntagmatic: early on, and in a massive way, Hegelian discourse reassembles, from the array of syntactic material before him, what we may call "empty words." By "empty words" we mean those that are now excluded by computer applications, such as articles, personal pronouns, prepositions, conjunctions, common verbal forms—auxiliaries: not only does their mass threaten to saturate research procedures, but the very interest of these words is considered to be nil. In Hegel this procedure of gathering "empty words" has the effect of producing notions that are not fixed in an iconic representation or a traditional semantic content but instead express moments of process or pure relationships. For example, *Sein für anderes, Anderssein, An sich* and *Ansich, Für sich* and *Fürsich, an und für sich, das an und für sich seiende, bei sich sein, in sich sein*, etc. It is very difficult to make isolated iconic uses of these terms, which can exist only in the movement of sentences in which they slip one into another and divide. In Hegel there are even phases of explicit interest in less common empty words, which he uses in major ways, even as concepts: *also, auch, daher, dieses, eins, etwas, hier, ist, insofern*, etc.

   The bulk of these terms easily absorbs the few elements of ordinary philosophical discourse that were already constituted in the same way and which we encounter in other philosophers writing in German: *das Ich, das Sein, das Wesen.* In the same way this mass absorbs substantivized infinitives (*das Erkennen, das Denken*, etc.), that is, it inserts process, the in-finite, the active verbal element into frameworks usually reserved for nominal substance. We might say the same about the numerous substantivized adjectives: *das Wahre* takes precedence over *die Wahrheit.* In the works' first printed editions, where the first letter of a substantivized adjective is not systematically capitalized, this slippage leads to another difficulty in reading, forcing the reader to choose between this form (e.g., "the True") and the other possibility, namely the elision of a substantive later picked up again, and which must then be found correctly in everything that precedes (e.g., "true knowledge"). Finally, as a result of a sort of "general syntactical preference," Hegel often does not repeat, when he recalls it, a substantive that has been elided but instead substitutes for it a pronoun that is identifiable only by its gender, whereas the reflex of the reader (for instance, the translator) is to repeat this substantive, adding a deictic. The effect of this procedure is to

force the reader to memorize, a historicization of the act of reading at the expense of habits of spatial orientation on the material surface of words, the presence of a capital letter on substantives, etc.

The result is a great frequency of identical or quasi-identical forms, which creates an impression of rhapsodic repetition and monotony, sometimes elevated by flights of rhetoric that are polemical or almost lyrical and that break all the more strongly with the whole: suddenly there is a whiff of cultural substance, images or concrete references, a proverb, a quotation of another author that plunges the reader into a second state. In the *Phenomenology* this often happens at the end of chapters, and in the last chapter, but in general Hegel does not use quotation marks to set off quotations, nor does he use proper names, references, and footnotes, just as he avoids examples, metaphors, and comparisons—the substantial baggage that cannot be unpacked without leaving the movement of the dialectical development.

2. This effect of monotony is made stronger by the simplification of the specifically syntactical material. For example, we find in Hegel a near monopoly of the present tense. Heidegger calls that his "vulgarity" and reproaches him for it. Similarly, connectives and modals are reduced to a few that assume identical logical-rhetorical functions: *wenn*, *dann* (inverted clause), *so, hiermit, somit, indem, erst, nur, oder, überhaupt, bloß, rein, allein, nun*. This relative sobriety seems to be induced by the phenomenon we have just described, the invasion of the lexical by the syntagmatic in Hegel's prose: from a strictly stylistic point of view, by combining with the richness of Schelling's syntactical vocabulary, for example, or by practicing through variation a pseudo-semanticization of syntactical words, the Hegelian text seems to have arrived at a complete disequilibrium, a sort of monster. Nevertheless, the deepest reason for the extreme syntactical austerity in Hegel's prose goes to the heart of his project: what applies to the conceptual lexicon applies also to the syntactical one.

3. The result (and partly the cause) of all this is a prose that makes connections and transitions into so many "decisive" moments. Much is at stake in the emergence and abolition of correlations, which constitutes a major difficulty for French translations that seek to depart from the spatial successiveness of the movement (by reorganizing the order of words in the French manner: that is more or less the tendency of Jean Hyppolite, and we can say that it is encouraged by the tradition of Kant translations that have no difficulty with transitions and displacements within vast wholes whose interior is in some sense open), or to escape the linguistic continuum of semantic networks by recourse to neologisms (or quasi-neologisms: *Anschauung, anschauen*: intuitionner; *Einsicht*: intellection; *Gleichheit, gleich*, systematically rendered as *égalité* or *égal* to the detriment of the much more frequent meaning of qualitative identity, or even resemblance), or by setting up new networks; for example, by translating *Selbst* as *soi*, one establishes a false network with the reflexive pronominal *soi* of *en soi, pour* *soi*, etc. but loses the strong correlation with the paradigm of identity (*dasselbe, selber*, etc.).

In comparison with the Kantian sentence, the Hegelian procedure of arranging-and-loading is completely original. We can intuitively perceive the content of the great, relatively symmetrical Kantian sentences, but in Hegel symmetrical periods are immediately destroyed, bent, and rendered unilateral, or else they twist themselves into ropes because the reversals of symmetries are not rhetorical aspects (specular reminders) of the external exposition but always the movement of the thing itself. Negativity is constantly at work and requires a strong and persistent effort on the part of anyone who wants to recollect the whole. This aspect is connected with Hegel's hostility to "pictures," whose apprehension through reading is never truly free of representation (the concept's being outside itself) and finally emerges in a consciousness that is more religious than philosophical. In Hegel, "picture-like" is clearly pejorative and connotes an address to a weak sort of thought. The necessity of attentive memory, of reading step by step, and of rereading constitutes the difficulty of philosophical work, as opposed to approaches to the true that do not plunge into the thing itself.

IV. The Beginning of the *Phenomenology of Mind*

This verbal strategy excludes direct dialogue with the discourse of others at the same time that Hegel's philosophy presents itself as a pure and simple dialectical collection of what is already there in contemporary philosophical discourse.

Thus the question of the beginning is raised. How can one begin without proceeding like traditional authors, for example, by referring to differences with others, or by definitions? It might be interesting to examine the beginning of the beginning: for example, the first sentences of the first paragraph of the introduction to the *Phenomenology*, which is itself a kind of prolegomenon, an initiation.

The introduction is formally distinct from the content of the experience of consciousness, of which phenomenology is the science, the knowledge, and in a way already the system.

It corresponds to the chapter on Absolute Knowledge, in which all the moments intersect and overlap, and therefore in which there are no longer any moments, where knowledge is complete (and can begin to be set forth as the true). It is thus not a moment but the empty concept of knowledge whose possibility is postulated as knowledge of what is, of the in-itself, of the Absolute, and as a knowledge that cannot be immediate and can attain truth (science as system, the pure logos of being) only by fulfilling and abolishing this difference in a history that is at the same time a demonstration, a succession of verifications in the thing itself.

The person who begins this history is also the one who rejects the last philosopher to have conceived this difference between knowledge and being in itself, that is, Kant. And thus, the first moment in the *Phenomenology* is devoted to Kant. But it is also devoted to another negation, another difference: the one that the philosophy of identity situates between absolute knowledge and natural consciousness. And Hegel's point of departure consists in thinking simultaneously of the unity of the Kantian procedure and the philosophy

of identity. To that end Hegel explains that Kant merely reflects common sense, that he simply follows Locke's thought to its logical outcomes. Kant cannot, in fact, know, because he does not move beyond the understanding and does not subject the critique to a dialectical verification. Critical thought is a delusion. Idealism, on the other hand, remains contingent and arbitrary: it does not demonstrate the indifference of the subject and the object but studies each of them in itself, compares and identifies them: identity is constructed, it is not an autogenous result. The *Phenomenology* continues: Kant's philosophy and the philosophy of identity are abstract and based on presuppositions. Kant simply conceives and posits the abstract difference between Being and Knowledge, whereas Fichte and Schelling conceive the abstract identity of being and knowledge. But all of them, under this identity, developed all the forms of the totality, which can now be recuperated: this is the Hegelian windfall. This recuperation is that of the modern, atomized subject whom it is also a question of reconciling with himself, with his culture, with the organic, with religion, the state, ethics, etc., in an adequate language.

It is in this context that the beginning of the *Phenomenology of Mind* should be read. The first sentence is both a stasis in the discourse of common sense and a switching-on of Hegelian discourse:

Es ist eine natürliche Vorstellung, daß, eh in der Philosophie an die Sache selbst, nemlich an das wirkliche Erkennen dessen, was in Wahrheit ist, gegangen wird, es nothwendig sey, vorher über das Erkennen sich zu verständigen, als das Werkzeug, wodurch man des Absoluten sich bemächtige, oder als das Mittel, durch welches hindurch man es erblicke, betrachtet wird.

(C'est une représentation tout à fait naturelle de penser qu'en philosophie, avant d'aborder la chose elle-même, savoir, la connaissance effective de ce qui est en vérité, il est nécessaire de s'accorder préalablement sur la connaissance que l'on considère comme l'outil qui permettra de s'emparer de l'absolu, ou comme le moyen au travers duquel on l'aperçoit.)

(Trans. J.-P. Lefebvre, Paris: Aubier, 1991, 79)

(It is natural to suppose that, before philosophy enters upon its subject proper—namely, the actual knowledge of what truly is—it is necessary to come first to an understanding concerning knowledge, which is looked upon as the instrument by which to take possession of the Absolute, or as the means through which to get a sight of it.)

(Trans. J. B. Baillie, 1910; New York, Harper, 1967, 131)

(It is a natural assumption that in philosophy, before we start to deal with its proper subject-matter, viz. the actual cognition of what truly is, one must first of all come to an understanding about cognition, which is regarded either as the instrument to get hold of the Absolute, or as the medium through which one discovers it.)

(Trans. A. V. Miller, 1977; Oxford, Oxford University Press, 46)

The expression "es ist eine natürliche Vorstellung, daß" has a quasi-trivial status (which the French translator assumes by adding "*tout à fait*" ("entirely"), as one might say "*mais naturellement*" (of course). Similarly, the expressions "die Sache selbst," "das wirkliche Erkennen," "was in Wahrheit ist," "das Absolute," "sich zu verständigen," are all in the ordinary register: the thing itself with which we are concerned, true knowledge, the true, the absolute, coming to agreement, etc. And at the same time Hegel delivers a first packet of rigorous conceptualization, made more precise and stabilized by more than a year of labor on the text of the whole of the *Phenomenology of Mind*: the *Vorstellung*, *représentation* in the French translation, "supposition" and "assumption" in the English, also has the precise sense that Hegel assigns to it in the *Phenomenology* as a whole, in its definitive hierarchy. The statement is already virtually turned around: to say what follows the word *daß* is nothing but, is only, *Vorstellung*, representation, and furthermore merely *natural* representation, because representation is the concept's being outside itself. *Sache selbst* (the thing itself) will be the principal marching order for the whole dialectical procedure (insofar as it is not external); *wirklich* already connotes the effectiveness that is not a pure and simple thingly or abstract "reality"; *was in Wahrheit ist* can also be read in an ontological sense as what, in truth, is; and *verständigen*, which designates agreement, also connotes the universality of the understanding, *Verstand*.

But it is not solely a matter of intertextual echoes. The words *natürliche Vorstellung*, with which the *Phenomenology* begins, also refer to the current state of philosophical reflection. This moment in the history of philosophy, Hegel's text proposes, has become a "nature," an immediate given whose aporias (here, the richest knowledge is at the same time the poorest: aiming at the truth, one ends up in the clouds of error) necessarily imply that the way of dialectical doubt that the opening of the preface describes is indeed commencing.

If Kant is in fact the subject here, then it is Kant insofar as he was the last to pose the question of knowledge and thus to walk off with the philosophical jackpot. Thus it is a strange Kant, fairly "Lockified" and revised by Fichte. And still, the critique of the *organon* "with which one grasps oneself" and of the milieu "through which one perceives" also refers to the very beginnings of philosophy. And thus we are already in the thing itself in the Hegelian sense, apparently devoting ourselves to avoiding a particular way of missing it. This will be the schema for the writing of the whole *Phenomenology of Mind*; Hegel's opening sentences describe, capture, and instantiate the effect on his writing of a procedure that consists in designating moments that already contain other moments and are already no longer themselves. Or, to put it another way, Hegel's language cannot not be a mere figure, simply a figure, of common language, of the language common to the greatest number of philosophers, and finally of common language as such, insofar as this common language always tends to test once again its "economic" essence, its aptitude for elementary reduction, that is, it tends to reinvest always once again in the word's pure time, leaving it to mute indices to designate images with a gesture, even if

these images are complicated concepts that are supposed to be heavy with history.

V. The Dynamicization of Semantemes

What is at issue should not, however, be understood under cover of a cluster of cliches regarding the contradictory meaning of certain terms that can designate a thing and its contrary: Hegelian concepts themselves, considered in their apparent semantic autonomy, are part of these mutations and redistributions. Here we think, of course, of the famous *Aufhebung*, which has become a test of strength for heavy lifters since Hegel himself pointed out that the term could signify both "abolish" and "preserve." He mentioned this precisely because this curiosity did not appear in his statements, because of the elementary law that holds that a term is never alone but is caught up in a general context and a particular syntagma, which guide the term's meaning without there being any need for long additional glosses. And thus, when Hegel says nothing, the term has the sense dominant in the language ("abolish"), which itself explains, by an explicit context, the cases (which are statistically in the minority) in which the term means, on the basis of a primary negative sense, to withdraw something from circulation, from presence *hic et nunc*, and to put this thing aside, to protect it, and to intend it for later. It is precisely because there is no possible iconic use of his concepts but only contextualized uses that this word has the meaning that Hyppolite very calmly translated by *supprimer* (abolish, cancel). Apart from this negative meaning, what does the expression *Aufhebung der Aufhebung* mean in Hegel's work? Only a pure knickknack of semantic inanity would remain.

Another consequence of the dynamics of Hegelian language is the necessity the French translator encounters of sometimes varying, more or less lightly, the translation of terms identical in the German text: thus *gleich* occupies a spectrum ranging from "identical" (dominant) to "equal" (much rarer), by way of "similar" or even "same"; *Anschauung* ranges from "contemplation" to "intuition," by way of "vision" pure and simple, or even "spectacle." These variations cannot but collide with the fetishistic relationship to isolated words. But that relation is precisely what is unfaithful because it obscures the effects of context, which are always semantically decisive. Conversely, certain terms, which are different in German, will be found in context always translated by the same French terms: the French word *intelligence* can translate *Klugheit, Verstand, Einsicht, Intelligenz*. Recourse to translator's notes makes it possible to respect the desire for verification that the reader may feel. Finally, the reading contract between the translator and his reader also commits the former not to play in an arbitrary manner with these necessary variations and to give the reader the benefit of his knowledge of the contexts: on this contractual basis we see that the same expressions are usually translated in the same way, when the author of the original text supervises the play of meaning in these expressions. We might list such cases: *allgemein* (general, universal), *erscheinen* (appear, in the trivial sense; be manifested phenomenally), *bestimmen* (determine, intend), *darstellen* (exhibit, represent), *dasein* (be there, exist), etc. What would one say about a translation that always translated Hegel's different prepositions (*an, ab, aus, auf, durch,* etc.) each by the same French preposition? The statements would be jammed. In Hegel, no doubt more than in other philosophers, semantic units, semantemes, are themselves subject to movement. If iconic immobility eventually seizes them, it will be because Hegel has lost the game. It is not impossible that he himself may have sometimes contributed to this sclerosis.

GESCHICHTLICH (GERMAN)

FRENCH   *historique/historial, historicité/historialité*

➤ *DESTINY*, HISTORIA UNIVERSALIS, HISTORY, and AUFHEBEN, DASEIN, EREIGNIS, ES GIBT, PRESENT, TATSACHE, *TIME, TO BE*

The German term *geschichtlich* is translated into English as "historical" but into French as *historique* when it appears in Hegel and as *historial* in Heidegger (the distinction is not drawn in English translations), and similarly for the noun *Geschichtlichkeit, historicité* or *historialité*. This is not a matter of secondary variation or translator's caprice. What the shift from the *historique* to the *historial* shows in French is the profound debate that took place in German philosophy, from Hegel to Heidegger, on the nature of what is truly *historical*, in other words, what makes a sequence of events history. The resources of the language are here invoked in a complex network that superimposes a famous pair of contraries (*Geschichte/Historie, geschichtlich/historisch*) and a strange etymology, *das Geschehen*, in English "happening, event, becoming," a sort of lexical matrix in which the relation between history and what happens is put into general question.

I. *Geschichte, Historie, Geschehen*

The examination of *Geschichte, geschichtlich* in Heideggerian terminology may begin with this remark of Heidegger in *Gesamtausgabe*:

> The country that can claim R. Descartes among its great thinkers, the founder of the doctrine of humanity understood as subjectivity, does not have a word for *Geschichte* in its language, by which it could distinguish the term from *Historie*.

> (Heidegger, *Gesamtausgabe*, vol. 79)

The first difficulty is thus to gain access to what the term *Geschichte* covers. The term is always understood by Heidegger to contrast with *Historie*, in the sense of historical science, historical studies, historiography.

Hegel had noted it:

In our language, the term *History* [*Geschichte*] unites the objective with the subjective side, and denotes quite as much the *historia rerum gestarum*, as the *res gestae* themselves; on the other hand it comprehends not less what has *happened* [*das Geschehene*], than the *narration* of what has happened [*Geschichtserzählung*].

(Hegel, *Vorlesungen*, 83; *Philosophy of History*, 60)

Raymond Aron comments:

The same word in French, English, and German applies to historical reality and the knowledge we have of it. *Histoire*, history, *Geschichte* refer at the same time to the becoming of humanity and to the science that men attempt to build to understand their becoming (even if the equivocation is attenuated, in German, by the existence of words*, Geschehen, Historie*, which only have one of the two senses).

(Aron, *Dimensions de la conscience historique*)

The decisive difference does not rest on the fact that German has two words where French has only one: the twofold meaning of *histoire* is also found in *Geschichte*. The important point is that German has, for *Geschichte,* a properly etymological resource in the verb *geschehen*, "to happen, to occur," which yields the noun *das Geschehen*, "becoming," and the substantivized adjective *Geschehene*, "what has become."

It is this resource that is continuously exploited by the philosophers of German Idealism. For Schelling, *das Geschehene,* that which has happened or has become (according to Ranke's expression: *was geschehen ist*)—for instance, Caesar having crossed the Rubicon, the Battle of Marignano in 1515, that is, so-called "factual" history (or "treaties and battles" history, in contrast with the problem-history dear to the Annales school)—is still not at the level of "history properly speaking" (*die eigentliche Geschichte*) or the level of what is "properly historical" (*eigentlich geschichtlich*), as Hegel says (*Vorlesungen*, 83). Schelling writes:

Was wäre alle *Historie*, wenn ihr nicht ein innrer Sinn zu Hilfe käme? Was sie bei so vielen ist, die zwar das meiste von allem *Geschehenen* wissen, aber von *eigentlicher Geschichte* nicht das geringste verstehen.

(What would all history be if an inner sense did not come to assist it? It would be what it is for so many who indeed know most all that has happened, but who know not the least thing about actual history.)

(Schelling, *Weltalter*, Einleitung; *The Ages of the World*, Eng. tr. Bolman)

The distinction is twofold: between *Historie* (science of history, historical studies) and *Geschichte* (history, *res gestae*), but also between "everything that has happened" (*das Geschehene*) and "history properly speaking" (*die eigentliche Geschichte*). History properly speaking is irreducible to what

has happened. It gets its meaning only from reappropriation or interiorization, from a way of knowing things not by rote (*auswendig*), but by the heart (*inwendig*), as Hegel says (*Phänomenologie des Geistes*, 35; *Phenomenology of Spirit*, 23–24). Speculatively, the lexical relation between *Geschehenes* and *Geschichte* is thus an index less of the proximity of two concepts or fields, than of the distance, even the abyss, that separates them.

II. *Geschichtlich* and *Historisch*: Heidegger, the Historial, and the Historic

If we move from the lines by Aron cited above to Heideggerian thought, it appears that the attenuation of the ambiguity that obtains between the nouns *Geschichte* and *Historie* becomes a radical differentiation at the level of the corresponding adjectives, *geschichtlich* versus *historisch*. *Historie* having been rejected as the mere chronological listing of events, and thus as the expression of a "calculating thought," *Geschichte* endows itself with a completely different relationship to temporality, proper to a "meditative thought."

We must nevertheless begin by recalling, in François Fédier's words, that "in the first period of his teaching at Freiburg, before 1923, Heidegger means by *historisch* what he will later call *geschichtlich*, that is, what is fully historical—in that any human being can only *live* in view of a dimension of being in the midst of which, having one day transmitted something which will be historical, he becomes fully in his turn the inheritor of a history" (Fédier, "Phénoménologie").

In French, then, Heidegger's adjective *geschichtlich* has been rendered *historial*, and the term *historique* has been used for *historisch*. *Historial* in French is not a neologism but an archaicism. We find it in Vincent de Beauvais, *Le Miroir historial du monde*, French translation of the *Speculum historiale* printed in Paris in 1495, but also in Montaigne. Henry Corbin, one of Heidegger's French translators, declared that "I coined the term *historialité*, and I think the term is worth keeping. There is the same relationship between *historialité* and *historicité* as between *existential* and *existentiel*" (see DASEIN and ESSENCE). This translation was nevertheless contested by J. A. Barash, who maintains *historique* and *historicité*, notably on the grounds that the terms *geschichtlich* and *Geschichtlichkeit* are not neologisms for Heidegger, and the aforementioned translation would amount to distancing him from the debates of his immediate predecessors and his contemporaries "in his age." Without having to settle this debate here, we can restrict ourselves to the following two remarks: (1) Corbin's initiative, which we think a happy one, is also related to his vision of "hiero-history," notably in Iranian Islamic spirituality; (2) the reliance on a single term, from Hegel to Heidegger in this case, does respect an existing lexicographical continuity, but the same term may take on entirely different overtones and thereby be newer than a neologism: thus *divertissement* is not a neologism in Pascal, nor is *Dasein* in Heidegger. In short, translation also takes place within a single language.

Does Corbin's translation of *geschichtlich* (in Heidegger) by *historial* stand up to Barash's criticism? Yes, and we should even be grateful to Corbin, who simply ran into these problems about the meaning of *geschichtlich* in Heidegger first, and brought them to our attention, and in addition found

resources in French to solve them. To study this question is to ask: how does *Geschichtlichkeit*—a word that seems to have been created by Hegel, taken over by Schelling and then Heine—take on a different meaning in Heidegger that radically differs from that which it had in Hegel?

III. *Geschichte* and *Geschichtlichkeit*: From Hegel and Schelling to Heidegger

The historicity (*Geschichtlichkeit*) described by German Idealists comes from a metaphysical conception—indeed this is the first time that history is conceived metaphysically—in which it refers to the dimension proper to the Spirit in its path toward itself, the concept of historicity being at bottom only the conceptualization of the necessity of this "toward." This path or ordeal (which is no doubt indissociable from a Christology) is thought of by Hegel as "negativity," with all that entails in terms of seriousness, pain, and patience; it is "the enormous labour of world-history" (*Phenomenology of Spirit*, preface, Fr. trans. J.-P. Lefebvre mod., 38, 46; Eng. trans. Miller, 8, 17). History is a way for Spirit to come to itself, the work of its coming to itself; history accomplishes and reveals (ironically, Schelling would add) what is proper to the Spirit, in a mobility that is essential to it, as Marcuse emphasized in 1932: "Historicity (*Geschichtlichkeit*) indicates the sense of what we aim at when we say of something: it is historical (*geschichtlich*). . . . What is historical becomes in a certain way (*geschieht*). History as becoming (*Geschehen*), as mobility, that is the problem posed" (*Hegel's Ontology*). The problem Marcuse identifies is also, in a way, the start of German Idealism. There is indeed a "history of self-consciousness," a decidedly transcendental history, as established by Schelling in the *System of Transcendental Idealism* of 1800, translating in his own way the *genetic* preoccupation of Fichte's philosophy. This history becomes legible in mythology understood as theogony, that is, as history rather than as a doctrine of the gods, *Göttergeschichte* rather than *Götterlehre*: it is the theogonic process of human consciousness.

For Heidegger, on the other hand, historicity is not anchored in the Spirit (the very term "spirit," *Geist*, is "avoided" in *Being and Time*, as made explicit in his § 10), but "in" *Da-sein* (if we can say that, since *Dasein* has no inside) and its facticity, the investigation of which is the purview of the existential analytic. Remarkably, it is in Heidegger's critical encounter with Aristotle (following the so-called "Natorp report," translated into French as *Interprétation phénoménologique d'Aristote* of 1922) rather than Hegel that historiality (as distinct from historicity) comes to be conceived as mobility inherent to any human life. In the compressed study of the links between Aristotelian ethics and physics, the ethical aspect of the ontological mobility of human life is made apparent. The clarification of the ethics foreshadowed in 1922 is reserved for the existential analytic of *Being and Time*, in the perspective of a "hermeneutics of facticity." *Faktizität* (facticity) constitutes, as Gadamer points out (in "Heidegger und die Griechen"), a sort of counterproof of everything that, in German Idealism, bears the mark of the Absolute (Spirit, self-consciousness, etc.), and as such indicates the difference of the appeal to historicity in absolute idealism and in the existential analytic: whence the abyss that separates *Geschichtlichkeit*-as-historicity from

Geschichtlichkeit-as-historiality, the world of the Spirit and the "self-world" (*Selbstwelt*).

Heidegger seems indeed to have established a link between the "metaphysics of subjectivity," which Descartes supposedly founded, and the fact that the French language does not have access to this dimension of history referred to by the German term *Geschichte*, or, even worse, collapses the *historial* and the *historique*. No doubt we must understand that *Geschichte* indicates a dimension of history that is not captured by a subjectivity, the action of a subject (even a collective one), understood such that it would be capable of "making history" (cf. Pasternak: "No one makes history"). *Geschichte* indicates a dimension of history that is all the more essential for being incapable of being "made" by man as an actor or agent and does not derive from what Heidegger called *Machenschaft* in the 1930s. *Machenschaft* is, in the common sense of the term, a warped machination, a tissue of dark actings. For Heidegger the term has a stronger sense: *Machenschaft* is what comes out of a doing/*machen*, from the effectivity of an efficient cause, for example, of an "operational" subject and thus derives from an implicit ontology of beings as "doable" or "makeable," that is, an implicit ontology that falls already within the rule or the spirit of modern technique conceived as a *Gestell*, whose counterpoints are *Gelassenheit* and *Ereignis* (cf. F. W. von Herrmann, *Wege ins Ereignis*; see COMBINATION AND CONCEPTUALIZATION, II). "What hells must the human being still cross, before he learns that he does not make himself?" Heidegger asks in a letter of 12 April 1968, to Hannah Arendt. The aspect of "history" designated by the German term *Geschichte* is one that man cannot, then, "make," but which he is able to allow to *geschehen* (become), or not. *Geschichte* thus indicates what comes *to* man, but not *from* man.

IV. *Geschichte, Geschehen, Geschick*: From the Historial to the History of Being

Hegel and Schelling, as we have seen, attempted in a way to separate *Geschichte*, history, from *Geschehen*, what happens or becomes in itself. Heidegger seems, on the contrary, to link them back together. *Geschichte* indicates a *Geschehen*, "becoming" or "happening," whose original meaning Heidegger sometimes traces back to Luther, in whom we find the word in the feminine as *die Geschichte* or *die Geschicht*, but much more frequently in the neuter, *das Geschicht*. In this sense *Geschicht* is *göttliche Schickung*, divine dispensation; Heidegger hears *Geschicht* as Luther does: as if deriving, if not from God, at least from a *Geschick*, a "dispatch" of which man is at best the recipient, and of which he must acknowledge receipt—of which he is even a *Schicksal*, a fate or a destination. What is truly *geschichtlich*, historial, is by that fact *geschicklick,* "destinal" or "epochal."

In sum, *Geschichte* should be understood:

1. on the basis of *Geschehen*, "des *Geschehens* dessen, was wir Geschichte nennen, d. h. des *Seins* dieses Seienden [the happening-occurring of what we call *Geschichte*, that is, of the Being of this being]" (*Gesamtausgabe*, 34: 82), as arrival or advent, and future, to come (Ger. *Zu-kunft*, irreducible to the future; cf. Péguy's French neologism: *évenir*; see PRESENT). *Geschichte* is only accessible as

such to a meditating, noncalculating thought, whence Heidegger's frequent homages to Jacob Burckhardt;

2. in the direction of a *Geschichtlichkeit* (according to the term that first appears in Hegel, Schelling, and Heine), *historicité* or *historialité*, in English "non-historiographical historicality," itself rooted in the temporality of *Dasein*. The specific mobility of *Dasein*, whose time is given on the basis of the future, throws it on an adventure (*Geschehen*) in which its historiality is rooted, related to the finitude of temporality in the being-toward-death taken on as such. Heidegger expresses this way of understanding *Geschichtlichkeit* in this manner: "Die Zeit nicht haben, sondern sich von ihr haben lassen, ist das Geschichtliche (Not having time in our possession, but being such that it takes possession of us, that is the historial)."

The possibility of a *Geschichte* contains the possibility of an *Ungeschichte* (non-history), of a *Geschichtsverlust* (loss of history) or a *Geschichtslosigkeit* (absence of history), when the historial dimension comes to be lacking.

In 1927 historiality is the epic of *Dasein*. But *Geschichte* becomes important to the thinking about fundamental ontology when the latter comes to be inscribed in the perspective of a *Seinsgeschichte* (*histoire de l'être*), or even a *Seynsgeschichte* (*histoire de l'estre*). "Historial" indicates that what concerns us may come to us without coming from us, unlike the "historical," even though the latter term refers both to a chronological account based on a *vulgäres Zeitverständnis* (a "vulgar conception" or "common understanding" of time) and to the idea that history, since it is capable of being made by man, would fall within the domain of the "doable," becoming thus a non-history in which nothing more can happen to us.

GESCHLECHT (GERMAN)

ENGLISH   race, kinship, lineage, community, generation, gender, sex

➤ *AUTRUI*, DASEIN, GENDER, *GENRE*, *HUMANITY*, LEIB, MENSCHHEIT, PEOPLE, SEX

As Heidegger reminds us, in a text that Derrida has commented upon at length, *Geschlecht* is impressively multivocal. It refers to race but also to kinship, generation, and gender, as well as the notion of sex, which divides all of the former: "The word equally means the human species [*das Menschengeschlecht*], in the sense of humanity [*Menschheit*], and species in the sense of tribe, stock, or family [*Stamme*, *Sippen*, *und Familien*], all of which is further intersected by the generic duality of the sexes [*das Zeifache der Geschlechter*]." This is why *Geschlecht* lends itself to a serious task of intralinguistic translation, which consists in finding equivalents for its various significations, in order to better circumscribe its meaning. The stakes of such a task are twofold: it must remove confusion about the different orders of belonging but also question the constitution and destination of human diversity.

I. The Multivocity of *Geschlect*

Four meanings of *Geschlecht* must be distinguished:

1. Paternal or maternal lineage (*Geschlecht vom Vater / von der Mutter*). It serves in this sense to assign identity. Thus, in Gotthold E. Lessing's play *Nathan the Wise* [*Nathan der Weise*], Nathan reveals that of his adopted daughter: "Do you not even know of what lineage the mother was [was für Geschlechts die Mutter war]?" (IV, 7). But once this

identity is specified in the sense of belonging to a lineage, it may become a sign of distinction. This is why *Geschlecht* also refers, in a more restrictive way, to nobility. To belong to a *Geschlecht* also refers, more narrowly, to nobility, as is shown in the same play (ibid., II, 6) by the exchange between Nathan and the Templar regarding von Stauffen's family: "NATHAN: Von Stauffen, there must be more members of this noble family [*des Geschlechts*]. TEMPLAR: Oh, yes, they were, there are yet many members of this noble family [*des Geschlechts*] rotting here."

2. *Geschlecht* also refers to a larger community, whose extension varies from tribe to humanity in general, by way of a people or a race. Humanity as a whole is thus referred to as *das Menschengeschlecht*, *das sterbliche Geschlecht,* or *das Geschlecht der Sterblichen* (the race of mortals). In a significant displacement of meaning from vertical to horizontal solidarity, *Geschlecht* may also mean a collection of individuals born at the same time: a generation.

3. In a different register *Geschlecht* refers to sexual difference (*der Geschlechtsunterschied*). *Geschlecht* is both sex in general and each sex in particular, male (*das männliche Geschlecht*) and female (*das weibliche Geschlecht*).

4. Finally, in a more abstract register, *Geschlecht* refers to the genus, in the sense of logical category, in the widest sense. It thus refers to the different genera of natural history as well as all sorts of objects and abstractions.

This multivocity, which owes much to the Greek *genos* (see PEOPLE), is problematic when we must translate *Geschlecht* into other languages. While the last two senses are easily identifiable and do not lead to confusion as long as context reveals when we must think of a sex or genus in a logical sense, translation becomes infinitely more complex once the term refers to a lineage, a generation, or a community or when it intersects with terms referring to people, nation, or race. In such cases the polysemy of *Geschlecht* is compounded by the polysemy of terms like "people," "race," and "nation" that must nonetheless be kept distinct from one another and from *Geschlecht.* What is more, this polysemy turns out to be problematical even in German itself, where *Geschlecht* competes with terms that share aspects of its sense, and which, whenever they are introduced or used, raises a theoretical difficulty and entails a polemic.

II. The Disambiguation of *Geschlect* and Its Difficulties

Between Kant and Herder a whole enterprise of terminological distinction may be said to be undertaken that aims at restricting the uncontrollable breadth of meanings of *Geschlecht* and substituting for it new, univocal concepts: *Stamm* and *Rasse*. In the essay *Determination of the Concept of Human Race* [*Bestimmung des Begriffs einer Menschenrasse*, 1785], Kant attempts to give *Rasse* a restrictive sense that preserves the unity of human kind, removing all equivocal use of the term. The goal is to avoid all confusion between species or kind and the races and to block attempts to think of the diversity of the "races" as grounded in an original diversity of distinct generations:

Thus the concept of a race [*der Begriff einer Rasse*] contains first the concept of a common phylum [*der Begriff eines gemeinschaftlichen Stammes*], second *necessarily hereditary* characters of the classificatory difference among the latter's descendants. Through the latter, reliable grounds of distinction are established according to which we can divide the species [*die Gattung*] into classes [*in Klassen*], which then, because of the first point, namely the unity of the phylum [*die Einheit des Stammes*], may only be called *races* [*Rassen*] and by no means *kinds* [*Arten*].

(Kant, *Bestimmung des Begriffs*)

Races (*Rassen*) are thus different classes of a genus whose unity of origin remains intact. This implies, however, that peoples and nations are no longer the primary natural divisions of humankind. *Rasse* intervenes between *Volk* and *Geschlecht*. This is why, in the same year in which Kant's essay is published, Herder argues in the second part of *Reflections on the Philosophy of History of Mankind* (1785) against the idea that we might use *Rasse* (for which he writes "Race") as an operative concept to determine such a primary division:

Some for instance have thought fit, to employ the term of *races* for four or five divisions, originally made in consequence of country or complexion: but I see no reason for this appellation. Race refers to a difference of origin, which in this case either does not exist, or in each of these countries, and under each of these complexions, comprises the most different races. For every nation is one people.

(Herder, *Reflections*)

However, it is above all in *Anthropology from a Pragmatic Point of View* (1797) that Kant attempts to fix the meanings of the term, by way of the characteristics that differentiate four types: those of the person (*der Person*), the people (*des Volks*), race (*der Rasse*), and the human species (*der Menschengattung*). *Geschlecht* and *Rasse* are essentially distinguished, then, by their finality. The first term, *Geschlecht*, is reserved for sexual difference, which has a twofold end in nature—the preservation of the species and, thanks to femininity, the culture and refinement of society. The second, *Rasse*, applies to a difference whose only end is assimilation, the mixing that gives the human its unity (*die Zusammenschmelzung verschiedener Rassen*). *Geschlecht*, *Stamm*, *Rasse*: the issue of the choice of terms is thus twofold. It relates both to considerations of the unity of humankind and of its finality.

Another sign of difficulty raised by *Geschlecht* comes from the possibility of using the word to refer to both horizontal solidarity (a generation) and vertical solidarity (the succession of generations). Such is, in effect, the reorientation of meaning that Luther declares, in a text that illustrates the difficulties of the word:

And his mercy extends from one generation [*Geschlecht*] to another. We must become accustomed to the usage in the Scripture which calls the succession of begettings and natural births *Geschlecter*. This is why the German word *Geschlecht* is not sufficient, but I do not know of a better. We call *Geschlechter* the stocks and the

union of blood brotherhoods [*geblüter Freundschaften*], but the word here must mean the natural succession between father and the child of his children, such that each of the members of this succession has the name *Geschlecht.*

(Grimm, art. "Geschlecht," 1984)

This confusion is found in the translation of the Hebrew term *tōledōt* [תּוֹלְדֹת], in Genesis 10, where, describing Noah's descendants, a shared humanity that Luther describes as "the table of peoples [*die Völkertafel*]" is laid out:

These *are* the families [*die Nachkommen*] of the sons of Noah, after their generations, in their nations [*in ihren Geschlechtern und Leuten*]: and by these were the nations divided in the earth after the flood.

(Gn 10:32, Luther's terms in brackets)

The retranslation of the same passage by Martin Buber and Franz Rosenzweig is thus significant (*Die fünf Bücher der Weisung*). They use *Sippe* (kinship) rather than *Nachkommen*, and the phrase *nach ihren Zeugungen, in ihren Stämmen* (according to their generations, in their tribes) instead of *in ihren Geschlechtern und Leuten*, thus distinguishing between vertical begetting (*Zeugungen*) and differentiated horizontal division (*Stämmen*). *Geschlecht* disappears, as though it were loaded with too much ambiguity to still refer to generation in the strict sense of begetting.

Geschlecht thus concentrates, even more than "people," "nation," or "race," the risks involved with any designation of community: that of being led back to an order of belonging deriving primarily from generation and ascendancy (thus from sexuality as well)—that is, the risk of a contamination of politics by genealogy.

GLAUBE (GERMAN)

ENGLISH   faith, belief
FRENCH   *foi, croyance*

➤ BELIEF, *CROYANCE*, and *FAITH*, FEELING, GEISTESWISSENSCHAFTEN, TRUTH

German vocabulary does not mark the distinction between faith and belief. It has a single word, *Glaube*, where English, French, and most Romance languages have two, which refer respectively to the (more or less deeply held) adherence to the dogmas of a religion and the (more or less perceptible) assent to all manner of representation or propositional content. This does not mean that German speakers do not have an idea of the distinction, but they nonetheless have difficulties giving it an expression in language.

I. The Difficulty of Translating Hume into German

A good example of these difficulties is found in German translations of English-language philosophical works that rely particularly on the notion of belief. Hume's *Enquiry Concerning Human Understanding* may be seen as a test case. The second part of section 5 aims to give, on the basis of the notion of *belief*, a "solution" to the "sceptical doubts concerning the operations of the understanding" raised in section 4. The conclusions we derive from experience rest on a *belief* that derives from *sentiment* or *feeling*, or even *some instinct* or *mechanical tendency*, and that may be described as a union of perception (direct or indirect, by way of memory) of an object and a certain link discerned between this object and another by habit. The German translations of this text—whether modern ones such as Richter's or older ones such as that by W. G. Tennemann, which contains Reinhold's essay *On Philosophical Scepticism* and in which German Idealism read Hume—systematically rendered "belief" by *Glaube*. However, for the same reason, as remarked by Richter in the English-German glossary accompanying his edition, these translations cannot capture the difference with "faith" as discussed in section 10, on miracles; for "faith" "in the religious sense," they still rely on *Glaube*.

II. Luther's Work on Language: *Glauben / Der Glaube*

The difficulty is also felt within German texts themselves, as the example of Luther shows. It is no doubt in his work, as the theologian of salvation by "faith alone [*sola fide*]" (as opposed to works) that *Glaube* takes on the status of a concept: his emphatic use of the word leaves a lasting mark on philosophy, most of all German Idealism. What is more, we find in Luther linguistically oriented remarks regarding the construction of the verb *glauben* (for instance, whether it should take the preposition *an*, rather than *in*). In a sermon from 1544 transcribed by Veit Dietrich, Luther draws the distinction between faith and belief:

A rich man, possessing great wealth and money, if he believes [*glaubt*] that he will not die of hunger this year, this is not faith [*Glaube*]. He who, by contrast, is destitute and yet still holds to the Word of God, according to which God will as his father procure him subsistence . . . , he does believe [*glaubt*] correctly.

(Luther, *Hauspostille, WA*, vol. 52)

As in French and other Romance languages, the verb *glauben* may refer both to what we call "faith" and to "belief," depending on their objects (in this case, believing in one's fortune and in the generosity of God). But in the first phase, the verb is in a strange way opposed to the noun of the same family, *Glaube*: there are ways of believing, *glauben*, that do not manifest *Glaube*. The problem is that Luther has a single family of words, *glauben/Glaube*, to describe the terms he is contrasting. This is not strictly speaking a problem of translation: French and other Romance languages have always drawn the distinction in this in advance. But the distinction that these languages have at their disposal does not make it possible to render Luther's work on his own language, except by violating its usage.

III. *Glaubensphilosophie*

A problem of translation does arise later, with the controversy started by Jacobi and what was called *Glaubensphilosophie*. Its origin lies in Kant's expression: "I was obliged therefore to abolish knowledge [*Wissen*] to make room for belief [*Glauben*]" (*Kritik der reinen Vernunft*). The translation of *Glauben* here is difficult. The objects that Kant attributes to it—God, liberty, immortality—are suggestive of faith, but the jurisdiction to which it belongs, practical reason, blocks any translation that would refer too directly to a religious reality. *Croyance* (belief) is in fact the translation adopted by all the French translators of the *Critique of Pure Reason*, from J. Barni, revised by P. Archambault, to A. Renault; in English, Kemp-Smith gives "to make room for *faith*," as do Paton and (more recently) Guyer and Wood.

Glauben here has a suppleness that French and English, always forced to choose between *foi* and *croyance* or "faith" and "belief," between religious and epistemological usages, do not. A grammatical phenomenon arises in addition. In the problem raised by Kant, it is a question not of a *Glaube*, but of a *Glauben*, that is, of a nominal infinitive, the "to believe," against which another nominal infinitive is contrasted, the "to know." In addition, the difference of form between *der Glaube* and *das Glauben* is tenuous: *Glaube*, a weak masculine, becomes *Glauben* in the accusative and the dative.

The title of Hegel's response to Kant, Fichte, and Jacobi in 1802, *Glauben und Wissen*, should thus be translated as *To Believe and To Know*, except that this is also misleading: the work's concern is not just with an investigation, à la Hume, of the degrees of certainty and of assent in human understanding. When Jacobi claims that all *Wissen* must "rise up" to a *Glauben*, he has God in mind above all, which—here Jacobi follows Kant—cannot be known, only believed. Kant, Fichte, Schelling, Jacobi, and Hegel all have the same object in view in the controversy: God, or the absolute. The title *Faith and Knowledge*—*Foi et savoir* in French—as a translation of Hegel's work would thus allow us to get around the difficulty, but it immediately gives rise to another one. A francophone reader may in effect be tempted unilaterally to lay down a familiar distinction between faith and reason, whereas for Kant, whom Hegel is discussing, *Glauben* is not distinguished from reason but rather results from the transfer of competencies of theoretical reason to practical reason. In fact, the question of *Glauben und Wissen*, which is prevalent throughout the beginning of German Idealism, brings together two questions that French habits tend to separate: that of the relationship between faith and reason on one hand, and that of the certainty to which

human knowledge may lay claim on the other (and we may see in this a continuation of the debate between Kant and Hume: cf. Jacobi, "David Hume"). The characteristic use of *Glaube* in German makes it possible to intertwine these questions so as to make them inseparable, whereas the separation of faith and belief encourages the French- and Romance-language reader to distinguish two different orders of problems.

GLÜCK, GLÜCKSELIGKEIT, SELIGKEIT, WOHLFAHRT (GERMAN)

ENGLISH	happiness, luck, welfare
FRENCH	*bonheur, félicité, béatitude, chance, fortune, prospérité*
GREEK	*eudaimonia* [εὐδαιμονία], *eutuchia* [εὐτυχία], *makariotês* [μακαριότης]
LATIN	*felicitas, beatitudo*

➤ *HAPPINESS*, and DAIMÔN, *DESTINY*, *LIBERTY*, MORAL SENSE, MORALS, PLEASURE, PRAXIS, *VIRTUE*

The difficulty of the German *Glück* comes from its double meaning of "happiness" and "luck." Among German-speakers themselves,

the criticisms of eudaimonism, beginning with Kant, focus on an unhealthy closeness between merit and chance. This explains in particular the addition of the compound *Glückseligkeit* (from *selig*, "blessed"), awkwardly translated into French as *félicité*, whereas the term usually only aims to express—with varying degrees of success—the conception of happiness dissociated from the accidents of chance. However, the difficulties of the users of *Glück* also relate to the power of the Aristotelian tradition in the moral thought of the German Enlightenment, and leads to the European or supranational dimension of the problem. The pair *Glück-Glückseligkeit* is consciously related to the distinction drawn in Aristotle's *Nicomachean Ethics* between *eutuchia* [εὐτυχία] (good fortune) and *eudaimonia* [εὐδαιμονία] (happiness), to which the difficulties of the third term *makariotês* [μακαριότης], which refers to the happiness of the gods, must also be added. The translation of the last term by *Seligkeit* and the intensive use of the word in religious contexts is reflected in *Glückseligkeit*, whose spiritual dimension resists attempts at translation. In English, at the same time, it is on the contrary the absence of this internalized dimension that explains how "happiness" could have opened the way to a philosophy of the common good and political happiness, for which other European countries do not have an equivalent.

I. The Greek Roots of the Debate

A. *Eudaimonia* and *eutuchia*

The question of happiness is a central problem of Greek thought. In the first pages of the *Nicomachean Ethics*, Aristotle summarizes the tradition:

> Let us resume our inquiry and state, in view of the fact that all knowledge and choice aims at some good, what it is that we say political science aims at and what is the highest of all goods achievable by action (*tôn praktôn agathôn* [τῶν πρακτῶν ἀγαθῶν]). Verbally there is very general agreement; for both the general run of men and people of superior refinement say that it is happiness, (*tên eudaimonian* [τὴν εὐδαιμονίαν]) and identify living well and faring well with being happy (*to d'eu zên kai to eu prattein* [τὸ δ' εὖ ζῆν καὶ τὸ εὖ πράττειν]) σοντ λα μᾶμε ψησοε Ουῷᾶτρε ηευρευχ (*τᾷιευδαιμονειν* [τῷ εὐδαιμονεῖν]).

> (1.4, 1095a ll. 14–20; Barnes trans.)

The term *eudaimonia* [εὐδαιμονία] used by Aristotle is not found in archaic texts; it does not appear in Homer, and is rare in Pindar. *Olbos* [ὄλβος], the Homeric term usually translated as "happiness," designates prosperity given by the gods to men, the enjoyment of that material happiness (and not just wealth, *ploutos* [πλοῦτος]) which, in a well-ordered cosmos, is the sign of a good life. *Olbos* is progressively replaced by *eudaimonia*, a term coming from the family of *daiomai* [δαίομαι], "to share": *eu-daimôn* [εὐ-δαίμων] is literally he "who has a good *daimôn*," a good distributive divinity (a good spirit), and hence "a good share." *Eudaimonia*, like *olbos*, refers in the first instance to the prosperity and happiness of the man favored by the gods (thus, Hesiod, *Works*, 824: *eudaimôn te kai olbios* [εὐδαίμων τε καὶ ὄλβιος]). It would be difficult to speak, regarding *eudaimonia*, of an internalization of the idea of happiness; someone is *eudaimôn* who knows how to take advantage of the external conditions of existence.

However, through the Aristotelian conception, the term acquires a practical and ethical specificity: *eudaimonia* is decidedly distinguished from good luck (*eutuchia* [εὐτυχία], from *tuchê* [τύχη], "fate, fortune"): "For many declare happiness (*eudaimonia*) to be identical with good luck (*eutuchia*)," Aristotle writes in the *Eudemian Ethics* (1.1.1214a25f; Barnes trans.). Euripides, however, is able to play with the three terms: "No man can count on his happiness (*eudaimôn anêr* [εὐδαίμων ἀνήρ]). Some have luck (*eutuchesteros* [εὐτυχέστερος]) and fortune (*olbou epirruentos* [ὄλβου ἐπιρρυέντος]) on their side but never happiness (*eudaimôn d'an ou* [εὐδαίμων δ' ἂν οὔ])" (*Medea*, 1228–30; Collier and Machemer trans.). The question of the permanence of the elements that compose happiness, hence the problem of time, plays an essential role here. Contrary to the extreme volatility of fortune and external goods, virtuous activities guarantee happiness by their stability (*bebaiotês* [βεβαιότης]; *Nicomachean Ethics*, 1.10.1100b12):

> Success or failure in life (*en tautais sc. tais tuchais* [ἐν ταύταις sc. ταῖς τύχαις]) does not depend on these, but human life, as we said, needs these as well (*prosdeitai* [προσδεῖται]), while excellent activities or their opposites are what determine happiness or the reverse (*kuriai d' eisin hai kat' aretên energeiai tês eudaimonias* [κύριαι δ' εἰσὶν αἱ κατ' ἀρετὴν ἐνέργειαι τῆς εὐδαιμονίας]).

> (1100b ll. 8–11; Barnes trans.)

The Aristotelian definition of happiness may seem like a moral one in the modern sense, insofar as it refers to the virtuous activity of the subject (to the point where Tricot, for example, consistently translates *to ariston* [τὸ ἄριστον], the best, the most excellent, by the French *Souverain Bien* [Sovereign Good], 1.8.1098b32, for example). However, the supplement *eutuchia* once again relates this definition of the happiness of a man to the share granted to him by the gods.

B. *Eudaimonia* and *makariotês*

The temporal perspective that plays an important role in determining the difference between *eutuchia* and *eudaimonia* also comes into play for the term *makariotês* [μακαριότης]. *Hoi makares* [οἱ μάκαρες], the blessed ones, is the expression that designates the gods (*Iliad*, 1.329). This happiness proper to the gods can only be tasted by mortals after death. This is why *makarios* [μακάριος] often refers to the deceased (the Ger. *selig*, "blessed," has the same use: *die Seligen*)—unless the vocative in familiar speech is just equivalent to "my good man" (Plato, *Protagoras*, 309c). Thus when Aristotle, putting the final touches on his definition of *eudaimonia*, adds to virtuous activity the fact of being sufficiently provided with external goods, and not simply living but also dying in this state, he also expresses the maximum and the limit of this conception:

> We shall call blessed (*makarious* [μακαρίους]) those among living men in whom these conditions are, and are to be, fulfilled—but blessed *men* (*makarious d'anthropous* [μακαρίους δ' ἀνθρώπους]).

> (*Nicomachean Ethics*, 1.10.1101a ll. 20–21)

The divide between happiness and blessedness is that between profane and sacred, immanence and transcendence.

It is of course made much of in religious texts, and is found discussed in almost all languages. In Saint Thomas Aquinas, this important Aristotelian concession is immediately emphasized: "[Aristotle] maintained that man does not achieve perfect felicity, but only a limited kind" (Posuit hominem non consequi felicitatem perfectam, sed suo modo) (*Summa contra gentiles*, III, 48). Aquinas reaffirms this distinction in the *Summa theologica* in a systematic way, contrasting *imperfecta beatitudo* (accessible to men on earth) to celestial *beatitudo perfecta* (which is inaccessible to them):

> Final perfection for men in their present life is their cleaving to God by activity which, however, cannot be continuous or consequently single, for activity becomes multiple when interrupted. That is why we cannot possess perfect happiness now, as Aristotle admits.
>
> Aquinas, *Summa theologica*, *prima secundae*, q. 3, a. 2, reply 4; T. Gilby trans.

In Latin, the original distinction between a profane *felicitas* (= *eudaimonia*) and a sacred *beatitudo* (= *makariotês*) is lost. Seneca's *vita beata* is not peculiar to the gods. The Latin words *felicitas* and *beatitudo* are practically synonymous; for Aquinas, it is thus the adjective that introduces the necessary distinctions.

■ See Box 1.

II. *Glückseligkeit*: Internal Happiness

In German, the distinction between blessedness and happiness does not pose a problem. The adjective *selig* and the corresponding noun *Seligkeit* clearly contrast with *Glück* and *glücklich*. The division, however, is not always so strict: we must emphasize the importance, in the eighteenth century, of the movement that leads the German language to use sacred vocabulary in profane contexts, under the influence especially of the sacralization of the world in Pietist language. Thus, without being celestial, the extreme happiness of a heart fully absorbed by love, that of the sage or monk, may demand the use of the term *Seligkeit*. However, despite its relative desacralization, *Seligkeit* still designates a happiness that can do without the external world, a religious happiness, or at least, a highly spiritualized one.

By contrast, the most commonly used word in German for expressing immanent or profane happiness does raise some difficulties. *Glück* reunites what the Greek disjunction between *eutuchia* and *eudaimonia* tried to separate. On one side, *Glück* refers to chance. It lies on the side of luck, or "favorable accident." In ancient texts, the word *Glück* is often used in a neutral way, without any positive connotation. We find some examples in Goethe:

> Das Glück ist eigensinnig, oft das Gemeine, das Nichtswürdige zu adeln und wohlüberlegte Taten mit einem gemeinen Ausgang zu entehren.
>
> (Fortune is capricious; she often ennobles the common, the worthless, while she dishonors well considered actions with an ignoble outcome.)
>
> (*Egmont*, act IV, scene 2)

Here, the French and English equivalents of the word *Glück* would be "fortune." In this sense, *Glück* seems like an inappropriate word for philosophers: it is too inconstant, independent of the will of men, and associated with the unpredictable wheel of fortune (*das Glücksrad*). In French, the word for "happiness," *bonheur,* also, originally, has the sense of good fortune (the word comes from *bon* and *heur*). But today it only seems to have this meaning in a secondary way, and in rare fixed expressions (*porter bonheur à quelqu'un, au petit bonheur, par bonheur,* etc.). Voltaire's article on "Félicité" in the RT: *Dictionnaire philosophique* clarifies the difference between *un bonheur* and *le bonheur*: "*Un bonheur* is a happy event. *Le bonheur*, taken indefinitely, means a *succession* of such events."

1

From happiness to apathy and *ataraxia*

The independence of *eudaimonia* [εὐδαιμονία] with regard to external goods is already invoked by Democritus (B 40, 170, 171 DK), who, like Heraclitus (B 119 DK), reinterprets the *daimôn* [δαίμων] psychologically and ethically, and is solidly established with Plato (*Laws*, 664c). However, it remains a paradoxical idea; when Xenophon relates the dialogue between Euthydemus and Socrates, this paradox is clearly still fresh:

> "But, granting this to be as you say," added Euthydemus, "you will certainly allow good fortune to be a good?" "I will," said Socrates, "provided this good fortune consists in things that are undoubtedly good." —"And how can it be that the things which compose good fortune should not be infallibly good?" —"They

are," answered Socrates, "unless you reckon among them beauty and strength of body, riches, honours, and other things of that nature." —"And how can a man be happy without them?" —"Rather," said Socrates, "how can a man be happy with things that are the causes of so many misfortunes?"

> (*The Memorable Things of Socrates*, Bysshe trans.)

Aristotle, in turn, conceptualizes *eudaimonia* contrary to what the word says: minimizing the share of chance and external goods (*eutuchia* [εὐτυχία]), he makes happiness depend on the highest excellence, that is, not on politics but on *theôria* [θεωρία], which makes man similar to god (*Nicomachean Ethics*, 10.7; see PRAXIS). But

the Stoics and Epicureans, who push the self-sufficiency of the sage to the extreme in different ways, are in the end forced to make real terminological inventions. For the two schools, happiness, far from being the good share that we enjoy until the end, is essentially characterized by its privative aspect, a point on which Stoic *a-patheia* [ἀ-πάθεια] (absence of passion, passivity; Plutarch, *Dion*, 32) and Epicurean *a-ponia* [ἀ-πόνια] and *a-taraxia* [ἀ-ταραξία] (absence of bodily suffering and absence of disturbance in the soul; Diogenes Laertius, 10.96; see PLEASURE) converge.

BIBLIOGRAPHY

Xenophon. *The Memorable Things of Socrates*. Bk. 4, chap. 2. Translated by E. Bysshe. London: Cassell, 1888.

The second meaning of *Glück* is indeed that of happiness strictly speaking: the fully satisfied consciousness, as the RT: *Le nouveau petit Robert* French dictionary has it. Standard German uses the two senses of *Glück* and its antonym *Unglück* (bad luck or unhappiness). The union within a single German word of the idea of a happy accident, luck, and that of happiness strictly speaking, is to some extent inconvenient for philosophers. For it is impossible to speak of happiness in the absence of a certain duration or stability: "For one swallow does not make a summer, nor does one day; and so too one day, or a short time, does not make a man blessed and happy" (*Nicomachean Ethics*, 1.7.1098a 18–20; Barnes trans.).

The extremely strong influence of Aristotelian reflection on happiness, beginning with the Renaissance, clearly explains the efforts at lexical differentiation, and especially the introduction of the compound *Glückseligkeit*, related to the attempts at definition made throughout the eighteenth century by Christian Wolff and his successors. In Wolff's *German Ethics*, joy (*Freude*) is defined as a sort of permanent pleasure (*Vergnügen*), and happiness (*Glückseligkeit*) as a "state of permanent joy." The stability of *Glückseligkeit* is thus vigorously championed. Lexically, happiness-*Glückseligkeit* seems to escape the instability characterizing *Glück*. The adjective *glückselig*, formed from *Glück* and *selig*, initially means "marked by happiness, rich in happiness." Happiness-*Glückseligkeit* is not an accident. While the word is not a neologism, it acquires an important role in philosophical and theological texts in the seventeenth and eighteenth centuries. In a certain way, behind *Glückseligkeit*, it is usually appropriate to read *eudaimonia*. This is also what is suggested by the philosophical dictionary of synonyms published at the end of the Enlightenment by Johann August Eberhard, RT: *Versuch einer allgemeinen deutschen Synonymik*:

> *Glückseligkeit* includes physical and moral good. The Greek word *eudaimonia*, which in the most widespread philosophical schools refers to the quintessence of all sorts of good, has thus been translated by it.

> For the texts of the eighteenth century in Germany, the translation of *Glückseligkeit* by "happiness" or *bonheur* seems in this sense more appropriate than "felicity," which in French (*félicité*) is of a more limited usage.

Philosophical German appeared to have recovered the Greek triad *eutuchia/eudaimonia/makariotês* in the form of *Glück/Glückseligkeit/Seligkeit*. In fact, however, the philosophical and lexical status of *Glückseligkeit* remains rather precarious. On one hand, the influence of *Seligkeit* confers a passive connotation onto *Glückseligkeit*, which becomes as a result "apathetic" or "quietist," and in this way clearly different from the *eudaimonia* that Aristotle had defined as a kind of "activity." Aristotle had compared happiness-*eudaimonia* with "living well and faring well" (to eu zên kai to eu prattein [τὸ εὖ ζῆν καὶ τὸ εὖ πράττειν]), but *eu prattein* also means "to succeed" (*Nicomachean Ethics*, 1.2.1095a19). The modern era did not really take over this dynamic conception of happiness inherent to Aristotle's position; whether defined as freedom from worry, in the Epicurean manner, or as a moment of satisfaction, modern happiness remains relatively static. A notable exception is the distinction established by

Diderot between what he calls "circumscribed happiness" and "expansive happiness":

> There is a circumscribed happiness which remains in me and which does not extend beyond. There is an expansive happiness which propagates itself, which throws itself on the present, which embraces the future and which revels in moral and physical enjoyments, in reality and fantasy, hoarding money, honors, paintings and kisses pell-mell.

> *("Man")*

By contrast, the definition proposed by Christian Wolff places happiness decidedly on the side of the sentiments; *Glückseligkeit* is both more internal and more spiritualized than the Greek word. This tendency is again emphasized by the erroneous but widespread etymology of the eighteenth century, according to which *selig* and *glückselig* (indeed often written *seelig*, *glückseelig*) are descended from *Seele*, soul. Beginning in the early nineteenth century, *glückselig/Glückseligkeit* undergo a certain evolution. Today, they refer to little more than a very spiritualized happiness. The severe critique of eudaimonism by Kant and his successors seems thus to be accompanied by certain lexical modifications. *Glückseligkeit*, though it has not entirely disappeared, has fallen into disuse. In contemporary texts, we find *Glück* (or *glücklich*) where an eighteenth-century author would have used *Glückseligkeit* (or *glückselig*) without fail. Thus, if the eighteenth century in Europe is the one in which happiness is most discussed, it is one in which happiness is not discussed with the same terms as those in common use today. Kant had already shown the way by using the adjective *glücklich* rather than *glückselig* with *Glückseligkeit*, most of the time. For in everyday language, *Glück* was always the more frequently used word for referring to happiness.

III. The Inconstancy of Fortune: *Glückseligkeit*, Nature, and Freedom in Kant

Whereas contemporary usage draws a rather clear line between *Glück* and *Glückseligkeit* and places the latter term on the side of a notion of felicity that seems to be definitively outmoded, the Kantian critique tends, in contrast, to devalue happiness-*Glückseligkeit* because of its compromising association with *Glück*. It is impossible, first, to give an objective definition of happiness:

> It is unfortunate that the concept of happiness is one which is so vague [Es ist ein Unglück, daß der Begriff der Glückseligkeit ein so unbestimmter Begriff ist], such that even though all men wish to achieve happiness, they are never able to say in a clear and univocal fashion what they truly wish for and desire.

> ("Grundlegung zur Metaphysik der Sitten,"
> in *Kants Gesammelte Schriften*)

By playing on the German words *Unglück* and *Glückseligkeit*, Kant shows that the philosophical question of happiness and eudaimonism is also a problem of vocabulary. *Glückseligkeit* is a feeling; the search for happiness is a desire. Yet, a feeling, wherever it may come from, is always physical (cf. *Groundwork of the Metaphysics of Morals*). It is this point that explains the Kantian refusal to make happiness the final end

of human activity. To construct a practical philosophy on the idea of happiness would be, for Kant, to accept the contamination of morality by the pleasure principle. Moreover (and this would be the second moment of Kant's critique of the misuse of *Glückseligkeit*), the concept of *Glückseligkeit* is related to external circumstances and thus to the happy accidents referred to by *Glück*. The subject is incapable of determining the conditions that make it possible for him to achieve happiness:

> The problem of determining reliably and universally which action would advance the happiness of a rational being is completely insoluble, and hence. . . there can be no imperative with regard to it that would in the strict sense command to do what makes us happy because happiness is not an ideal of reason, but of the imagination.

(*Groundwork of the Metaphysics of Morals*)

Kant emphasizes the fundamentally empirical element of the definition of happiness:

> To be happy (*glücklich zu sein*) is necessarily the demand of every rational but finite being and therefore an unavoidable determining ground of its faculty of desire. For satisfaction (*die Zufriedenheit*) with one's whole existence is not, as it were, an original possession and a beatitude (*Seligkeit*), which would presuppose a consciousness of one's independent self-sufficiency, but is instead a problem imposed upon him by his finite nature itself, because he is needy and this need is directed to the matter of his faculty of desire, that is, something related to a subjective feeling of pleasure or displeasure underlying it by which is determined what he needs in order to be satisfied with his condition.

(*Critique of Practical Reason,* §3)

Kant thus destroys the efforts made in Germany to differentiate *Glückseligkeit* and *Glück*. Happiness-*Glückseligkeit* suffers from the inconstancy of fortune (*Glück*). For Kant, happiness remains fundamentally within the sphere of nature. Human freedom has no part of it.

■ See Box 2.

IV. Political Happiness: The Anglo-American Path

The English translation of *eudaimonia*, "happiness," does not have the spiritualist aura and connotation of *Glückseligkeit*. The dividing line between "happiness" and "bliss," "happy" and "blessed" or "blissful" is clearly marked. "Happiness" has a much more immanent ring than the German *Glückseligkeit*; its etymological connection to chance and "happening" (happenstance, happily) remains strong. This no doubt explains why the English word is able, in the eighteenth century, to raise the political possibilites implicit in the Aristotelian understanding of happiness, notably in the

---

2

Glückseligkeit in Hegel

Hegel takes up the Kantian criticism of eudaimonism:

> To estimate rightly what we owe to Kant in the matter, we ought to set before our minds the form of practical philosophy and in particular of "moral philosophy" which prevailed in his time. It may be generally described as a system of Eudaemonism, which, when asked what man's chief end ought to be, replied Happiness (*Glückseligkeit*). And by happiness Eudaemonism understood the satisfaction of the private appetites, wishes, and wants of the man: thus raising the contingent and particular into a principle for the will and its actualization. To this Eudaemonism, which was destitute of stability and consistency, and which left the "door and gate" wide open for every whim and caprice, Kant opposed the practical reason, and thus emphasized the need for a principle of will which should be universal and lay the same obligation on all.

(*Encyclopedia of the Philosophical Sciences I,* addition to §54)

In the *Philosophical Propaedeutic* from the years 1808 to 1811, Hegel had strongly emphasized the necessary terminological distinctions:

> Well-being (*Wohlsein*), as the adaptation of the external to our internal being, we call Pleasure (*Vergnügen*). Happiness (*Glückseligkeit*) is not a mere individual pleasure but an enduring condition [which is] in part the actual Pleasure itself [and], in part also, the circumstances and means through which one always has, at will, the ability to create a state of comfort and pleasure for himself. The latter form is the pleasure of the mind. In Happiness, however, as in Pleasure, there lies the idea of good fortune [good luck] (*Glück*): that it is an accidental matter (*zufällig*) whether or not the external circumstances agree with the internal determinations of the desires. Blessedness (*Seligkeit*), on the contrary, consists in this: that no fortune [luck] pertains to it: that is, that in it the agreement of the external existence with the internal desire is not accidental. Blessedness can be predicated only of God.

The opposition to the principles of eudaimonism is especially virulent in Hegel's early works. Thus, in the article "Faith and Knowledge" of 1802, Hegel even accuses Kant, Jacobi, and Fichte of unconscious eudaimonism:

> What is the relation of this basic character to the philosophies of Kant, Jacobi, and Fichte? So little do these philosophies step out of this basic character that, on the contrary, they have merely perfected it to the highest degree. Their conscious direction is flatly opposed to the principle of Eudaemonism. However, because they are nothing but this direction, their positive character is just this principle itself.

Nevertheless, one has the impression that, without rejecting the fundamental criticism of eudaimonism, Hegel later seeks to attenuate Kant's critiques of the concept of happiness. In the *Phenomenology of Spirit (*§602), he notes:

> The moral consciousness cannot renounce happiness and drop this element out of its absolute purpose. . . . The harmony of morality and nature, or—seeing that nature is taken account of merely so far as consciousness finds out nature's unity with it—the harmony of morality

(continued)

and happiness, is thought of as necessarily existing; it is *postulated*.

Hegel confers a certain dignity upon happiness-*Glückseligkeit* in this manner. The first version of the *Encyclopedia of the Philosophical Sciences* explained that the idea of happiness conditioned a choice that must be made from among one's various present desires: Happiness is the confused representation of the satisfaction of all drives, which, however, are either entirely or partly sacrificed to each other, preferred and presupposed. Hegel no longer rejects the superior form of the concept of happiness (*Glückseligkeit*) on the side of nature, as Kant had done. Similarly, in the additions to the *Elements of the Philosophy of Right* due to his student Gans, we read:

> In happiness, thought already has some power over the natural force, of the drives, for it is not content with the instantaneous force of the drives, for it is not content with the instantaneous,

but requires a whole of happiness (*eni Ganzes von Glück*).

In this passage, the coexistence of the terms *Glückseligkeit* and *Glück* nevertheless poses problems for the translator. In his translation of the *Principles of the Philosophy of Right*, Robert Derathé translates the two terms respectively as *félicité* and *bonheur*. Here, *Glückseligkeit* does indeed refer to a superior form of happiness, a stable and spiritualized happiness, and *Glück* a temporally more limited happiness—good fortune. However, the Hegelian passage also refers to the whole of pre-Kantian thinking on *Glückseligkeit*, very visible especially in popular philosophy of the eighteenth century, and Aristotelian and Leibniz-Wolffian in inspiration (see, for example, the translation of the *Nicomachean Ethics* by Christian Garve, one of the protagonists of popular philosophy). The translation of *Glückseligkeit* by "happiness" in the Hegelian text would enable us to emphasize this intertextual link, but would to some extent smooth over the distinction between *Glückseligkeit* and *Glück*.

Scottish school of the philosophy of *moral sense*. Thus, in his *Inquiry into the Original of Our Ideas of Beauty and Virtue* (1725), Francis Hutcheson finds the touchstone of the morality of our actions in the statement "*that Action* is *best*, which accomplishes the *greatest Happiness* for the *greatest Numbers*" (cf. also the expression of "happiness of mankind"). This possibility is expressed especially clearly in the American Declaration of Independence: "We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness." In this text, happiness does not refer only to an individual good, but to a collective one as well, that is, in the proper sense of the term, a civil or *political* good. It concerns, for example, the right to determine the type of government suited to the city (cf., on this point, D. Sternberger's article "Das Menschenrecht, nach Glück zu streben").

In this sense, the term "happiness" approaches the idea of welfare (in Ger. *Wohlfahrt*, "salvation," "prosperity") of which the French Revolutionaries will give a rather exact translation when they speak of the *salut public.* "Welfare" (and *Wohlfahrt*) refers to the image of the traveler who, having escaped the obstacles and dangers of the journey, arrives in a safe harbor. Where "happiness" (or *Glück*) refers only to the sphere of immanence, "welfare" or *Wohlfahrt* often have a religious connotation, though it is barely perceptible today. We may note, in this regard, that the French translation of "welfare state" or *Wohlfahrtstaat* by *État providence* accentuates this aspect that has become attenuated in English and German; the Spanish for welfare state, *Estado de bienestar*, embeds the immanent aspect of the term by compounding *bien*, "well" or "good," with the stative *estar* rather than existential *ser* (see SPANISH). Alongside *Wohlfahrt*, which refers to a public or private

salvation, German also has a word reserved for the public sphere: *das Gemeinwohl*, the common good.

➤ ANALOGY, BOGOČELOVEČESTVO, DAIMÔN, *DESTINY*, DEVIL, DUENDE, OIKONOMIA, OMNITUDO REALITATIS, *RELIGION*, SVET, THEMIS, *TO BE*, WELT

All European languages contain words for designating the divine. This comes from the Judeo-Christian beliefs of the populations that speak them and also from the prebiblical foundations of the European region.

The presence of this vocabulary is not a trivial matter, since Christian missionaries did meet certain peoples for whom it was necessary to borrow a word—the Latin *deus*, for example, used as a proper name—for lack of a native equivalent.

I. European Languages Today

The French *dieu* comes from the Latin *deus*, as does the Spanish *dios*, the Portuguese *deus*, and the Italian *dio*.

Germanic languages use words like the German *Gott* and the English "god." The etymology of these terms is unclear. Two Indo-European roots have been suggested. One means "to invoke," the other "to pour, to offer a libation" (see Gr. *cheô* [χέω]). God would thus be whatever is invoked or that to which a libation is offered. There is a temptation to hear a link, etymologically unfounded however, between "god" and "good." Whence certain euphemisms such as the exclamation "My goodness!" The vernacular French *le bon Dieu* thus sounds mildly pleonastic to the Germanic ear.

The word *bog* [бог], common to Slavic languages with slight variations, may be related to the Sanskrit *bhaga*, "lord." The latter term may come from a root meaning "to distribute," evoking the Greek *daimôn* [δαίμων] (demon) from *daiomai* (δαίομαι) (see DAIMÔN).

The Hungarian *isten* is borrowed from the Persia *ištán*, identical to the Pehlevi *yazdan* (cf. Rédei, "Über die Herkunft").

Jumala in Finnish may originally be a proper name, that of the supreme God, lord of the sky.

The Basque *jainko/jinko* designates both a god in general and the Christian God, also called *Jaungoikoa*, "the Lord on high."

II. Classical Languages and Holy Writings

The Greek *theos* [θεός] exists already in Mycenean as *teo*. Its true etymology remains obscure (see RT: Chantraine, *Dictionnaire étymologique de la langue grecque*). It may be from *thesos [*θεσος], from *tithêmi* [τίθημι] (cf. also RT: Benveniste, *Le vocabulaire des institutions indo-européenes*; see THEMIS). The Greeks offered various fictional etymologies related to different ways of representing the divine. The first of these etymologies derived *theos* from the verb *tithêmi*, "to place" (Herodotus, II, 52, 1: "they placed [*thentes* (θέντες)] all things"), which suggests the idea of a setting-up of the world, rather than a creation *ex nihilo*. The verb *theô* [θέω], "to run," was also suggested (Plato, *Cratylus*, 397c; Cornutus, *De die natali*, 1). This is based on the identification of the gods with the celestial bodies, found in late Plato (*Timaeus*, 40a–d) and his school (*Epinomis*, 984d), and it plays with the fact that ether (*aithêr* [αἰθήρ]), the clarity of the sky in which the gods reside, is itself interpreted as that which "is always running" (*aei-thein* [ἀεὶ-θεῖν]).

The Church Fathers (cf. Prestige, *God in Patristic Thought*) took up both hypotheses and added a third by way of the noun *thea* [θέα], "spectacle"—the gods having made the world visible (Eusebius of Caesaria, *Preparatio Evangelica*, V, 3, 182D).

The ancient form of the Latin *deus* is *deiuos.* The word, paradoxically, has nothing to do with the Greek *theos* but is in fact related to the Sanskrit *devas*. *Ju-*, in *Ju-piter*, designates the clarity of the sky, related to *dies*, "the day"; the sense survives in the expression *sub Dio*, "under the open sky."

The association of the sky with divinity is old and widespread. If we believe Suetonius (*Life of Augustus*, 97, 2), the Etruscan word for "god" was *aesar*, perhaps related to the Germanic word for iron (Ger. *Eisen*), the metal that falls to earth in meteorites (cf. Lat. *sidus* and Gr. *sidêros* [σίδηρος]). There is a late echo of this "celestial" etymology when Hölderlin claims to believe that God is "manifest like the sky [*offenbar wie der Himmel*]" ("In lieblicher Bläue," *Sämmtliche Werke*).

The sacred books of Judaism, and then of Christianity, of course, speak often of God. In them the Greek translates Hebrew terms. Thus the word present in all Semitic languages, *Ēl* [אֵל], which no doubt expressed the idea of power. There is also an elongated form, *Èloah* [אֱלוֹהַּ]. As for *Èlohim* [אֱלֹהִים], more frequent in Hebrew, the plural ending (-*īm*) probably indicates majesty.

Arabs, both Muslim and Christian, give God the name of Allah [الله]. He is already known as the supreme God and creator of everything before the advent of Islam (Qur'an, XXIX, 61; XXXI, 25; XLIII, 87). The word is the contraction of *al-ilā* [الإله] which pairs a form of the common noun *El* with the article. The word thus oscillates between its linguistic status as a common noun and its usage, which makes it a proper name.

III. Modern Forms

The scholarly register of European languages has kept the Greek root *theo-* and uses it in several dozen technical terms, some more common than others.

Some of them are old, such as "theology." Plato coins *theologia* [θεολογία] to refer to the way in which the gods should be spoken of, one more dignified than what is later called "mythology" (*Republic* II, 379a). The word "theology" keeps that meaning for a long time, as found in Pascal: "The poets made a hundred different theologies" (*Pensées*, Br. 613). In Latin Augustine uses the word in his polemic with Varro to mean a philosophical doctrine concerning the divine, and he explains it as *ratio sive sermo de divinitate*, "reasoning or discourse concerning divinity" (*City of God*, VIII, 1).

For Pseudo-Dionysius the Areopagite, the word also refers to the essence of God in himself, in his tripartite nature, as opposed to the benevolent action of God in human history (*oikonomia* [οἰκονομία], see OIKONOMIA). John Scotus Erigena translates Dionysius's Greek into Latin in *Divine names*, I, 15 (PL, v. 122, col. 463 b): *theologia* becomes *divinae essentiae investigatio*; II, 30 (col. 599b): *divinae naturae speculatio*; then III, 29 (col. 705b): "[investigat] quid de una omnium causa, quae Deus est, pie debeat aestimari [it seeks what should piously be conjectured of the unique cause of everything, which is God]." The word appears in its modern sense in Abelard around 1120, as the title of his *Theology*, named after its opening words, *Summi boni*. It finally becomes established in Thomas Aquinas, as referring to a science.

"Theocracy," most often understood today in the sense of a "clerical regime," did not originally refer to the power of the human administrators of the sacred but rather the opposite: Flavius Josephus coined *theokratia* [θεοκρατία] in a defense of Judaism. He indicates by it the fact that the divine Law is what has power in Judaism, rather than any particular person.

Other technical uses of the root *theo-* are found in the sort of words whose construction gives them an air of antiquity but that are in fact the result of the modern thirst to come up with ancient titles. The most well-known case is that of "theodicy," coined by Leibniz as the title of his book published in 1710, in which he aims to show the justice (*dikê* [δίκη]) of God (see THEMIS).

GOGO (BASQUE)

ENGLISH	power of the soul, mind, spirit
FRENCH	*puissance de l'âme, esprit*
LATIN	*anima, spiritus, mens*

In Basque, *gogo* expresses all the processes of interiority and subjectivity. Despite the efforts of some writers to use the term to replace the neologisms *arima* and *espiritu* from the Latin tradition (transpositions of the Latin *anima* and *spiritus*) in the translations of Christian texts, *gogo* never takes on the sense of "soul" or "spirit." It refers without exception to the power of the soul (memory or will) or to the psychological experience of the subject (desire, wish, thought, consciousness) rather than to the soul as such. While there are terms in Basque for "will" (*nahi*), "desire" (*gura*), "thought" (*asmo*) or "memory"

(*or*[*h*]*oi*), they are in reality often associated and juxtaposed with *gogo* as a generic term. By way of several derivative terms belonging to its semantic field (the RT: *Diccionario retana de autoridades de la lengua vasca* lists about 180), we may thus even express "sympathy," "ennui," and "disgust," among other feelings.

I. *Gogo* as a Principle

Arima has always been the translation of the Christian concept of the soul (*anima*), notably when the latter has a theological sense. In Dechepare, for example, *arima* is understood in relation to the themes of the resurrection: "arima et gorpucetan or vertan pizturic" (souls and bodies, all will be immediately resuscitated; RT: *Linguae vasconum primitiae*, 1.323); of creation: "arima creatu" (ibid., 1.3); of salvation: "arimaren saluacera" (ibid., 1.52: "to save the soul"); or of the soul in pain: "arima gaixoa" (ibid., 1.95: "poor soul"). However, in the first half of the twentieth century, we find several attempts, part of a purist linguistic movement, to replace the term *arima* by *gogo*. We thus read in a dictionary from 1916: "Arima (anima), alma, voz erdérica sustituible por 'gogo'" (*Arima* [*anima*], "soul," foreign term replaceable by *gogo*; López Mendizábal, *Diccionario Castellano-Euskera*).

Altube argues against this tendency (*Erderismos*). The basis of his argument was the fear of a "lexicographical poverty," since the substitution represented a linguistic step backward. In addition, *gogo* never expresses the concept of the soul in the theological sense, namely, the created soul, which may be resuscitated or saved, since it refers rather to soul understood as a *power*.

We might therefore think that *gogo* would be an equivalent for the Latin *anima* conceived in a more philosophical sense, like the collection of powers of memory, will, or understanding in Augustine, or again as an equivalent to Aquinas's *mens*, which groups together intelligence, memory, and will. Pierre de Axular, however, along with all the other authors or translators of Christian texts in the sixteenth to nineteenth centuries, translates this division of faculties of the soul by using *arima*: "Arimac bere penac beçala, arimaren potenciec eta botheréc ere, cein baitira adimendua, vorondatea, eta memoria, içanen dituzte bere pena *moldeac*" (Just as the soul has its pains, the powers and capacities of the soul, which are understanding, will, and memory, also have their own pains; *Gero*, 57:586).

Nor is *gogo* generally used to express this division of the soul, since we only find one occurrence of this use in Perez de Betolaça (sixteenth century): "Arimako potenziak dira iru: lelengoa, zenzuna. Bigarrena, gogoa. Irugarrena, borondatea" (The powers of the soul are three: the first, understanding. The second, *gogo*. The third, will; *Doctrina christiana en romance y basquenze*).

The same impossibility of replacing the calque of the Latin word with *gogo* is confronted by the term *espiritu* (or *izpiritu*), even though we may find a few texts from the seventeenth century in which *gogo* is substituted for *espiritu* in a remarkable way (thus, in Oihenart: "Glori' Aitari, Semeari / Eta Gogo Sainduari" [Glory to the Father, to the Son / and to the Holy *Gogo*]). When Axular, for example, attempts to find equivalents for the Latin *spiritus*, he chooses, in his translation of Augustine, the term *hats* (breath): "in ultimo vitae spiritu . . . axquen *hatsaren* aurthiquitcean" (in giving the

last breath; *Gero*, chap. 15). The only context in which *gogo* seems truly close to what we mean by "spirit" or "mind" is that of the subjective sphere of affectivity and thought, of the "mental": "orazione mentala, edo izpirituaz eta gogoz egiten dena" (mental prayer, or that which is done by the spirit and by *gogo*; St. Francis of Sales, *Philotea*). Similarly, Joanes Leizarraga used *gogo* to render what is meant in French by the term *esprit*: "*perplexités d'*esprit . . . *gogo*-arràguretaric" [perplexities of the spirit] (*Testamentu berria*).

Gogo is thus always relative to the *subject*, and its use cannot extend to something else. In this regard, it is not synonymous with the Greek *nous*, which, according to some, governed the processes of the universe. But we might then think that it is very close to the Latin *animus*, which evokes will, memory, thought, desire, intention, and mood (RT: *Thesaurus linguae latinae*). We should recall in this context what Leizarraga says of the term *arima* in the lexicon that follows his translation of the New Testament (the first ever in Basque): even though he uses *arima* several times in the theological sense, there is nonetheless a meaning of the term that is translatable for him by *gogo*, when the latter is synonymous with "affection": "*Arimá*, hartzen da . . . Batzutan, *gogoagatic* edo affectioneagatic" (*Arimá* is taken . . . sometimes for *gogo* or for affection; *Testamentu berria*, 1202). And indeed, the frequent association of *gogo* with another term referring to a precise feeling or a better defined faculty shows the entirely subjective character of *gogo*.

II. *Gogo*: Different Faculties

Although the powers of the soul are most often referred to by their Latin calques (*zenzuna, memoria, borondate* [sense or understanding, memory, will]), we have seen that Betolaça used *gogo* to translate "memory." Axular, for his part, made *gogo* an equivalent for *borondate*, or "will."

> Hartcen dugu *gogo*, hartcen dugu vorondate, obra onac eguin behar ditugula . . . ordea han . . . beharrenean faltatcen dugu. Ceren hartcen dugun *gogo* eta *vorondate* hura, ezpaita fina, ezpaita cinezcoa eta ez deliberatuqui deliberatua; *nahicundea* baita eta ez *nahia*.

> (We take from *gogo*, we take from will [*borondate*], that from which we do good works . . . and yet . . . we miss the most necessary. Because *gogo* and this will [*borondate*] which we have taken is not authentic, it is not likely and it is not deliberately deliberated; because it concerns bad will ["weak will," *nahikunde*] and not will [*nahi*].)

> (*Gero*, chap. 3)

In this text the three terms Axular used to refer to the will all appear: *gogo*, *borondate* (or *vorondate*), and *nahi*. Although *borondate* is almost always associated in Axular's work with *gogo*, there are other places where *borondate* is equivalent to *nahi*: "gure nahia, eta vorondatea" (*Gero*, chap. 15). *Nahi* in Basque means either "will" or "desire," and the intertwining of these terms allows this author to associate *gogo* with desire: "Eta *desira* hautan, gueroco *gogoan* eta vorondatean, dembora guztia iragaiten çaicu" (And in these desires, in *gogo* and the *will* of the future, all of our time passes; *Gero*, chap. 3).

A collection of Basque proverbs from 1596 provides us with another example of the usage of these terms. The author

translates *nay* into Castilian by *voluntad* (will) or by *deseo* (desire): "Galdu çe eguic aldia, / ta idoro dayc naya. No pierdas la sazon/ y hallaras el *desseo*" (Do not miss the opportunity, / and you will find the *desire*; Urquijo, *Refranero vasco*).

However, even though *gogo* may be substituted for *borondate*, for *nahi*, for *desir*, or even for *gura* (another Basque term closer to "desire"), these terms are not entirely equivalent to it. This is why Dechepare could write: "gogo honez nahi dicit çure eguina laudatu" (I want [*nahi*] to praise what you do in good *gogo*; RT: *Linguae vasconum primitiae*, 13). The equivalence between *gogo* and the other terms is not reciprocal: *gogo* may no doubt replace any other term in its vast conceptual field, but the reverse is not true. *Gogo* acts in effect as a power that collects together the semantic fields of the will, desire, and memory ("[cócientcia(k)] orhoitcen çaitu, guztiac [falta] gogora eccartcen derauzquitçu" [(it, conscience) reminds you of them (your faults), it brings them all to *gogo*; Axular, *Gero*, 45]) and of thought ("eguin çuen, Piramide batcuen eguiteco gogoeta, asmua eta pensua" [He had the *gogoeta*, the *asmo* and the thought of making several Pyramids; *Gero*, 1:26]). *Gogoeta*, formed by adding the suffix *-eta*, means the action that *gogo* produces and can thus serve to translate the Latin *cogitatio*. Axular thus writes (*Gero*, 36): "Gure *gogoa* ecin dagoque *gogoeta* gabe; ecin gauteque, cerbaitetan pensatu gabe" (Our *gogo* cannot be without *gogoeta*; we cannot be without thinking about something). Axular here nevertheless remains ambiguous: by preserving the multivocity of *gogoeta*, he keeps within the orbit of the Latin *cogitatio*, but by relating the term to thought alone, he comes close to the reduction that has just been made by Descartes.

GOOD / EVIL

This dichotomy, fundamental in the fields of ethics and moral inquiry, flows from the Latin: *bonum* and *malum* are the neuter nominalization of the adjectives *bonus* (good, well behaved) and *malus* (bad, evil). The etymology of both Latin adjectives, which combine a physical and an ethical sense, is uncertain.

1. On the relationship between diverse kinds of excellence, nobility, courage, and moral quality, see VIRTÙ, Box 1); cf. *VIRTUE.* On the particularly sensitive relationship in Greek between the good or inner kindness and outward beauty, see BEAUTY, Box 1; cf. DOXA, ERSCHEINUNG, *PHÉNOMÈNE.* On the relationship between the true and the good—or more precisely, the "better," which is fundamental to relativism, see TRUTH, Box 2.

2. The Latinate "good/evil" dichotomy quickly proves unable to render all the nuances of the corresponding Germanic terminological complex, with which it does not coincide. In French, juxtaposing *bien/mal* and *bon/mauvais* or *bon/méchant,* as is commonly done in translating Nietzsche's *Genealogy of Morals,* will not suffice to exhaust the more complex play of oppositions in German: *Gut/Böse, Wohl/Übel,* (*Weh*)-*Gut/Schlecht.*

3. Another constellation that is difficult to translate appears in English in the opposition between "right" and "just," which is almost impossible to render in French, and in the relationship between each of these two terms and "good": see RIGHT/JUST/GOOD; cf. FAIR.

4. On the Russian diglossia *dobro/blago,* see RUSSIAN.

➤ DUTY, *HAPPINESS,* MORALS, *VALUE*

GOÛT

ENGLISH	taste
GERMAN	*Geschmack*
ITALIAN	*gusto*
LATIN	*gustus*
SPANISH	*gusto*

➤ AESTHETICS, ARGUTEZZA, BEAUTY, CLASSIC, GENIUS, INGENIUM, MANIERA, SENSE, STANDARD, *VALUE*

Gusto in Italian and Spanish, *goût* in French, *Geschmack* in German, and "taste" in English all have a twofold sense, one gustatory and one aesthetic. European languages borrowed the word for referring to what we now call aesthetic judgment from the vocabulary of the five senses. Though it is important, this semantic ambiguity is not the real source of the constant difficulties presented by the concept of taste in the field of aesthetics. These come rather from specific misunderstandings arising out of the division between aesthetics as a philosophical discipline and ancient theories of art. Related to *giudizio,* the word *gusto* as used by Italians in the Renaissance refers to sharpness of judgment, the capacity for discernment, the specific disposition of an artist. It may have an ethical, psychological, even a political meaning. In the sixteenth and seventeenth centuries, *gusto* in Spanish and *goût* in French retain the senses of sharpness and discernment. Though they are increasingly used in the sense of aesthetic judgment over the course of the seventeenth century, especially in France, their usage does not display a normative character at the start. It is only in the eighteenth century that *goût* is assimilated to *bon goût,* at the same time as it takes on a more and more subjective sense, notably under the influence of new philosophical trends. The conceptual development of taste in English-language philosophies of aesthetic experience gives a new direction to thinking about taste, while still preserving for the term the range of meanings attached to *gusto* and *goût.*

The real break with the tradition of the theory of art takes place with the Kantian definition of taste, which leads to denying judgments concerning taste any possible objectivity. The loss of this minimal objectivity of judgments of taste, proper to aesthetic intersubjectivity as conceived in the classical period, paved the way for a henceforth dominant conception of taste according to which there is no possible correlation between taste as a faculty of evaluation and the aesthetic properties of the work of art (this last understood in the philosophically realist sense given to the term "property," that is, a given that exists independently of consciousness). Still, the question raised by the multivocity of the concept as the tradition transmits it to us, that of the plurality of its functions and its finalities, remains untouched. The same goes for the question of the translatability of what was really thought in these conceptions, which amply exceed the relation to art.

I. The Continent of Taste before the Age of Aesthetics

Gusto in Italian and in Spanish, like *goût* in French, derives from the Latin *gustus,* which means the fact of tasting, the taste of a thing, and the tasting sample (the Indo-European root, which we find in the Greek *geuomai* [γεύομαι], means "to feel," "to taste," "to appreciate, to like" [RT: *Dictionnaire étymologique de la langue latine*]). *Gustus* is in competition with *sapor,* "savor, taste," and "sense of taste," physical and moral; *sapere,* which means "to have taste," with regard to savory things, is also said of people of taste, discernment, relating the qualities of the palate to those of the mind, whence *sapientia,* "wisdom" (Cicero, *De finibus,* 2.24: "non sequitur ut cui cor sapiat, ei non sapiat palatus" [having taste with the mind does not entail lacking taste with the palate]; similarly, and more generally, *sentio* and *sensus* link the senses and judgment; see SENSE).

Though the Italian definition of *gusto* in terms of judgment does not really retain the idea of savor, the French and Spanish definitions do. In his RT: *Thresor de la langue française tant ancienne que moderne,* published in 1606, Jean Nicod, who always explains the meaning of each French word by its corresponding Latin, thus defines taste as *intellectus saporum,* which he himself translates by "judgment of flavors." We also find this sense of flavor present in the definition Baltasar Gracián gives of good taste: "un buen gusto sazona toda la vida" (a good taste adds spice to life).

A. *Gusto* as *habitus,* disposition and judgment in Italian theories

The word *gusto* early on acquired a metaphorical sense very distant from its gustatory origins: it indicates moods, desires, and drives. It may express, as in Dante, a "bold desire" (*ardito gusto*) (*Paradise,* 32.v.122) or a "disdainful indignation" (*disdegnoso gusto*) (*Inferno,* 13.v.70). However, the importance of *gusto,* its influence and its diffusion in European languages, appear in regard to problems about the experience of art in the sixteenth and seventeenth centuries. Thus, when Vasari says that Michelangelo had judgment and taste in everything: *giudizio e gusto in tutte cose* (*Le Vite,** VII), the word *gusto* does not refer to a perceptual receptivity; it indicates, of course, an ability to discern properly artistic qualities, the acuity of the "judgment of the eyes," as in Leonardo da Vinci, but equally and sometimes exclusively it means the dispositions proper, the idiosyncrasy inherent to an individual (an artist or an art-lover).

This idiosyncrasy is often less the mark of artistic sensibility than an expression of temperament, as understood by the then very widespread theory of temperaments, of the specific *complezione* of the personality of an artist. In the relations between masters and students, the first problem is thus to find affinities, a harmony between each person's taste and temperament, so that the teaching may be as productive as possible. This is why Antonio Francesco Doni insists in his treatise, regarding the art of drapery, that the disciple should take care in choosing his master:

> Questi panni sono tutta gratia e maniera che s'acquista per studiare una materia fatta d'altro maestro che piu t'é ito a gusto che alcuno altro.

> (These draperies are all grace and style [*maniera*], which one acquires by studying a matter created by a master who is better suited to your taste than any other.)

> (*Il Disegno*)

What is decisive here is not *gusto* as a capacity of judgment, but rather the disposition or temperament as the expression of a unique individuality, insofar as these determine the artist's *maniera*, or his style. Taste is not just the principle of identity of a *maniera* or an artist: it can also refer to a group, an artistic school, even a nation (for Vasari, for example, the Germans have a *gusto gotico*, which is essentially suited to their dispositions and temperament).

Gusto also takes the meaning of a certain faculty of judging and evaluating aesthetic or artistic qualities and tends progressively to replace *giudizio*, which is often reduced to an act of perception, a way of discerning and distinguishing that calls upon both sensibility and intellect. In the sixteenth century, a text by Paolo Pino shows the orientation of *gusto* in relation to *giudizio*, despite their obvious multivocity:

> Sono varii li giudicii umani, diverse le complessioni, abbiamo medesmamente l'uno dall'altro estratto l'intelletto nel gusto, la qual differenzia causa che non a tutti aggradano equalmente le cose.

> (The judgments of men are varied and their temperaments different, we have in the same way extracted one from the other the intellect from taste, and this difference is why things do not please everyone in the same way.)

> (*Dialogo di pittura*; trans. M. Pardo)

In the seventeenth century, a theorist as careful as Bellori in fixing the clarity and precision of artistic concepts cites Nicolas Poussin's definition of painting (written in Italian) with deference. Yet Poussin considers *gusto* to be a synonym for *maniera* and *stile* (a relatively new word at the time):

> Lo stile è una maniera particolare ed industria di dipingere e disegnare nata dal particolare genio di ciascuno nell'applicazione e nell'uso dell'idea, il quale stile, maniera o gusto si tienne dalla parte della natura e dell'ingegno.

> (Style is an individual manner and ingenuity in painting and drawing born of a genius which is the individual's alone, in the application and the use of the idea;

this style, manner, or taste, comes from nature and the mind.)

> ("Osservazioni di Nicolo Pussino," in Bellori, *Le Vite*; trans. A. Sedgwick Wohl)

A different definition by Filippo Baldinucci can in a sense be said to complete this one, by making a fundamental determination, one that in fact dominates artistic activity until the beginning of the nineteenth century: *gusto* is the exercise of judgment in the adequate application of the rules of art:

> Gusto e Buon gusto, si applicano anche alle opere d'arte, nelle quali l'autore abbia seguite le regole del bello, ed abbiano grazia, eleganza, garbo, e simile.

> (Taste and good taste also apply to works of art, those in which the author has followed the rules of the beautiful and which possess grace, elegance, delicacy, and other similar things.)

> (*Vocabolario Toscano dell'arte del disegno*)

In this alliance with systems of rules for the arts, *gusto* can resolve the tension that existed between its original, idiosyncratic, and individual sense, and the demand for universality proper to art and the classical theory of art.

B. Predominance and exemplarity of *gusto*: Baltasar Gracián

In Spanish in the late sixteenth and seventeenth centuries, *gusto* rarely implies a judgment of taste in the properly aesthetic or artistic sense. Indeed, it appears rather more like a mode of implicit evaluation, a value judgment that is exercised in well-determined circumstances, namely in the world of the court and the political sphere. It refers to the idea of skill, the faculty of adapting oneself with ingenuity to the behavior of others, and knowing how to extract the greatest profit from it. In Baltasar Gracián, who develops the most precise theory of taste, *gusto* does not have the creative fertility of *ingenio* (spirit) or *genio* (genius), both of which, however, imply *el ejercicio y cultura del gusto* (the exercise and cultivation of taste) (*Agudeza y Arte de Ingenio*). When it is exclusively a capacity and a mode of judgment, *gusto* is not distinct from *genio*. However, it is distinguished from it insofar as *gusto* is exercised over a period of long maturation; it is the fruit of the study of books, works, and men, even though it reveals itself in an immediate mode. Like *ingenio*, *gusto* is an act that can take place only at the right moment, when the mind is truly absorbed and when matters have arrived at their highest degree of perfection. Whence the difficulty in clearly defining *gusto*, which, like the subtlety of *agudeza* and the dazzling inventiveness of *ingenio*, can capture the characteristic feature within a plurality of relations and sensible qualities, thus attesting to the superiority of someone who is capable of such just and perspicacious judgment. If *ingenio* is the art of spiritual invention, *gusto* is the most perfect acuity in the art of discernment. In this sense, true *gusto* obeys a teleology of perfecting itself as *buen gusto*, as correct evaluation. *Ingenio*, *agudeza*, and *gusto* have a common trait: they occur in a unique, privileged mind, one in which the *genio* reaches its peak of excellence and ephemeral glory, in conformity, in this aspect, with the vision of the world of many Jesuit theorists. Insofar as it is manifest in rare moments of

the life of the mind, *gusto* is inaccessible to youth (too un-educated) and impossible in old age (too feeble). It is a form of knowledge (*gustar* implies *saber*, to know). As to its origins, Gracián writes, "Si la admiracion es hija de la ignorancia, también es madre del gusto" (If admiration is the daughter of ignorance, it is also the mother of taste) (*El Criticón*). This admiration, however, which also applies to the circumstances of life, to the most exceptional qualities of things, and to art, requires a superior form of discernment, necessary for the wise man to carry out his task, such that taste in the end encompasses the whole of life, whether practical or contemplative.

With Gracián, the denial of any possible universality to taste appears for the first time with striking clarity, couched in multiple repetitions of the claim that it is a rare capacity. Thus in the *Oráculo manual* (*Pocket Oracle*), maxim 28: "How truly wise the man who was unhappy at the thought he might please the masses! An excess of applause from the vulgar never satisfies the discreet"; or maxim 39: "Recognize things at their peak, at their best, and know how to take advantage of them. . . . Not everyone can, and not all those who can know how to" (trans. J. Robbins). This power of selection (*elección*), this faculty of judging in both moral and aesthetic matters, goes hand in hand with *ingenio*, since mind and taste are "twin brothers." Only *buen gusto* is able to grasp the imperceptible grace of something, a being or a work, all the nuances of this *despejo*, which Amelot de la Houssaie translates into French as the *je ne sais quoi*, and which represents the *vida de toda perfección* (the life of all perfection). Only *buen gusto* can discern in the *despejo* the superior quality that is the perfection of perfection without which all beauty is dead. Thus,

> Es eminencia de buen gusto gozar de cada cosa en su complemento.

> (It's the height of good taste to enjoy things at their most perfect.)

> (*Oráculo manual*, §39; trans. J. Robbins)

The idea that taste as specific judgment is known by its extreme rarity, that is to say, by a faculty that only a few can exercise adequately, is thus radicalized. It appears in the seventeenth and nineteenth centuries in France, in Germany with Schopenhauer, who is inspired by de Houssaie's translation for his own translation of Gracián into German, and, more indirectly, in Nietzsche.

C. Taste and rules

The French meaning of *goût* borrows relatively little from the dominant Italian or Spanish models. One of the characteristics of the word and its uses in the seventeenth and eighteenth centuries is to imply, openly or tacitly, a denial of the logical categories inherited by Scholasticism, and to oppose what was then called "the language of pedants." We do not find this desire for autonomy, and sometimes provocation, in Italian or Spanish texts. Narrowly related to tact, fine discernment, the spirit of opportunity, French *goût* is considered more in terms of relations, cleverly mastered situations, or the act of judgment than in terms of judgment of idiosyncratic properties or dispositions as in Italy. The ancient sense of enjoyment and fine discernment takes on a new value in Bossuet, especially when he cites the phrase of the dying Grand Condé: "'Yes,' he said, 'we shall see God as he is, face to face.' He repeated in Latin, with marvelous taste, these great words" (*Oraison funèbre du Grand Condé*, 1687). The word expresses the idea of an extraordinary pleasure, an exceptional acuity of mind, that is a mixture of sympathy in the most affective sense and clairvoyant intelligence.

■ See Box 1.

It is precisely this conception of an adjudicating activity whose basis seems to lack any justification that will later become the object of all the misunderstandings and ambiguities surrounding the use of the term "taste." This remark holds true as well for the notion of a rule (the taste that cleaves to the rules described by La Rochefoucauld), indissociable from the power of "good judgment." The rule was never, for the theorists of the seventeenth century, a rigid

---

1

La Rochefoucauld's definition of taste

For La Rochefoucauld, taste refers to a faculty of "judging soundly," which comes close to wit without really being assimilated to it. Like Dominique Bouhours, Antoine Gombauld Chevalier de Méré, and many others among his contemporaries, La Rochefoucauld makes taste a specific form of judgment that does not consist in a purely intellectual act, but that is not reducible to affects either, nor, most importantly, to a feeling like aesthetic pleasure, in the sense used in the eighteenth century. More precise than Pascal's *esprit de finesse*, it is central in the relations to others or toward artworks, even though the logic constituting this mode of evaluation cannot be analyzed except by a description.

La Rochefoucauld's definition of taste is in a way paradigmatic:

This term "taste" has many meanings, and it is easy to make mistakes with it. There is a difference between the taste which carries us towards things and the taste which makes us know and discern their qualities by applying rules to them: one may like comedy without having taste which is fine and delicate enough to judge it well, and one may have taste which is good enough to judge comedy well without liking it.

> ("Du goût," in *Maximes et Réflexions diverses*, §10; trans. E. H. and A. M. Blackmore and Francine Giguère)

If it is possible to "judge comedy well without liking it," this is because there is a faculty of evaluation that can distinguish the artistic or aesthetic qualities of a work with greater clarity than that of most people. That presupposes then that there are unique and exceptional qualities inherent in works and an especially clear-sighted power of evaluation that we call taste.

and more or less arbitrary norm imposed by groups of dominant art-lovers, but rather an essential mediation in relation to a work of art. It is the exemplification of the exceptional achievement of a work (that of a Raphael or a Carracci), to which it is not appropriate to conform, strictly speaking, but which is to be imitated in an act that is itself freely creative. If the translation of the notions of taste and rules rested on so many misunderstandings, it is because aesthetic criticism, especially since Lessing, deliberately referred to the more normative sense that was given to the terms "taste" and "rules" in the eighteenth century by Charles Batteux and, above all, Voltaire.

Taste in the eighteenth century in France takes two different shapes. One tends to affirm the rarity of a faculty that is truly able to discern the unique properties of a work of art. The other is part of the birth of aesthetics, and aims to respond to specifically philosophical demands. In cultivated circles, to write about, interpret, and evaluate a painting or a sculpture requires something other than the general faculty of judgment: above all, "an exquisite taste" is required, that is an aptitude for grasping the rarest nuances and the most delicate aesthetic properties that escape the perception of most viewers.

> There are a thousand men of good sense for one man of taste, and a thousand people of taste for one of exquisite taste.
>
> (Diderot, "Letter on the Deaf and Dumb," trans. Margaret Jourdain)

This belief, though foreign to any elitism in the nineteenth-century sense, certainly runs the risk of being inconsistent with a line of thought primarily concerned with determining the conditions of a universal judgment. The question of the universality of aesthetic judgment tends indeed to arise with the influence of English theorists. Voltaire attempted to resolve this inconsistency in a way that, while not always original, was considerably influential. The importance of his writings on the subject is that they take advantage of the multivocity of *goût*, appealing sometimes to the meaning inherited from the seventeenth century, and sometimes giving the concept an explicitly normative inflection. What distinguishes him from the authors of the previous century is that he defines taste as a necessary reference to the rules of classicism. The rule, which was productive insofar as it had the value of an example, becomes a norm, which is a rule that is henceforth fixed, unchangeable and more or less incontestable. Thus, he writes, "[T]here was no longer any taste in Italy" (*The Age of Louis XIV*). The phrase means that Italian artists no longer conformed to the system of rules proper to the classical ideal, and that they produced extravagant works like those of Bernini and Borromini. Taste is based less on an aesthetic subjectivity than a sort of legislation that is immanent to the works produced, as in this phrase: "The real reason is that, among people who cultivate the fine arts, many years are required to purify language and taste" (ibid.). "Taste" here refers to a sort of ideality in the union of the rules applied correctly and the genius of the artist. Hence, for example, regarding Addison, "Addison's words breathe taste" (ibid.), that is, they are works in which

we see the alliance of good sense, imagination, and respect for the rules. This is why Voltaire considers Addison to be a "perfected Rabelais," that is, like a Rabelais who had shown taste. His conception of taste, unlike that of Jean-Baptiste Du Bos or Diderot, constitutes a final movement of resistance against English influence insofar as, for him, the power of aesthetic judgment precisely does *not* derive from sentiment or the intellect: what is most important is the correct fit between the creative act and the system of rules of the theory of classical art. And it is, above all, this somewhat dogmatic position that was widely spread throughout Europe, much more so than the writings of Charles Batteux or Rousseau, to the point where French taste became synonymous with normativity and arbitrary objectivism about aesthetic criteria. This usage and meaning of the word have survived down to the present as a counterexample and a concept to be avoided in any aesthetic theory. They are not, however, especially representative of the thought of the eighteenth century, since we find very different conceptions in Du Bos, the abbé Trublet, Montesquieu, and Batteux. Thus, the abbé Trublet gives an active role to the sentiment of beauty only to those who are genuinely cultivated:

> Since arguments require instruction, it appears that the appreciation of the beautiful belongs in the first instance to people of cultivated taste; the dilemma is resolved in their favor.
>
> (*Essays upon Several Subjects of Literature and Morality*)

However, the original claim in his book is that the more taste, that is, cultivated taste, is developed, the more feeling and reason are destined to blend with one another.

This is the final attempt to surmount the growing antinomy between aesthetic feeling and rational thought in the Enlightenment. But Rousseau prevents this possible synthesis for a long time, by effecting a decisive reversal. The word "taste" now becomes an indefinable notion:

> Of all the natural gifts Taste is the one which is felt the most and explained the least; it would not be what it is, if we could define it: for it judges objects on which judgment has no purchase, and serves, so to speak, as glasses for reason.
>
> ("Goût" in *Dictionnaire de musique*)

In reality, *goût* is an instinct for Rousseau (as it is for Leibniz), and the feeling of the beautiful cannot be a judgment in the sense of an expression relating concepts and empirical data. The judgment of taste is thus not truly a judgment, as understood in logical thought—that is, a statement that may lead to an objective proposition—just as an evaluative proposition for Frege, Wittenstein, and logicians cannot be a true proposition, since its truth-value cannot be determined. Inexpressible sentiment and mental activity irreducible to any objectification—this is how taste, as conceived by Rousseau, appears in the Kantian problem of reflective judgment and in contemporary aesthetics.

II. The Properly Aesthetic Genesis of "Taste"

The aesthetic construction of the English "taste" plays a central role in the eighteenth century, as we are reminded by

the author of the entry "Taste" in *A Companion to Aesthetics* (Cooper 1992). The English term inherits a considerable history that began, as we have seen, in the Renaissance. According to the painter Sir Joshua Reynolds, in conformity with Italian and French traditions, "taste" is the instrument of a reflection on the perfection of art in England:

> Every language has adopted terms expressive of this excellence. The *gusto grande* of the Italians, the *beau idéal* of the French, and the *great style, genius,* and *taste* among the English, are but different appellations of the same thing.
>
> ("The Great Leading Principles of the Grand Style . . . ," Third Discourse in *Discourses*)

"Taste" is thus part of the European history of the concept. But it is in England that this history is reworked by philosophers and thenceforth is part of a context that is proper to the Anglo-Saxon tradition.

The usage of "taste" makes it at first a term that rationalizes social distinctions. The word refers to a rule and justification for developing a discourse on civilization, the mores whose danger is always a division between civilized and barbarous tastes. When good taste is exercised, pleasure develops in society. "Taste" is here very close to "relish," or "delectation." But the meaning of the term shifts, coming to refer also to an operation of the subject that begins in feeling. The word thus means aesthetic experience as, and the experience of, contemplation, which presumes both a theory of perception and of evaluation. The fragility and the ambiguities of this concept must then be emphasized, as it attempts to delineate a unique mode of judgment while at the same time recognizing that which is immanent in the emotions.

"Taste" thus appears in the first instance as a prescriptive concept in which art and society are intertwined. The rules of taste do not have an absolute value, but are rather aimed at raising individuals up to a state of being civilized. Taste becomes noticed as part of polite society with Addison and Steele's *Spectator*, which, from 1711 to 1714, offers chronicles of customs, arts, and social behaviors in order to observe and spread the rules of life and British politeness of *gentlemen* and their culture. The intent is "[t]o discover, how we may, to best Advantage, form within our-selves what in the polite World is call'd a *Relish*, or Good TASTE," writes Shaftesbury in *Characteristics of Men, Manners, Opinions, Times.* Making oneself a subject of taste has as a necessary correlate the correction and daily adjustments that politeness requires as a set of collective rules of propriety that yield the improvement of society.

Beyond its application to the production of pleasure in society, the word "taste" is associated with the presence in humans of a natural sense that functions as an immediate possible evaluation. Taste can thus be compared with having a gift or a talent whose innate or acquired nature is debated. Etymologically, "taste" comes from the Latin *tangere*; it is initially a matter of touching, tact, in the proper and the figurative senses. It evokes a delicate and spontaneous appreciation. The use of "taste" presupposes reflection about the notion of sense, understood as sensory device. In 1759 Alexander Gerard published "An Essay on Taste," which

received the prize given by the Edinburgh Society for the Encouragement of Arts for the best essay on the subject. According to the essay, which consists of a summary of different theses on taste being discussed in Scotland at the time, taste structures the perception of "works of art and genius" and may be related to the principles by which the mind receives pleasure or pain. These principles are the *internal senses*: those of novelty, grandeur or sublimity, beauty, imitation, harmony, ridicule, and virtue. The union of the internal senses shapes and perfects taste insofar as it makes it possible to excite the most exquisite pleasures. To discover the deepest qualities of taste, the internal senses are aided by judgment, the faculty that distinguishes different things, separates truth and falsehood, compares objects and their qualities. Judgment introduces the possibility of not only perceiving but also of assessing the meaning of a work. It operates *after* the powerful exercise of feelings by the internal senses, which allow one to experience pleasure or displeasure; judgment *then* brings to taste the depth of penetration. "Taste" now refers to a compound operation, both perceptual and intellectual, immediate and mediated, perceptive and evaluative. Hume, in *Of the Standard of Taste*, also takes account of the composite character of taste. "Taste" cannot be defined only by the internal correctness of sentiments, even if the philosopher must accept the variety of tastes, proof of the vital and ordinary attraction that all individuals have for their own sentiments. At the same time, taste presumes agreement, a process of evaluation that assesses the relations of works to beauty. The delicacy of taste by which the mind refines emotions makes correct expressions of artistic judgment possible. This aesthetic capacity requires an exercise by which the real qualities of a work are identified. Adam Smith, in *The Theory of Moral Sentiments*, offers a similar figure of the "man of taste" who distinguishes slight, often imperceptible differences of beauty or ugliness.

The tension expressed by "taste" between perception and evaluation continues to enrich aesthetic reflection. The work of the English art critic Clive Bell, *Art* (1914), for instance, interestingly extends the construction of aesthetic emotion in terms of "sense" and "taste" by suggesting a return to personal experience in art on the basis of an "aesthetic emotion" that is not reducible to a simple subjective representation of the contemplated object. On the side of the value of art, Malcolm Budd in *Values of Art* (1995), focusing on the determination of the artistic value of a work, posits the experience of the work of art as an act of intelligence and discusses Hume's standard of taste.

III. Taste Put to the Test of Philosophical Reflection: From Transcendental Subjectivity to Taste as a Method of Determining Value

A. The transcendental revolution: *Geschmack* as reflective judgment

Though English philosophers draw attention to the productivity and autonomy of aesthetic subjectivity, they nevertheless remain faithful to traditional conceptions of taste as a faculty of discernment of a certain type. The real break with all previous theories of taste comes with Kant's critical philosophy, which attempts to destroy the idea dear to

Baumgarten of a cognitive aesthetics, founded on rational and normative principles.

It is in Baumgarten's *Metaphysica* and *Aesthetica* that we find one of the first properly philosophical definitions of taste, insofar as it attempts to renew the problem of relations between the sensible and the intelligible. This means that the concept does indeed now fall within the specific domain of philosophy. Baumgarten, however, who writes and thinks in Latin, is keen to preserve the rhetorical and humanist heritage by reconciling it with the demands of Leibnizian metaphysics, here represented especially by Wolff's school. For Baumgarten, *gustus* is, like the other faculties, a form of knowledge (*cognitio inferior*), a sensible experience of reality:

Gustus significatu latiori de sensualibus, i.e. quae sentiuntur, est judicium sensuum.

(In the widest sense, taste in the domain of the sensible, that is, what is felt, is the judgment of the senses.)

(*Metaphysica*, §608)

It is thanks to this sensory organ that the object of judgment is felt. *Gustus* is thus determined as a sensible faculty of judgment, but one that presupposes some training to reach full maturity (*maturitas*), a bit as in Gracián: "Talis gustus est sapor non publicus (purior, eruditus*)*" (The taste that corresponds is an uncommon flavor [purer and more cultivated]) (ibid.). Insofar as this faculty is effectively cognitive, since it accounts for certain experiences of reality, it may commit errors of judgment, as in the case of perceptual illusions. It is thus central as a *facultas diiudicandi*, as a faculty of judging aesthetically.

Kant's aesthetic thought rests in part on the rejection of this perspective, which still makes it possible to intellectualize the forms of sensory judgments, or rather, of judgments, which would imply both a sort of virtual intelligibility and a minimal objectivity. The original meaning of *Geschmack*, as the word is used beginning with the *Critique of Pure Reason*, in the famous note (to §1) on the "Transcendental Aesthetic," is based on a radical rejection of *gustus* as conceived by Baumgarten:

The Germans are the only ones who now employ the word "aesthetics" to designate that which others call the critique of taste. The ground for this is a failed hope, held by the excellent analyst Baumgarten, of bringing the critical estimation of the beautiful under principles of reason, and elevating its rules to a science. But this effort is futile. For the putative rules or criteria are merely empirical as far as their most prominent sources are concerned, and can therefore never serve as determinate *a priori* rules according to which our judgment of taste must be directed; rather the latter constitutes the genuine touchstone of the correctness of the former.

(trans. Guyer and Wood, 173)

This note explicitly condemns the project of the *Aesthetica*, and no further allusion is made to it, even in the third Critique, where its claims are indirectly refuted. Indeed, in the *Critique of Judgement* (1.1), the first definition of taste makes it

a faculty of judgment that deals less with an object than with a mode of representation:

Geschmack ist das Beurteilungsvermögen eines Gegenstandes oder einer Vorstellungsart durch ein Wohlgefallen oder Missgefallen ohne alles Interesse. Der Gegenstand eines solchen Wohlgefallens heisst schön.

(*Taste* is the faculty of estimating an object or a mode of representation by means of a delight or aversion *apart from any interest*. The object of such a delight is called *beautiful*.)

("Analytic of the Beautiful," §5; trans. J. C. Meredith)

Kant's desire to conform above all to his project of a transcendental philosophy is clear from this first definition on. For his judgment of taste does not deal with the object as such, nor with its properties, nor with a rule of art, nor even with the aesthetic sensation that the object incites, but with the mode of representation born from the sensation. And this mode of representation in its turn causes a specific sentiment that is none other than the sentiment of pleasure conceived of as the *Bestimmungsgrund* (basis) of the aesthetic experience. Insofar as it is manifested by a sentiment, taste is a form of reflective judgment referring to the structures of aesthetic subjectivity as it is understood from within the project of a transcendental philosophy. This is why the only predicate Kant allows definitively for the beautiful is the feeling of pleasure. One of the great difficulties encountered in making judgments of taste as described in the "Analytic of the Beautiful" is to want to reconcile the self-referential character of taste with the requirement of universal communicability, subjectively grounded—that is, with the claim to subjective universality.

B. *Geschmack* on trial

If Hegel gives a relatively restricted role to the problem of taste in his *Lectures on Aesthetics*, it is because he disqualifies the latter as a criterion for the understanding of a work of art. As a manifestation of aesthetic subjectivity, taste is for him an essential obstacle to the genuinely philosophical analysis of art. A large swathe of aesthetic thought in the twentieth century (especially that of Lukács and Adorno) is influenced by this condemnation, and actively embraces its theoretical consequences. Taste henceforth ceased to be a constitutive element of interpretation; it is no longer anything more than a parasitic form of subjectivism.

In Hegel, *Geschmack* is used without any reference to the problem of reflective judgment that exercised Kant. When he analyzes it, it is exclusively in a polemical way, to attack eighteenth-century theories of art:

Another kind of interest consisted not in the express aim of producing genuine works of art directly but in the intention of developing through such theories a judgement on works of art, in short, of developing *taste*. As examples, Home's *Elements of Criticism*, the works of Batteux, and Ramler's *Einleitung in die schönen Wissenschaften* were books much read in their day. Taste in this sense concerns the arrangement and treatment, the aptness and perfection of what belongs to the external

appearance of a work of art (*Geschmack in diesem Sinne betrifft die Anordnung und Behandlung, das Schickliche und Ausgebildete dessen, was zur äusseren Erscheinung eines Kunstwerks gehört*). Moreover they drew into the principles of taste views which were taken from the old psychology and had been derived from empirical observations of mental capacities and activities, passions and their probable intensification, sequence, etc. But it remains ever the case that every man apprehends works of art or characters, actions, and events according to the measure of his insight and his feelings; and since the development of taste only touched on what was external and meagre, and besides took its prescriptions likewise from only a narrow range of works of art and a limited training of the intellect and the feelings, its scope was unsatisfactory and incapable of grasping the inner [meaning] and truth [of art] and sharpening the eye for detecting these things.

<div align="right">

(Introduction to *Aesthetics: Lectures on Fine Art*, trans. T. M. Knox, 1:27)

</div>

The concept of taste thus no longer has anything but a negative meaning, for the purpose of showing the weakness of earlier theories; it refers more to frankly erroneous conceptions than to a precise function. Art lovers and connoisseurs have, according to Hegel, been focusing on technical details, secondary and contingent understandings. This excessive attention to the "external manifestation" of a work of art is the sign, according to Hegel, of an aesthetics that gives a dominant role to sensation, sensory perception, and even sentiment. Taste thus becomes synonymous with immediate sensation, subjectivity that is exclusively attached to the least essential aspects of a work of art. It has not only lost all critical fertility but also turns out to be a secondary activity, screening off the deeper meaning of art, since it refers to the perceptible as such, that is, to what is inadequate for spirit. This contrast between "taste" as sensible knowledge relying on rules external to its object, and "spirit" as true knowledge of art may be surprising, precisely because it remains a pure opposition, ending in a condemnation and a radical rejection of taste. It is thus not as a "moment" that taste is eliminated, but as a false path, noxious and contrary to spirit as interiority. The difficulty of determining a precise meaning, some kind of use for taste comes from the fact that Hegel has subjected it to a trial that is strongly conditioned by an opposition to any form of sensualism or subjectivism. Through this concept, Hegel takes aim above all at the primacy of sensation, at feeling as a positing of subjectivity, at the recognition of appearance as such—in other words, at the eighteenth century.

C. The positivity of *Geschmack* as a fundamental mode of evaluation

Nineteenth-century thought inquires increasingly into the nature and functions of value judgments. This reactivation of value judgments, however—implicit in Schopenhauer, central in Nietzsche, and then problematic in Max Weber and Rickert—brings with it a rehabilitation of taste as a mode of evaluation.

With Schopenhauer, taste regains its philosophical dignity, since it is an expression of the will to live (*Wille zum Leben*). This metaphysical notion of the will to live is based, according to Schopenhauer, on the life sciences. Thenceforth, it is possible to form a physiology of taste, of theories of the specific activity of the sense organs having a positive cognitive value. The *aisthêsis* [αἴσθησις] of taste thus conceived, determined by physiology, optics, and the medical sciences, necessarily escapes transcendental subjectivity and Hegelian critique, becoming itself a major interpretive form, not only of art but also of reality and culture. The meaning of the word is still implicit in Schopenhauer's demonstrations (for example, those regarding the important question of style, and especially philosophical style) and it is never conceptualized as such: *Geschmack* refers most often to taste in the Spanish sense (remember that Schopenhauer translated Gracián), and especially the French sense as transmitted by the eighteenth century. If he thinks of *Geschmack* in the sense of *gusto* and *goût*, it is in order to produce new criteria of a mode of philosophical reasoning of which Nietzsche is the main beneficiary.

When Nietzsche uses *Geschmack*, it is most often as a constitutive element of evaluation and to make it central to a determination of any possible value.

> Und ihr sagt mir, Freunde, dass nicht zu streiten sei über Geschmack und Schmecken? Aber alles Leben ist Streit um Geschmack und Schmecken! Geschmack: das ist Gewicht zugleich und Wagschale und Wägender; und wehe allem Lebendigen, das ohne Streit um Gewicht und Wagschale und Wägende leben wollte!

> (And you say to me, friends, there is no disputing over taste and tasting? But all of life is a dispute over taste and tasting! Taste: that is weight and at the same time scales and weigher; and woe to anything living that would live without disputes over weight and scales and weighers!)

<div align="right">

("Von den Erhabenen," in *Also sprach Zarathoustra*, of *Werke*, 2:373; "On Those Who Are Sublime," in *Thus Spoke Zarathustra*, of *Complete Works*, trans. G. Parkes)

</div>

We note that in the translation of the Latin adage "de gustibus coloribusque non disputandum" the German retains only the gustatory part: *Geschmack* and *Schmecken*, taste and what has flavor.

Among the many uses Nietzsche makes of the concept of taste, these lines from *Zarathustra* have the particular interest relying on the three emblematic figures of the scale, weight, and the weigher. The triple relation clearly shows an effort to overcome the purely subjective dimension of the evaluation by positing correlates and constitutive criteria of axiological experience. Balance and weight do not refer to the principle of subjectivity of evaluation, any more than they would be mere metaphors intended to communicate that taste is a value judgment. In reality, the emblematic definition of "taste" is already axiological: it presupposes that any thought is an interpretation, evaluation, and conflict at the same time. This does not mean exactly that taste is a sufficient condition for deciding the value or nonvalue of something, but that it must be rehabilitated insofar as it

is constitutive of any evaluation, thus as one of the means of resolving certain ethical and aesthetic questions. "What decides against Christianity now is our taste, not our reasons" (*The Gay Science*, trans. J. Nauckhoff and A. del Caro, §132), or "It is we thinkers who first have to determine the *palatableness* of things and, if necessary, decree it" (*Daybreak*, §505; trans. M. Clark et al.). If any sensation or perception already contains an evaluation, taste must be constitutive of value judgment and evaluation.

■ See Box 2.

IV. Crisis and Reevaluation of the Functions of Taste in Contemporary Aesthetics

The refusal to grant cognitive content to judgments of taste and evaluation is characteristic of a philosophical attitude that is widely shared today. The question of the meaning and the function of "taste" is thus endlessly deferred, or even ruled out a priori, including in the domain of aesthetics. The rather general argument that disqualifies aesthetic judgment founded on taste is that one can never, on the basis of a perception of the artistic and aesthetic properties of a work of art, derive or infer a judgment, or rather a proposition with any sort of objectivity or validity. Taste thus seems fated to refer almost always to the structures of subjectivity, thus to the Kantian problem of reflective judgment. The growing disqualification of value judgment in aesthetic reflection since the nineteenth century only confirmed the discredit cast upon taste.

In contemporary aesthetics, taste is a concept that most often has only a negative meaning, or presents an evident lack of content. Deprived of any possibility of reference (for example, to the work of art as such or to the activity of the subject of aesthetic experience), its definitions are for the most part purely negative. Thus, Reinhard Knodt claims, "Das Zeitalter des guten Geschmacks ist vorbei" (The time of good taste has passed) (*Aesthetische Korrespondenzen*). This type of claim, returned to over and over again in aesthetic criticism, tends to eliminate the notion of taste as a capacity of discerning aesthetic and artistic properties at one blow, without ever analyzing what it implies. For this critique is directed at a semantic content that was never the one transmitted by the tradition; it relies on the erroneous and anachronistic idea of taste as conformity to a system of more or less arbitrary norms. With few exceptions, defining this concept no longer consists in determining a precise sense for it, but rather in producing ideologically based arguments that are hostile to any idea of any aptitude for discerning aesthetic qualities in a work of art and determining them according to a hierarchy.

In the twentieth century, the aesthetic thought that develops in the field of analytic philosophy is the only one that attempts to restore a precise semantic content to the notion of taste. Taste is not simply assimilated to an arbitrary form of value judgment or an idiosyncratic fact. It is with regard to the question of the definition of aesthetic concepts and the determination of aesthetic properties of a work—hence of acts of predication—that the notion has been rehabilitated, in particular by Frank Sibley. His article "Aesthetic Concepts" (*Philosophical Review*) provoked a number of reactions and polemics, precisely because it claims to affirm the positivity of taste, its productive and effective activity in the determination of an aesthetic property of an object. For Sibley, a statement about specifically aesthetic qualities cannot be distinguished from one about sensible qualities unless we appeal to a type of activity that is different from that of simple perception, namely the exercise of taste: "Therefore, when a word or expression is such that its application requires taste or perceptivity, I will call it an *aesthetic* term or expression, and similarly, I will speak of aesthetic concepts or concepts of taste." Sibley's whole problem, and especially that of his

---

2

"The Yes and No of the palate"

It is precisely this primacy of the evaluative that is most often the object of misinterpretation, incomprehension, and principled opposition by commentators.

The way in which Habermas cites the phrase "the Yes and No of the palate," which Nietzsche uses in §224 of *Beyond Good and Evil*, is in this regard especially significant.

In this paragraph, Nietzsche contrasts the "historical sense" (*der historische Sinn*) that "we other Europeans claim as our peculiarity," this faculty that "the moderns" have for understanding all the forms of evaluation and of tasting all things, with the capacity for rejecting and excluding that "the men of an aristocratic civilization"

had toward anything that did not agree with their own value system. It is thus that the French of the seventeenth century, he says, were incapable of appreciating Homer:

The very definite Yes and No of their palate, their easy nausea, their hesitant reserve toward everything foreign, their horror of the poor taste even of a lively curiosity, and altogether the reluctance of every noble and self-sufficient culture to own a new desire, a dissatisfaction with what is one's own, and admiration for what is foreign—all this inclines and disposes them unfavorably even against the best things in the world which are

not theirs or *could* not become their prey.

(*Beyond Good and Evil*, trans. W. Kaufmann)

Habermas thus interprets Nietzsche's way of proceeding: "Nietzsche enthrones taste, 'the Yes and No of the palate,' as the organ of a 'knowledge' beyond true and the false, beyond good and evil" ("The Entwinement of Myth and Enlightenment," in *The Philosophical Discourse of Modernity*, 96). To invalidate Nietzsche's thought, Habermas does not even bother with an argument: it suffices for him to emphasize what is in his eyes the exorbitant role of taste as a mode of knowledge, in order to make it a sort of model of irrationality.

successors, is to break out of this somewhat circular reasoning contained in the definition: taste is a necessary condition for the production of aesthetic concepts, and these concepts presuppose the exercise of taste as a specific capacity for discerning the qualities or properties proper to art. Without going further here into this problem, which has the merit of raising again the question of the logic of aesthetic predicates and aesthetic criteria, we may see here a rehabilitation of taste, not as a transcendental faculty but as a necessary condition of the validation of aesthetic concepts.

The appeal to ordinary language, or rather the desire to accept it as such, or as the possibility of resolving certain logico-semantic aporias, are proper to analytic philosophy. Wittgenstein, considering the semantic content of aesthetic concepts just as problematic as that of other philosophical notions, uses the term *Geschmack* several times. In the *Vermischte Bemerkungen*, he writes, "Feilen ist *manchmal* Tätigkeit des Geschmacks, manchmal nicht. *Ich* habe Geschmack" (Sometimes polishing is a function of taste, but sometimes not. *I* have taste)" (*Culture and Value*, trans. P. Winch). In every case, the word *Geschmack* is curiously used in a noncritical, that is, nonphilosophical way. Even though the *Bemerkungen* belong to Wittgenstein's philosophical thought, *Geschmack* here preserves all the density and the clarity of words of ordinary language. This leaves intact the possibility of using the word without losing the useful irresponsibility that allows one to say that, after all, taste is taste.

GOVERNMENT

"Government" comes from the Latin *gubernare*, which, like the Greek *kubernaô* [κυβερνάω], refers to being at the helm of a ship, hence to direct, to command. The term initially refers to governing or directing a collectivity or any kind of institution, before coming to be applied more specifically to political communities. It is applied at once to the way in which a collectivity is directed (good or bad government, or what is today called "governance"), to the regime by which this mode of directing is instantiated (the types of government), and finally to the actual authority exercising "executive" power, which has the power of constraint distinct from "legislative" and "judiciary" powers. We may focus here on the difference between the English and French networks, with English often speaking of "government" where continental traditions speak of the powers of the "State" instead. See STATE/GOVERNMENT, and LAW. See also HERRSCHAFT, POLIS, POLITICS, *STATE.*

➤ *AUTHORITY, DOMINATION, DROIT*, LEX, MIR, *POWER*

GRACE

The Latin *gratia* (from *gratus*, "pleasant, charming, dear, grateful") refers to a way of being agreeable to others or vice versa. It suggests "favor, gratitude, good relations," including at the physical level: "charm, attractiveness." Church language has made special use of it to render the Greek *charis* [χάρις] (e.g., *gratificus*, benevolent = *charistêrios* [χαριστήριος])—when, for example, the Virgin Mary is addressed as "full of grace," we hear that she is dear, benevolent, and charming. The term thus hovers at the boundaries of the aesthetic and the religious.

I. Aesthetics of Grace

1. For the Greek *charis*, and the way in which *chairein* [χαίρειν] refers to the pleasure of being, the joy of existing in the beauty of the world, see PLEASURE, I.A. Cf., for an entirely different connotation, the German *Gelassenheit* (see *SERENITY*).

   See also WELT, Box 1, on *kosmos* [κόσμος]; and BEAUTY, Box 1, on the study of the syntagma *kalos kagathos* [καλὸς κἀγαθός].
2. On the terminological network put in place in the Italian aesthetic of the Renaissance, see LEGGIADRIA, "grace, lightness." See also SPREZZATURA; cf. ARGUTEZZA, CONCETTO, DISEGNO.
3. On the relation between grace and beauty, and the *je ne sais quoi*, see BEAUTY, Box 4, GOÛT; cf. BAROQUE, INGENIUM, STILL.

II. Grace and the Divine

On divine grace as related to the organization of the world, besides *charis* and WELT, Box 1 (see above, I.1), see the Russian SVET, "light, world"; see also BOGOČELOVEČESTVO, "divine-humanity." For the relation between grace and cunning, or divine machination, see OIKONOMIA, TALAṬṬUF; cf. *RUSE*; between grace and pardon, see PARDON.

For *Anmut* and the German terminological network, see GEMÜT.

See also, related to grace as a calling, BERUF; cf. PIETAS, SECULARIZATION.

GREEK

Constancy and Change in the Greek Language

➤ AIÔN, EPOCHÊ, ESSENCE, ESTI, EUROPE, LOGOS, RUSSIAN, SUBJECT, TO TRANSLATE, UNDERSTANDING

We know that it is difficult to translate ancient Greek, the "mother tongue" of philosophy, into any vernacular language, and that it has been thus since it was first translated into Latin. Less well known is the difficulty of translating it into modern Greek, which can be attributed in particular—despite the exceptional longevity of the language—to the vagaries of the diglossia that constitutes its historical evolution.

Theophilos Voreas, professor of philosophy at the University of Athens toward the end of the nineteenth century, is generally recognized as the father of a rigorous policy in the creation of philosophical terminology in modern Greek. Despite his attempt, there is still major variation in the translations into modern from ancient Greek. The teaching of the latter in schools and the domination into the 1970s of an archaist language, Katharevousa, which literally means "purified," hid these difficulties for a long time. Despite the upheaval of syntax between ancient and modern Greek, it seemed that it was enough to use the ancient terms to believe one had a clear idea of what was in question. Intuition and translation are not the same thing, however; the increasing use of the demotic language, beginning in the middle of the twentieth century, made manifest the imprecision in modern uses of ancient philosophical terms and the modifications these had suffered owing to successive translations, as well as to the mediation of other European languages. While it is true that a translator can always resolve difficulties by simply going back to the ancient terms (which is often done), this practice only defers the problem of meaning. The proliferation of translations into modern Greek of the ancient texts written in Greek or Latin, as well as that of modern texts written in other languages, makes it possible to gain a better understanding of the scope of the shifts and the misunderstandings they may cause.

NOTE: For convenience, I have chosen the Erasmian pronunciation for ancient Greek (including for *koinê*), and I have opted for iotacism (generally, the use of "i" for ι, η, ει, οι, υι) for modern Greek—though I have relied on "y" for υ and on "o" for ο and ω. For the accents, I have adopted the varied usage of the authors themselves, some adopting ancient accentuation, others simplifying, and still others suppressing the breathings and accents on the monosyllables, but accepting a tonic accent for the rest. Finally, the simplification of current grammar replaces the ancient third declension with the first, which is accepted in Katharevousa; thus, for σκέψις, we write σκέψη. Furthermore, even though current grammar has suppressed the ancient infinitive, it is nevertheless preserved in an idiomatic fashion: we speak of becoming (*to gignesthai* [το γίγνεσθαι]), thinking (*to noein, to phronein, to skepsasthai* [το νοείν, το φρονείν, το σκέπτεσθαι]), and so on. Finally, I have constantly relied on Babiniotis's RT: *Lexiko tês neas Hellênikês glôssas* (Dictionary of the modern Greek language) as a guide.

I. The Historical Context

A. The evolution of Greek

The unity of Greek, since the archaic world, is a phenomenon that never ceases to amaze those who examine it. Recent studies show that this unity goes back to the Mycenean period and has adapted to the specific changes of the evolution of any language. However, Greek has undergone serious crises, especially when attempts have been made to restore an older language or establish a nobler one, with claims that the current language, produced by an evolution marked by cultural integration, has become impoverished.

We find this phenomenon in Russian, for example—where Ferguson distinguishes "diglossia" (the same language containing a vulgar and a noble language) from "bilingualism" or "multilingualism" (the copresence of two or more national languages in the same country). "Diglossia" in modern Greece is considerable, to the point of making it difficult, or even impossible, to translate certain terms from ancient and medieval Greek.

The unity of Greek was acquired piecemeal: first, through the shift from a syllabic linguistic system (the writing called Linear B) to an alphabetical system (inherited from the Phoenicians, who may themselves have gotten it from the Greeks); then, in agreement with a variety of related dialects that clearly did not impede communication; and finally, thanks to the political evolution of archaic Greece, which contributed to the arrival of Hellenic wisdom. From the philosophical point of view, it is this last stage that is essential, since a terminology was built on it that made the progressive creation of a philosophical language possible.

The distribution of cities around cultural and ritual centers such as Delphi and Delos may explain why this first unitary structure of the language had such historical dynamism. These centers radiated in a sphere that was delimited by the colonial extension of the different cities, promoting the constitution of a common world. This type of topology guaranteed Greek a kind of unity, contrasting with the dispersion described in the biblical episode of Babel. In the Hellenic space, even when political actions involve mobility (as in the Trojan War or Ulysses's adventures), the center of reference remains circumscribed by the contours of a fixed territoriality. The Homeric epics and the Hesiodic genealogies constitute a mythical testimony of the formation of a topological unity that assigns Greek its historical rootedness, and attest as well to Greek's status as a lasting reference point for education and culture (see BILDUNG, Box 1), as factors unifying a common world.

These breaks become more pronounced in the classical period. The Attic language, symbol of the Athenian city, animated by democratic structures and a dominant politicoeconomic will, is the product of a break with dialectal practice. The expansion of philosophy owes much to Attic, which consolidated philosophical terminology according to the norms imposed by Athenian philosophy—the Academy, the Lyceum, the Garden, and so on. The adoption of Attic by the Macedonian court, when it concludes the political unification of Greece, is not unrelated to the rapid evolution of Greek into a "common" (*koinê*) language. This language spread throughout Alexander's empire, beyond the Hellenic space. Cosmopolitanism thus favors the banalization of *koinê*, which contributes to the persistence of Greek in the Roman Empire before the domination of Latin (starting in the second century BCE in administration and after the fourth century CE in the cultural sphere). Having become a *lingua franca*, Greek achieved a communicational proximity and produced a civilizing impact without precedence in Europe, imposing Hellenic culture on the whole Mediterranean region.

■ See Box 1.

B. The vagaries of diglossia

The synchronic unity of diverse dialects, to which were added, first, the diachronic unity of Attic, then the more active unity of *koinê*, did not prevent linguistic crises. These concern the deliberate choice of the type of language that could best express Greek in its historical authenticity. It is in

1

Athens, or the homophony of the world

Aelius Aristides (117–189 CE), a Greek from Mysia and a Roman citizen living in the empire, wrote a praise of Rome (*Roman Oration*) and a praise of Athens (*Panathenaicos*), which together are the most extreme praise of the Greek language and a testament to its role in the empire.

For Rome, the world is no longer divided into "Greeks" and "barbarians," since "Roman" became "the name of a sort of common race" (*Roman Oration*, paragraph) 63), and the whole ecumene is spatially accessible and "tamed" (101). But while Rome is all-powerful, it is monodic. "Like a well-cleaned enclosure, the inhabited world pronounces a single sound, more precise than that of a chorus" (30); we should even say that it is mute: on the model of the army, an "eternal chorus" (87), "everything obeys in silence" (31).

Athens presents the reverse model: rather than extending, it is the "center of the center" (*Panathenaicos*, paragraph 15), which offers "an unmixed, pure language [*elikrinê de kai katharan . . . phônên,* as the Katharevousa aims to be], without anything disturbing it, a paradigm of any Greek conversation" (14). Here, the universality is no longer territorial but logical; in Attic, idiom, language, and speech all merge: "All without exception speak the single common language of the race [*tou genous*; see PEOPLE], and through you [i.e., the Athenians] the whole universe has become homophone" (226). Greek, the "definition and criterion of education and culture [*horos tina paideias*; see BILDUNG]" (227), is the language of sharing, appropriate for public life—to the extent that there can still be one, under Rome.

this context that we may speak of linguistic conflicts peculiar to diglossia.

The first conflict took place, in antiquity, in the name of the defense of Attic against the universalization of Greek, which was interpreted as implying the language's banalization and its integration into different cultural contexts. In this turbulent history, the most significant event is the translation of the Hebrew Bible into Greek, in Alexandria around the third century BCE. By adapting to the "common" language, the Judaic message was spread more easily.

■ See Box 2.

Inversely, the reactions in response to the hegemony of *koinê* Greek based their arguments on history itself, endowing the language with an ideological background. In the Hellenistic period, resistance animated by nostalgia gave rise to "Atticism"—a purified and quasi-artificial language, practiced by erudite people and philosophers. Atticism was imposed at the expense of the natural evolution of the language and its dialects, thenceforth establishing two languages, one for intellectuals and one for the people. Thus the problem of diglossia was born in antiquity, and its ideological background has been at work unceasingly within Greek culture ever since.

Much later, in the ninth century, a second major conflict arose over the status of modern Greek. It is likely that the substitution of Latin for Greek in the West and the pressure of the multilingualism of the empire, arising from Roman conquests, led to the fragmentation of *koinê* into several dialects. The Hellenization of the Eastern Empire, which preserves Atticism with few modifications until the Byzantine Renaissance of the eleventh and twelfth centuries, undoubtedly served to slow down the pace of this fragmentation, but it never managed to weaken Greek's diglossia, which was encouraged by the increasingly hierarchical shape the state and the church acquired beginning in the fourth century. Written and administrative language reveals a difference both of class and culture. During Ottoman domination, new transformations came up against the need to preserve the ecclesiastical language, since the only organized institution was that of the church. During this period, then, not only Atticism but also *koinê* became incomprehensible to people under the pressure of the evolution of the spoken language in a more popular direction, slowly forming what was called the "demotic" language. Knowing all of these languages at once was considered a feat and indicated a higher level of culture.

However, it is not in the regions occupied by the Ottomans, covering the multiethnic collection of the Balkans, that Greek's diglossia displayed its perverse effects, since the clergy spreading the language and the faith was generally little educated and sided with spoken and popular speech. It is rather in the Hellenic schools of Italy, where an archaist language was being taught, that we see the source of the purified language (Katharevousa). By disturbing the natural evolution of the language, the purists initiated a proliferation of debates that were only solved in the second half of the twentieth century (1976), when the Greek government, faced with the excesses of the purified language imposed by the regime of the colonels (1967), decided to install the spoken language as the only official one by a unanimous vote in the parliament.

C. The philosophical context of Hellenic modernity

Philosophy was born speaking Greek, which for at least a millennium was its only language. We may add to this another millennium, for while in the West, the hegemony of Greek disappeared in the Roman period, Latin-speaking philosophers continued to use it until the beginning of the Middle Ages. This is a unique phenomenon, implying that there is a "historical" link between a particular language, Greek, and the birth and development of philosophy. Indeed, it is said,

2

Greek, the sacred language

➤ TO TRANSLATE

The Jews of Alexandria, organized in a *politeuma*, spoke Greek and undertook the translation of the Hebrew Bible into Greek beginning in the third century BCE. It is by way of a piece of propaganda coming out of this milieu of Hellenized Jews in Alexandria, the *Letter of Aristeas*, that the legend of the so-called Septuagint translation was disseminated. According to the letter, King Ptolemy II Philadelphus (285–247 BCE) commissioned seventy-two (or seventy) Jewish scholars, sent to Alexandria for the purpose by the high priest of Jerusalem, to translate the Pentateuch into Greek, for the needs of Greek-speaking Jews in Egypt. Each of the translators supposedly worked separately, and they all produced miraculously identical versions. This was the first translation of the sacred Hebrew texts into a Western language and in all likelihood the first collective translation known. The legend of these uniform translations, attributed to divine inspiration, leads paradoxically to the negation of the Septuagint as a product of translation and to the authentication of the translated text as completely homologous to the original. The audience for the translation, encouraged by the legend, came to obscure the Hebrew origins of the translated books and played a decisive role in the process of Hellenization of Jewish monotheism. Further, while rabbinical Judaism, especially beginning with the destruction of the second temple in 70 CE, was hostile to the translation, it was adopted by the authors of the Christian scriptures, and until Saint Jerome, by almost all Christian communities. Thus the Greek version of the Septuagint became the Mediterranean Bible for the more and more Hellenized Jews, and then of the early church, which made it its Old Testament in all the regions of the empire where it spread, until Western Europe opted for Latin.

Demotiki and Katharevousa

To understand the contrast between *demotiki* and Katharevousa, we must give some of the cultural context that laid the foundations for the 1821 Greek war of independence against the Ottoman Empire. Several intellectuals, including Adamantios Koraïs, who lived in France, promoted the idea of a return to the past and felt the need for a new language that was adapted to teaching and more authentic than the vulgar language. Was it necessary to return to ancient Greek, or create a purified language, called, for this reason, Katharevousa? The first option was received unenthusiastically, so that although classical antiquity was still idealized, the second option was the one adopted. Koraïs had insisted on the role of language in the formation of a new Greece, affirming that the character of a nation is recognized by its language. For him, ancient Greece had joined liberty and pure language, whereas Ottoman domination favored an impure language. Henceforth, only the knowledge of ancestral texts would be capable of purifying the language of foreign elements. Paradoxically, this partisan of the Enlightenment initiated an ideology of pure language that would have negative effects on philosophy in Greece, thenceforth tributary to the discourse of others, whether modern or European, creators of new thoughts at the time when the Greeks remained under the Ottomans. Once officially recognized, this language was adopted in the universities, especially for the teaching of philosophy.

The defense of a demotic language in science came rather late. It can be attributed to Greeks living in the diaspora in the nineteenth century—in Paris (Psicharis), in England and the Indies (Pallis, Emphaliotis), as well as in Istanbul (Vlastos) and Bucharest (Photiadis). The result of this struggle was the formation of an educational association, in 1910, that fought for the adoption of the demotic as the official language. Meanwhile, however, the translation of the Bible and some ancient tragedies into demotic provoked an outcry and a political debate. The project failed under the pressure of partisans of Katharevousa, led by G. Mistriotis, professor at the University of Athens, who spoke of the need to save the "national language." A vote in the parliament in 1911 provisionally closed debate, despite a liberal government directed by E. Vénizelos, who was sympathetic to the innovators. An article of the Greek constitution forbade the official use of the demotic language, ignoring its place in daily life.

But when, in 1945, Charálampos Theodoridis wrote his *Introduction to Philosophy* in demotic, the book was highly successful. Philosophers continued to hesitate about the choice of language, until the government established demotic as the only official language of the Greek republic in 1976. Six years later, an association for the Greek language published a manifesto signed by seven well-known personalities—including Odysseas Elytis, winner of the Nobel Prize in literature, and Georgios Babiniotis, the most gifted linguist of the time—criticizing the legal establishment of the language, seeing in it a linguistic and expressive constraint likely to destroy "the foundations of the freedom of thought" in the name of an "artificial" demotic established by self-described "modernists." Reactions followed, reopening a debate that was believed closed, and whose tangible result was the retention by some writers of "breathing marks" and accents suppressed by the most recent version of demotic, and the use of a language that avoids what some consider the "mistakes" of modern Greek.

under Heidegger's influence, that Greek (with which German is associated) is the philosophical language par excellence.

- See Box 4.

Without rejecting this rather dated view, now shaken up by the worldwide expansion of Anglo-American philosophy, we must admit that Greek, though it has persevered, has not managed to preserve the fertility of the philosophical past that it helped shape, even in the space it rules. The program begun several decades ago in Greece of promoting modern and contemporary Greek philosophers is revealing: their fame can rarely, in current conditions, extend beyond the boundaries of Hellenism.

To explain this shortcoming, it is common to invoke the fall of Byzantium and the rule of Greek-speaking lands by the Ottoman Empire. According to this explanation, the Ottoman Empire comprised four hundred years during which, in the extensive territory populated by people of Greek origin (stretching from Moldova to current Greece and from Asia Minor to the coast of the Black Sea), a complete intellectual desert supposedly lay. The local populations, thanks to the Church and some teachers attempting to preserve Greek, were most often reduced to speaking the popular language. On the other hand, the intellectuals who sought refuge on the Ionian islands that had escaped the Ottomans, or in Italy, were perceived as a source of hope for the future of an independent Greece.

During this period, philosophical texts were sometimes written in Latin and often in an archaist form of Greek, more rarely in simple Greek. They are mostly commentaries on ancient thought, especially Aristotle, who was in fashion in Padua and Venice. Theophilos Korydaleus (d. 1646), who reorganized the patriarchal School of Constantinople, may be considered with Gerasimos Vlachos (d. 1685) to be the pioneer of modern Greek commentary on the works of Aristotle.

Aristotle's presence in the Balkans became a major element of the renewal of ancient philosophy in Greek-speaking space, linking up with the beginning of the Ottoman period when Gennadius II Scholarios, the first patriarch after the fall of Constantinople, established Aristotelianism over against Gemistus Plethon's Platonism.

In the following period, Neohellenic philosophy—essentially that practiced in universities—spoke Katharevousa: a language that brought it closer to its prestigious past, even though that past was read in the light of the European philosophies in fashion at the time. A friend of Adamantios Koraïs, Neophytos Vamvas (d. 1855), took up both the "ideology" of Destutt de Tracy and of F. Thurot, and the rhetoric of H. Blair, which dominated the British landscape of the eighteenth century. He was the first to occupy the chair of philosophy at the University of Athens (1837). T. Reid and D. Steward, through their translations, also had their hour of glory among French-speaking Greek philosophers, alongside the spiritualists V. Cousin and T. Jouffroy, who were ascendant for a time. In another domain of thought, C. Koumas (d. 1836) defended critical philosophy, initiating the more and more active presence of German philosophy in Greece, which in turn intensified the introduction of ancient philosophy in teaching. Thus, the cult of antiquity, illuminated by the lights of European philosophy, became the motive element of the intellectual renewal of modern Greece. In contrast, Greek-Christian ideology remained the permanent point of reference for conservative philosophers in Greece.

At the same time, the social crises opened the way for socialist thought, with Platon Drakoulis and Georgios Skliros (d. 1919). The latter's claims were taken up in turn by J. Kordatos and Dimitrios Glenos, another philosopher trained in Germany, where he participated in debates in favor of the demotic language. On the philosophical level, Glenos opposed to the dynamic idealism of the Hegelian school what he called "dynamic

Heidegger: "The prephilosophical language of the Greeks was already philosophical"

Let us agree with Jean-Pierre Lefebvre: the way in which Heidegger thinks about the complex historical relationship between Greek, German, and philosophy constitutes "ontological nationalism."

Ousia tou ontos means in translation: The beingness of beings [*Seiendheit des Seienden*]. We say, on the other hand: The being of beings [*Sein des Seienden*]. "Beingness" is a very unusual and *artificial* linguistic form that occurs only in the sphere of philosophical reflection. We cannot say this, however, of the corresponding Greek word. *Ousia* is not an artificial expression which first occurs in philosophy, but belongs to the everyday language and speech of the Greeks.

Philosophy took up the word from its pre-philosophical usage. If this could happen so easily, and with no artificiality, then we must conclude that the *pre-philosophical* language of the Greeks was already *philosophical*. This is actually the case. The history of the basic word of Greek philosophy is an exemplary demonstration of the fact that the *Greek language is philosophical*, i.e., not that Greek is loaded with philosophical terminology, but that it philosophizes in its basic structure and formation. The same applies to every genuine language, in different degrees to be sure. The extent to which this is so depends on the depth and power of the people who speak the language and exist

within it. Only our German language has a deep and creative philosophical character to compare with the Greek.

(Heidegger, *The Essence of Human Freedom*)

realism," that is, dialectical materialism interpreted by means of a synthesis between Democritus and Heraclitus. For him, any reference to the Greek philosophical past entailed a creative historicity that is able to appropriate it in the context of the concrete givens of contemporary life. Glenos was a subtle analyst of social divisions, which he interprets as the result of diglossia. After him, we must wait until the reform that was urged, between 1950 and 1960, by another German-trained philosopher, E. P. Papanoutsos, to witness the modernization of philosophy in education.

Finally, philosophy is expressed above all in literature, where several authors had already written in demotic. The great poet Kostis Palamas (1859–1943) brought literature and philosophy together in the light of Nietzsche. In his wake, but also in those of Bergson (whose student he was) and Marx, Nikos Kazantzakis (1883–1957) was a fervent defender of *demotiki*, which he enriched with powerful and original work. The real philosophical revolution in modern Greece is thus found, not in pure philosophy, but in literature. Greek literature, a generator of thought, uses new forms to rehearse the origins of Greek thought, when, with Parmenides, Empedocles, and Plato, literature and philosophy were not distinguished from one another. Writers are thus the ones who defended the demotic language against the Katharevousa of academic philosophers.

II. Translating Greek into Greek?

A. *Logos* and *orthologiko*

Since ancient times, the multivocity of the term *logos* is the most spectacular sign of the permanence of the Greek language. Its ambivalence, which mainly conjoins the senses of "speech" and "reason," requires a constant reliance on context, which is sometimes still insufficient to clarify the word's meaning. Yet, while the understanding of *logos* as "word" or "speech" remains intact in modern Greek, it is not so with the senses of "gathering together" and "reason." (We will not pause to consider the first of these, since, occluded in most dictionaries though used by some philosophers inspired by Heidegger, it would require a lengthy study in its own right.)

To say "reason," modern Greek relies, much more than on *logos*, on the semantics of thought (*noisi* [νόηση], *skepsi* [σκέψη]). There are nevertheless vestiges of what may have been the term's ancient semantic core: "what is the reason for your position . . ." (ποιος ο λόγος . . .), "I have no reason to . . ." (δεν έχω λόγο να . . .). However, instead of using *logos* to say "reason" in the sense of *ratio*, modern Greek speaks rather, by inflection, of "what is rational" or of "the logical" (*logiko* [λογικό]). It is from the expression *orthos logos* [ορθός λόγος], "right or straight reason," that we take "rational" and "rationalism," forming the portmanteau words *orthologiko* [ορθολογικό] and *orthologismos* [ορθολογισμός], respectively. We can understand why, given this situation of deficiency and complementation, philosophers prefer to keep the old word, even if the dictionary avoids it. In his translation into modern Greek of Jacques Derrida's essay "Plato's Pharmacy," Lazos writes that "Derrida mainly uses the words *discours, parole, raison*, or *logos* to translate λόγος. In Greek, *logos* has all these meanings. Thus I translate all these words with the

word *logos* and place the corresponding French term in parentheses." In sum, even when he preserves the term *logos*, a Greek today must clarify in parentheses which sense he is using. Moreover, the sense of "reason" is exceptional and is identified with "cause," or, when referring to something "rational," paired with *orthos: orthos logos*. This transgression of the modern dictionary is found in other translators, who use *logos* to refer to the Stoic divine (Reason), to the second person of the Christian Trinity (Word), to seminal reason— these are therefore calques rather than translations—as well as to Kant's pure reason. The confusion of these translators is such that they sometimes use *logos* while adding, in parentheses, *logikos* [λογικός] (rational), or, inversely, that they use *logos* for all contentious cases that concern thought (cf. Y. Tzavaras in Plotinus, *Enneads*, 30–33). As a result: either we keep *logos* without translating it, or we translate it by "reasoning," "constitutive power," "logical capacity," "notion," "rationality," "discussion," and so forth, but leaving a fringe of untranslatability.

To get a grip on this situation, Babiniotis draws up, in his *Dictionary*, a table for the word *logikos* [λογικός] (rational, logical), considering how best to express *logos* in the sense of "reason." He explains that "the λογικός (rational) refers to what is related to λόγος, in the sense of the functioning of the intellect (νου), the discursive thought (διάνοιας), the logical thought (λογικής νόησης) of man." Then, having articulated the word's sense by means of contrasts with the irrational, the insane, and so on, Babiniotis appeals to the semantic range attached to the faculty of thinking in the sense of *phrenes* [φρένες], to place in relief the proper character of someone who acts rationally (*emphron*) [έμφρων] or irrationally (*aphron* [άφρων], *paraphron* [παράφρων]). These clarifications confirm that the notion of *logos* [λόγος], "reason," is manifested above all by a derived form, *logikos*, itself clarified by the varied semantics of thinking and thought.

In the face of the texts of ancient philosophy, a Greek-speaker is just as helpless as a French- or English-speaker. Even more so, perhaps, since he or she is tempted to set aside the difficulty by not translating at all, rather than to admit the limits of his or her language.

B. *Skepsis* and the field of thought

To translate "think" and "thought" in ancient Greek, we use, on the one hand, the semantics of the "intellect" (*noos* [νόος], *noys* [νοῦς], *nous*)—to apprehend (*noein* [νοεῖν]), intellection (*noisis* [νόησις]), to think discursively (διανοεῖσθαι), discursive thought (*dianoia* [διάνοια])—and, on the other, that of the "mind" (*phrin* [φρήν])—to think sensibly, in conformity with good sense (*phrono* [φρονῶ]), practical intelligence (*phronisis* [φρόνησις]), and so forth. Later, the notion of "spirit" (*pneuma* [πνεῦμα]) is added, introduced by Stoicism in the sense of "breath" (wind and breath of life); Christianity dematerializes *pneuma* and thus ensures for the term an impressive promotion into more transcendental realms. Although this evolution complicates the project of translation, current confusions are due less to language than to choices that, rather than retaining the usual sense of "intellect," confuse *nous* with "spirit," "wit," "intelligence," as Pierre Hadot does in his translations of Plotinus (cf. his justification in *Enneads*, 38). Such hesitations are also found among

Greeks, when they refer to Le Seene and Lavelle's philosophy of mind by the expression "philosophy of νοῦς" and not *pneuma* [πνεῦμα] (cf. Charálampos Theodoridis, *Introduction to Philosophy*).

But the fact that in modern Greek the ancient terminologies of thought (*noêsis* [νόησις]) and reflection (*skepsis* [σκέψις]) have been fused together leads to more palpable difficulties. *Skepsis*, a concept discussed by the Skeptical school, leads to paradoxes in modern texts, when we speak, for example, of "the thought of the Skeptics"(η σκέψη των σκεπτινών) or the "thinkers of reflection" (ή των στοχαστών της σκέψης). An analogous fusion took place with the semantics of the activity of contemplating (*stochazomai* [στοχάζομαι]). Whereas in antiquity, *stochazomai* means "to aim," "tend toward," or even "to seek" and "to conjecture," in modern Greek it means both the common activity of reflecting as well as the more elevating one of thinking, "meditation" (*stochasmos* [στοχασμός]). In the literature of the nineteenth and twentieth centuries (Solomos [1798–1857] to Palamas [1859–1943]), *stochazomai* is used to indicate thought—whence the use of *stochastis* [στοχαστής] to mean "thinker." In addition, the activity of reasoning and calculating (*logizomai* [λογίζομαι], *ypologizo* [υπολογίζω], *logariazo* [λογαριάζω]) is often confused with the activity of thinking (*skeptomai* [σκέπτομαι]) as well.

Although contemporary Greek translators and philosophers are trammeled by these different inflections of key philosophical terms, they do not confront them as problems. To avoid semantic confusion, they often prefer to keep the ancient terms, although, in common language, the semantics of *skeptesthai* and *skepsis* (for instance) have dominated since the middle of the twentieth century. The junction between ancient and modern Greek occurs at *nous* [νοῦς] (or νους), which expresses the seat of thought, while giving the impression of preserving the ancient sense of "intellect." Although the term was most often used in compound expressions meaning "to have in mind," "to keep one's head," "to be sensible," and so on, it has a general and encompassing sense that goes beyond the archaic one of the noun "project" and the classical one of the highest faculty of thinking, "intuition." Babiniotis speaks of the "collection of spiritual faculties [πνευματικών δυνάμεων] of man, allowing him to apprehend reality and articulate its data." This generalization reveals that we may associate *nous* [νους] with other activities, such as judging [*krino* [κρίνω]], imagining (*phantazomai* [φαντάζομαι]), reasoning (*sullogizomai* [συλλογίζομαι]), reflecting (*skeptomai* [σκέπτομαι]), or meditating (*stochazomai* [στοχάζομαι]). In the latter case, Solomos writes in his dialogue on language: "Come to your [faculty] of thought [τὸνοῦ], contemplate [στοχάσου] the evil produced by written language."

Matters become complicated once we get to the semantics of the word *skepsis*, which is used to clarify the senses of the other terms meaning "to think" and "thought." For *stochazomai* [στοχάζομαι], the *Dictionary* mentions: (1) "I think deeply" (*skeptomai vathia* [σκέπτομαι βαθιά]), "I think discursively" (*dianooumai* [διανοούμαι]); (2) "I think well" (*skeptomai kala* [σκέπτομαι καλά]), with as synonyms "I calculate" (*ypologizo* [υπολογίζω], *logariazo* [λογαριάζω]). The same goes for the other sense of νους: "capacity for someone to

think (να σκέπτεται), to produce logical thoughts (σκέψεις), to create in a spiritual way; . . . to judge according to the circumstances," and so forth. This predominance of the semantics of *skeptomai* [σκέπτομαι] and *skepsis/skepsi* [σκέψις/σκέψη] is the more troubling in not always having been the case: thus, in his *Philosophy of the Renaissance*, Logothetis, a defender of Katharevousa in philosophy, limits the semantics of *skepsis* to specifically Skeptical schools of thought (Montaigne, Charron), associated with *skepsis* and *amphivolia* (doubt), and uses the semantics of *nous* to refer to "thought" and that of *logos* to mean "reason."

With regard to σκέψη, Babiniotis speaks of the "collection of points of view and positions someone holds regarding a social phenomenon, a way of analyzing it and interpreting it; theory," preceding this sense by others such as "process during which we manipulate certain data in our brains, to end up with a result"; or again, "what someone thinks (σκέπτεται) of an affair; idea, reasoning." The duality of the general sense, which brings in both social action and theory (understood as "vision of the world"), widens the domain of action of *skepsis*. If we add to *skeptomai* the sense of reasoning and meditating, we realize that the term has become untranslatable.

We should observe that the semantics of *nous* [νοῦς] has never, since Parmenides's time, replaced fully the semantics of *skepsis*, used since Homer—well before the Skeptics gave the term its philosophical destiny and well before it conquered modern Greek in claiming for itself the sense of "thought." In Homer, *skeptomai* means to look in all directions in order to observe. Ulysses says: "I happened to glance aft (*skepsamenos* [σκεψάμενος]) at ship and oarsmen and caught sight of their arms and legs, dangling high overhead. Voices came down to me in anguish, calling my name for the last time" (*Odyssey*, 12.244–49). This sense of looking attentively in several directions leads to a sense of what one might call "looking at by means of thought," of thinking on the basis of at least two possibilities. For example, in Sophocles, the verb sometimes means "to look at" or "to see" (*Ajax*, 1028) and sometimes "to reflect" or "to think through" (*Oedipus Rex*, 584). In the second case, Creon responds to Oedipus's accusations: "Think [*skepsai* (σκέψαι)] first about this: other things being equal, do you find the cares of power preferable to a rest which nothing disturbs?" We find the same ambivalence in Plato's texts. In the *Protagoras*, Socrates says that the examination of health requires observation of the parts of the body and adds that he desires, in the interest of reflection [*pros tên skepsin* (πρὸς τὴν σκέψιν)], to do the same thing for the pleasant and the good, in order to reveal the thought [*tês dianoias* (τῆς διανοίας)] of his interlocutor and see if his conception is similar to or different from that of most men (352a–b). This last specification isolates the pre-Skeptical sense of *skepsis*: it is a reflection that presents a choice between two or more positions.

The Skeptics reject this choice, giving the same weight to each position and suspending all judgment as a result (see EPOCHÊ). *Skepsis* differs from *dianoia* [διάνοια] (discursive thought), analyzed as identical to "intention." In modern Greek, when we clarify the sense of *dianoia*—which is used most often to mean inventiveness or genius, however—we speak of the "functioning of thought (σκέψης) which codifies sense data in concepts and representations" (Babiniotis).

Everything works as though in modern Greek, *skepsis* and *skeptomai* were the genus of which noetic and discursive thought were the species. This extensive character of *skepsis* is explained by the fact that the process of reflection may intervene in action, alongside "deliberation." The Skeptics exploited this perspective, whereas Plato avoided combining these elements.

To the question "what is scepticism (*skepsis*)?," Sextus Empiricus responds: it is "an ability to set out oppositions among things which appear and are thought of (*ta nooumena*) in any way at all, an ability by which, because of the equipollence in the opposed objects and accounts, we come first to suspension of judgment and afterwards to tranquility" (*Outlines of Scepticism*, 1.8). If the Skeptic supposes that, as a result of the equality of the two sides of an argument, no reasoning may be more persuasive than its opposite or any other, he envisages, thanks to the suspension of judgment, the arrest of discursive thought (*dianoia*), thus also of seeking and deliberation. This approach entangles theory with action, inasmuch as it must take account of all possible directions—with a consequent modification of the semantic landscape of the ancient language. As a result, another path is opened, from which modern Greek derives its own concepts, requiring us to negotiate an intralinguistic translation for a whole collection of past philosophical notions.

The semantic modifications of modern Greek also concern other uses, for example, the use of "brain" or "brains" to refer to the collection of mental faculties, as a synonym of "spirit" (*pneuma*) and "thought." Even more than in French, the metaphor of the brain expresses "human thought" (*anthroponi skepsi* [ανθρώπινη σκέψη]) in Greek—so much so that E. Roussos, translator of the fragments of Heraclitus (*Peri physeos*), renders *tis autôn noos* [τίς αὐτῶν νόος] (fr. 104 DK) first by "what is their brain/thought [το μυαλό]?" and then by "thought" [ὁ νοῦς], whereas K. P. Mihailidis (*Philosophes archaïques*), more prudently, translates *noos* by *nous*. In agreement with other translators, the latter acts with the same prudence when he translates *nous* [νοῦς] and *noein* [νοεῖν] in Parmenides, whereas Roussos once again innovates by translating *noein* by *to na to ennois* [τό νά τό ἐννοεῖς], that is, "I apprehend the meaning" [ἔχω στο νου μον, or again, συλλαμβάνω στη σκέψη μου]. Further, in his philosophy manual for students, P. Roulia observes that Parmenides "found in thought (σκέψη) the stability necessary for knowledge. However, he was led to identify thought (σκέψη) and reality." And his celebrated statement (fr. 3 DK, τὸ γὰρ αὐτὸ νοεῖν τεναὶ εἶναι) means: "When we think (σκεφτόμαστε), we determine things (νου) with our intellect. Our thought (νόηση) thus is identified with reality. Reality is as a consequence intelligible (νοητή)." Roulia worries at this point whether students will clearly understand what is at issue here, where three processes may be confused: reflecting, thinking, and apprehending—but many philosophers are in the same position.

Tzavaras, who is currently the most inventive translator working in the field of ancient Greek philosophy, often reserves the ancient Greek for the pre-Socratics, but he takes more chances when translating Plotinus and the German thinkers. As to the first, in his anthology of several texts of the *Enneads* (30–33), he opts in favor of *skeptomai* to translate *phronô*, *noô*, and *dianooûmai*. For example, "They are as

good as gods, insofar as they do not think (δενσνέπτονται) sometimes correctly and sometimes wrongly, but think (σνέπτονται) always what is correct in their intellect (μέσα στο νου τους)" (5.8.3.23–25: καλοὶ δὲ ἤθεοί. οὐ γὰρ δὴ ποτὲ μὲν φρονοῦσι, ποτὲ δὲ ἀφραίνουσιν, ἀλλ' ἀεὶ φρονοῦσιν ἐν ἀπαθεῖ τῷ νῷ). Further, even though he has a tendency to preserve the terms *dianoia* and *noêsis*, he sometimes translates "the thoughts" (*hai noêseis* [αἱ νοήσεις]) by "the thoughts of the intellect" (*skepsis tou nou* [σνέψεις του νου]) (5.5.1.24). Additionally, although he translates νοῦς νοῶν by νοῶνν ους, he suddenly changes direction and translates: "however, when you think it (ὅταν ὅμως τον σνέπ τεσαι) . . . , think (σνέψου) that it is a matter of the good, for as the productive cause of the reasonable (ἔλλογης) and intellective (νοητινῆς) life, it is a power of life and the intellect (νου)" (5.5.10.9–12: ὅταν δὲ νοῇς . . . , νόει τἀγαθόν—ζωῆς γὰρ ἔμφρονος καὶ νοερᾶς αἴτιος δύναμις ὢν [ἀφ' οὗ] ζωῆς καὶ νοῦ).

Given this situation, would not a reverse attitude, reducing all the semantics expressing "to think" and "thought" to that of *skepsis* and *skeptesthai*, have a better chance of expressing what is at issue? This option was taken up by Vayenas to translate some of Heidegger's texts from the *Wegmarken*, using *skepsis* for "thought" most of the time, regardless of the philosopher in question (Parmenides, Descartes, Kant, and Hegel). Parmenides's fragment 3, where it is said that "thinking and being are the same," now becomes: τὸ ἴδιο εἶναι σνέψη καὶ εἶναι. Regarding Kant, he specifies that "I think" (*skephtomai* [σνέφτομαι]) means: "I link up a given variety of representations" (which corresponds to "judge"). Further, he translates *tranzendentale Überlegung* or *Reflexion* by "reflection/transcendental thought" (*huperbatiki skepsi* [ὑπερβατινὴ σνέψη]), *Reflexion-begriffe* by "apprehensions of thought/reflection" (*antilipsis tis skepsis* [ἀντιλήψεις τῆς σνέψης]), and *Sein und Denken* by "to be and to think" or "Being and thinking" or "Being and Thought" (εἶναι καὶ σνέψη). The Hegelian usage of the Cartesian *ego cogito sum* is rendered as "I think, I am" (σνέπτομαι, εἶμαι)—which we also find in many other works, including high school philosophy manuals. Finally, the Heideggerian formula of "Western thought" is rendered by *dytiki skepsi* [δυτινὴ σνέψη], which resembles common expressions like "modern Greek thought," "socialist thought," whereas one could use *dianoisi* [διανόηση] and *stochasmos* [στοχασμός]. The massive presence in Vayenas's work of the semantics of *skepsis*, no doubt owing to his desire to conform to contemporary linguistic usage, accentuates the confusion and justifies the position of those who wish to return to a pre-Skeptical semantics. These vagaries show how difficult "thought" and its cognates are to translate into modern Greek, if only because the dominant translation by *skepsis* at bottom tends to mean "reflection" rather than "thought."

C. *Ousia, huparxis, hupostasis*: Essence and existence

At first sight, *ousia* [οὐσία] should not pose a problem in modern Greek, since it is commonly used today to indicate the essence and nature of something. However, the evolution of the sense of the term, beginning in antiquity, has greatly complicated the task of modern Greek philosophers. The meaning already shifted importantly between Plato and Aristotle, as the first conceives *ousia* in the common sense of

"property" (material goods) and in the philosophical sense as the essence of something, whereas the latter adds other meanings, available and obligatory as a result of identifying *ousia* and *hupokeimenon* [ὑποκείμενον] (this identification requires him to designate by *ousia* sometimes the *eidos* [εἶδος], "form, species, or specificity"; sometimes the composite of matter and *eidos*; and sometimes matter itself). The Stoics in turn envisage *ousia* as an indeterminate substrate, whereas Medioplatonist and Neoplatonist thinkers return to the sense of "essence," and Christology assimilates *ousia* and *hupostasis* [ὑπόστασις], enriching *ousia* with other values, which modern Greek no longer commands.

In addition, the Latin translation of *ousia* by *substantia* creates problems for Greek translators, thenceforth confronted with new philosophies, coming from the Renaissance and modernity, where the notion of substance becomes central. Although they take this mediation more and more seriously, and translate "substance" not by *ousia* but by *hupostasi*, they are usually satisfied with standardizing *ousia* for antiquity and the Byzantine Middle Ages—by not translating it.

The problem arising from the pair "essence"/"existence" is thenceforth rendered very complex. Let us take Vikentios Damodos (d. 1752) as a guide. Trained in Aristotelianism in the Flaginian school in Venice and Padua, he was an adept of nominalism and was influenced by Descartes and Gassendi. He associates *ousia* and *huparxis* [ὕπαρξις] (existence), starting with the Thomist notion of "composite substance" constituted by essence (*essentia*) and being as existence (*esse*)—even though this is for him a conceptual and not, as it was for Aquinas, a real distinction. Damodos knows that in Thomism, the individual substance is not to be confused with the essence, since the latter must combine with being or existence to form substance. However, this distinction was constantly obscured by modern translators when they dealt with philosophies that give accounts of substance, from the Middle Ages to the Renaissance and the modern era. Logothetis, for example, translates *substantia* and *essentia* by *ousia*. He even magnifies the confusion by specifying that Nizzoli considers that *ousia* signifies particular things (*ta kath' hekaston* [τὰ καθ' ἕκαστον]). Tzavaras, aware of the difficulties, is the only one to have taken a different path, choosing in his anthology of texts of Plotinus to translate *ousia* by "to be" (*einai* [εἶναι]). These confusions in the use of a term as important as *ousia* reveal that the word is not only untranslatable in French or English (where it is rendered by "essence," "substance," "reality," "being"), but is equally so in Greek. Moreover, once medieval and modern mediation comes in, associating with *ousia* the notion of "substance" conceived by Thomism according to the unity of *essentia* and *esse* (and *existentia*), things get out of hand entirely.

Let us then start over, beginning this time from the verb *huparchein* [ὑπάρχειν]. It initially meant "to begin," "to be at the origin of," "to take the initiative"; then, "to exist prior to"; and then, "to be at the disposal of"; and finally, "to belong to." The latter sense is used in logic to express "attribution." Aristotle writes, for example, "If A is not attributed to any B, B will not be attributed to any A," or "If A is not an attribute of any B, then B will not be an attribute of any A" (εἰ . . . μηδενὶ τῷ Β τὸ Α ὑπάρχειν, οὐδὲ τῷ Α οὐδενὶ ὑπάρξει τὸ Β; *Prior Analytics* 1.2). The sense of "attribute" conceived as a mode of belonging may be understood as "that which contributes to something," near the common usage "to be at the disposal of something or someone." It is in this sense that we use the expression *ta huparchonta* [τὰ ὑπάρχοντα]: *ta huparchonta* designates the present situation, existing things. This sense of the expression thus opens onto the question of existence. While in antiquity, the expression's ambivalence is the order of the day, the evolution of the language went in favor of simplification, to the advantage of the sense of "to exist."

This modern usage of *huparchein*, to mean the existence of something or other, had to confront in our own time the problem of translating *existence* as used in existentialism, which assigns existence only to humans. The very name of this school of thought already sets in contrast two terminologies: *huparxismos* [ὑπαρξισμός] and *existentialismos* [ἐξιστενσιαλισμός]. Today, the first expression is generally preferred to the calque. The name of a philosophical school is of course no more than a matter of convention, but the translation of the concept of existence itself reveals more tenacious difficulties. Thus, when Malevitsis translates, in 1970, Jean Wahl's book *Les philosophes de l'existence*, he chooses *hupostasis* [ὑπόστασις], and not *huparxis* [ὕπαρξις], to render *existence*. Malevitsis bases his decision on Heidegger's and Jasper's refusal to be identified as existentialists, and seeks to avoid the confusion between the ontic existence of beings and the existence proper to humankind. This is why he avoids the traditional translation by *huparxis*. The idea is important, for since antiquity, the semantics of *huparchein* has lost its secret complicity with the subtleties of the semantics of *archê/archô/archomai* (principle and beginning, foundation/I command/I begin). The term *hupostasis*, however, also has a long history, which is rooted in Neoplatonism and in Christology, reaching its culmination with the formation of the term *substantia* (substance). The interference with the question of "being" increased the opacity of its meaning to such an extent that even Malevitsis is forced to add the term *huparxis* in brackets to avoid confusion.

Thus, the analysis of the most important words in ancient philosophy can give no comfort to translators who believe in the transparency of meaning, even though they are Greek-speakers.

GUT / BÖSE, WOHL / ÜBEL (WEH), GUT / SCHLECHT (GERMAN)

ENGLISH	good/evil, good/bad
FRENCH	*bien/mal*, *bon/méchant*, *bon/mauvais*
LATIN	*bonum*, *malum*

➤ GOOD/EVIL, and BEAUTY, FAIR, GLÜCK, MORALS, PLEASURE, RIGHT/JUST/GOOD, WERT, WILL

Two examples, Immanuel Kant and Friedrich Nietzsche, reveal the link formed in Germany between reflection about good and evil and reflection on the powers of language. Formally, the two philosophers have in common the splitting up of the objects of reflection, adding to the initial pair of "good" (*gut*) and "evil" (*böse*) a second pair, *wohl/übel* or *gut/schlecht*. This in turn requires studying not only the contrast each pair presents, but also the contrast between the pairs.

I. The Kantian Split: Sensibility and Pure Reason

The second section of the Analytic of Pure Practical Reason of the *Critique of Practical Reason* is distinguished by unusual attention on Kant's part to the singularity and power of languages. Good and evil are studied there as "the sole objects of a practical reason" (Kant, *Gesammelte Schriften*, 5:57, trans. Pluhar, 78)—the only two objects possible, according to Kant, since any other object "taken as a principle determining the faculty of desire" makes the will lose its autonomy. Further, these two objects themselves, good and evil, must have a secondary status: they are determined by the moral law, which precedes them as it precedes all content in pure practical reason. This is what Kant calls the "paradox of method in a Critique of practical reason" (218). The demonstration begins by appealing to the "use of language [*Sprachgebrauch*]," which distinguishes the good (*das Gute*) from the pleasant (*das Angenehme*) and excludes the grounding of good and evil on objects of experience, that is, on the feeling of pleasure and pain. Kant can then deplore the "limitation of the language" (80), visible, according to him, in the Scholastic uses of the notions of *bonum* and *malum*, which do not permit a distinction on this point. Latin's ambiguity is best seen in its contrast to German, which, Kant notes, does not countenance it—for which, Kant says, praise is due to the language:

> The German language is fortunate to possess the expressions that keep this difference from being overlooked. It has two very different concepts and also equally different expressions for what the Latins designate by a single word, *bonum* [or *malum*]: for *bonum* it has *das Gute* and *das Wohl*; it has *das Böse* and *das Übel* (or *Weh*), so that there are two quite different judgments according to whether in an action we take into consideration its good and evil or our well-being and woe (bad).
>
> (Kant, *Gesammelte Schriften*, 5:59–60, trans. Pluhar, 80–81)

German thus divides in two the single opposition *bonum/malum*: into *wohl/übel*, which relates to the agreeable or disagreeable state in which the subject finds himself; and *gut/böse*, which always "signifies a reference to the *will* insofar as the will is determined by the *law of reason* to make something its object" (*Gesammelte Schriften*, 5:60, trans. Pluhar, 81).

Here, the French translator, Francis Picavet, can do nothing but preserve the original terms in italics. This is Picavet's version of Kant's comment:

> La langue allemande a le bonheur de posséder des expressions qui ne laissent pas échapper cette différence. Pour designer ce que les Latins appellent d'un mot unique *bonum*, elle a deux concepts très distincts et deux expressions moins distinctes. Pour *bonum*, elle a les deux mots *Gute* et *Wohl*, pour *malum*, *Böse* et *Übel* (ou *Weh*), de sorte que nous exprimons deux jugements tout à fait différents lorsque nous considerons dans une action [ce]

qui en constitue ou ce qu'on appelle *Gute* et *Böse* ou ce qu'on appelle *Wohl* et *Weh* (*Übel*).

Picavet's discomfort is well expressed by his note to this passage: "By replacing the German words that Kant is attempting to *define* with French words, we could only give a false expression of the thought: their meaning is made clear by their context" (61 n. 2).

The context here is a doubled contrast that French cannot denote: although French does have the pairs of synonyms that Kant adds to clarify what he means by *wohl* and *übel* (*Annehmlichkeit* and *Unannehmlichkeit*; *agrément* and *désagrément*, namely "agreement" in the sense of "agreeableness," and "disagreement" in the sense of "what disagrees with one"; *Vergnügen* and *Schmerze*; *contentement* and *douleur*; "pleasure" and "pain" [*Gesammelte Schriften*, 5:58–59; trans. Picavet, 60]), it has no words other than *bien* and *mal* to render *Gut* and *Böse*, notions of good and evil that, according to Kant, do not belong to morality.

Kant's praise of German is a delicate interpretive matter. The first French translator of the *Critique of Practical Reason*, Jules Barni (1848), applies the criticism addressed to Latin to French as well, but for Kant it is no doubt less a matter of exalting his mother tongue than, in the spirit of the Enlightenment, of criticizing Scholasticism and its language.

II. Psychological Qualifications or Moral Values?

French is not, in fact, limited to the pair *bien*/*mal*; it also has the pair *bon*/*mauvais*, "good"/"bad," on which Picavet sometimes relies for translating matters related to sensation (cf. 60: "le concept de ce qui est tout simplement *mauvais*," "the concept of what is simply *bad*," for "schlechthin Böse," *Gesammelte Schriften*, 5:58). There is nevertheless a reason why this new pair does not allow us to resolve the difficulty. The two pairs *bien* and *mal* and *bon* and *mauvais* are not of the same grammatical nature. German, however, is able to retain the pairs' grammatical parallelism, since the (somewhat antiquated) pair of adverbs *wohl*/*übel* may be replaced by *gut*/*schlecht*; both are adverbial and adjectival, and thus grammatically parallel to *gut*/*böse*. New difficulties then appear, however, as witnessed by the translation of the first essay of Nietzsche's *On the Genealogy of Morality*.

The title given to this essay, "Gut und Böse, Gut und Schlecht," was translated into French as "Bon et méchant, bon et mauvais." A new split takes place: this time that of two "evaluations" (cf., e.g., §2 and §7, in *Werke*, 6.2:273 and 280; trans. Hildenbrand and Gratien, 21 and 30; trans. Diethe, 12 and 21), of two ways to impose value judgments on reality, namely that of slaves and that of the noble or powerful. Their relations have two main characteristics. First, the splitting of these evaluations reveals that there is a more fundamental division than that of good and evil, that which contrasts the high and the "low" (*einem "Unten"*), the superior and the inferior (§2). Second, and above all, the conflict does not just run through both pairs, but rather opposes them to one another, the bad according to the slaves being "*precisely the 'good' of the other morality*" (§11, in *Werke*, 6.2:288, trans. Diethe, 24). According to Nietzsche, the two oppositions form a system, and this system has a history—the age-old

and "frightful combat" between "two *opposite* values 'good and bad,' 'good and evil'" ("*die beiden entgegengesetzten Werte 'gut und schlecht,' 'gut und böse,'*" §16, in *Werke*, 6.2:299, trans. Diethe, 52)—insofar as it does not (as in Kant) contrast two human faculties (sensibility and pure reason), but rather different and unequal *men*.

It is precisely on reaching the work's conclusion that the French translation reveals its limits:

> Grund genug für mich, selbst zu Ende zu kommen, vorausgesetzt, daß es längst zur Genüge klar geworden ist, was ich *will*, was ich gerade mit jener gefährlichen Losung will, welche meinem letzten Buche auf den Leib geschrieben ist: "*Jenseits von Gut und Böse*." . . . Dies heißt zum mindesten *nicht* "Jenseits von Gut und Schlecht."

> Car on aura compris depuis longtemps ce que c'est que je *veux*, ce que je veux justement avec ce mot d'ordre dangereux qui donne son titre à mon dernier livre: *Par-delà bien et mal* (*Jenseits von Gut und Böse*). . . . Ce qui du moins *ne veut pas* dire: "Par-delà bon et mauvais" (*Dies heisst zum mindesten nicht: "Jenseits von Gut und Schlecht"*).

> Assuming that it has been sufficiently clear for some time what I *want*, what I actually want with that dangerous slogan which is written on the spine of my last book, *Beyond Good and Evil*. . . . At least this does *not* mean "Beyond Good and Bad."

> (§16, in *Werke*, 6.2:302, trans. Diethe, 36)

Here, suddenly, the translation of "Gut und Böse" by "bon et méchant" disappears, pushed off the page by the pair "bien et mal." This is not a small detail, since *On the Genealogy of Morality* is intended, as its subtitle reminds its readers, "to complete and clarify the recently published *Beyond Good and Evil*." The translation "bon et méchant," "good and bad," is not at all imprecise, and it works for everything that has gone thus far; the problem is simply that "Gut und Böse" is both adjectival and adverbial, and means *both* "bon et méchant" and "bien et mal," that is, both the psychological qualifications associated with the adjectives and the more strictly moral qualifications associated with the adverbs. With the adjective *bon*, French can render the indeterminacy of Nietzsche's *Gut*, which appears in both pairs of words, and whose meaning varies precisely depending on whether it is inserted in one or the other; on the other hand, for *Gut* and its antonym, French finds itself required to choose between an adjective ("bon et méchant") and an adverb ("bien et mal"), that is, between a psychological style and a moral style, which Nietzsche's method distinctively refuses to separate. With respect to what we saw in Kant, the problem is thus reversed. It is not that French does not have enough distinctions, but that it has too many: *bien* and *mal* crowd onto *bon* and *méchant* and *bon* and *mauvais*.

We should note that Nietzsche's method aims from the start to be linguistic as well, from its reflections on "the right of the masters to give names" (§2, in *Werke*, 6.2:273, trans. Diethe, 13), through to the final question on the contribution of "linguistics, and especially the science of etymology," to "the history of the evolution of moral sentiments" (§16, in *Werke*, 6.2:303, trans. Diethe, 37). It is furthermore tempting

to search out the Greek in Nietzsche's German, especially in the pair *gut/schlecht*, which is, so to speak, retranslated from the pair *agathos/kakos* [ἀγαθός/κακός] (§5). Nietzsche's "good" thus makes us hear the Greek untranslatables *kalos kagathos* [καλὸς κἀγαθός] (see BEAUTY) and *eu prattein* [εὖ πράττειν] (see PRAXIS) (§10), which make his *gut* appear in its two primary dimensions, distinction and activity.

Despite the link of German with Greek, affirmed several times in *On the Genealogy of Morality*, Nietzsche, unlike Kant, does not grant any privilege to the German language. German, for him, does certainly provide exemplary confirmation of the genealogy of evaluations, deriving *schlecht* (bad) from *schlicht* (the senses of "simple," then "base," "of low birth," are listed in the Grimms' dictionary [RT: *Deutsches Wörterbuch, s.v.*], flowing from the senses of "right," "flat or straight"), but it remains the case that "the expressions of the 'good' in the different languages . . . all refer to *the same transformation of the concepts*" (§4, in *Werke*, 6.2:275, trans. Diethe, 14). Here again, the interpretation will differ, depending on whether we stress the progress of the sciences of language or the alleged origin of the "beautiful *blond beast*"—which Nietzsche says, however, might be "Roman, Arabic, Germanic, or Japanese" (§11).

GREEK	*esti* [ἔστι]
SPANISH	*hay, haber*

➤ *IL Y A* [ES GIBT, ESTI], and ASPECT, FICAR, PRESENT, REALITY, SPANISH, *TO BE*

The French *il y a* and the German *es gibt* may be translated into Portuguese (and analogously into Castilian Spanish) by three distinct impersonal verbs: (1) *há*, from the verb *haver* (derived from the Latin *habere*), constructed with neither subject nor adverb but taking an object; (2) *tem*, from the verb *ter* (from the Latin *tenere*), which absorbed all the possessive meaning of *haver*; and finally, in a more elevated, literary, and philosophical register, (3) the pronominal form *dá-se,* analogous to *es gibt*, whose origin is the passive form of the Latin, *datur*. Their usage is not always interchangeable, which emphasizes the semantic differences of the three verbs (in addition to the etymological ones) and may help us see the difference between *il y a* and *es gibt*.

I. The Meaning of *Há*, without a Subject

The Portuguese verb *haver* (*haber* in Spanish) has the same origin as the verb *avoir* (French) "to have": the Latin *habere*. However, it is the Portuguese verb *ter*, much more often than *haver*, that is most often translated into French by *avoir*. *Haver* lost its possessive sense and was replaced by *ter* for such purposes. It has retained auxiliary functions, both aspectual and modal; some rare uses as a main verb with very specific meanings; and above all, the impersonal existential function. This limitation created its meaning and makes it one of the most important verbs in Portuguese, alongside the verb *ser*, "to be," for any fundamental ontological questioning. In a note to her translation of Heidegger's *Being and Time*, for example, Marcia Cavalcante appeals to the sense of the verb *haver* to explain the specific usage of the German verb *geben* in the expression *es gibt*, even though she chooses to translate it by the Portuguese form equivalent to the German, *dá-se*:

> To distinguish the ontological level of the establishment of structures from the ontic level of derivations, *Being and Time* reserves the verb *to give* [*dar-se*] (*geben*), and thus inserts [*incutindo*] the active and transitive meaning in the process referred to by the verb *haver*. As a consequence, to give [*dar-se*] always refers to the movements of being and to its truth in presence, in existence, in temporality, in history.
>
> (*Ser e tempo*)

In its standard meaning, *há* requires neither a subject, real or apparent, nor an adverb of place. The lack of a subject

does not pose any grammatical problems in Portuguese; for personal verbs, it is even stylistically desirable insofar as the personal endings are, as in Latin, clearly distinct (*amo, amas, ama, amamos, amais, amam*), unlike in English or French, where they cannot be distinguished phonetically without a subject pronoun ([I] love; [you] love; [he] loves; [they] love). The word once functioned as an adverb of place, as in this sentence by a sixteenth-century grammarian: "E por não ficar confusão em este nome próprio, pois i há muitos homens que têm um mesmo nome" (And so there should be no confusion in this proper name, for there are many men who have the same name; J. de Barros, *Gramática da língua portuguesa*), but that usage gradually disappeared from the verbal expression. There remains only the direct object of the verb: what is projected toward existence. The direct object of *há* cannot be confused with a subject; *há*, like any impersonal verb, is invariant and of course never agrees with its complement in gender or number: *há flores no prado* (there are flowers in the prairie). Indeed, if we needed to find a "real subject," we would rather have to look to the now-vanished adverb of place, which had the logical role of a whole containing the objects, as explained by Mattoso Câmara:

> We may understand it from the usage of *habere* in existential phrases of vulgar Latin, when a noun of place stood first as a subject, for example . . . "Africa has lions." The shift towards an impersonal construction took place when we perceived the place as a "décor" rather than as a "possessor." This yields its presentation with the preposition *in* or its expression by the adverb *ibi* (Arch. Port. *hi*, Fr. *y*, etc.): "*in arca Noe habuit homines I*" (Bourciez, 1930). Everyday Brazilian shows that this is a natural inclination of the mind, as it reproduces the change, this time with the verb *ter* [to have, to possess], in the same conditions: "in Africa [there are] lions (*na Africa tem leões*)." We may say that the place name, which was first a subject, was integrated into the fact or the predicate considered in itself, without reference to a possessor external to it.
>
> (*Princípios de ligüística geral*)

Haver and *ter*, in their existential usage, are constructed in exactly the same way, even though there is always a difference of nuance. *Ter*, even as an auxiliary or existential, retains the reassuring and solid aspect of possession. The poet Carlos Drummond de Andrade uses *ter* to refer to a stone encountered on the road: "Tinha uma pedra no meio do caminho" (very roughly, "was a stone in the middle of the road" or "had a stone in the middle of the road" [*Reunião*]; note the absence of "there" or a pronoun, personal or impersonal, such as "one," "he," or "we" in the translations). The verb *haver* could replace *ter*, but the verse would lose

its gravity. In contrast, the idea of flourishing, escape, and suppleness of this other verse would completely disappear without *haver*: "Minha alma é uma lembrana que há em mim" (My soul is a memory which is in me; Pessoa, *Poemas inéditos*). In this case, more than being an object which I solidly own, the soul, Pessoa tells his readers, is the eruption of an object, "a memory" in the region of the "I."

The absence of the subject and the adverb of place in Portuguese yields an idea of presence in the world, instantaneous, without any other support than its arrival itself, a starting point neither substantial nor subjective, for anything that exists—like a *satori*, the zen event, which Barthes defines as "a more or less powerful (though in no way formal) seism that causes knowledge, or the subject, to vacillate: it creates an emptiness of language [un *vide de parole*]" (*L'empire des signes*). We may almost always translate *haver* by way of a phrase based on the verb "to have," but we cannot translate this lack of subject, which marks its existential meaning. We cannot render the effect of suspension that it produces in its object by projecting it from nowhere into presence: "Há um azul em abuso de beleza" (There is some blue as the height [or trespass or misuse] of beauty; M. Barros, *O livro das ignorãcas*).

II. *Haver*, the Future, and the Expression of the Future

Neither can we render *haver*'s projective aspect, which anticipates and both outstrips and shoots forth existing objects and the pure event of the future. According to the syntax of the verb *haver*, everything that is posited as real (*isto que há*, lit., what [there] is) gets its existence in an élan that is open in the present. Presence becomes the opening of the future, which, reigning in the power of the possible, anticipates and supports what exists. Thus, "the future" is called *o que haverá* (lit., what will have) by António Quadros, where determination is disclosed by a difference from, and even a surpassing of, the possessive sense of *ter* (to have / to possess):

> The future [*o que haverá*] is not yet what is eternally [*não é ainda o que é*] but nor is it already what one is in space time [*não é já o que se é*], it is rather the open and endless horizon of freedom. The future [*o que haverá*] is not what one will have [*o que se terá*] either, but precisely what will transcend having and being had [*o ter e o sermos tidos*—*sermos tidos* is the past personal infinitive of the verb *ter*, to have, in the first person plural; see PORTUGUESE, Box 2], a participation in movement, which never is fulfilled in possession.

> (*O espírito da cultura portuguesa*)

It is significant that the idea of a "future" should be framed by a Portuguese philosopher based on the meaning of the verb *haver*. The verb *haver* keeps alive expressions in Portuguese from which flow the future forms in neo-Latin tongues. Benveniste notes a similar phenomenon regarding the origin of the future in Romance languages, coming from a progressive extension of predictions and prophecies, a shift that is "born among Christian writers and theologians beginning with Tertullian (at the beginning of the third century BCE)" (*Problèmes de linguistique générale*, 2:131). This event in the history of languages is comparable to what happened synchronically in contemporary Portuguese (2:132):

> The syntagm *habere* + infinitive coexisted for a long time with the old future, without crossing it, since it conveyed a distinct notion. There were thus two expressions for the future: one as intention (this is the simple form with -*bo*, -*am*), the other has predestination (this is the syntagm: "what is to happen" > "what will happen."

In Portuguese, this ancient verbal syntagm, *haver*, followed by the infinitive of the main verb, no longer coexists with the earlier Latin future but rather with the future from Romance languages in which the verb *habeo*, reduced to a suffix, becomes a simple verbal ending. This recent simple future takes over the intentional meaning of the old Latin future. Thus the two expressions for the future coexist in this sentence from a contemporary writer:

> . . . os ímanes que, na sua aldeia, hão-de fazer voar a passarola, cujos, ainda por cima, terão de vir do estrangeiro . . .

> (. . . the magnets which in his village *must make* the aerostat fly, which furthermore must come from abroad . . .)

> (Saramago, *Memorial do convento*)

The mesoclitic pronoun (the unstressed pronoun object, *lhes* in the example below, is inserted between the radical—the infinitive of the verb—and the ending of the conjugated verb in the simple future of the pronominal voice) highlights this formation of the future in Portuguese:

> Aos que têm seara em casa, pagar-lhes-ão a semeadura; aos que vão buscar a seara tão longe, hão-lhes de medir a semeadura e hão-lhes de contar os passos.

> (To those who have fields at home, we will pay for the seeds; to those who go far to find fields, we will measure the seeds and count the steps.)

> (Vieira, *Sermão da sexagésima*)

This notion of projection, of blooming forth, cuts across most contemporary uses of *haver*, as a future auxiliary as well as an impersonal verb referring to existence. Thus, inasmuch as it refers to this bursting forth into presence, *há* is similar to the Greek *esti* [ἔστι], or in the plural *eisi* [εἰσί], put at the head of a sentence, which is usually followed by a subject with which it agrees. The difference is that in Portuguese what would be the "real" subject is not at all understood nor analyzed as a subject, but really as an object, thrown in front. The future projects itself as an object, and the real anticipates itself—since, from the very start, *há* what is.

HAPPINESS

The difficulty of the notion of happiness (luck, good fortune, prosperity, joy, felicity) has to do with the fact that it is located in a double register: the moral and even religious horizon of the goals of life (see *VIRTUE,* and in particular VIRTÙ), but also the entirely contingent register of the chance aspects of life (see DAIMÔN, *DESTINY,* and particularly KÊR). The English term "happiness" thus preserves an etymological connection to a sense of "coming or happening by chance; fortuitous; chance" (RT: *Oxford English Dictionary*, s.v.). In the French term *bonheur*, these different perspectives are now collected in the problematics of satisfaction: see PLEASURE.

The group of terms created in German on the basis of *Glück* and *Seligkeit* has the advantage of reflecting the initial complexity of the Greek words that it seeks to translate (*eutuchia* [εὐτυχία], *eudaimonia* [εὐδαιμονία], *olbos* [ὄλβος], *makariotês* [μακαριότης]), as well as that of the Latin (*felicitas*, *beatitudo*), of which French retains only the religious connotations. Compare the English, however—as in Hamlet's dying words to Horatio: "If thou didst ever hold me in thy heart, / *Absent thee from felicity* awhile, / And in this harsh world draw thy breath in pain" (Shakespeare, *Hamlet*, 5.2). In addition, German has created the term *Wohlfahrt*, from the adjective *wohl* (good), borrowed by the English "welfare" to designate material prosperity; it is remarkable that French persists in the religious lexicon by translating "welfare state" as *État-providence*; cf. *BIEN-ÊTRE.*

In almost all European languages, then, happiness is synonymous with luck or good fortune, the advantages we receive by chance. German, however, with the difference between *Glück* and *Glückseligkeit*, seeks to strengthen (in the tradition of Aristotle's distinction between *eutuchia* and *eudaimonia*) an opposition between the moral goal ("happiness" that pertains to the innermost spiritual life) and favorable contingency.

The problems raised by these different terms are discussed in the entry GLÜCK.

➤ DUTY, *GOOD / EVIL*, MORALS, *VALUE*

HEART

I. An Essential Organ

The French word *cœur* (like the Eng. "cardiac") derives from the Latin *cor, cordis*, which itself derives from the Greek *kardia* [καρδία], a word that is connected with the Indo-European root [*k̑ērd-] (whence the Ger. *Herz*, the Russ. *serdtse* [сердце]), which designates an essential organ. But when we compare Greek, Latin, or the Semitic languages, we see that the organs and their functions are far from coinciding in all these languages or at different historical stages so that the word "heart" can serve to translate more than one organ (in Greek, for example, *kêr* [κῆρ], *kardia* or *thumos* [θυμός]), and yet each time "heart" is only one of the possible translations: see in particular CONSCIOUSNESS (esp. Box 1), GEMÜT, GOGO, LËV, SAMOST', SOUL (esp. Boxes 3 and 4).

II. Metaphors and Oppositions

"Heart," which names the central organ in the circulation of the blood and is used by extension for the chest or stomach, comes to designate the seat of the humors and feelings, for example, love but also courage (derived from *cor*). This latter can be located in other cultures and especially in antiquity in the liver, the lungs, or breath (Gr. *thumos*, Lat. *animus*). See, in addition to SOUL and CONSCIOUSNESS, the Italian VIRTÙ; see also ACEDIA, LOVE, MELANCHOLY, PATHOS, and, more generally, *MALAISE.*

As the seat of the feelings and affections, the heart can represent either another source of knowledge—for example, when Pascal declares that "in reality, we know truth not only through reason, but also through the heart" (*Pensées*, 110)—or even the antonym of reason, as when Pascal writes, "The heart has its reasons that reason does not know" (ibid., 423): see LOGOS, MADNESS, *REASON* [INTELLECT, INTELLECTUS, UNDERSTANDING], *TO SENSE.*

In certain spiritual traditions the heart is considered to be the innermost core of the personality. Thus the Bible, also taking into account other internal organs, declares that God is a "searcher of heart and soul" (literally, kidneys and hearts) (Ps. 7:10). Many other passages in the Hebrew text, which are taken over and completed by the Christian scriptures, accord this metaphor a major role: "I will give them one heart, and put a new spirit within them; I will take the stony heart out of their flesh and give them a heart of flesh" (Ezek. 11:19); see LEIB and LËV.

Thus the heart designates what is essential in each thing, its essence. See LËV and cf. ESSENCE, *TO BE*, TO TI ÊN EINAI.

➤ GENIUS, INGENIUM, WILL

HEIMAT (GERMAN)

ENGLISH   homeland
FRENCH   *terre natale*

➤ *FATHERLAND* and CIVIL SOCIETY, DESTINY, OIKEIÔSIS, PEOPLE, PROPERTY, WORLD

Heimat, which is often translated as "homeland," refers, like *Vaterland* (fatherland), if not to one's explicit place of birth, at least to one's place of origin. However, whereas the latter refers explicitly to a genealogy (the *Vaterland* is the *Land des Väters*, the country of one's father), the belonging that is implied by *Heimat* is more complex. *Heimat*, which comes from *Heim* (home, domicile), is in effect the land where one stays and is settled and where the dimensions of the homeland and the home become mixed. It is the place that is ours (or the one that has become it) since it is either destined for or appropriated by us. Unlike *Vaterland*, it thus refers to the proper place, in a sense that is more ontological than genealogical. Different uses, including political ones, result for both terms.

I. *Vaterland*: Belonging through Birth and Political Community

In addition to its first meaning, *Vaterland* acquires a political meaning starting in the eighteenth century. To have a *Vaterland*, a fatherland, is to belong to a public community, which gives (or at least ought to give) a right to citizenship. It is public, insofar as it is clearly identifiable, for everyone, by birth. Thus, Kant writes in his *Rechtslehre* (*Doctrine of Right*) in §50:

> A *country* (*territorium*) [*das Land*] whose inhabitants [*Einsassen*] are citizens [*Mitbürger*] of it [*gemeinen Wesens*] simply by its constitution, without their having to perform any special act to establish the right (and so are citizens by birth [*mithin durch die Geburt*]), is called their *native land* [*Vaterland*].

> (Kant, *Doctrine of Right, Metaphysics of Morals*, 110)

The *Vaterland* is thus a community to which one belongs de facto. It does not require any particular appropriation. At the same time it is that which naturally gives the right to citizenship. It constitutes a sort of precitizenship. This is shown by the fact that citizenship requires, in return, an attachment to the *Vaterland*, a debt that is manifested notably in an obligation with regard to defense, or even sacrifice. The whole problem of politics is thus to know how to acquire citizenship without having a prior identification of this public community, how to become a citizen of a country when the latter is not one's *Vaterland* by birth, the *Land* (country) of one's fathers.

II. *Heimat*: Ontological Rootedness

Heimat directs the question of belonging in an entirely different way. In general, *Heimat* may refer simply to the place where something has occurred—an invention or a work—the place of birth attributed to it. However, this very generality lends itself to an ontological inflection. *Heimat* is less the place that someone or other recognizes as his own, like a place of birth, than the place where one is and becomes what one was destined to be and become, one's proper place. As a

place of destination (or even mission), *Heimat* then becomes what allows a being to manifest itself and develop, to reveal its essence. That kind of inflection is already noticeable in Hegel's philosophy of history, including that which undergirds his own history of philosophy. Thus, he may write, regarding the Greeks,

> But what makes us specially at home [*bei ihnen ist es uns heimatlich zu Mute*] with the Greeks is that they made their world their home [*sich selbst ihre Welt zur Heimat gemacht haben*]; the common spirit of homeliness unites us both.

> (Hegel, *History of Philosophy*, 150)

However, making one's world a *Heimat* means nothing other than welcoming the *Weltgeist*. *Heimat* is thus the place where the *Weltgeist* (the spirit or mind of the world) is manifested:

> This region, which was long the theatre of world history, does not have a clearly defined nucleus of its own, but is oriented outwards, looking towards the Mediterranean. While the middle and north of Europe were still uncultivated, the world spirit [*Weltgeist*] had its residence [*Heimat*] there.

> (Hegel, *Philosophy of World History*, 195)

It is in Heidegger's work above all that this ontologicization of *Heimat* is most fully developed. For it is defined first with regard to its loss and absence (*Heimatlosigkeit*). *Heimat* is in effect the birthplace in which a man finds himself rooted, the closest place. And this rootedness means first of all that he may develop there, in conformity with his being. In the proximity and familiarity of this place, understood as a gift, he finds the source of a meditative thought and a work. Thus the address *Gelassenheit* ("Serenity") begins in these terms:

> I thank my homeland [*Heimat*] for all that it has given me along the path of my life.

> (Heidegger, *Discourse on Thinking: Translation of* Gelassenheit)

From this flows the three-fold questioning that governs Heidegger's thought with respect to *Heimat*:

1. Is the rootedness of the work (beginning with the work of thinking) not necessary to its production?

   We grow thoughtful and ask: does not the flourishing of any genuine work depend upon its roots in a native soil [*die verwurzelung im Boden einer Heimat*]?

   (Ibid.)

   What *Heimat* connotes is thus the idea of a proper basis (*Grund*) understood as a ground (*Boden*) or a land, "the depth of the native soil [*die Tiefe des heimatlichen Boden*]" (ibid.).

2. The appropriation of *Heimat* is thus the object of a summons that, if it is not directly political in itself, leads all politics to this demand for rootedness in a land (*die Bodenständigkeit*). In this way, after the war Heidegger considers the problem of Germans who have become

estranged from their country more troubling than that of refugees:

> Many Germans have lost their homeland [*haben ihre Heimat verloren*]. . . . They are strangers now to their former homeland [*sie sind der alten Heimat entfremdet*]. And those who *have* stayed on in their homeland [*die in der Heimat Gebliebenen*]? Often they are still more homeless [*heimatloser*] than those who have been driven from their homeland [*die Heimatvertriebenen*].

(Ibid., 48)

The first effect of the ontologicization of *Heimat* is thus to make the question of citizenship (that which concerns the *Vaterland*, in the Kantian sense of the term) a secondary problem in relation to the generalized character of this rootlessness that threatens man "in his most intimate being" (ibid.).

3. As a further result, there is a new task for thought, in which its political responsibility would be exhausted: to think and find a new *Heimat* in which human works can again take root:

> Thus we ask now: even if the old rootedness [*die alte Bodenständigkeit*] is being lost in this age, may not a new ground and foundation [*ein neuer Grund und Boden*] be granted again to man, a foundation and ground out of which man's nature and all his works can flourish in a new way even in the atomic age? What could the ground and foundation be for the new rootedness [*welches wäre der Grund und Boden für eine künftige Bodenständigkeit*]?

(Ibid.)

■ See Box 1.

III. Can There Be *Heimat* without *Vaterland*?

Nevertheless, the term *Heimat* does not lose all political significance. Can there be *Heimat* without *Vaterland*? Can someone who is deprived of rights in a given place make it his own place and home? Is not a depoliticized notion of *Heimat* in reality highly political? This is the question raised by Jean Améry in *Jenseits von Schuld und Sühne*, which raises the question of the status of Jews in Nazi Germany. It is, he explains, because Jews were forbidden to recognize Germany as their *Heimat* that they were able to be deprived of their rights—and thus find themselves without a *Vaterland*. However, it is also because they were deprived of rights that no *Heimat* was possible for them. *Heimat* is therefore not only a proper place but also one that furnishes at least a minimum of security. What the depoliticization of *Heimat* forgets, in falling back on a traditional familiarity, is that for an individual deprived of rights, someone without a country, no *Heimat* is possible:

> [F]irst, with all due brevity, the relationship between homeland [*Heimat*] and fatherland [*Vaterland*] must be clarified, because a widespread attitude claims to accept the idea of homeland in its regional, folkloristic limits at least as something of picturesque value, while fatherland is extremely suspicious to it as a demagogic catch-word and a characteristic of reactionary obstinacy. . . . [S]ince I am a qualified homeless person [*Heimatlos*] I dare to stand up for the value that homeland signifies, and I also reject the sharp-witted differentiation between homeland and fatherland, and in the end believe that a person of my generation can get along only poorly without both, which are one and the same. Whoever has no fatherland—that is to say, no shelter in an autonomous social body representing an independent governmental entity—has, so I believe, no homeland either.

(Améry, *Mind's Limits*)

It is thus when one is deprived that the difference between *Vaterland* and *Heimat* is best discussed, but it is also then that it becomes obscured. The loss of *Vaterland* refers to a very precise political situation. It is the fact of stateless people, and it refers to the difficulty (even impossibility) of acquiring

---

1

The *Heimatlosen* of the "Gay Science"

Being rooted in a *Heimat* may also suggest diametrically opposed demands in philosophy. For Nietzsche, in the voice of Zarathustra, it refers to the collection of attachments (to a land, a countryside, a family) from which one must extricate oneself in order for a new thought or writing to be possible. *Heimat* is not the proper place in which a work is rooted but a place that one must know how to leave, on pain of repeating what was already thought and said. It is both a *Vater-land* and a *Mutter-land*, not in the sense of a political community, but a collection of dependencies (a tradition, an authority, insofar as they presuppose and even demand affective links):

> But nowhere did I find home [*Heimat*]; I am unsettled [*unstätt bin ich*] in every settlement, and a departure at every gate. Foreign [*fremd*] to me and a mockery are these people of the present to whom my heart recently drove me; and I am driven out of father- and motherlands [*vertrieben bin ich aus Vater- und Mutterländern*].

> *(Nietzsche, Thus Spoke Zarathustra, "On the Land of Education")*

In *The Gay Science*, Nietzsche refers to "the children of the future," to whom his *gaya scienza* is addressed, as "stateless" (*Heimatlosen*).

BIBLIOGRAPHY

Nietzsche, Friedrich. *Also Sprach Zarathustra*. Edited by Giorgio Colli and Mazzino Montinari. In *Kritische Studienausgabe*. Vol. 4. Berlin: De Gruyter, 1988. rights without an identification and a prior belonging to the type of community that the term designates. It affects those who were forced or chose to leave their country. In contrast, the lack of *Heimat* does not necessarily imply displacement or exile. It refers rather to being uprooted, the loss of a place where one can be fully oneself. Except when one or the other is exploited and the two become confused—when belonging to a *Heimat* is what gives one the right to a *Vaterland*—the uprootedness is no longer ontological but rather refers to the lack of a familiar and safe home, a permanent threat to one's own security.

Marc Crépon

2

Das Unheimliche

➤ ANXIETY, ENTSTELLUNG, MALAISE, SUBJECT, THEMIS, UNCONSCIOUS, VERNEINUNG

The substantivized antonym of *heimlich*, *das Unheimliche*, refers to anxiety, which has belonged to the vocabulary of psychoanalysis since Freud. "Worrying strangeness": the German term is "untranslatable," notes Bertrand Féron, who retains Marie Bonaparte's translation but allows that the French glosses it, eliminating the *Heim* of the home, suppressing the *un* of disapproval (*L'Inquietante Étrangeté et autres essais*). James Strachey chooses "uncanny": unable to mobilize an equivalent formed from *home*, he relies on the privative of "canny," from *can*, "to be able, to be capable," from the same family as *to know*.

Freud, in his eponymous essay (1919) is more attentive than ever to his language and to other languages: "The German word *un-heimlich* is obviously the opposite of *heimlich* (homely), *heimisch* (native)—the opposite of what is familiar; and we are tempted to conclude that what is 'uncanny' is frightening precisely because it is *not* known and familiar" ("The Uncanny," 17:220). Yet this is false: "the uncanny is that class of the frightening which leads back to what is known of old and long familiar" (ibid.). And Freud, dictionaries in hand, states that "this particular shade of what is frightening" is lacking "in many languages"—perhaps precisely because they are "foreign" to us (ibid., 17:221). What is remarkable is that in a nuance of German, *heimlich* can coincide with its opposite and mean not only "familiar, comfortable" but also "hidden," the "secret [*geheim*]," even though we can understand that, as the brothers Grimm say, from "domestic" comes the concept of what is "withdrawn from the eyes of strangers" (ibid., 17: 225). Freud's attention is drawn there by a remark of Schelling: "We notice that Schelling says something which throws quite a new light on the concept of the *Unheimlich*, for which we were certainly not prepared. According to him, everything is *unheimlich* that ought to have remained secret and hidden but has come to light" (ibid.—Freud cites Schelling via Daniel Sanders [see RT: Sanders, *Wörterbuch der deutschen Sprache*, 1860]; here is Schelling's text, *Philosophie der Mythologie*, 2.2:649: *unheimlich nennet man alles, was in Geheimnis, im Verborgennen, in der Latenz bleiben sollte und hervorgetreten ist*, with the difference that, as David Stimilli notes, Sanders omits *in der Latenz*!).

The context of Schelling's definition, which Freud perhaps did not know, is the status of Nemesis: this "strangely worrying" principle above the law (*nomos* [νόμος]), which the Olympian religion tries to hide (*die Gewalt jenes unheimlichen Princips, das in der früheren Religionen herrschte* [the power of the strangely worrying principle that dominated in earlier religions] [Einleitung in *Philosophie der Mythologie*, 649]). Nemesis is in effect nothing other than "the very power of this supreme law of the world which throws everything into motion, which allows nothing to remain hidden, which requires everything hidden to appear, and forces it, in a way, morally to show itself [*das alles Verborgen zum Hervortreten antreibt und gleichsam moralisch zwingt sich zu zeigen*]" (*Historical-Critical Introduction*, 146–47). Nemesis, the hidden power, by definition brings what is hidden out into the light; Pindar calls her "more just than justice," *huperdikon* [ὑπέρδικον] (*Pythiques*, 10:45; *Olympian Odes*, 8:86).

The *Unheimlich* thus refers to the hidden that is suddenly forced to show itself; in Freudian language, "something repressed which *recurs* [*etwas wiedekehrendes Verdrängtes*]" ("The Uncanny," 17:241). We may understand, Freud says, why "linguistic usage has extended *das Heimliche* (homely) into its opposite, *das Unheimliche*; for this uncanny is in reality nothing new or alien, but something which is familiar and old-established in the mind and which has become alienated from it only through the process of repression [*nur durch den Prozess der Verdrängung entfremdet worden ist*]" (ibid.). It thus constitutes a special kind of anxiety, "when infantile complexes which have been repressed [*verdrängte infantile Komplexe*] are once more revived by some impression," as in Hoffman's "Sandman," or when "something *actually happens* in our lives which seems to confirm the old, discarded beliefs [*überwundene primitive Überzeugungen*]" (ibid., 247–49), as in the unintentional repetition that mimics fatality so well.

Realizing that one is not even at home in oneself is the anxiety of the modern subject in the face of the *Unheimliches*.

HERRSCHAFT (GERMAN)

ENGLISH   domination

➤ *AUTHORITY, DOMINATION, LIBERTY, POWER* and ECONOMY, MACHT, OIKONOMIA, PRAXIS, PROPERTY, SECULARIZATION, STATE

The term, which is omnipresent in the German medieval tradition and in both legal and political reflection, never really became defined as a concept. It was used from the beginning to refer not only to the dignity of someone who is assumed to be venerable and wise because old but also to the authority exercised by the father of a family considered the head of a clan and to the relation of property exercised by the head of a clan over territory. However, it was never established as a stable equivalent in German for translating Latin notions such as *dominium, dominatio, potestas,* etc. For Kant, and then Marx, the use of the term does not always lead to its conceptualization. In contemporary thought the term still has a wide extension at the cost of definitional rigor; this is the case with the use made by the Frankfurt school, and only Max Weber attempted to make it precise, though more from a functional than thematic perspective.

I. Semantic Evolution

The term *herscaft* or *hertoum*, in Old High German, doubtless comes from the adjective *her*, which means "gray-haired," "dignified." The comparative *heriro*, which translated the Latin *senior* and the Greek *presbuteros* [πρεσβύτερος], was used to make the noun *herre*, in the seventh century, which was more or less equivalent to *dominus* (cf. RT: Grimm, *Deutsches Wörterbuch*, 4.2:1124f.; G. Ehrismann, "Die Wörter für 'Herr' im Althochdeutschen"). Whereas in the Middle Ages the distinction between *potestas* (royal power) and *auctoritas* (papal authority) was constantly being refined, leading to a clear opposition (cf. W. Ensslin, "Auctorita und Potestas"; Habermas, *Structural Transformation*, chap. I, §2)—whose extreme consequences were the establishment of an independent legal system in France (Cujas's reform under Philippe Auguste) and the Anglican schism—the term *Herrschaft* remained, in the Germanic era, relatively indeterminate and referred to the power of the father over a family and servants, in the same way as the relationship to property and serfs. However, it also had the sense of dignity and (moral) superiority, and beginning in the thirteenth century it referred to an official function. The contrast between *Herr/Knecht* is already present in the form of the difference of status between the landowner and someone who only has tenure of it, but this contrast remains, from a terminological point of view, indistinct from that between lord and vassal and that between a king and the royal domain. These two meanings rest on a single translation of the term *dominus*, which is still in the background as the means of expressing the specific power of the emperor—*dominus mundi.* The power of the pope, the king, and the princes is expressed by *Gewalt* or *Macht*, translating *potestas, imperium, regnum,* or *regimen*, whereas *Herrschaft* remains, it seems, linked to a relation that is fundamentally based in the register of property (over the members of the extended family as well as material goods and land). However, at the turn of the thirteenth and fourteenth centuries, when Louis IV of Bavaria openly opposed Pope John XXII, Marsilius of Padua in his *Defensor pacis* (ca. 1324) and William of Ockham in his *Breviloquium de potestate papae* (ca. 1341) distinguish between property and power, with the goal of contesting papal pretensions to temporal power and property, denying that *Herrschaft* can subsume the two aspects or combine them. The *Constitutio in favorem principium* of 1232 establishes the notion of *dominus terrae*, translated as *lantherr*, but we must wait until the fourteenth century for the power of the *Herr im Land* to be associated with the term *Herrschaft*, even though the word's meaning can refer to a function as well as a property (cf. RT: Grimm, *Deutsches Wörterbuch*, s.v. "Landesherrschaft") on which, most often, the exercise of power rests.

Between "property" and "power" (*Gewalt*, power exercised over persons), *Herrschaft* remains both multivalent and abstract. It is difficult to specify it by way of other notions, whether through its French equivalents—*autorité, domination, pouvoir, seigneurie*; its German ones—*Herrschung, Regiment, Obrigkeit, Oberherrschaft*; or English ones—"command," "dominion," "lordship," "reign," "rule." Adelung's dictionary (1775, 2:1133f.) defines *Herrschaft* as a concrete term—unlike *Gewalt*—that refers either to persons exercising authority over land, a place, or a family, or to the domain (abstract or concrete) over which they exercise it.

Nicolas of Cusa is one of the first to contrast, on the basis of natural law, the sovereignty of the people with a domination that does not have the power it exercises (*De concordantia*

catholica [1433], p. 152f.), according to Pliny's adage (*Panegyric to Trajan*, 55, 7): Principis sedem obtines, non sit domino locus (you have a prince so as not to have a master). It is only then that domination relates to an abusive use of power understood as an exercise overseen by the law and subordinate in one way or another to a relatively independent control. Similarly, Erasmus goes so far as to deny that the term *Herrschaft* (translating *dominium*) is a "Christian term," and contrasts this pagan term with *administratio* (*Institutio principis christiani* [1517], in *Ein nützliche underwisung eines Christlichen fürstur wol zu regieren*, Zurich, 1521, p. 23). These two thinkers thus lay the basis for a semantic tradition whose effects are visible throughout the eighteenth century, where some encyclopedias and dictionaries (RT: Scheidemantel, *Repertorium reale pragmaticum juris publici et feudalis imperii romano-germanici*, vol. 2, 1793, and the *Deutsche Encyclopädie oder allgemeines Real Wörterbuch aller Kunste und Wissenschaften von einer Gesellschaft Gelehrten*, 1790, 15:285f.) register the evolution of the term: the antonyms we find then—*Freiheit, Knechtschaft*—are the focus of a critique of domination understood in this way. Luther offers a more ambiguous account of the situation, since he oscillates between a more critical conception of domination, contrasting *Herrschaft* with *Obrigkeit* and *Regiment*—"Now, whoever wants to be a Christian prince must abandon any intention of lording it over people and using force" (*Von weltlicher Obrigkeit* 11:271f.; *On Secular Authority*, 34)—but also yields to the temptation of justifying power in general:

> Since God gave temporal domination to the pagans and the understanding, he certainly must have created people who, with wisdom and courage, had the desire to dedicate themselves to, who were destined to it, and who knew how to maintain it.
>
> (Luther, Interpretation of Psalm 101, in *Werke*, 51:243)

On one hand he radicalizes the Augustinian doctrine of the two reigns—sometimes considering power to be purely profane (cf. "Wochenpredigten über Matthias" [Weekly sermons on Matthew 5–7] [1530–32], in *Werke*, 32:440)—but he also tries, on the other hand, to legitimate his biases by all theological means available, of which Thomas Münzer accuses him during the peasant uprisings, since Luther was on the side of the nobility. Similarly, he ignores all the contemporary legal constructions, which tended to limit or control power in general. This is what distinguishes him from Calvin, who not only took account of these legal and constitutional innovations but is careful not to give domination any kind of divine origin.

II. *Herrschaft/Knechtschaft*

Hegel first introduced this distinction, the inspiration of which is Pauline, in a theological context (*The Spirit of Christianity* [1798–99], 1907, p. 374): it concerns a split that prevents any free union between individuals, but this distinction is overturned, outmoded by the Christian vision. In the *Phenomenology of Spirit*, the distinction describes a stage of self-consciousness. However, we can neither rigorously determine it from the point of view of a dated historical

development nor reduce it to a psychological interpretation. Vico did attempt to give a pseudo-historical date to this process by referring it to the "domination of the Cyclops" (*La Scienza nuova* 1:324). The difficulty comes, here again, from the indeterminacy that affects the possibility of filling out these two notions: the master is at bottom not defined except by the fact that he is ready to sacrifice his life, whereas the slave prefers submission to death. It is rather the definition of work, refused by the master and accepted by the slave, that is at issue in this distinction, as well as the introduction of negativity as a source of historical evolution. It is clearly difficult to understand the transformation of this distinction into the consciousness of liberty as either an attested fact or a utopia—we would be tempted rather to conceive it as an anticipation by Hegel of the general flow of history after the French Revolution, and more generally as the confirmation that the modern era is crossed by the critique of the established order, a criticism that is justified by the fact that negativity cannot be removed from any social position or any instance of power.

At the strictly lexicographical level, the distinction between *Herrschaft/Knechtschaft* refers first exclusively to a legal semantic domain. In the second half of the eighteenth century, the Aristotelian-Christian tradition, which justified the relation of domination by one man of another, is questioned bit by bit, and the emergent semantic tendency, which seems to reinforce itself in the nineteenth century, gradually removes the legal content from the terms in favor of a wider meaning, of a politico-philosophical order, where what is more and more in dispute is the legal foundation of the nonnatural relation of domination. The influence of the French Revolution was felt across the Rhine, though this did not really lead to a more rigorous, conceptual definition of *Herrschaft*.

III. A Kantian Pause: The Notion of *Hausherrschaft*

It is significant that Kant in his treatise "Towards Perpetual Peace," in which he examines and contrasts different forms of government, does not use the term *Herrschaft*, not even when referring to despotism, the regime he opposes with republicanism, which in Kant's view is the only form of government that seems capable of allowing an evolution toward a constitution founded on law. The term appears, however, in the domain of private law, in Kant's *Metaphysics of Morals* (6:283, §30), where it refers to the power of the master of the house (*Hausherrschaft*), recalling the ancient notion of the *oikodespotês* [οἰκοδεσπότης]. This is indeed a kind of power related to the person (ibid., §30, Gregor, tr., *Metaphysics of Morals*, 66) from within a "society of unequals (one party *being in command* or being its head [*Herrschaft*], the other *obeying*, i.e., serving) (*imperantis et subiecti domestici*)." Kant shows himself to be thoroughly attuned to the erosion of this domestic power, undermined in the eighteenth century by the emergence of the notion of contracts, which in its weakened, contractual form now both justifies the dependence and recognizes the personhood of the one who obeys: this is why the relation of inequality thus described has its limits (ibid.). It nevertheless remains difficult, both in the letter and in the spirit of the categorical imperative, to grant—as Kant *also* does—the possibility to make "direct

use of a person *as of* a thing, as a means to my end," even if this use is limited to the "usufruct" of the other's person and consequently does not genuinely attack his status as a person nor "[infringe] upon his personality" (ibid., 126–27, §2 and §3, explanatory remarks on *Metaphysical First Principles of the Doctrine of Right).* The *Critique of Practical Reason* leaves no doubt on that score:

> In all of creation everything one wants and over which one has any power can also be used *merely as a means*; only the human being, and with him every rational creature, is a *purpose in itself.*

> (Kant, *Kritik der praktischen Vernunft*, 5:87; *Critique of Practical Reason*, 112)

The gap signaled by Kant's contradictory treatment of *Herrschaft* is foundational to the subsequent critique of domination, especially in Marx. On one hand the exploitation of the person is condemned—and the arguments appeal to this condemnation, which is morally based on the absolute value of the person—while on the other hand the emancipation of the human race in conformity with the spirit of the categorical imperative has not yet been realized in nature (the only solution seems to be revolution, which must be a "radical revolution which can only be that of radical needs," *Zur Kritik der Hegelschen Rechtsphilosophie* [Critique of the Hegelian Philosophy of Right], introduction, in *Marx-Engels Werke*, 387). The contemporary critique of domination, of whatever nature (racial, sexual, etc.) is also based in the same source: the impossibility of reducing domination, even by a proliferation of regulations and jurisprudence, whether in the private domain or the public one.

IV. Anonymous Domination

Marx effects a remarkable shift in the sense of *Herrschaft* by depersonalizing its content, without, nevertheless, giving it a properly conceptual definition:

> The proletariat will use its political supremacy [*politische Herrschaft*] to wrest, by degrees, all capital from the bourgeoisie, to centralise all instruments of production in the hands of the State, i.e., of the proletariat organised as the ruling class; and to increase the total of productive forces as rapidly as possible.

> (Marx, *Manifest der Kommunistischen Partei* [The Communist Manifesto], in *Marx-Engels Werke,* 4:481; *Marx-Engels Reader*)

This depersonalization takes place, however, essentially in the domain that determines all other political and social conflicts, namely the economic one: "Capital is, therefore, not a personal, it is a social power (ibid., 476; *Marx-Engels Reader*, 485)." The main difference between the archaic, "natural" forms of production and those that develop in the framework of a civilization is revealed in the personal or anonymous form of the relation between owner and producer:

> In the first case, the domination [*Herrschaft*] of the proprietor over the propertyless may be based on a personal relationship, on a kind of community; in the

second, it must have taken on a material shape in a third party—money.

> (Marx, *Die deutsche Ideologie* [The German Ideology], in *Marx-Engels Werke,* 3:65; *Marx-Engels Reader*)

Nevertheless, and even in developed societies where the most advanced form of modern capitalism reigns—hence, the most anonymous form of domination—we may still interpret "the hidden basis of the entire social structure and with it the political form of the relation of sovereignty and dependence, in short, the corresponding specific form of the state" as a "master-slave" relation: "the direct relationship of the owners of the conditions of production to the direct producers" (*Capital*, 3:555, which is nothing less than the appropriation of extra unpaid work (the presupposition of surplus value). However depersonalized, the relation between the dominant and the dominated retains a "personal" dimension, that of the concrete and immediate experience of domination. Marx does not further clarify the nature of this "personal" dimension—though he does claim that it is essential and that all the rest of the social edifice flows from it. Marxist reflection on the progressive depersonalization of the relations of production, which goes as far as their reification, nevertheless remains silent on what the initial and historical "success" of domination is. In the 1960s–1970s this anonymity of domination becomes caricatured, and a radicalized version is at times set to use in denunciations of a mysterious "system":

> If man eats, drinks, is housed, reproduces, it is because the system needs him to reproduce to reproduce itself: it needs men. If it could function with slaves, there would be no "free" workers. If it could function with asexual mechanical slaves, there would be no sexual reproduction. . . . The system can only produce and reproduce individuals as elements of the system. There can be no exception.

> (Baudrillard, *Pour une critique de l'économie politique du signe*)

What the state was for Hegel, the "effective reality of the moral idea," as well as the "effective reality of concrete freedom" (*Philosophy of Right*, §§257, 260), is, for Marx, society without class, emancipation realized, the negation of the liberal distinction between state and society and the identity between economic content and political form. It is, in short, the identity between the material and the formal principles: concrete isonomia, history beyond what was hitherto recognized as the sole engine, beyond the class struggle, humanity freed from domination—from any form of domination. The Communist Revolution "abolishes the rule of all classes with the classes themselves, because it is carried through by the class which no longer counts as a class in society, is not recognized as a class, and is in itself the expression of the dissolution of all classes, nationalities, etc. within present society" (Marx, *Die deutsche Ideologie*). Yet Marx was just as discreet about this radiant future as he was about the "dictatorship of the proletariat" and refrained in both cases from prophecy. Nor did he see that any critique of this order had a precisely Kantian basis, in the fact that idea and reality rarely coincide, and in morality, politics, and social matters, never. Or that the

critique cannot work against the material state of affairs without constantly appealing, even if only implicitly, to the formal level. And it is no accident that the reduction of politics to economics, a recurrent theme of Marxism (more than in Marx, in fact), goes hand in hand with a fundamental neglect of law and right (*droit*).

In the *Critique of the Hegelian Philosophy of Right* and *The German Ideology*, then, Marx describes functions that, in the prospective society that has been freed from all form of domination, are related to that very domination in earlier societies, by turning to a vocabulary that allows him to avoid the contemptible term *Herrschaft*—without, however, giving a conceptual solution to the problem that *Herrschaft* presents: *Oberaufsicht* (superior control), *Leitung* (direction), *kommandierender Wille* (directing will), etc.

Related to this situation is the fact that, less than forty years after Marx's death, Georg Simmel also tried to avoid the notion in his *Soziologie*: "Man wants to be dominated [*beherrscht*], the majority of men cannot exist without being guided [*Führung*]" (109). And we know the result of substituting *Führung* or *Führerschaft* for *Herrschaft* in sociological and political terminology.

V. Attempt at Clarification: Max Weber

Max Weber distinguishes three types of domination: rational domination (whose purest form is the domination exercised by means of an administration obeying rigorous criteria, like arithmetical accounting), traditional domination, and charismatic domination (*Economy and Society*, 215). Domination is thus a phenomenon that is common to all the historical forms it takes on—whether it is close to one of the types described or strays from it, following all the possible gradations resulting from mixture and compromise among all three types—and we may see in this a sort of psycho-social anthropological constant. Despite Marianne Weber's efforts to hide the importance of Nietzschean sources in her husband's thought, it must be recognized—in this case as a barely veiled reemergence of the notion of the will to power. Whereas power (*Macht*) means "the probability that one actor within a social relationship will be in a position to carry out his own will despite resistance, regardless of the basis on which this probability rests" (ibid., chap. 1), domination (*Herrschaft*) refers to "the probability that a command with a given specific content will be obeyed by a given group of persons" (ibid.). To impose one's will or to obey an order seem to be the two necessarily complementary components that describe a relation of forces in the framework of power relations. However, we immediately see that this definition clearly ignores the reasons that make it the case that an order is followed: "But a certain minimum of assured power to issue commands, thus of domination, must be provided for in nearly every conceivable case" (ibid.). While he invokes discipline in this context, Weber does not indicate what makes it the case that this discipline is consented to. Insofar, however, as he recognizes that obedience may equally be based on loyalty or fidelity, and that it therefore no longer functions according to a formal relationship between the one who gives an order and the one who takes it (ibid.), it is no longer possible to think that the notion of domination he offers could remain neutral from an axiological point of view, since we would be logically required to include in its definition an impulse or

motive resulting from a value judgment. The result is the reappearance of the technical difficulty proper to any critique of domination that aims to proceed by generalized induction. For Weber, the demand of axiological neutrality can only also neutralize the notion of domination: the result is the weakening of the conceptual possibilities of the effective critique of domination. This demand in a way blocks, in equal measure, both the *apologia* of domination (A. Gehlen, 1993) and the general *critique* of domination which, as developed by the Frankfurt School (T. W. Adorno et al., 1950, and especially, with M. Horkheimer, *The Dialectic of Enlightenment* [1944]), leads (without lifting the veil that seems to enshroud domination) to this desperate admission: "In the enigmatic readiness of the technologically educated masses to fall under the sway of any despotism, in its self-destructive affinity to popular paranoia, and in all uncomprehended absurdity, the weakness of the modern theoretical faculty is apparent" (*Dialectic of Enlightenment*, Eng. trans. J. Cumming (Continuum), xiii). These are the same notes resounding in the famous pamphlet by La Boétie:

> The weakness among us men is such: we must often obey force. . . . It is an extreme misfortune to be subjected to a master of whom one can never be certain if he is good, since it is always in his power to be bad when he wishes.
>
> (*De la servitude volontaire ou Contr'un* [1574])

HISTORIA UNIVERSALIS (LATIN)

ENGLISH   world history, general history, universal history
FRENCH   *histoire universelle, histoire générale, histoire mondiale*
GERMAN   *Universalhistorie, Weltgeschichte, Welthistorie, allgemeine (Welt)Geschichte*

➤ CORSO, GEISTESWISSENSCHAFTEN, GESCHICHTLICH, HISTORY, PEOPLE, SECULARIZATION, WELT

The concept is of Latin origin—the first *historia universalis* appears in 1304—and in fact covers two distinct practices: the exhaustive juxtaposition of political histories on one hand, and the link between profane history (restricted to a few choice peoples) with Catholic history on the other. In the second half of the eighteenth century, having collectively rejected both of these methods, French, German, and British thinkers attempted to develop new historical universalities, which make use of terminological choices that do not strictly align. It is not surprising, then, that they all more or less simultaneously, though in different ways, rediscover Vico, whose project had no doubt "anticipated" their own.

I. Catholic Universality, Empirical Universality, Universality of Progress

In 1783 Gabriel Bonnot de Mably distinguishes two concepts of "universal history": the first covers the empirical exhaustiveness of simple "collections of individual histories," the second describes Catholic universality as practiced by Bossuet in his *Discours* of 1681, in which he traced "everything back to a few famous people"(Mably, *De la manière d'écrire l'histoire*). The distinction clearly shows a real equivocity. We could illustrate the first sense by the *Introduction à l'histoire, générale et politique, de l'univers; où l'on voit l'origine, les révolutions et la situation présente des différents États de l'Europe, de l'Asie, de l'Afrique et de l'Amérique* (Introduction to the general and political history of the universe; in which we see the origin, the revolutions, and the present situation of the various States of Europe, Asia, Africa, and America) (Amsterdam, 1721), by which A.-A Bruzen de La Martinière "completed" the work of Samuel von Pufendorf, *Einleitung zur Geschichte der europäischen Staaten* (Frankfurt, 1682), translated by C. Rouxel in 1710. La Martinière's concern is to juxtapose dynastic and military histories, thus above all political ones, from all known nations to the extent that this is possible. In cases such as for the "Negroes of Africa," says La Martinière, their "common customs" will have to do."

In 1756, Voltaire rejects both empirical historiography and the sorts of universal history found in Boussuet and La Martinière. His work of 1756, *Essai sur l'histoire générale et sur les mœurs et l'esprit des nations depuis Charlemagne jusqu'à nos jours* (Essay on general history and on the morals and spirits of nations from Charlemagne to the present), rejects any Augustinianism by offering a history that claimed to be truly universal inasmuch as it was exclusively profane, and thus extended to all peoples of the earth (with the disappearance of the Catholic *telos* all retroactive selection disappears as well). It was also a rejection of political history, a history of princes and battles, in favor of a truly universal history as extended to the "morals and spirits of nations," that is, to anything by which nations had their own substance, independently of those who governed them and their conflicts. The result for Voltaire is "a chaos of events, factions, revolutions, and crimes" but the consequence of this "chaos" is the universalization of the task of thinking of universal history as an essentially worldly and pan-institutional process (it henceforth wins out over all human moral and legal institutions). In France, this new way of thinking about "universal history" leads to the abandonment of the phrase "histoire universelle," and when Condorcet abstains from following Voltaire and writing "the history of governments, laws, morals, manners, opinions, among the different peoples who have successively occupied the globe," he replaces it with a "historical tableau of the progress of the human spirit." The following century will bring a desire to reconcile Catholic universality with "Progress," and in this context it becomes possible to write works such as J. F. A. Boulland's *Essai d'histoire universelle ou exposé comparatif des traditions de tous les peuples depuis les temps primitifs jusqu'à nos jours* (Essay in universal history or comparative presentation of the traditions of all peoples from primitive times to the present day) (Paris, 1836).

II. The "Natural History of Mankind" as *Histoire Raisonnée*

In 1767, Adam Ferguson carefully avoids using the expression "history of the world," which had been the title of a work by Sir Walter Raleigh in 1614, or the expression "universal

history," which he might have come across in Henry Boling-broke (*Letters on the Study and Use of History*). He prefers to refer to his undertaking as "the general history of nations" (*An Essay on the History of Civil Society*, I, 10), by which he clearly means "*of* all *nations*"(II, 1; III, 6; II, 8). It is surprising to see Ferguson translate the plural from the preface of Montesquieu's *De l'esprit des lois*—"les histoires de toutes les nations"—by a collective singular ("the general history"), but it provides evidence for a new universality under construction—a bit in the way that in Vico, "le storie di tutto le nazioni" could be subsumed under "una storia ideal eterna" (*Scienza nuova*, 1744, §145). Indeed, while Ferguson's phrase echoes Voltaire's—Claude-François Bergier translates it correctly into French as "l'histoire générale des nations" (*Essai sur l'histoire de la société civile*)—and while this echo of Voltaire is significant (as Ferguson's work concerns a process that is essentially worldly, worldwide, and civil)—it remains the case that its "generality" is nevertheless different from the sort one finds in Voltaire. Ferguson's results from the empiricist overlay of the trajectories followed by the observable nations; or rather, his "generality" is the abstract process that any nation must follow to the extent that circumstances permit. In this sense, what is abstract is also "natural," and John Millar suggests the expression "natural history of mankind" to describe this way of proceeding (*The Origin of the Distinction of Ranks*). Matters soon get more complicated. When Dugald Stewart suggests in 1793 a French translation of "natural history" thus understood, he does not propose *histoire naturelle* or *histoire générale*, but rather *histoire raisonée* (Smith, *Works and Correspondence*); he has in mind d'Alembert, who in the *Essai sur les éléments de philosophie* in 1759 had invoked "l'histoire générale et raisonnée des sciences et des arts"(chap. 2). The translation is surprising, but not absurd at all: Stewart could evoke, for his English-speaking reader, David Hume's *Natural History of Religion* (1757), but he had to avoid the French phrase "histoire naturelle de l'humanité," which would have necessarily called Buffon to mind for a French readership and entailed an entirely different sort of inquiry. Moreover, the word *raisonnée* contrasted with *révélée* (revealed), as "natural" with "supernatural," which allowed Stewart to preserve what was essential in the original title.

III. *Weltgeschichte* vs. *Universalhistorie*

The German translation of Voltaire's *Essai sur l'histoire générale*, published in 1762, suggests the compound *allgemeine Weltgeschichte* (a "general history of the world"). The expression is Kant's, but the use has changed. Kant uses the compound term in 1784 in stating the ninth proposition of the *Idee zu einer allgemeinen Geschichte*, in which he is concerned, contrary to the later translation of Voltaire's essay, to justify a historical teleology that Voltaire would have rejected. What is this teleology (it is a novel—but we should excuse it for that), if not the realization of what Leibniz had reserved for God, namely, "this novel of human life which tells the universal history of humankind" (*Essai de Théodicée*, II), and which Leibniz contrasts with the "sort of universal history" assigned to man, aimed simply at gathering all the "useful" facts (*Nouveaux essais*, IV)? *Allgemeine Weltgeschichte* is no doubt something like a theodicy of history, and we can just as well say, here in the 1700s, *allgemeine Geschichte*, *Universalgeschichte*, or *Weltgeschichte*, as Schiller's inaugural lecture at

Jena in 1789 demonstrates ("Was heisst und zu welchem Ende studiert man Universalgeschichte?"). At a pinch, a translator could get by with "general history," "universal history," or "world history" (but "history of the world" would be less anachronistic).

However, the translator would then be at a loss when she comes up against *Welthistorie*, for example, in Ernesti's preface to the German translation of *A General History of the World, from the Creation to the Present Time* (London, 1764–67), under the direction of W. Guthrie and J. Gray, also published under the title *Allgemeine Weltgeschichte von der Schöpfung an bis auf gegenwärtige Zeit* (Leipzig, 1765–1808). She will also be troubled, and much more frequently, by *Universalhistorie*, still commonly used in the 1770s: J. C. Gatterer publishes an *Einleitung in die synchronistische Universalhistorie* in 1771, but in 1785 a *Weltgeschichte in ihren ganzen Umfange*. Similarly, A. L. Schlözer publishes a *Vorstellung einer Universalhistorie* in 1772, and in 1779, a *Vorbereitung zur Weltgeschichte für Kinder*. It is essentially during these years that *Weltgeschichte* wins out over *Universalhistorie*, which is why Kant spontaneously adopts it for rethinking Leibniz's "universal history." Why the substitution, however? The answer lies in Kant, in the last paragraph of the *Idee zu einer allgemeinen Geschichte*, but also in Schlözer, writing a year later:

§1: Universalhistorie war weiland nichts als ein "Gemengsel von einigen historischen Datis, die der Theolog zum Verständnis der Bibel, und der Philolog zur Erklärung der alten griechischen und römischen Schriftsteller und Denkmäler, nötig hatte": war nichts als eine Hilfswissenschaft der biblischen und Profanphilologie. . . .

§2: Weltgeschichte ist eine systematische Sammlung von Tatsätzen, vermittelst deren der gegenwärtige Zustand der Erde und des Menschengeschlechts, aus Gründen verstehen lässt.

(§1: *Universalhistorie* was at the time only a "mix of some historical *data* which were needed by the theologian for the understanding of the Bible and the philologist for the explication of ancient writers and Greek and Roman artists": it was nothing but an auxiliary science for biblical and profane philology.

§2: *Weltgeschichte* is a systematic collection of facts by means of which the current state of the Earth and the human race become comprehensible on the basis of its principles.)

At bottom, choosing *Weltgeschichte* was choosing *Welt* and *Geschichte*. *Welt* to refer to what is *weltlich* (worldly), and not just to *Welt* as universality. *Geschichte* to refer to what is "systematic," in contrast with Greek *historia*, and to distinguish a process from a simple scholarly inventory. *Weltgeschichte* is the evolution of the human race considered in its past, present, even future totality—but always in earthly terms—and it pushes the aggregate of *Universalhistorie* back into the prehistory of history, as a metaphysical substrate. We can thus understand how the precise nature of this systematicity, understood as *Zusammenhang* (teleological connection? a priori? etc.) was what defined the stakes in the debates among German philosophers of history.

HISTORY / STORY

DUTCH	*Geschiedenis*
GERMAN	*Historie, Historik, Geschichten, Geschichte*
GREEK	*historia* [ἱστορία], *historiê* [ἱστορίη]
ITALIAN	*storia, storiografia*
LATIN	*historia, gesta, res gestae*

➤ DICHTUNG, ERLEBEN, ERZÄHLEN, *FICTION*, GEISTESWISSENSCHAFTEN, GESCHICHTLICH, HISTORIA UNIVERSALIS, LOGOS, MEMORY, MIMÊSIS, MOMENT, PRESENT

The path from the Greek *historia* to the Latin *historia* to the French *histoire* (It. *storia*, Sp. *historia*, Eng. "history," Ger. *Historie*) seems simple and direct. History was always history! One clue, however, should put us on guard: why did German end up distinguishing *Historie* (a clear translation of the Latin *historia*) from *Geschichte* (referring to what has happened but also the recounting we give of it, the study of the past—"History" with a capital *H*)?

What, then, was the ancient path? From *historiê* [ἱστορίη] (the Ionian form of *historia* [ἱστορία]), from the Herodotean inquiry to Roman *historia*, and from the universal history of the Greek Polybius, a hostage in Rome for seventeen years, to the ecclesiastical history of Eusebius, bishop of Caesarea, and to the sacred history of Augustine, the word has not covered the same field—far from it. We seem to have moved from *historia* by itself, claimed to be a new practice, to *historia* furnished with all sorts of qualifications (universal, ecclesiastical, and so on).

Definitions of history during the Middle Ages were largely inspired by those inherited from antiquity. In the modern era, we have witnessed a progressive differentiation, both semantic and linguistic. The first consequence is a clearer distinction between facts and their narrative. The second is the progressive construction of a reflective dimension. In parallel, while the derivatives from the Latin *historia* were taken up by most languages, German (followed by Dutch) substituted in the place of *Historie* the notion of *Geschichte*, which reunites what has taken place with the narrative report of it. At the same time, German moved from the plural *Geschichten* to the collective singular *Geschichte*. This transformation illustrates in turn the introduction of a totalizing perspective that brings a reflective eye to bear upon the collection of individual histories. Languages that remained in the tradition of the term *historia* effected the same change in perspective, although without giving it formal expression.

The development of a historical science, one echoing the elaboration of a philosophy of history that attempts to reconfigure the relation between past, present, and future, took place within scholarly traditions that became progressively marked by national concerns. Despite the often intense contacts between the respective communities, these evolutions helped fix specific semantic usages. However, the questions that animate the debates among historians are largely held in common: the historicization of the field of knowledge (associated in German with the term *Historismus*), the relation between relativism and universalism, the relation between the historical object and its exposition by the historian, and the emergence of a history of history (*storia della storiografia*, as it is known in its most prominent, Italian form) gave rise to further developments that inflect and renew the uses of the notion of history and its equivalents.

I. *Historia*: From Greek Inquiry to Latin Histories

A. The *histôr* and the bard

The epic features a character known as the *histôr*. Is he a witness or a judge? For Émile Benveniste, *histôr* refers to the witness. Etymologically, *histôr* [ἵστωρ] (like *historein* [ἱστορεῖν] and *historia* [ἱστορία]) goes back to *idein* [ἰδεῖν], "to see," and to (*w*)*oida* [οἶδα], "I know." "I see," "I know": already the intertwining of seeing and knowing is laid down. The *histôr* would thus be a witness "insofar as he knows, but in the first instance because he has seen" (RT: Benveniste, *Le vocabulaire des institutions indo-européennes*). However, in the two scenes of the *Iliad* where a *histôr* is required, it is clear that we are not in the presence of a witness in the sense of one who knows from having seen. During Patroclus's

funeral, Ajax and Idomeneus are in disagreement with regard to knowing who is in front after passing the marker in the chariot race organized by Achilles; Ajax suggests taking Agamemnon as *histôr* (*Iliad*, 23.482–87). Whatever Agamemnon's exact role may be, it is certain that he has not seen the scene at all. Similarly, the extraordinary shield forged by Hephaistos for Achilles contains a representation of a scene in which two men with a serious disagreement (reparations for a murder) decide to call a *histôr* (*Iliad*, 18.497–502). The *histôr* is clearly not a witness to the murder. In both cases, stepping into a dispute (*neikos* [νεῖκος]), the *histôr* is not one who, by his intervention alone, can put an end to the differences by adjudicating between conflicting versions, but is, rather, the guarantor (for the present or indeed for the future) of what will have been agreed upon by the two parties (cf. Scheid-Tissinier, "À propos du rôler").

This first entry into the lexical field of *historia* reveals a broader view of the epic as a sort of prehistory of history. What, in fact, is the mechanism of epic speech, and what is the configuration of knowledge that bears it? The bard, inspired by the muses, daughters of Zeus and Memory (*Mnêmosunê*), is a seer, whereas the omniscience of the muses is based on the fact that they are always there: they see everything. "You are at hand, and you know all things," says the poet in the *Iliad* (2.485). When Odysseus addresses the bard of the Phaeacians, he praises him thus:

> I respect you, Demodocus, more than any man alive— / surely the muse has taught you, Zeus's daughter, / or god Apollo himself. How true to life, / all too true . . . you sing the Achaeans' fate, / all they did and suffered, all they soldiered through, / as if you were there yourself [*autos pareôn* (αὐτὸς παρεὼν)] or heard from one who was [*akousas* (ἀκούσας)].
>
> (*Odyssey*, 8.546–51)

This scene has symbolic value. For what will the bard sing at the request of Odysseus? Of the sacking of Troy. It is the first narration of the event, even while the presence of Odysseus certifies that *that* really did happen.

Demodocus, in sum, would be the first historian, and his narrative, the birth of history—although with the following difference, which in fact changes everything: Demodocus was not there and did not see anything (he is blind), whereas Odysseus is both an actor and a witness. Whence the astonishing (false) question of Odysseus: is your account not too precise *not* to come from direct observation? Human vision (a historian before its time, in the sense of seeing with one's own eyes or learning from someone who has seen) becomes, with these two verses, the benchmark of divine vision. It is precisely as if there were a strange and brief juxtaposition of two Demodocuses: one (still) a bard and the other (already) a historian. What happens there is like a lightning bolt cast over a different possible configuration of knowledge: precisely the one that the first historiography will come to occupy, the one to which, it turns out, Herodotus will give both form and name two or three centuries later: *historiê*. Of course, this juxtaposition in the Homeric work neither makes such *historiê* necessary nor even likely—simply possible.

B. *Historiê* and *historein*: Inquiry and inquirer

"Inquiry" in all senses of the term, *historiê* refers more to a state of mind (the fact of one who *historei* [ἱστορεῖ], "inquires into") and a way of proceeding than to a particular domain in which it is specifically exercised. It is a word belonging to intellectual history at this time (the first half of the fifth century BCE), possibly a fashionable word: it means what it means, and each writer bends it to his needs. Without entirely forgetting the *histôr* / judge or guarantor of epic poetry, the word has several layers of meaning and must have functioned as a lexical crossroads.

We can use it to describe the activity of a "traveling-inquirer" like Democritus, a judicial inquiry (seeking to know something, inquiring, certifying something). The tragic poets were aware of it—Oedipus, addressing his daughters, says of himself: "Seeing [*horôn* (ὁρῶν)] nothing, children, knowing [*historôn* (ἱστορῶν)] nothing, I became your father, I fathered you in the soil that gave me life" (Sophocles, *Oedipus Rex*, 1624–6). And the medical writers used it as well.

■ See Box 1.

Borrowing it or otherwise making it his own, Herodotus gives it as the key word for his whole enterprise: "From [of, pertaining to, belonging to] Herodotus of Halicarnassus, here is the account of his *historiê* . . ." (1.1). Given in the genitive, these first words are like an inaugural signature of someone who comes to present, in public and in his own name, the fruits of his research. He is someone who *historei* (he never calls himself a "historian"), coming to claim a position of knowledge that is as yet entirely unconstructed. Beyond the opening sentence, Herodotus uses the verb *historein* to refer to the type of work he has done. Thus, when he attempts to resolve the difficult question of the sources of the Nile, he clarifies:

> I myself travelled as far as Elephantine and saw things with my very own eyes [*autoptês* (αὐτόπτης)], and subsequently made enquiries of others [*akoêi historeôn* (ἀκοῇ ἱστορέων)].
>
> (Herodotus, *Histories*, 2.29)

Several times (2.19, 34, 118), *historein* is used in a context of oral inquiry, but the traveler has nonetheless first gone to the location in question. In 2.44, seeking to understand who Heracles is, Herodotus specifies that he went as far as Tyre in Phoenicia. There, he saw the sanctuaries that were devoted to the demigod, and he questioned the priests. An "inquiry" (*ta historêmata* [τὰ ἱστορήματα]) is thus the combination of these procedures, the eye and the ear, eyewitness and hearsay: "These enquiries of mine, then, clearly show that . . ." (2.113). To see henceforth, he must make sacrifices (go and see) and learn to see (gather testimony, collect different versions, report them, classify them according to what he knows from elsewhere and according to their degree of likelihood).

From an epistemological point of view, *historiê* functions as a substitute (a sort of ersatz) for original, divine vision, although providing only a limited and never-complete vision. The concern now is only with men and their great accomplishments (the bard, in contrast, sang of both men and gods), in a time that is also that of men alone.

1

The history of doctors

The Hippocratic corpus presents several very interesting examples, beginning with the oath itself, which calls upon the gods as witnesses, that is, as guarantors:

> I swear by Apollo the healer, by Aesculapius, by Health and all the powers of healing, and call to witness [*historas poieumenos* (ἵστορας ποιεύμενος)] all the gods and goddesses that I may keep this Oath and Promise to the best of my ability and judgment.
>
> (Hippocrates, *Ancient Medicine*)

The gods are called upon to hear (not to see) and to be guarantors of the oath made by the applicant. We are again in the presence of the epic *histôr*.

Historion as proof. In *Diseases, IV*, the author lists "proofs" (he has seven of them) that drink does not go into the lungs, before concluding:

> Indeed I would not have advanced any of these proofs in support of my argument, were it not for the fact that it is a very generally held opinion [*dokeousi* (δοκέουσι)] that drink goes into the lung, and against an opinion strongly held one is obliged to advance many proofs [*polla historia* (πολλὰ ἱστόρια)], if one is going to turn the hearer from his former opinion and persuade him by what one says.
>
> (*Diseases IV*, 56.7, in *Hippocratic Treatises*)

Historein

> A physician does not violate etiquette even if, being in difficulties on occasion over a patient and in the dark through inexperience, he should urge the calling in of others, in order to learn by consultation the truth about the case, and in order that there may be fellow-workers to afford abundant help.
>
> (Hippocrates, *Hippocratic Treatises*)

The investigation of what is related to the sick person and his disease proceeds from the common basis established by group consultations.

Historiê as inquiry or the knowledge resulting. The treatise *Ancient Medicine* (or, *Tradition in Medicine*; chap. 20), claiming that only medicine can give us precise knowledge of the nature of man, invokes an inquiry (*historiê*) into "what man is and how he exists because it seems to me indispensable for a doctor to have made such studies and to be fully acquainted with Nature."

We may follow the relationship between *historia* and autopsy or eyewitnessing (the fact that the doctor has seen with his own eyes and has direct knowledge) into the second century CE: *historia* presenting itself as a narrative of autopsy. Thus, in "An Outline of Empiricism," Galen presents and critiques the position of doctors of the empiricist school:

> The first and foremost criterion of true history, the empiricists have said, is

what the person who makes the judgment has perceived for himself. For, if we find one of those things written down in a book by somebody which we have perceived for ourselves, we will say that the history is true. But this criterion is of no use if we want to learn something new. For we do not need to learn from a book any of those things which we already know on the basis of our own perception. Most useful and at the same time more truly a criterion of history is agreement [*sumphônia* (συμφωνία)].

Galen then presents an example: imagine a medication that one does not know. Everyone writing about it says that it has a certain effect. Should one believe them? Yes, says Galen, from the very fact of the *sumphônia*.

Against time, which erases everything, the historian creates a work of memory, and since instability is the rule, he must give a parallel, balanced account, like a fair judge, of the great and small cities: he will be their guarantor.

The muse as unique announcer having gone silent, a narrative with a twofold structure is put in place: on one hand, the *I*, the inquirer and narrator, who comes and goes, gauging and judging; on the other, the profusion of *logoi* [λόγοι], accounts, maintained by all and sundry (including the anonymous *legetai* [λέγεται], "it is said that"), which he inventories and reports. Between these two, in the movement from one side to the other, is established a process of "interlocution," which is always being renegotiated, that forms the deep texture and that is the purpose of the historical narrative.

C. *Suggraphein*: Transcribing what the eye witnesses

With Thucydides, who is commonly held to be the other, if not the true, founder of history, what is initially striking is the intention to break from Herodotus. *The Peloponnesian War* is at no point put under the heading of *historia*: the noun never appears, nor does the verb *historein*. It is not that

Thucydides declined to inquire—quite the contrary; but he put his work in the category of "setting in writing" (*suggraphein* [συγγράφειν]): "Thucydides, an Athenian, recorded the war between the Peloponnesians and the Athenians, writing how they waged it against each other . . . " (1.1). The verb means "to take note," "put into writing," or in a more technical sense, "to write out a legal document, a contract." Later, when history will be a genre, *suggraphein* and *suggrapheus* [συγγραφεύς] (*scriptor* in Latin) will come to mean historical writing and the historian. However, neither *suggrapheus* nor *scriptor* ever refers to historians alone (that is to say, as a distinct vocation): the historian is, rather, a writer practicing a certain kind of writing. But for Thucydides, a historian of the present, to say that he *suggraphei* is to say that he reports what has just happened from up close, what is in fact still going on. He does not write the history of the war but rather puts the war into writing, baptizing forever these thirty years of hostilities as the Peloponnesian War.

To do so, he decisively gives priority to the first of the two means of knowledge available to the historian, the eye (*opsis* [ὄψις]) and the ear (*akoê* [ἀκοή]): the eye is the only

one of the two allowing for a clear and distinct vision (*saphôs eidenai* [σαφῶς εἰδέναι]). *Historiê* and *historein*, too closely related to oral forms of inquiry, no longer have their place in his epistemology. The ear is never trustworthy: what is *said* is trafficked, spread, transmitted—everything that comes from memory is subject to deformation and yields, deliberately or insidiously, to the law of pleasure that rules word of mouth. This is why there is no other scientific history but that of the present. And there still remains a need for the eye and the fact of seeing oneself to be sifted through a critique of testimony. Writing history is the transcription of an eyewitnessing, or better, of an autopsy. The goal being sought must be what is useful.

D. History as a genre: A *historia* without *historein*

Neither *historia* nor *historein* reappear immediately. Xenophon made no use of them either. Accounts of so-called Greek matters, *Hellenika*, were written by now-lost chroniclers, and Xenophon wrote his own *Hellenika*, picking up exactly where Thucydides left off. In the fourth century BCE, Ephorus, whom Polybius recognized as his only predecessor in the project of composing universal history (see HISTORIA UNIVERSALIS), did publish *Historiai*, which were a way of linking up with the Herodotean project; however, it is only in the preface to Polybius's *Histories* that we gain a clear confirmation that *historia* has become a genre on its own: "Had previous chroniclers neglected to speak in praise of History in general . . ." (1.1); "if this had been the case," Polybius seems to argue, "then I would have to make the sacrifice, but since this is not the case, I can spare myself." There follows immediately a series of variations on the theme of history as *paideia* [παιδεία] (education), *gumnasia* [γυμνασία] (training), and *didaskalos* [διδάσκαλος] (teacher) in order to face the vicissitudes of life. A century later, Cicero's expression of *historia* as *magistra vitae* (mistress or directress of life; *De oratore*, 2.9, 36) will simply take up this program again and resume the project—and so too will Dionysius of Halicarnassus (a contemporary of Augustus) who defined, or is said to have defined, history as "philosophy on the basis of examples" (*Ars rhetorica*, 11.2): moral philosophy, of course. However, we are now in Rome, or somewhere between Greece and Rome. Henceforth, we have a *historia* without *historein*.

What happened between the fourth and second centuries BCE, when indeed many histories were being written (almost all lost)? What happened to the curious inquirer, emulator, and rival to the bard of the past? Or to the one who, with a different ambition, wished to make his history *the* political science, giving the men of the future a way of understanding their own present? They disappeared, whereas *historia* settled in. However—or so the moderns tell us—in the process, *historia* was caught by rhetoric: it became (as in Isocrates) a branch of eulogy. Aristotle, for his part, relegated it to the domain of particulars. As for Athens, the experience of defeat at the hands of Sparta and its consequences led to a lasting reversal of the situation: to face (or indeed, to avoid) the difficulties of the present, they turned wholeheartedly toward the past with the idea of imitating it. Here is where the theme of history as a provider of examples (*paradeigmata* [παραδείγματα], *exempla*) arises, becoming rapidly and for a long time a topos of the historical genre: history as a

"mistress of life." Faced with a crisis of the present, one may become more concerned with establishing continuities: with recounting the events of the history of the city or the history of the world from the beginning to the present day. The historian, in these circumstances, acquired a greater need for books and headed down the path of libraries. The role of inquiry (*historiê*) diminished, and that of compilation increased: the historian became a reader. Everyone agrees in reckoning that the facts are given, that the facts are there; the important part is to put them together—not what to say, but how to say it.

■ See Box 2.

E. Narrative history: *Narratio*

As Lucian of Samosata reminded us in the second century CE, the historian's "business" is "to superinduce upon events the charm of order, and set them forth in the most lucid fashion he can manage" (*How to Write History*, 51). The historian is like the sculptors Phidias and Praxiteles: we put the primary material at his disposal, and he comes afterward to fashion it and give it form.

There are stylistic models from this point on: they are catalogued and studied; students in schools of rhetoric learn to imitate them. *Historia* has become a literary genre, and when Cicero asks about the beginnings of history, he gives a literary history of history, running from the annals of ancient Rome (organized by year) to a *narratio* that is more and more elaborate and self-conscious. History, to say it in Latin, will be henceforth—maybe even only—*narratio*.

History is useful for the training of orators; as Quintilian emphasizes, however, its goal and expression are different from those that pertain to the eloquence of the forum.

> History [*historia*], also, may provide the orator with a nutriment which we may compare to some rich and pleasant juice. But when we read it, we must remember that many of the excellences of the historian require to be shunned by the orator. For history has a certain affinity to poetry and may be regarded as a kind of prose poem [*carmen solutum*], while it is written for the purposes of narrative [*ad narrandum*], not of proof [*ad probandum*], and designed from beginning to end not for immediate effect or the instant necessities of forensic strife, but to record events for the benefit of posterity and to win glory for its author [*ad memoriam posteritatis et ingenii famam*].

> (*Institutio oratoria*, 10.1.31–34)

Historia is a narration of *res gestae*, of what has been accomplished, and especially of the grand deeds of the Roman people: recalling the "high deeds of the greatest people of the world" (1.3): this is Livy's project. *Historia romana* henceforth becomes the past of the city, which "Augustus watches over" (Probus, *Life of Virgil*, 28)—Augustus was himself the author of a monument testament, rightly entitled *Res gestae*, in which he recounted both his actions and those of the Roman Empire.

■ See Box 3.

Whatever debates this genre of *narratio* might have entailed did not have a great influence on historical productions in Rome at the time. (Lucian, for instance, is clearly

2

History between rhetoric and philosophy

Rhetoric and history: Isocrates

Defining philosophy as what is useful "to words and to action," Isocrates never directly dealt with history and never legislated as to what a historical narrative should look like. However, he is taken for a master (a harmful one), whose influence shattered the development of history. Thus, in the nineteenth century, the German historian Johann Gustav Droysen reckoned that Isocrates "drew history into paths from which never Polybius vainly exerted himself to bring it back" (*Outline of the Principles of History*). In our day, Arnaldo Momigliano ("History in an Age of Ideologies") compared the position of the American historian Hayden White and that of Isocrates:

> Nor are we entirely on new ground when we hear from Hayden White that history is a form of rhetoric to be treated according to methods of rhetorical research. As I have already implied, some of us still remember that a problematic relationship between history and rhetoric already existed in the school of Isocrates in the fourth century B.C.: then, as now, the problem for history was to avoid being absorbed by rhetoric, whatever the contacts between the two.

While Isocrates does not speak about history, he is clear that he puts the burden of presentation and the deployment of past facts on the *logos*:

> But since discourses [*logoi* (λόγοι)] can naturally be set out in many ways about the same matters, and one can make great things small and give greatness to small things, or set out old issues in a new way and speak in a traditional way about things that have happened recently, we must not avoid issues about which others have spoken before, but rather, we must

try to speak better than they have. What happened in the past is available to all of us [*koinai* (κοιναὶ)], but it is the mark of a wise person to use these events at an appropriate time [*en kairôi* (ἐν καιρῷ)], conceive fitting arguments about each of them, and set them out in good style.

(*Panegyricus*, 8–9)

Aristotle and *historia*

Aristotle was in part a determined practitioner of empirical inquiries (*historiai*)—the *History of Animals* (*Hai peri tôn zôôn historiai*) is the most well-known example—but he never uses the verb *historein*. On the other hand, he assigns history—this time as the narration of past events—only to the domain of the particular, not granting it access to the universal and hence science (*epistêmê* [ἐπιστήμη]):

> From what we have said it will be seen that the poet's function is to describe, not the thing that has happened, but a kind of thing that might happen, i.e., what is possible as being probable or necessary. The distinction between historian and poet is not in the one writing prose and the other verse—you might put the work of Herodotus into verse, and it would still be a species of history; it consists really in this, that the one describes the thing that has been [τὰ γενόμενα λέγειν], and the other a kind of thing that might be [οἷα ἂν γένοιτο]. Hence poetry is something more philosophic and of graver import than history, since its statements are of the nature rather of universals [μᾶλλον τὰ καθόλου], whereas those of history (*historia*) are singulars [τὰ καθ᾽ ἕκαστον]. By a universal statement I mean one as

to what such or such a kind of man will probably or necessarily say or do—which is the aim of poetry, though it affixes proper names to the characters; by a singular statement, one as to what, say, Alcibiades did or had done to him.

(*Poetics*, 9.1451a36–b11)

Thus, caught between the orator and the philosopher, the historian does not have his own land and has no choice but to borrow from both while claiming that he can satisfy everyone, as Polybius does, at the risk of pleasing no one but the lovers of stories—with pleasure having replaced both usefulness and truth, which are nevertheless still claimed as the true goals of history.

playing with these traditional classifications of *historia* in his *True History*.) Eloquence and the orator lost their importance, and *historia* continued to claim, with varying degrees of looseness, to be *historia magistra*—history as educator. Christians took it over. However, the primary shift was when the Bible became *historia* (as reporting true facts that really happened), since it is certain that whatever contradicts it is false. As a result, with Augustine, there is henceforth a *historia divina* and a *historia gentium*. The former, which is found in the Holy Scripture must be decoded, since it is a bearer of hidden meaning.

II. From Particular Histories to History— *Geschichte*—and to the Science of History

A. *Historia* and *gesta*

Throughout the Middle Ages, the meanings of the term "history" were marked by Latin references and hence evolved little. Isidore of Seville refered to the three essential characteristics laid out by Cicero: "history is first a narrative of past facts, through which these events are known" (historia est narratio rei gestae . . . , per quam ea, quae in praeterito facta sunt, dignoscuntur; *Etymologiae*, 1.41). Though it rests first on

3

Historia [ἱστορία], *muthos* [μῦθος] / *fabula, plasma* [πλάσμα] / *argumentum*

If history does belong to the narrative genre, what precisely is its place? How should we locate it in such a vast field—vast inasmuch as a narrative element may be found in every literary work? Once the distinction between a narrative of the facts (*ergon* [ἔργον]) and speech (*logos* [λόγος]) was first established, as in Thucydides, history as a whole was henceforth implicated in narration. It was at this point that both Greek and Latin rhetoricians and grammarians began to suggest different classifications. It is not a question of epistemology, but rather of characterization based on content.

The *Rhetoric to Herennius* (86–83 BCE; anonymous) distinguishes three types of narrative. The third is divided in two—one concerning persons, the other actions:

That which consists in describing actions has three forms: fable [*fabula*], history [*historia*], fiction [*argumentum*]. Fable contains elements which are neither true nor likely, like those found in the tragedies. History contains events which have taken place, but at a time distant from ours. Fiction is an invented narrative which could have taken place, like the subjects of comedy.

(*Rhetoric to Herennius*, 1.12)

The grammarian Asclepiades of Myrleia (second to first centuries BCE), also a historian of Bithynia, distinguished three parts part of the latter. In general, history is an *amethodos hulê* [ἀμέθοδος ὕλη], an unformed matter, coming from no particular technical skill (ibid., 1.266). We may, in any case, retain here his adoption of the threefold categorization:

"One of the subjects of history is history [*historia*], another is myth [*muthos*], and the third is fiction [*plasma*]." History, in the restricted sense, "is an exposition of true things which actually happened, such as that Alexander died in Babylon poisoned by plotters, and fiction is when things which did not happen are told like those that did, such as comic plots and mimes, while a myth is an exposition of things which have not happened and are false, such as when 'they sing that' the race of venomous spiders and snakes was born 'from the blood of the Titans' [Nicander, *Poisonous Creatures* 8–10]" (ibid., 1.263–64).

History is not technique. There is no method for distinguishing what is historical (in the restricted sense) from what is not. On Sextus's description, history can escape Aristotelian particulars (*kat'hekaston* [κατ᾽ ἕκαστον]) less than ever. As for historian-grammarians, their judgment (*krisis* [κρίσις]) does not allow them to distinguish between true and false narrative.

direct testimony, it also includes earlier times. On that basis, it thus covers, second, the testimonies of the past to the extent they are thought to be a reliable source of knowledge. Third, the term "history" also refers to the object of historical knowledge, whether it is a single event or a collection of them. Subsequently, the term *gesta*, the neuter plural of *gestum*, referring to facts that have occurred, is grammatically transformed into a feminine singular and becomes synonymous with *historia* (the narration of facts that have occurred; cf. *geste* in Old French) and then comes to refer to one of the four historiographical subgenres: chronicles, which relate to a historical theme, usually developed from its origins down to the present time; annals, which record facts year by year; the *vita*, biography, especially of the hagiographical sort; and the *gesta,* which relates the actions of a series of dignitaries, and through them, the history of an institution (the papacy, the empire, etc.). In addition, derived from the chronicle, we find histories of particular peoples, such as Cassiodorus's history of the Goths. It is only around the twelfth century that the boundary between *res gestae* and *historia* is reclarified: the latter is more reserved for the veridical recounting of the past, whereas the other terms have looser meanings, loosely covering the senses of "actions" or "events."

In the system of *artes liberales*, *historia* was attached, within the *trivium,* to grammar and rhetoric. As *magistra vitae*, in Cicero's phrase, it provides examples that may be used in argument to win the assent of the interlocutor or the reader.

While the humanists rediscovered antiquity and posited at the same time a special relationship between their own time and that of the ancients, they did not, for all that, develop a new concept of history. Lorenzo Valla (*Historia Ferdinandii regis Aragoniae*, 1528) praised history in relation to poetry but insisted above all, like Politian and Budé, on the methodological objective of precision, of *fides historica.* To reach this objective, the humanists added to the knowledge of antiquity, cultivating the technical subtleties of auxiliary sciences, of philology, geography, chronology, genealogy, and numismatics and maximized the methodological gains, but they did not discuss the field of history insofar as it is related to knowledge.

Machiavelli stayed with the idea of *exempla* taken from *istorie*, the works of history, which must serve the actor in the present. It is the immutable character of human nature that guarantees, in a way, the comparability of situations and allows us to jump between antiquity and the present. If we can imitate the examples of the past, this is because fundamentally neither the times nor people have changed. Francesco Guicciardini, for his part, attempted to describe the limits of rational political action. However, neither he nor Machiavelli suggested a new definition of history. They remained entirely oriented toward objects and events whose causal connections they attempted, each in his own way, to discern.

The concept of history became inflected in the sixteenth century by two French authors. In his work dealing with the link between universal history and a jurisprudence directed at the problems of action (*De institutione historiae universae et ejus cum jurisprudentia conjuntione*, 1561), François Baudouin called into action a comparative vision,

encompassing ancient and biblical history, sacred and profane history, Eastern and Western history—a history whose underlying unity is the question of the agreement (or disagreement) between human action and the law. He established in this way a fundamental distinction between natural history and the history of man while also bringing into play the stock of new knowledge acquired by the modern era. Some years later, Jean Bodin, formulated the principles of historical knowledge and pushed the degree of methodological rigor further than ever before. He thus took an important step toward the foundation of an empirical science of history (*Methodus ad facilem historiarum cognitionem*, 1566). Finally, the new turning point for history was announced at the same time by a learned Italian, Francesco Patrizi. He proclaimed that "la historia è memoria delle cose humane" (history is the record of human affairs) and thus indicated that historians should move away from the direct observation of things to open up a new, distinct, and proper space of experience (*Della historia: Dieci dialoghi*).

■ See Box 4.

B. The descendants of *historia* versus *Geschichte*

The new turning point in the history of *historia* can be observed in great detail starting in the second half of the eighteenth century with Vico, who constructed a general vision of human history. While distinguishing its stages, he drew attention to the diversity of legal structures, languages, and cultures. In Germany especially, a semantic shift took place: the progressive substitution of the term *Geschichte* for that of *Historie*. Reinhart Koselleck has shown that this change came in two parts. The first of these is the shift from a plurality of individual histories (*Geschichte* as a feminine plural, another form of *Geschichten*) to the collective singular *Geschichte*. The term *Geschichte* refers, from the Middle Ages onward, both to the event and to its recounting. Until the end of the

eighteenth century, however, it was mostly used with regard to singular facts, relating to the multiple forms of a *Geschehen*, a chain of events in the past. The plural usage emphasizes precisely the multitude of particular facts. The singular, which was progressively adopted, not only captures the totality of these individual histories but also their abstraction, their generality. As a result, some authors introduced a reflective dimension, and history entered the field of consciousness. Adelung's dictionary (RT: *Versuch eines vollständingen grammatisch-kritischen Wörterbuches*) of 1775 marks the shift while maintaining the two meanings side by side. According to Adelung, *Geschichte* means

[w]hat has happened, a thing which has occurred, as well as, in another meaning, any modification either active or passive which happens to something. In a more narrow and customary sense, the word picks out various modifications related to one another which, taken together, constitute a certain whole. . . . In this meaning we often use it as a collective and without a plural form, for several past events of a single species.

It is true that the shift took place slowly. In 1857, for instance, Droysen still contrasted the singular and the plural forms of *historia*, specifying: "Above histories lies History (*Historik*)." By this time, however, the hierarchy was clearly established.

We may also describe this change—this is the second part of the shift discussed by Koselleck—as the progressive absorption of the term *Historie*, taken from the Latin (and Greek), by *Geschichte*. Winckelmann provided a striking example in 1764. In the title of his work *Geschichte der Kunst des Altertums*, we can no longer distinguish whether the stress is placed on artistic objects or on the tableau of the whole that comes from the narrative. In his preface, Winckelmann clarifies:

4

Historia, history, *Geschichte*

At the linguistic level, the use of terms began to stabilize in the major European languages in the sixteenth century. On one hand, the Romance languages more or less took over the meanings created on the basis of Latin and Greek that focus on the narrative presentation of events, as opposed to the events themselves. *Histoire*, *istoria* (which became *storia*), *historia*, etc., are direct translations. English introduced a distinction between "history" and "story," the first being reserved for scholarly use, whereas the second singularizes particular histories and, if necessary, their literary presentation. In German, *Historie* replaced the Latin term but from the beginning of the eighteenth century onward was rivaled by the originally Germanic word *Geschichte*. The Dutch *Geschiedenis* followed the evolution of *Geschichte*, whereas

Scandinavian languages stayed with the semantic group of *historia*. The peculiarity of the semantic family *Geschichte* is that the word means both the narrative of the event and the event itself. The spread of the term *Geschichte* marked a deep transformation in the very conception of history, including in historiographical traditions that remain in the family of *history / histoire*. In *Zur Philosophie der Geschichte*, Hegel himself tried to generalize on the basis of the peculiarities of the semantic evolution of German:

In our language, the term *History* [*Geschichte*] unites the objective with the subjective side, and denotes quite as much the *historia rerum gestarum*, as the *res gestae* themselves. . . . This union of the two meanings we must regard

as of a higher order than mere outward accident.

The association of the individual and the state is what, according to him, constitutes the very condition of history. It produces history at the same time as the vision that is turned toward it. Hegel leaves aside, however, the fact that his demonstration is based on a linguistic peculiarity restricted to German.

Hegel, Georg Wilhelm Friedrich. *Zur Philosophie der Geschichte*. Edited by Hermann Glöckner. Stuttgart: Frommann, 1928. Translation by John Sibree: *The Philosophy of History*. Mineola, NY: Dover, 2004.

[T]he history [*Geschichte*] of the art of Antiquity which I have undertaken to write is not a simple narration of its sequence and its transformations; rather I take the word history [*Geschichte*] in another sense, that which it has in the Greek language, and my intention is to deliver an attempt at a system which is capable of being taught.

By referring to *historia*, Winckelmann formally took over the definitions transmitted from antiquity. These definitions, beginning with Cicero's, had from the beginning allowed individual histories to coexist with a "generic" history that did not require particular objects. At the same time, however, Cicero opened up a new, abstract dimension, which permits the intellectual construction of a totality, a system. Writing just after Vico, Johann Christoph Gatterer used the phrase "system of events" (*System von Begebenheiten*), to which he attributed a temporality different from that which normally regulates the citizen's daily perception of time (*Vom historischen Plan und der darauf sich gründenden Zusammenfügung der Erzählungen*, 1767). For his part, Kant reserved the term *Historie* for empirical history, which simply lines up the facts, whereas *Geschichte*, especially in reference to the conception of an a priori *Geschichte*, that is, as a construction of reason, opens up the possibility of presenting an "aggregation" of human actions in the form of a system, organized according to a logic of the whole. Hegel, by drawing a distinction between a primitive history (*ursprüngliche Geschichte*, history written by witnesses), reflective history (*reflektierende Geschichte*, the history of historians, who construct a special relationship to their object), and a philosophical history (*philosophische Geschichte*), pushed the concept of a systematic history further, which in its most abstract variation takes the form of a *Welt-Geschichte*, a world history. As such, philosophical history deals with the evolution of logical substance, the activity and the work of the spirit as it makes itself the object of its own consciousness and makes effective, by the same stroke, the principle of freedom. All of these reformulations are the indication of a profound change that paved the way for the "historical science" of the nineteenth century. However, they coincided, in particular, with changes in the perception of time that preceded and accompanied the experience of revolution.

C. Change of experience and the mutation of history: *Historisierung,* historicization of the field of knowledge

The simultaneity of the experience of revolution (in the wide sense) with the changes that occurred in the conception of history suggests a clear break—or at least novelty. It indicates, in effect, a twofold link that was decisive in what followed: first, between the experience of the present and the definition of history, and second, between models of temporality and representations of historicity. On both levels, the violent and massive intrusion of manifestations of the revolutionary break produced chain reactions that modified the self-perception of contemporary European cultures. From this point of view, the changes to the notion of *history / Geschichte* led to the heart of the problem of the link between experience and the attempts to rationalize it as a collective phenomenon.

We may observe that a similar internal reform movement arose in France and in England, but in the two historiographical traditions at issue, it rests on different bases. In France the foundational role is often assigned to Voltaire, who, on the theoretical level (*Essai sur l'histoire générale et sur les moeurs et l'esprit des nations depuis Charlemagne jusqu'à nos jours*, 1756) as well as the practical historical one (*Le siècle de Louis XIV*, 1751), introduced a general vision of the historical process. In place of a universal Christian history in the style of Bossuet, Voltaire substituted a history of another type, just as universal, that describes the history of humanity as a long process of civilization leading up to the victory of the human spirit over the forces of obscurantism. In so doing, he put man at the center of history. Although Voltaire was later reproached for the overly "philosophical" character of his approach, it remains the case that he became the model, in his turn, both intellectual and stylistic for at least two generations of French historians. François Guizot, though attempting to establish a new type of history at the methodological level, remains tributary in his *Histoire de la civilisation en Europe* (1828–30) to the conception of a "macro" intellectual history that places the process of civilization center stage, following a teleological schema (see HISTORIA UNIVERSALIS).

In Great Britain, a comparable role was played by William Robertson, with *History of Scotland* (1759), and by David Hume, with *History of Great Britain* (1754–62). The two works became reference points for the new historiography, presenting the high subjects of a nascent national history in a newly revitalized style. Edward Gibbon's *Decline and Fall of the Roman Empire* (1776–88), which follows the same theoretical principles and deploys comparable literary qualities, had considerable influence throughout Europe.

The nineteenth century saw the consolidation of the central role that in the new order fell to history. Here again we may discern two levels: first, the progressive penetration of the whole field of knowledge by a historical vision. This movement affected all disciplines, from philology to linguistics and economics to the new life sciences and the social sciences, even theology. In large part, the scientization of these domains is equivalent to the historicization of their objects. Scientific progress could be measured according to the degree of pertinence of historical schemas of explanation. At a second level, however, the set of histories proper to a specific domain had to become something more than a simple aggregate or accumulation. Rather, they now constituted a specific means of production of knowledge, which lay down as a principle that the intelligibility of human action is always a function of examining it within the dimension of time. The historian's eye is supposed to penetrate the dimension of time and holds the key to it. As a result, history became, in a way, the queen of disciplines in the nineteenth century. It incarnated, more specifically, the idea of progress, in the sense that it alone is able to integrate the sum of knowledge produced by these diverse disciplines. As a science of evolution, it is at the root of any vision of becoming in the world; as a science of explanation, it looks at human action in all its aspects. On the two levels, it was from then on supposed to give accounts of both continuities and discontinuities.

D. The work of history: Poetry, novel, *Anschaulichkeit*

This all-encompassing aspiration gives history a role comparable to that of philosophy on one hand and religion on the other: it becomes in its turn a sort of secular religion. That said, the relations it has with religion remain ambiguous. On one hand, it substitutes its own capacity for explanation for divine providence, which earlier had been the basis for the unfolding of things. In this sense, Gatterer could posit that the goal of history is to restore the *nexus rerum universalis* (a universal connection of things in the world), a term that anticipates Humboldt and Ranke's *Zusammenhang* (interrelation). On the other hand, it does not eliminate references to providence either. For Ranke, it is in fact its relationship to the divine that gives history its unity. The historian must reconstruct the past while recognizing that insofar as each period is directly related to God (*unmittelbar zu Gott*), a part of history always remains hidden, inaccessible to rationality and historical reconstruction. Unity is thus a quality both internal and external to history. We may add Hegel's version, also an all-encompassing one, which emphasizes the work that spirit performs in history, work that gives spirit its progressive knowledge of what it is:

> Dieser Prozeß, dem Geiste zu seinem Selbst, zu seinem Begriffe zu verhelfen, ist die Geschichte.

> (History is the process whereby the spirit discovers itself and its own concept.)

> (*Die Vernunft in der Geschichte*)

These three variations have in common the fact that they all aim at a global level, beyond events and particulars, and thus give comfort to the universalizing aspirations of history.

At the practical level of historiography, we can observe the same universalizing movement. In his article on the task of the historian, Humboldt established a clear distinction between the materials of history ("events," *Begebenheiten*) and history itself (*Geschichte selbst*) that cannot be obtained according to the precepts of the critique of sources. Rather, history itself is revealed to the historian only insofar as he manages to uncover the "internal connection" (*innerer Zusammenhang*) of the facts, the general idea that structures the whole ("Über die Aufgabe des Geschichtschreibers"). In the search for this structure, he must exhibit gifts analogous to those of the poet, and more generally, of the artist. In a letter of 7 May 1821 (*Briefwechsel*) to the jurist F. G. Welcker, Humboldt commented on his text:

> There I compared history to art, which does not so much consist in imitating forms as in rendering perceptible the idea which lies in these forms.

> (Ich habe darin die Geschichte mit der Kunst verglichen, die auch nicht sowohl Nachahmung der Gestalt, als Versinnlichung der in der Gestalt ruhenden Idee ist.)

Humboldt thus reopened the great debate, which cuts across a wide swath of historiography, on the relationship between history and poetry, history and novels. Diderot had already, with regard to Richardson, contrasted a history that would be a "bad novel" with the novel that would be a "good story [*histoire*]" (*Éloge de Richardson*). In trying to paint "local color," so-called romantic French historians attempted to include the virtues of the novel, especially those of Walter Scott, in their historical tableaus. Augustin Thierry praised the "prodigious intelligence of the past" deployed by the novelist, at the expense of the simple, blinkered erudition of the traditional historian (preface to *Dix ans d'études historiques*, 1835). According to him, this is because novels, by putting forward clear and coherent principles of intelligibility, come closer to the truth than dusty history, which just gathers facts. In England, Macaulay's *History of England* was strongly inspired by Walter Scott. Ranke, for his part, opposed the novel, establishing a strict distinction between science and fiction. According to him, Walter Scott sins by deforming the facts. The only criteria of historical science must be the historical truth, which can be uncovered by the detailed critique of sources. Ranke constructed his whole historical science both against earlier historiography and against the pretensions of fiction; however, it is easy to see that at the level of the narrative, he nevertheless deployed the formal principles of the novel, aiming for both *Anschaulichkeit* (which relates at the same time to perceptible character, accessible to the senses, and to demonstration by example; see ANSCHAULICHKEIT) and the effect of a whole produced by narration. By insisting on irreducible individuality, by describing even the life of institutions and collectivities as individual evolutions, and by deploying varied stylistic registers, he placed many of the essential ingredients of fiction at the service of history. In doing so, he integrated the two elements of narration and argumentation, whose mixture characterizes historical discourse. In the German historiographical tradition, which emphasizes the scientization of the domain of history, the role of literary techniques has often been underestimated, whereas Michelet in France is widely appreciated for having managed a synthesis of literature and history. Such national distinctions prove misleading if they are too absolutely applied: we may recall that Theodor Mommsen himself saw the imagination not only as "the mother of all poetry, but also of all history" (Die Phantasie ist, wie aller Poesie so auch aller Historie Mutter; *Römische Geschichte*).

■ See Box 5.

E. Historical knowledge, the crisis of history, and historicism

By the middle of the nineteenth century, the meanings of the terms "history," *histoire, storia, historia* on one hand and *Geschichte* (to which the Dutch *Geschiedenes* corresponds) on the other had more or less stabilized. They follow, of course, the small evolutions of historiography and the movements of the philosophy of history, but they remain in the framework of the semantic fields we have been sketching. While some particular kinds of history emerge from it (social history, cultural history, history of mentalities, intellectual history, microhistory, world history, and so on), these can generally be attributed to small rearrangements of the relations between these semantic fields and to the discovery of new approaches or new objects. Even though they most often form within national historiographical traditions, the trends they refer to in general go beyond the frameworks of these traditions, and their terms enter into the process of translation of the international scientific community.

5

Historiography, history of history, *Historik*

The term *historiographie* refers in French to the history of history, historical work that takes historical discourse as its object, the ways of writing history from its beginnings. In German, *Historiographie* retains only a weakened sense and is often taken to be synonymous with "history" (*Geschichte*): "historiography" in the French sense is rendered by *Historiographie-geschichte*, whereas *histoire de l'historiographie* would seem tautologous in French. In Italian, on the other hand, *storiografia* is similar to the German *Historiographie*, as indicated, for example, by the title of the journal *Storia della storiografia*. In English, "historiography" is used in the sense of "history writing," which more or less intersects with the Italian and German meanings. These examples show that we in fact have a continuum, where at one end history is assimilated to any investigation of facts of the past, and at the other, we insist on the reflexive character of any historical operation. To refer to the theory and methodology of history, German uses the term *Historik*, which does not have an equivalent in the other languages. It gives this reflexion a special status, which German historians, in particular Droysen, wished to keep out of the hands of philosophy, especially the philosophy of history. *Historik* refers both to reflection and presentation, especially to the goals of teaching.

In contrast, controversies occasionally arise about the role of history in human experience as well as the different ways of thinking about this experience. Beginning in 1874, Nietzsche led the first attack against the all-encompassing ambitions of history by contrasting the imperatives of life (*Leben*) with a relativist logic of historical method, which pushes the knowledge of detail so far as to lose sight of the whole. According to him, generalized historicism ("das überschwemmende, betäubende und gewaltsame Historisieren") threatened the foundations of culture: "To be so overwhelmed and bewildered by history is, as the ancients demonstrate, not at all necessary for youth" (*Vom Nutzen und Nachtheil*). Against what he considered to be the harmful grip of the past, Nietzsche advanced the logic and the necessities of the present, as well as the action that life calls for. In so doing, he set off the crisis of historicism. Taking Ranke's principle to the extreme, which would prevent the historian from taking on the double role of judge of the past and master of the present, the historical school is alleged to have lost sight of the values that must guide political action. The neo-Kantians of the school of Baden, problematizing the production of sociohistorical knowledge, attempted to get out of this historicist dilemma. They insisted, on one hand, on the difference between the knowledge produced by the sciences of nature, which is organized into rules and laws, and that belonging to the "ideographical" sciences, like history, which describe perceptible (*anschaulich*) configurations. On the other hand, they distinguished between the sciences of nature (*Naturwissenschaften*) and those of culture (*Kulturwissenschaften*), the latter being defined as those that bring historical material into the sphere of values recognized within groups. The neo-Kantians gave Max Weber the tools for a theory of values thanks to which he hoped to reconstruct a form of objectivity required for giving a scientific grounding to the social sciences. Ernst Troeltsch, who was one of the most accomplished thinkers about the crisis of history, used the same theoretical premises to compare the social sciences (*Geisteswissenschaften*) with the problems of action. In parallel with the neo-Kantians, Dilthey, in *The Formation of the Historical World in the Human Sciences* (*Der Aufbau der geschichtlichen Welt in den Geisteswissenschaften*), which sketches the project of a "critique of historical reason," attempted to move beyond Kantian critical philosophy by positing that man as a producer of historical knowledge was himself a historical being ("The primary condition for the possibility of historical science is contained in the fact that I am myself a historical being and that the one who investigates history is the same as the one who makes history [*daß der, welcher Geschichte erforscht, derselbe ist, der die Geschichte macht*]", "Plan for Continuation"). It is not thanks to reason that man manages to understand the past, but to *Erlebnis*, of his capacity as a living being to live and understand situations from the inside.

Furthermore, theorists of history such as Croce claimed to represent the Hegelian school of thought by insisting on the constructed character of historical knowledge. The truth is not in the facts but instead is the result of a fusion between a philological critique and a philosophical attempt at systematization. As a result, Croce emphasized the fact that through the historian's act of thinking, history is anchored in the present: the spirit is both a productive factor in history and the result of the past that precedes it. As a consequence, Croce said, "all history is contemporary history" (*Theory and History of Historiography*). Collingwood (*The Idea of History*, 1946) emphasized in turn the specificity of historical knowledge, which always deals with intellectual materials and never with facts of nature. If Toynbee (*A Study of History*, 1934–61) explored the limits between natural and historical sciences, constructing a world history of societies and cultures, existentialist philosophy placed emphasis back onto the individual. It reconstrues the historicity of being, of *Dasein*, as a fundamental given of existence. Neither Husserl nor Heidegger, however, had much of an impact on historiography or on the conception of history used by historians themselves.

In France, the positivist tradition played a decisive role both before and after Raymond Aron considered the theoretical problem of history by discussing the developments of German philosophy of history and Henri Marrou suggested integrating the question of the varied relationships between historians and their subjects into the discussion of historical knowledge. Even while criticizing it, historians inspired directly by Durkheim's sociology, as well as the historians of politics or, again, the specialists of economic and social history, cleaved to the objectivist ideal of history. That goes for the first Annales school as well, to a certain extent. Through his critique of the "historicizing" history or the "positivist

history" of someone like Charles Seignobos, Lucien Febvre sketched a science of history whose all-encompassing ambition, taking in all of the human sciences, is analogous to that of the exact sciences (*Combats pour l'histoire*). It is true that the problem of the form in which the results of research were to be presented was always considered to be a domain separate from that of historiographical activity proper (this distinction is driven perhaps by French literary and rhetorical culture). However, for the majority of historians, this was precisely and *merely* a question of presentation, one without any direct theoretical implications. It is only in the wake of the "linguistic turn" that, for the last twenty or so years, earlier debates about the twofold quality of *Geschichte* as *historia rerum gestarum* and *res gestae* were to some extent realized. Begun in the United States, this debate is now international, although with "national" variations. Countries with a hermeneutical tradition, like Germany or Italy, were initially more receptive than England or France, where empiricist and positivist trends have maintained strong positions. However, it would be misguided to make a simple parallel between, on one hand, the hermeneutical point of view and postmodern relativism, which attempt to reduce history to the creation of a story, and analytical, or objectivist, traditions on the other. The interpenetration of these two dimensions—the abstract construction of the "fact" from a collection of data that are analytic as well as hermeneutic and its presentation in the form of a more or less sophisticated narrative, producing meaning by its organization—is what has always been one of the most essential features of historical activity.

Rhetoric of history and "metahistory"

The debates unleashed by Hayden White's book *Metahistory* pick up a discussion of the questions of historical presentation that had busied historians in France, Germany, and England in the nineteenth century. Although Ranke had attempted to establish the greatest distance possible between fiction and historical science, he nevertheless used a great variety of narrative artifices to present the results of his investigations. Relying on the ideal of a world history whose unity is based on its divine inspiration, he aimed to achieve objectivity thanks to historiographical procedures that precede the writing and hence are independent of it. Droysen, for his part, was aware of the interactions between the construction of historical knowledge and the mode of presentation. For him, presentation is directly related to the other operations constituting history. The historian must choose, from among a variety of possible modes, that which corresponds to the question he wishes to ask of his documents. In his "Topik," Droysen, abandoning the idea that past reality only corresponds to a single presentation, attempted to think of a plurality of forms of presentation that relate to different ways of constructing a relationship between the past and the present. Analytic presentation (*untersuchende Darstellung*), narrative presentation (*erzählende Darstellung*), didactic presentation (*didaktische Darstellung*), and discursive presentation (*diskussive* or *erörternde Darstellung*) are all genres that link the object of empirical research with the present of the historian and that are all aimed at specific audiences.

The discussion provoked by White's book links up with the positions defended by his predecessors and radicalizes them. Reversing the position of objectivist history, White saw in historical discourse only one form among others of producing statements about the past. As a production of knowledge about it, nothing distinguishes history from novels or myths. The historian is caught between discursive constraints and implicit structures analogous to those of the novelist. His freedom is limited to being able to choose between different modes of exposition, but he remains a prisoner of the structural presuppositions of each. By calling into question the notion of a "historical fact" and insisting on the implications proper to the "metahistorical" level, White wished to reunite *history* and *story*, bringing the historiographical operation and the invention of a story closer together. Far from contrasting rhetoric and truth, the *linguistic turn*, by stipulating that every historical discourse produces its own truth, confuses the two elements. The responses to White hardly go beyond the positions advanced by Droysen. Between the objectivism of the partisans of facts and the relativism of the protagonists of postmodern fiction, Droysen, and later Max Weber, posited that historical knowledge does remain possible, as long as we accept its provisional status, due to the fundamental historicity of the categories of perception and analysis used by the historian. It is precisely this account of the perspectivism of knowledge and its anchor in an ever-moving present that gives specificity to the knowledge of a historian. The result is a plurality of forms of presentation that correspond to the variability of the questions posed and the transformations of the historical gaze.

HOMONYM / SYNONYM

GREEK	*homônuma* [ὁμώνυμα] / *sunônuma* [συνώνυμα]
LATIN	*homonyma, aequivoca/synonyma, univoca*

➤ ANALOGY, CONNOTATION, INTENTION, LOGOS, MIMÊSIS, PARONYM, SENSE, SIGN, SIGNIFIER/SIGNIFIED, *SOPHISM*, SUPPOSITION, *TO BE*, TO TRANSLATE, WORD

The words "homonymy" and "synonymy," modeled on the Greek in most modern languages, do not in and of themselves present translation difficulties. But the similarity of the words hides a number of shifts in meaning that are all the more complex, and therefore less often thematized, because they are linked to an ontological landscape that changes according to different doctrines and times, and in particular the avatars of the Aristotelian critique of Platonism. This has led to recurrent difficulties in the understanding

of ancient texts, manifested through a certain number of mistranslations, that make them unintelligible nowadays. Indeed, why could we not say there is a relationship of pure and simple "homonymy" between what we today commonly call "homonyms," as in the case of homophones like the English "all" and "awl," or the French *vert* (green) and *verre* (glass), as well as the classic example in Aristotle's *Categories*, which describes a man and his portrait as "homonyms"?

More generally, the question regarding homonymy and synonymy is the question of the conditions, or criteria, of identity of meaning: indeed, since Aristotle, the possibility of a noncontradictory discourse and communication between men is founded on the univocality of words and sentences: "For not to have one meaning is to have no meaning" (*Metaphysics*, Γ.4, 1006b7–8, trans. Barnes). Questioning these criteria of identity of meaning led medieval philosophers to redefine the notions of *equivocatio* and *univocatio*, in order to distinguish between different types of semantic variation. Semantic identity is disrupted as soon as an expression "means" or "stands in for" a number of things, or in a proposition, as soon as it is *multiplex*. But it is not necessarily ambiguous, since it is possible for it to signify clearly several different things at the same time. We are thus confronted by a network of terms—*equivocatio*, *univocatio*, *multiplicitas*, *ambiguitas*—that coexist alongside the terms modeled on the Greek: *homônuma* [ὁμώνυμα], *sunônuma* [συνώνυμα], and the corresponding derivations. The search for homonymy, intentional or not, is thus the first prerequisite of logic, or even of a certain ethics of language.

1. Disentangling the Problems

A. Things or words: The referent-name derivation

The commonly accepted contemporary definitions of homonymy are rather vague. Homonymy is most often defined as the symmetrical opposite of synonymy: broadly speaking, homonymy exists whenever one word has several meanings ("eine Name mit mehreren Bedeutungen"), and synonymy whenever several words have a single meaning ("eine Bedeutung mit mehreren Namen," quoted by Ritter in RT: *Historisches Wörterbuch der Philosophie*, s.v.). This definition is inherited from a long tradition that was already well established among Latin grammarians—for example, in the collection of *Differentiae*, which appeared under the name of Fronton: "Hononymia una voca multa significat, synonymia multis vocibus idem testatur" (Homonymy means several things with the help of one word, synonymy shows one thing with the help of several words, RT: *Grammatici Latini*, 7:525). We can, however, already see an indication of an initial problem between these apparently congruent definitions: Is it a matter of the relationship between words and their meanings (Ritter) or of the relationship between words and things (Fronton)?

One answer to the question of whether homonyms and synonyms refer to things or words was the following: "A specific difficulty of the history of composite words ending in -onym comes from the fact that they are applied successively—and also more seriously, simultaneously—to the referent and to the name itself. . . . History subsequently continued to use this derivation" (Lallot, *La grammaire de Denys le Thrace*, 152), one of the key elements of this history being the Aristotelian critique of the doctrine of Ideas.

Nowadays, homonyms and synonyms are words. In antiquity, they could be things or words. Thus the *Iliad* says that the two Ajaxes, the son of Telamon and the son of Oileus, and not their names, are homonyms (*Iliad*, 18.720, trans. Murray, 283), but the *Odyssey* says that the name "Odysseus" is an eponym (literally "named after," *epi* [ἐπί], in order to indicate a particularly significant etymology), well suited to the man Odysseus, who has "wounded" (*odussamenos* [ὀδυσσάμενος]) his grandfather's heart (*Odyssey*, 19.407–10, trans. Murray, 257–59).

Plato uses homonyms (*Phaedo*, 78e; *Timaeus*, 52a) to describe things that are sensible with respect to the intelligible models that confer upon them both being and eponymy (*Parmenides*, 133d, trans. Gill and Ryan, 136); the art of language, insofar as it claims to fabricate everything, according to the Sophist, is a mimetic art like painting that fabricates copies of copies, "images and homonyms of beings (mimê-mata kai homônuma tôn ontôn [μιμήματα καὶ ὁμώνυμα τῶν ὄντων]," *Sophist*, 234b, trans. White, 21; see MIMÊSIS): the relationship of homonymy thus connects Ideas, sensible things, and their simulacra, particularly words (*eidôla legomena* [εἴδωλα λεγόμενα], 234c), so things and words.

Aristotle in turn sometimes explicitly considers things (*Categories* 1), sometimes words, as if this were self-evident (*Sophistical Refutations*). The idea according to which homonymy in ancient times had to do with things is a result of the historical preeminence of its definition in the *Categories*, which indeed contains the first definition of homonyms, and to which one always refers. It has become the normative meaning of homonym, even if one disagrees with it. This explains the term's subsequent fortunes, and the glosses that displace its meaning.

If we are to believe Simplicius (*Commentary on Aristotle's Categories*, 38.19–24), it was Speusippe, Plato's nephew and successor at the head of the Academy, who first introduced the terminological pair *homônumos-sunônumos*, in the context of a systematic classification of "words" (*onomata* [ὀνόματα]) alone.

Greek commentators partially adopted this system, but applied it once again to things. They were followed in this respect by Latin commentators, who used a double set of terms, based on a double set of oppositions—name: identical/different, definition: identical/different (cf. Boethius [*In Categorias Aristotelis commentaria*, 163C–164A, in RT: *PL* 64], who uses the Latin terms; see Desbordes, "Homonymie et synonymie," 61, for the other Latin texts).

The apparent symmetry is obviously an illusion: if different things are *univoca*, *aequivoca*, or *diversivoca*, it is the same thing that is *multivoca*. A multivocal thing is one that is literally designated by several expressions, *voces*, these *voces* being what we nowadays term "synonyms." In this respect, we are following the usage that Simplicius was already calling "modern" (36.30), putting his finger on the motif of an oscillation between the ancient and modern meanings of synonymy: when we study types, we call synonyms several "things" represented by the same word with the same meaning (a man and an ox, when they are both represented as having the same meaning "animal," are synonyms)—this is "the most literal meaning," as Aristotle would say in the *Categories*. But when we are interested in the plurality and variety of words, we call synonyms several "words" that represent the same thing, and that for Speusippe would be termed polyonyms (in the same way that, for Aristotle

in his *Rhetoric* [3.2, 1404b37–1405a2, trans. Barnes, 2:2240], "to proceed" and "to advance," *poreuesthai* [πορεύεσθαι] and *badizein* [βαδίζειν], are synonyms): this is the modern meaning that prevailed with the Stoics (for example, Alexander and Paris: see Simplicius, 36.7–32).

Generally speaking, Aristotle's commentators, while asserting that homonyms are things, also apply the adjective "homonymous" to words. Simplicius is particularly aware of this shift ("In its literal sense, it is realities and not words that produce homonymy," RT: *CAG* 8:24.20ff. / "It is clear, then, that a noun is homonymous," 25.5). It becomes the locus itself of a distinction between a conceptualist interpretation of homonymy that has a Stoic nuance to it (one single word, with several *ennoiai* [έννοιαι], "mental representations"), and a participatory interpretation that is Neoplatonic in nature (74.28–75.5; see Luna's commentary on Simplicius's *Commentaire sur les "Catégories" d'Aristote*, especially part 3, pp. 88–90). More recently—with Luna, for example—"homonymy" is used to describe things, and "equivocality" to describe words (e.g., ibid., 11 n. 26). The definition of the Grammarians, close to the Stoics, opts for words, and within words, their *phônê* [φωνή]: for Denys of Thrace (2–1 BCE), as well as for Oswald Ducrot and Jean-Marie Schaeffer, homonyms are essentially homophones. But this definition is in opposition to that of the philosophers, namely Aristotle and the commentators of the *Categories*. Boethius makes a clear distinction between the adjective *aequivoca*, which describes not things, but the manner in which they are expressed, and the substantive *aequivocatio*, which describes a phenomenon that has to do with words—not only nouns, but also verbs, prepositions, and conjunctions:

> AEQUIVOCA, inquit, dicitur res scilicet, quae per se ipsas aequivocae non sunt, nisi uno nomine praedicentur: Quare quoniam ut aequivoca sint, ex communi vocabulo trahunt, recte ait, aequivoca dicuntur. Non enim sunt aequivoca sed dicuntur. Fit autem non solum in nominibus sed etiam in verbis aequivocatio.

> (Equivocal, he says [Aristotle, *Categories*, chap. 1], that is to say things, which are not in themselves equivocal, unless a common noun is predicated upon them. This is why, since the fact that they are equivocal is because they share a common term, Aristotle rightly says: "They are equivocal in their expression." Indeed, they are not equivocal, but are expressed equivocally. Equivocation happens not just with nouns, but also with verbs.)

> (*In Categorias Aristotelis commentaria,* 164C, in RT: *PL* 64)

B. The symmetry/asymmetry between homonymy and synonymy

A second knot of problems that needs to be disentangled is the symmetrical or asymmetrical relationship between homonymy and synonymy. The RT: *DHLF* gives some indication of this confusion. In it we read that "*homonyme* is a borrowing from the Latin *homonymus*," "the same pronunciation but with a different meaning," which is itself borrowed from the Greek *homônumos*: "bearing the same name, and using the same denomination," made up of *homos* (from which we get *homo-*) and *onoma*, "name." But we also read

that *synonyme* is borrowed from the Latin *synonymus*, which itself is derived from "the Greek *sunônumos*, 'having the same name as,' from *sun* [σύν] 'with, together,' and *onoma*." Paradoxically, the two Greek adjectives *homônumos* and *sunônumos* end up having the same definition: "bearing the same name," "having the same name as." This confusion is all the more troubling since this definition of synonymy is incompatible with the one that follows, but that is nonetheless also related to its Greek etymology: "[Synonymy] refers in the sixteenth century to a word that has an analogous meaning to another word (a common type), but whose meaning has two different values, etymological and Aristotelian." How can we understand this confusion?

The RT: *DHLF* is certainly not wrong: *synonyme* and *homonyme* start out, in the most ancient attestations, as what we would today call "synonyms," since both describe something different bearing the same name. We come across "homonyms" (*homônumoi* [ὁμώνυμοι]) once in Homer, applied to the two Ajaxes (*Iliad,* 17.720). But Euripides uses "synonym" with exactly the same meaning: Menelaus has just learned that a woman with the same name as Helen is living in the palace, and consoles himself in wondering whether "some other land [can] share the name of Lacedaemon or of Troy" (*Helen,* 495, trans. Burian, 93), pointing out that it is not unusual "for many men to have the same name [*onomata taut' echousin* (όνόματα ταῦτ' ἔχουσιν)], and for one city to share a name with another city, one woman with another woman" (497–99). This no doubt explains the belated appearance, and the extreme rarity before Aristotle, of the second term, which was merely a doublet of the first. (Plato, who uses *homônumos* sixteen times, never once uses *sunônumos*.) Later on, one of the favorite games of the commentators of the *Categories* will be to show the sense in which homonyms, such as the two Ajaxes, are also synonyms, by virtue of the constant use of "insofar as": even if "insofar as he is Ajax," the son of Telamon and the son of Oileus are homonyms, "insofar as they are men," they are synonyms (see Pophyry, 62.30 and 64.10–20; Dexippe, 19.20 and 22.15; Simplicius, 29–31 and 35.9–36.6).

■ See Box 1.

II. The Definition of the *Categories*

A. The text and its translation

Aristotle proposed the first known definition of homonyms and synonyms (as well as paronyms; see PARONYM) at the beginning of the *Categories*: this text is the matrix of all commentaries and all subsequent transformations. However, its most common understanding is based on a mistranslation, or at least on a shift that is linked to the misplaced fecundity of a more modern conception of homonymy.

■ See Box 2.

B. Ontological causes and consequences of the Aristotelian definition

1. Nature/culture: The Aristotelian classifications

So the species (man, ox) of a same genus (animal)—or, if one prefers, the species and their genus (man, animal; see, for example, *Topics,* 3.123a 28ff., trans. Barnes, 1:206–7)—will always be synonyms of one another—this would be the paradigm

1

The modern asymmetry between homonymy and synonymy: Homonyms and homophones (the case of French)

The asymmetry between homonymy and synonymy often surfaces within modern definitions, as testified by Ducrot and Schaeffer's *Nouveau dictionnaire des sciences du langage*. Indeed, according to them, synonymy takes into account two or more "expressions" (words, groups of words, utterances), whereas homonymy takes into account not the word or expression, but the "phonic reality" (RT: *Nouveau dictionnaire des sciences du langage*, 398–99): homonyms are nowadays essentially homophones, such as the French *vair*, *verre*, *vert*, *vers*, and *vert*, to the extent that we would term "homonym" both several distinct words, as well as one word, or at least one unique spelling of a word (*rame* de papier [ream of paper] and *rame* de navire [ship's oar]). This definition, particularly in its emphasis on the *phônê*, is very close to that of the ancient grammarians (Denys le Thrace, *Technê grammatikê*, 12.6 and 7; *Scholies*, 554.31–32; see Lallot, *La grammaire de Denys le Thrace*, 152).

What is more, the criteria we use for homonymy seem particularly difficult to hold on to. In fact, if it is not easy to decide with synonymy whether two meanings are identical (in terms of connotation, expressive value, and so on), how do we determine whether two meanings are "radically different"? Homonymy, unlike synonymy, is caught within a network of phenomena that are "similar, but of a different nature" (RT: *Nouveau dictionnaire des sciences du langage*, 399), such as "contextual determination" ("This shop is open on Monday": only on Monday / even on Monday?), "polysemy" ("le *bureau* Louis XIV" [Louis XIV desk] and "le *bureau* de poste" [post office]), "extension" (to love one's father, and to love jam),

"indetermination" (what speakers of English call "vagueness": "Am I 'rich'?"), "oppositional meaning" (*small* microbes and *small* elephants).

At the level of syntax and semantics, some linguistics researchers, such as Antoine Culioli, have been interested in the phenomenon of paraphrase: this was a matter of considering formal variations, even very minimal ones, within a family of paraphrastic utterances, so as to go back to the enunciative or predicative operations from which they are derived, and to understand the semantic differences they conceal (for example, in French, to say "Peter eats the apple," one could say: "Pierre, la pomme il la mange" / "La pomme, Pierre il la mange" / "C'est la pomme que mange Pierre," etc.).

The criterion Ducrot and Schaeffer adopt to distinguish between what is a homonym and what is not a homonym is the impossibility of finding any point in common between the different meanings of a word: "no common core, nor even any continuity," no explanation nor any derivation. This corresponds exactly to the Aristotelian criterion used for homonyms that are *apo tuchês* [ἀπό τύχης], "coincidental" (the classic example being *kleis* [κλείς], meaning both "key" and "collarbone"). Yet the arbitrary nature of the distinctions proposed still remains: thus Ducrot and Schaeffer choose not to differentiate between "homonymy" and "ambiguity" ("the phenomena of ambiguity or of homonymy," RT: *Nouveau dictionnaire des sciences du langage*, 399). One might object that the term "ambiguous" (and it is certainly not obvious that it should be contrasted with "equivocal") can in no way be applied to homophones, or to a much broader semantic

field than "homonym" (an ambiguous attitude). One might compare this above all to the way Quine or Hintikka ("Aristotle and the Ambiguity of Ambiguity," 138) use the term: they both, by contrast, distinguish between ambiguity and homonymy on the basis of etymology. The criterion of pure coincidence is only truly met in the case of words that have emerged out of different etymologies (the *rame* [oar] of a ship, from the Sanskrit *aritra*, "which moves," as opposed to the Arabic *rizma* [الرزمة], "packet of clothes," for a *rame* [ream] of paper, according to Littré [RT: *Le Littré: Dictionnaire de la langue française en un volume*]), which Aristotle does not talk about, but for which we might reserve the term "homonyms."

All of these categories are part of a long heritage going back to the different, and sometimes contradictory, distinctions first articulated in antiquity, to precise ontological ends. The apparently arbitrary nature of these differences and these criteria is no doubt due to the fact that we no longer question what is at stake nor what is intended by the concept.

Whatever the case may be, the essential characteristic of modern homonymy is that it is applied exclusively to words, and is even reduced to the phenomena of homophony. It is presented consequently as a marginal phenomenon, linked to the signifier, likely to be of interest mainly to psychoanalysis, or to lovers of witticisms and puns, but of secondary importance for the analysis of language (see SIGNIFIER/SIGNIFIED).

itself of synonymy—as would also singular copies, or the "parts" of one and the same species (see *Categories*, 3a33–b9, trans. Barnes, 1:6): one might say that *phusis* [φύσις], nature as a process of engendering, like natural science as a genealogical classification, proceeds by synonymy (see *Of the Generation of Animals,* 2.1.735a2ff.: "Generation happens by synonymy").

On the other hand, all of those phenomena having to do with *technê* [τέχνη], with art, *mimêsis* [μίμησις], imitation, and with resemblance more generally, will be homonyms: for Aristotle, resemblance is the very paradigm of homonymy. We are no doubt here as far as we could be from our modern conception, according to which a good homonymy is a purely accidental homonymy, as is the case, precisely, with

homophones (see, for example, Box 1, with Jaako Hintikka's forceful critique).

2. The critique of Platonism

We would not be able to understand the choice of this paradigm without reference to the critique of the Platonic doctrine of ideas: Aristotle is keen to emphasize that, by Plato's own admission (see above, I.A), the relationship between model and image (*eidos* [εἶδος] and *eidôlon* [εἴδωλον]), intelligible and sensible, is merely a relationship of homonymy. Now homonymy can only appear, in the Aristotelian system, as a contingent artifact that reveals either the malice of the Sophist or the poverty of language. So, in place of the Platonism of participation, we have to substitute the

2

How to translate the definitions of the *Categories*?

When things have only a name in common and the definition of the being which corresponds to the name is different, they are called *homonymous*. Thus, for example, both a man and a picture are animals. These have only a name in common and the definition of being which corresponds to the name is different; for if one is to say what being an animal is for each of them, one will give two distinct definitions.

When things have the name in common and the definition of being which corresponds to the name is the same, they are called *synonymous*. Thus, for example, both a man and an ox are animals. Each of these is called, by a common name, an animal, and the definition of being is also the same; for if one is to give the definition of each—what being an animal is for each of them—one will give the same definition.

(Ὁμώνυμα λέγεται ὧν ὄνομα μόνον κοινόν, ὁ δὲ κατὰ τοὔνομα λόγος τῆς οὐσίας ἕτερος, οἷον ζῷον ὅ τε ἄνθρωπος καὶ τὸ γεγραμμένον· τούτων γὰρ ὄνομα μόνον κοινόν, ὁ δὲ κατὰ τοὔνομα λόγος τῆς οὐσίας ἕτερος· ἐὰν γὰρ ἀποδιδῷ τις τί ἐστιν αὐτῶν ἑκατέρῳ τὸ ζῴῳ εἶναι, ἴδιον ἑκατέρου λόγον ἀποδώσει. συνώνυμα δὲ λέγεται ὧν τό τε ὄνομα κοινὸν καὶ ὁ κατὰ τοὔνομα λόγος τῆς οὐσίας ὁ αὐτός, οἷον ζῷον ὅ τε ἄνθρωπος καὶ ὁ βοῦς· τούτων γὰρ ἑκάτερον κοινῷ ὀνόματι προσαγορεύεται ζῷον, καὶ ὁ λόγος δὲ τῆς οὐσίας ὁ αὐτός· ἐὰν γὰρ ἀποδιδῷ τις τὸν ἑκατέρου λόγον τί ἐστιν αὐτῶν ἑκατέρῳ τὸ ζῴῳ εἶναι, τὸν αὐτὸν λόγον ἀποδώσει.)

(Aristotle, *Categories,* 1.1a1–12, trans. Barnes, 1:3)

We will not translate *zôion* [ζῷον]; the Greek word, from *zôê* [ζωή], "life," means "animate, living being" (see ANIMAL). But it also means "character or figure (man or animal) represented in a painting" (the painted image of an animate being, Herodotus, 3.88, or Plato, *Republic,* 7.515a). Lastly, it has this meaning of a "painted image," even when the model being represented is not living (Herodotus, 4.88, "having represented faithfully according to nature [*zôia grapsamenos* (ζῷα γραψάμενος)], the crossing of the Bosphorus," or Plato, *Laws,* 769a). In other words, *zôion*, referring to any work of a *zôgraphos* [ζωγράφος], a painter, can also denote what we would call a "still life."

The difference between languages here comes fully into play: the classic definition of homonymy and synonymy originates in and around a homonym. At play at this juncture in the *Categories*, in fact, is not just the difference between languages, but also Aristotle's characteristic irony, which consists in exploiting the paradoxical economy of the Platonic doctrine, according to which a living being is never anything more than the response to an idea, without having even to acknowledge that this paradox is inscribed within the Greek.

There is an error that we have to avoid in translation. We may think that with *onoma* [ὄνομα] we are dealing not with a word, or a name, that can be attributed to two homonyms (in this case, the word *zôion*), but with a name that would name homonyms themselves (in this case, the word "man"). This is an error that Tricot commits unfailingly in his translations of Aristotle into French, on the one hand by translating *onoma* by "*the* name," *le nom* (Zanatta does the same: "*il* nome"), on the other hand by translating *to gegrammenon* [τὸ γεγραμμένον] as "the painting of a *man*," which then becomes "man." "We call *homonyms* the things that only have a *name* in common, whereas the notion referred to by this name is varied. For example, *animal* is equally a real man and a painted *man*. These two things indeed only have in common their *name*" (emphasis added). The example in Tricot's footnote adds to this impression: "Things that are homonyms . . . which only share a name . . . for example . . . *kleis* [κλεὶς] means a key and a collarbone." But this example is particularly ill-chosen for the case of a man and his portrait, since *kleis* (according to Aristotle, for whom a key and a collarbone are completely unlike one another) is a homonymy where "the difference is considerable, because it bears upon the outer form [*kata tên idean* (κατὰ τὴν ἰδέαν)]" (*Nicomachean Ethics,* 5.2, 1129a26–32; commentators, moreover, use this passage to illustrate "coincidental homonymies").

The example of *kleis*, which precisely does not imply any third term like *zôion*, adds to the belief that for Aristotle, as for us nowadays, homonyms always have the same name and a different definition. We come across the same misinterpretation with synonyms. Here again: "When things have the name in common and the definition of being which corresponds to the name is the same, they are called *synonymous*. Thus, for example, both a man and an ox are animals." which Tricot glosses as: "Synonymous things are identical in nature and *in name*" (trans. Tricot, 25 n. 2 , emphasis added).

It is nevertheless important to understand that neither homonyms nor synonyms must have "the" same name in common, in the sense of "their" name: they have "a" name in common (*onoma*, 1a1 and 9), what Ackrill, in contrast to Tricot, translates carefully as "a name in common," "a common name." It is this single common name, *zôion*, that we sometimes use as a homonym, when its definition has to change from one application to another (a man is endowed with life, but his portrait is not), and sometimes use as a synonym, when the same definition can be given for each occurrence (a man and an ox are each one an animal). Happily, the most recent French translations (of Bodéüs, and of Lallot and Ildefonse) have at last corrected Tricot's misinterpretation.

It should be said, in defense of the mistranslations of the *Categories*, that numerous examples of Aristotelian homonyms work without any third term, that is, directly from the names of the homonyms themselves—for example, the "hand" or the "eye" of both a living being and a dead body (*De anima,* 2.1, 412b14ff., 21, trans. Barnes, 1:657). In each of these cases we find that the word in common is indeed their name, which obviously does not have the same essential definition. Whatever the case, these are simply a subset of the homonyms as previously defined, and do not contradict this definition.

It is worth pointing out, finally, that the commentators' lemmata and Tricot's are translated in the same way, even in English (including those commentators who, like Evangeliou, even quote Ackrill's correct translation): "their name in common." However, in the commentary itself, we find, when it is impossible to do otherwise, and as if compelled by the truth, "a name": thus in Ammonius, lemma, 1a1, 18.18: "that have only *their name* in common"; but ibid., 20.3: "[Ajaxes] have *a name* in common."

Boethius's Latin translation of Aristotle is as follows:

Aequivoca dicuntur quorum nomen solum commune est, secundum nomen vero substantiae ratio diversa, ut animal homo et quod pingitur. . . . Univoca dicuntur quorum et nomen commune est et secundum nomen eadem substantiae ratio, ut animal homo atque bos.

(Aristotle, *Categories,* 1a1, trans. Boethius)

But his commentary makes apparent the reading we have just described: we can only talk about things being equivocal if we predicate upon them a name, or a word, in common. Latin, however, encounters another

problem that Greek did not have: whereas *zôion* in Greek denotes any representation (not necessarily of a subject), this is not the case with the term "animal." Boethius, who considers the composite expressions "living man" and "painted man" (*homo vivus*, *homo pictus*), maintains nevertheless that one could apply to them not only the word "animal" (animate being: "Indeed, whether it is a matter of a painted man or a living man, the word *animal being* is used equally for one and the other"), but also the word "animal" and the word "man" considered together ("one or the other could both in fact be called *man* or *animate being*"). Later, he only takes into account the name *homo*, which produces a major change: we in fact move from the perspective of a predication genus-species to the semantic perspective of the "transfer of the name" of one reality to another: "ut ex homine vivo ad picturam nomen hominis dictum est" (From living man, we apply the name of man to a painting; see *translatio*, in TO TRANSLATE). We see, thus, that this change of perspective is partially induced by a problem of translation and of language: the fact that *zôion* and "animal" are not superimposed, and the argument about complex expressions sharing a common name, *homo vivus*, *homo*

pictus, which is maintained even when the latter expression is replaced by *pictura*.

Aristotelianism of predication, which the categories established in the *Categories* allow us to found.

■ See Box 3.

3. What it means to speak: Looking for homonymy

The entire Aristotelian logic (meaning of words, predicative syntax, syllogism) depends on "the most stable principle of all," the onto-logical principle that establishes a link between the order of being and the order of discourse, which has come down to posterity as the principle of noncontradiction: "The same attribute cannot at the same time belong and not belong to the same subject in the same respect [*to gar auto hama huparchein te kai mê huparchein adunaton tôi autôi kai kata to auto* (τὸ γὰρ αὐτὸ ἅμα ὑπάρχειν τε καὶ μὴ ὑπάρχειν ἀδύνατον τῷ αὐτῷ καὶ κατὰ τὸ αὐτό)]," *Metaphysics,* Γ.3, 1005b19–20, trans. Barnes, 2:1588). In fact, the refutation of his adversaries—which constitutes the only possible demonstration—is based entirely on the demand for univocality. Aristotle indeed proposes the following series of equivalences as if it were self-evident: "to speak" (*legein* [λέγειν], or what is proper to man, who otherwise would be nothing but a plant, Γ.3, 1006a13–15); "to say something" (*legein ti* [λέγειν τι], 1006a13, 22); "to say something that is significant both for himself and for another [*sêmainein ti kai autôi kai allôi* (σημαίνειν τι καὶ αὐτῷ καὶ ἄλλῳ)]"; "to mean something unique," "for not to have one meaning is to have no meaning [*to gar mê hen sêmainein outhen sêmainein estin* (τὸ γὰρ μὴ ἓν σημαίνειν οὐθὲν σημαίνειν ἐστίν)]" (1006b7–8). The principle

of noncontradiction is thus proved and actualized only because it is impossible for the same (word) simultaneously to have and not to have the same (meaning). Univocality is well and truly the necessary condition of the entire logic (Cassin and Narcy, *La décision du sens*, 9–40; see SENSE). So Aristotle tracks down homonymy by proposing to distinguish between the different meanings of the same word, so as to be able to put, if need be, a different word alongside each definition ("tetheiê . . . idion onoma kath' hekaston ton logon [τεθείη . . . ἴδιον ὄνομα καθ' ἕκαστον τὸν λόγον]," *Metaphysics,* Γ.3, 1006b5; cf. 18–20), for "the point in question is not this, whether the same thing can at the same time be and not be a man in name, but whether it can in fact [*to auto einai kai mê einai anthrôpon to onoma, alla to pragma* (τὸ αὐτὸ εἶναι καὶ μὴ εἶναι ἄνθρωπον τὸ ὄνομα, ἀλλὰ τὸ πρᾶγμα)]" (1006b20–22, trans. Barnes, 2:1589; and Cassin and Narcy, *La décision du sens*, 195–97).

Whenever Aristotle's interest is focused on language as such, no longer on its ontological basis, but as a discursive technique, as is the case in the *Sophistical Refutations*, then it is words and words alone, and no longer things, that are said to be homonyms. The cause of homonymy, a deep-rooted linguistic disease, is that there are more things than there are words, and we therefore have to use the same words for several things (*Sophistical Refutations,* 1.164a4–19). Aristotle, in order to make up for the linguistic deficit that the adversaries of the principle use to their advantage, attempts therefore to remedy the arguments by diagnosing

3

Aristotle, or, Against the homonymy of ideas

Socrates, or so Aristotle maintains, did not grant that either universals or definitions had a separate existence. Philosophers who came after Socrates, Aristotle says,

gave them separate existence [*echôrisan* (ἐχώρισαν)], and this was the kind of thing they called Ideas [ἰδέας]. Therefore it followed for them, almost by the same argument, that there must be Ideas of all things that are spoken of universally [πάντων ἰδέας εἶναι τῶν καθόλου λεγομένων], and it was almost as if a man wished to count certain things, and while they were few thought he would not be able to count them, but made them more and then counted them; for the Forms are almost more numerous than the groups of sensible things [τῶν καθ' ἕκαστα αἰσθητῶν], yet it was in seeking the causes of sensible things that they proceeded from these to the Forms. For each set of substances there answers a Form which has the same name and exists apart from the substances

[καθ' ἕκαστόν τε γὰρ ὁμώνυμόν ἔστι καὶ παρὰ τὰς οὐσίας], and so also in the other categories there is one character common to many individuals, whether these be sensible or eternal.

(*Metaphysics,* M.4, 1078b30–1079a3, trans. Barnes, 2:1705–6)

(Note that we follow Tredennick's reading of this passage, rather than Jaeger's.)

Commentators note that one would expect to find "synonym" where the Greek reads "homonym." (Indeed, H. Tredennick translates "synonym" in place of "homonym.") Did Aristotle mistake the two concepts? Or should we understand there to be a certain fuzziness in the terminology, as Léon Robin did? Neither alternative is satisfactory; rather, Aristotle's use of "homonym" signals the virulence of his critique of Platonic "participation," which does not even acknowledge that items that participate in the same idea may have a common definition. This is clearly expressed in *Metaphysics* A:

And if the Ideas and the particulars that share them [τῶν ἰδεῶν καὶ τῶν μετεχόντων] have the same Form [ταὐτὸ εἶδος], there will be something common to these; for why should [the numeral] 2 be one and the same in the perishable 2s or in those which are many but eternal, and not the same in the 2 itself as in the particular 2 [αὐτῆς καὶ τῆς τινός]? But if they have not the same Form, they must have only the name in common [ὁμώνυμα ἄν εἴη], and it is as if one were to call both Callias and a wooden image a man, without observing any community between them.

(*Metaphysics,* A.9, 991a2–8; cf. Γ.4, 1008a34–b3, trans. Barnes)

The choice then lies between the so-called third man argument (cf. Plato's Parmenides) and homonymy.

Barbara Cassin
Frédérique Ildefonse

the voluntary confusions that attempt to derive some benefit from the different sorts of homonymy, which he identifies in terms of *lexis.* Here we come closest of all to the modern conception of homonymy as homophony.

4. The case of being, *pollachôs legomenon*

Is being a genus (which is thus linked to synonymy), or is it not? Is being a homonym, or is it not? Aristotle's most consistent answer to these two questions, which have become epochal, is "no." Indeed, he repeats that being is expressed multiply: it is a *pollachôs legemenon* [πολλαχῶς λεγομένον]—neither homonymy nor analogy but, to borrow Gwilym E. L. Owen's expression, which has become an established term, "focal meaning." Aristotle puts being, like the good or the one, as one of the "homonyms deriving from unity, or which have unity as their aim" ("aph' henos, pros hen [ἀφ ' ἑνὸς πρὸς ἕν]"), which he therefore distinguishes from "coincidental" homonyms (or rather, those occurring "by chance," *apo tuchês* [ἀπὸ τύχης]), and from homonyms "by analogy" (to be understood as proportion: as sight is in the body, so reason is in the soul; *Nicomachean Ethics,* 1.4, 1096b25–30, trans. Barnes, 2:1733; *Eudemian Ethics,* 7.2, 1236a17 and b25). But for being, and specifically in book Γ of the *Metaphysics,* this case is very explicitly distinguished from a case of homonymy: "There are many senses in which a thing may be said to 'be,' but they are related to one central point, one definite kind of thing, and are not homonymous [*pros hen kai mian tina phusin kai ouch homônumôs* (πρὸς ἓν καὶ μίαν τινὰ φύσιν καὶ οὐχ ὁμωνύμως)]," *Metaphysics,* Γ.2, 1003a34; cf. 1003b5–6); "So, too, there are many senses in which a thing is said to be, but all refer to one starting-point

[*pollachôs men all' hapan pros mian archên* (πολλαχῶς μὲν ἀλλ' ἅπαν πρὸς μίαν ἀρχήν)]." How can we satisfactorily account for this shifting status, and where can we place "being"? The difficulty leads to a hardening of homonymies themselves; thus Porphyry chooses to place *aph' henos* and *pros hen* in the category of homonymy, which will lead to a reinterpretation of analogy (see ANALOGY and PARONYM).

III. The Taxonomy of Porphyry and Its Posterity

Porphyry systematizes the various scattered references in Aristotle and proposes a taxonomy of homonyms (65.18–68.1). This will be subsequently taken up and modified by commentators (see Ammonius, 21.15–22.2; Simplicius, 31.23–33.21; on the relationship of the commentators to each other, see, for example, Luna's commentaries on Simplicius, *Commentaire sur les "Catégories" d'Aristote,* 128 and 146; and on the classification, see ibid., 46, schemas pp. 98 and 100), and then taken up again by Boethius (*In Categorias Aristotelis,* 166 B–C, in RT: *PL,* 64), thereby passing into the medieval Latin tradition (see Libera, "Les sources gréco-arabes," and see ANALOGY). In the schema below, *P* indicates the terms used by Porphyry, *B* those used by Boethius (trans. Desbordes, 166B–C, in Desbordes, "Homonymie et synonymie"), and *T* those in the *Paraphrasis Themistiana* whenever they differ from *B* (*Anonymi Paraphrasis Themistiana*, ed. Minio-Paluello [*Aristoteles latinus,* 1.15], 136–37).

In Porphyry, we note that:

The *on* [ὄν], and everything that is *pollachôs*, comes under the heading of homonymy, contrary to the indications in book Γ, for example (see Porphyry, *Isagoge,* 2.10: "Let us simply posit, as in the *Categories*,

Homonyms P homônumai B aequivoca				
1. Coincidental P *apo tuchês* B *casu* T *fortuitu* Alexander (son of Priam) / Alexander (king of Macedonia)	**2. Intentional, deliberate** P *apo dianoias* B *consilio* T *hominum voluntate*			
	2.1. By resemblance P *kath' homoiotêta* B *secundum similitudinem* ex. *Man* / real portrait, a portrait of a *man*	**2.2. By analogy** P *kat' analogian* [sc. by proportion] B *secundum proportionem* T *pro parte*	**2.3. single source**	**2.4. single goal**
			P. aph' *henos kai pros hen, pollachôs legomenon* [together, 2.3 and 2.4 designate what comes to be called the analogy of attribution, that is, the case of being]	
		ex. A "*principle*" —understood (by analogy) as the origin in a series of numbers, or as the point in a line	*ab uno* ex. "*Medical,*" as in a "*medical scalpel*" or a "*medical* potion"	*ad unum* ex. *A healthy* walk, *healthy* food, because they furnish or give or lead to *health*

the ten first types as playing the role of so many first principles: assuming we call them all beings, he says, we will do this homonymously, and not synonymously").

The only example of coincidental homonyms is associated with proper names: there is more than one man named Alexander. Yet this is not an Aristotelian example, whereas other examples from the corpus are for their part sometimes presented under this heading: in particular, the example of *kleis,* or key/clavichord, which is given as a homonymy that is easy to identify because it brings into play homonymous things that are visibly different (*Nicomachean Ethics,* 5.2, 1129a27–31). Or elsewhere, the examples of *kuôn* [κύων], dog as a barking animal / Dog as a constellation of stars, and of aetos [άετός], eagle/pediment, given as "literal tropes" of homonymy, insofar as "the word or expression has several meanings" (as distinct from "tropes of usage," "each time habit makes us speaks thus," *Sophistical Refutations,* 4.166a.15–17). This is perhaps one way of indicating the inherent difficulty of Aristotelian examples: even according to most dictionary definitions, *kleis* implies a resemblance (the collarbone locks together the chest, and has the shape of a hook, like a key; cf. RT: LSJ, on this entry), just as the star constellation resembles a dog, and the pediment spreads its wings over the column. In fact, this resemblance reveals the difficulty of finding unmotivated homonymies, which thus conform to Aristotle's definitions. The only choice is therefore between homophones and specimens (see Hintikka,

"Aristotle and the Ambiguity of Ambiguity," and Cassin, *L'Effet sophistique*, 348–53).

All of the other homonyms come from intentional homonyms. And the *Categories* defines one precisely determined kind, and one alone: homonyms by resemblance. This congruent delocalization allows us to ask again the question of the senses of being.

IV. Ambiguity and the Major New Latin Terms

The notion of *equivocatio*, because of the need to harmonize the different sources, whether Aristotelian (the *Categories*, the *Sophistical Refutations*, the *Topics*) or not (the Stoic sources, beginning with Augustine's *De dialectica*), will become clearer and more divided. As far as the notion of *univocatio* is concerned, it takes on a specific meaning that describes any acceptable variant of a term that does not derive from a new "institution," and thus becomes the key notion of the Terminist theory of *suppositio,* or reference (see SUPPOSITION). Terminologically, these conflicts and reconfigurations led to a specialized understanding, and two distinct usages, of the terms *univoca* and *synonyma*, even though the former served originally as a translation of the latter.

A. Homonymy and ambiguity

Besides the terms already mentioned, Boethius talks in *De divisione* of utterances that are *ambigua*, in relation to the syntactical ambiguity caused by the double accusative (for example, "audio Graecos vicisse Troianos" [I hear that the Greeks have conquered the Trojans / that the Trojans have conquered the Greeks]), which corresponds to *amphibolia* or *amphibologia* in the taxonomy of the *Sophistical Refutations*.

Referring to the *Topics* (1.15) and the *Sophistical Refutations*, he makes a distinction between an expression (*vox*) that is *simplex*, which means one thing only, and a *multiplex* expression, which means several things ("multiplex idest multa significans"). An utterance can be *multiplex* or polysemic if only one of its parts is equivocal, or if it is wholly equivocal: it is a matter of an *amphibola oratio*, a phrase with two senses. Boethius is interested in the different ways of disambiguating ("dividing") a polysemic utterance, by adding a determination, for example, or producing a paraphrase (to use the example cited earlier: "audio quod Graeci vicerint Troianos"; RT: *PL,* 64.889–90). It is the word *multiplex*, along with *duplex*, that is used as the generic term in the medieval tradition. Thus the classification of the first six paralogisms of the *Sophistical Refutations*, those which deal with discourse, established by Galen on the basis of the distinction between effective / potential / apparent, is always given as a classification of the types of *multiplicitates*. (On the difficulty of knowing which Greek term the Latin *multiplicitas* refers to, and on the Greek *ditton* [διττόν], see Ebbesen, *Commentators and Commentaries*, 3:174.)

A proposition that is *multiplex* (or *duplex*) means several things, without necessarily being ambiguous. Thus "Socrates calvus philosophus ambulat" is *multiplex* because "from the point of view of baldness, of philosophy, and of walking, there is nothing unique that can be attached [to the subject]." The case is different for "animal rationale mortale homo est," which is a proposition that is unique (*una, simplex, singular*) because the different elements of the predicate, spoken continuously, "make something that is one," and thus constitute a unique predicate. "Canis animal est" is both *multiplex* and ambiguous: the predicate *canis* is a term that, because it is equivocal, contains multiple things that cannot be reduced to a unique thing, so it cannot be used to make a unique affirmation: "There is one single *vox* but a multiple affirmation" (Boethius, *In Librum Aristotelis Peri hermeneias*, 2nd ed., 352–56; cf. Aristotle, *Peri hermêneias,* 11). This is why, whenever the question is *multiplex* (if its subject or its predicate are not simple), we also need to reply with a *multiplex* answer (Boethius, *In Librum Aristotelis Peri hermeneias*, 358).

Augustine, in the *De dialectica*, is interested in the sign and its value (*vis*; see SENSE), which is in direct proportion to its capacity to "move the listener." The obstacles preventing this value from being realized, and thereby preventing the sign from attaining truth, are obscurity (*obscuritas*) and ambiguity (*ambiguitas*). Augustine accepts the position of the "dialecticians," that every word is ambiguous, rejecting Cicero's mocking remarks ("How, then, can they explain ambiguities with ambiguities?" from a lost fragment of the *Hortensius*), and adding that this affirmation is valid for words considered in isolation: *ambigua* are dispelled within a line of argument whenever they are joined to other *ambigua* (*De dialectica,* 9). Augustine proposes a classification of "ambiguities," and begins by dividing them into those that are spoken and those that are written. Among the first set are two main types, the *univoca* and the *aequivoca*, defined as "things" (*ea*, neutral pronoun) possessing the same name (whether this name is construed as a proper or a common noun) with an identical/different definition. A child, an old man, a fool, a wise man, a big man, a small man, can all be referred to using

the name "man," allowing for the same definition "mortal animal having the ability to reason" (which poses a further problem in the case of a fool, or a child), and additionally having a name and a definition that belong to each of these on its own: the multiplicity of species understood as a single genus is considered here as an endless source of ambiguity in the lexicon. The set of *aequivoca* clearly demonstrates that Augustine has now turned his attention to *names*. The first example testifies to this: "*Tullius* is a name, a dactyl foot, and an equivocation." "Equivocations" are divided into three groups, depending on whether the ambiguity is due to technical, especially grammatical, uses (*ab arte*), which include all those that are metalinguistic and autonymous; whether it is due to usage (*ab usu*); or whether it is due to both of these together. Augustine distinguishes in particular *aequivoca* that have the same origin (including where there is a transfer of meaning—for example, *Tullius* applied to the prince of eloquence or to his statue, as well as other transfers of meaning borrowed from rhetoric, from the whole to the part, from the type to the species, and so on) from those that have a different origin (when a same form, such as *nepos*, has two different meanings). Augustine pays a remarkable degree of attention to metalinguistic ambiguity, to the distinction between a word insofar as it is "used," and a word insofar as it is "mentioned," not only in the *De dialectica*, but also in the *De magistro* (on the opposition *verbum-dictio*, see WORD; this ambiguity also appears independently, it seems, in the term *suppositio materialis* from the twelfth century on; see SUPPOSITION).

The terms *amphibolia* and *amphibologia* are reserved for syntactical ambiguity. In Greek, the terms referring to the idea of ambiguity have been formed from the prefix *amphi-* (on two sides), producing the verb *amphiballesthai* [ἀμφιβάλλεσθαι], "to give rise to ambiguity," and the adjective *amphibolos* [ἀμφίβολος], with its opposite *anamphibolos* [ἀναμφίβολος] (Lallot, "Apollonius Dyscole et l'ambiguïté linguistique"). The term has a generic meaning and encompasses different kinds, including homonymy, homophony, and syntactical ambiguity; but it also refers in a more limited way to ambiguity of syntax or of construction, the second type of paralogism in the *Sophistical Refutations*, and distinct from the first type, homonymy, which is confined to the word. The *Sophistical Refutations* distinguish between two types of syntactical ambiguity. *Amphibolia* is to a sentence what equivocation is to a simple noun, that is, following Galen's terminology, an "actual" multiplicity: indeed, a construction with a double accusative, such as "video lupum comedere canem" ("I see the wolf eating the dog" or "I see the dog eating the wolf"), "in actuality" conveys two meanings, so that grammarians since antiquity have justifiably classed it as one of the "flaws" (*vitia*) of discourse. Conversely, composition (and division) is a "potential" multiplicity, in the same way that an incorrect "accent" is for a simple noun: "vidisti baculo hunc percussum" can mean either, in its divided meaning, "with a stick, you saw this person struck" (false: you did not employ the stick to see the person being struck), or, in its composite meaning, "you saw this person struck with a stick" (true). The two possible meanings do not exist simultaneously, but we can have one or the other, and the problem lies in knowing what it is that

"conveys ambiguity" (the graphic sequence, without its intonation or punctuation?). Composition/division proves itself to be an extremely powerful logical tool, allowing us to deal especially with problems of the extent of the logical operators: for example, "omnis homo qui currit movetur" (Any man who runs is in motion), in which *omnis* could refer simply to *homo* (divided meaning) or to *homo qui currit* (composite meaning), which leads to unrestricted or restricted interpretations of the relative pronoun. The same opposition is also used to distinguish the modalities *de dicto* and *de res*: for example, "possibile est sedentem ambulare" (It is possible for someone who is sitting down to walk), which is false according to the divided interpretation ("It is possible—that someone who is sitting down is walking," just as it is false that someone who is sitting down is walking), but true according to the composite interpretation (someone who is sitting down may be able to walk).

B. The difference or juxtaposition of synonyms and univocals

The notion of *univocatio* has a complex history. Throughout the Middle Ages, it characterizes any semantic variation of a word that does not derive from a "new imposition." So the fact that in an expression like "homo currit," *homo* can mean "a man" or "man" (generically), is not a case of equivocation in the same way as the use of the noun *canis*, which is a unique signifier "imposed" on three different things: a dog, a dogfish, and the star constellation. The reflection on *univocatio* is linked, at the beginning of the twelfth century, to the passage on contradiction in *Peri hermêneias* (6.17a34–37). There are three distinct historical moments.

1. Boethius, commenting on this passage, and alluding explicitly to the *Sophistical Refutations*, defines the six conditions of a true opposition (contradiction and contrariness): the terms, in both the affirmative and the negative, must be neither (1) equivocal nor (2) univocal, which is the case for "homo ambulat": "Man as a species and man as someone in particular are univocal" (specialis homo et particularis homo univocas sunt); nor must they be (3) considered in terms of different parts (which corresponds to the *fallacia secundum quid* and *simpliciter* of the *Refutations*, with the example "the eye is white" / "is not white," depending on whether one is referring to the white of the eye or the pupil); nor (4) considered in terms of different relations ("ten is double" / "is not double"); nor (5) considered in terms of different times ("Socrates is sitting down" / "is not sitting down"); nor (6) considered in terms of different verbal moods ("Catullus sees" / "does not see," referring on the one hand to the act of seeing, on the other to the power of sight) (*In Librum Aristotelis Peri hermeneias*, 132–34).

2. Abelard compares this passage on contradiction to Boethius's commentary on the first chapter of the *Categories*. Following Porphyry, Boethius distinguishes first of all, as we saw, between coincidental equivocation and deliberate equivocation. Then, in discussing the different transfers of meaning, he distinguishes between those that are produced for reasons of ornamentation, and are not to be considered as equivocation, and those that are produced "because of the lack

of names" (still understood to cover proper as well as common nouns): a name belonging to a thing is therefore transferred to another thing that does not have one, so it becomes the name for two different things, and thus an equivocal name. Abelard groups under the heading *univocatio* all transfers of meaning that do not come about because of a "lack of names," that is, both poetic transfers and those that Boethius mentioned with regard to contradiction (for example, the generic or specific meanings of *homo*). These different cases can be grouped together into the same category because they share two essential characteristics: they are variations of meaning that do not come from a new, imposed meaning, and they only appear in a given context.

3. The rediscovery of the *Sophistical Refutations* around 1130 allows for a comparison of these conditions with those given by Aristotle as the conditions for a true refutation (167a20ff.). The term "synonym," which appears in the Latin translation of the *Sophistical Refutations* (167a20), is preserved in this form ("Elenchus est contradictio eiusdem et unius, non nominis sed rei, et nominis non sinonimi sed eiusdem" [Refutation is a contradiction that is of one and the same thing, according to a oneness that is not only of the name but of the thing, and of a name that is not only a synonym, but that is one and the same name]), illustrated by the example of the "synonyms" (in the modern sense of the term) Marcus/Tullius, Cicero's two names: *sinonimus* is thus not to be confused with Boethius's *univocus*. The framework provided by the *Refutations* proves to be problematic, since *equivocatio* can cover either the entire range of paralogisms in discourse, or the first of these, "equivocation," or the first kind of equivocation itself. Indeed, we know that equivocation, like *amphibolia*, is divided into three kinds: the first kind is produced when a noun is imposed on different things, which it signifies in an equivalent manner, which is the "coincidental" equivocation that Porphyry or Boethius distinguish in the *Categories* (for example, *canis*), or equivocation strictly speaking. The second kind occurs when the different things that the word signifies are ordered according to a hierarchy "secundum prius et posterius" (according to before and after), which happens in cases of metaphorical usage (and here the example found in the *Categories*, of a living man and the painting of a man, reappears): so this is the case with *translatio*, but also with *univocatio* (if one considers that a name refers *per prius* to individuals, and *per posterius*, for example, to one's one name; see *translatio* in TO TRANSLATE). The third kind originates in the particular meaning a word has in a given context: for example, it is only in the expression *monachus albus* (white monk) that "white" has the meaning of "Cistercian." The different phenomena related to *univocatio* are classified first and foremost under the second kind of equivocation ("All the sophisms that Boethius calls univocal sophisms come under this second kind of equivocation. Aristotle discussed equivocation in a broad sense, since he included univocal meaning":

commentary on the *Sophistical Refutations*, in De Rijk, *Logica modernorum*, 1:302), but equally considered along with other types of paralogism. So, for example, the ambiguity of *homo* in "homo est species" / "Socrates est homo" can be thought of as *equivocatio* (if one considers that it is a transfer of meaning), as *figura dictionis* (while it has the same "form," *homo* has several meanings), or as *accidens* (the type of predication is different) (De Rijk, ibid.; Rosier, "Évolution des notions d'*univocatio* et *equivocatio*").

The phenonemon of univocality will be at the heart of Terminist logic and, insofar as it is applied to things, stays with the translation and commentaries on the first chapter of the *Categories* (cf. Petrus Hispanus, *Tractatus*, ed. De Rijk). All of the different meanings of a "same" term, in a given context, will fall under or be derived from this univocality, and these different meanings will be subject to classification according to the kinds of "supposition" proper to the terms (see SUPPOSITION). The notions of equivocation and univocation will find a new use in theology when it comes to analyzing "divine predications": in the expressions "God is just" / "man is just," the predicate will be, depending on the author, considered as the expression of its subject equivocally (it is the same signifier, but it signifies absolutely different things), univocally (there is something common in the two predications, and something different, which are analyzed particularly in terms of different connotation; see CONNOTATION), or analogically (see ANALOGY; cf. particularly Ashworth, "Analogy and Equivocation").

The following points will help us measure the evolution of the meaning of homonymy, and to chart the gap between the ancient concept and the modern one—which is the primary source of misunderstandings today.

1. In antiquity, homonyms and synonyms are not employed primarily with respect to words, but mainly, and in any case also, in relation to things: the two Ajaxes, the *eidos* and the *eidôlon*, a man and the drawing of a man, a man and an ox.

2. In antiquity, homonyms and synonyms are not in a position of reverse symmetry (one word–several meanings / one meaning–several words): if we follow the canonical definitions in the *Categories*, it is a matter in every case of several things, and one word naming or defining them—though this word can itself have one or several meanings.

3. *Univocatio* is introduced in the Middle Ages, in contrast to *equivocatio*, to describe a multiplicity of meanings of a word that does not derive from a new, imposed meaning, whether it is a matter of metaphorical usages, or of contextually determined meanings of a "same" word. "Univocation" is when one and the same word is being considered, whereas "equivocation" (cf. *canis*: "dog," "constellation") is when there are several words. The notion of univocation plays an important role in the genesis of the theory of supposition, which is concerned precisely with identifying the referential variants of a "same" term. Whereas in the Middle Ages, the emphasis falls on the oneness of a word underlying its multiple meanings, univocation will come to describe the oneness of the meaning of a word: in the Middle Ages, a univocal word was a word that was "one," behind or in spite of its many varieties of usage; today, in contrast, a univocal word is a word that has only one meaning. In both cases, however, a word such as this is not equivocal in the strict sense, initially because its multiplicity did not affect its original and immutable semantic being, which is defined by imposition, and today because it does not have several meanings. But although univocation in the Middle Ages is "polysemic," modern univocation, by contrast, is not.

| HUMANITY

"Humanity" designates at once the ensemble of humankind, and, as in the classic Latin *humanitas*, the ensemble of characteristics that define human nature as being separate from animal life, particularly the value of philanthropy—benevolence, culture, politeness, savoir-vivre. The German doublet *Menschheit/Humanität* provides a good entry point into this complex network of meaning.

I. *Menschheit/Humanität*

1. German terminology distinguishes between belonging to the human race (*Menschheit*), which relates to nature, and the sentiment of humanity (*Humanität*, directly connected to the Latin *humanitas*), which relates to culture and opens onto the idea of the "humanities" and "humanism": see MENSCHHEIT, and cf. BILDUNG, GESCHLECHT.

2. The link between this community of nature and relations with the other is explored in MITMENSCH (cf. *AUTRUI*).

II. Man/Animal/God: Nature and Culture

1. On the nature of man and the distinction man/animal, see ANIMAL, BEHAVIOR, GESCHLECHT; related to language and reason, see LOGOS, REASON; cf. HOMONYM; related to politics and the political, see CIVILTÀ, *CIVILITY, CIVILIZATION,* CIVIL SOCIETY, *COMMUNITY,* POLIS; related to art, see AESTHETICS, ART, MIMÊSIS; related to ways of being in the world, see DASEIN, ERLEBEN, LEIB, *MALAISE*; cf. NATURE, PATHOS.

   For the Greek definition of "man," one should consult LIGHT, Box 1, and TO TRANSLATE, Box 1, The Latin derivations of "man" are covered in MENSCHHEIT; see also PIETAS and RELIGIO.

2. On culture as a natural property of humankind, see *CULTURE*, and in particular BILDUNG, Boxes 1, 3, and LIGHT (with an explanation of the meaning of the German *Aufklärung* and the Hebrew *haśkālāh* [הַשְׂקָלָה] in LIGHT, Box 3), PERFECTIBILITY; cf. GEISTESWISSENSCHAFTEN, MORALS.

3. On the difference between man and god/the gods, one should consult *GRACE, RELIGION,* and, in particular, BOGOČELOVEČESTVO.

It is striking to note that certain dominant traditions in European philosophy (in particular transcendental philosophy, from Immanuel Kant to Edmund Husserl), and a tradition of grammatical analysis with its origins in antiquity that prevailed in structural linguistics (Roman Jakobson, Émile Benveniste), were united in closely associating the possibility of reflexive thought with the use of personal pronouns, taken as indicators of "subjectivity within language." The Cartesian "ego cogito, ego sum" has thus had its philosophical privilege justified and firmly established. We should qualify this representation in two ways: the linguistic forms that it presupposes are not in any sense universal, and other grammatical analyses are possible; and it is just as important to examine closely the shared linguisticism of Europe and to compare the theoretical effects of the expressions of the so-called *sujet de l'énonciation* (the utterer of the speech-event, the "speaking subject") and the *sujet de l'énoncé* (the "spoken-of" subject, the subject of the utterance), in order to understand how language predisposes thought to reflexivity within different speculative problematics.

Within this perspective, what is sketched out here is a description of the cycle of the "first person" in modern philosophy—going from the German dialectics of the *Ich* and the *Selbst* (Johann Gottlieb Fichte and his equation *Ich = Ich*, then his opposition of the *Ich* to the *Nicht-Ich*; Friedrich Hegel and his problematizing of self-consciousness as the reciprocity of *Ich* and *Wir*), to the English invention of "self" and "own" (at the core of John Locke's self-consciousness), and finally to the European recognition of the ontological primacy of the ego and the alter ego (in Husserl's phenomenology)—so as to then introduce within this thinking the limits envisaged by Arthur Rimbaud's paradoxical expression "Je est un autre" (I is another). This could serve as a common epigraph to the ways thinkers have gone beyond "first-person" subjectivity toward transcendence, impersonal corporeality, or transindividual anonymity, for which Michel Foucault invented the term *pensée du dehors* (thinking of the outside).

I. Having an "I"; Being "a Person"

At the beginning of his *Anthropology from a Pragmatic Point of View* (lectures published in 1797), Kant writes:

> The fact that the human being can have the "I" in his representations raises him infinitely above all other living beings on earth [Dass der Mensch in seiner Vorstellung das Ich haben kann, erhebt ihn unendlich über alle alleren auf Erden lebenden Wesen]. Because of this he is a *person* [*Dadurch ist er eine Person*]; and by virtue of the unity of consciousness through all changes that happen to him, one and the same person—i.e., through rank and dignity and entirely different being from things, such as irrational animals, with which one can do as one likes. This holds even when he cannot yet say "I" [selbst wenn er das Ich nicht sprechen kann], because he still has it in thoughts, just as all languages must think it when they speak in the first person, even if they do not have a special word to express this concept of "I" [ob sie zwar diese Ichheit nicht durch ein besonderes Wort ausdrücken]. For this faculty (namely, to think) is understanding.

> (*Anthropology from a Pragmatic Point of View*, trans. Louden, 15)

The text goes on—150 years before Paul Guillaume—to discuss the age when small children stop talking about themselves in the third person and start saying "I": "durch Ich zu sprechen." The translator of the French edition of this text, Michel Foucault, renders Kant's *das Ich* by *le Je*. He clearly did not want to adopt the French term—*moïté*—often used for the technical neologism of the German word *Ichheit*, invented at the start of the thirteenth century by Meister Eckhart, not only because he considered this a linguistic barbarism, but also because he clearly saw that Kant's object is the *Je* (the possibility of saying "I"), and not the *Moi* ("Me" or "Myself," that is, the possibility of describing or judging the Self). At the same time, following the main thread of the text, Foucault had to simplify the doubleness hidden within its opening sentence: to be "a person" (who is "one") is to be able to use the word *Ich*, but it also means including (the) *Ich*—this "something" that is not a thing—within its representation. In a sense, this is to represent the unrepresentable that the *Ich* names "for itself [*für sich Selbst*]."

This formulation is connected to the decisive developments of the *Critique of Pure Reason*, where the "transcendental subject" is theorized for the first time (see SUBJECT). A thesis is here being put forward that is both extremely debatable and determining for the development of Western philosophy. It is debatable because it is Eurocentric, and consequently idealist, and only apparently attentive to the materiality of language. Let us admit with Jakobson that every language contains a complete system of references of the code to itself, from the code to the message, from the message to itself, and from the message to the code—and notably that there is necessarily a class of specific units of meaning (shifters, or *embrayeurs* in French) whose function is to refer to the singularity of an actual message. Personal pronouns

correspond exceptionally well to this definition (as do demonstratives, adverbs of time and place, verb tenses, and so on). We can thus, following Benveniste's famous analyses, characterize the individual act of appropriating language as a problem of subjectivity in language—"Language is so organized that it permits each speaker to *appropriate to himself* an entire language by designating himself as *I*" (*Problems in General Linguistics*, trans. Meek, 226)—thereby creating a short-circuit between the instance of utterance (*énonciation*) and the statement (*énoncé*). But the fact of using the word "subjectivity" is an indication of the circularity of such definitions, since it takes as given (as was the case in Kant's text cited above) that the "normal" or "implicit" form is one in which the agent, the support of any attribution in a statement, and the "instance of discourse" (ibid.) or what carries the word, that is, the generic speaking being ("man"), can all be subsumed under one and the same concept. This situation is only characteristic of some languages, however, or even some of their usages. The "simplicity" of the Indo-European system of personal pronouns is not a "linguistic universal."

In Japanese, for example, we observe two correlative phenomena (Takao Suzuki) that contrast with the usages of modern European languages (or only occupy a place in European languages deemed to be residual, infantile, artificial, or pathological). On the one hand, the terms we would call personal pronouns (above all, the equivalents of "I" and "you") have no etymological stability: historically, they are substituted for one another, following a continual process of devaluation and replacement, linked to the transformation of marks of respect into marks of familiarity or condescension. On the other hand, the normal form by which speakers are designated in a statement consists of marking their respective position or role in the social relationships (which are almost always asymmetrical) within which communication is initiated. Particularly important in this regard are the terms of kinship that, by a characteristic fiction, can be extended to other types of relationship.

It seems that European languages by contrast are made up, over a very long period of time, of a kind of specific universalism, which neutralizes the qualities and the roles of speakers (or, by contrast, allows them to be emphasized: "The king wishes it to be so," "Grandfather is going to get angry!" "Madame is served"), so as to bring out the abstract, and virtually reciprocal, positions of sender and receiver of spoken language: the one who has spoken will then listen, and vice versa. Jakobson is therefore right when he criticizes Husserl's interpretation of this point in his *Logical Investigations*, where he says that "the word 'I' refers to different persons depending on the situation, and for this reason takes on a new meaning each time." To the contrary, the meaning of "I" is the same every time; it is what speakers—subjects—possess in common, that by which they individually appropriate for themselves the instrument of communication. It would of course be important to study the interaction of linguistic usages, of institutional transformations (the emergence of an increasingly broad sphere of formal equality that encroaches on both the public and the private), and finally of various logico-grammatical theorizations, all of which have made possible the recognition of this norm, its standardization in scholarly as much as in popular

language, and its interiorization and conceptualization in notions such as "person," "subject," "agency," "individuality," "ecceity," and so on.

Even though it is falsely universal, this thesis has been a determining one for the history of European philosophy. We can return to it, but critically, particularly by situating it within the horizon of the problem of translation. In elaborating a philosophical discourse concerned with subjectivity, we would have to then pay attention to the reciprocal action between concepts and linguistic forms as they differ from one language to another, against a background of shared characteristics. This is indeed one of the keys to the untranslatable "translatability" that characterizes the sharing or colinguisticity (*colinguisme*) of European philosophy, and it is surprising that there have been no major attempts to use the question of personal pronouns as a basis for developing the same kind of philological and philosophical analyses that have been brought to bear on the syntactical and semantic effects of the verb *être* (to be) in the constitution of classical ontology, from Benveniste to Barbara Cassin. There have been a few notable exceptions, such as Jaakko Hintikka's analyses of the performative nature of the Cartesian *cogito*, or, more recently, Marco Baschera's analyses of the Kantian *Ich denke* as a linguistic act, and also to some extent Ernst Tugendhat's analyses of Wittgenstein, Heidegger, and Hegel. The ground had been laid, however, on the one hand by the tradition of the critique of the metaphysics of the subject as a "grammatical convention," which goes from David Hume and Friedrich Nietzsche to the Ludwig Wittgenstein of the *Tractatus logico-philosophicus* and the *Philosophical Investigations*, and on the other hand by Wilhelm von Humboldt's reflections on the originary nature of reference to the subject in different languages, developed by Ernst Cassirer in the *Philosophy of Symbolic Forms* into a summary of the forms of expression of the *Ich-Beziehung* (I-relation).

We will focus our comments on four groups of problems, which will naturally spill over into one another: the naming of the first person, with the possibilities of mention and negation that this allows (in particular in German); the connotations of the first- and third-person reflexives (in English "self"; in French *moi, soi*; in German *Selbst*); the reasons for the recourse to foreign nouns for the subject (above all, the Latin *ego* in modern languages); and finally, the problems posed by the use of the indefinite and the neuter in philosophy ("one" in English, *ça* and *on* in French, for example). But we have to begin by discussing several difficulties concerning the very notions of person and personal pronoun.

▪ See Box 1.

II. *Vom Ich*

The theory of the subject in German Idealism, from Kant to Fichte and Hegel (we could gather all of these *Vom Ich* under the heading of Schelling's first essay, titled, precisely, "Vom Ich . . .") depends on a certain flexibility of the *Ich*, which can be partially transposed to English, but which has no equivalent in French. French does not nominalize the main subject, but instead offers a reflexive form, *le moi*, which produces the effect of objectivation, whereas *Ich* is immediately perceived as an autonym. As a consequence,

1

True and false persons

➤ ACTOR, Box 1; SUBJECT, Box 6

In his article "The Nature of Pronouns," Émile Benveniste explains that only the first and second persons are "real persons," and the corresponding pronouns "real personal pronouns," since they alone refer to interlocutors, that is, they imply the utterance within the statement itself:

> The third person is not a "person": it is really the verbal form whose function is to represent the non-person. . . . One should be fully aware that the "third person" is the only one by which a *thing* is predicated verbally. The "third person" must not, therefore, be imagined as a person suited to depersonalization. There is no apheresis of the person; it is exactly the non-person, which possesses as its sign the absence of that which specifically qualifies the "I" and the "you." Because it does not imply any person, it can take any subject whatsoever or no subject, and this subject, expressed or not, is never posited as a "person." . . . The third person has, with respect to the form itself, the constant characteristic and function of representing a non-personal invariant, and nothing but that. But if "I" and "you" are both characterized by the sign of person, one really feels that in their turn they are opposed to one another within the category they constitute by a feature whose linguistic nature should be defined. . . . A special correlation which we call, for want of a better term, the *correlation of subjectivity*, belongs to the *I-you* pair in its own right. . . . One could thus define "you" as the *non-subjective person*, in contrast to the *subjective person* that "I" represents; and these two "persons" are together opposed to the "non-person" form (= he). It would seem that all the relations established among the three forms of the singular should remain the same when they are transposed to the plural. . . . The ordinary distinction of the singular and plural should be, if not replaced, at least interpreted in the order of persons by a distinction between *strict person* (= "singular") and *amplified person* (= "plural"). Only the "third person," being a non-person, admits of a true plural.

> (Benveniste, *Problems in General Linguistics*, trans. Meek)

This famous analysis is justified both by its recourse to a contemporary formalism of communication that builds reference into language itself, and by a modern metaphysics opposing persons to things. Indeed, it represents their point of fusion. It is thus contrasted to an older tradition, originating with Aristotelianism and perfected by the time of the Renaissance, according to which (and in a manner one could call realist or objective) it was rather the "third person" that properly characterized what was understood by person. The notion of a person (*prosôpon* [πρόσωπον], *persona*) was conceived on the basis of the notion of a name, signifying the *suppositum* (subject) of an attribution that the statement translates, represents, or expresses:

> The person is the mode of signification via which the verb consignifies the property of speaking not insofar as it is something innate, but insofar as the thing of the verb is applicable to the thing of the *suppositum* subsisting by itself according to the properties of speech. The person thereby affects the verb [*inest verbo*] by virtue of its attributive aptitude with regard to the *suppositum*, according to a varied mode of attribution.

> (Thomas d'Erfurt, *Grammatica speculativa*, quoted by Jacques Julien)

The "names" *ipse*, *ego*, or *tu*, which "consignify" the person speaking, or to whom one is speaking, must then be interpreted both as abstractions and as targeting the individual being within a situation: singular universals of a kind. One might be tempted to think that this tradition still informs certain reductionist attempts of contemporary analytical philosophy, notably those inspired by Russell ("egocentric particulars") and by Strawson ("individual occurrences").

But this tradition is also opposed to the point of view developed by the logic of the Stoics, and transmitted from there to the grammarians of the same school. Instead of being focused on a determinate person (and, in a sense, then being appropriated by this person), the "subjective" link here between *énonciation* and *énoncé* is by contrast generalized and anticipated in a theory of meaning. Persons are defined equivocally, both in relation to the action described in itself (as agent or patient) and in relation to speech (insofar as they can sustain a discourse about themselves, and more generally they can "attest to" their actions or those of another). To quote Apollonius Dyscolus: "Persons who take part in an act are divided up into grammatical persons . . . but the act itself remains external to the person and to the number, and can thus be combined with all persons and numbers . . .; the term person is appropriate in that it demonstrates a corporeal *deixis* and a mental disposition." Frédérique Ildefonse claims that the coincidence "between the agent of the physical world and the grammatical person," inseparably linked to the way in which "the same term *diathesis* [= disposition] within the realm of signifieds is common to a physical diathesis and mood, that is, to a *diathesis* of the soul," is essential to the Stoic notion of a person. In other words, a person is projected onto different individualities not on the basis of an intrinsic relation between thought and language, but on the basis of events in the world where actions meet words, producing meaning-effects. This is the point of departure for Gilles Deleuze when he conceives the "play of persons" on the basis of a "neutral, pre-individual and impersonal field in which it is deployed" (*The Logic of Sense*, trans. Lester). But alternatively, one can find an echo in the syntactical theory of Jean-Claude Milner, who takes up the question of personal pronouns on the basis of "reflexivity" (in French, *me*, *moi*, *se*, *soi*), and of the way in which, in certain languages, this interferes with the expression of reciprocity and collectivity (the general notion of "coreference").

These irreconcilable perspectives create a tension that is constantly present in modern philosophical theories of the "subject" and the "person." But it is not always resolved in the same way, since each language has its own way of quoting, of being reflexive, of denying, and so on, and philosophical thought suffers the effects of this linguistic particularity (or, if one prefers, exploits its possibilities). Hence the untranslatabilities that also foster the renewal of theories of subjectivity.

the Kantian formulation *das Ich* (which is closely associated with *das Ich denke*, often written as *das: Ich denke*, suggesting by homophony with the conjunction *dass*, "that," a near equivalence between nomination and proposition: "*the* I think," "[the fact] *that* I think") works both as a reference to a subjective being and as a reference to the linguistic form, to the act of speech in which it is said. Writing *le Je* (the I) only works in French if a grammarian is making a mention of the subject pronoun, or as a Germanism in a philosophical translation, which even then is of fairly recent usage (Italian, by contrast, uses the *Io* without any problem, as we see, for example, with Giovanni Gentile, and Spanish philosophy uses *Yo*—in José Ortega y Gasset or Xavier Zubiri, for instance). One could not imagine Blaise Pascal writing "Le Je est haïssable" instead of "Le Moi est haïssable" (The self is detestable; we will return later on to the problem of "Je est un autre" [I is another]). Consequently, it is practically impossible for a French ear to hear the nominal form of *Ich* without assuming the reflexive *le moi*. The ambivalence specific to Kant's analysis of "self-consciousness" as a reciprocal folding together of appearance and truth, of recognition and misrecognition (see SUBJECT), falls back onto the psychological or moral doctrine of the illusions everyone entertains about him- or herself (and particularly the way one over- or underestimates oneself).

The absolute "simplicity" of the word *Ich*, with its particular flexibility, accounts in part for the dialectical power that is deployed in the field of the *Ichheit*, whose literal transposition into French always presents insurmountable difficulties. One understands why it is in the German language that the speculative philosophy of modern Europe has developed the antithesis of the paths of "being" and of "the I," an antithesis that seems to repeat very ancient theological alternatives concerning the "name of God" (Cassirer, "Sprache und Mythos," 139: "Der Weg über das Sein und der Weg über das Ich"). Here are three examples:

1. In the *Wissenschaftslehre* of 1794, Fichte gave an interpretation of the Kantian transcendental apperception that is based on the homology between the logical principle of identity (*A = A*) and a proposition that can also be written algebraically *Ich = Ich* ("Ich gleich Ich"). This proposition, which can be understood to mean "Ich bin Ich," is ontological in the strict sense, since it expresses what is proper to *Ich* as being, its internal reflexivity and its self-identity, and the way in which *Ich* poses itself as self-consciousness (Fichte's expression for *Selbstbewusstsein* is "Das Ich setzt sich schlechthin als sich setzend" [The *Ich* posits itself as a pure self-positing]). It is thus a subjective absolute that brings to philosophy a new foundation in the form of an intellectual intuition (in this sense, it cancels out the effects of Kant's critique). French can do no better than to translate this as *Moi = Moi*, even occasionally risking *Je suis Je*. A sentence that sought to render Fichte's prose into French might offer the following: "Je suis absolument parce que je suis; et je suis absolument ce que je suis; ces deux affirmations étant pour le Moi [*Ich*]. . . . Le Moi [*Ich*] pose originairement son propre être" (I am absolutely because I am; and I am absolutely what I am; these two statements for the Self. . . . The Self originally posits its own being: *Œuvres choisies de philosophie première*, French trans. Philonenko, 22). Here, however, the French translation is incapable of conveying the symmetry of the German text. It thus fails to translate (unless it glosses it in a commentary) the movement proper to subjective idealism, which goes further back than the logical principle of identity, to the transcendental identity of the *Ich*, perceiving itself and uttering itself in its own immediacy.

2. This failure of translation is even more apparent in the following stage of the Fichtean dialectic, when it is stated that in its movement of self-positing, *Ich* "posits itself immediately both as *Ich* and as *Nicht-Ich*," contradicting this time the form of the principle of identity in its traditional development (*A* is not non-*A*). Indeed, *Nicht-Ich*—the negation not of a predicate, but of a singular term, which for this reason Tugendhat considers an absurdity, *ein Unding*, and which literally also means a "non-thing"—is not (*le*) *Non-Moi* (Non-Self) but it is, in the simplicity of one and the same negation, both "[all] that which I am not" and the "nothingness of the I," even its annihilation, that is, its being deprived of any substantial determination. A formulation such as ". . . in the self [Fr.: *le Moi*] I oppose a divisible not-self to the divisible self," about which Fichte tells us that "the resources of the absolutely and unconditionally certain are now exhausted" (*Science of Knowledge*, trans. Heath and Lachs, 110), does not allow us—in French, by means of the expression *Non-Moi*—to understand that *Nicht-Ich* still contains within it the form of the subject, but modified by a negation (or that *Nicht-Ich* is an *Ich* that negates itself as such). French masks, therefore, the linguistic roots of the elaboration that led Fichte to overcome the interpretation of the opposition between *Ich* and *Nicht-Ich* as an antagonism between subject and object (or between consciousness and the world, or freedom and nature), and to make it the expression of an intersubjectivity or "constituent interpersonality," an originary unity of the "I" and the "You" (or of the person of the subject and the person of others).

3. Hegel, for his part, incessantly criticized what he considered to be the "formalism," the "motionless tautology [*bewegungslose Tautologie*]," of the equation *Ich = Ich*. This is one of the central threads of the *Phenomenology of Spirit*, which begins with the analysis of the emptiness of sense certainty, described as suspended in a purely verbal self-referentiality ("Das Bewusstsein ist *Ich*, weiter nichts, ein reiner *Dieser*; der *Einzelne* weiss reines Dieses, oder das *Einzelne*," an almost untranslatable sentence because of the equivocality of *Ich* and the alternation of masculine and neuter: "Consciousness, for its part, is in this certainty only as a pure 'I'; or I am in it only as a pure 'This,' and the object similarly only as a pure 'This' "; *Phenomenology of Spirit*, trans. Miller, 58). In the same text, however (the chapter "Die Wahrheit der Gewissheit seiner selbst" [The Truth of Self-Certainty]), Hegel introduces in turn an expression based on the syntax of personal pronouns in order to set in motion the dialectics of self-consciousness: "*Ich*, das *Wir*, und *Wir*, das *Ich*, ist" (ed. Hoffmeister, 140). This expression is immediately followed by the famous discussion of "autonomy and non-autonomy of self-consciousness: lordship and bondage." The extant translations—"*I that is We*" and "*We that is I*" (Fr.: "Un Moi qui est un Nous, et un Nous qui est un Moi," or "Un je qui est un Nous, et un Nous qui est un Je")—do not adequately render the movement of identification that passes through the other, which Hegel makes the active force of the progression of Spirit (*Geist*). In order to mark the appropriation of alterity in the interiority of the same subject, through the negation of negation, we would need to translate by forcing the syntax: "*I that We* are, *We that I* am" (Fr.: "Moi que Nous sommes, Nous que Je suis").

For once, the detour via the French terminology of the *moi* is useful, since this Hegelian formula transposes an idea originally expressed by Rousseau:

> À l'instant, au lieu de la personne particulière de chaque contractant, cet acte d'association produit un corps moral et collectif composé d'autant de membres que l'assemblée a de voix, lequel reçoit de ce même acte son unité, son moi commun, sa vie et sa volonté.

> (At once, in place of the individual person of each contracting party, this act of association produces a moral and collective body composed of as many members as there are voices in the assembly, which receives from this same act its unity, its common *self*, its life and its will.)

> (*Contrat social*, 1.6, trans. Cress, 24)

But where Rousseau described in a naturalistic manner how an individual was formed from individuals, even if he is attributed the interiority of a consciousness after the fact, as a way of interpreting the enigma of an alienation that is at the same time a liberation, Hegel places us from the outset in the immanence of the subject, which he connotes by the use of the first-person singular and plural. He uses what Benveniste calls the difference between a "person in the strict sense" and an "amplified person" (in other words, the fact that "I" is both opposed to "We" and included in it to make a person) as a means of presenting the tension between the two terms as a sort of conflictual reflection inherent in the constitution of the subject, which is the decisive moment in the transformation of the individual spirit into a universal spirit that knows itself (*Geist* as an absolute form of the *Selbst*).

III. From the *Moi* to the "Self," from the "Self" to the *Soi*

Leaving aside the semantics of the German *Selbst*, which is remarkable by virtue of the possibilities of forming compound words from it (for example, *Selbstbewusstsein*, *Selbstbestimmung*, *Selbstständigkeit*, *Sebsterfahrung*, *Selbstbildung*, *Selbstverständigung*, etc.) (see SELBST), we will now look more closely at the double displacement that occurs between French and English: from *moi* to "self," from "self" to *soi*. What we have is a minor drama of betrayal. Played out initially within a very short space of time, it has continuously informed the conflictual relationship between the psychologies and philosophies of personal identity that are particular to these two languages (from the opposition between Hume and Rousseau in the eighteenth century, to the difference of approach between the American pragmatists such as William James or George Herbert Mead, and the French phenomenology of Jean-Paul Sartre or Paul Ricœur).

In his *An Essay concerning Human Understanding* (2.27, *Of Identity and Diversity*), Locke invented two major concepts of modern philosophy: "consciousness" and "the self" (see CONSCIOUSNESS). His immediate context and background was the invention of the expression *le moi* in French philosophy and literature (Descartes, Pascal, Malebranche). It was Pascal, as we know, who popularized the *moi*: "Je sens que je puis n'avoir point été, car le moi consiste dans ma pensée" (I feel that I might not have been, since the *moi* consists of my thought [*Pensées*, B469/L135]); "Qu'est-ce que le moi? . . . Où est donc ce moi, s'il n'est ni dans le corps ni dans l'âme? Et comment aimer le corps ou l'âme, sinon pour ces qualités, qui ne sont point ce qui fait le moi, puisqu'elles sont périssables?" (What is the *moi*? . . . Where then is this *moi*, if it is neither in the body nor in the soul? And how is one to love the body or the soul if not for those qualities which are not what makes up the *moi*, since they are perishable? [ibid., B323/L688]). But Descartes, in his *Discourse on Method* (fourth part), had already written: "Ce moi, c'est-à-dire mon âme, par laquelle je suis ce que je suis" (This *moi*, that is to say my soul, by which I am what I am). And this striking formulation had already been interpolated by the French translator in the course of the Fourth Meditation (Descartes, *Œuvres*, 9:62). The substantivization of the self-reference (*ce moi*, *Ego ille*) is at the heart of the Cartesian interrogation of identity. It imposes a very strong grammatical constraint on any translations: to go from the expression *le moi* to "the self" is to enact a profound transformation, such that it is no longer possible to go back the other way. This is why Pierre Coste, the French translator of Locke, had to create, in turn, *le soi*, an innovation whose effects are still felt today. (Coste's note to his translation of Locke's *Essay* says: "Pascal's *moi* in a sense authorizes me to use *soi*, *soi-même*, in order to express the feeling, which everyone has within himself, that he is the one and the same [ce sentiment que chacun a en lui-même qu'il est le même]; or,

to put it more clearly, I am thus obliged to translate it out of an indispensable necessity; for I could not express in any other way the meaning it has for my Author, who has taken the same liberty with his own Language. The circumlocutions I could use in this instance would get in the way of what he is saying, and would render it perhaps completely unintelligible.") But present-day usages of the English "self" and the French *soi* do not really correspond to one another. One cannot write in French *mon soi* (as in the English "myself" or "My Self"), much less use this noun in the plural (unlike the English "ourselves"). Rather than establishing a universal concept, translation opens out onto a drifting-apart of meaning.

The way in which Locke takes advantage of the particularities of one language to transform the problematics that originated in another is quite remarkable. Indeed, although English has not developed any expression equivalent to the form *das Ich* or *le moi*, it does have at its disposal a great variety of usages for "self," which incline the English-language conceptualization of the subject to imagine it as a disposition or property of oneself. The term "self" (whose etymology remains obscure) encompasses both a pronominal usage (corresponding to the Latin *ipse*) and an adjectival

usage (corresponding sometimes to the Latin *ipse*, and sometimes to the Latin *idem*; thus "myself" and "oneself," or "the same," "the selfsame"). There are early nominal uses, both with and without the article ("self," "the self"). Finally, there are different combinations: "self" compounded with pronouns and possessives, written either as a single word to emphasize its pronominal function (itself, himself, myself, oneself), or as two separate words, introducing a noun tending to substitute for the pronoun itself as a form of intensification (itself, himself, myself, oneself); or compounded with nouns or adjectives, to form notions of an action being applied to the subject itself, such as "self-conscious" and "self-consciousness" (as in the Greek terms formed with *auto-* and *heauto-*, where Romance languages would use a genitive construction: *causa sui*, *compos sui*, *cause de soi*, *maîtrise de soi*, *conscience de soi*).

■ See Box 2.

No less decisive is the reciprocity, bordering on equivalence, that is established between "myself" and "my own" when the subject, addressing himself, is referring to that which belongs most closely or properly to him. "My own, confirm me!" the poet Robert Browning will write ("By the

To, auto, h(e)auto, to auto: The construction of identity in Greek

➤ *IDENTITY, SELF* [SELBST, SAMOST'], TO TI ÊN EINAI

We have retained a large number of composite terms calqued from the Greek, often via Latin, and constructed using the pronoun *autos, -ê, -o* [αὐτός, -ή, -ό], such as "autograph, autodidact, automaton, autonomous", to refer to the action that the subject carries out personally and most often on himself (written in one's own hand, someone who teaches himself, that which moves by itself, that which establishes its own laws). This formation was virtually as extendable and generalizable in ancient Greek as the compound words in *Selbst-* are in present-day German (see SELBST; in French it has also brought several recent inventions in which the second term is French (for example, *auto-allumage* [self-lighting, 1904], RT: *DHLF*, s.v. *auto*).

Autos is itself made up of the particle *au* [αὖ], which indicates succession (then), repetition (again), or opposition (on the other hand); and of *ho, hê, to* [ὁ, ἡ, τό], a deictic (this one, that one) that in classical Greek becomes the definite article "the" (although *ho men, ho de* [ὁ μέν, ὁ δέ], for example, continue to mean "this one, that one"). The first and literal sense of *autos* is thus something like "on the other hand, and then this one here, in contrast to that other one" (cf. RT: *Dictionnaire grec français*, s.v.). *Autos* grammatically has three essential uses:

1. In cases other than the nominative, it acts as a reminder pronoun in the third person, with an anaphoric usage (*auton horô* [αὐτόν ὁρῶ], "I see him"; *ho patêr autou* [ὁ πατήρ αὐτοῦ], "the father of him," "his father," as in the Latin *eius*, *eorum*).

2. It is used as an emphatic pronoun or adjective (Lat. *ipse*, Fr. *même*), either on its own (as in the Pythagorean *Autos epha* [Αὐτὸς ἔφα], "The Master says"), or apposed to a personal pronoun (*egô autos* [ἐγὼ αὐτός], "it is me in person who," "myself") or to a noun (*auto to pragma* [αὐτὸ τὸ πρᾶγμα], "the thing itself"; *dikaion auto* [δίκαιον αὐτό], "what is just in itself").

It is often used in this way at the same time as the reflexive pronoun, *heautos, -ê, -o* [ἑαυτός, -ή, -ό], which is itself a combination of two pronouns: *he* [ἕ], a third-person personal pronoun, which we find in Homer, followed by *autos*; when the reflexive is contracted into *hautou, -ês, -ou* [αὑτοῦ, -ῆς, -οῦ], the two are only distinguished in terms of breath (rough breathing for the reflexive, transliterated by an aspirate *h*); thus the Delphic formula given in the *Charmides* (165b), "to gignôskein auton heauton

[τὸ γιγνώσκειν αὐτὸν ἑαυτόν], "to know oneself in oneself," and the fact of being "auto kath' auto" [αὐτὸ καθ' αὐτό] indicates the separate ontological status, "in oneself and by oneself," or perhaps "in oneself and for oneself," of the Platonic idea.

3. Finally, when it is immediately preceded by the article *ho autos, hê autê, to auto* [ὁ αὐτός, ἡ αὐτή, τό αὐτό], it has the same meaning as the Latin *idem*, "the same." The Greek makes a very clear distinction by its word order between "ho autos theos [ὁ αὐτὸς θεός]," "the same god," and "hautos ho theos [αὐτὸς ὁ θεός]," "the god himself."

In Greek, then, a constellation of terms tightly binds together the two aspects of identity: ipseity, or the constitution of a self, and "sameness," the construction of an identity-to-oneself or to another-than-oneself. A number of languages have analogous procedures, such that the presence of an article makes the difference in meaning: French (*soi*) *même* / *le même* (*que*), German *Selbst*/ *dasselbe*, in contrast to Latin *ipse*/*idem*, and English "self"/"same." But in Greek, the article is primarily a constituent of the term itself, *au-t-os*. There follows from this a quite

singular and informative series of linguistic gestures that one could characterize, along with Friedrich Schleiermacher, as constituting a kind of schema of how the Greeks conceived of identity. This series is, de facto, philosophically determining.

Let us start with the article. Greek only has a definite article (unlike Latin, which has none, or French, for example, which distinguishes between *le*, definite, and *un*, indefinite). In archaic Greek, what will become the article, *ho, hê, to*, manifestly has a strong, demonstrative meaning, which is why it functions referentially, or as a liaison, close to a relative pronoun (see RT: *Aperçu d'une histoire de la langue grecque*, 188, 192ff.). When, after Homer, it becomes an article, this little word remains remarkably consistent. Its presence alone next to a noun confers upon it a presumption or a presupposition of existence, so we find it regularly next to proper names (in Greek, one says *ho Sokratês* [ὁ Σοκράτης], "the Socrates," and not "Socrates"). It is used even more clearly to differentiate the subject from the predicate in a sentence in which word order alone is not sufficient: one would not say in Greek "*a* is *a*," but rather "the *a* is *a* (or "*a* the *a* is," or "is the *a a*," etc.). Someone like Gorgias, for example, uses this as an argument against the identity of the subject and the predicate, in the form in which a statement of identity is made. Thus, for instance, with "to mê on esti mê on [τὸ μὴ ὄν ἐστὶ ὄν]," "the nonbeing is a nonbeing," one says, whether one likes it or not, that the subject "to mê on [τὸ μὴ ὄν]," "the nonbeing," has another type of consistency and existence than the predicate "mê on [μὴ ὄν]," "a nonbeing" (*De Melisso Xenophane Gorgia*, 978a25b = G.3–4, in Cassin, *Si Parménide*, 636). This is also why the article can be used so easily to "substantivize" not only adjectives (*to kalon* [τὸ καλόν], "the beautiful one" in Plato's *Symposium*), participles, and infinitives (*to on* [τὸ ὄν] and *to einai* [τὸ εἶναι], "the being" and "Being"), but

all sorts of expressions (see, for example, TO TI ÊN EINAI, the "essence of what being was," the "quiddity" of Aristotle in Latin), as well as words or whole sentences, which go from being used to being mentioned, as if put into quotation marks (in Aristotle, for example, cf. *Metaphysics,* Γ.4, 1006b13–15).

The first and strongest testimony to this organization of identity as a function of the constellation *to*, *auto*, *to auto* is the way in which Parmenides's *Poem* constructs the identity of being. Following what he calls "the road of [*it is*]" (which, moreover, is referred to as *hê men* [ἡ μὲν], "this one," in opposition to *hê de* [ἡ δὲ], "that one," 2.3 and 5), Parmenides discusses the whole range of forms and possibilities, syntactical as well as semantic, of the verb *esti* [ἔστι], "is" (third-person singular, 2.3; see TO BE), ending with *to eon* [τὸ ἐὸν], "the being" (substantivized participle, 8.32), that is, the subject identified as such only at the end of the road (and a demonstrative article, emphasized with a particle, will thereafter be sufficient to refer to it: *to ge* [τό γε], 8.37, "the/that in any case," or *to gar* [τὸ γὰρ], 8.44, "the/that indeed"). One of the crucial points of the operation occurs in fragment 3, whose meaning has been so controversial, but acclaimed by Heidegger as the guiding principle of Western philosophy: "to gar auto noein estin te kai einai [τὸ γὰρ αὐτὸ νοεῖν ἐστίν τε καὶ εἶναι]," which could be translated literally as "a same indeed is both thinking and being." One might interpret this phrase as meaning that thinking and being are one and the same, and understand it along with Heidegger not as a declaration of subjectivism and idealism *avant la lettre*— being is only ever what we think it is—but as a "belonging together" of being and thinking, and thus as a determination of man himself (*An Introduction to Metaphysics*). But one could also interpret it in terms of how this *to auto* is formed: *to*, "the"/"this"; *au*, "again, once more"; *to*, "the"/"this." The particle joins together the same element two times; "the

same" in Greek is articulated as "the re-the," "this re-this." In other words, the consistency of identity (*to auto*, "the same" in the sense of a same thing, something identifiable as being the same as itself) is nothing other than the conjunction (*te kai*) of thinking and being. Indeed, this is where being itself, properly articulated, will find in *te eon* the name of a subsisting and knowable subject, or ipseity par excellence.

Fire Side"). This reciprocity enables Locke to fuse a modern problematic of identity and diversity with an ancient problematic of appropriation (*oikeiôsis, convenientia*; see OIKEIÔSIS), terms at either end of a spectrum between which notions concerning recognition, consciousness, memory, imputation, responsibility for oneself and one's own actions, all insinuate themselves. In English, "own" is both an adjective and a verb. As an adjective, it is combined with the possessives "my," "his," and so on, as an intensifier ("my own house," "I am my own master") and separately ("I am on my own"). As a verb ("to own"), it has a wide range of meanings, including "to possess," "to admit," "to confess," "to recognize," "to declare," and "to claim": these all have the sense of saying something is "one's own." Locke draws together all

the different senses of the term, separately or in different combinations (as in: "owns all the actions of that thing, as its own": *An Essay*, 2.27.17). The result of these constructions is an amalgamation of the paradigms of being and having, which is typical of what has been termed, from the point of view of political philosophy, a "possessive individualism." Basically, "me" is ("I am") "mine," and what is "most properly mine" is "myself" (just as what is most properly "yours" is "yourself," "his" is "himself," etc.).

Even though this amalgamation goes as far back as the Greek discourses on *oikeios* and *idios* describing the particularity of the self (cf. Vernant), it is only with Locke that it occupies the center ground of modern philosophy. It finds its way through to us, continually reinforced, up until the

liminal thesis of *Sein und Zeit* (§9), in which Martin Heidegger identifies the existential particularity of human *Dasein* with *Jemeinigkeit*, another neologism (this time a German one, literally "being each time mine") that is just as difficult to translate as the English "self." In a sense, then, Heidegger's neologism "self" turns back into its opposite, since the content of the English "own" (in German *das Eigene*) is merely the imminence of death, the only "thing" that "properly" belongs to each one of us. We will see how Heidegger's reversal of the Lockean tradition is accompanied by a new revolution in the naming of the subject.

In the passages in Locke's *Essay* where the doctrine of personal identity is elaborated (above all, 2.27), all of these virtual senses are brought into play through the slippery movement of the writing. In a first stage we go from the idea of identity as simple "sameness" to that of reflexive identity, or "ipseity": the word "self" at that point becomes a noun. From comparative expressions ("the same with itself"), we move easily to "that is self to itself" (equivalent to the idea of consciousness):

> Consider what person stands for. . . . When we see, hear, smell, taste, feel, meditate, or will any thing, we know that we do so . . . and by this every one is to himself, that which he calls *self* . . . it is the same *self* now as it was then; and it is by the same *self* with this present one that now reflects on it, that that action was done.
>
> (*An Essay*, 2.27.9)

Locke provides two equivalent expressions, which could be exchanged for one another: "to be one (identical) Person" and "to be one self." In a second stage, "self" sometimes serves as a substitute for the first person, and sometimes as its double, entering into dialogue with it, and showing concern for it:

> Had I the same consciousness . . . I could no more doubt that I, that write this now . . . was the same self, place that self in what Substance you please, than that I that write this am the same my self now whilst I write. . . . That with which the consciousness of this present thinking thing can join its self, makes the same person, and is one self with its, and with nothing else; and so attributes to its self, and owns all the actions of that thing.
>
> (Ibid., §§16–17)

"Self" as a common noun slips to "self" as an almost proper noun (without an article), while retaining the possibility of being understood as a possessive. In equating expressions such as "I am my self," "I am the same self," and "I am the same my self," Locke turns "self" into the representation of oneself for oneself, the term to whom (or to which) I attribute what I attribute to myself, what I care for when I care for myself. Finally, Locke gives the name "Person" (which he defines not as a grammatical or theological term, but as a "forensic term") to the "self" that had itself been used to clarify the singularity of "personal identity":

> *Person*, as I take it, is the name for this *self*. Wherever a man finds, what he calls himself, there I think another may say is the same person. . . . This personality extends

its *self* beyond present existence . . . whereby it becomes concerned and accountable, own and impute to it*self* past actions.
>
> (Ibid., §26)

From the perspective of inner judgment (which anticipates the Final Judgment), Locke translates into the language of the "self" the expression of Descartes, substituting "consciousness" for "my soul" in the process of identifying that by which "I am what I am," and playing once again on the possessive: "that consciousness, whereby I am my self to my self."

This idea of being oneself for one's person obviously suggests an element of reflection, or internal distance. There is thus an uncertainty about the question of knowing whether the identical and identity are "myself," or rather are "in me" as an object, an image, or a verbal simulacrum. But the "self" for Locke is nothing more than an "appearing to oneself" or "perceiving oneself" that is identical through time. It could not, therefore, in fact split in two, whether the split is imagined to occur between a real self and an apparent one (as in Leibniz), or between an actor and a spectator (Hume, Smith), or between subject and object, or between I and Me (in the way that G. H. Mead decomposes the Self into an "I" and a "Me," which continuously switch places: it would be interesting to explore what Mead's model perhaps owes to an oblique relation to French). This vanishing distance is ultimately the pure differential of the subject. It corresponds remarkably to the idea that Locke's theorization of consciousness attempts to found, marked by a tension between the representation of a fixed point to which the entire temporal succession of ideas would be connected, and that of the flux of representation, the continuity of which would itself produce identity. It appears to us primarily, though, as the effect of a play on words—an ironic state of affairs, when we consider the extent to which Locke tried to separate a theory of knowledge based on pure associations of ideas, from the linguistic "garments" of these ideas.

■ See Box 3.

IV. Returns of the *Ego*

French, then, has the duality of the *je* and the *moi*, which allows it to problematize identity, and later introspection, from the perspective of both an affirmation of certainty and a passion for existence (but also for disappearance); German has the flexibility of the *Ich*, which encompasses a dialectics of position, of reflection, and of negation; and English has a synthetic expression of moral responsibility and mental appropriation: the "self." We might then assume that the rules of the game are set, so to speak (unless and until we take into account other, different languages, of course), and that it is all a matter, precisely, of translation. A few enigmas remain, however, of which the most striking is the way in which philosophy in the twentieth century has set about reviving the Latin *ego*, like a *Fremdwort* that is nonetheless, by definition, absolutely familiar.

A. "Ego-psychology"

It is by no means certain that this "return of *ego*" poses exactly the same problems in all contexts, first of all because

3

The "self" in psychoanalysis

It was in the English-speaking world, around 1960, and mainly through the influence of Donald W. Winnicott that the term "self" truly began to appear in psychoanalytical literature. Since then, it has become firmly established in psychoanalysis in its English form, even though there have been occasional attempts to translate it as *soi* in French, as *Selbst* in German, or as an equivalent term in other European languages. What seems to hamper these translations is, on the one hand, a cultural particularity implying that the English "self" refers to an aspect of one's personality that is hidden, or liable to be misunderstood or neglected (as suggested, for example, by the expression "Take care of yourself"), and on the other hand, the epistemological difficulty for contemporary psychoanalysts that an unreserved mobilization around this concept has caused. Indeed, when Winnicott defines the "self" as different from the "I," saying that for him, "the self, which is not me, is the person within me" (see ES), some authors see in this new concept a useful complement to the three psychic terms introduced by Freud in his second topology (the *Ich* [Ego], the *Es* [Id], and the *Über-Ich* [Superego]), whereas others consider it as bastardization that would bring us back to a pre-Freudian, personalist, even Bergsonian phenomenology of autonomy and of a unified I.

In fact, as Jean-Bertrand Pontalis has shown in an excellent analysis of the epistemological aspects of the problem ("Naissance et reconnaissance du 'soi'"), the self according to Winnicott and several other English-speaking psychoanalysts should not be interpreted exclusively from a theoretical point of view, in relation to the conceptual apparatus elaborated by Freud. When they introduce the "self," these authors are in fact concerned about "responding to problems posed by the analysis of their patients, and not about demonstrating the inadequacy or the deficiencies of the Freudian metapsychology." What was at stake for them, then, was "more the determination of a domain of experience, than the theoretical critique of the validity of a concept."

The "self" was actually first used in 1950 by the New York psychoanalyst Heinz Hartmann, who was originally from Vienna, in the context of the "Ego-Psychology" movement. Hartmann set out to dissociate an "I" that is defined by its functions (motor control, perception, experience of reality, anticipation, thought, and so on), from a "self" that represented the person as such, as distinct from external objects and other people. This bipartition in effect isolates narcissism, which is exalted in the feeling of plenitude and the self-sufficiency of one's entire being, whereas, as Pontalis puts it, "the constitution of a self [*moi*] is linked to the recognition of the other, for whom it serves as a model."

As for the problematic elaborated by Winnicott in the context of what he calls the "transitional object" and the "potential space," this leads to a distinction between the "true self" and the "false self," which has often been popularized in a trivial and normative sense. The first is formed in a relation that the subject has with its subjective objects, which takes on a solipsistic character corresponding to the "right to not be discovered, if need be, to not communicate, insofar as any such needs, if they are recognized, reveal that the individual feels he is real in the secret communication that he has with that which is most subjective within him" (Pontalis, "Naissance et reconnaissance du 'soi,'" 180). The "false self" corresponds, for its part, to the need the subject has to adapt to external objects as they are presented to him by the environment. According to Pontalis, this would be close to what Helen Deutsch in 1942 called the "as if" personality, in the sense that it is characterized by a developed behavior and psychological ease that is apparently well adapted, but that functions in a void, notwithstanding a constant oscillation between an extreme submission to the external world and exposure to its misfortunes, and a readiness to react to these misfortunes to one's own advantage. But this bipolarity of the "true self" and the "false self" has nothing to do with a dichotomy between two personality types, where one, the "true self," would be the only authentic one, whereas the other, the "false self," would be more or less alienated by environmental constraints. According to Winnicott, these two "selves" in effect form a pair in which the second protects the first, even if it appears to do nothing more than hide or cross-dress it. For it is important that the "true self," in its position of noncommunication, should need to be protected. There would, then, only be a genuine pathology in cases where there was a clear split between these two aspects of the personality. Then again, however, concepts of this kind are only relevant, in Winnicott's eyes, if they prove to be useful at a given moment in a clinical situation, and they do not compromise the Freudian problematic of the self (*moi*).

Pontalis, Jean-Bertrand. "Naissance et reconnaissance du 'soi.'" In *Entre le rêve et la douleur*. Paris: Gallimard / La Pléiade, 1977.

the fact of writing *ego* or "the ego" in the middle of an ordinary sentence does not produce the same effect of strangeness in all languages. We should reserve a special place for the (by now universal) consequences of the generalization of an English psychoanalytic terminology, in which the *Ich* of Freud's second topological theory was translated as "the ego," whereas *Es* was translated as "the id" (see ES). These effects are easier to understand when we explain not only, following Alexandre Abensour, that the term "ego" in English comes out of a psychological and medical vocabulary, but also that it thereby prematurely gave rise to all sorts of composite words referring to the fact of relating ideas and behaviors "to the self," or even of putting them in "the service of the self" ("ego-attitude," "ego-complex," "ego-consciousness" [sic],

"ego-satisfaction," and so on, leading to all sorts of astonishing redundancies, such as "ego-identity," all attested by the *Oxford English Dictionary* [RT] of the nineteenth and twentieth centuries). This influence even extends to certain texts by Lacan, who was notoriously hostile to "ego-psychology," whence his lecture to the British Psychoanalytical Society on 2 May 1951, "Quelques réflexions sur l'*Ego*" (Some reflections on the *ego*, quoted in Ogilvie, *Lacan*, 52), a title that was not lacking in irony. But the fact that Lacan had in mind a theorization of "paranoiac knowledge" suggests another direction: that of the usages, scientific or parodic, of the word "ego" (including the expression "my ego") to refer to the narcissistic image that the subject forms of itself ("the *ego* of the Prime Minister is highly developed").

B. *Das transzendentale Ego*

More directly linked to our discussion is the introduction of "egological" terminology in Husserl's phenomenology, and the very profound effects it produces there. Although Husserl had only used classical terminology in the *Logische Untersuchungen* (*Logical Investigations*) of 1900–1901 and in the *Ideen* of 1913—the terminology of transcendental Idealism, posing the usual problems of translation (thus in *Ideen*, 1.57: "Die Frage nach der Ausschaltung des reinen Ich," which Paul Ricœur translated into French as "Le Moi pur est-il mis hors circuit?" [Is the pure self (Husserl: "the pure 'I'") put out of circulation?])—the texts from his late period, starting with the *Cartesianische Meditationen* (the *Cartesian Meditations* were originally delivered as lectures in German at the Sorbonne in 1929, and were translated into French by E. Levinas and G. Peiffer before they were even published in the original German) begin to introduce another terminology, that of the "transcendental ego [*das transzendentale Ego*]." How should we understand this retranslation into Latin, which could seem merely pedantic? We might look for the reason in the context and the intentions of the text, without going into the complexity of the problems raised by the way in which Husserl's conception of subjectivity evolved. These have provided an endless source of debate for contemporary philosophy, from Sartre's major article on "La transcendance de l'ego" (The transcendence of the ego, 1936), in which he problematizes the relationship between consciousness, the *Je*, and the *Moi* (self), to the controversy between Jacques Derrida (*La voix et le phénomène* [Speech and phenomena], 1967) and Michel Henry (*L'essence de la manifestation* [The essence of manifestation], 1963) in the 1960s around the question of the auto-affection of the subject.

The first and simplest reason resides in the fact that Husserl cites Descartes, whose philosophical gesture he hopes to repeat:

> If we examine the content of the *Meditations*, we note that we are effectuating a return [*Rückgang*] to the philosophical *ego* . . . a return to the *ego* of the pure *cogitationes*.
>
> (*Cartesian Meditations*, trans. Cairns, Introduction, §1)

The text of Descartes that Husserl invokes is the original Latin text, thus at same time continuing a German university tradition, and marking the persistence of a linguistic *universitas* common to spiritual Europe, a teleological horizon in which Husserl situates, precisely, the primacy of transcendental subjectivity. We might say that with Husserl's reprise of Descartes, the *ego* is immediately perceived as absolutely translatable (unlike Heidegger's *Dasein*, for example, which ends up being perceived as untranslatable into other languages). The Latin Descartes, whose thought (re)inaugurates philosophy, symbolically summarized in the use he makes of the noun *ego* and of the expression "ego cogito, ego sum," is not so much French as European, and thus universal in the sense of European universality, whose crisis Husserl then undertakes to interpret. Husserl was no doubt unaware of the fact that the turns of phrase used by Descartes in the *Meditationes de prima philosophia* (Metaphysical meditations) to problematize *ipseity*, in particular the "ille ego, qui iam necessario sum" of the Second Meditation, would not have been possible without a constant back-and-forth movement

between ancient Latin and classical French ("Ce moi, c'est-à-dire mon âme, par laquelle je suis ce que je suis" [This self, that is to say my soul, by which I am what I am]). Kant's reading of Descartes, however, in which *Je* and *Je pense*, even *Je me pense* (I think myself), are taken as names for the subject, is tacitly assumed. A circle is thus traced, which we will have to follow back to its origins in order to reinterpret its meaning.

Two themes, respectively opening and closing the arguments developed in the *Cartesian Meditations*, seem to us to be worthy of attention here. We suggest that bringing them together offers a key to Husserl's linguistic artifice.

First of all, Husserl describes what he calls a "transzendentale Selbsterfahrung" (translated into French by Levinas and Peiffer as "expérience interne transcendentale" [transcendental inner experience], and by Marc de Launay as "auto-expérience transcendentale"; compare Dorion Cairns's English "transcendental self-experience"), by virtue of which we can gain access to "a universal and apodictic structure of the experience of the I [*des Ich*] which extends across all of the particular domains of affective and possible self-experience [*Selbsterfahrung* again]" (§12). This *Selbsterfahrung* has a specific kind of manifestation, in which consciousness "is given" in the mode of "itself" ("im Modus Er selbst") or of "oneself" ("Es Selbst") (§24). It is then described as *Selbstkonstitution* ("constitution de soi-même," "auto-constitution"), which is tantamount to saying that the consciousness that is named *ego* also appears to itself as sufficient, as the origin of its own meanings or qualities. This is what Husserl calls a "transcendental solipsism." Unlike Kant, however, Husserl does not offer this experience in which the "I" (*Ich*) perceives itself as the "identical pole of lived experiences," "the substratum of *habitus*," and so on, as an illusion constitutive of subjectivity. Nor does he see within it, like Heidegger (writing at approximately the same moment in *Sein und Zeit*), the risk of "missing the sense of the being of *sum*." But he makes it the point of departure and the horizon of a "self-interpretation" (*Selbstauslegung*) in which the *ego* will discover progressively what gives it its meaning, which had not been immediately noticed, except partially.

Now, the essential content of this "discovering of the transcendental sphere of being [*Enthüllung der transzendentalen Seinssphäre*]" is the constitutive function that intersubjectivity has for the *ego* itself—what Husserl called, in an analysis that has since become well known, a constitution of the ego as an *alter ego*, or an "original pairing" (*Paarung*) of the *ego*:

> In this intentionality a new meaning of being is constituted, which transcends the limits of my monadic ego in my self-specificity [*der neue Seinssinn, der mein monadisches ego in seiner Selbsteigenheit überschreitet*; Levinas and Peiffer translated this as: "un sens existentiel nouveau qui transgresse l'être propre de mon *ego* monadique"], and it constitutes an ego for itself not as *my-self* [*nicht als Ich-selbst*], but insofar as it is reflected in my own I [*in meinem eigenen Ich*], my monad. But the second ego is not purely and simply there, properly given to us itself [*uns eigentlich selbst gegeben*; Levinas and Peiffer: "donné en personne"], it is constituted on the contrary as an alter ego, and I am myself this ego [*Ich selbst in meiner Eigenheit bin*; Levinas and Peiffer: "c'est

moi-même, dans mon être propre"], designated as a moment by the expression *alter ego*.

(*Cartesian Meditations*, Fifth Meditation, §44)

Solipsism is thus reversed from the inside, or, to be more exact, it opens out onto a new transcendental problem that is deeply enigmatic by Husserl's own admission. This relates to the fact that constitutive intersubjectivity (since the *ego* would not be the subject of a thinking of the world of objects, if this world were not in its origin common to a reciprocal multiplicity of subjectivities) has as its condition the representation of "itself as an other," an *alter ego* that is both generic and concrete, irreducible to (the) *ego* and yet indiscernible from it (that is, from the "I") in its constitution. Husserl calls this elsewhere (§56) "eine objektivierende Gleichstellung meines Daseins und des aller Anderen" (an objectifying placing of my being and that of all others on the same level), which is experienced from the inside (Levinas and Peiffer translate this as: "une assimilation objectivante qui place mon être et celui de tous les autres sur le même plan"; de Launay proposes the following: "une équivalence objectivante de mon existence et de celle de tous les autres").

Through this verbal association, Husserl manages to account for the meaning of his initial choices, but he can only do it by going beyond Descartes and returning to an earlier layer of the humanist tradition. The term *alter ego*, which became commonplace and even banal in the different European languages during the nineteenth century, in the sense of a close friend, a personal representative, someone in whom you can confide, and so on (it first appears in French in Honoré de Balzac), is usually traced back to Cicero's *De amicitia* (*Laelius*), where we actually only find the expressions "tamquam alter idem" and "alterum similem sui" to denote a true friend. The fact is, however, that the expression goes much farther back (Pythagoras: *ti esti philos* [τι ἔστι φίλος]; *allos egô* [ἄλλος ἐγώ], according to Hermias, *In Phaedrus,* 199A). It casts over our entire culture the question of the possibility of experiencing intellectually or affectively something beyond the alternative of self and stranger/other (*Fremd*, in Husserl's text). This is the question Michel de Montaigne asked in an ethical register, for example, about his unique friendship with La Boétie ("Because it was he; because it was I"). Husserl also uses it to inform his reshaping of ontology, at the same time illuminating how we should understand that Descartes had indicated to philosophy the way toward a radical questioning, and yet had missed its transcendental meaning. We might perhaps suggest, then, that from the first, the return to the *ego* and the return of the *ego* (as a universal word) had been overdetermined by the possibility of saying the *alter ego* authentically (see MITMENSCH, NEIGHBOR, and LOVE).

V. *Je Est un Autre*: It Thinks (Me)

Let us immediately articulate this dialectic with another ontologico-linguistic problem, the one indicated by Rimbaud's expression: "Je est un autre" (I is an other). This could be just another way of translating *alter (est) ego*, or even *ille ego*. However, the uncertainty in French between the masculine and the neuter, and the way in which Rimbaud forces the syntax, points toward other interpretations. These are, moreover, in part suggested by Rimbaud's letter to Paul Demeny (15 May 1871), where this expression first appears, since there it is a question for the poet of discovering within himself a disproportionate creative power for which he is not responsible:

> J'assiste à l'éclosion de ma pensée: je la regarde, je l'écoute. . . . Si les vieux imbéciles n'avaient pas trouvé du Moi que la signification fausse, nous n'aurion pas balayé ces millions de squelettes qui . . . ont accumulé les produits de leur intelligence borgnesse, en s'en proclamant les auteurs!

> (I witness the unfolding of my own thought: I watch it, I listen to it. . . . If the old fools had not discovered only the false significance of the Ego, we should not now be having to sweep away those millions of skeletons which . . . have been piling up the fruits of their one-eyed intellects, and claiming to be, themselves, the author of them!)

(Trans. Oliver Bernard, in Kwasny,
Towards the Open Field, 146)

At issue for Rimbaud, too, is how to recover the meaning of an ancient kind of delirium, in which madness communicates with enthusiasm:

> En Grèce, ai-je dit, vers et lyres rythment l'Action. . . . L'intelligence universelle a toujours jeté ses idées, naturellement. . . . Le Poète se fait voyant par un long, immense et raisonné dérèglement de tous les sens.

> (In Greece, I say, verses and lyres take their rhythm from Action. . . . Universal Mind has always thrown out its ideas naturally. . . . The Poet makes himself a *seer* by a long, prodigious, and rational disordering of *all the senses*.)

(Ibid., 147)

What suddenly bursts forth here (in certain limit-conditions where the "I" escapes from the "Self" [*Moi*]) is the paradox of the equivalence between the personal and the impersonal, or better still, borrowing Benveniste's categories, between a "person" and a "non-person," in all of its different modalities.

There are basically three types of these modalities, which philosophy has always designated as being on the horizon of the "I," as its other side, or its limit, or its truth. "Das Wesen, welches in uns denkt," Kant wrote in the *Kritik der reinen Vernunft* (374), in which he sketched out a surprisingly tripartite personification: "Ich, oder Er, oder Es (das Ding)"—"What thinks in us," then, could be "Him" or "Her" (God, Being, Truth, Nature); it could be "that" (the body, desires or impulses, the unconscious); it could be "one" (the impersonal of a common thought, what circulates as speech between all subjects). Let us conclude by summarizing these three translations.

"Je est un autre" (I is an other) is to say it is God, the only one capable of using absolutely the *Ich-Prädikation* (Cassirer) in order to name himself. We know that the Bible (perhaps inspired by other models, notably Egyptian, but this is not the place to get into the disputes about which came first) was originally theophanic in its formulation ("Éyéh asher éhyéh," that is, "I am who I am," or "I am who I will be," Ex 3:14; see Box 4). It gives rise in the mystical tradition to

some surprising reversals, such as in Meister Eckhart, where we find the exclusive appropriation of the "I" and the "I am" by the "base of the base" of the soul (*Urgrund*), itself conceived as a creative nothingness that precedes the existence of God. If we accept that the secularization of the divine name in philosophy truly begins with the "ego sum, ego existo," or "I am, I exist," of Descartes, we see that this statement, modern by definition, serves in its turn as a point of departure for a series of displacements and reversals. This is the case when Spinoza in the *Ethics* sets down the factual axiom "homo cogitat" (since this undefined "man" is very close to an impersonal "one," he simply expresses one of the ways in which substance or nature thinks itself, and thus produces itself). It is the case in an entirely different way when the romantic and theosophist Franz von Baader "inverts" the Cartesian *cogito*: "cogitor [a Deo], ergo Deus est" (God thinks me, therefore he is, cited by Baumgardt, *Franz von Baader*). Without these precedents, Hegel would not have been able to attribute the Self to the Spirit as universal rationality, that is, to overcome the Cartesian formulation asserting the absolute subjectivity of a "thought of thought."

■ See Box 4.

But "Je est un autre" should also be understood as referring to the power of the individual body, or, as Locke said, to its "uneasiness," that is, its perpetual motion and desire, of which it is confusedly perceived to be the seat. Parodying Descartes, Voltaire had written (*Philosophical Letters*, 13): "I am body and I think: I know nothing more than that" (or "That's all I know about that [je n'en sais pas d'advantage]").

Many authors, particularly German-language ones, from Georg Lichtenberg up to Nietzsche and Wittgenstein, have for their part emphasized the idea that the subject's self-reference, and the irreplaceable identity of which it is meant to be sign, are of no use when it comes to imagining the essence of thought: so one should not write *Ich denke*, except as a derivative effect, but rather *es denkt*, "it thinks" or "there is thought," as one says *es regnet*, "it is raining." The most interesting consequences of these two points of view occur when they are fused together in a doctrine of the unconscious, as is the case with Freud. In his second topology, the "reservoir of drives" is named *Es*, which has been translated into French as (the) *ça*, as opposed to the *moi* (*das Ich*) and the *surmoi* (*das Über-Ich*) (which in some ways is the *Il*, *Ille* that surmount the *ego*, a divine or paternal model of authority). The meaning of these strange grammatical designations for the "instances of the psychic personality" is no doubt to reestablish the ancient idea of the conflict between the different parts of the soul, but in the modern horizon of thought reflecting upon its faculties of expression. This only comes out clearly once they give rise to a reciprocal formulation: the "Wo Es war, soll Ich werden" of the *New Lectures on Psychoanalysis* (1932), where *Es* should indeed be conceived as a subject (or at least "of the subject"), since *Ich* is by definition a subject. Subjectivity only arises in a process in which the personal and the impersonal can switch places, the places occupied by a thought that reflects upon itself in the at least apparent unity of a first person, and by a thought that undoes itself and misrecognizes itself in the conflict of representations attached to the body (life drives, death drives).

4

Exodus 3:14

The only theophany of the divine Name transmitted by the Old Testament is to be found in the book of Exodus. This happens in two stages. Once he has been "given the mission" by Yahweh to "bring the sons of Israel out of Egypt" (Ex 3:11), Moses asks God by what name he should be called by them: "Then Moses said to God, 'If I come to the people of Israel and say to them, 'The God of your fathers has sent me to you,' and they ask me, 'What is his name?' what shall I say to them?'" Exodus 3:14 gives the double answer: "God said to Moses, 'I AM WHO I AM.' And he said, 'Say this to the people of Israel, "I AM has sent me to you."'" So in theory, Exodus 3:14 contains two names: "I AM WHO I AM" (Ex 3:14a), and "I AM" (Ex 3:14b), the first generally considered by ancient and medieval exegesis as a mystical name, revealed to Moses alone in its fullness, and the second as an exoteric name, intended for "the people of Israel." In relation to the other names used to refer to God in various traditions—Yahweh in the "Yahwist" tradition, El

Shaddaï [The Lord] in the "sacerdotal" tradition—the name revealed to Moses in Exodus 3:14 (a passage belonging to the "Elohistic" tradition) has had a particular, even extraordinary, fate. A feature of the original formulation as it is recorded in the holy writ, "Éhyéh asher éhyéh," is that it does not contain any immediate metaphysical connotation. The natural meaning on which exegetes agree is "I am the Living One who lives," "The absolute Living One" (it being understood that the Living One is also a living *being*, and that the name Yahweh, corresponding to *à éhyéh* in the third person, is commonly understood as "he is"). However, if, as Gilson noted, there is no metaphysics *in* Exodus, there is a "metaphysics of Exodus," an apprehension of God as Being or as The Being, based upon a certain understanding of the revealed Name. This understanding relies on a fact of translation—in this case, on the translation of the passage in the Septuagint, the Greek version of the Old Testament written in order to transmit the biblical message to the Jews of

the Hellenic diaspora, which introduced the word *on* [ὄν].

It is with the transposition by the Judeo-Hellenistic translators of the Septuagint that "Éhyéh asher éhyéh" becomes "I am the Being," the *on* [ὄν], an "ontological" transposition that reaches its peak in Jewish thought with Philo of Alexandria (cf. Starobinski-Safran, "Exode 3, 14," 47–56). This transfer was decisively established in the Latin Vulgate, when Exodus 3:14a was translated as "Ego sum qui sum," and Exodus 3:14b as "Qui est (misit me ad vos)," with the French "Je suis celui qui est" (I am the one who is), prevalent in the seventeenth century, being the product of a collage of 14a and 14b that was dictated by the concern for elegance. (Compare the King James version: "And God said unto Moses, I AM THAT I AM: and he said, Thus shalt thou say unto the children of Israel, I AM hath sent me unto you.") It would be pointless—and impossible—to examine here all of the exegeses that have been proposed of the theophany of Exodus. We shall

content ourselves with noting the extremes at either end of their spectrum. At one end, there is the refusal to respond, the "true God not able to put himself at the mercy of men by giving them a name that would express his essence"—a refusal translated by the elliptical nature of a formulation understood as "I am who I am," "I am what I am." At the other end, there is the affirmation of God as Being itself—in the sense of "I am: the one who am/is"—or at least the affirmation of his "existence" (as opposed to nothingness or evil). This would be a guarantee of his truthfulness, with Jesus also referring to himself in this sense by using the expression "I am" in John 8:24: "For you will die in your sins unless you believe *I am*," which contains a transparent allusion to the Name of Exodus, but which translators generally prefer (for reasons having to do with the awkwardness of the original expression) to render as: "You will die in your sins unless you believe *what I am*." What interests us here is more limited in scope, and assumes that one accepts the horizon of the "metaphysical" reading: the play between the I and being, between the *ego* and the *sum*. This play reaches its maximum intensity in Eckhart's interpretation of the Name of Exodus, particularly in his rewriting of Exodus 3:14 as "Deus est ipsum suum esse," which gives rise to all sorts of variations, wavering between "God is himself his being" and "God is the being-oneself." The ultimate expression chosen by Eckhart was "Ipse est 'Qui est'" ("Himself is 'Who is,'" understood in the sense of "it is Himself, this *ipse*"—the *Ich* [= *ego*, "I"] of the German *Sermons*—"who is"). It is an *Ipse*, or more exactly a *Solus Ipse* (Him alone), hidden in the words of Moses,

that Meister Eckhart seeks to uncover in his reading: "Deus est ipsum esse et essentia ipsius est ipsum esse. Ipse est id quod est et is qui est, Exodi 3: Sum qui sum, Qui est misit me. Per ipsum et in ipso est omen quod est, ipsa sufficientia, in quo et per quem et a quo sufficit omnibus" (God is being himself and the essence of himself is being himself. Himself is what is and the one who is, Exodus 3: I am who I am, Who is has sent me. By himself and in himself is all that is, sufficiency itself, in whom and for whom and by whom he is sufficient for all [*In Exodum*, no. 158, in *Lateinischen Werke*, 2:140.5–9]). In Eckhart, the "metaphysics of Exodus" thus tends toward a theology of the *Ipse*, and this is why, basing his commentary of Exodus 3:14 mainly on the testimony of Maimonides, Eckhart is principally interested in showing that in the divine statement, the copula (*sum*) and the attribute (*sum*) are identified with the subject, with this Ego that God alone is in reality (*In Exodum*, nos. 14–21, in *Die lateinischen Werke,* 2:20.1–28, 10). The play between I and being is explicitly thematized in the German sermon 77 by comparing two passages in the Bible: "*Ego* mitto angelum meum" (Luke 7:27): "I send my messenger," which contains the word "I" (*Ego*); and "Ecce, mitto angelum meum" (Mal 3:1): "Behold, I send my messenger," which does not. The absence of the word *ego* signifies the ineffable nature of God: the fact that the soul cannot be expressed or put into words, "when it apprehends itself in its own content," and the fact that "God and the soul are one, to the extent that God can have no property by which he would be distinguished from the soul, or would be anything other than it, such that he cannot

say: *Ego mitto angelum meum*." The presence of the word *ego* signifies, by contrast, "the is-ness [*isticheit*] of God," that is, "the fact that God alone is" and the fact that he is "indistinct from all things," "for God is in all things and he is closer to them than they are to themselves."

As Abensour notes (see ES), the very simple and yet improbable translation of "Wo Es war soll Ich werden" proposed by Lacan ("Là où c'était, là comme sujet dois-je advenir" [Where it was, I must come into being], *Écrits*, 864, trans. Fink) allows us to speak again the "language of ontology." Should we be surprised that in this respect, Lacan's translation involves, under the name of *grand Autre* (big Other), a kind of short-circuiting of two previous interpretations of "Je est un autre"? If He is not the unconscious, at the very least we should say, with François Regnault, that "God is unconscious."

But with this Lacanian reference, we come to the third possible way of understanding the "non-person" and of transforming the "I" into its other: this other appears, then, as the order of language itself, the symbolic. As we know, Lacan is not alone in proposing such an interpretation, in which "ça pense" (it thinks) is always already preceded by "ça parle" (it speaks). It was also prevalent in Heidegger, for whom the impersonality of language as constitutive was initially presented pejoratively, as a characteristic of improper

(*uneigentlich*) being, the "one," or "any man" (*das Man*), who is essentially the man of public conversation, of the noisy exchange of opinions (as opposed to the silent figure, "absolutely my own," of care). Fleeing the anxiety felt at the possibility of its own death, *Dasein* or the existent can only respond to the question "Who am I?" by assuming a "public identity," expressed in language through common meanings (*Being and Time*, pt. 1, chap. 4). The precise meaning of the French pronoun *on* ([*das*] *man*) is certainly not easy to understand because of the interrelation between the phenomenological analysis and the value judgment, but its translations are instructive. English has recourse to no less than three correlative terms—"anyone," "one," and "they" (a term originally used in discussing Heidegger's text by the philosopher William Richardson, and retained in the standard English translation by John Macquarrie and Edward Robinson)—which thus shift the anonymity of the one to the many, in a way that allegorically invokes the masses. In Italian, they privilege the impersonal turn of phrase: *si dice*,

which represents "tutti e nessuno, il *medium* in cui l'esserci o *Dasein*, si dissipa nella chiacchiera" (Everyone and no-one, the *medium* in which *Dasein* dissolves into chatter: Bodei, "Migrazioni di identità," 646). Spanish has *dicen* and *se dice*; gossip and hearsay are *el qué dirán*, the "what-will-they-say."

But such combinations of private identity and public expression (whose counterpart is the tireless quest for the voices of silence, in mystical experience or in poetry, a non-speech where being preferentially expresses itself, and which would in a sense be situated this side of the "I" as well as of the "one") are not strictly necessary. Beyond the alternative of the Lacanian "subject of the unconscious," speaking or signifying like the truth in the "place of the Other," and of Heidegger's anonymous subject-as-multitude of daily chatter, the most persuasive determination has without doubt been proposed by Michel Foucault in his commentary of the neutral in Blanchot. "The other" is thought turning back to its constitutive exteriority, which is essentially the infinite dispersion of the effects of language:

The "I" who speaks—fragments, disperses, scatters, disappearing in that naked space. If the only site for language is indeed the solitary sovereignty of "I speak" then in principle nothing can limit it—not the one to whom it is addressed, not the truth of what it says, not the values or systems of representation it utilizes. In short, it is no longer discourse and the communications of meaning, but a spreading forth of language in its raw state, an unfolding of pure exteriority. And the subject that speaks is less the responsible agent of a discourse (what holds it, what uses it to assert and judge, what sometimes represents itself in it by means of a grammatical form designed to have that effect) than a non-existence in whose emptiness the unending outpouring of language uninterruptedly continues.

(Foucault, *Thought from Outside*, trans.
Massumi and Mehlman, 11)

We have covered (at the cost of certain simplifications) the cycle of expressions of the subject in the European code of persons. Two hypotheses have emerged, which call for further investigation. The first is that no one language is absolutely sufficient to complete this cycle, but the unveiling of the relationship between language and thought that the subject "consignifies" (as the Scholastics would say) can only occur by transferring the question from one language into another language, that is, by reformulating it within this other language according to its own syntax. The second is that this cycle clearly reproduces the cycle of the statements at the origin of the metaphysical principle: tautology or identity, conflict or contradiction, repetition or reflection, difference or alienation. These ontological figures are not engendered; even less are they predetermined by language. But what is certain is that without a linguistic formulation (*disposition*), and without the culture of this formulation, they would not be thinkable, and therefore would not have been thought.

IDEA

I. Idea and Ontology

1. The word "idea" comes from the philosophical Latin *idea* (from *videre*, "to see"), used notably by Seneca (*Letters* 58.18) in translating Plato's Greek *idea* [ἰδέα] (from *idein* [ἰδεῖν], the aorist of *horaô* [ὁράω], "to see"), which—in a running set of exchanges and cross-references with the closely related term *eidos* [εἶδος]—means "visible form, aspect," and later "distinctive form, essence."

   See SPECIES for analysis of the respective networks of the Latin and the Greek (cf. *FORM*).

2. The word has since Plato been one of the key terms of ontology, constantly invested with different meanings in different languages (*idée* in French, *Idee* in German, and so on), and by different philosophies, at the junction between objectivity (the "Idea" in Plato and Hegel) and subjectivity ("Ideas" in Locke and Kant), a crossing point that is expressed, for example, by the notion of the "objective reality of the idea" in Descartes (see REALITY, III).

See ERSCHEINUNG, ESSENCE, ESTI, REALITY, RES, TO TI ÊN EINAI, UNIVERSALS; and CONSCIOUSNESS, SOUL; cf. CONCEPTUS, PERCEPTION, REPRÉSENTATION.

II. Idea and Aesthetics

In Aesthetics, of particular importance is the relationship between the surface or image, and the underlying reality or model.

See BEAUTY, CONCETTO, Box 1, DISEGNO, *IMAGE* [BILD, EIDÔLON], MIMÊSIS; cf. ART, PLASTICITY.

➤ *FORM, TO BE*

IDENTITY

"Identity" is derived from *identitas*, which is from the pronoun *idem*, "the same" (no doubt a composite of the demonstrative and of an emphatic particle), which is one of a cluster of late inventions that are untraceable in classical Latin. Even the English and French terms are polysemic, weaving together the notions of "sameness" and of "ipseity": it thus encompasses two distinct terminologies in Latin, which open up particular sets of problems.

I. Identity, Sameness, Ipseity

1. In accordance with its Latin etymology, "identity" denotes first of all something that is indiscernible, the "same," in the sense of "the same as," or "identical to," *idem*. The Greek expresses this identity-indiscernibility with the term *ho autos* [ὁ αὐτός], *to auto* [τὸ αὐτό], with the article placed in front of the demonstrative.

2. "Identity" also refers to a person, to personal identity: even in the sense of "oneself," ipseity, from the Latin *ipse*, which means "itself," "in person" (*ego ipse*, myself, *moi-même* in French, etc.). The Greek expresses this identity-ipseity using the same demonstrative, *autos* [αὐτός], but without an article, which is sometimes attached to the pronoun: *egô autos* [ἐγὼ αὐτός], like *ego ipse*, "myself in person." This is the meaning of "identity" in "identity card" and "identification procedure."

   See I/ME/MYSELF (for the Greek, see Box 2), *PERSON*, SAMOST', SELBST; cf. ES.

3. On the transition from the ontological register to the transcendental register, in which "reflexive" identity is conceived as the condition of possibility of speaking, see I/ME/MYSELF, SUBJECT, and cf. CONSCIOUSNESS, *PERSON*, SPEECH ACT.

II. The Inextricable Link between the Different Sets of Problems: Essence, Resemblance

Sameness and ipseity are inextricably linked in several essentially philosophical ways:

1. The first way to be oneself is to be verified as being identical to oneself, just as the subject and predicate are in the principle of identity "*a* is *a*," which requires a comparison between two elements that are said ultimately to be one and the same, and indicated either by their

position in the order of the words (see WORD ORDER), or by the presence or absence of an article (see I/ME/MYSELF, Box 2; see also PRINCIPLE, and cf. SUBJECT and PRÉDICABLE, PREDICATION).

2. Ipseity refers to the definition, to the essence, to the idea whereby a thing is what it is. Plato links the question of ipseity and intelligibility together with the question of the resemblance to the model and to the idea: the two senses of identity are thus joined dialectically; see EIDÔLON, MIMÊSIS, SPECIES: cf. BEAUTY. For a broader perspective, see ESSENCE, ESTI, *TO BE,* TO TI ÊN EINAI.

One could compare this to the French, which makes a distinction in word order between "l'homme même" (the very man) and "le même homme" (the same man).

3. In terms of the question of the image, the expression of identity is directly linked to the question of resemblance, and of similitude, sameness, *similis* (Lat.), *homos* [ὁμός] and *homoios* [ὅμοιος] (Gr.), from the Indo-European root **sem,* "one," allowing for attention to be focused on the common points between two entities that remain distinct; in addition to MIMÊSIS and *IMAGE,* see ANALOGY.

The distinction between sameness and ipseity has been particularly rigorous and inventive in English since Locke (sameness/identity): see in particular STAND, where we see the beginning of a new expression of identity in metaphorical terms (the metaphor of "holding oneself up," of "taking a stand," or even the juridical concept of "having standing"), which is shared by English and German, but not French (*se tenir debout*); cf. STANDARD.

4. Finally, we might consider the problematic extension of self-identity as a question of the individual to a question of collective identity, which leads to varying connotations in names of peoples from one language to another; see NAROD and PEOPLE; cf. *FATHERLAND,* HEIMAT.

➤ ACTOR, OBJECT

IL Y A

Il y a expresses the presence of something, or the way in which the world is given. The French turn of phrase is quite idiomatic, especially because of the adverb *y,* which indicates place (but, according to the *Dictionnaire historique de la langue française,* the *y* in the expression *il y a* "has no meaning that can be analyzed"; RT: *DHLF,* s.v.). Other languages use simple or complex expressions that contain either the verb "to have" (*há* in Portuguese, *hay* in Castilian Spanish), "to be" (*esti* [ἐστι] in Greek, *est* in Latin, "there is" in English), "to give" (*es gibt* in German, *dá-se* in Portuguese, *se da* in Castilian), or "to hold" (*tem* in Portuguese, and analogously in Castilian). See ES GIBT, ESTI, HÁ, and SEIN, Box 1. More generally, on the relationship between being and presence, see also *TO BE* [SPANISH], and ERSCHEINUNG, ESSENCE, NATURE, PRESENT, TO TI ÊN EINAI, WELT.

➤ ASPECT, LIGHT, MEMORY.

IMAGE

The English "image" is a calque of the Latin *imago,* which literally denotes a material imitation, particularly effigies of the dead, and which psychoanalysis invests with its own meaning (see EIDÔLON, Box 2). We begin with the Greek, because of the multiplicity of non-synonymous words denoting the image in the language, and with the German, because of the large number of terms that are derived from *Bild.*

I. *Eidôlon*: The Complexity of the Greek Vocabulary of the Image

The Greek names for image always privilege one of its defining or functional characteristics: *eikôn* [εἰκών], "similitude," *phantasma* [φάντασμα], "appearance in light" (see PHANTASIA, IMAGINATION, from *phôs* [φῶς], "light," and LIGHT), *tupos* [τύπος], "imprint, impression," and so on. The entry EIDÔLON, the most general term derived from the verb meaning "to see," and that denotes the image as something visible by which we can see another thing, discusses at greater length the main difficulties of interpretation and translation that have arisen in ontology and optics, via the Arabic (*ma'nā* [المعنى]; see also INTENTION).

Many other Latin terms than *imago* can be translated as "image" (*simulacrum, figura, forma, effigies, pictura, species*). These respond, but do not correspond, to the Greek terms: "species," for example, is the translation that Cicero favors for the Platonic *eidos* [εἶδος], "idea, essence"; but in other philosophical contexts, the word can denote *eidôlon* [εἴδωλον], "image" and "simulacrum." The Latin entry SPECIES discusses the Latin translations of *eidos,* in its pairing with *eidôlon* (see ESSENCE, IDEA).

II. *Bild*: The Large Number of German Derivations

The entry for the German BILD discusses a network of terms that are systematically connected to each other, and that allow us to articulate the relationship of the image to its model: *Urbild/Abbild* (model/copy), *Gleichbild* (a copy that is a good likeness), *Nachbild* (ectype), which can be considered in light of the Hebrew terms in Genesis (*ṣèlèm* [צֶלֶם], *demūt* [דְמוּת]). This exceptionally broad constellation includes *Einbildungskraft,* the imagination as the faculty by which one forms images (see *IMAGINATION*), and *Bildung,* education (see BILDUNG, CIVILIZATION, CULTURE).

III. The Complexity of the Problems

1. The aesthetic dimension of the image is discussed in the entry MIMÊSIS, "imitation/representation" (see *IMITATION*); see also DESCRIPTION, TABLEAU.

2. On the literary and rhetorical dimension of the image, see EIDÔLON, Box 1, and COMMONPLACE, COMPARISON; see also ARGUTEZZA, CONCETTO, INGENIUM.

3. On the possibility of a theology and a politics based on the image as the visible trace of the invisible, see OIKONOMIA (and ECONOMY).

4. On the ontology of being and appearing, see *APPEARANCE,* DOXA, ERSCHEINUNG.

5. On the logic of truth as resemblance and similitude, see *FICTION,* TRUTH.

6. On the cognitive dimension of the image, see REPRÉSENTATION; see also PERCEPTION, SENSE.

IMAGINATION

The English "imagination" comes from the relatively obscure imperial Latin word *imaginatio* (itself derived from *imago*, whose principal meaning is "effigy, portrait"; see *IMAGE*), whereas the Greek root, *phantasia* [φαντασία] (from *phôs* [φῶς], "light"), evolved in the sense of "fantasy, phantasm" (see PHANTASIA, Box 3, for the psychoanalytic lexicon).

I. The Tension between Production and Reproduction

The difference between *phantasia* and *imaginatio*, as shown by the difficulties experienced in translating the Greek into Latin, is the difference between the creative force of apparitions (PHANTASIA, see DOXA and ERSCHEINUNG) and the reproductive faculty of images (see EIDÔLON, MIMÊSIS, and REPRÉSENTATION), each of these terms also itself being internally distressed by this tension and the value judgments that come with it.

On the Scholastic tradition, based on Avicenna's translations of Arabic philosophy, see SENSUS COMMUNIS [COMMON SENSE and *SENS COMMUN*]; cf. INTENTION.

The pair *phantasia* and *imaginatio* is put to work in different ways in the German tradition (*Phantasie/Einbildungskraft*, see BILD and BILDUNG; here we must take into account the extraordinary richness of the family of words that places the image and the imagination on the side of education and culture), and in the English tradition, which tends in contrast to differentiate the power to produce fictions depending upon the extent to which it is arbitrary or necessary (FANCY, see also *FICTION*).

II. The Imagination as a Faculty: Aesthetics and Epistemology

This same tension determines the place of the imagination in the play of faculties and the modalities of being in the world. Is the imagination a faculty that is necessary for the exercise of the other faculties, operating somewhere between passivity (see AESTHETICS, FEELING, PATHOS; cf. SENSE) and activity (see *REASON*; cf. INTELLECT, INTELLECTUS, INTENTION, *INTUITION,* MEMORY, SOUL, UNDERSTANDING)? Or is it rather, as Blaise Pascal puts it, a "mistress of error and falsity" (*Pensées*, frag. 41; see TRUTH)?

1. BILD discusses the difference that Immanuel Kant places at the heart of the *Critique of Pure Reason*, between a "reproductive" empirical imagination and a transcendental imagination that "produces" the schemata, and is thus the condition of possibility of our representations.
2. Prior to and beyond the critical distinctions between concept and intuition, image and idea, the Italian tradition insists on the metaphorical capacity of images and of the imagination in art and in thought (see ARGUTEZZA, CONCETTO, DISEGNO; cf. BEAUTY, INGENIUM).

IMITATION

"Imitation" is borrowed from the derived Latin term *imitatio* (imitation, copy, faculty of imitating). It is one of the major possible translations of the Greek *mimêsis* [μίμησις] (see MIMÊSIS), besides representation (see REPRÉSENTATION). *Mimêsis*, which endured as the key term of aesthetic questions since Plato and Aristotle, is in fact understood sometimes as resemblance, in terms of a pictorial model (and is in that sense associated with image; see *IMAGE* [BILD, EIDÔLON] and *IMAGINATION*), and sometimes as representation, drawing most proximately on theatrical models (see ACTOR).

I. Imitation and Reproduction

See ART, MANIERA, TABLEAU.
Cf. BEAUTY, DISEGNO, GOÛT.

II. Imitation, Logic, Rhetoric

See ANALOGY, COMPARISON, DESCRIPTION, ERZÄHLEN.
Cf. *FICTION, POETRY,* TRUTH.

IMPLICATION

ENGLISH	entailment, implicature
FRENCH	*implication*
GERMAN	*nachsichziehen, zurfolgehaben, Folge(-rung), Schluß, Konsequenz, Implikation, Implikatur*
GREEK	*sumpeplegmenon* [συμπεπλεγμένον], *sumperasma* [συμπέρασμα], *sunêmmenon* [συνημμένον], *akolouthia* [ἀκολουθία], *antakolouthia* [ἀντακολουθία]
LATIN	*illatio, inferentia, consequentia*

➤ ANALOGY, PROPOSITION, SENSE, SUPPOSITION, TRUTH

Implication denotes, in modern logic, a relation between propositions and statements such that, from the truth-value of the antecedent (true or false), one can derive the truth of the consequent. More broadly, "we can say that one idea implies another if the first idea cannot be thought without the second one" (RT: Lalande, *Vocabulaire technique et critique de la philosophie*). Common usage makes no strict differentiation between "to imply," "to infer," and "to lead to." The verb "to infer," meaning "to draw a consequence, to deduce" (a use dating to 1372), and the noun "inference," meaning "consequence" (from 1606), do not on the face of it seem to be manifestly different from "to imply" and "implication." Indeed, nothing originally distinguished "implication" as Lalande defines it—"a logical relation by which one thing implies another"—from "inference" as it is defined in Diderot and d'Alembert's *Encyclopédie* (1765): "A logical operation by which one accepts a proposition because of its connection to other propositions held to be true." The same phenomenon can be seen in German, in which the terms corresponding to "implication" (*Nachsichziehen, Zurfolgehaben*), "inference" ([*Schluß*]-*Folgerung, Schluß*), "to infer" (*schließen*), "consequence" (*Folge*[-*rung*], *Schluß, Konsequenz*), "reasoning" ([*Schluß-*]*Folgerung*), and "to reason" (*schließen, Schlußfolgerungen ziehen*) intersect or overlap to a large extent.

The history of the French verb *impliquer*, however, reveals several characteristics that the term does not share with "to infer" or "to lead to." First of all, it was originally (1663) connected to the notion of contradiction, as shown in the use of *impliquer* in *impliquer contradiction,* in the sense of "to be contradictory." This connection does not, however, explain how *impliquer* has passed into its most commonly accepted meaning—"implicitly entail"—in the logical sense of "to lead to a consequence." Indeed, these two senses constantly interfere with one another in European philosophical languages, which

certainly poses a number of difficult problems for translators. The same phenomenon can be found in the case of the English verb "to import," commonly given as a synonym for "to mean" or "to imply," but often wavering instead, in certain cases, between "to entail" and "to imply." In French, the noun itself is generally left as it is (*import existentiel*, see SENSE, Box 4). The French *importer* (as used by Rabelais, 1536), "to necessitate, to entail," formed via the Italian *importare* (as used by Dante), from the Old French *emporter*, "to entail, to have as a consequence," dropped out of usage, and was brought back through English. The nature of the connection between the two primary meanings of *impliquer* (or of *implicare* in Italian), "to entail implicitly" and "to lead to a consequence," nonetheless remains obscure. Another difficulty is understanding how the transition occurs from *impliquer*, "to lead to a consequence," to "implication," "a logical relation in which one statement necessarily supposes another one," and how we can determine what in this precise case distinguishes "implication" from "presupposition."

We therefore need to be attentive to what is implicit in *impliquer* and "implication," to the dimension of the *pli* (pleat or fold), of the *repli* (folding back), and of the *pliure* (folding), in order to separate out "imply," "infer," "lead to," or "implication," "inference," "consequence"—which requires us to go back to Latin, and especially to medieval Latin. Once we have clarified the relationship between the modern sense of "implication" and the medieval sense of *implicatio*, we will be able to examine certain derivations (*implicature*) or substitutes ("entailment") of terms related to the field of *implicatio*, assuming that it is difficulties with the concept of implication (the paradoxes of material implication) that have given rise to newly coined words corresponding to the original logical attempts. Finally, this whole set of difficulties becomes clearer as we go further upstream, using the same vocabulary of implication, through the conflation of several heterogeneous logical gestures that come from an entirely different systematics in Aristotle and the Stoics.

I. The Vocabulary of Implication and the *Implicatio*

A number of different terms in medieval Latin can express in a more or less equivalent manner the relationship between propositions and statements such that, from the truth-value of the antecedent (true or false), one can derive the truth-value of the consequent: *illatio*, *inferentia*, *consequentia*. Peter Abelard makes no distinction in using the terms *consequentia* for the hypothetical "*si est homo est animal*" (*Dialectica*, 473) and *inferentia* for "*si non est iustus homo, est non-iustus homo*" (ibid., 414). It is certainly true that: (1) *illatio* appears above all in the context of the *Topics*, and denotes more specifically a reasoning (*argumentum* in Boethius), allowing for a consequence to be drawn from a given place (for example, "*illatio a causa, illatio a simili, illatio a pari, illatio a partibus*"); (2) *consequentia* sometimes has a very general sense, as in "*consequentia est quaedam habitudo inter antecedens et consequens*" (De Rijk, *Logica modernorum*, 2.1:38), and is in any case present in the expressions *sequitur* and *consequitur* (to follow, to ensue, to result in); (3) *inferentia* frequently appears, by contrast, in the context of the *Peri hermêneias*, whether it is as part of the square of oppositions, in order to explain the "law" of opposite, subcontrary, contradictory, or subalternate propositions (*Logica modernorum*, 2.1:115), or whether it is in order to determine the rules for converting propositions (ibid., 131–39). Nevertheless, it is one of these three terms (or other related terms) that in the Middle Ages expresses the logical relationship of implication, and not the

terms from the *implicatio* family. In short, *implicatio* does not originally refer to implication.

In the twelfth century, a number of treatises were developed on the "implicits" (*tractatus implicitarum*) that studied the logico-semantic properties of propositions said to be *implicationes*, or relative propositions. The term *implicitus*, the past participle of the verb *implico*, was used in classical Latin in the sense of "to be joined, mixed, enveloped," and the verb *implico* adds to these senses the idea of "unforeseen difficulty" (*impedire*) and even of "deceit" (*fallere*). The source of the logical usage of the term is a passage from *De interpretatione* on the contrariety of propositions (14.23b25–27), in which *implicitus* renders the Greek *sumpeplegmenê* [συμπεπλεγμένη], a term formed from *sumplekô* [συμπλέκω], "to bind together," from the same family as *sumplokê* [συμπλοκή], which since Plato (*Politics* 278b; *Sophist* 262c) has referred to the combination of letters that make up a word, and the interrelation of noun and verb that makes up a proposition:

> Aristotle: hê de tou hoti kakon to agathon sumpeplegmenê estin; kai gar hoti ouk agathon anagkê isôs hupolambanein ton auton [ἡ δὲ τοῦ ὅτι κακὸν τὸ ἀγαθὸν συμπεπλεγμένη ἐστίν· καὶ γὰρ ὅτι οὐκ ἀγαθὸν ἀνάγκη ἴσως ὑπολαμβάνειν τὸν αὐτόν].
>
> (*De interpretatione* [*Peri hermêneias*] 23b25–27)

> Boethius: Illa vero quae est "quoniam malum est quod est bonum" implicata est: et enim quoniam non bonum est necesse est idem ipsum opinari.
>
> (*Aristoteles latinus*, 2.1–2, p. 36, 4–6)

> Jules Tricot: Quant au jugement "le bon est mal," ce n'est en réalité qu'une combinaison de jugements, cars sans doute est-il nécessaire de sous-entendre en même temps "le bon n'est pas le bon."
>
> (Trans. Tricot, 141)

> J. L. Ackrill: The belief that the good is bad is complex, for the same person must perhaps suppose also that it is not good.
>
> (Trans. Ackrill, 66; cf. his perplexed commentary, 154–55)

Aristotle wishes here to define the contrariety between two statements or opinions. Starting from the principle that a maximally false proposition set in opposition to a maximally true proposition deserves the name "contrary," Aristotle demonstrates in successive stages that "the good is good" is a maximally true proposition, since it applies to the essence of good, and predicates the same of the same (which the proposition "the good is the not-bad" does not do, since it is only true by accident); and that the maximally false proposition is one that entails the negation of the same attribute, namely, "the good is not good." The question then is one of knowing whether "the good is bad" also deserves to be called contrary. Aristotle replies that this proposition is not the maximally false proposition opposed to the maximally true proposition. Indeed, "the good is

bad" is *sumpeplegmenê*. This term condenses all of the moments of the transition from the simple idea of a container, to the "modern" idea of implication or of presupposition. For Boethius, the proposition is *duplex*, or equivocal: it has a double meaning, "because it contains within itself [*continet in se, intra se*]: *bonum non est*"; and Boethius concludes that only two "simple" propositions can be said to be contrary (*Commentarii in librum Aristotelis Peri hermêneais*, 1st ed., 219). This latter thesis is consistent with Aristotle's, for whom only "the good is not good" (simple proposition) is the opposite of "the good is good" (simple proposition). However, the respective analyses of "the good is bad," a proposition that Boethius calls *implicita*, are manifestly not the same: indeed, for Aristotle, the "doxa hoti kakon to agathon [δόξα ὅτι κακὸν τὸ ἀγαθόν]," the opinion according to which the good is bad, is only contrary to "the good is good" to the extent that it "contains" (in Boethius's terms) "the good is not good"; whereas for Boethius, it is to the extent that it contains *bonum non est*—a remarkably ambiguous expression in Latin (it can mean "the good is not," "there is nothing good," and even, in the appropriate context, "the good is not good"). Abelard goes in the same direction as Aristotle: "the good is bad" is "implicit" with respect to "the good is not good." He explains clearly the meaning of the term *implicita*: "That is to say, implying 'the good is not good' within itself, and in a certain sense containing it [*implicans eam in se, et quodammodo continens*]" (*Glossa super Periermeneias*, 99–100). But he adds, as Aristotle did not: "Because whoever thinks that 'the good is bad' also thinks that 'the good is not good,' whereas the reverse does not hold true [*sed non convertitur*]." This explanation is decisive for the history of implication, since one can certainly express in terms of "implication" in the modern sense what Abelard expresses when he notes the nonreciprocity of the two propositions (one can say that "the good is bad" implies or presupposes "the good is not good," whereas "the good is not good" does not imply "the good is bad"). Modern translations of Aristotle inherit these difficulties. Boethius and Abelard bequeath to posterity an interpretation of the passage in Aristotle according to which "the good is bad" can only be considered the opposite of "the good is good" insofar as, an "implicit" proposition, it contains the contradictory meaning of "the good is good," namely, "the good is not good." It is the meaning of "to contain a contradiction" that, in a still rather obscure way, takes up this analysis by specifying the meaning of *impliquer*. In any case, the first attested use in French of the verb is in 1377 in Oresme, in the syntagm *impliquer contradiction* (RT: *DHLF*, 1793).

These same texts give rise to another analysis in the second half of the twelfth century: a *propositio implicita* is a proposition that "implies," that is, that contains two propositions called *explicitae*, and that are its equivalent when paraphrased. Thus, "*homo qui est albus est animal quod currit*" (A man who is white is an animal who runs) contains the two explicits, "homo est albus" and "animal currit." Only by "exposing" or "resolving" (*expositio, resolutio*) such an *implicita* proposition can one assign it a truth-value:

Omnis implicito habet duas explicitas. . . . Verbi gratia: *Socrates est id quod est homo*, haec implicita aequivalet huic copulativae constanti ex explicitis: *Socrates est aliquid est illud est homo*, haec est vera, quare et implicita vera.

Every "implicit" has two "explicits." . . . For example: "Socrates is that which is a man," this "implicit" is equivalent to the following conjunctive proposition made up of two "explicits": "Socrates is something and that is a man"; this latter proposition is true, so the "implicit" is also true.

"Materials for a Study," 43)

</div>

The "contained" propositions are usually relative propositions, which are called *implicationes*, and this term remains, even though the name *propositio implicita* becomes increasingly rare, perhaps because they are subsequently classified within the larger category of "exponible" propositions, which need precisely to be "exposed" or paraphrased for their logical structure to be highlighted. In the treatises of Terminist logic, one chapter is devoted to the phenomenon of *restrictio*, a restriction in the denotation or the *suppositio* of the noun (see SUPPOSITION). Relative expressions (*implicationes*), along with others, have a restrictive function (*vis, officium implicandi*), just like adjectives and participles: in "a man who argues runs," the term "man," because of the relative expression "who runs," is restricted to denoting the present—moreover, according to grammarians, there is an equivalence between the relative expression "qui *currit*" and the participle *currens* (*Summe metenses*, ed. De Rijk, in *Logica modernorum*, 2.1:464). In the case in which a relative expression is restrictive, its function is to "leave something that is constant [*aliquid pro constanti relinquere*]," that is, to produce, in modern terms, a preassertion that conditions the truth of the main assertion without being its primary object. This is expressed very clearly in the following passage from a thirteenth-century logical treatise:

Implicare est pro constanti et involute aliquid significare. Ut cum dicitur homo qui est albus currit. "Pro constanti" dico, quia praeter hoc quod assertitur ibi cursus de homine, aliquid datur intelligi, scilicet hominem album; "involute" dico quia praeter hoc quod ibi proprie et principaliter significatur hominem currere, aliquid intus intelligitur, scilicet hominem esse album. Per hoc patet quod implicare est intus plicare. Id enim quod intus plicamus sive ponimus, pro constanti relinquimus. Unde implicare nil aliud est quam subiectum sub aliqua dispositione pro constanti relinquere et de illo sic disposito aliquid affirmare.

"To imply" is to signify something by stating it as constant, and in a hidden manner. For example, when we say "the man who is white runs." I say "stating it as constant" because, beyond the assertion that predicates the running of the man, we are given to understand something else, namely that the man is white; I say "in a hidden manner" because, beyond what is signified primarily and literally, namely that the man is running, we are given to understand something else within (*intus*), namely that the man is white. It follows from this that *implicare* is nothing other than *intus plicare*

("folded within"). What we fold or state within, we leave as a constant. It follows from this that "to imply" is nothing other than leaving something as a constant in the subject, such that the subject is under a certain disposition, and that it is under this disposition that something about it is affirmed.

(*De implicationibus*, ed. De Rijk, in "Some Notes," 100)

N.B. Giusberti ("Materials for a Study," 31) always reads *pro constanti*, whereas the manuscript edited by De Rijk sometimes has *pro contenti*, and sometimes *precontenti*, this latter term attested nowhere else.

This is truly an example of what the 1662 *Logic* of Port-Royal will describe as an "incidental assertion."

The situation is even more complex, however, insofar as this operation only relates to one usage of a relative proposition, when it is restrictive. A restriction can sometimes be blocked, and the logical reinscriptions are then different for restrictive and nonrestrictive relative propositions. One such case of a blockage is that of "false implications," as in "a [or the] man who is a donkey runs," where there is a conflict (*repugnantia*) between what the determinate term itself denotes (man) and the determination (donkey). The truth-values of the propositions containing relatives thus differ according to whether they are restrictive, and of composite meaning—(a) "*homo qui est albus currit*" (A man who is white runs)—or nonrestrictive, and of divided meaning—(b) "*homo currit qui est albus*" (A man, who is white, is running). When the relative is restrictive, as in (a), the implicit only produces one single assertion, as we saw (since the relative corresponds to a pre-assertion), and is thus the equivalent of a hypothetical. Only in the second case can there be a "resolution" of the implicit into two explicits—(c) "*homo currit,*" (d) "*homo est albus*"—and a logical equivalence between the implicit and the conjunction of the two explicits—(e) "*homo currit et ille est albus*"; so it is only in this instance that one can say, in the modern sense, that (b) implies (c) and (d), and therefore (e).

■ See Box 1.

II. "Implication"/"Implicature"

The term "implicature" was introduced in 1967 by H. P. Grice in the William James Lectures (Harvard), which he delivered under the title "Logic and Conversation." These lectures set out the basis of a logical approach to communication, that is, logical relations in conversational contexts. The need was felt for a term that is distinct from "implication," insofar as "implication" is a relation between propositions (in the logical sense), whereas "implicature" is a relation between statements, within a given context. "Implication" is a relation bearing on the truth or falsity of propositions, whereas "implicature" brings an extra meaning to the statements it governs. Whenever "implicature" is determined according to its context, it enters the field of pragmatics, and therefore has to be distinguished from presupposition.

Logical implication is a relation between two propositions, one of which is the logical consequence of the other. The English equivalent of "logical implication" is "entailment." This word is derived from "tail" (Old French *taille*; Middle English *entaill* or *entailen* = en + tail), and prior to its

logical use, the meaning of "entailment" is "restriction," "tail" having the sense of "limitation." An entailment was originally a limitation on the transfer or handing down of a property or an inheritance. The two senses of entailment have two elements in common: (a) the handing down of a property; and (b) the limitation on one of the poles of this transfer. In logical "entailment," a property is transferred from the antecedent to the consequent, and normally in semantics, the limitation on the antecedent is stressed. One might thus advance the hypothesis that the mutation from the juridical sense to the logical sense occurred by analogy on the basis of these common elements.

In logic, one makes a distinction between material implication and formal implication. Material implication ("if . . . then . . . ," symbolized by ⊃), also called Philonian implication (because it was formalized by Philo of Megara), is only false when the antecedent is true and the consequent false. In terms of a formalization of communication, this has the flaw of bringing with it a counterintuitive semantics, since a false proposition implies materially any proposition: "If the moon is made of green cheese, then 2 + 2 = 4!" The "*ex falso quodlibet sequitur,*" which is how this fact is expressed, has a long history going back to antiquity (for the Stoics and the Megarian philosophers, it is the difference between Philonian implication and Diodorean implication): it traverses the theory of consequences in the Middle Ages, and is one of the paradoxes of material implication that is perfectly summed up in these two rules of Jean Buridan: (1) if P is false, Q follows from P; (2) if P is true, P follows from Q (Bochenski, *History of Formal Logic*, 208). Formal implication (see Russell, *Principles of Mathematics*, 36–41) is a universal conditional implication: $\{\forall x\, (Ax \supset Bx)\}$ (for any x, if Ax, then Bx).

Different means of resolving the paradoxes of implication have been used. Lewis's "strict implication" (Lewis and Langford, *Symbolic Logic*) is defined as an implication that is reinforced such that it is impossible for the antecedent to be true and the consequent false, yet it has the same flaw as material implication (an impossible—that is, necessarily false—proposition strictly implies any proposition). The relation of entailment introduced by Moore in 1923 is a relation that avoids these paradoxes by requiring a logical derivation of the antecedent from the consequent (in this case, "if 2 + 2 = 5, then 2 + 3 = 5" is false, since the consequent cannot be logically derived from the antecedent). Occasionally, one has to call upon the pair "entailment"/"implication" in order to distinguish between an implication in the sense of material implication and an implication in George Moore's sense, which is also sometimes called "relevant implication" (Anderson and Belnap, *Entailment*), to ensure that the entire network of terms is covered.

Along with this first series of terms in which "entailment" and "implication" alternate with one another, there is a second series of terms that contrasts two kinds of "implicature." The word "implicature" (French *implicature*, German *Implikatur*) is formed from "implication" and the suffix –*ture*, which expresses a resultant aspect (for example, "signature"; cf. Latin *temperatura*, from *temperare*). "Implication" is derived from "to imply" and "implicature" from "to implicate" (from the Latin *in* + *plicare*, from *plex*; cf. the Indo-European *plek*), which has the same meaning.

1

The Greek vocabulary of implication: Disparity and systematicity

The word *implication* in French covers and translates an extremely varied Greek vocabulary that bears the mark of heterogeneous logical and systematic operations, depending on whether one is dealing with Aristotle or the Stoics.

The passage through medieval Latin allows us to understand retrospectively the connection in Aristotelian logic between the *implicatio* of the implicits (*sumplegmenê*, as an interweaving or interlacing) and conclusive or consequential implication, *sumperasma* [συμπέρασμα] in Greek (or *sumpeperasmenon* [συμπεπερασμένον], *sumpeperasmenê* [συμπεπερασμένη], from *perainô* [περαίνω], "to limit"), which is the terminology used in the *Organon* to denote the conclusion of a syllogism (*Prior Analytics* 1.15.34a21–24: if one designates as *A* the premise [*tas protaseis* (τὰς προτάσεις)] and as *B* the conclusion [*to sumperasma* (συμπέρασμα)]). When Tricot translates Aristotle's famous definition of the syllogism at *Prior Analytics* 1.1.24b18–21, he chooses to render as the French noun *consequence* Aristotle's verbal form *sumbainei* [συμβαίνει], that which "goes with" the premise and results from it.

> A syllogism is a discourse [*logos* (λόγος)] in which, certain things being stated, something other than what is stated necessarily results simply from the fact of what is stated. *Simply from the fact of what is stated*, I mean that it is because of this that the **consequence** is obtained [*legô de tôi tauta einai to dia tauta sumbainei* (λέγω δὲ τῷ ταῦτα εἶναι τὸ διὰ ταῦτα συμβαίνει)].
>
> (Ibid., 1.1, 24b18–21; italics J. Tricot, bold B. Cassin)

To make the connection with the modern sense of *implication*, though, we also have to take into account, as is most often the case, the Stoics' use of the same terms. What the Stoics call *sumpeplegmenon* [συμπεπλεγμένον] is a "conjunctive" proposition; for example: "And it is daytime, and it is light" (it is true both that *A* and that *B*). The conjunctive is the third type of nonsimple proposition, after the "conditional" (*sunêmmenon* [συνημμένον]; for example: "If it is daytime, then it is light")

and the "subconditional" (*parasunêmmenon* [παρασυνημμένον]; for example: "Since it is daytime, it is light"), and before the "disjunctive" (*diezeugmenon* [διεζευγμένον]; for example: "Either it is daytime, or it is night") (Diogenes Laertius 7.71–72; cf. RT: Long and Sedley, *The Hellenistic Philosophers*, A35, 2:209 and 1:208). One can see that there is no implication in the conjunctive, whereas there is one in the *sunêmmenon* in "if . . . then . . . ," which constitutes the Stoic expression par excellence (and as distinct from the Aristotelian syllogism). Indeed, it is around the conditional that the question and the vocabulary of implication opens out again. The Aristotelian *sumbainein* [συμβαίνειν], which denotes the accidental nature of a result, however clearly it has been demonstrated (and we should not forget that *sumbebêkos* [συμβεβηκός] denotes accident; see SUBJECT, I), is replaced by *akolouthein* [ἀκολουθεῖν] (from the copulative *a-* and *keleuthos* [κέλευθος], "path" [RT: Chantraine, *Dictionnaire étymologique de la langue grecque*, s.v. ἀκόλουθος]), which denotes instead being accompanied by a consequent conformity: This connector (that is, the "if") indicates that the second proposition ("it is light") follows (*akolouthei* [ἀκολουθεῖ]) from the first ("it is daytime") (Diogenes Laertius, 7.71). Attempts, beginning with Philo or Diodorus Cronus and continuing to the present day, to determine the criteria of a "valid" conditional (*to hugies sunêmmenon* [τὸ ὑγιὲς συνημμένον] offer, among other possibilities, the notion of *emphasis* [ἔμφασις], which Long and Sedley translate as "entailment" and Brunschwig and Pellegrin as "implication" (Sextus Empiricus, *The Skeptic Way*, in RT: Long and Sedley, *The Hellenistic Philosophers*, 35B, 2:211 and 1:209), a term that is normally used to refer to a reflected image and to the force, including rhetorical force, of an impression. Elsewhere, "emphasis" is explained in terms of *dunamis* [δύναμις], of "virtual" content ("When we have the premise which results in a certain conclusion, we also have this conclusion virtually [*dunamei* (δυνάμει)] in the premise, even if it is not explicitly indicated [*kan kat' ekphoran mê legetai* (κἂν κατ᾽ ἐκφορὰν μὴ λέγεται)], Sextus Empiricus, *Against*

the Grammarians 8.229ff., trans. D. L. Blank, 49 = RT: Long and Sedley, *The Hellenistic Philosophers*, G36 (4), 2:219 and 1:209)—where connecting the different meanings of "implication" creates new problems.

One has to understand that the type of logical implication represented by the conditional implies, in the double sense of "contains implicitly" and "has as its consequence," the entire logical, physical, and moral Stoic system. It is a matter of *to akolouthon en zôêi* [τὸ ἀκόλουθον ἐν ζωῇ], "consequentiality in life," as Long and Sedley translate it (Stobeus 2.85.13 = RT: Long and Sedley, *The Hellenistic Philosophers*, 59B, 2:356; Cicero prefers *congruere*, *De finibus* 3.17 = RT: Long and Sedley, *The Hellenistic Philosophers*, 59D, 2:356). It is the same word, *akolouthia* [ἀκολουθία], that refers to the conduct consequent upon itself that is the conduct of the wise man, the chain of causes defining will or fate, and finally the relationship that joins the antecedent to the consequent in a true proposition.

Victor Goldschmidt, having cited Émile Bréhier (in *Le système stoïcien*, 53 n. 6), puts the emphasis on *antakolouthia* [ἀντακολουθία], the neologism coined by the Stoics that one could translate as "reciprocal implication," and that refers specifically to the solidarity of virtues (*antakolouthia tôn aretôn* [ἀντακολουθία τῶν ἀρετῶν], Diogenes Laertius 7.125; Goldschmidt, *Le système stoïcien*, 65–66) as a group that would be encompassed by dialectical virtue, immobilizing *akolouthia* in the absolute present of the wise man. "Implication" is, in the final analysis, from then on, the most literal name of the system as such.

The Gricean concept of "implicature" is an extension and modification of the concept of presupposition, which differs from material implication in that the negation of the antecedent implies the consequent (the question "Have you stopped beating your wife?" presupposes the existence of a wife in both cases). In this sense, implicature escapes the paradoxes of material implication from the outset. Grice distinguishes

two kinds of implicature, conventional and conversational. Conventional implicature is practically equivalent to presupposition, since it refers to the presuppositions attached by linguistic convention to lexical items or expressions. For example, "Mary even loves Peter" has a relation of conventional implicature to "Mary loves other entities than Peter." This is equivalent to: "'Mary even loves Peter' presupposes

'Mary loves other entities than Peter.' " With this kind of implicature, we remain within the lexical, and thus the semantic, field. Conventional implicature, however, is different from material implication, since it is relative to a language (in the example, the English for the word "even"). With conversational implicature, we are no longer dependent on a linguistic expression, but move into pragmatics (the theory of the relation between statements and contexts). Grice gives the following example: If, in answer to someone's question about how *X* is getting on in his new job, I reply, "Well, he likes his colleagues, and he's not in prison yet," what is implied pragmatically by this assertion depends on the context (and not on a linguistic expression). It is, for example, compatible with two very different contexts: one in which *X* has been trapped by unscrupulous colleagues in some shady deal, and one in which *X* is dishonest and well known for his irascible nature.

IN SITU (LATIN)

ENGLISH	site-specific, in place
FRENCH	*sur place, dans son site, in situ*

➤ *LIEU* and ART, CONCETTO, MOMENT, WORK

In common usage in archeology, the Latin phrase *in situ* was adopted at the end of the 1960s and during the 1970s by critics and artists to refer to a basic trait of a large number of works that were not only produced for a particular site but also designed with the physical, institutional, and symbolic characteristics of the place in mind—galleries, museums, public spaces, or even natural spaces, sometimes very remote, as was often the case for the American earthworks (the creators of which also used the expression "site-specific"), or in the work of Christo and Jeanne-Claude. Understood in this sense, *in situ* has since become part of the vocabulary of aesthetics and criticism.

For archeologists, *in situ* applies to two distinct levels of reality: (1) To an object when it is discovered in the supposed site of its original use. If this is the case, its situation, especially the object's physical relation to the other traces of the past that accompany it, is crucial in clarifying its function and its meaning. (2) To the mode of presentation of the vestiges of the past on the very site of their discovery, in other words, a museographical organization that facilitates the visitors' understanding.

In its aesthetic sense, *in situ* combines the two meanings of its use in archeology. The work *in situ*, constructed in function of the place, has to be viewed on site, and it acquires its full significance in the dialectical relation that it enters into with the place where it is installed. Thus the notion of *in situ* is an assault on one of the fundamental principles of traditional aesthetics, the notion of the autonomy of the work of art. This autonomy, once considered as a sign of freedom that allowed the cultural object or the commemorative monument, for example, to acquire a properly aesthetic dignity, legitimated the existence of the museum as a place where a miscellany of objects torn from their original context were gathered together. It is no coincidence, then, that the term *in situ* became more widely used in the 1970s, when many artists developed a range of strategies for contesting the logic of the museum. Ever since Daniel Buren's projects and those of Land Art popularized the term, it has been used by artists of all kinds.

INGENIUM (LATIN)

ARABIC	*ḥads* [الحدس]
ENGLISH	wit, humor
FRENCH	*esprit*
GERMAN	*Witz*
GREEK	*euphuia* [εὐφυΐα]
ITALIAN	*ingegno*
SPANISH	*ingenio*

➤ *REASON*, SOUL, *WITTICISM*, and ARGUTEZZA, BAROQUE, COMPARISON, CONCETTO, GEMÜT, GENIUS, INTELLECT, INTELLECTUS, INTENTION, NONSENSE, SIGNIFIER/SIGNIFIED, *SOPHISM*, TALENT

The word *ingenium*, commonly used in Latin during antiquity and in philosophical Latin up to the early modern period, is rich in meaning. Of the Romance languages, only the words *ingegno* in Italian and *ingenio* in Spanish have preserved the essence of this richness. In French the numerous derivations of *ingenium* have retained only a partial or more or less distant relation to its source word, and the term *esprit*, often used as an equivalent, has very particular connotations. The English "wit," and the German *Witz,* both have different etymologies and reproduce only in a rather restricted way the semantic constellation expressed by the Latin word, which thus presents modern translators with literally insurmountable difficulties.

I. *Ingenium, Euphuia*

Ingenium (*in-geno*, *gigno*) is associated with a large Indo-European family of words relating to procreation and birth. Its usage in Latin is spread around four distinct but nonetheless clearly interlinked semantic themes, which are enumerated in Egidio Forcellini's *Totius latinitatis lexicon* (1865). *Ingenium* designates first of all the innate qualities of a thing (*vis, natura, indoles, insita facultas*). Secondly, it is applied to human beings and their natural dispositions, their temperament, the way they are (*natura, indoles, mores*). Then it expresses, among man's natural dispositions, intelligence, skill, inventiveness (*vis animi, facultas insita excogitandi, percipiendi, sloertia, inventio*). Finally it designates, metonymically, persons who are particularly endowed with this faculty (*ingenia* is a synonym for *homines ingeniosi*).

In all of these different uses, *ingenium* expresses, whenever it refers to humans, the innate element within human beings of productivity, of creativity, of the capacity of going beyond and transforming the given, whether it is a matter of intellectual speculation, poetic and artistic creation, persuasive speech, technical innovations, or social and political practices. "It calls," writes Cicero, "for great intelligence [*ingenium*] to separate the mind [*mentem*] from the senses [*a sensibus*] and to sever thought [*cogitationem*] from mere habit" (*Tusculan Disputations* 1: XVI, 41). He elsewhere talks about the *divinum ingenium* that allies men with the gods, but it is in the field of rhetoric that he is most careful to show the importance of *ingenium* as a factor in oratorical invention:

> Since, then, in speaking, three things are requisite for finding argument; genius [*acumen*], method, (which, if we please, we may call art,) and diligence, I cannot but assign the chief place to *ingenium*.

> (Cicero, *On Oratory and Orators*, II, 35, 147–48)

One can see that *ingenium* is assimilated here to its primary quality, *acumen*, a word that designates the acute (*acutus*), penetrating, fine character of something (*acutezza* in Italian and *agudeza* in Spanish are derived from *acutus*, the French equivalent of which is *pointe*, see ARGUTEZZA). What does the action of *ingenium* consist of? Of "leaping over what is at our feet" (*ingenii specimen est quodam transilire ente pedes positum*) in order to grasp the relations, the similarities between things that may be very far from one another. One can understand why the ability to form metaphors, that is, to work with transfers of meanings of words to bring them closer together, is for Cicero one of the privileged manifestations of *ingenium* in the field of persuasive oratory and of poetry.

On this point he is only repeating what Aristotle says about *euphuia* [εὐφυΐα], the "good natural disposition," close to the first meaning of *ingenium*, that is, necessary for finding resemblances and making metaphors:

> But the greatest thing by far is to be a master of metaphor. It is the one thing that cannot be learnt from others; and it is also a sign of genius [εὐφυΐα], since a good metaphor implies an intuitive perception of the similarity in dissimilar: for to make good metaphors is to be good at perceiving resemblances.

> (Aristotle, *Poetics*, 22, 1459a 7)

See COMPARISON, Box 1.

■ See Box 1.

II. The Humanistic and Baroque *Ingenio* and *Ingegno*

The technical significance that the term *ingenium* took on in the field of rhetoric and poetics continues on down the centuries, to the detriment of the richness and depth of the philosophical meaning of this word. Renaissance humanism, however, still attributes to *ingenium* a specific faculty an incomparable power in the field of knowledge and action. The Spaniard Juan Luis Vives wrote, in his *Introductio ad sapientiam* (1524), that *ingenium*, a prerogative of humans, is the "force of intelligence by which our mind examines things one by one, knows what is good to do and what is not." It "is cultivated and refined by means of many arts: it is taught through a broad and admirable knowledge of things, by which it grasps more precisely the natures and values of things one by one."

It has been said that *ingenium*, at the end of the sixteenth century and in the first half of the seventeenth century, had become a mannerist or baroque concept par excellence, with specific reference to authors such as Huarte de San Juan, with his *Examen de ingenios, para las sciencias* (1575); Pellegrini, with *Delle acutezze, che altrimenti spirite, vivezze e concetti, volparmente si appellano* (1630) and *I fonti dell'ingegno ridotti ad arte* (1650); Tesauro, with *Il Canocchiale aristotelico, o sia Idea dell'arguta et ingeniosa elocutione, che serve a tutta l'arte oratoria, lapidaria et simbolica* (1648). For a long time these texts were studied from a purely aesthetic point of view, in relation to the literary trends of Gongorism, Marinism, Concettism, or Preciosity. Looking at them more closely, one can see that the *ingegno* of the Italians and the *ingenio* of the Spanish not only have stylistic and ornamental effects, but also have,

1

Intuition, Arabic *ḥads* (ARABIC [الحدس])

➤ TERM (Box 2)

Aristotle, in discussing scientific knowledge, mentions a capacity he calls "readiness of mind" (*agchinoia* [ἀγχίνοια]), to which he also devotes several lines in his discussion of intellectual virtues (*dianoétiques*) (*Nicomachean Ethics*, VI, 10, 1142b 5; ed., Barnes, vol.2). He defines it as "a talent for hitting upon (*eustokia* [εὐστοχία]) the middle term in an imperceptible time" (*Posterior Analytics*, I, 34, 89b 10ff; ed., Barnes, vol 1). The first Latin translation mistakenly reads *eustochia*, which Thomas Aquinas paraphrases as *bona conjecturatio* (*Commentary on the Nicomachean Ethics*, VI, 8, § 1219). Arabic translators of the *Analytics* have translated this term as *ḏakā* [الذكاء] ("finesse, intelligence"), but explain εὐστοχία by "goodness of the *ḥads* [الحدس]" (Mantiq Aristu [منطق أرسطو], ed. Badawi, p. 426, 5). The passage in the *Nicomachean Ethics* is translated as "wisdom of the intellect" (*ǧawḏaʿīya 'l'aql* [جوذعية العقل] [Aristu, *al-Akhlaq*, 222, 15]). Avicenna discusses *ḥads* on several occasions (cf. Goichon, *Lexique de la langue philosophique d'Ibn Sina*, § 140, p. 65ff) and gives it a major place in his epistemology (cf. Gutas, *Introduction to Reading Avicenna's Philosophical Works*, 161–66). He gives a precise definition of the term: all scientific knowledge is acquired by syllogisms, whose pivot is the middle term. This term can be arrived at through teaching or through "the *ḥads*, [which] is an action of the mind by which [the mind] deduces for itself the middle term." Its teaching, moreover, is itself based in the final analysis on intuitions (al-Šifā, *Avicenna's De Anima, Being the Psychological Part of Kitab al-Shifa*, (vol. 1, part 6). The *ḥads* is thus, on the one hand, the intuition of principles, but it is also the capacity of taking in simultaneously all of the stages of a discursive argumentation. Avicenna thus offers the concept of a knowledge that is neither simply intuitive nor simply discursive but like a discursiveness condensed into a single act of intuition, thereby anticipating Descartes's program (*Regulae*, VII: AT, 10: 387ff)—except that what for Descartes is acquired methodically is for Avicenna an innate gift. For him, whoever possesses *ḥads* has no need of a master and can reinvent all the sciences for himself—which, in fact, is what Avicenna in his autobiography boasts that he has done. This allows him among other things to offer a philosophical theory of prophetic knowledge. The Latin translators render the term *ḥads* on occasion as *subtilitas* but in most cases as *ingenium* (Avicenna Latinus, *Liber sextus de naturalibus*, 152 ff). To describe someone who is very intelligent as a "genius," and to say that a "genius" is like a prophet, is to place oneself within the tradition of Avicenna.

first and foremost, a richness in terms of the order of knowledge and of moral and social existence. Cervantes's titles are characteristically subtle: in *El ingenioso hidalgo don Quijote de la Mancha* (1605) and *El ingenioso caballero don Quijote de la Mancha* (1615), *ingenio* is attributed ironically, as if it were an absurd characterization, to the mad knight, who is nevertheless revealed to embody many of the most prized characteristics of humanist intelligence. Gracián, in *El discreto* (1646), which paints a portrait of the "man of discernment," emphasizes the fact that *ingenio* belongs to the "domain of understanding," and he defines it precisely as the "courage of understanding," his work being the *concepto* that immediately establishes a correlation between phenomena that are distant from one another. Because it spreads a "divine light," *ingenio* thus permits man to "decipher the world," which would otherwise remain mute and unknown.

The last and no doubt greatest representative of the ancient humanist tradition for whom *ingenium* is the human faculty par excellence is Vico, who in *De nostri temporis studiorum ratione* (1709) and *De antiquissima Italorum sapientia* (1710) revives the Ciceronian theory of *ingenium*, contrasting its "topical" fertility to the sterility of Descartes's analytic and deductive method. Finally, in *Scienza nuova* (1725, 1730, 1744), Vico notes first that *ingegno* as a power of the imagination rich in metaphors is what characterizes youth; he then proceeds to give it a central place in the life of nations, especially in the first stages of their development, when men are "poetically" creating their world.

III. The French *Esprit*

In *De ratione*, Vico remarks that "the French, when they wish to give a name to the faculty of the mind that allows one to join together quickly, appropriately and felicitously separate things, which we call *ingegno*, use the word *esprit* (*spiritus*), and they turn this power of the mind that is manifest in synthesis into something quite simple, because their excessively subtle intelligence excels in the finer points of reasoning rather than in synthesis." Whatever the value of this explanation may be, the fact is that the French language, however rich its vocabulary is in words derived from *ingenium* (*ingénieux, ingéniosité, engin, ingénieur, s'ingénier, génie*), has no equivalent of the Latin word, unlike Italian and Spanish. The term *esprit*, whose range of meanings is vast, was used quite early on to translate it, at the cost of a great deal of equivocation, given the vagueness of the French word. The chevalier de Méré, in his *Discours de l'esprit* (1677), for example, writes, "It seems to me that *esprit* consists of understanding things, in being able to consider them from all sorts of perspectives, in judging clearly what they are, and their precise value, in discerning what one thing has in common with, and what distinguishes it from, another, and in knowing the right paths to take in order to discover those that are hidden." He adds that "it is a

great sign of *esprit* to invent Arts and Sciences." And it is clear that the *esprit de finesse* that Pascal, a friend of Méré, contrasts to the Cartesian *esprit de géométrie* has many points in common with the baroque *ingenium*. In the eighteenth century *ingenium* again crops up in the definition that Voltaire gives of *esprit* in the article "Esprit" of the RT: *Encyclopédie* of Diderot and d'Alembert:

Ce mot, en tant qu'il signifie une qualité de l'âme, est un de ces termes vagues, auxquels tous ceux qui les prononcent attachent presque toujours des sens différents. Il exprime autre chose que jugement, génie, goût, talent, pénétration, étendue, grâce, finesse; et il doit tenir de tous ces mérites: on pourrait le définir, raison ingénieuse.

(This word, insofar as it signifies a quality of the soul, is one of those vague terms to which everyone who uses it almost always attaches different meanings. It expresses something other than judgment, genius, taste, talent, penetration, expanse, grace, finesse; and it has all of these merits: one could define it as ingenious reason.)

IV. "Wit" and *Witz*

In English "wit" is generally considered to be the closest equivalent of the Latin *ingenium* (it is important to remember, however, that "wit," like *Witz* in German, comes from a different root than *ingenium* and refers to the notion of knowledge and not "natural talent"). Shaftesbury, writing in a tradition different from rationalist intellectualism, understands "wit" to preserve something of the power of metaphorical invention that the *ingenium* so dear to humanist rhetoric contains.

■ See Box 2.

In fact, there can be no real equivalence of meaning between "wit" and *ingenium*, as demonstrated by the difficulties experienced by Vico's English translators, who propose

---

2

"Wit and/or humor"

"Wit" generally designates a cognitive power that is different from "mind" and is an activity of thought (*esprit*) in which the imagination allows for the enjoyment of ideas, and for a sense of the beauty of ideas. "Wit" thus incorporates "humor," which permits a pleasurable, even eloquent, relationship to thought. Thus, in his *Essay on the Freedom of Wit and Humor*, Shaftesbury analyses a critical operation of the mind (*esprit*) that manifests itself in good humor and on the occasion of pleasant conversation among friends. The difficulty of translating into other languages the terms "wit" and "humor," and of understanding them, and understanding how they are connected, flows not from an aversion to joining together that which is funny and that which has to do with intelligence, but also from the polysemy of the terms: what do the French, for example, make of "humor" when it becomes for them *humour* and refers to what they customarily call *l'humour anglais* (the English sense of humor).

a. "Wit" and "mind"

"Wit" is not "mind." "Mind" refers to the nature of the mind, or intelligence (*esprit*), whereas "wit" refers to a cognitive activity and experience. In Hobbes (*Leviathan*, 134–35), "wit" has the sense of the mind as a power of understanding similarities between things that might seem very distant from one another. "Natural wit" is close to *ingenium*; it is an ability to see resemblances that are rarely noticed. According to Hobbes, "to have a good wit" is different from "to have a good

judgment," since judgment consists of identifying differences and dissimilarities, of using discernment. In *An Essay Concerning Human Understanding*, Locke makes a distinction quite close to Hobbes's distinction between "mind," "wit," and "judgment" (*Essay*, 156). Whereas judgment has an analytic function whose aim is to separate out different ideas, the mind or intelligence (*esprit*) as "wit" quickly and pleasantly joins ideas together: "that entertainment and pleasantry of Wit, which strikes so lively on the Fancy, and therefore so acceptable to all People" (ibid.).

b. "Wit" and *Witz*

"Wit" thus resembles the German *Witz*. The two terms refer to a kind of knowledge (the common root is *wissen*) that is not an analytic discursiveness but demonstrates a creative mind that creates resemblances while being aware of the possibility of the sociability of thought (Lacoue-Labarthe, Nancy, and Lang, *L'Absolu littéraire*, 2; *The Literary Absolute*, 53). "Wit" denotes an individual burst of brilliance that, in addition to its value as entertainment, can produce puns and jokes, which are the singular forms by which wit is expressed.

c. The pleasure of using language

In Hume the effect produced by wit may be said to be the same as that produced by eloquence; both bring pleasure to the use of language (*Treatise of Human Nature*, 611). But the pleasure one takes in "wit" or in eloquence is not of the same type as the pleasure taken

in "good humor." "Good humor" is only immediately pleasant to the person speaking and is only then communicated to others through sympathy. "Wit," by contrast, has an immediate social value that is deployed especially in the pleasures of conversation: "As wisdom and good sense are valued, because they are *useful* to the person possess'd of them; so *wit* and *eloquence* are valued, because they are *immediately agreeable* to others" (ibid.). Finally, "wit" and "humor" are distinguished from "wisdom" and "good sense," which are only of value to the person who possesses them. In the eighteenth century, "humor" is often associated with "wit" to express a way of relating to others in a mode of gaiety, or even through jokes and puns. But "humour," before being translated into French as *humour*, signifies humor understood as temperament [*humeur* in French]: "Indeed, what is that you call wit or humour?" (Shaftesbury, "Exercises," 99). However, according to Samuel Johnson's RT: *Dictionary of the English Language*, "humor" means a "general turn or temper of mind" but also "jocularity, merriment," and he includes in his understanding repartee, happiness, even hilarity. Humor already contains something of what the French call *l'humour anglais*, that is to say, something more than a simple disposition of the mind: a singular way of laughing that is very English, and the translation of which into French merely refers one back to the English word "humor," which remains quite indeterminate for a French person.

(continued)

(continued)

d. The tradition of "wit and/or humor" is split into two moments

"Humor" originally referred to humor as temperament. Good humor is when humor as temperament is converted into a joyful disposition. In his *Essay on the Freedom of Wit and Humour*, Shaftesbury proposed subjecting the realm of truth to laughter:

> Truth, 'tis suppos'd, may bear all Lights: and one of those principal Lights or natural Mediums, by which Things are to be view'd, in order to a thorow recognition, is Ridicule it-self.
>
> (Shaftesbury, *Characteristics*, 1: 61)

In this theory of the critical use of laughter, "wit" consists in an operation of the mind (*esprit*) in which the commerce of joyful passions depends on a regulated play between wit and humor, on the model of an exchange of ideas that is at once playful, pleasant, and polite:

> Wit will mend upon our hands, and Humour will refine it-self; if we take care not to tamper with it.
>
> (Ibid., 1: 64)

A humor that is not "tampered with" is a humor that does not allow itself to be distorted by melancholy or excessive laughter. "Humor," then, becomes synonymous with other terms often used by Shaftesbury ("raillery," "irony," and "ridicule") but only inasmuch as these words are associated with the possibility of measured and benevolent laughter. "Wit" and "humor" could never include the outrageous comedy of buffoonery and of the burlesque (Shaftesbury, *Characteristics*, 72) that are associated with carnival and cabaret in having entertainment as their sole purpose.

"Humor" in its connection to a physiological disposition comes to mean humor in the second, non-humoral sense. From then on, wit and humor come together to emphasize a remarkable activity of the mind. Humor now forms the basis of the permanent disposition of an individual—we might refer to "a man of great humor." Furthermore, humor produces ambiguous and contradictory figures, as if it never had one single meaning. Alice, in *Alice's Adventures in Wonderland* by Lewis Carroll, is constantly growing bigger and smaller, without ever knowing as she goes through her adventures what it is that makes her bigger or smaller. Could we say that English humor, so difficult to translate in all its figures, is in some sense defined by Lewis Carroll's attempts to show the real world in all of its possibilities simultaneously, creating comic effects by superimposing elements that are logically necessary onto elements that are logically incompatible—and for that reason, unmasterable?

the terms "ingenuity," "invention," "inventiveness," "genius," "perception," and "wit" to try to get close to the semantic richness of *ingegno* in Vico's texts.

The situation is identical in German. It is interesting to see how Kant, in two different contexts, gives two different equivalent terms for the same word, *ingenium*. In the *Critique of Judgment* ("Analytic of the Sublime"), he defines genius (*Genie*) as the "talent (natural gift) [of the mind: *Gemüt, ingenium*] that gives the rule to art" (*Critique of Judgment*, § 46). In the *Anthropology from a Pragmatic Point of View*, after having said that "the faculty of discovering the particular for the universal (the rule) is the power of judgment," he adds that, in the same way, "the faculty of thinking up the universal for the particular is wit (*Witz* [*ingenium*]). . . . The outstanding talent in both is noticing even the smallest similarity or dissimilarity. The faculty to do this is acumen (*Scharfsinn* [*acumen*])" (§ 44). In order to define what he means by *Witz*, Kant therefore has recourse to the vocabulary of classical rhetoric—*ingenium* and its *acumen*. At the same time, while he acknowledges the "richness" of *Witz*, he limits its scope to the anthropological realm of worldly life and assimilates it to "a sort of intellectual luxury," which he contrasts to "the common and healthy form of understanding." French translations of Kant reflect the difficulty of rendering the word *Witz* in this text. Among the recent editions of the *Anthropology*, Michel Foucault's translation of the passage just cited proposes the classic word *esprit* (Kant, *Anthropologie du point de vue pragmatique*, Fr. trans. by M. Foucault, 1970, 71).

Another translation, in order to mark the relationship to *ingenium* that Kant himself indicates, prefers *ingéniosité* (Kant, *Anthropologie du point de vue pragmatique*, Fr. trans. by A. Renault, 1993, 149), while a third gives *combinaison spirituelle* (*Anthropologie du point de vue pragmatique*, Fr. trans. by P. Jalabert, 1986, 1019).

■ See Box 3.

Ingenium is thus a notion that in itself is clear, in spite of its complexity and richness, but that certain national languages—and not minor ones from a philosophical point of view—do not succeed in translating satisfactorily.

Witz according to Freud and his translators

The importance that Freud accorded to the psychic mechanisms of *Witz* belongs manifestly to the semantic field of the *ingenium* of antiquity, organized by the ideas of creativity, acuity, and convention. But since the appearance of the work entitled *Der Witz und seine Beziehung zum Unbewussten* (1905)—which Lacan considered, along with the *Interpretation of Dreams* and the *Psychology of Everyday Life*, as one of the three "canonical" texts of Freud—the translation of *Witz* has caused no end of problems for psychoanalysts. The most recent translation into Castilian Spanish renders *Witz* as *chiste*, "joke." The first French translators of Freud's work, Marie Bonaparte and Marcel Nathan, opted for *mot d'esprit* (*Le mot d'esprit et ses rapports avec l'inconscient*, 1930); Italian similarly translates *Witz* as *motto di spirito* (*Il motto di spirito e la sua relazione con l'inconscio*, trans. S. Daniele and E. Sagittario, 1975). Bonaparte and Nathan's choice was retained by Denis Messier in an excellent new edition in 1988 (*Le mot d'esprit et ses rapports avec l'inconscient*, with a prefatory note by Jean-Bernard Pontalis, in which he discusses the term). This gave rise, it seems, to good deal of hesitation, since Lacan for his part proposed translating *Witz* as *trait d'esprit* (*Écrits*, 1966; see also *Le Séminaire*, bk. 5 (1957–1958), *Les Formations de l'inconscient*, 1998), bringing it closer to another German term, *Blitz*, which refers to a flash of lightning. Moreover, in 1989 the editors of the *Oeuvres complètes de Freud* (Presses Universitaires de France) published the translation of the work on *Witz* in their volume 7 under the title *Le Trait d'esprit*, arguing from the premise that there is supposedly a "Freudian language" that different foreign-language versions have to take into account, especially where *Witz* is concerned. The meaning of *Witz*, they claim, is not *mot d'esprit* but "a characteristic trait of the 'esprit freudien' [Freudian *Witz*]." Confronted by these oppositions and perplexities, certain psychoanalysts have even asked whether it would not be better to give up trying to translate Freud's *Witz* altogether, just as some have become resigned to doing for the typically British term *nonsense* (see J.-B. Pontalis, foreword to Freud, *Le mot d'esprit et ses rapports avec l'inconscient*, 34).

The question of *Witz* also arose among English-language Freudians, occasionally generating a degree of controversy. In 1916 the Austro-Hungarian–born American psychoanalyst Abraham A. Brill published, along with several other projects of this kind, all adjudged to be equally bad, the first translation of Freud's work on *Witz*, a term Brill chose to translate as "wit," without seeing that this would privilege the meaning of "intellectual witticism," as when one says of someone that he is a "man of wit." James Strachey, who set about revising Brill's translations, made clear at the outset his preference for "joke," which by contrast risked extending the intellectual meaning of the Freudian *Witz* to the entire range of comic expressions (plays on words, witticisms, puns, all kinds of jokes, funny stories—particularly Jewish—sallies in the manner of the Italian *scherzo*, etc.). In a preface to his English translation, (*Jokes and Their Relation to the Unconscious*, in *The Standard Edition of the Complete Psychological Works* [1960], 8: 7) Strachey explains as follows why he decided to choose "joke" (and even "jokes," in the plural):

> To translate it "Wit" opens the door to unfortunate misapprehensions. In ordinary English usage "wit" and "witty" have a highly restricted meaning and are applied only to the most refined and intellectual kind of jokes. The briefest inspection of the examples in these pages will show that "*Witz*" and "*witzig*" have a far wider connotation. "Joke," on the other hand seems itself to be too wide and to cover the German "*Scherz*" as well. The only solution in this and similar dilemmas has seemed to be to adopt one English word for some corresponding German one, and to keep to it quite consistently and invariably even if in some particular context it seems the wrong one.

In this debate one needs to understand moreover that "wit" (which has the same etymology as *Witz*, that of knowing—*wissen*) can mean both witticisms (*mots d'esprit*), as well as the faculty of inventing them, in the same way that the German *Phantasie* means both a particular fantasy and the general power of the imagination (see PHANTASIA, Box 3).

The dilemmas surrounding these different ways of translating the Freudian *Witz* are in part due to the fact that it is considered in its relation to the unconscious. Like the "Freudianslip," the failed act, or condensation in a dream, it has the sense of something jutting out, of a sudden idea (*Einfall* in German), that is, an idea that suddenly appears without one's expecting it to, and that can surprise even the person uttering it. According to Freud, the *Witz* is a successful slip that comes unexpectedly from the unconscious, like the term *famillionaire*—a kind of crasis between "familiar" [as an attitude] and "millionaire"—which so interested Lacan (and Freud himself, more than anyone), and by means of which some poor devil accidentally let it be known that he had been treated kindly by the nonetheless very wealthy Baron de Rothschild. Freud explains and glosses as follows the thought contained in this *Witz*, or this "joke" of the mind (*gestreicher Einfall*): "we had to add to the sentence 'Rothschild had treated him quite as his equal—quite "famillionairely"' a supplementary proposition that, abbreviated to its maximum degree, was expressed as: 'as much as a millionaire is capable of treating anyone'" (*Jokes and their Relation to the Unconscious*, trans. Strachey, 12–13). The source of the pleasure deriving from these games of the mind (*jeux de l'esprit*), or more precisely, of the unconscious, is just such a mechanism of condensation.

| INSTANT

"Instant," from the Latin *in-stare*, "to stand on, hold close," is one of the possible designations of the atom of time: it is the commonly accepted translation of the Aristotelian *to nun* [τὸ νῦν], literally, "the now," of which physical time is made up; see AIÔN.

It is also, this time paying attention to the insistence (which one can hear in "instant") of that which is presently going to happen, a way of naming the pressure of the present at the heart of subjective duration; see MOMENT for a discussion of the Greek *kairos* [καιρός] (opportunity), the German *Augenblick* (blink of an eye), and Kierkegaard's Danish *øjeblik* (to be complemented by PLUDSELIGHED, "suddenness," which emphasizes the discontinuity of irruption); JETZTZEIT, which in Benjamin's vocabulary refers to the messianic effectiveness of an "at-present" in history. See, more generally, PRESENT and *TIME*.

On the way in which an instant can bring together or condense time, see *ETERNITY* [AIÔN], *INTUITION* [ANSCHAULICHKEIT, UNDERSTANDING]; cf. *ACT*, GOD, *WISDOM*.

On the way in which instantaneity is expressed verbally, see ASPECT.

➤ *EVENT*, GLÜCK, HISTORY, MEMORY, *PROGRESS*

| INSTINCT

Derived from the classical Latin *instinctus*, which means "instigation, impulse, excitation" (from the Indo-European root **stig-*, "to prick"), the French word *instinct* nowadays means "an innate and powerful tendency, common to all living beings and all individuals of the same species," and in the sciences "an innate tendency of actions that are determined according to species, performed perfectly without any prior experience, and subordinated to the conditions of the environment" (RT: *Le nouveau petit Robert*, s.v.). One finds the word in German as *Instinkt*, in English as "instinct," and in Italian as *istinto*. The difference between animal and man traditionally overlaps with the difference between instinct and intelligence: see ANIMAL, and *DISPOSITION,* UNDERSTANDING, Box 1 (on the Greek *nous* [νοῦς], the meaning of which ranges from the inbred tenacity or the "sense of smell" of a dog, to the divine spirit, to divine intuition); cf. LOGOS, *REASON*.

A particular, major problem regarding the translation of *instinct* has taken shape around the use of the German term *Instinkt* in the vocabulary of psychoanalysis, with some authors assimilating it to *Trieb*, a term of German origin that is the biological equivalent of *instinct*, and that one also finds in Freud, but with a very different meaning. Indeed, according to Laplanche and Pontalis, "When Freud does use the word *Instinkt* it is in the classical sense: he speaks of *Instinkt* in animals confronted by danger . . . when Freud asks whether 'inherited mental formations exist in the human being—something analogous to instinct in animals' he does not look for such a counterpart in what he calls *Trieb*, but instead in that 'hereditary, genetically acquired factor in mental life' " (RT: *Vocabulaire de la psychanalyse*, trans. Nicholson-Smith, 214). This is why in France, after a period of time when *instinct* was more prevalent, *Trieb* is now normally translated as *pulsion* (impulse), in the sense of an instinctual movement toward an object that is not predetermined. English translators render *Trieb* as "instinct," or more judiciously as "drive," a term that does not have the same origin as *Trieb*, but that nonetheless has some of the biological connotations of Freud's theory. See DRIVE, WUNSCH; see also ES, UNCONSCIOUS.

➤ ERLEBEN, INGENIUM, *INTUITION*, NATURE

| INTELLECT, INTELLIGER (FRENCH)

LATIN   *intellectus*, *intelligere*; *concipere*, *comprehendere*
ITALIAN   *intelletto*

➤ INTELLECTUS, UNDERSTANDING, and CONCETTO, CONSCIOUSNESS, GEMÜT, I/ME/MYSELF, *INTUITION*, *REASON*, SOUL

In the seventeenth century, a period of translation of Latin philosophical language into French philosophical language, most notably through the translation of the major works of Descartes (*Meditationes*, *Principia philosophiae*), the Latin word *intellectus* appears to be almost untranslatable, at least insofar as it is practically never translated into French by the word that corresponds to it, *intellect*, but by a word belonging to an entirely different semantic field, *entendement* (understanding). Yet the word *intellect* has been part of the French language for centuries. In fact, as early as the thirteenth century we can find it in the *Livres dou Trésor*, by Brunetto Latini (1260), even though it seems that it remains a technical term that has not really passed into common use. The French language has lacked an author comparable to Dante, who contributed greatly to popularizing the word *intelletto* in Italian from the fourteenth century onward. The word *entendement*, by contrast, which first appeared in the *Oxford Psalter* (1120), very soon came into common use. We find it especially in the fourteenth century when Nicole Oresme, associating *entendement* with the word *raison*, uses it in his French translation of Aristotle's *Nicomachean Ethics* (to render the Greek *nous* [νοῦς]), and in the sixteenth century the term is used frequently by Montaigne in his *Essays*, but to refer to a quality rather than a faculty—the quality of the *gens d'entendement* (men of understanding). Furthermore, while Montaigne uses the word *intelligence*, he never uses the word *intellect*.

The term *intellect* did not really become widespread in French until the nineteenth century, following Renan, and in the context of the translation of the Averroist lexicon. The influence of Italian on French also perhaps played some role. In any case, it is striking to see that the term that the otherwise very "Cartesian" Valéry most often uses in his *Notebooks* is not *entendement* but *intellect*.

I. *Intellectus* in the Renaissance: The Example of Bovelles

The key question is knowing whether—aside from a few rare occurrences, most notably in Guez de Balzac or in Malebranche—the near-impossibility of translating *intellectus* into French literally as *intellect*, or even of using the word *intellect* in an original text in the Renaissance and into the early eighteenth century, simply reflects the limits of the vocabulary in use at the time, or whether there is not, linked to this semantic displacement toward *entendement*, a

philosophical transformation that is every bit as determining. For at the beginning of the Renaissance, to talk about *intellectus* was not simply to study the workings of human *entendement*, but was above all to invoke the mode of existence and of knowledge of a separate *intellectus*, that of the angels. The 1511 *Liber de intellectu* of Charles de Bovelles is a good example: Bovelles treats human *intellectus* entirely by contrasting it to the pure *intellectus* of angels. According to Renaissance philosophy, human thought could be studied only by comparison with the pure *intellectus* of a separate intelligence. There was a vertical hierarchy of modes of thought: *sensus, ratio, intellectus, mens*, which were prefigured in the *De conjecturis* of Nicolas of Cusa (1440). *Sensus* was a mode of apprehension belonging to the body, *ratio* belonging to humans, *intellectus* to a pure intelligence (*intelligentia*), and *mens* to God. A manuscript note written by Beatus Rhenanus, an Alsatian student of Lefèvre d'Étaples and of Bovelles, identifies four distinct modes of philosophizing, according to these four modes of knowing, with intellectual philosophy thus falling halfway between rational philosophy and the philosophy of the mind. How we can or should conceive of the capacity of knowing proper to humans is played out across this spectrum. If humans are distinguished by reason alone, their knowledge is limited to the abstractive mode of knowing on the basis of sensible types, whereas the intuitive mode is reserved for the pure *intellectus* of angels. As far as humans are concerned, however, Bovelles rejects precisely this originally Scotist separation between abstractive knowledge and intuitive knowledge, the former being the only knowledge available to humans in their life. For Bovelles, by contrast, man is not only reason, but also *intellectus*: he is able to reach a state of fulfillment that raises him to the level of the *intellectus* of angels when his knowledge, originally abstractive, is capable of an intuitive force. Bovelles then talks of a *vis intuitiva* for the *intellectus* of man himself. For Bovelles, the spectrum of *ratio, intellectus, mens* is no longer a limiting principle, but a dynamic schema.

II. The Cartesian Distinction of the Different Modes of Thought: *Intelligere, Concipere, Comprehendere*

A radical shift in the world of the mind obviously occurs between Bovelles and Descartes. The vertical gradation of intellectual beings is no longer the measure of the capacity of fulfillment of the human mind. The enumeration in the "Second Meditation" is well known, in which the terms that are carefully differentiated by medieval and Renaissance Noetics are presented by Descartes as equivalent: "res cogitans, id est, mens, sive animus, sive intellectus, sive ratio" (*Meditationes de Prima Philosophia* in *Œuvres* [*AT*], 7:27). Now, there is a direct, immediate contrast between man's finite *intellectus* and God's infinite one. The distinctions that Descartes's philosophy sets in place no longer operate among nouns—*ratio, intellectus, mens*—designating both distinct faculties and ontologically different beings; rather, they work among verbal forms that signal the different ways of thinking and knowing proper to man: *intelligere, concipere, comprehendere* (the distinction is made particularly clear in Descartes's *Entretien avec Burman*, in *Œuvres* [AT] 5:154). Contemporary translators of Descartes, such as the duc de Luynes, seem curiously unaware of the distinction between *intelligere* and *concipere*,

and they often translate *intelligere* as "'to conceive." Yet, as Jean-Marie Beyssade suggests, following Descartes's detailed analysis, the gap between *intelligere* and *concipere* is the very gap between the idea and the concept. As for the difference between *intelligere* and *comprehendere*, this is a distinction of principle for the entirety of Cartesian metaphysics. The distinction is drawn in relation to our knowledge of the infinite being: we are capable of "knowing" it (*intelligere*)—or of apprehending it with our intellect (*intelliger* in French, even though this word was not yet in current usage at the time)—without for all that "understanding" it (*comprehendere*).

Descartes was not the first to apply this distinction or these terms to our knowledge of God. The distinction between *mente attingere* and *comprehendere* formulated by Descartes in a letter to Mersenne (January 21, 1641, in *Œuvres* [AT], 3:284), referring to a passage in Saint Augustine, turns out to follow precisely this distinction, as presented in Augustine's text:

> Attingere aliquantum mente Deum, magna beatitudo est: comprehendere autem, omnino impossibile.
>
> (To reach God in some way with our mind is a great happiness, but to understand Him is impossible.)
>
> (*Sermo* 117, chap. 3, 5, PL, vol. 38, col. 663; *Sermons*, trans. E. Hill)

It is therefore plausible that Descartes knew of this text by Augustine, which is not however, cited by Zbigniew Janowski in his *Index augustino-cartésien* (83–85). On the other hand, and since the focus of this entry is the transition from the Renaissance to the classical age, we should mention Nicholas of Cusa, who, two centuries before Descartes, had written in book 1 of his *Docte ignorance* that God is *intelligé de manière incompréhensible* (*incomprehensibiliter intelligitur*, "apprehended or 'intellected' without comprehension"). Cusanus's near-oxymoron has not been rendered faithfully by the French translators of the twentieth-century: Abel Rey in 1930 translated it the other way around as *compris sans être saisi* (understood without being grasped), while Maurice de Gandillac in 1942 translated the two words using the same term: *compris de façon incompréhensible* (comprehended incomprehensibly), thereby eliding the distinction between *intelligere* and *comprehendere*, possibly with a view to making the effect of the contrast more radical. The differentiated usage of the two terms is equally present in Cusanus's Latin. Does Cartesian metaphysics, then, simply take up Cusanus's distinction? This is certainly not the case. The *Meditations* do not adapt Cusanus's *docte ignorance* (learned ignorance) for the classical age. Book 1 of the *Docte ignorance* ended by stating the primacy of negative theology; Descartes, by contrast, emphasizes the fact that man is naturally capable of a "positive" knowledge or intellection of the infinite being. It is this capacity itself that characterizes the metaphysical way of thinking.

A tradition of interpretation that emerged in France in the second half of the twentieth century, however, has downplayed the importance of the Cartesian distinction between *intelligere* and *comprehendere*. To take an example: when Ferdinand Alquié wanted to justify the absence of the "Conversation with Burman" from his edition of Descartes's *Œuvres philosophiques*, he translated as *nous comprenons*

(we understand) the verb *intelligimus* used by the philosopher in relation to our knowledge of God's perfections (see *Œuvres philosophiques*, 3:766). What is more, in his concern to promote the image of a pre-Kantian Descartes, he spoke in 1950 of an "unknowable transcendence" and of a "metaphysics of an inaccessible being" in relation to the God of the *Meditations* (*La Découverte métaphysique de l'homme chez Descartes*, 113 [p. 109 in 1987 ed.]). More recently, Jean-Luc Marion has developed a similar interpretation by invoking the "unknowability" of an "inaccessible" God in Descartes (*Questions cartésiennes* 2:233, 240). Both conclude by referring to the presence of a "negative theology," or *via negativa* in Descartes (Alquié, *La Découverte métaphysique*, 88; Marion, *Questions cartésiennes*, 246).

These interpretations tend toward replacing the Cartesian metaphysics of the positively known infinite with a theology of an incomprehensible omnipotence. Descartes, however, tells us something very different: in the "Third Meditation" (in *Œuvres* [AT], 7:45), the supremely knowing character (*summe intelligentem*) of the divine substance is affirmed *before* its omnipotence. From this one may then conclude that the name of the supremely "intelligent" being is intelligible to us only to the degree that the supreme being is indeed understood (*intelligo*) to be "supremely intelligent": "*Dei nomine intelligo . . . ,*" writes Descartes in the same sentence. One cannot emphasize enough, then, the importance of the Cartesian distinction between *intelligere* and *comprehendere*. At stake here, no doubt, is our perception of modern metaphysics, since we find in the *Meditations* a metaphysical thinking that does not subscribe to the Scholastic thesis (taken up by Kant in the modern age) of the impossibility for man to have any "intellectual intuition." An attentive rereading of Descartes's Latin texts might then contribute to a reevaluation of the intellective capacities of man, which should continue to inform our use of the word "intellect."

INTELLECTUS (LATIN)

ARABIC	*'aql* [العقل]
ENGLISH	mind, intellect, understanding, meaning, thought
FRENCH	*intellect, entendement, sens, signification, pensée*
GERMAN	*Vernunft, Intellekt, Verstand, Sinn*
GREEK	*nous* [νοῦς], *epinoia* [ἐπίνοια], *logistikon* [λογιστικόν]
ITALIAN	*intelletto, significato*

➤ INTELLECT, *INTUITION*, *REASON*, UNDERSTANDING and CONSCIOUSNESS, GEMÜT, PERCEPTION, REPRÉSENTATION, SENSE, SOUL

Intellectus is one of the most polysemic terms in medieval Latin. It applies as much to "the meaning of" something (we talk about the *intellectus* of a sentence or of a judgment, Ger. *Sinn*, Fr. *sens*, It. *significato*), as to the verb "to mean" (in the sense of *vouloir-dire* in French, that is, a speaker or writer's intention or "meaning-to-say"), or to the "meaning understood" (that is, the "meaning," "intentional" or not, as it is "received" in the mind of the listener), and more broadly to "signification" or "significance," in the sense of "full of meaning," as is the case in the programmatic expression of theology and of exegesis: *intellectus fideli*, the "intellection" or "understanding" of faith. To mean, to understand, to comprehend: these different meanings do not pose a problem for the translator since vernacular language has often separated them out into terms that have evolved in different ways, to the exclusion of other uses. The word *intellectus* covers, in addition to the spheres of meaning and of understanding, almost all of the notions relating to thought, its activity, and its conditions of possibility. This is where the difficulties lie. As a fundamental term of ancient and medieval psychology, *intellectus* and the series of terms that are derived from or related to it (*intelligere*, *intellectualis*, *intelligibilis*) pose particular, if not insoluble, problems for the translator.

The most delicate problem comes from the fact that words such as the English "understanding," or the French *entendement*, or the German *Verstand*, which, at various times, have become accepted equivalents of the Latin *intellectus,* do not correspond to the field that it covers in the Peripatetic and Scholastic lexicon. The transformation of *intellectus* into "understanding" (*entendement*) marks a break in the history of theories of the soul. Indeed, the post-Lockean notion of "understanding" used by Leibniz to discuss the Averroist theory of the "unity of the intellect" no more overlaps with that of *intellectus* than the pair of terms *intellectus/ratio* overlaps with the pair *Verstand/Vernunft* that are Kant's legacy to modernity. Neither an empiricist psychology of understanding nor a theory of the transcendental are possible frameworks within which the Aristotelian *nous* [νοῦς] can be accommodated. The medieval *intellectus,* like the *nous* it harbors, is pulled not only between understanding and reason but also between different meanings of a (supposedly) identical faculty named *entendement*, *Verstand*, "understanding," assigned to it by different philosophers of language, theories, and often incommensurable assumptions. It is, then, an example of an untranslatable term, whose untranslatability flows from a certain undertranslation (its original dimension is only apparent in expressions like "intellectual intuition," the *intellektuelle Anschauung* that Kant rejected for understanding), as well as from a certain overtranslation. This latter has no better example than the case of Ernest Renan, who, because he interpreted *intellectus* as "reason" in the Kantian sense of the term, denounced in the noetics of Averroës an obscure and inadequate affirmation of the "universality of the principles of pure reason" and the no less confused affirmation of a "unity of psychological constitution in all of humankind" (Cf. E. Renan, *Averroès et l'averroïsme,* Maisonneuve et Larose, "Dédale," 1997, 109). Similarly, modern interpretations of the medieval theory of the intellect that replace the concepts of poietic intellect (or agent) and material (or possible) intellect with those of productive and of receptive mind bring to bear on the theory of *intellectus* models of reading that are as foreign to it as they are to the Peripatetic theory of *nous*, which is its source. To understand clearly why the *intellectus-nous* is neither Lockean understanding nor Kantian reason (*Vernunft*), one has to be clear about the inaugural distinction between *nous* and *dianoia* [διανοία] and to distinguish between the Peripatetic and non-Peripatetic uses of the term *intellectus.* Before the Latin translations of *De anima*, *intellectus* did not in fact refer to the *nous* of Aristotle and his Greek commentators but usually to the deeply Stoicist notion of color: *epinoia* [ἐπίνοια]. These two oppositions—*nous* vs *dianoia* and *nous* vs *epinoia*—mark two historical periods of *intellectus*: the

one pre-Socratic, when it is synonymous with *opinio*, and the other Scholastic, when it refers to the *intellect-nous* of *De anima* 3.4–5, distinguishing it from *ratio*. We will focus in this entry on the Peripatetic usages, which are the most poorly served by modern translations.

I. The *Intellectus* between *Nous* and *Epinoia*

In the Scholastic vocabulary, *intellectus* has at least ten meanings that are more or less interconnected: (1) the Peripatetic *nous*, understood in the sense of "substance"; (2) the same, in the sense of "faculty" (Ger. *Vermögen*) or "faculty of knowledge" (Ger. *Erkenntnisvermögen*); (3) the nonsensible or suprasensible faculty of knowledge, but not distinct from *ratio* (that is, without taking into account the distinction between intuitive knowledge and discursive knowledge); (4) a cognitive activity, an act of knowledge, intellection or intelligence (synonym: *intellegentia*); (5) the nonsensible intuitive faculty of knowledge, which penetrates the intimate essence of things (according to the medieval etymology bringing together *intelligere* and *legere intus*, see Box 1); (6) the "*habitus* of principles," as distinct from *prudentia*, *sapientia*, and *scientia*, but also from *ratio* and *synteresis* (see CONSCIOUSNESS), the Greek *nous tôn archôn* [νοῦς τῶν ἀρχῶν], and the Latin *habitus principiorum* (for example, "intellectus dicitur *habitus primum principiorum*," Thomas Aquinas, *Summa theologica*, I, q. 58, 3c, "quendam specialem habitum, qui dicitur *intellectus principiorum*, ibid., q. 799, 12c); (7) intellectual inspection (Ger. *Einsicht*), synonymous with *intellegentia*, and the antonym of which is *ratio*; (8) conception, comprehension, interpretation, understanding, or meaning (Ger. *Verständnis*, *intellektuelle Auffassung*, for example "*verbum illud Philosophi universaliter verum est in omni intellectu* [this sentence of Aristotle's is absolutely true, whichever way one takes it]," Thomas Aquinas, *Summa theologica*, 1, q. 87, 1 *ad 3m*, "*secundum intellectum Augustini* [according to the sense in which St. Augustine understands it]," ibid. q. 58, 7 *ad 1m*); (9) a nonsensible representation (*Vernunftsvorstellung*) or a notion, synomous with *ratio*, in the sense of a definitional formula (for example, "*voces sunt signa intellectuum*," Thomas Aquinas, *Summa theologica*, q. 13, 1c, "*composito intellectum est in intellectu*," ibid., q. 17, 3a); (10) significance or meaning (Ger. *Bedeutung*, *Sinn*), synonymous with *ratio* (in the sense of the definitional formula, *logos*-formula, *sensus*, *significatio*, *virtus*, *vis* ["expressive force or impact"] of a word).

▪ See Box 1.

1

On the etymology of *intellectus*

The word *intellectus* is formed by joining together *inter* and *legere*, where *legere* has the meaning of "to bind," "to bring together," "to collect," which is one of the meanings of the Greek *legô* [λέγω], and of the German *lesen* (see LOGOS). In the Middle Ages *intelligere*, sometimes attested as *intellegere*, is sometimes associated with *intra-* or *intus- legere*, *legere* here having the banal sense of "to read," and not to bind. Several good examples of

this "etymology" are provided by Thomas Aquinas: "*Nomen intellectus sumitur ex hoc, quod intima rei cognoscit, est enim intellegere quasi intus legere* [The name 'intellect' is derived from the fact that it knows the intimate nature of a thing: indeed, *intelliger* is tantamount to saying 'to read inside']," *Quaestiones disputate De veritate*, q. 1, 12c); "*Dicitur autem intellectus ex eo quo intus legit intuendo essentiam rei; intellectus et ratio differunt*

quantum ad modum cognoscendi, quia scilicet intellectus cognoscit simplici intuitu, ratio vero discurrendo de uno in aliud [it is called 'intellect' because it reads inside, that is, has an intuition of the essence of a thing; intellect and reason differ as to the mode of knowledge, since intellect is an act of simple intuition, whereas reason moves discursively from one thing to another]," *Summa theologica*, I, q. 59, a. 1, *ad. 1m*)

As we can see, certain Scholastic usages of *intellectus* refer to the *nóêsis* [νόησις] of Aristotle, understood at times as thought in general, and at other times as so-called "intuitive" thinking (contrasted to *dianoia* [διάνοία] or "discursive" thinking). Other usages refer to the *nous* properly speaking, or the intellect, itself understood by some interpreters as "intuitive reason" and contrasted in this sense to *to dianoètikon* [τὸ διανοητικόν] or "discursive reason." Still others, finally, refer to that which is intelligible or thinkable (= *noêton* [νοητόν]), or even to the concept or the notion of something (= *noêma* [νόημα]). This polysemy, which means that the same term refers at once to a faculty, its operation, and its object, is one of the main difficulties in reading medieval texts, as well as Greek texts (see *aisthêsis* under the entry SENSE).

If in the Scholastic and "Arabo-Latin" tradition *intellectus* has the primary meaning of intellect, in the original "Greco-Latin" tradition (that of Boethius) it sometimes has the meaning of *epinoia* [ἐπίνοια] ("that which comes to mind," "reflection," "imagination," "thought," rather than, by extension, "intelligence" in general, or even "common sense"), which is usually translated as *opinio*. This usage is still attested in the thirteenth century, mainly in William of Moerbeke's translations (*De Anima, in the Version of William of Moerbeke: and the Commentary of St. Thomas Aquinas*, translated into English by Kenelm Foster and Silvester Humphries, Boston: Routledge and Kegan Paul, 1959). It is the word *intellectus*, and not *opinio*, that appears in the translation of the mute citation of *Isagoge*, through which Simplicius, in his *Commentary* on the *Categories*, dismisses the problem of universals from the field of logic: "*si enim sunt universalia sive intellectu solo esse habeant, alterius utique erit negotii inquirere* [to know if universals exist or only have their existence in thought, would in fact be an entirely different kind of study]" (cf. Simplicius, *In praedicamenta Aristotelis*, trans. William of Moerbeke, ed. A. Pattin, Louvain: Publications universitaires–Paris; Béatrice Nauwelaerts, *Corpus Latinum Commentariorum in Aristotelem Graecorum*, V/1, 1971, 71, 44–45. The use of *intellectus* to translate *epinoia*, interpreted this time in the sense of a concept that is "posterior in the order of being," is also attested in Moerbeke's translation of Simplicius's *Commentary*:

> aut quia aliqui perimebant universalia et intellectualia et ea quae qualitercumque intelliguntur aut quia etsi haec essent in natura, intellectus ipsorum posterius accepimus

> (either because some reject universals, intelligibles, and everything that is the object of some form of intellection, or because, even though they actually exist [in nature], we only get their concept [thought] afterwards)

> (Ibid., 261, 83–86)

We might also note in this passage the use of the word *intellectualia* in the sense of "intelligibles." We might finally point out that, in its pre-Socratic usage, *intellectus* is often contrasted both to "reason" and to "intelligence." This distinction, probably borrowed from Boethius's *Consolation of Philosophy*, disappears after the reception of Aristotle.

■ See Box 2.

2

Intellectus vs *intellegentia, ratio* vs *rationalitas*

Given the etymology they provide for *intellectus*, the medievals have a tendency to use *intelligentia* and *intellegentia* (where the form *legô*, "to read," is more immediately transparent) as equivalent terms. Authors in the twelfth century generally go along with Boethius in distinguishing between *sensus, imaginatio, ratio, intellectus* and *intelligentia/intellegentia*—*mens* staying, as it does for Saint Augustine, in a generic position, in the sense of "soul." This is the case, for example, with Isaac of Stella, *Epistula de anima*, PL 194, 1884C–1885B; Sermo, 4, PL 194, 1701C–1702C), with Alcher of Clairvaux (*De spiritu et anima*, chap. 4, PL 40, 782 and 7, PL 40, 787) and with Alain de Lille (PL 210, 673D). At that time *ratio, intellectus*, and *intelligentia/intellegentia* form a real triad of terms. For Isaac (a) "reason," *ratio*, is the "faculty of the soul that perceives the incorporeal forms of corporeal things," (b) "intellect," *intellectus*, is the "faculty of the soul that perceives the forms of truly incorporeal things," (c) and *intelligentia/intellegentia*, "intelligence," is the "faculty of the soul that has God as its immediate object." In

his *De anima*, written between 1126 and 1150, Dominique Gondissalvi developed the distinction by contrasting *intellectus* as a purveyor of science (*scientia*), which separates the intelligible from the sensible (by abstraction), with *intelligentia/intellegentia*, which generates wisdom (*sapientia*), "the superior eye" of the soul, devoted exclusively to contemplating pure intelligibles. This type of knowledge, the "intelligence" that surpasses "science," allows the soul to "contemplate itself" and to "reflect while contemplating them, as in a mirror, both God and the eternal intelligibles." It is assimilated to "rapture," the prototype of which is the ascension to the "third heaven" that the apostle Paul speaks of.

The terms *rationalitas* and *ratio* are often used in the Middle Ages in the obvious sense of "rational" or "discursive faculty" (= *dianoia*). In the treatise *De intellectibus* (whose title means "the intellections" and not "the intellects"), Abelard distinguishes rationality, imparted to all "rational" creatures, from the accomplished reason of those who are capable of exercising it fully. *Rationalitas*

and *ratio* are thus more or less distinguished as "reasoning" (capable of reason) and "rational" (as a positive predicate, referring to the fullness of reasoning in action, rationality as it is exercised). Cf. Abelard, *De intellectibus*:

> Rationality is not the same thing as reason: in fact, rationality belongs to all angelic and human minds, which is why one calls them rational; but reason only belongs to a few, as we have said, namely, only to the minds that are distinct. This is why I think that there is as much difference between rationality and reason, as there is between the power to run, and the power to run easily, according to which Aristotle calls runners "those who possess" the ease of movement of supple limbs. Thus, any mind that can discern using its own nature possesses rationality. But the only person to "possess" reason is the one who is in a state of being capable of exercising it easily, without being hindered by any weakness of his age, or by any bodily handicap, which would cause

him some disturbance, and make him mad or stupid.

(Abelard, *De intellectibus*, §8–9)

If we move on to the vernacular, it is Middle High German that offers the most interesting series of terms for considering the complex relations that developed subsequently in modern languages between *Vernunft* and *Verstand*, "understanding" and "reason." It is essentially a question of the pairs *vernünficheit/vernünftecheit; vernunft; verstentenisse/ verstantnisse*, attested in German mysticism, particularly but not exclusively in Meister Eckhart. On the face of it, the law of correspondence seems easy enough to establish: *vernunft* is understood as the equivalent of *ratio*; *verstentenisse/verstantnisse* as the equivalent of *intellectus*; and *venünfticheit/ vernünftecheit* hovering somewhere between *intellectualitas* and *ratio*. This system of equivalences is, however, too schematic. In fact, the distinction *ratio/intellectus* continues into Scholastic vocabulary with the division of *intellectus* into *intellectus agens* and

intellectus possibilis, inherited from the Greco-Arabic exegesis of *De anima* 3.4–5. This basic distinction is also expressed in German medieval literature. One important witness here is the opuscule known as *Ein schoene ler von der selikeyt* (A beautiful theory of happiness), attributed to a certain Eckhart of Gründig, who expounds and discusses the theses of Meister Eckhart and of Dietrich of Freiburg on the nature of the beatitudes. In this treatise the "agent" intellect and the "possible" intellect clearly have their German equivalents: for the former, *diu würkendiu vernunft*, and for the latter, *diu müglichiu vernunft*. Cf. W. Preger, "*Der altdeutsche Tractat von der wirkenden und möglichen Vernunft*" [*Sitzb. Ak. Wiss. München, philos.-philol. hist Classe*, 1], 1871, 189, 1–16, for the agent intellect, and 188, 14–25, for the possible intellect. It does not appear possible then to consider that the opposition between *rationalitas* and *ratio* is the same as the German *vernünfticheit/vernünftecheit* vs. *vernunft*. All of these terms correspond more to *intellectus* than to the modern *Vernunft*. Moreover, in Meister

Eckhart *vernunftekeit* translates equally as *intellectualitas*, *intellegentia*, and *intellectus* [= *nous*].

II. *Intellectus* and the Vocabulary of the Peripatetic Noetics

The difficulty of the medieval lexicon of intellect derives first and foremost from the difficulty of Aristotle's vocabulary in *De anima*, and because of the continuous superimposition of translations and commentaries, from Greek to Latin, or from Greek to Arabic. As we read in *De anima* 3.5, the distinction between the different sorts of intellect is quite obscure. It merely touches on the ideas of dynamic intellect (through the phrase *touto de ho panta dunamei eikeina* [τοῦτο δὲ ὅ πάντα δυνάμει ἐκεῖνα]), of poietic intellect or intellect as agent (of the kind, τὸ αἴτιον καὶ ποιητικόν), and of passive intellect (*ho de pathêtikos nous* [ὁ δὲ παθητικὸς νοῦς])", without proposing any systematic construction between them. Indeed, it was the commentators of Aristotle, first among them being Alexander of Aphrodisias, who provided in advance the medieval notions of *intellectus*.

A. Agent intellect, hylic (material, possible) intellect

In *De intellectu*, Alexander of Aphrodisias attributes to Aristotle a distinction among three sorts of intellect: material intellect (*nous hulikos* [νοῦς ὑλικός]), the intellect "according to the habitus" (*nous kath'hexin* [νοῦς καθ' ἕξιν]), and the poietic intellect (*nous poiêtikos* [νοῦς ποιητικός]—"*nous esti kata Aristotelê trittos* [νοῦς ἐστι κατὰ Ἀριστοτέλη τριττός]" (the intellect is threefold according to Aristotle) (cf. P. Moraux, *Alexandre exégète de la noétique d'Aristote*, Liège, Faculté de philosophie-Paris, E. Droz, "Bibliothèque de la faculté de philosophie et lettres de l'Université de Liège," Fasc. XCIX, 1942, 185; ed. Bruns, 106, 19). This tripartite distinction was adopted by all of the commentators and became so widely accepted as Aristotelian that the Arabic translation on which

Averroës based his *Long Commenary* of *De anima* incorporated Alexander's division into Aristotle's text itself.

■ See Box 3.

In fact, not only does Aristotle not talk of *nous kath' hexin*, but the very distinction between agent intellect and hylic or possible intellect is far from being as clearly formulated in *De anima* as Alexander leads us to think. Besides the few lines in *De anima* 3.4 and 5, devoted to the intellect as "analogous to matter," similar to a "tabula rasa," which also mention the "possible" intellect, and besides the extremely enigmatic passage in 3.5, referring to the intellect that "produces" intelligibles, one would be hard pressed to cite any text by Aristotle that offered an actual "theory of the intellect." We have to turn instead to the noetic works of Alexander that have come down to us, that is, the *Peri psuchês* [Περὶ ψυχῆς] (*De anima*), edited by I. Bruns in 1887 (*Supplementum Aristotelicum*, II, 1, Berlin, 1892, 1–100) and the *De anima liber alter*, also called *Mantissa* (Bruns, ibid., 101–86), which is a collection of twenty-five treatises comprising notably, in number one, a second and short version of *Peri psuchês* (Bruns, 101, 1–106, 17) and in number two (Bruns, ibid., 106, 18–113, 24) the famous *Peri nou* [Περὶ νοῦ] (On the intellect), in order to look for an exposition of the Peripatetic theory of the intellect, which, through its Greek and Arabic commentators, has permeated medieval Scholastics.

B. Speculative intellect, theoretical intellect

Scholastic philosophers often used the expression *intellectus speculativus*, which modern translations often render with a calque ("speculative intellect," Fr. *intellect spéculatif*, It. *intelletto speculativo*, etc.). While this is not wrong, the literal

3

A translation by Alexander incorporated into Aristotle's original text

The *Textus* 17 = *De anima* 3.5, 430a10–14 on which Averroës comments is the following:

> Et quia, quemadmodum in Natura, est aliquid in unoquoque genere quod est materia (et est illud quod est illa omnia in potentia), et aliud quod est causa et agens (et hoc est illud propter quod agit quidlibet, sicut dispositio artificii apud materiam), necesse est ut in anima existant hee differentie.
>
> (And since, just as in Nature, there is in each kind something that is matter [and is that which is potential in all of these things], and another thing that is cause and agent [and is that by virtue of which everything acts, as is the case with art in relation to matter], these differences also necessarily exist in the soul too.)
>
> (Crawford ed., 436, 1–7)

The original in Tricot's French translation, is as follows:

> Mais puisque, dans la nature toute entière, on distingue d'abord quelque chose qui sert de matière à chaque genre (et c'est ce qui est en puissance tous les êtres du genre), et ensuite une autre chose qui est la cause et l'agent parce qu'elle les produit tous, situation dont celle de l'art par rapport à sa matière est un exemple, il est nécessaire que, dans l'âme aussi, on retrouve ces différences.
>
> (Vrin, 1992, p. 181)

> (But since, in all of nature, we distinguish first of all something that is matter in each genus [and it is that which is potential in all of the beings of a genus], and then another thing which is that cause and agent because it produces them all, a situation of which the relationship of art to its matter is an example, we also necessarily find these differences in the soul.)

The decisive change (Alexander's incorporation) occurs in the *Textus* 18 = *De anima* 3.5, 430a14–17, where three differences are mentioned, contrary to the binary division maintained in *Textus* 17:

> Oportet igitur ut in ea sit intellectus qui est intellectus secundum quod efficitur omne, et intellectus qui est intellectus secundum quod facit ipsum intelligere omne, et intellectus secundum quod intelligit omne, quasi habitus, qui est quasi lux. Lux enimquoquo modo etiam facit colores qui sunt in potentia colores in actu.
>
> (So within it there is also necessarily [1] an intellect that is intellect to the extent that it becomes all, and [2] an intellect that is an intellect to the extent that it allows it to conceive of all, and [3] an intellect to the extent that it conceives of everything as a habitus does—that is, in a manner resembling the action of light. For in a certain way, light also makes potential colors into actual colors.)
>
> (Crawford ed., 437, 1–7)

To be compared with Tricot's French:

> Et, en fait, on y distingue, d'une part, l'intellect qui est analogue à la matière, par le fait qu'il devient tous les intelligibles, et d'autre part, l'intellect [qui est analogue à la cause efficiente], parce qu'il les produit tous, attendu qu'il est une sorte d'état analogue à la lumière: car, en un certain sens, la lumière, elle aussi, convertit les couleurs en puissance, en couleurs en acte.
>
> (Vrin, 1992, 181–82)

> (And indeed, we can distinguish in it, on the one hand, the intellect that is analogous to matter, by the fact that it becomes all of the intelligibles, and on the other hand, the intellect [that is analogous to the efficient cause], because it produces all, considering that it is in a sort of analogous state to light: for, in a certain sense, light too converts potential colors into actual colors.)

translation masks its homonymy. The expression derives from the Latin translation of the *Long Commentary* of Averroës on *De anima*; the analysis of different passages of the Aristotelian *De anima* and its adoption by Averroës demonstrate that the "speculative" intellect in fact refers to three sorts of entities: (1) the faculty referred to by Aristotle as "theoretical intellect" in *De anima* 3.6, 42925ff. (Arabic '*aql naẓarī* [العقل النظري]), as opposed to the "practical intellect" of *De anima* 3.7, 421a1ff. (Arabic '*aql 'amali* [العقل العملي]); (2) the "composite" of the material intellect and the agent intellect, which Averroës calls "produced intellect" (*factus*), in other words, not a faculty, but an act or activity (that is, the "intellection of indivisibles," according to Aristotle, *ta adiaireta* [τὰ ἀδιαίρετα], *ta hapla* [τὰ ἁπλᾶ], and the intellection of the "composites," or objects of judgment); (3) the agent intellect insofar as it is joined to the material intellect and is for man the essential "form." This is a meaning that originated with Themistius and which he extrapolated from a passage in *De anima* 2. 2, 413b24–25 (Tricot, 76-77), where in speaking of the "intellect and of the theoretical faculty," Aristotle indicates that "it seems indeed that this is an entirely different type of soul, and that on its own it can be separated, as the eternal, from the corruptible" (cf. Themistius, in *III De anima, ad* 430a 20–25; Verbeke, 232, 44–46 and 233, 80–82). These three senses obviously cannot work concurrently. The immediate context allows one in theory to determine the meaning. The Latin *res speculativae* generally refers to the objects of the activity of the theoretical intellect in the second sense of the term, that is, first and foremost, the indivisibles invoked in *De anima* 3.6, 430a26–31. It is worth pointing out that this activity in Averroës is called "representation" (*taṣawwur* [التصوّر], Latin *formatio*, "forming," which survives in "to form a plan," in the sense of "to conceive of a plan"), in that it applies to intelligibles envisaged in themselves, outside of any predication, while the consideration of the "noêmes" (*ma'nā* [المعنى], "intention"), the combination of which in predications "contains truth or falsity," is called "consent" (*taṣdīq* [التصديق], Lat. *fides*, "faith"). In the Arabo-Latin translations of Aristotle (as well as in those of Avicenna and of Averroës), the expression corresponding most often to *noein* [νοεῖν] is *formare per intellectum* (the substantive being

formatio per intellectum = "representation by the intellect," Arabic *al-taṣawwur bi-al-ʿaql* [التصوّر بالعقل]).

C. Habitual intellect, acquired intellect, common intellect

The expression "*intellect in habitus*" or "habitual intellect" (*intellectus in habitu*) corresponds to the *nous kath' hexin* of Alexander of Aphrodisias. The notion of *habitus* as the power of the intellect to accomplish its own action—intellection—is illustrated in Alexander by the metaphor of the artisan: "The intellect has another degree, namely when it thinks and possesses the *habitus* to conceive, and is able to assume the forms of the intelligibles through its own power, a power one might compare to the power of those who have the *habitus* within them to make things, and who are capable of producing their own works" (cf. Théry, 76). The expression *intellectus in habitu* appears frequently in Avicenna's Latin texts, in the Latin translation of al-Ghazālī, and from there in most of the Scholastics. Generally speaking, what we call "acquired intellect" or "actual intellect" (*in effectu*) is the intellect that "considers, in act, the conclusions drawn from propositions which are self-evident," while "habitual intellect" refers to those same conclusions insofar as the intellect "possesses them without actually thinking of them." The *intellectus in habitu*, however, is often assimilated to the *habitus principiorum* discussed in the *Second Analytics.* It is in this sense that it appears, for example, in Albert the Great, when, in the *Summa de creaturis*, IIa paragraphs, q. 54, he contrasts the "habitual" intellect, in the sense of the "possession of principles that have not been received from a master," which we know "by simply knowing the terms that compose it," with the "acquired" (*acquisitus*) intellect, meaning the possession of "principles that one acquires in contact with a master through teaching and studying." Since the "acquired" intellect can also refer to the intellect "acquired externally" (*adeptus*, Greek *thurathen* [θύραθεν]), in the more or less mystical sense, extrapolated by Alexander (see Box 4) from a passage in the *Parva naturalia* (*De generatione animalium*, 736b20–29), there is a considerable amount of terminological confusion. The main source of confusion comes from the fact that underneath apparently similar Latin expressions we find notions that are sometimes Greek, sometimes Arabic, and sometimes Greco-Arabic in origin, whose meaning varies from the union or "conjunction" (Lat. *conjunctio, copulatio, connexio*, Ar. *ittiṣāl* [الاتصال]) of the human soul and the separate agent intellect, to the simple acquisition, through teaching or through reason, of a stock of intelligibles.

■ See Box 4.

The notions of *intellectus adeptus* (Ar. *al-ʿaql mustafād* [العقل المستفاد] and of *intellectus adeptus agens* ("acquired intellect agent," Ar. *al-ʿaql al-mustafād al-fāʿil* [العقل المستفاد الفاعل]), expressing the state of *connexio*, are among the most obscure in medieval psychology. While he may not be able to determine the exact meaning of the doctrines he is confronted with (and which vary considerably from one author to the next, from Alexander to al-Fārābī, and from Avicenna to Averroës), the reader of the noetic texts must always, going back to the Greek, and following Alexander, distinguish between at least two incompatible meanings of the "acquired" intellect: (1) the agent intellect acquired "from outside," that is the *nous ho thurathen* [νοῦς ὁ θύραθεν] (Lat. *adeptus*), and (2) scientific knowledge acquired from the first intelligibles, with or without the help of a master, that is *nous epiktêtos* [νοῦς ἐπίκτητος] (Lat. *acquisitus, possessus, possessivus*].

Although the notion of "common intellect" is sometimes seen as identical to that of the "habitual" intellect, it has an original content. Grafted on to the Aristotelian doctrine of the patient (*passivus, passibilis*) intellect, this creation by Themistius in fact carries a clearly Platonic content, bearing no relation to the pair *in habitu* vs *in effectu*.

■ See Box 5.

D. *Intellectus passibilis* vs. *intellectus possibilis*

De anima 3.5, 430a20–25 alludes to a so-called "patient" or "passive" intellect (*nous pathêtikos* [νοῦς παθητικός]), which is often confused with the "hylic" or material intellect (*nous hulikos* [νοῦς ὑλικός]) of Alexander, that is, the "possible" intellect of the Scholastics. Because it was easy to confuse

---

4

The "acquired" intellect: A misinterpretation that became a technical term

Alexander interpreted the Aristotelian notion of intellect "from outside" in a very particular sense: for him, it was a question of the agent intellect, acquired by the soul at each contemplation of the separate intelligible. Cf. Alexander of Aphrodisia, *De anima*:

> When the intelligible is by its own nature exactly as it is thought [= intelligible] . . . it remains incorruptible when it ceases to be thought; so the intellect which thought it is also incorruptible: not the material intellect which serves as its

support (for it is corrupted at the same time as the soul is corrupted, since it is a power of the soul, and at the same time as it is corrupted, its habitus, its capacity and its perfection are also corrupted), but the intellect which, when it was thinking it, had become identical to it in its act (for, given that it becomes similar to each content of thought when this content is thought, what it thinks becomes exactly what it is thinking. And this intellect is the one that comes to us from outside and which is incorruptible. . . . So all those

who are intent on having something of the divine within themselves will have to endeavor to succeed in thinking something of this kind.

(Bruns ed., 90, 11–91, 7)

It is worth noting that in the fragments of Theophrastus that have survived we find, by contrast, the question of knowing in what sense the intellect that is "from outside" (*exôthen* [ἔξωθεν]) or "added on" (*epithetos* [ἐπίθετος]) can be said to be "congenital" (*sumphuês* [συμφυής]).

5

The common intellect according to Themistius

The expression "common intellect," coined by Themistius and widely adopted in medieval literature under the name *intellectus communis*, was the source of a great deal of confusion. Despite what the Latin suggests, the *intellectus communis* was not a "common" or "general" concept, as opposed to a "singular" or "particular" concept. The "common intellect" (*koinos nous* [κοινὸς νοῦς]) was the name Themistius gave to Aristotle's passible intellect. Cf. Themistius,

In III De anima, ad 430a 25, and Verbeke, 239, 1–241, 34, who discusses the "so-called 'common' intellect in the way that man is composed of a soul and a body in which anger and desire (Latin *concupiscentia*) reside, which Plato considers corruptible." The "common" or "passible" intellect of Themistius illustrates the Platonic thesis according to which "the intellect alone is immortal, whereas the passions, and the 'reason inherent in them,' which Aristotle

calls the *passive intellect*, are corruptible." Themistius also supports the thesis according to which "human passions *are not entirely irrational*, since they listen to reason, and are susceptible to education and instruction."

---

passibilis and *possibilis* in medieval manuscripts, a theory of the corruptibility of the passive (possible) part of the intellective soul was often attributed to Aristotle, when there was nothing to really justify this. Cf. Aristotle, *De anima*:

> Actual knowledge is identical with its object: in the individual, potential knowledge is in time prior to actual knowledge, but absolutely it is not prior even in time. It does not sometimes think and sometimes not think. When separated it is alone just what it is, and this alone is immortal and eternal (we do not remember because, while this is impossible, passive thought is perishable); and without this nothing thinks.

> (Aristotle, *De anima*, 3.5, 430a, Barnes, *On the Soul*, 1: 684)

For ancient and medieval interpreters the intellect that Tricot's French translation presents as "patient intellect" is not the possible or material intellect but either (1) the "speculative" or "theoretical" intellect (Ar. '*aql naẓarī* [العقل النظري]), which, as we saw, refers both to an actual theoretical intelligible (what Alexander calls "habitual intellect" or the intellect *in habitus*) and to the very act of "speculating" (Lat. *considerare*), which, like any physical act or act of the mind, can be engendered and corrupted; or (2) the intellect that Themistius calls "common intellect" (see Box 5); or (3) as Averroës maintains, "the forms of the imagination as the cogitative faculty proper to man acts upon them." In none of these three cases is it the material or possible intellect itself. The confusion between possible intellect and passible intellect has determined the modern interpretation of Averroism. This is well testified by Leibniz's summary of the noetics of Averroës, in the course of which the transformation of *intellectus* into "understanding" (*entendement*) takes place, and which attests to the paradigm shift between medieval psychology and modern psychology mentioned earlier (see UNDERSTANDING).

■ See Box 6.

III. "Intellectus" and Its Derived Terms

Several adjectives are formed from *intellectus.* The adjective *intellectivus, -a, -um* (antonym: *sensitivus, sensibilis*) is

the most widespread. It is used in the most diverse contexts: one talks of *cognitio*, of *apprehensio*, of *operatio*, of *potentia*, of *intentio*, and of *visio i.*, but also of *memoria i.*, and of *habitus i.*, as well as of *anima* and of *substantia i.* If the ancient German translations render *intellectivus* by *übersinnlich*, "suprasensible," nowadays one talks more readily of "intellective," or "intellectual," and even "noetic" knowledge. The term "intellectual" is normally reserved for *intellectualis, -e*, the semantic spectrum of which is almost identical to that of *intellectivus*: one talks of *conceptio*, *cognitio*, *apprehensio*, *existimatio*, *operatio*, *intentio*, *visio i.*, but also of *desiderium*, *appetitus*, *amor*, *delectatio i.* and even of *species i.* (synonymous with *intelligibilis*). Understood broadly, *intellectualis, -e*, characterizes the cognitive function of the intellect, whether it is intuitive or discursive (synonym: *intellectivus, rationalis*); strictly speaking, *intellectualis* applies only to the intuitive cognitive function of the intellect, as distinct from reason (antonym: *rationalis*). It is in this sense that Thomas Aquinas describes angels as "intellectual beings":

> Therefore they [angels] are called intellectual beings (*intellectuales*), because even with ourselves the things which are instantly [*statim* = nondiscursive, sudden, in a single act of intuition] apprehended are said to be "intellected" (*intelligi*); hence intellect is defined as the habit of first principles (*habitus primorum principiorum*). But human souls which acquire knowledge of truth by the discursive method are called rational (*animae ver humane, quae veritatis notitiam per quendam discursum adquirunt, dicuntur rationales*).

> (*The Summa Theologica of Saint Thomas Aquinas*, trans. Fathers of the English Dominican Province, rev. Daniel J. Sullivan, 2 vol., London: William Benton, 1952. Vol. 1, q. 58, Art. 3, [Thomas Aquinas's *Answer*], 302)

The noun *intellectualitas* (antonym: *sensibilitas*) usually refers to the state of being intelligible—*intellectualitas* thus has the meaning more of intelligibility than of intellectuality (*Summa theologica* III, q. 23, 2c: "*no autem secundum intellectualitatem, quia forma domus in materia non est intelligibilis*," where *intellectualitas* refers to a

6

Leibniz and Averroës: Medieval psychology and modern psychology

By analogy to the theological expression "monophysite," referring to the thesis of the one nature of Christ (and not Christ's double nature, as divine and human), Leibniz coins the word "monopsychite" to refer to the Averroist thesis of the one intellect, which he presents as a return to the pristine nature of the Soul of the Stoic world:

> Plato's soul of the world has been taken in this sense by some, but there is more indication that the Stoics succumbed to the universal soul which swallows all the rest. Those who are of this opinion might be called "Monopsychites," since according to them there is in reality only one soul that subsists.
>
> (G. W. Leibniz, *Theodicy: Essays on the Goodness of God, the Freedom of Man and the Origin of Evil*, ed. Austin Farrer, trans. E. M. Huggard, LaSalle, IL: Open Court, 1985, 79)

This single *intellectus* is, however, baptized "Mind," and even then not so much "single" as "universal." Leibniz sometimes coordinates "Mind" with *intellectus*, translated as "understanding" (*entendement*), with *intellectus agens* becoming "active understanding," as opposed to "passive understanding," an expression translating an *intellectus patiens* that has no real equivalent in medieval texts, which talk of either *intellectus possibilis* (possible or "material" intellect), or *intellectus passibilis* (imagination), thereby giving rise to much confusion:

> Some discerning people have believed and still believe today, that there is only one single spirit, which is universal and animates the whole universe and all its parts, each according to its structure and the organs which it finds there, just as the same wind current causes different organ pipes to give off different sounds. Thus they also hold that when an animal has sound organs, the spirit produces the effect of a particular soul in it but that when the organs are corrupted, this particular soul reduces to nothing or returns, so to speak, to the ocean of the universal spirit. Aristotle has seemed to some to have had an opinion approaching this, which was later revived by Averroës, a celebrated Arabian philosopher. He believed that there is an *intellectus agens*, or "active understanding," and that the former, coming from without, is eternal and universal for all, while the passive understanding, being particular for each, disappears at man's death. This was the doctrine of certain Peripatetics two or three centuries ago, such as Pomponatius, Contarini, and others, and one recognizes traces of it in the late Mr. Naudé.
>
> (Leibniz's "Considérations sur la doctrine d'un Espirit universal unique" [1702], in *Système nouveau de la nature et de la communication des substances et autres textes* (1690–1703), Eng. trans. Leroy E. Loemker, "Reflections on the Doctrine of a Single Universal Spirit" [1702], in *Philosophical Papers and Letters,* vol. 2, Dordrecht, Neth.: Kluwer, 1989, 554)

Leibniz's interpretation of *De anima* 3.5, 430a20–25, and his reading of Averroës's interpretation of Aristotle, are without foundation. For Averroës, the *intellectus passibilis* is nothing but the images that are subject to the activity of the *vis cogitativa*, a condition sine qua non of the activity of the material or possible intellect (see INTENTION, Box 2):

> Now [Aristotle] understands here by *passible intellect* the forms of the imagination as the cogitative faculty proper to man acts upon them. Indeed, this faculty has a rational character, and its activity consists either in leaving the "intention" of the imagined form with the individual, in his memory, or in distinguishing it from him in the "formative" faculty [= *al-muṣawwira* (المصوّرة)] and the imagination. Now, it is clear that the intellect we call "material" receives the imagined entities after this distinction. Consequently, the passible intellect is necessary for the conception by the [material] intellect. Aristotle thus said quite rightly: *And we do not remember, for it is not passible, while the passible intellect is corruptible: and without that, it conceives nothing*. That is to say: without the imaginative and cogitative faculty, the intellect we call "material" conceives nothing.
>
> (Averroës, *In III De anima*, commentary 20)

mode of cognizability, Ger. *Erkennbarkeit*). The word can however also refer to the fact of being endowed with thought (for example "*intellectualitas consequitur immaterialitatem,*" *Summa theologica* I, q. 105, 3c). The neuter plural noun *intellectualia* denotes either the universals (intelligibles) or the separate substances, as objects of philosophical theology (intelligent intelligibles). The context generally allows one to determine the meaning. The verb *intelligere/intellegere*, whose meaning is apparent (= Gr. *noein* [νοεῖν]), remains difficult to translate. The main translations suggested range from "conceptualize" or "think (noetically)" in English, to *penser*, *concevoir par l'intellect*, or *intelliger* in French (the latter a neologism enabling the series *intellect, intelligible, intelliger* to be preserved). None of these is entirely satisfactory.

INTENTION

ARABIC	*ma'nā* [المعنى]
	ma'qūl [معقول]
FRENCH	*intention*
GERMAN	*Intention*, *übersinnliches Erkenntnisbild*, *Vorstellung der Vernunft*, *Begriff*
GREEK	*noêma* [νόημα]
ITALIAN	*intenzione*
LATIN	*intentio*

➤ *CONCEPT*, CONSCIOUSNESS, DASEIN, EPOCHÊ, ERLEBEN, *FORM*, *IMAGE*, LOGOS, OBJECT, *PHÉNOMÈNE*, REALITY, REPRÉSENTATION, RES, SACHVERHALT, SENSE, SOUL, UNIVERSALS, WILL

"Intention" is a doubly polysemic term. As well as the equivocation that exists in French or Italian between the accepted meaning of the term—that of intention as in "to intend to" or as in "moral intention"—and the psycho-phenomenological meaning (which does not exist in German, where the first meaning is expressed as *Absicht*), the term presents, in this second, psycho-phenomenological register, a radical ambiguity, and is deeply divided between divergent philosophical paradigms. Indeed, the semantic field of "intention" covers a series of distinct phenomena, whose progressive coordination in the history of philosophy partly explains how saturated the modern notion of intentionality has become, torn as it is between the Husserlian phenomenological model, and that of the philosophy of mind. Thus, as Hilary Putnam has shown, the term "intentionality" has, in actual usage, widely diverse senses, namely, (1) for words, sentences, and other representations to have a meaning; (2) for representations to be able to designate (that is, to be true for) an actually existing thing, or, when there are several things, to designate each one of these; (3) for representations to be able to apply to something that does not exist; and (4) for a "state of mind" to be able to apply to a "state of affairs" (Putnam, *Representation and Reality*, 1). We will attempt to show here how the same word has come to mean, in German and thereafter in the other languages of philosophy, "the intentionality of linguistic expressions [*die Intentionalität von sprachlichen Äußerungen*]," the intentionality of acts of the mind or of thought (*die Intentionalität von Denktaten*), or that of acts of perception (*die Intentionalität von Wahrnehmungen*).

I. Intention and Meaning

The relation between intention and meaning, or sense, is attested in several theses in Edmund Husserl's *Ideen*, especially when he defines the "fundamental element of intentionality" by equating the "intentional object [*Objekt*]" with "objective sense or meaning," and posits that "to have a meaning, to aim at some meaning," is the fundamental character of all consciousness, which as a consequence is not only lived experience, but a lived experience that has a "noetic" meaning ("*Sinn zu haben, bzw. etwas 'im Sinne zu haben' ist der Grundcharakter alles Bewußtseins, das darum nicht nur überhaupt Erlebnis, sondern sinnhabendes, 'noetisches' ist,*" *Ideen* 1, §90, p. 185 [206], trans. Kersten). In fact, the distortions or gaps that Putnam points out are in part due to the fact that the Husserlian intentional lived experience is assigned two aspects, a "noetic" aspect and a "noematic" aspect; the latter includes precisely the sense "separated out from this

lived experience, insofar as it casts its look appropriately." The "sense" in question is not, however, "significance" or "meaning" as it is commonly understood, but concerns existence and nonexistence.

The "situation" that, according to Husserl, defines "sense" is the fact that "the non-existence (or the conviction of non-existence) of the objectivated or thought of Object pure and simple pertaining to the objectivation in question (and therefore to any particular intentive mental process whatever) cannot steal its something objectivated as objectivated, that therefore the distinction between both must be made" (*Ideen* 1, §90, p. 185 [206], trans. Kersten). The fact that "sense" is indifferent to the existence or nonexistence of the object is therefore the salient phenomenon indicated by the word "sense" in the analysis of intentionality. Husserl says, in this regard, that "the Scholastic distinction between the mental [*mentalem*], intentional or immanental Object on the one hand, and the actual [*wirklichem*] Object on the other hand," refers to the distinction between the object and the existence of the object. Yet he radically contests the assimilation of the intentional object to an immanental object in the sense of an object "actually present in phenomenological purity" (*Ideen* 1, §90, p. 186 [206], trans. Kersten): sense is not a real component of lived experience, like *hulê* [ὕλη] (that is, for example, the data of sensation, *Empfindungsdaten*, and what is more, "*not every really inherent moment* in the concrete unity of an intentive mental process itself has the *fundamental characteristic, intentionality*," *Ideen* 2, §36, trans. Kersten). Nor is it a psychic reality, or even a portrait or a sign. To attribute a "copy function" to intentional lived experience would lead to an "infinite regress": "A second immanental tree, or even an 'internal image' of the actual tree standing out there before me, is in no way given, and to suppose that hypothetically leads to an absurdity" (ibid.). Husserlian "sense" is thus not to be understood as simply borrowing the notion of "immanent object," but as a "*correlate* belonging to the essence of phenomenologically reduced perception [*das zum Wesen phänomenologisch reduzierten Wahrnehmungen gehörige Korrelat*]" (*Ideen* 1, §90, p. 187 [209], trans. Kersten). Insofar as it is limited to the vague notion of representation, the connection Putnam makes between intentionality and nonexistence does not fully capture the Husserlian notion of "sense" (nor, a fortiori, that of a "complete noema" distinguished from a "core of meaning"). Nonetheless, the sense of "intention" or "intentionality" is marked by a series of oscillations that Putnam's taxonomy translates very well.

II. Intention and Intentionality

The conception of intentionality that has for a long time been predominant in French-language literature comes principally from Husserl's *Cartesian Meditations*. According to this conception, (a) "without exception, every conscious process is, in itself, consciousness *of* such and such, regardless of what the rightful actuality-status of this objective such-and-such may be, and regardless of the circumstance that I, as standing in the transcendental attitude, abstain from acceptance of this object as well as from all my other natural acceptances" (*Cartesian Meditations*, trans. Cairns); and (b) every state of consciousness "aims at" something, and carries within itself, as that which is "aimed at" (as the

object of an intention), its "respective *cogitatum*"—what Husserl summarizes as follows in the famous formula of §14 of the Second Meditation:

> Wobei das Wort Intentionalität dann nichts anderes als diese allgemeine Grundeigenschaft des Bewußtseins, Bewußtsein von etwas zu sein, als *cogito* sein *cogitatum* in sich zu tragen, bedeutet.
>
> The word intentionality signifies nothing else than this universal fundamental property of consciousness: to be conscious *of* something; as a *cogito*, to bear within itself its *cogitatum*.
>
> (*Cartesian Meditations*, §14, ed. Ströcker, 35; trans. Cairns)

(N.B.: It is worth pointing out how closely this resembles the formulas introducing the *cogito* in §14, ed. Ströcker, 34: "*Der Transzendentale Titel ego cogito muß also um ein Glied erweitert werden: Jedes cogito, jedes Bewußtseinserlebnis . . . meint irgend etwas und trägt in dieser Weise der Gemeinten in sich selbst sein jeweiliges cogitatum, und jedes tut das in seiner Weise.*")

Several francophone and anglophone interpreters tend nowadays to forget, however, the "fundamental property" of consciousness, "to be conscious *of* something," for Husserl refers neither to "a relation between some psychological occurrence—called a mental process—and another real factual existence [*realen Dasein*]—called an object," nor to "a psychological connection taking place in Objective [*objektiven*] actuality between the one and the other," but rather to "mental processes purely with respect to their essence," that is to say, to "pure essences and . . . that which is 'a priori' included in the essences with unconditional necessity" ("*Vielmehr ist von Erlebnissen rein ihrem Wesen nach, bzw. von reinen Wesen die Rede und von dem, was in den Wesen, 'a priori,' in unbedingter Notwendigkeit beschlossen ist*": *Ideen* 1, §34, p. 64 [74], trans. Kersten). Intentionality is not a connection between a physical fact and a psychic fact.

When we are caught in the contemporary, post-Wittgensteinian opposition between "empiricism" and "intentionalism," we tend to forget that we often invoke intentionality over and against a conception of mental acts that states that no mental act can have an extra-mental entity as its content. So "intentionalism" consists in maintaining the "intentionality of the mind," which means that our acts orient us toward things outside ourselves. This is, however, a weak (even trivial) characterization of phenomenological intentionality, which does not greatly value the Husserlian distinction between a "thing pure and simple" (*Sache*) and a "complete intentional object [*Objekt*]" (*Ideen* 1, §34, pp. 66–67, trans. Kersten). Similarly, the discussions generated by the behaviorist proposition according to which we can and must eliminate all intentional entities (the "mentalist expressions" of natural language) gives "intentional" a meaning that is so reduced or so metaphorical that we might wonder whether "intention" here had anything whatsoever to do with phenomenology. Even more complex debates have developed beyond the field of basic Husserlian studies, particularly in anglophone philosophy. One example of this is the discussion between Wilfrid Sellars and Roderick Chisholm on the relationship between thoughts and the

semantic properties of language. Sellars states that "thoughts as intentional entities are derived from the semantic properties of language," which means that "intentionality resides in the metalinguistic utterances that express the semantic properties of an object language" (the so-called weak irreducibility thesis), whereas Chisholm maintains, on the contrary, that "the semantic properties of language, and thus the metalinguistic utterances that express them, are derived from the properties of thoughts, which are the fundamental support of intentionality" (the so-called strong irreducibility thesis; cf. Cayla, *Routes et déroutes de l'intentionnalité*).

III. Intention and *Intentio*

As fragmented as it might at first appear, the plurality of meanings of "intention" can be seen as relatively coherent if it is considered as the continuation, or as another version, of the original polysemy of the Latin *intentio*. Indeed, in this term we find not only the effects wrought by successive translations, but also the shadow cast over the modern philosophical lexicon by the different stages of the genesis of the medieval notion. Certain contemporary debates about intentionality might, then, appear to some extent to rearticulate—by simplifying or complicating them—problems that were tackled in the Middle Ages within a more unitary framework.

The Scholastic Latin *intentio* presents an extraordinarily rich array of meanings. The term can in fact be translated as (1) attention (German *Aufmerksamkeit*); (2) aim, objective, purpose (German *Anstrebung*, *Absicht*, *Vorhaben*); (3) relationship, rapport (synonym *habitudo*, German *Beziehung*, cf. Thomas Aquinas, *In Sent. I*, d. 25, qu. 1.3c); (4) meaning, in the sense of a speaker's intention to mean something (*intentio loquentis*, *intentio proferentis*); (5) image, copy, resemblance, similarity (synonym *similitudo*, German *Ähnlichkeit*, *Abbild*); (6) representation, notion, concept (synonyms *conceptio intelligibilis*, *ratio*, *conceptus*, *repraesentatio*, German *übersinnliches Erkenntnisbild*, *Vorstellung der Vernunft*, *Begriff*); (7) intelligible form (synonym *species*); or (8) extra-mental resemblance. The polysemy of *intentio* is mentioned by Duns Scotus (*Reportata Parisiensa* 2, d. 13, art. un., trans. McCarthy, 39; *Ordinatio*, trans. McCarthy, 26), who reduces it to four primary meanings:

Notandum est quod hoc nomen "intentio" est equivocum. Uno modo dicitur actus voluntatis "intentio." Alio modo: ratio formalis in re, sicut intentio rei a qua accipitir genus differt ab intentione a qua accipitur differentia. Tertio modo dicitur conceptus. Quarto modo, dicitur ratio tendendi in obiectum, sicut similitudo dicitur ratio tendendi in illus cuius est. Et isto modo dicitur lumen "intentio" vel "species" lucis.

We have to note that the noun "intention" is equivocal. The first meaning of "intention" is an act of will. A second is: a formal reason present in a thing, in the sense that in a thing, the intention from which the generic type is derived is different from the intention from which the (specific) difference is derived. A third meaning of "intention" refers to a concept. And a fourth meaning [of intention] refers to the way in which one reaches out or extends towards an object, in the sense that a resemblance is one way of extending towards the thing which it resembles. And it is in this sense that the light emitted is the "intention" or the [intentional] "species" of the source of a light.

A. *Intentio* as *actus voluntatis*: Intention and attention

The ethical meaning of *intentio*, the first one that is historically attested, is closely related to the contemporary meaning of voluntary intention. However, since St. Augustine, the dimension of active orientation immanent to the notion of *intentio* has been presented as a characteristic not only of the will, but also, by extension, of any cognitive process. Understood in this sense, *intentio* becomes synonymous with attention. The proximity of intention to attention is well known to phenomenologists. Husserl gives a unified discussion of this (from the noetic and noematic point view) in his analysis of "mutations" or "attentional modifications," when he attempts to describe, for the "complete noema," the variations of the correlative appearance of the noetic modifications (*Ideen* 1, §92, pp. 189–190, trans. Kersten). He stresses, moreover, that

nicht einmal des Wesenszusammenhang zwischen Aufmerksamkeit und Intentionalität—diese fundamentale Tatsache, daß Aufmerksamkeit überhaupt nichts anderes ist also eine Grundart intentionaler Modifikationen—ist meines Wissens früher je hervorgehoben worden.

not even the essential connection between attention and intentionality—this fundamental fact: that attention of every sort is nothing else than a fundamental species of *intentive* modifications—has ever, to my knowledge, been emphasized before.

(*Ideen* 1, §92, p. 192 [215] n. 1, trans. Kersten)

The couple "intention"/"attention" (which corresponds also to the English "directedness") was attested, in exemplary fashion, in St. Augustine's analysis of visual sensation:

Itemque illa animi intentio, quae in ea re quam videmus tenet sensum, atque utrumque coniungit, non tantum ab ea re visibili natura differt: quandoquidem iste animus, illud corpus est: sed ab ipso quoque sensui atque visione: quoniam solius animi est haec intentio.

Further also, that attention of the mind which keeps the sense in that thing which we see, and connects both, not only differs from that visible thing in its nature; in that the one is mind, and the other body; but also from the sense and the vision itself: since this attention is the act of the mind alone.

(*De Trinitate*, 11.2.2, ed. Haddan and Knight)

Intentio and *attendere*, "to pay attention to," "to intend" (German *Aufmerksamkeit*), are often combined. This is true of Abelard, in his theory of abstraction as selective attention (which prefigures the theories of John Stuart Mill and of William Hamilton):

Dum in homine hoc solum quod ad humanitatis naturam attinet intelligere nitimur, utpote animal rationale

mortale, circumscriptis scilicet omnibus aliis que ad substantiam humanitatis non attinent, profecto multa se per imaginationem nolenti animo obiiciunt que omnino ab intentione abiecimus. . . . Adeo . . . ut . . ., dum aliquid tamquam incorporeum per intellectum attendo, sensum usu tamquam corporeum imaginari cogor.

While we try only to conceive in man that which concerns the nature of his humanity—that is, as a mortal, rational animal—, after having eliminated everything else that does not concern the substance of humanity, many things that we had completely rejected from our purview become ob-jects of the mind through the imagination. . . . While I attend to a thing as incorporeal in an act of intellection, I am forced through the use of my senses to imagine it as corporeal.

<div align="right">(Abelard, De intellectibus §19)</div>

The ad-tension (the "tension-toward" or "tending-toward") or the attention in the expression "directedness toward" is thus the first meaning of *intentio* in the field of cognition, whether this "tending-toward" is provoked by the thing itself (that is, the ob-ject present), or whether it is spontaneous (that is, as the aim of a distant or absent term). The etymology of *intentio* as *tendere in aliud* suggests a limited distinction between attention, and aim or purpose strictly speaking (lexicalized in German as *Aufmerksamkeit*, and *Absicht*, *Anstrebung*, and *Vorhaben*). It is in the first sense that Thomas Aquinas writes that attention is the "condition required for the activity of any cognitive faculty" ("*ad actum cuiuslibet cognoscitivae potentiae requiritur intentio*," *De veritate*, quarto 13.3c). In the second sense, he stresses that *intentio* refers to the activity of the faculty of thought insofar as it "directs what it apprehends to the knowledge of something else, or to some operation [*id, quod apprehendit, ordinat ad aliquid aliud cognoscendum vel operandum*]" (*Summa theologiae* 1, q. 79, a. 10 ad 3m). As Duns Scotus writes, however, precisely insofar as *intendere* means "*in aliud tendere,*" and if it is true that every cognitive power is said to aim or extend toward an object, solely by virtue of the fact that an object is ob-jected with respect to this power: to this degree and under these circumstances, *intendere* is to be understood more precisely as that which is voluntarily oriented toward an object, whether it is absent or present (*Reportata Parisiensa* 2, d. 38, q. 1). Voluntary attention is thus a fundamental and inextricable aspect of *intentio*. This sense is undoubtedly inherited from St. Augustine, for whom it played a central role in his theory of perception and memory. He used this sense of *intentio* almost identically in both his tripartite corporeal vision (that is, [a] the form the body perceived, [b] the image that is formed of it in the intention of the person discerning it, and [c] the attention of the will that joins these two together) and his description of the operation of memory (which also has a tripartite structure: [1] the imaginary vestige that remains in one's memory; [2] the impression of this vestige in the mind's intention, when one recalls it; and [3] the attention of the will that, once again, joins the two together). The original Latin is as follows: "*[a] forma corporis, [b] conformatio que fit in cernentis aspectu, [c] intentio voluntatis utrumque coniungens*" [*De Trinitate*, 14.3.5, pp. 354–56], and

"*1. imaginatio corporis que in memoria est, 2. informatio, cum ad eam convertitur acies cogitantis, 3. intentio voluntatis utrumque coniungens*" [*De Trinitate*, 15.3.5, pp. 430–33]).

B. *Intentio* as form (*ratio formalis in re*)

Intentio can often mean "form." This form has nothing to do with the "form of the body perceived," as described in St. Augustine's theory of vision, but is rather the Aristotelian idea of form. This is to be understood as both the form and the definition (or the definitional form) realized in extra-mental things, according to one of the characteristic ambiguities of the term *logos* [λόγος]. (On the distinction between the two meanings of logos—*logos*-definition and *logos*-form—see Cassin, *Aristote et le logos*, 107–10, as well as 257–93, in particular 260–63.) As *ratio formalis in re* (Scotus, "a formal reason present in a thing"), *intentio* thus refers to what Alexander of Aphrodisias called the *logos koinos* [λόγος κοινός], both a common notion (*logos*-formula) and a common form (*logos*-form), or, if one prefers, the "common definition" and "common nature" fully present in each thing, and equally, which is to say entirely, predicated of all things that are fully what they are by virtue of this common notion and form. The use of the word *intentio* as *ratio formalis in re* continues, then, the idiosyncrasy of Alexander's vocabulary. When, for example, he states that "the definition of man" ("a bipedal terrestrial animal") is common because it applies to "all" men, and is "fully in each one," he substitutes the definition itself for the "common quality named in this definition," thereby combining an expression and what it refers to. This understanding of *intentio* is the one determining what Lloyd calls, with respect to Alexander, the "conventional picture of forms as universals *in re*" (cf. Lloyd, *Form and Universal*, 51), a thesis based on a "confusion of the universal with the form."

C. *Intentio* as *conceptus* (concept)

"Concept" is one of the most frequently attested meanings of *intentio*. It is very clear in the following description by Thomas Aquinas of the process of conceptualization, which includes all of the implied terms:

> Intellectus per speciem rei formatus intellegendo format in seipso quandam intentionem rei intellectae, quae est ratio ipsius, quam significat definitio.

> Formed from a species [form] of a thing, whenever the intellect conceives, it forms within itself an intention of the thing conceived, this intention being the notion of the thing as signified by its definition [or: "by the term 'definition' (when applied to that notion)"].

<div align="right">(Summa contra Gentiles 1, q. 53)</div>

Intentio is thus obviously linked to *conceptio*, *conceptus*, and *ratio*, without ever being exactly synonymous with them. In the above passage from the *Summa contra Gentiles*, intention appears as the content of a notion (= *ratio*), expressed/signified by its definition. But not all texts define it so decisively. In many discussions, *intentio* and *conceptus* are considered to be equivalent. In others, *intentiones* replaces the awkward expression *passiones animae*, which constitutes the top of the semiotic triangle of *De interpretatione* (see SIGN). In this case, it is the tripartite

nature of the *phônai* [φωναί]—that is, as "vocal sounds," as *noêmata* [νοήματα] (noemata or concepts), and as *onta* [ὄντα] (beings, also called "things," *ta pragmata* [τὰ πράγματα])—inherited from the Neoplatonic commentaries on the *Categories* that, when superimposed on the triangle "vocal sounds, affects or passions of the soul, and things," explains the appearance in this context of *intentio* as noema, or concept. *Intentiones* in the sense of *noêmata* is thus part of a history that goes back a long way, with the earliest attested reference perhaps the distinction mentioned by Clement of Alexandria (*Stromates*, 8.8.23.1, ed. Stählin, 3:94.5–12) between *onomata* [ὀνόματα] (names), *noêmata* (concepts, whose names are symbols), and *hupokeimena* [ὑποκείμενα] ("actual substrata, of which concepts are the impressions made within us"; cf. on this point Pépin, "Clément d'Alexandrie," in particular 271–79).

D. *Intentio* as *ratio tendendi in obiectum,*
the angle of the aim or intention

The fourth sense of *intentio*, which at first glance is close to what Franz Brentano calls "*die Richtung auf ein Objekt*" (the orientation toward an object), is in fact the most enigmatic. In some ways, it is bound up with the third sense, if *ratio tendendi* refers to what serves as a formal principle in the act of intention by which a cognitive power is oriented toward its object ("*illud per quod tamquam per principium formale in obiectum tendit sensus*"). In this case, *ratio tendendi* indeed refers to a conceptual *similitudo* that constitutes the angle of the aim or intention. But the analysis becomes complicated when Duns Scotus includes in this fourth sense a resemblance that is both extra-mental and nonconceptual, stating that "*ipso modo dicitur lumen 'intentio' vel 'specio' lucis*" (It is in this sense that the light emitted [or luminosity] is said to be the "intention" or the "species" of the source of the light). There is something quite puzzling about this thesis. First, it assumes that we can treat luminosity (*lumen*) as a *conceptum* produced by an extra-mental thing (*lux*), independent of any activity or act of the intellect. Yet this statement corresponds to a precise theory of intentionality that stipulates that "every concept is [the concept] of a first intention which [the concept] is naturally producible immediately by the thing itself, without any operation or act of the intellect" (Duns Scotus, *Ordinatio* 1.23, ed. Balić, 5:360: "*omnis conceptus est intentionis primae qui natus est fieri immediate a re, sine opere vel actu intellectus negociantis*"). Here, the term *intentio* is used to express an intuition that would be directly opposed to that of modern "intentionalism," insofar as it suggests that objects themselves engender the concepts that represent them to the mind (a thesis that is compatible with the statement by which the *noêmata* are the impressions made within us by the *hupokeimena* [ὑποκείμενα]). This intuition is also in contrast to the theory one assumes to be standard, according to which all intentions, in the sense of concepts, are produced by the intellect, or are the species formed by the intellect, and are existing within the intellect. The example Duns Scotus gives is not, however, a neutral one.

The classical distinction in the medieval theory of light between *lumen*, as the light emitted or radiating in a transparent or diaphanous milieu, and *lux*, as the source of light, assumes that there is an engendering relation between *lux*

and *lumen*, which paradoxically recalls one of the oldest meanings of the concept: the fruit (*proles*) of conception in the literal sense of the term. It is indeed this register that underlies the use of *intentio* when the example of light is discussed: the source of light "engenders" luminosity. "*Lux,*" writes Scotus, "*gignat lumen tamquam propriam speciem sensibilem sui*" (*Ordinatio* 2.13, trans. McCarthy, 276). This vocabulary, which one could readily term "Augustinian," is even more pronounced among theorists of optics or *perspectiva*, particularly when they discuss the theme of the "multiplication of species." One of the founding fathers of the theory, Robert Grosseteste, writes literally that the generic term *lux* has to be broken down into light that engenders (*generans*) or gives birth (*gignens*), and light that is engendered (*generata*) or given birth to (*gignata*): "The light that is in the sun engenders from its substance the light that is in the air [*lux quae est in sole gignit ex sua substantia lumen in aere*]" (Grosseteste, *Commentarius in Posteriorum analyticorum libros* 1.17, ed. Rossi, 244–45). This engendering relation, which preserves both the alterity and a certain essential unity between what engenders and what is engendered, undoubtedly explains why one can discuss, on the shoulders of a further play on the word "species," the theme of the propagation of light, and then the theme of the perception of colors, and beyond that of perception itself, by resorting to the language of propagation, and of the multiplication of natural species. Matthieu of Aquasparta explains in these terms that "every corporeal or spiritual form, real or intentional, has an engendering and self-disseminating force, either actually, as in the case of forms subjected to generation and corruption, or intentionally" (*Quaestiones disputate de gratia*, q. 8, ed. Doucet, 214).

As surprising as it might seem, *intentio* is thus both a rival of *conceptus*, coming from another network and another interlinguistic field (Arabo-Latin, as we shall see, and no longer Greco-Latin), and an equivalent of *conceptus*, as far as the semantic aspect of generation and conception is concerned. Duns Scotus, who was among the first to articulate an authentic theory of intentionality as an orientation toward an object, also played a major role in naturalizing intentionality. He was well aware that *intentio* understood as *conceptus* derived from Arabic theories of optics, and that as *similitudo* or *species*, *lumen* that is multiplied according to three different types of ray (*rectus*, *fractus*, *reflexus*) denotes the "sensible species of *lux*, immediately engendered by it." But he consciously used this perspectivisit theory to explain that the formal reason of a given intellection, the *species genita* (engendered form), which is nothing other than that of the *imago gignentis* (the image of what engenders it), requires a "real presence" of the object to the cognitive power, that is, a "sufficient proximity to enable engendering" of the said species by the object itself, an engendering that places the present object "*sub ratione cognoscibilis vel repraesentati,*" in short, makes it knowable or representable (*Ordinatio* 1.3.3.1, ed. Balić, 6:232). Briefly, then: the word *intentio* serves here to express the process by means of which objects directly engender their image in the intellect. A movement whose directionality is exactly opposite that of an orientation toward the object troubles any understanding of *intentio* as "*ratio tendendi in obiectum.*"

This tension is only relieved once the perspectivist theory of *intentio* is rejected as an epistemological model, and as a framework for a theory of perception based on a direct gnoseological realism—that is, once intentionality no longer functions as a characteristic or a mode of being of *similitudo* or *species* engendered by an object, independent of any perceiving subject. We are now able to trace this decision back to Pierre d'Auriole, who opened up the space for a new reflection on the phenomenality of appearing. Indeed, it was against the idea that once could admit every extra-mental intentional existence that Pierre d'Auriole established his theory, reducing the intentional being of *lumen* to a real being, and reformulating the notion of intentional being in terms of apparent or phenomenal being (*esse apparens*), with intentional being reserved, in the strictest sense, for the mode of being of color in a rainbow. *Esse intentionale* became, on this basis, a synonym of *esse obiectivum* or *fictitium sive apparens* ("objective or fictive or apparent being," that is, phenomenal), and was contrasted to "*esse reale et fixum in rerum naturae absque omni apprehensione*" (real being remaining stable in natural reality outside of any perception). Anything accorded intentional being could not exist outside of perception: it is merely a *conceptus objectivus* (objective concept), or, to put it more accurately, an *apparitio objectiva* (objective phenomenon: *Scriptum*, 1.23, ed. Pinborg, 133–34).

IV. The Geneses of Intentionality

A. In-existence

It was Brentano, consciously borrowing from the Scholastics, who introduced the term "intentionality" (*Intentionalität*) into the vocabulary of psychology. This initiative was directly responsible for the adoption of the term and the concept in intentional psychology and phenomenology. Brentanian intentionality is supposed to define the specificity of mental phenomena, by a kind of relation that is named, rather unfortunately, "intentional in-existence":

Jedes psychisches Phänomen ist durch das charakterisiert, was die Scholastiker der Mittelalters die intentionale (auch wohl mentale) Inexistenz eines Gegenstandes genannt haben, und was wir, obwohl wir nicht ganz unzweideutigen Ausdrücken, die Beziehung auf einen Inhalt, die Richtung auf ein Objekt (worunter hier nicht eine Realität zu verstehen is), oder die immanente Gegenständlichkeit nennen würden.

Every mental phenomenon is characterized by what the Scholastics of the Middle Ages called the intentional (or mental) inexistence of an object, and what we might call, though not wholly unambiguously, reference to a content, direction toward an object (which is not to be understood here as meaning a thing), or immanent objectivity.

(Brentano, *Psychologie- vom empirischen Standpunkt*, 1:124–25 ; trans. Rancurello et al., 88)

One might wonder about the translation of "die immanente Gegenständlichkeit" by "an immanent objectivity." The definite article (*die*) could suggest that it is rather a question of "immanent objective existence," of the opening of the object

as immanent to the psychic. *Gegenständlichkeit* is, however, an expression that is as equivocal as *Intentionalität*. One might also assume that Brentano is using it in the same sense as Bernard Bolzano when, in discussing the influence of "things that make no claim to existence [*Dinge, die keinen Anspruch auf Wirklichkeit machen*]," he wonders about the *Gegenständlichkeit* (objective existence) of the concept "which we quite rightly associate with the word *infinite*." "The next question to be asked," Bolzano writes, "is that concerning its *objective existence*—that is, whether there exist objects to which it can be applied, whether there exist sets which we may judge to be infinite in the sense here" (cf. Bolzano, *Paradoxien des Unendlichen*, §13, p. 13, trans. Prejonsky, 84). "In-existence," which has nothing to do with nonexistence (German *Nicht-Existenz*), denotes a type of presentification that has to do with inherence, in the sense of "being present," "existing in," "residing in" (German *Innewohnen*): in all psychic phenomena, there is an object.

In this sense, intentionality expresses the fact that, as Aristotle writes in *De anima* (8.431b30–432a1), "it is not the stone itself that is in the soul, but the form of the stone" ("*ou gar ho lithos en têi psuchêi, alla to eidos* [οὐ γὰρ ὁ λίθος ἐν τῇ ψυχῇ, ἀλλὰ τὸ εἶδος]"). To speak about intentionality here amounts to saying that the mode of presence of a stone in the soul is intentional and not real, that the extra-mental thing is not "really" but only "intentionally" inherent in the soul. This lexical choice has a history, and its reasons. The notion of "intentional being" must not be confused with that of *esse obiectivum* or "objective." The mention of the "direction toward an object" nonetheless places emphasis on a dimension of mental in-existence—that is, the orientation or direction toward an object—that has caused many problems for readers of Brentano. According to Putnam, Brentano, in contrast to Husserl, did not maintain that "the intentionality of the mental . . . provided a way of understanding how mind and world are related and how it is that in acts of consciousness we come to be directed to an *object*" (cf. Putnam, *Representation and Reality*, 88); rather, he merely wished to indicate that "mental phenomena were characterized by being directed toward contents" (ibid.). Whether or not Putnam's interpretation is well founded, it remains the case that the "tending toward an object" suggested by the currently accepted Latin etymology of the verb *intendere* (*tendere in*) was very early on considered as a characteristic aspect of the kind of mental presentation envisaged by Aristotle in *De anima* (8.431b30–432a1). Radulphus Brito defines intentionality on the basis of this "tending toward": *intentio* is "that by which an intellect tends toward a thing [*tendit in rem*]" (Pinborg, "Radulphus Brito's Sophism," 141 n. 49). In medieval texts, the directionality of *intentio* competes explicitly with the very notion of a mental content. In fact, the same term refers both to the movement by which the intellect is directed toward an object or apprehends a mental content, and to the intrapsychic mode of presentation of this same object and content. This overlap is not without consequences for the status of intentionality in modern philosophy. The nature of this polysemy is fundamentally linked to the history of its translations. Indeed, the word *intentio* only appears in its different usages, at the end of the twelfth century, in the Arabo-Latin translations of Aristotle and of the Peripatetic corpus as a translation of

the Arabic *ma'na* [المعنى]. Its ambiguity is at its origin, the same as that of the term it translates. The word *ma'na* [المعنى] corresponds to the Greek *logos* [λόγος], *noêma* [νόημα], *dianoia* [διάνοια], *ennoia* [ἔννοια], *theôrêma* [θεώρημα], and *pragma* [πρᾶγμα], among others (Endress, "Du grec au latin à travers l'arabe," 151–57). The Arabo-Latin *intentio* has just as many meanings, since it is equivalent to at least three kinds of term: (a) a thought, concept, idea, notion; (b) a signification (in which we find the dimension of the English "to mean," or the French *vouloir dire*); and (c) an entity. That the same term refers at the same time to a mental act, a content, a cognitive state, and an object is clearly apparent in the fact that, from the thirteenth century on, *intentio* has equally meant either the concept of a thing, or the thing itself as it is conceived, or both at once. So the notion of "relational intention" is thus from the outset, in the Middle Ages, programmatically inscribed within the idea of an originary shared belonging of *intentio rei* and *res intenta*. In the same register, there is a further ambiguity in the pair *logos-ma'na* [المعنى], which progressively colors the term *intentio* with the double nuances of "form" (as in the expression "the intention of a thing," *intentio rei*—that is, the "form of a thing") and "formulation" (as in the expression "the intention of

man," *intentio hominis*—in other words, "the definitional formulation characterizing the concept of man," that is, "rational, mortal, bipedal animal").

■ See Box 1.

B. *Intentio* as an optical term

If *intentio* is often a synonym both for a concept and for the thing conceived, the notion itself of presentation / presentification / intentional presence covers several other lexical networks. A first set is linked to the technical vocabulary of optics, and to the dissemination of the theories and the work of Alhazen, for whom *intentio* was the name of the form affecting the apparatus of sight, and then by extension its mode of being in the physical medium of transmission: one speaks, in this sense, of the *esse intentionale* of the thing *in medio*. This is the sense in which the Latin translation of the Averroës *Magnum commentarium* on Aristotle's *De anima* discusses the "spiritual being" of the extra-mental things affecting sight: in the medium of transmission, the *res* has an *esse spirituale*, not an *esse materiale*. The equivalence between *spirituale* and *intentionale* is a characteristic of the Latin lexicon of Averroës (cf. Averroës, *Magnum commentarium in* De anima 2, comm. 97, ed.

1

Intentio and *ma'nā* [المعنى]

The Arabic *ma'nan* (with the article: *al-ma'nā* [المعنى]) means what is on one's mind, what one is referring to, what one means (German *meinen*—no etymological link to English "mean"; French *vouloir dire*) by a word, or a notion. The Arabic root *'NY* [ع ن ى] indeed means "to aim." Ninth-century translations chose the word to translate several meanings of the Greek *logos* [λόγος]. So in Aristotle's treatise *De anima*, we read that sensation is affected by color, or flavor, or sound, not insofar as each of these is said, but to the extent that it is such and such a quality, and "according to *logos*" (2.12, 424a24, trans. Barnes). Commentators have sought to define more precisely the status of this being which affects sensations in this way. Themistius (*Paraphrase of* De anima, ed. Heinze, p. 78, 3.10.13) also uses *logos* [λόγος]. The Arabic translates the term in Themistius's paraphrase of Aristotle as *ma'nā* [المعنى] (1.7.11, trans. Lyons), as it does for Aristotle's original (Averroës, *Magnum commentarium in* De anima, §121, ed. Crawford; cf. Bos, *Aristotle's* De anima *Translated into Hebrew*, 107.658). Avicenna uses the term in a number of different senses (cf. RT: Goichon, *Lexique de la langue philosophique d'Ibn Sînâ*, §469, pp. 253–55), including one meaning, very close to our own, that was close to the *lekton* [λεκτόν] of the Stoics (*Avicenna's* De anima, 287). In the twelfth century, the word

was translated from the Arabic of Avicenna and Averroës by the Latin word *intentio*. Likewise, Jewish translators from the Ibn Tibbo (or Ibn Tibbon) family translated it as *'inyan* [עִנְיָן]. Latin translations popularized this meaning, which thus has little in common with our "intention," in the sense of "to intend to do something." It is in this sense that we talk of "intentional species" (Roger Marston was the first to use the term) as what our perceptive organs receive, stripping concrete things of their matter to retain only their form. Avicenna defined the object of logic as being "the second intellected concepts [*ma'ani* (معاني)] which are based on the first intellected concepts, [and which are based on them] from the point of view of [the fact of their having] the quality of [being] that by which we attain the unknown from the known, not from the point of view of the fact of their being intellected: they have an intellectual existence that depends on absolutely no matter, or that depends on noncorporeal matter (*Shifa': Métaphysique*, 1.2, 10.17–11.2). The Scholastics followed him by distinguishing *intentio prima* and *intentio secunda* (starting with Godefroid de Fontaines), and this usage became so common that it enabled François Rabelais to joke: "comedere secunda intentiones" (to eat second intentions: *Pantagruel* 1.7), that is to say, pure abstractions (see Box 2 below). This mode of existence

in the intellect alone was sometimes called *intentionalitas* (Pierre d'Auriole, Étienne de Rieti), and the phenomenole usage of "intentionality," borrowed by Husserl from Brentano, is the most recent part of this history.

Crawford, 277.28–30): "*Color habet duplex esse, scilicet esse in corpore colorato [et hoc est esse corporale] et esse in diaffono [et hoc est esse spirituale],*" which Albertus Magnus translated as, "In matter, form has material being, in the diaphanous, on the contrary, color does not have a material being, but a spiritual being" (Albertus Magnus, *De intellectu et intelligibili*, 1.3.1).

C. *Intentio* as the form of the inner senses

A second lexical network is provided by the terminology particular to the *Avicenna latinus*, which uses the word *intentio* to refer to a representation whose origin is nonsensible, formed in the inner senses, and associated with a sensible apprehension effected by the outer senses. In this network, *intentio* refers in its literal sense to the *vis aestimationis* or estimative faculty, the role of which is to apprehend "unsensed intentions residing in singular sensibles." Understood in this way, "intentions" are what the inner senses perceive of a sensible reality without the "intermediary of the outer senses." The "unsensed intentions of the sensibles" are thus contrasted with the "forms of the sensibles" that are at first perceived by the outer senses, and only subsequently by the inner senses (and because of them). A characteristic example of an "intention" in this sense is the property or character of "dangerousness" of a wolf, which a sheep perceives in a nonsensible way, and which causes it to run away at the sight of a wolf, that is, when its "form" is presented to its outer senses (see Box 2 here, and SENSUS COMMUNIS). In Averroës, the opposition between intention and image acquires a new, almost "iconic" aspect. Indeed, for him, an image only "depicts" certain external characterisitics of a real object, or certain of its particular or common sensible properties (color, "'form" in the sense of "figure," etc.), but it does not "represent" them. *Intentio,* by contrast, represents certain elements of the "individual this" that are not given in an image, and that correspond to what this individual is insofar as it is "this individual." To speak of the iconic aspect of *intentio* thus means that *intentio* alone makes present a given individual as the individual he or she is, whereas an image only presents a set of sensible characteristics. For Averroës, it is a specialized faculty, the cogitative faculty, that is capable of separating out *intentio* (*ma'nā al-khayāl* [معنى الخيال]) from the image (*al-khayāl* [الخيال]).

▪ See Box 2.

The distinction Porphyry makes between first imposition (*prôtê thesis* [πρώτη θέσις]) and second imposition (*deutera thesis* [δευτέρα θέσις]) of names is partly what forms the basis for the medieval analysis of *intentiones* as first intentions and second intentions. According to Porphyry, names are first applied ("first imposition") to sensibles, and only subsequently to intelligibles, considered as things that are "anterior in themselves" (that is, naturally), but posterior in the order of perception (Porphyry, *In Categoria Aristotelis*, ed. Busse, 90.20ff. and 91.20–27). Being perceived first (i.e., before the "commons"), sensibles or individuals are the first objects of signification (ibid., 91.6–12). Intelligibles are thereby the object of a "secondary" linguistic imposition. In the Middle Ages, the distinction between the two types of imposition was used as a tool for differentiating between the ways in which thought is oriented toward an object. For Pierre

d'Auvergne, "the intellect has two ways of being oriented towards things [*supra res ipsas intellectus duplicem habet motum*]." A first movement orients it directly or immediately toward things themselves. Through this movement, it obtains knowledge of the nature of the things on which it imposes a name. This "nature" is the quiddity of a thing, and the name imposed is a name of first intention ("man," "animal," "Socrates"), because it signifies "the concept of the intellect that is first oriented toward the thing itself [*in rem ipsam primo intellectus intendentis*]." The second movement is the one whereby the intellect is oriented toward a thing that is "already apprehended," in order to attach to it the "conditions" of consideration upon which depends the attribution of a second-intention name, or "universal name." Starting out from the same premises, the Modists developed an actual theory of intentions.

The *modista* Radulphus Brito (Raoul le Breton) defined *intentio* as "that by which the intellect is oriented towards a thing [*tendit in rem*]." He articulated the contemporary distinctions (those of Simon of Faversham or Pierre d'Auvergne) into an actual combined system where we find both the Aristotelian and Thomist topos of the "three operations of the intellect" (apprehension, judgment, reasoning) and the Modist semantic theory of paronyms. He was thus able to bring into play a single distinction between the abstract and the concrete at the three levels of operation, allowing him to conflate the trivial opposition between the intention and the thing. At the level of the first operation (the apprehension of a reality according to its own particular mode of being), Brito made the distinction between a first abstract intention, or "knowledge of the thing" (*cognitio rei*), and a first concrete intention, or "the thing as it is known" (*res sic cognita*). He thus returned to the theme of paronymy (the abstract/concrete relation), which had provided his predecessors with the general framework for the intelligibility needed to elucidate the status of second intentions. For Brito, however, the correspondence between the paronymic meaning and the semantic status of intentions could be generalized into an actual theory of intentional objectness, since he maintained that every kind of knowledge "names its object" in the same way that "abstract accidents name their subject," which is to say, concretely: "*Et ita semper cognitio denominant suum obiectum, sicut accidentia abstracta denominant suum subiectum*" (cf. Pinborg, "Radulph Brito's Sophism," 141). From this basis, an entire taxonomy was established, encompassing *prima intentio in concreto* (joining together *res intenta*, "the thing intended," and *prima intentio in abstracta*, "first abstract intention"), *intentio secunda in abstracta*, and *intentio secunda in concreto*, these last two assigned once again to the second and then the third operations of the intellect. This ponderous architecture was brutally shaken up by the Nominalists, particularly William of Ockham, who reconfigured the theory of impositions and the theory of intentions into an entirely different doctrine.

Taking into account what was for him a cardinal difference separating words in spoken and written languages from the concepts and terms of the language of the mind, William of Ockham redefined the relationship between "impositions" and "intentions."

▪ See Box 3.

2

"Cogitative" and its Greek, Arabic, and Latin equivalents

In the vocabulary of medieval philosophical psychology, the distinction between *nous* [νοῦς], *to noêtikon* [τὸ νοητικόν], and *to dianoêtikon* [τὸ διανοητικόν] (literally "intellect," "intellective or noetic faculty," and "dianoetic faculty") was usually reduced to an opposition between the Arabic or Latin equivalents of *nous* and *to dianoêtikon*. This reduction corresponds to the fact, noted by Bodéüs (Aristotle, *Catégories*, ed. Bodéüs, 146 n. 6), that *De anima* does not strictly delineate between the faculty called *to dianoêtikon* in 413b13, 414b18, or 431a14, and the faculty is elsewhere referred to as *to noêtikon*. The French translations of the Greek, which range from *faculté discursive* (discursive faculty: Tricot) to *réflexion* (reflection: Bodéüs), show that for them, the basic opposition was between *dianoia* [διάνοια]—so-called discursive thought—and *noêsis* [νόησις]—so-called intuitive thought. This same division commands how the field was organized in medieval times, when it was structured around the pair *vis cogitativa* and *intellectus*.

In the tradition of Arabic Peripateticism, *to dianoêtikon* appears at the center of a three-term system, corresponding to the so-called passible or material "faculties of perception": the imaginative, the cogitative, and the rememorative. These terms need to be clarified, however. In Avicenna, for whom there are five inner senses (see SENSUS COMMUNIS), the cogitative refers to the same faculty as the imaginative. It is the third inner sense, the *vis cogitativa* (*al-quwwat al-mufakkira* [القوة المفكّرة]) in man, or *imaginativa* in animals, whose function is to divide and compose the images retained by the imagination, the second of the inner senses. In Averroës, on the other hand, for whom the division of the inner senses is tripartite, the cogitative assumes part of the functions that Avicenna reserves for the estimative: perceiving intentions (see Box 1). In his commentary on *De sensu et sensato*, Averroës describes as follows the functioning of the three faculties relating to the "inner senses": "The sense perceives the extra-mental thing, then the *formative faculty* [i.e., the imaginative faculty] forms [an image] of it; then the *distinctive faculty* [i.e., the cogitative faculty] distinguishes the intention of this form from its description; then the retensive faculty receives what the distinctive faculty has distinguished" (cf. Black, "Memory, Individuals, and the Past," 168–69). In the Latin translation of Averroës's *Magnum commentarium* on Aristotle's *De anima*, these three faculties are designated using the triad (*virtus*) *imaginativa-cogitativa-rememorativa*—three

faculties whose function is to "make present the form of the thing imagined in the absence of the corresponding sensation."

The five faculties distinguished by Avicenna—(a) common sense (*banṭāsiā* [بنطاسيا]), (b) imagination, (c) imaginative (for animals) or cogitative (for man), (d) estimative, (e) memory—are thus reconfigured by Averroës: (1) *imaginativa* = (a), (b); (2) *cogitativa* = (c), (d); (3) *rememorativa* = (e). In fact, the particular role of the "cogitative" faculty endowed with a "rational character" consists of either (1) depositing or registering in memory the "intention" of the imagined form taken with the individual, which serves as the substrate of that form, or (2) distinguishing memory from this individual substrate in the "imaginative" (*al-mutakhayy-ila* [المتخيّلة]) or "formative" (*al-muṣawwira* [المصوّرة]) faculty and in the "imagination." The cogitative is thus in a median position relative to these two other faculties: in relation to imagination, because of its abstractive activity, which works with images; and in relation to memory, because of its activity of depositing, which consists of transmitting abstract individual intentions to a receptacle (a faculty of the mind conceived as the "receiving faculty" or instance). It is from this deposit, receptacle, or store that one draws the "imagined intentions" necessary for the noetic process of abstraction: the cooperation among the faculties of the inner sense enables the "presentation of the image of a sensible thing" upon which the activity of the "*virtus rationalis abstracta*" is exerted. This activity, as the agent intellect, "extracts a universal intention" and then, as the material intellect, "receives" it and "apprehends" it (or "comprehends" or "thinks" it). For Averroës, the distinction between "cogitative faculty" and "intellect" (cf. *Magnum commentarium in* De anima 2.29, ed. Crawford, 172.25–173.32, in relation to 414b18: "*Deinde dixit: Et in aliis distinguens et intellectus. Idest, et ponamus etiam pro manifesto quod virtus cogitativa et intellectus existunt in aliis modis animalium que non sunt homines*") is misinterpreted in the Galenic tradition. It is also misinterpreted by all those who attribute to Aristotle a doctrine of the intellect as a "faculty existing in a body." In the Scholastic tradition, "cogitative" generally retains this meaning. Certain authors, however, stress the aspect of "individual abstraction." If the cogitative does not produce universal concepts, it at least presents or delivers the individual form of a thing insofar as it is such-and-such a "thing" (for example, a "man" or a "line"). This individual "form" is not reduced to the collection of particular or common accidents that

characterize each individual as an "individual" (this man, this line).

> Ipsa [= virtus cogitativa] cognoscit intentiones, id est formas individuales omnium decem praedicamentorum, ut formam individualem huius hominis, secundum quod hic homo, et hanc lineam . . . et huiusmodi plura ita quod non tantum cognoscit accidentia sensibilia communia et propria, sed intentionem non sensatam, et exspoliat eam ab eis, quae fuerunt ei coniuncta de sensibilibus communibus et propriis.

> It is this [*virtus cogitativa*] which knows intentions, that is, the individual forms of what falls into one of the ten categories, like the individual form of this man inasmuch as he is this man, or like this line . . . and many other things of this same kind, such that it does not only know the common and particular sensible accidents, but also the nonsensible intention, which it extracts and separates out from the common and particular sensibles that are connected to it.

Intentions and imposition according to William of Ockham

William of Ockham calls categorematic signs "first-imposition names," that is, oral or written words that conventionally signify individual extra-mental things. He calls the natural conceptual signs of the individual things to which they are subordinate "first intentions"; the categorematic oral or written words conventionally signifying other conventional signs he refers to as "second-imposition names"; and the mental categorematic conceptual signs that signify naturally other mental signs he calls "second intentions." This general grid proves to be remarkably complex in its concrete applications. The expression "second-imposition name" can be understood, in fact, in two ways. (1a) In the broad sense, any name that signifies conventionally instituted sounds as conventionally instituted sounds is a second-imposition name, that is, insofar as it signifies, whether or not it is applicable to the intentions of the soul (which are natural signs). This is the case for expressions such as "noun," "pronoun," "conjunction," "verb," "case," "number," "mood," "tense," and so on, "understood in the way a grammarian uses them," that is, "to signify the parts of speech *while* they signify" (nouns that are predicable of vocal sounds both *when* they do not signify and *when* they do signify are thus not second-imposition names). (1b) In the strict sense, any name that signifies conventionally instituted signs without being able to be applied to the intentions of the soul (which are natural signs) is a second-imposition name. This is the case for expressions such as "conjugation" or "figure,"

which cannot signify an intention of the soul (and this is the only reason to exclude them from second-imposition names in the strict sense), since there are no distinctions of conjugations or of figures for "mental" verbs.

First-imposition names are all names that are neither names in the sense of (1a) nor names in the sense of (1b). However, the expression "first-imposition name" can be understood in two ways. (2a) In the broad sense, everything that is not a second-imposition name is a first-imposition name: in this sense, syncategorematic terms are first-imposition names. (2b) In the strict sense, only categorematic names that are not second-imposition names are first-imposition names.

First-imposition names in the strict sense of (2b) are themselves of two sorts, that is, certain among them (3a) are second-intention names, others (3b) are first-intention names. Second-intention names are those which are "precisely" imposed in order to signify both intentions of the soul that are natural signs, and other signs that are instituted conventionally (or however such signs are characterized). There is thus (3a1) a broad sense and (3a2) a strict sense of the expression "second-imposition names." In the broad sense (3a1), a second-intention name is a name that signifies intentions of the soul (which are natural signs), and that can also signify or not "conventionally instituted signs, only *when* they are signs," that is, second-imposition names in the sense (1a). In the sense (3a1), a second-intention name can also be at the same time a second-imposition name. This is the case

for names used in relation to what are called "universals." The names "genus," "species," and so on, like the names "universal" and "predicable," are second-intention names because they signify "nothing other" than intentions of the soul (which are natural signs), or arbitrarily instituted signs. In the strict sense (3a2), a second-intention name is a name that only signifies intentions of the soul (which are natural signs). In the sense (3a2), "no second-intention name is a second-imposition name."

First-imposition names are all other names, that is, all those that signify things that are neither signs, nor what characterizes these signs. But here again, we can distinguish between (3b1) names that signify "precisely" things that are not signs intended to substitute for other things, and (3b2) names that simultaneously signify such things and signify signs, such as the names "thing," "being," "something" (*aliquid*), and so on, that is, what the Scholastics termed "transcendentals."

There are thus signs that signify both conventional signs and mental signs: these are second-imposition names in the broad sense (1a), which are either oral words or written words, and second-intention names in the broad sense (3a1), which are concepts. There are also names that are both first imposition and second intention: first imposition, because they do not signify a conventional sign; but second intention, because they signify a mental concept: the case par excellence is the oral word "concept."

This complex classification—which allows us to foreground a metalinguistic aspect by identifying the possibility of a reciprocal application at the two levels of mental language and conventional language (since a second-imposition name can be applied to a mental concept, and a second-intention name can be applied to a conventional sign)—is, if we forget the "particularist" ontological thesis that supports the whole thesis, one of the three pillars of the doctrine of universals.

V. Intentionality as an Anti-Aristotelian Theory

A. Action of things or of the intellect?

The medieval theory of intentionality, even if it is based on a rereading of *De anima* 3.8, 431b30–432a1, is to some extent anti-Aristotelian. To be more exact, it opposes the naturalist dimension of the notion of psychic impression elaborated by commentators on the basis of the opening lines of *De interpretatione*. Indeed, the principal function of the idea of an intentional presence of the thing to the intellect is to break

with a strictly empiricist (or, as one might say, "inscriptionist") reading of the *passio animae*, attributing to Aristotle a reduction of concepts to simple impressions or inscriptions (or resemblances) of things "in" the soul. Because intentionality is here understood as an orientation of the intellect toward the object, the explanation of thought as the impression of a *species* in the soul by the thing itself—a causal model that poses the problem of how one passes from a sensible impression to an intelligible concept, and makes it necessary to distinguish between two types of *species*: a *species* that is "imprinted in the senses" (*species impressa*) and a *species* that is "expressed in thought" (*species expressa*)—gives way to the description of the process by which a cognitive power is actively oriented toward an object, where its act terminates. In Aristotelian terms, there is thus a shift in the problematics of the theory of intentionality. It is no longer a matter of explaining what action exterior things exert on the soul through the intermediary of sensible *species*, but rather of describing the way in which the intellect, understood as a power of apprehension (*potentia apprehensiva*),

moves to act (*perficitur*) and ends (*terminatur*) as an apprehension "of something" (see SENSE, Box 1).

Duns Scotus gives the theory its canonical formulation when he posits that "in an apprehensive power, the motor principle does not have to be the proper object of this power from the angle where it is a motor, but the object from the angle where it terminates the given power," that is to say, its endpoint, its pole of actualization, its "ending"—which is tantamount to saying that "cognitive power does not so much have to receive the *species* of an object [*recipere speciem obiecti*], as to be oriented by its activity toward it [*tendere per actum suum in obiectum*]."

B. Intention, representation, and aim

The Brentanian thesis of "intentional in-existence," which defines psychic phenomena by the fact that they "contain an object within them intentionally," goes hand in hand with a second thesis, equally popular, that affirms that every mental act is either a representation (*Vorstellung*) or "based on a representation" (this is the case, for example, with judgments and affections). For the school of thought around Brentano, then, the question of intentionality develops spontaneously out of the notion of representation, which is understood as essentially "oriented" toward an object (*Gegenstand*). The notion of intentional object is therefore explored from the point of view of representation, against the background of a distinction between the ob-ject itself, the *ob-stant* or *Gegenstand* ("the object taken independent of thought" or the object "as it stands before" thought, and is "that toward which representation is directed"; Twardowski, *Zur Lehre von Inhalt und Gegenstand der Vorstellungen*, 4), and the "immanent object" (*immanentes Objekt*) or "content" (*Inhalt*) of representation, which alone deserves the name of "intentional object," literally speaking. Now, however, the case of "representations without objects" (*gegenstandslose Vorstellungen*), following the terminology previously introduced by Bolzano, will stand in need of redefinition. It is not enough to say that every representation has a content, but that each representation does not for all that have its corresponding ob-ject. It is false, from the point of view of terminological rigor, to talk about "inobjective" representations. According to Twardowski, there are no representations "which would not represent something as an object" (ibid., 25), or representations "to which would correspond no object." There are, however, a number of representations "for which an object does not exist" (ibid., 29). Even if these comments fall far short of the "broadening of the sphere of the object even beyond being and non-being" (which only Alexius Meinong's "theory of objects" will provide), the idea of "representations for which an object does not exist" exposes one of the fundamental problematics conveyed by the notion of intentionality (see RES).

The medieval theory of objectual intention (*aspectus*) is, in this sense, part of the proto-history of the *gegenstandslose Vorstellungen* (representations without objects). According to this theory, particularly elaborated by Pierre-Jean Olieu (Olivi) around 1280, every cognitive act (sensible or intelligible) requires an *aspectus* "having as its actual term an object" or, more literally, "ending in actuality on an object [*super obiectum actualiter terminatus*]." This does not mean that the principle of the cognitive act must in all cases be

a real object, functioning as a cause of perception: in many cases, on the contrary, it is a substitutive, purely "terminative and representative" object that is the principle of the cognitive act—for example, a memorial *species* (if it is a question of a "thought of absent objects")—and that "presents itself in place of the external thing," when "this thing is not itself the object of an aim or intention" (Olieu, *Quaestiones in secundum librum Sententiarum*, q. 74, ed. Jensen, 3:113). A representation, an image, a *species*, or a "presential object" (*praesentialis*) thus provides a substitutive presence, which "is the object of an aim or intention, and terminates it," whenever there is no object (really) present. The distinction between a terminative object and a causal object gives a more interesting range of meaning to intentionality understood as orientation toward an object.

C. "Intention"/"in-tension"/"pro-tention"

If the triad "in,tention"-"pro,tention"-"re,tention" has enjoyed a particular fortune in the phenomenological analysis of the intimate consciousness of time, the intentional structure of thought itself was presented in the Middle Ages in terms of "pro-tention." The vocabulary of "tending" (*in/pro*) immanent to intentionality was established more permanently in the fourteenth century. During this time, it combined with the vocabulary of "aiming" expressed with and around St. Augustine's and Boethius's notion of the "highest pointing of the mind" (*acies mentis*; see ARGUTEZZA). For medieval philosophers, to say that the "intentional power," the *vis inventiva* of a cognitive faculty (*potentia cognitiva*), "tends toward an object [*in obiectum intendit*]" was to say that it "extends toward it within itself [*intra se protenditur*]" and that, "in this pro-tention" itself, "it points toward that which is ob-jected" ("*et protendendo acuitur quod est acute ad aliquod sibi obiectum intenta*"). "Acuity" does not refer, then, to a circumstantial modality of thought that is subject to variation: it is a constitutive trait of its intentionality. Intention, as an "actual aim" (*aspectus actualis*), is fundamentally pro-tentive. It is a movement of tending toward, of opening out or unfolding, by which a cognitive faculty "is sharpened" and "points" in the direction of the object (Olieu, *Quaestiones in secundum librum Sententiarum*, ed. Jensen, 3:64).

| INTUITION

➤ BEAUTY, BILD, COMPARISON, *IMAGINATION*, *INSTANT*, INTENTION, MEMORY, MERKMAL, SIGN

"Intuition" comes from the Latin *intuitio*, which in Chalcidius's translation of Plato's *Timaeus* refers to an image reflected in a mirror. The term is derived from the verb *intueri*, which means "to see," "to look upon" (*tueri* means "to see" and "to look over," "to protect"), with a connotation of intensity—attentively, fixedly, admiringly, immediately, and all at once—and applies as much to sight in the literal sense, that of the eyes of the body, as to metaphorical sight, through the eyes of the soul. Intuition is thus a direct vision of something given that presents itself immediately as real and true. In modern philosophy, the term brings together a Cartesian source (what is clear and evident) and a Kantian source (the objectivity of the object).

I. Intuition and the Evident

A. Intuition, sensation, intellect

The first network is that of sensible intuition, which is connected to the immediacy of perception and thus to its truth (see PERCEPTION, Box 3; SENSE, I.A and Box 1; cf. *TO SENSE*, TRUTH). The second is connected to intelligible

intuition, which has to do with ideas (see *IDEA*). The English and French *intuition* covers a wide range of terms denoting, even before Plato, this kind of instantaneous intellection; it is frequently used to translate the Greek *nous* [νοῦς], "mind," or *noêsis* [νόησις], "thought," and even *noêma* [νόημα], "object of thought," whenever they are being contrasted with more discursive procedures, such as *dianoia* [διάνοια], but it is equally often used to translate *epibolê* [ἐπιβολή] (from *epiballô* [ἐπιβάλλω], "to throw onto," from which we get the standard meanings of "imposition," "apposition," "superimposition," "an imposed tax," "project"), a terminology that, from Epicurus to Plotinus and beyond, refers to the direct application of the mind. The various Latin translations are just as complex: *intellectus* is one of the translations of *nous* (but only one, since *nous* is also translated as *sensus*; see SENSE), and yet it is not translated into French by *intuition*, but rather by *intellect* or *entendement* (understanding); and we find the Latin *intuitus* in the philosophical texts of the European classical age, in Descartes, for example (the Scholastics had coined *notitia* or *cognitio intuitiva*, which were taken up by Spinoza and Leibniz). (On this cluster of terms linked to the names of the faculties, see INTELLECT, INTELLECTUS, UNDERSTANDING; cf. *CONCEPT, REASON*.)

B. Intuition and the relation to the divine

"Intuition," via *nous* and *intellectus*, is one of the ways of characterizing God (see INTELLECTUS, TERM, Box 2; cf. GOD, LOGOS).

The theological importance of intuition relates to the problem of "beatific vision" or "transparency," which was later on transposed in the metaphysics of Malebranche as a question of the "vision in God"; intuition is also both closely connected and opposed to the thematics of truth as "light" or "suddenly seeing clearly" (see LIGHT, SVET, TRUTH; cf. OIKONOMIA).

C. Intuition and subjectivity

Apperception, properly speaking, which is connected to the consciousness that a subject has of itself, constitutes a particular case of intuition (see COMMON SENSE, CONSCIOUSNESS, ERLEBEN, I/ME/MYSELF, PERCEPTION, *SELF*, SENSE, SOUL, SUBJECT, TATSACHE (and below, §III); cf. *ACT, CERTITUDE, DASEIN*).

A constituting relation-to-self opens out on to the singularity of the individual (see GENIUS, INGENIUM, *PERSON*). Intuition is characterized in this context by an intelligent, but always spontaneous or sudden behavior, perhaps even a prephilosophical one, based in a certain analogy of *noêsis* with "flair" (see UNDERSTANDING, Box 1); it can be understood in terms of the connotations of *ḥads* [الحدس] in Avicenna's Arabic (see INGENIUM, Box 1), and it is found in the opposition English speakers make between semantic intuition and pragmatic insight (the "sight" that illuminates or clarifies a difficulty).

More generally, the position of the subject determines a *Weltanschauung*, an "intuition of the world," whose meaning ranges from the cosmological to the romantic, and even ideological (see WELTANSCHAUUNG).

II. Intuition and the Object of Intuition

A. The various usages of *Anschauung*

The Kantian revolution split the history of the different usages of *Anschauung* (and of "intuition") in two, insofar as it set up in opposition to the intellectual intuition (we already find *intuitio intellectualis* in Nicholas of Cusa) inherited from *noêsis*, which is contrasted with the empirical and the sensible world, the paradoxical concept of a sensible intuition (*sinnliche Anschauung*) that is nonetheless susceptible of being "pure" and that constitutes the foundation of the given of phenomena or of the diversity of experience. For Kant, the former is deeply illusory, and the latter forms a system with the concept (*Begriff*) and constitutes the field of representation. (On the singularity of Kant's vocabulary, see BEGRIFF and *CONCEPT*, ERSCHEINUNG, GEGENSTAND, REALITY, REPRÉSENTATION, SEIN: cf. OMNITUDO REALITATIS.) Kant's revolution is correlative with the broadening of the meaning of "aesthetics" to cover the general science of sensibility (see AESTHETICS; cf. GEFÜHL, SENSE).

In French, *comprendre* and *penser* correspond to some extent to the activity of *Begriff*, but the language lacks a technical term for *anschauen* and so has coined the verb *intuitionner* (see BEGRIFF, GEMÜT, Box 1, and GERMAN).

Since Kant, transcendental idealism has explored the possibility of separating out the pure intuition of the sensible, but without reference to a noumenal "thing in itself," so conferring upon it the meaning of a constitutive activity (see TATSACHE). Conversely, the epistemology of quantum physics has explored a problem of visualization that is not connected to a sensible given, but instead to the theoretical possibility of representation (see ANSCHAULICHKEIT and the particularly significant evolution of the meaning of this term).

B. The "given"

Intuition implies a certain mode of access to an object. Its character of being immediately obvious culminates in the problematic of the given and of the "donation without a donor" (see ES GIBT, HÁ, and more generally, *IL Y A*).

Contemporary philosophy has been divided between a devalorization of intuition in favor of praxis in the Marxist tradition (see PRAXIS) and the reconstitution of a doctrine of the intuition of essences on the far side of the Kantian critique of the intelligible world, in Husserl and some of the phenomenological tradition, with the thematics of *Wesenschau* or *Wesenanschauung* (see GEGENSTAND).

III. Intuition and Intuitionism

Intuitionism can be understood in several ways, all of which refer to a valorization of the immediacy of a type of knowledge.

On its usage in moral philosophy, in particular in the Anglo-Saxon world, see FAIR and compare MORAL SENSE, UTILITY, WERT. On its usage in the epistemology of mathematics, and more generally in the field of analytical philosophy, where "intuitionism" (Poincaré, Brouwer) is opposed to "formalism" and "logicism," see EPISTEMOLOGY and PRINCIPLE, and compare ANSCHAULICHKEIT.

ISTINA [истина] (RUSSIAN)

ENGLISH   truth
FRENCH   *vérité*
GREEK   *alêtheia* [ἀλήθεια]
HEBREW   *'emet* [אֱמֶת]
LATIN   *veritas*

➤ TRUTH, and DASEIN, MIR, POSTUPOK, PRAVDA, REALITY, RUSSIAN, SOBORNOST', SVOBODA, *TO BE*, *WORLD*

The Russian word *istina* [истина], unlike its French translation *vérité*, has a primarily ontological sense: it means: "what is, what truly exists." The epistemological sense of "a statement conforming to reality, a true judgment," is secondary and derived in relation to this ontological sense. The logical sense of "veracity" is, moreover, translated by a different Russian noun, *istinnost'* [истинность], so that *istina* and *istinnost'* are translated into English using the same word, "truth." In Russian philosophy there is a fundamental opposition between *istina* as true existence and *istina* as true judgment. Considered separately from its epistemological meaning, the term *istina* can then be understood in two contrasting ways. In the philosophy of Vladimir Solovyov, it has an objective and impersonal character: *istina* is the objective self-identity of reality; but for the existentialists, *istina* takes on a dynamic meaning: "what is" is nothing other than the identity of the act and the event.

I. *Istina*: Truth as the Reality and Self-Identity of Being

The modern Russian word *istina* [истина], like the Slavonic *istina*, corresponds to the Greek *alêtheia*. It comes from the Slavonic *ist*, *istov*, "true," "real" (RT: *Ètimologičeskij slovar' russkogo jazyka*, 144; Preobazhenskij, *Ètimologičeskij slovar' russkogo jazyka*, 1:275–76). Dictionaries propose three versions of the etymology of *ist*: according to the oldest thesis this term is derived from the Indo-European *es-* (to be); according to another it is formed from the prefix *iz-* and from the form *sto-* ("that which is upright," "which is upright"), as in the Latin *ex-sistere*, *ex-stare*; finally, according to Vasmer, the most likely version links *ist* and *istina* to the pronominal form *is-to* ("the same"), analogous to the Latin *iste*. *Ist* means "the same" in modern Bugarian, like the Slovenian *îsti*, and the Serbian and Croatian *ïstî* (Vasmer, *Ètimologičeskij slovar'*, 144).

Pavel Florensky, in *The Pillar and Ground of the Truth*, undertakes a comparative study of the notion of truth among the Slavs, the Greeks, the Romans, and the Jews. For him the Greek *alêtheia* [ἀλήθεια] has a gnoseological meaning of "that which resists forgetting," while the Latin *veritas* has a primarily cultural and juridical sense (it is "the real state of the thing judged"), and the Hebrew *'emet* [אֱמֶת] "comes from the history of the holy word, from theocracy" (*'emet* meaning "faithful word," "reliable promise"). Florensky writes the following about the Russian word:

> Our Russian word for "truth," *istina*, is linguistically close to the verb "to be": *istina*—*estina*. *Istina* in Russian has thus come to mean, by itself, the notion of absolute reality: *istina* is what is (*sušče* [сущее]), what truly exists (*podlinno suščestvujuščee* [подлинно существующее]), *to ontôs on* or *ho ontôs on*; as opposed to what is illusory, apparent, not real, impermanent. The Russian language marks the ontological aspect of this idea in the word *istina*. *Istina* thus means an absolute self-identity, or being equal to oneself, absolute exactness and authenticity (*podlinnost'* [подлинность]).

> (Florensky, *Pillar and Ground*)

The term *sušče* (in Greek, *to ontôs on* [τὸ ὄντως ὄν]) has been translated into French as *ce qui est* (what is) or *l'être* (being) (Berdyayev, *Khomiakov*, 195), as *existant concret* (concrete existent) (Berdyayev, *Essai de métaphysique eschatologique*, for example, 111), and more rarely, as *étant* (being) (Berdyayev, *Khomiakov*, 196). If in French *étant* is opposed to *existant*, in Russian *suščestvujuščee* (that which exists) and *sušče* are considered as synonyms, as are *bytie* [бытие] (being) and *suščestvovanie* [существование] (existence); their opposition normally requires a reference to the French *existence* or the German *Existenz*. So by situating *istina* within this ontological field, Florensky is relating it to the identity of being in itself.

It is this ontological concept of truth that has often led Russian philosophers to stress the fundamental opposition between truth as authentic being (*bytie*) and truth as true judgment. Nicolas Berdyayev acknowledges this:

> Russians do not accept that truth (*istina*) can be discovered by purely intellectual means, by reasoning. They do not accept that truth (*istina*) is merely judgment. And no theory of knowledge, no methodology is evidently capable of shaking this pre-rational conviction of the Russians, namely that apprehending what is, can only be given in terms of the complete life of the mind [*esprit*], the fullness of life.

> (Berdyayev, *Khomiakov*, 81–82)

Istina, understood then as being and the identity of the real, is not accessible to the purely logical or intellectual subject but is always related to the act of a person, to a choice one makes.

II. *Istina* and the Supra-personal Subject (Solovyov)

There are, however, two ways of conceiving of the relation to *istina*. The first, in Vladimir Solovyov, associates the objectivity of being (*istina* as *ousia*, substance and quiddity) with going beyond subjectivity. In reaction to this, the second one, that of the Russian existentialists, interprets *istina* as *energeia* [ἐνέργεια], an act or exercise rooted in the person. In his *Teoretičeskaja filosofija* (Theoretical philosophy), Solovyov makes a distinction between the truth of an isolated fact, or a formally universal logical truth, and truth properly speaking, that is, truth as *bezuslovno-sušče* [безусловно-сущее] (what exists absolutely). *Bezuslovno-sušče* is a noun made up of the substantivized participle corresponding to the Greek *to on* [τὸ ὄν] (being), and the adverb *bezuslovo* (unconditionally), analogous to the Greek *anupothetôs* [ἀνυποθέτως]. Truth in this latter sense constitutes the (possibly inaccessible) object of the risky enterprise that is philosophy. Although philosophy is a personal matter, it requires going beyond the limits of a particular existence. Solovyov writes:

> True philosophy begins when the empirical subject rises up through supra-personal inspiration to the realm of truth (*istina*). For even if one cannot define in advance

what truth (*istina*) is, one must at least say what it is not. It is not in the realm of the separate and isolated self.

(Solovyov, *Teoretičeskaja filosofija*, 213)

In short, truth, namely "what truly exists," is objective. This is why it is only revealed to the "mind" (*esprit*), that is, to the supra-personal or properly philosophical (*dux* [дух], "mind") subject, insofar as it is distinguished from the empirical (*duša* [душа], "soul") and the logical (*um* [ум], "intellect") subject. For Solovyov, a classical thinker of the nineteenth century in the tradition of Hegel and of rationalism, *istina* is thus the self-identify of the supra-personal objective world; it is revealed to the mind that thinks itself.

III. *Istina* and Existentialism

In contrast to Solovyov's objectivism, we find three distinct interpretations of *istina* in Russian existentialism: the term forms part of an individualist problematics with Shestov, a creationist problematics with Berdyaev, and an ethical problematics with Bakhtin.

A. Lev Shestov: *Istina* and the singularity of a person (*ličnost'*)

In the fourth chapter of *Athens and Jerusalem* (1951), Shestov contrasts truth (*istina*) to truths (*istiny* [истины], the plural of truth):

In searching for the origins of being, metaphysics has not been able to find universal and necessary truth (*istina*), whereas in studying what comes from these origins, the positive sciences have discovered a number of "truths" (*istiny*). Does this not mean that the "truths" (*istiny*) of the positive sciences are false truths (*istiny ložnye* [истины ложные]), or at least fleeting truths, which last no more than an instant?

(Shestov, *Athens and Jerusalem*, 334)

"Universal and necessary truth," like Solovyov's "logical truth," is revealed to the "logical subject," designated by the pronoun *vse* [все] ("all," often in quotation marks), analogous to the German *man* (one). The fact that philosophy has been incapable of reaching this "universal and necessary truth" is far from being an objection against metaphysics. On the contrary, "metaphysics does not want to, and must not, give us truths (*istiny*) that are compulsory for all" (ibid.), since they would then merely lead to "constraining truths," likes those that the positive sciences offer us. In order to discover authentic truth, metaphysics has precisely to give up the "sword of necessity," that is, its claims to a valid universal truth.

However, if the logical subject in Shestov and Solovyov is incapable of discovering authentic truth, from an existential point of view, Solovyov's supra-personal subject does not exist. On the contrary, "the truth (*istina*) is revealed to an empirical person (*ličnost'* [личность]), and only to an empirical person" (ibid., 336). Contrasting the empirical person to the *vse* [все] (all), Shestov compares the empirical/transcendental distinction with that of living/dead: "Someone who is alive, what this school of thought calls an empirical person, was the main obstacle for Solovyov" (ibid.). *Istina* thus acquires an existential character: like, for example, Socrates's

demon or Saint Paul's vision on the road to Damascus, it cannot be recognized by "all." Unlike *istina*, which necessarily applies to "all" (*istina* as judgment), *istina* as "what is" is one particular and personal truth, "what truly exists for an empirical person, when this person is alone with him or herself":

It is only when we are alone with ourselves, under the impenetrable veil of the mystery of individual being, of an empirical personality (*ličnost'*), that we sometimes decide to renounce these real or illusory rights, these prerogatives that we enjoy by virtue of our participation in a world that is common to all. It is then that the final, or near-final truths (*istiny*) suddenly burn brightly before our eyes.

(Ibid., 335)

Unspeakable, incommunicable, these ultimate truths die by being expressed in the words and structures of language that attempt to transform them into rational, necessary, comprehensible, and obvious judgments "for ever and for all."

B. Nicolas Berdyaev: *Istina*, communion (*soobščenie*), and creative freedom (*svoboda*)

Berdyaev also opposes truth as judgment and truth as existence:

I am the way, the truth (istina) and the life. What does this phrase mean? It means that truth (*istina*) is not intellectual or exclusively gnoseological in character, but that it has to be understood comprehensively: it is existential.

(Berdyaev, *Truth and Revelation*, 21)

However for Berdyaev, unlike Shestov, existential *istina* is a matter not of the individual, but of intersubjectivity: "Truth is communitarian (*istina kommjunotarna* [истина коммюнотарна]); in other words, it assumes contact (*soobščenie* [сообщение] and fraternity between men" (ibid., p. 24). The best translation of *soobščenie* in French is *communion*; indeed, Berdyaev often uses two words, *soobščenie* and the transliteration of the French word "communion," as synonyms (Berdyaev, *Ja i mir objektov*, 165). Communion is the fruit of love (*ljubov'* [любовь]) and of friendship (*družba* [дружба]). The adjective *kommjunotarnyj*, often used as a secular equivalent of *sobornyj* [соборный] (catholic, universal), is also borrowed from the French. That which is communitarian, as opposed to collective, is based on the freedom (*svoboda* [свобода]) of each person. The idea of "original freedom" as a source of creation, whether divine or human, is central to Berdyaev's metaphysics, which are developed out of Jakob Böhme's doctrine of *Ungrund*. This freedom, *svoboda*, gives an absolute character to human subjectivity. But human creation always implies a departure from self, an elimination of self, and is only realized in the communion with others.

Reality as an "objective given (*ob'ektivnaja dannost'* [объективная данность]" that is imposed from "outside (*izvne* [извне])" the person (*ličnost'*) is at the opposite extreme of creative human existence. Berdyaev sees it as the source of slavery and of the submission of man: "It is completely wrong

to attribute a purely theoretical meaning to truth (*istina*), and to only see it as a kind of intellectual submission of the knowing subject to a reality which is given to it from the outside" (*Truth and Revelation*, 22–23). *Istina*, as "what truly exists," has nothing in common with given reality; but this reality can be transformed or transfigured by the creative energy of the original freedom present in the creative act. It is in this sense, then, that we should understand the following sentence: "Truth (*istina*) is not a reality, nor a corollary of the real: it is the very sense of the real, its *Logos*, its supreme quality and value" (ibid., p. 22). *Istina*, which is thus dynamic in nature, is "what truly exists in reality: subjectivation, the transfiguration of the real." Truth as transfiguration ultimately has a theological and eschatological meaning: it leads, through communion and the creative act of a person, to the "definitive victory" over our "fallen state of objectivation" (Berdyayev, *Essai de métaphysique eschatologique*, p. 63), or in other words, toward the end of being (*bytie*).

C. Mikhail Bakhtin: *Istina* and *pravda*

Bakhtin, for his part, contrasts logical *istina* not to ontological *istina*, but to *pravda* [правда] (truth in justice), a term that translates the Greek *dikaiosunê* [δικαιοσύνη], but understood within an entirely different set of oppositions, such that it is usually translated into French, for want of anything better, as *vérité* (truth). This opposition needs to be read in the context of Bakhtin's critique of the "abstraction" of scientific philosophy, as presented in his theory entitled *Toward a Philosophy of the Act* (written at the start of the 1920s and never completed). For him, the theoretical world with its "abstract truth (*otvlečënnaja istina* [отвлечённая истина])," is incapable of containing *postupok* [поступок] (an ethical act). Contrasting "theoretical abstraction" to what he termed "participating thought," one that considers the being "inside the act (*postupok*)," he proposed an original version of existentialism: ethical existentialism. His "subject" is no longer the knowing subject, but the acting subject.

Pravda does not exclude theoretical *istina*. On the contrary, it assumes and completes it through a personal responsibility: "The entire infinite context of possible human theoretical knowledge—science—must become something *answerably known* [*uznanie*]. . . . This does not in the least diminish and distort the autonomous truth (*istina*) of theoretical knowledge, but, on the contrary, completes it to the point where it becomes compellingly valid truth-justice (*pravda*)." (*Toward a Philosophy*, 49) The absolute nature of *istina* is preserved, since a responsible action does not imply any relativity:

When considered from our standpoint, the autonomy of truth (*istina*), its purity and self-determination from the standpoint of method are completely preserved. It is precisely on the condition that it is pure that truth can participate answerably in Being-as-event (*bytie-sobytie* [бытие событие]); life-as-event does not need a truth that is relative from within itself (*otnositel'naja istina* [относительная истина]). The validity of truth (*istina*) is sufficient unto itself, absolute, and eternal, and an answerable act or deed of cognition takes into account this peculiarity of it; that is what constitutes its essence.

(Ibid., 9–10)

So *istina* retains its epistemological meaning, "what is, from the objective or scientific point of view," but it is relieved of its ontological meaning: it can no longer refer to "what truly exists," nor to what French translators have sometimes rendered (for example, Berdyayev) as *vérité philosophique* (philosophical truth) (*Khomiakov*, 7). For Bakhtin metaphysics (for which he uses the expression *prima philosophia*, or doctrine of "being as being") has to go beyond the limits of the theoretical world: "It is only from within the actually performed act (*postupok*), which is once-occurrent, integral, and unitary in its answerability, that we can find an approach to unitary and once-occurrent Being in its concrete actuality. A first philosophy can orient itself only with respect to that actually performed act (*postupok*)" (ibid., 28). "What truly exists" is not *istina*, but *postupok*, an act invested with *pravda*. The world of "what is," within which *postupok* takes place, is the being-event (*bytie-sobytie*). With this term Bakhtin introduces an etymological metaphor: *sobytie* means "event," but literally *so-bytie* signifies "co-being," "co-existence," that is, a shared world. *Bytie-sobytie*, analogous to the German *Mitwelt*, is the antonym of the world of theoretical *istina*: it implies authentic existence and participation.

- See Box 1.

Since *istina*, like *pravda*, is normally translated as "truth," the precise meaning of these two terms is thereby lost. This is why, in contexts where *istina* is set in opposition to *pravda*, the least incorrect solution is to explain the first term in terms of "philosophical truth," or "theoretical truth," or even "abstract truth," which marks a clear distinction with *pravda*, whose meaning is "truth in justice" (see, for example, Berdyayev, *Khomiakov*, 7). Whereas *istina* expresses the authenticity of "what is," *pravda* emphasizes the fact that the thing has the character of being right or just.

Podnogotnaja, truth, and the practice of the question

There is a synonym of *istina* that is also translated as "truth": this is the term *podnogotnaja* [подноготная], which refers to "a truth hidden by someone, circumstances or details carefully concealed." It is encountered in situations where there is a question of "throwing light on" an affair, of trying to "uncover" the truth, for example, in a trial: it is an adjectival noun formed from the group of words *podnogotnaja istina*. Originally, *podnogot-naja* referred to a sort of torture, or an interrogation, as when pointed objects are thrust "under the fingernails"—*pod nogti* [под ногти], or in the singular *pod nogot'* [под ноготь] (cf. RT: *Ètimologičeskij slovar' russkogo jazyka,* 352). Similarly, the term *podlinnyi* [подлинный] (authentic) is etymologically linked to the

ancient practice that consists, in a trial (*pravëž* [правёж]), of beating a suspect with a "long stick (*podlinnik* [подлинник])" to force him to tell the truth (RT: *Etymological Dictionary of the Russian Language*, 2:186).

The Russian term isolates a part of the meaning of the Greek *alêtheia* [ἀλήθεια], which also comes from a judicial trial. *Alêtheia*, which etymologically means "unveiling," "dis-covering," was uncovered quite normally during a trial through the use of torture (*basanizein* [βασανίζειν]) on slaves called to testify, who were freed in this way from allegiance to their masters. But *alêtheia* as "un-veiling" embraces all of the senses of truth, from authenticity to justness; and the Greek system of justice opens out onto

judgment and the faculty of discriminating (*krisis* [ϰρίσις], *krinein* [ϰρίνειν]). Conceived as *alêtheia,* the truth extends its semantic orbit to the questioning of philosophy itself, as attested by the way in which Plato calls as a witness the verses by Parmenides in order for them to confess under torture that the false presupposes the existence of non-being (*The Sophist*, 237a–237b; Eng. ed. N. White (Hackett), 25): " 'Never shall this force itself on us, that that which is not may be; While you search, keep your thought far away from this path.' So we have his testimony to this. And our own way of speaking itself would make the point especially obvious if we examined it a little (*basanistheis* [βασανισθείς])."

ITALIAN

A Philosophy for Nonphilosophers Too

► ART, ATTUALITÀ, BEAUTY, CIVILTÀ, EUROPE, FRENCH, GOÛT, LEGGIADRIA, MÊTIS, PRAXIS, SPREZZATURA, VIRTÙ

The public of nonphilosophers are privileged interlocutors of Italian philosophers, who consider all humans not only as animals endowed with reason, but also as animals who nurture desires and formulate projects. What characterizes Italian philosophy, and what is reflected in its network of concepts, the styles of its research, and its language, is—to quote Machiavelli—the fact that it does not simply search for logical truth, but rather "the effective truth of the thing" in all its complexity. The fundamental terms of the Italian philosophical lexicon are common to the European tradition: where they are distinctive is in the expressive quality each singular author brings to them. The margin of untranslatability of these terms is thus not because of the "spirit of the language" but of the particular poetic or artistic "stamp" of the individual writers who create or reinterpret them. They are born of language that is cultivated but not specialized, clear but not technical, intuitive but not mystical: language in which the greatest mathematical rigor exists alongside the most intense pathos. In this sense, its register is characterized by an interweaving of reason and imagination, of concept and metaphor.

I. A Civil Philosophy

In the West, philosophy is for the most part transnational. If one were, as a hypothetical experiment, to trace contour lines and isobars to connect theories belonging to the same genre, but dispersed across different geographical areas, one would plainly see that these would lead us to draw maps whose borders do not coincide at all with those of existing states or national languages. Despite this, it is undeniable that Italian philosophy—like other philosophies—has

acquired and retained a distinctive set of features of its own, and possesses a personal repertory of recurring themes, and of references to a particular expressive and conceptual register.

From a broad historical perspective, and taking into account the limits imposed by its irreducible complexity, the Italian language has been characterized by a constant and predominant civil vocation. By "civil" I mean a philosophy that is not immediately tied to the sphere of the state, nor to that of religion, nor to that of interiority. In fact, ever since its humanist and Renaissance origins, its privileged interlocutors have not been the specialists, clerics, or students attending university, but a wider public, a civil society one has sought to orient, to influence, to mold.

The first circle of interlocutors was made up of compatriots, fallen heirs of a great past, citizens of a community that in the beginning was simply a linguistic community, politically divided into a plurality of fragile religious states and, from a spiritual point of view, conditioned by a Catholic church that was too powerful (Italian philosophy has consequently developed a number of supplementary functions in the face of weak political institutions, and a certain contentiousness in the face of the massive presence of the Catholic church). The second circle—with the emphasis here on "universalist" traits—is made up of all people.

The most representative Italian philosophers, then, have not closed themselves off in narrow local circles, any more than they have devoted themselves to questions having to do with a particular logical, metaphysical, or theological sublime, as was the case in other nations—England, Germany, and Spain—where the weight of Scholastic or academic philosophy was felt for a much longer time, precisely because the caesura that humanism and the Renaissance represented was not so strong in these countries. These Italian

philosophers took as their object of investigation questions that implicated virtually all of the population (the "nonphilosophers," as Benedetto Croce called them), knowing full well that they were dealing with animals who not only were endowed with reason but who also nurtured desires and formulated projects, animals whose thoughts, acts, and expectations were not bound by already established forms of argumentation, or even by defined—rigorously, of course—methods and languages, but shaped in an abstract and general way.

II. "The Effective Truth of the Thing"

Italian philosophy has consequently been at its best in its attempts to find solutions to problems where the relations between the universal and the particular are at stake, where logic comes up against empiricism. These problems (and the vocabulary to express them) are born of the overlapping of social relations and the variables that have mixed with them. This has produced an individual conscience divided between an awareness of the limits imposed by reality and the projection of desires, between tradition and innovation, between the opacity of historical experience and its transcription in images and concepts, between the powerlessness of moral laws and the implacable nature of the world, between thought and lived experience. Whence the many—often successful—attempts to carve out spaces of rationality in territories that seem deprived of it, to give meaning to forms of knowledge and practices that often appear to be dominated by the imponderable nature of power, taste, and chance: political philosophy, the theory of history, aesthetics, and the history of philosophy (these all being fields, moreover, where the weight of subjectivity and of individuality prove to be decisive).

It is important to emphasize that in rejecting the predominant philosophical perspectives, it is not a matter of "weakening" claims to the intelligibility of the real, but on the contrary of the effort to highlight spaces that were all too often hastily abandoned (and left to lie fallow) by a reason that had identified itself excessively with the sometimes triumphant paradigms of the physical sciences and of mathematics, to the extent that it modeled itself on them. Italian philosophers are consequently philosophers more of "impure reason," who take into account the conditioning, the imperfections, and the possibilities of the world, than philosophers of pure reason and of abstraction. In other words, they tend toward the concrete, in the etymological sense of the Latin *concretus*, the past participle of the verb *concrescere*, which refers precisely to what grows by aggregation, in a dense and bushy way (corresponding to the English "thick," as opposed to "thin," in the terms first introduced several decades ago by Bernard Williams, in relation to a moral discourse that is irreducible to formulas and precepts).

Although these philosophies are not interested in the knowledge of the absolute, of the immutable, or of norms that have no exception, they certainly do not abandon the search for truth, and are absolutely not given over to skepticism and relativism. On the contrary, the great tradition of Italian philosophy has never given up hope of the existence of a truth, or of the possibility of attaining it. This has been true since the time of Dante, who expresses it as follows:

Io veggio ben che già mai non si sazia
nostro intelletto, se 'l ver non lo illustra
di fuor dal qual nessun vero si spazia.
Posasi in esso come fera in lustra
tosto che giunto l'ha : e giunger pòllo,
se non, ciascun disio sarebbe frustra.

(I now see well : we cannot satisfy
our mind unless it is enlightened by
the truth beyond whose boundary no truth lies.
Mind, reaching that truth, rests within it
a beast within its lair; mind can attain
that truth—if not, all our desires were vain.)

(*Paradiso*, IV.124–29, in *La divina commedia,*
ed. A. Lanza; trans. A. Mandelbaum in
The Divine Comedy of Dante Alighieri)

What characterizes Italian philosophy, and what is reflected in its network of concepts, the styles of its research, and its language, is—to quote Machiavelli—the fact that it does not simply search for logical truth, but rather the "verità effettuale della cosa" (effective truth of the thing), which often contradicts what appears in the first instance, and proves, without this being its cause, to be lacking an intrinsic rationality *juxta propria principia* (according to its own principles). But this truth is not reached through simple reasoning. That is, Italian philosophy has always maintained the tension between *epistêmê* and *praxis*, between the knowledge of what cannot be other than what it is, and the knowledge of what can be different to what it is, between the a priori and the a posteriori—not in order to stay midstream, but to cross from one bank to the other.

Although this philosophy distinguishes between the two terms, the world of thought seeks never to lose contact completely with the world of life, in the same way that it seeks not to isolate the public sphere from the private sphere. Despite the importance of the Catholic church and widespread religious practices, or perhaps because of these, a philosophy of interiority, of the dramatic or intimate dialogue with oneself, like the one that developed in France, from Pascal to Maine de Biran, or in Denmark with Kierkegaard, has essentially been absent in Italy. This is not only because of the externalizing tendency and the theatricality of the Roman Catholic rite, or the mental blocks caused by the fear of the Inquisition and the "tribunals of conscience" of the Counter-Reformation, but also because of the highly hierarchized institutionalization of the relations between the faithful and God. Unlike Lutheranism or Calvinism, Roman Catholicism is the guardian of a juridical culture, formalized over the centuries, which meticulously and knowingly regulates the behavior of the faithful. In the Italian philosophical tradition, one can consequently see, in opposition to the Protestant belief according to which *sola fides justificat* (faith alone justifies), the traces of the "religion by good works," of the existence in the world, that are proper to Catholicism—in other words, what is not shown to be effective has no value.

The fundamental terms of the Italian philosophical lexicon (which we will see adopted by a constellation of authors such as Machiavelli, Bruno, Galileo, Vico, Leopardi, Croce, and Gramsci) are generally those common to the European tradition, which has its deepest roots in the trinity "Athens,

Rome, Jerusalem." Where these terms are distinctive is in the expressive quality that each singular author brings to them. In other words, the untranslatability of these terms is not the fruit of the "spirit of the language," but derives rather from the particular poetic or artistic "stamp" of the individual writers who create or reinterpret them (and this pertains as much to their lexicon as to their syntax). Conversely, the apparent ease with which they can be translated is not because they have their source, as is the case for English, in everyday language, but rather because they are born of a language that is cultivated, but not specialized; clear, but not technical; intuitive, but not mystical—a language that, to paraphrase the title of a well-known work by Jean Starobinski, tends rather toward transparency than toward obstacles (*Jean-Jacques Rousseau: La transparence et l'obstacle*, 1971). This is why one needs, more than in other cultures, to know the intellectual history of Italy to understand the terms well. The degree of abstraction of concepts, or more precisely their comprehensibility, is typically higher in Italian than in English (which is lexically far richer, with four or five times the number of words—around seven hundred and fifty thousand words, as opposed to one hundred and fifty thousand) and not as high as in German, such that Italian concepts have to "cover" connotations that, in other languages, are distributed among several subconcepts. The syntax, in addition, does not present any particular irregularities or traps: it is generally less complex, and constructed of clauses that are shorter than the German written by Luther from Latin, but more articulated than the short, dry sentences in English. As a result, the turns of phrase and the punctuation sometimes have to be reworked to match the rhythms of the language into which Italian is translated.

The constant reference, whether implicit or explicit, to the universe defined by the idea of an effective reality proves to be fundamental from a conceptual point of view. It is, of course, close to the Aristotelian tradition of *auto to pragma*, of which the *Sache selbst* (the fundamental matter for thought, the thing itself, the matter itself) and the *Wirklichkeit* (reality) are what, in Hegelian terms, we would mark as the goal or the end point. However, the Italian version of this concept implies something concrete which distances it from other philosophical cultures (for that matter, the young Hegel developed the meaning of *Wirklichkeit* from Machiavelli, whom he studied in order to write his uncompleted work, *The German Constitution*).

■ See Box 1.

III. *Volgare* and Poetic Logic

In its use of the *volgare* (vulgar), Italian philosophical vocabulary does not make a clean break with the scholarly language by definition, with Latin, since the relationship of the latter to the former is seen as a direct one. Latin remains, in its exemplary and "classical" simplicity, the skeleton beneath the flesh of Italian, which is linked to the spoken language

---

Machiavelli: *Verità effettuale della cosa* and knowledge of detail

Machiavelli himself might serve as the primary example, in the field of politics: the understanding of the *verità effettuale della cosa* (effective truth of the thing) is implied by the knowledge of particular things in their specificity. This does not exclude, but on the contrary presupposes, a movement of knowledge toward the universal: this also implies the overcoming (and not the abandonment) of the confused and distorting vision of the imagination and of opinion, as much as that (transparent and well articulated depending on the genre) of norms and laws that are governed by reason, without relying on the experience of concrete situations.

In a chapter of the *Discourses on the First Decade of Titus Livius* entitled "That though Men deceive themselves in Generalities, in Particulars they judge truly," Machiavelli analyzes the situation in Florence after the Medici were banished from there in 1494. In the absence of a constituted government, and because of the daily worsening of the political situation, many people tended at that time to attribute responsibility for this to the ambition of the seignory. But as soon as one of them in turn managed to occupy a position of high public office, his ideas regarding the real situation of the city came closer and closer to the reality, and he abandoned both the opinions that circulated among his friends, as well as the precepts and abstract rules by which he had to begin his apprenticeship of public affairs:

> From time to time it happened that one or another of those who used this language rose to be of the chief magistracy, and so soon as he obtained this advancement, and saw things nearer, became aware whence the disorders I have spoken of really came, the dangers attending them, and the difficulty in dealing with them; and recognizing that they were the growth of the times, and not occasioned by particular men, suddenly altered his views and conduct; a nearer knowledge of facts freeing him from the false impressions he had been led into on a general view of affairs. But those who had heard him speak as a private citizen, when they saw him remain inactive after he was made a magistrate, believed that this arose not from his having obtained any better knowledge of things, but from his having been cajoled or corrupted by the great.

> (trans. Ninian Thompson, *Discourses on the First Decade of Titus Livius*, 1:47)

Whence Machiavelli's explicit intention to remain attached to reality, without following the drifting movement of his imagination and his desires:

> But, it being my intention to write a thing which shall be useful to him who apprehends it, it appears to me more appropriate to follow up the real truth of a matter than the imagination of it; for many have pictured republics and principalities which in fact have never been known or seen, because how one lives is so far distant from how one ought to live, that he who neglects what is done for what ought to be done, sooner effects his ruin than his preservation.

> (trans. W. K. Marriott, *The Prince*, chap. 15)

of different regions. The fundamental categories of the classical and medieval philosophical tradition (*res, natura, causa, substantia, ratio, conscientia* [thing, nature, cause, substance, reason, conscience]) are not seen to require any particular interpretative effort. Unlike German (where a philosophical term is added to that of ordinary language—for example, there is *Differenz* and *Unterschied* [difference])—the concepts used in philosophy in Italy are the same as those used in ordinary language. In order to enrich their meaning, or acquire a greater determination, they only have to go through the "thickness" of reasoning and *exempla* [examples], and travel from the convent cells and university classrooms to the public squares and offices of the most cultivated citizens, and in the process, they are retranslated into spoken language. Bilingualism (Latin/Italian) in philosophy was very early on limited to scholars of other nations or, as was the case with Giambattista Vico, to the inaugural theses read out in an academic context (e.g., his *De nostri temporis studiorum ratione* of 1708 and *De antiquissima Italorum sapientia, ex linguae latinae originibus eruenda* of 1710). The widespread practice of using the vulgar language was helped by the fact that Italian, at least from the sixteenth century to the end of the eighteenth century, was recognized as a language of culture (a language, it is true, that was generally carried along more by melodrama, theater, and literature, than by philosophy).

■ See Box 2.

Whereas German philosophers from Hegel to Heidegger considered their eminently speculative language as the most appropriate to express philosophical thought, it never crossed the minds of Italian philosophers to make such a claim for their own language. Neither did they intentionally seek a specific technical vocabulary, relating to the philosophical *koinê* coming out of the European tradition. Italian philosophy aimed instead for the expressive power of concepts and of argumentation: its ideal was closer to that of music, in which the greatest mathematical rigor exists alongside the most intense pathos. As Giacomo Leopardi (1798–1837) observed of Galileo (*Zibaldone*, ed. Solmi, 2:285), he was guided by "the association of precision with

The "illustrious vulgar tongue": A language for philosophy

Conscious of the fact that many people had not had any philosophical training, and convinced that "all men want to know" and were thus seeking philosophical knowledge, Dante made a plan to organize a philosophical banquet that the greatest possible number of people could attend. Not only was the *Convivio* (around 1304) conceived as a sort of summary of philosophical knowledge for the illiterate (the *non litterati*), but also it contained an explicit reflection on the transmission of knowledge, and consequently, on philosophical language. Although Dante was certainly not the first to write philosophy in the vulgar tongue, he was the person who articulated most clearly the problem of the relation between language and philosophy, and worked out all of its consequences, thereby transforming both the mode of expression and the content of philosophy. The *Divine Comedy* (1307–20) realized fully the ideal of such a philosophico-moral pedagogy addressed to all, and dedicated to a vast reform of the social and political world "for the good of the world which lives badly" (in pro del mondo che mal vive).

Dante's treatise *De vulgari eloquentia* (On vernacular eloquence), written around the same time as the *Convivio*, attempts to lay the theoretical foundation of a new use of the vulgar. Drawing on an analysis of the different modes of expression, the "vulgar tongue" (*locutio vulgaris*) and the "secondary tongue" (*locutio secundaria, grammatica*) (of which the first is natural, common to all, corruptible and variable, and the second artificial, reserved for the literate, eternal and invariable with regard to place and time), and following a historico-biblical itinerary going from the unity of the Adamic idiom to the infinite division of idioms after Babel, Dante postulates the need for an "illustrious vulgar tongue" that would avoid the disadvantages of the two spoken languages, while retaining their essential qualities (see LANGUAGE). This illustrious vulgar tongue, which he says should be common to all Italian city-states without belonging to any of them, is comparable to the first elements of each genre, which become their measure:

The noblest signs which characterize the actions of Italians do not belong to any city state of Italy and are common to all of them; and we can put among them the vulgar tongue we banished earlier, and which breathes its perfume in each city without staying in any of them. Yet it may breathe its perfume more intensely in one city state than in another, just as the simplest of perfumes who is God breathes His perfume in men more than in beasts, in animals more than in plants, in plants more than in minerals, and in minerals more than in fire, in fire more than in the earth.

(trans. S. Botterill, *De vulgari eloquentia*, I, chap. 16)

This vulgar tongue that the poet-philosopher sought—a few examples of which he recognized in several inspired contemporaries—would make it possible for the existing local vulgar tongues to be measured, evaluated, and compared. The aim of Dante's uncompleted work was to establish the rules, as much from a grammatical as poetic or rhetorical point of view, of this vulgar tongue, which could lay claim to the universalism of Latin without having its rigidity, and to the expressiveness of the vulgar without the irregularities of fragmentation. By writing his "sacred poem," Dante simultaneously produced a model and an exemplum. The language and the form of the *Divine Comedy* were the means he gave himself to create a new philosophy for a new audience: the secular public.

BIBLIOGRAPHY

Alighieri, Dante. *De vulgari eloquentia*. Edited, translated, and with an introduction by Steven Botterill. Cambridge: Cambridge University Press, 1996. The unfinished Latin text was composed ca. 1302–5 and published in Vicenza, Italy, as early as 1529.

elegance." In this sense, its register is characterized by an interweaving of reason and imagination, of concept and metaphor. Or rather, in Vico's terms, by marrying together the logic of reason and what he refers to in the *Scienza Nuova* as "poetic logic."

Because it is a question of understanding the logic of transformations, of finding a meaning to the continual becoming of things, of confronting this *mutazione* (mutation) so often mentioned by Giordano Bruno in the sixteenth century as the essence of things and the source of *delettazione* (delectation) rather than of sadness and melancholy (see his *Spaccio della bestia trionfante*), the language of Italian philosophy tries to be incisive and enlightening in a familiar mode. It works far better in the form of a dialogue (from Alberti to Galileo and Leopardi), or in statements that are rich in figurative expressions created by the imagination, than in the dry form of a systematic treatise or a metaphysical meditation. But as with Bruno, there is always some order in the swirl of mutations, and at their heart any changes take place around a fixed pivot:

> Time takes away everything and gives everything: all things change, nothing is annihilated; one alone is immutable, one alone is eternal and can remain eternally one and the same. . . . With this philosophy, my spirit takes on another dimension, and my intellect is magnified.

> (*Candelaio*, vol. 1; trans. G. Moliterno, *Candlebearer*)

The fact that there is no hierarchy in the infinite universe, and as a consequence there are no absolute center and periphery, is also reflected in the syntax: given that every element of the sentence, even the commas, could become the center of the discourse, Bruno rejected—as Yves Hersant, one of his French translators, has observed—hierarchical constructions based on subordinate clauses, and his reasoning was almost always expressed using coordinated clauses (which are typically a series of relative clauses). In addition, he mixed together, following the whims of his imagination, the three styles (low, middle, high) of the Aristotelian tradition, and introduced trivial language. The vulgar and the sublime, reason and "heroic fury," logic and the imagination, could thus exist alongside one another and fuse together.

And it was precisely this "poetic logic" of the imagination that Vico called for to show the roots of the "pure mind," which humans attain when they are at the highest point of the development of a civilization. Through the idea of a poetic logic, Vico takes myths, religion, passions, and art out of the sterile space of the irrational and shows that they have a specific and fecund legitimacy, a logic to be exact, with rules that, while not coinciding with those of the "mind opened out" (*mente dispiegata*), illuminate the meaning of what we achieve without intending to, or unreflectively:

> So that while rational metaphysics teaches us that *homo intelligendo fit omnia*, this imaginative metaphysics [*metafisica fantastica*] show that *homo non intelligendo fit omnia*; and perhaps there is more truth in the second statement than in the first, for man, when he understands, opens up his mind and apprehends things, but when he does not understand, he does things from

himself and, transforming himself in them, he becomes these very things.

> (trans. L. Pompa, *The First New Science* [translation modified])

We are indebted to Vico for the discovery that the internal logic of events is not only revealed through reason but also through the imagination, which obeys laws that are in fact more constricting and more demanding than the laws of reason. And this involves a legacy from the past that we cannot suppress. In the *ingens sylva* (the great forest), where he locates the primitive relations that humans have between themselves and with nature, promiscuity reigns. Marriages do not exist, because the considered and solemn choice of a woman with whom to have one's own children has not yet happened. Mating between *bestioni* (wild animals) is thus a matter of force and chance; dead bodies putrefy with no tombs; conflicts are resolved by force, or by cunning. The historical period that follows, however, equally obeys poetic logic—though it is now the birth of a civic order that this logic imposes. The monogamous family and religion appear, and with them, humanity leaves behind its state of savagery. The *gentes majores* (those who claim to be able to interpret the visible order in the skies contemplated from the clearings in the forest [see Box 3]) feel the need to impose from on high laws reflecting a similar order onto those who are living in anarchy. The political imagination of the *gentes majores*—which draws upon myths and supernatural powers, on fears and hopes—is thus at the origin of a fictional order, but in which men believe, thanks to the power of the imagination (*fingunt simul creduntque*). It regulates and gives meaning to the moments that mark the solemn emergence of a life that will from that point on be lived together: it establishes tombs for the dead, the celebration of marriage, the worship of gods. If human history has a meaning, it is not because it derives from a rational logical that is internal to events, but because an order has been imposed on these events that has come forth from the imagination, and that is little by little rationalized through myths, rites, juridical concepts, and moral obligations, all of which appear subsequently. In an effort to express the genesis of the reason that is deployed within imagination, the linear language of the Latin works by Vico becomes, in *The New Science*, complex and overloaded; from a syntactical point of view, parenthetical comments and digressions proliferate. But it is always powerfully expressive.

▪ See Box 3.

IV. "Ultraphilosophy"

It was Giacomo Leopardi, however, who really attempted to establish a lasting alliance between philosophy and reason, reason and imagination, clarity and distinctness of concepts and indetermination. He challenged their reciprocal isolation to show how they were complementary in their antagonism. For Leopardi, only someone who is at the same time a philosopher and a poet can understand reality. If he does not want to be only "half a philosopher," a thinker in effect has a duty to experience passions and illusions:

> Anyone who does not have, or has never had, any imagination or feelings, anyone who is unaware of the

3

Illuminismo

➤ LIGHT

Illuminismo has nothing in common with what in French is referred to as *illuminisme*, whether one is talking about the doctrine of certain mystics such as Swedenborg or Böhme, or in psychiatry, "a pathological exaltation accompanied by visions of supernatural phenomena" (*Le Petit Robert*). But *illuminismo*, the Italian Enlightenment, is also distinct from the French *Lumières*, the English Enlightenment, and the German *Aufklärung* in its determination not to lose sight of the psychic faculties and the social conditions out of which reason emerges.

Although Vico did not, strictly speaking, belong to the Enlightenment movement, we already find in him, well before Heidegger, the idea that a "clearing" has a philosophical importance, as a place where light and shadow, order and disorder meet, as well as the site of emergence of rationality and poetic fantasy. Indeed, for Vico, the first men contrasted the disorder of their existence in the *ingens sylva*—the great forest of their origins—with the order of the sky, to which their imagination attributes a name:

> So a few giants, who had to be the strongest of them, and who were spread out in the woods at the tops of the mountains, where the fiercest beasts have their lairs, terrified and astonished by the great effect of which they did not know the cause, raised their eyes and noticed the sky. . . . Then they imagined that the sky was an immense living body which, seeing it thus, they called Jupiter, the first god of the so-called *gentes majores*, who by the flash of lightning, and the rumble of thunder, wanted to tell them something.

> (trans. L. Pompa, *The First New Science*, Book 1 [translation modified])

In this way, the "opened mind" has an origin, which it is impossible to abstract, and a consistency that is continually limited by historical givens, which one cannot deduce rationally (the "certain" and the "blind labyrinth of man's heart"). This "opened mind" is threatened by a return to the stages he had gone through previously, by virtue of which it can happen that those who have attained a high level of civilization "turn cities into forests, and forests into men's lairs" (ibid.). A shadow of new barbarism is thus projected onto the cleared space of civilization.

The figures of the Italian Enlightenment—in its two main centers, Naples and Milan—retain a close contact with civil society and practical life. The explicit refusal of metaphysics and of abstraction is exemplified by Antonio Genovesi (1712–69), the first person in Europe to be appointed to a chair in political economy (in 1754), and whose thought focused on the interwoven interests and aspirations of humankind, and on the struggle against privilege. The Enlightenment philosophy of Lombardy was more oriented toward law; it also found expression in the dynamic review *Il caffè* (1764–66), and its major representatives were Pietro Verri (1728–97) and Cesare Beccaria (1738–94). The Enlightenment project for them, on the one hand, developed in the direction of a modernization of society, facilitating the individual search for happiness, and, on the other, aimed at making the correctional system more humane through the abolition of torture, by humanizing punishment, and by making judgments more clear-cut and quicker. The light of a human reason (and no longer that of Providence) that tried hard to become more just, thus struggled to break through the darkness of social life.

possibilities of enthusiasm, of heroism, of vivid and great illusions, of strong and varied passions, anyone who does not know the vast system of beauty, who does not read or feel, or has never read or felt, the poets, cannot by any means be a great, true and perfect philosopher . . . it is absolutely indispensable that a man such as this be a sovereign and perfect poet. Not in order to reason like a poet, but to examine like the coldest and most calculating rationalist [*ragionatore*] what *only* the most ardent *poet* can know. . . . Reason needs the imagination and the illusions it destroys; the true needs the false, substance needs appearance, the most perfect insensibility needs the most vivid sensibility, ice needs fire, patience needs impatience, powerlessness needs sovereign power, the smallest needs the largest, geometry and algebra need poetry, etc.

(*Zibaldone* [4 October 1821])

Leopardi is here stating a more general tendency of Italian philosophy, already present most explicitly in Vico: the determination to break down the walls separating reason from imagination, and philosophy from poetry, without, however, being responsible for confusing these roles. Each, in effect, feeds off the other, while remaining firmly in its place:

philosophy occupies the space of the real, and poetry that of the imagination, which is complementary, and each recognizes the demands of the other. Because of this, the philosopher has to take into account not only truth (this is his principal aim) but also illusions, which are essential ingredients of human nature, and which intervene to a great degree in the existence of individuals. And it is not enough to recognize them as such, and then put them aside, since they have "very strong roots" so that even if one cuts them down and understands their vanity, "they grow back again." However, human "noble nature," as we read in Leopardi's poem *La Ginestra* (vv. 111–17), is heroically opposed to illusions and it sacrifices no part of truth, but has, on the contrary, the courage to confront these illusions ("The noble nature is the one / who dares to lift his mortal eyes / to confront our common destiny / and, with honest words / that subtract nothing from the truth, / admits the pain that is our destiny, / and our poor and feeble state" [Leopardi, *Canti*, trans. J. Galassi]).

Since it recognizes the power of illusions, philosophy consequently must, according to Leopardi, be bound to the experience of the senses, and remain close to the effective truth of the thing. This is different from what happens in the context of German culture, which, in fusing together poetry and philosophy, ends up producing hybrid philosophical

poems, chimerical constructions that reach their apogee, Leopardi writes, in the self-celebration of Germany:

> Che non provan sistemi et congetture
> E teorie dell'alemanna gente ?
> Per lor, non tanto nelle cose oscure
> L'un dì tutto sappiam, l'altro niente,
> Ma nelle chiare ancor dubbi e paure
> E caligin si crea continuamente:
> Pur manifesto si conosce in tutto.
> Che di seme tedesco il mondo è frutto.

> (Is there something that the systems and conjectures
> And theories of the German people do not prove?
> For them, they are not so many obscure things
> So that one day we know everything, the next nothing.
> But they are clear things that are endlessly clouded by fog
> And continual doubts and fears are born;
> All in all, we see manifestly
> That the world is the fruit of a Germanic seed.)

> (*Paralipomeni della Batracomiomachia*, l.17; trans.
> G. Caserta, *The War of the Mice and the Crabs*, 6)

Yet the Germans (whose philosophical culture Leopardi did not know well) have no reason for self-celebration:

> The German men of letters' lack of a social life, and their ceaseless life of study and isolation in their offices not only divorces their thoughts from men (and from the opinions of others), but also from things. This is why their theories, their systems, their philosophies are for the most part *poems of reason*, whatever the genre they examine: politics, literature, metaphysics, morality, and even physics, etc. Indeed, the English (such as Bacon, Newton, Locke), the French (such as Rousseau and Cabanis), and even some Italians (Galileo, Filangieri, etc.) have made great, *true and concrete*, discoveries about nature and the theory of man, of governments, and so on, but the Germans have made none.

> (*Zibaldone* [30 August 1822])

Leopardi attempts to complete and go beyond rationalism and the Enlightenment, which the cultures of his "superb and foolish" century have blocked. He seeks to do this by elaborating an "ultraphilosophy" that is closely linked with poetry, and that is able to offer an exact assessment of the nature of man as a desiring being, but a being also incapable of realizing the infinity of its desire, and of attaining a lasting pleasure. Paraphrasing Carl von Clausewitz, one might say that "ultraphilosophy" is nothing but the continuation of philosophy through other means, namely, those of poetry—means which, once they are known and used, ought nevertheless not trouble or overly excite "very cold reason."

Philosophy should use the indeterminate beauty of poetry to reject any conception of form as pure, fixed, rigid, and innate form (Platonic in its origin, but taken up by Christianity, and identified with God). Since all knowledge comes from the senses, and is fueled by the imagination and by reason, beginning with a ceaseless working on the materials that are transmitted to them, humans affirm that all things are given

and cannot be deduced—which contrasts with any idea of innateness:

> The destruction of innate ideas destroys the principle of goodness, of beauty, of absolute perfection, as well as their opposites, that is, of a perfection which would be founded on reason, a superior form to the existence of the subjects which contain it, and thus eternal, immutable, necessary, primordial, existing before such subjects, and independently of them.

> (*Zibaldone* [17 July 1821])

It thus becomes absurd to speak of good and evil, of beauty and ugliness, of order and disorder, as absolutes. Indeed, once innate ideas have been eliminated,

> There is no other reason possible why things should be absolutely and necessarily such and such a way—some good, others bad—independently of each will, each event, each *fact*. The only reason that is for all, in reality, resides in these facts, and consequently this reason is always and only ever relative. So nothing is good, true, bad, ugly, false, except relatively; and the conventional relationships between things is also relative, and this, if we can put it this way, is absolutely so.

> (*Zibaldone* [17 July 1821])

In the metaphysical tradition, what is bad, false, or ugly has an eminently negative connotation: they are deprived, respectively, of what is good, true, and beautiful. Leopardi roots out the very assumptions of such a conception. Demonstrating that what is bad is not an accidental, voluntary, human disruption of a divine or natural order that would, if it were not for this, be perfect, he dismisses both the substantialist conception of the plenitude of being, and the thesis of the existence of a *kosmos*, that is, a harmonious and divine structure (synonymous with both beauty and order). The pillars of the architectonics of the good, the true, and the beautiful, which have been present almost continuously from Plato through to Leibniz, thus collapse. The principle of an independent (*absolutus*) order at the root of all things, a source—moral, logical, or aesthetic—of justification of the world and of human actions—this principle now ceases to exist:

> For no one thing is absolutely necessary: that is, there is no absolute reason preventing it from not being, or from not being such and such a way, etc. . . . This is tantamount to saying that there is not, or there has never been, a first and universal principle of things, or that if it exists, or has existed, we cannot in any way know it, since we do not and cannot have the slightest evidence to judge things prior to things, and to know them beyond pure, real facts. . . . There is no doubt that if we destroy the pre-existing Platonic forms of things, we destroy God.

> (*Zibaldone*)

The *Summum malum* falls along with the *Summum bonum*, Satan falls along with God. Men and their histories remain consequently alone in a cosmos that knows nothing of them, and that conceals no finality for them.

V. Historicism and the Nonphilosopher

Italian historicism (from Croce to Gramsci) has contested Jacobin abstractions, which Leopardi had already denounced, by highlighting the obstacles, the blocks, and the specificity—or rather the concrete nature—of each historical situation and the consequent necessity of making reality the measure of thought. Leopardi was inspired more by Vincenzo Cuoco's *Saggio sulla rivoluzione napoletana* (Essay on the Neapolitan Revolution of 1799) than by Marx. That is, he reflected more on failed revolutions and the lessons to be drawn from sudden defeats, than on radical innovations and on preparing for new insurrections. Italian historicism is characterized precisely by the encounter between history and utopia: a history energized, structured, innervated by a utopian goal (that of emancipation) and a utopia held in check and weighed down, forced to take into account certain obligations and the limits of what was possible, the obstacles that lay in the way, and how one navigated one's way through them. In the ethical and political, but also aesthetic domains, the attachment to the real, to the effective truth of the thing, the fidelity to the world and the ability to communicate, are once again valued, by Croce, for example, in opposition to empty interiority and its claims. Beauty, consequently, is nothing other than the effective expression in a singular and unique work of art, of an intuition that would otherwise remain indeterminate and without content in our feelings and in our mind, and of which we are fully conscious only because someone was able to express it. Indeed, beauty is, for Croce, when he writes his *Aesthetic*, "a successful expression, or better, simply expression, since when expression is not successful it is not an expression" (trans. Colin Lyas, *The Aesthetic as the Science of Expression and of the Linguistic in General*). The proof afforded by reality, together with its communicability, shatters the prejudice hidden within the belief that the confused interiority of intention is enough to create a work of art:

> One sometimes hears people say they have many great thoughts in their mind, but they cannot manage to express them. In truth, if they had them, they would have transformed them into fine, ringing words, and thus expressed them. If, when they express them, these thoughts seem to evaporate, or appear to be rare and poor, it is because they did not exist, or because they were rare or poor.

> (Ibid.)

Like those who nurture illusions about the value of their own wealth, who are then harshly contradicted by mathematics, we usually tend to overestimate the intensity of our intuitive gifts. Expression—that damned-if-you-do, damned-if-you-don't trap-that-is-also-a-bridge that Croce builds for us here—shows us our limits and, at the same time, makes us more aware of the fact that a painter "is a painter because he sees what others only feel, or glimpse, but do not see" (ibid.).

For Croce, the love of the concrete goes as far as a defense of "nonphilosophy," which he declares as philosophy's legitimate son, and which disseminates a culture, and contributes to the layering of philosophical ideas in the unreflective form of good sense:

> I despise philosophy that is nasty, presumptuous and dilettante: presumptuous when it discusses difficult things as if they were not difficult, and dilettante with respect to sacred things. By contrast, I very much like the nonphilosopher, who does not get upset and remains indifferent to philosophical arguments, distinctions, and dialectics, who possesses truth by stating it in a few simple principles, and in clear sentences, which are a reliable guide for his judgment and action: the man of good sense and of wisdom.

> ("Il non-filosofo," in *Frammenti di etica*)

This man is, precisely, the philosopher's son, because "good sense is in fact nothing other than the legacy of previous philosophies, which have been continually enriched by their capacity to welcome the clear results of the new kind of philosophizing. This is not a gift of nature, but the fruit of history, a product distilled by the historical labor of thought; and since he welcomes the results, and only the results, unconcerned by how they were obtained, he welcomes them without debate or subtle arguments, and without any doctrinal methods" (ibid.).

For Gramsci, this concern—allied to more political intentions—to build this narrow, treacherous bridge between the philosophical high-mindedness of the elite and the spontaneous philosophy of nonphilosophers, between reason and common sense, is almost obsessive:

> It is essential to destroy the widespread prejudice that philosophy is a strange and difficult thing just because it is the specific intellectual activity of a particular category of specialists or of professional and systematic philosophers. It must first be shown that all men are "philosophers," by defining the limits and characteristics of the "spontaneous philosophy" which is proper to everybody. This philosophy is contained in: 1. language itself, which is a totality of determined notions and concepts and not just of words grammatically devoid of content; 2. "common sense" and "good sense"; 3. popular religion and, therefore, also in the entire system of beliefs, superstitions, opinions, ways of seeing things and of acting, which surface collectively under the name of "folklore."

> (*Selections from the Prison Notebooks of Antonio Gramsci*, ed. Q. Hoare and G. Nowell-Smith)

The only difference between the philosophy of philosophers and that of nonphilosophers comes from the level of critical awareness and of active conceptual elaboration that each manifests or claims. Whence, the following rhetorical question:

> [I]s it better to "think," without having a critical awareness, in a disjointed and episodic way? In other words, is it better to take part in a conception of the world mechanically imposed by the external environment, i.e. by one of the many social groups in which everyone is automatically involved from the moment of his entry into the conscious world (and this can be one's village or province; it can have its origins in the parish and the "intellectual activity" of the local priest or

ageing patriarch whose wisdom is law, or in the little old woman who has inherited the lore of the witches or the minor intellectual soured by his own stupidity and inability to act)? Or, on the other hand, is it better to work out consciously and critically one's own conception of the world and thus, in connection with the labours of one's own brain, choose one's sphere of activity, take an active part in the creation of the history of the world, be one's own guide, refusing to accept passively and supinely from outside the moulding of one's personality?

(Ibid.)

■ See Box 4.

The almost neorealist value of concrete lived experience, of the link between determinate historical and economic situations, is also central to Italian historicism in general, including after Croce and Gramsci. It is manifest in the recognition of rights and of the implacable nature of time itself, and by the refusal to take refuge in the corrupt shelter of consciousness, in the comforting but sterile isolation of private space, or to seek a way to escape into glorious but illusory utopias that promise immediate regeneration. According to historians, we should accentuate the link between philosophy and the effective history of men, or the "real roots of ideal choices," since philosophy consists of "recovering the humanity of thought, of rekindling the humanity of thought, the *human flesh* without which these thoughts would not be in the world" (E. Garin, *La filosofia come sapere storico*). Each philosophy thus relies on the fact that men change, as do the intellectual tools used to understand reality. The historian of philosophy from now on discovers "in place and instead of philosophy understood as the autonomous development of a self-sufficient knowledge, a plurality of fields of investigation, of positions, of visions, in relation to which the unity of the act of philosophizing is conceived as a certain level of critical awareness, or at the very most, as the need to unify the different fields of research" (V. Verra, *La filosofia dal'45 ad oggi*). Once again, in historicism, philosophy is conceived as being itself directed toward the concrete, and aims ultimately to become the point of liaison between what is experienced and what is thought.

VI. *Mechanê* and Machines

When we again consider, from the point of view of the sciences, the basic characteristics of Italian philosophy, whether translatable or untranslatable, we note the fundamental contribution made by Italy, from Leonardo da Vinci to Galileo, from Volta to Pacinotti, from Marconi to Fermi. Oddly, we might also observe that there has never been any indigenous reflection on the philosophy of science or on logic—if we exclude Galileo himself and the figures (who for a long time remained rather isolated) of Peano, Vailati, and Enriques. As a consequence, no technical or specialized language has been disseminated, and in general it has recently been imported from the Anglo-Saxon world.

However, Galileo is an excellent example of the particular attitude of the Italian tradition that seeks, on the one hand, to position itself from the point of view of nonphilosophers and nonspecialists alike, and on the other, to show that behind general and abstract formulae lie hidden unexpected situations, but ones that have their own logic, which we understand by respecting the specificity of the object. Thus, through his crystalline prose, Galileo constantly puts himself in these dialogues in the position of an interlocutor, Simplicio, designed to represent in exemplary fashion the way of thinking that was dominant at the time in the scientific community, the one that drew on the well-established authority of Aristotle and Ptolemy. Galileo sought to refute this authority by means of "experiments undertaken and demonstrations that were certain," but certainly not to ignore it. On the contrary, he kept it as a constant point of reference, and as an indicator of a common sense that had to be raised patiently to the level of a new scientific knowledge. As a representative of the Accademia dei Lincei, founded in 1604 by Federico Cesi, Galileo's ideal was precisely to have the eye of a lynx in searching for the truth where it was the most difficult to reach, and where appearances could often be deceptive.

In his research, Galileo advocates starting out from simple elements that, when combined together, offer the meaning of what is more complex:

I have a little book, shorter than Aristotle's or Ovid's, which contains every science and does not demand lengthy study: it is the alphabet; anyone able to assemble vowels and consonants in an ordered way will find in it a source of the truest answers to all questions, and will draw from it teachings of all the sciences and all the arts; this is exactly the way in which a painter, with the different plain colors next to one another on his palette, knows how, in mixing a little bit of one to another, and even adding a little bit of a third, to represent men, plants, buildings, birds, fish, in short, to imitate all visible objects; and yet on his palette there are no eyes, feathers, scales, leaves or stones.

(trans. S. Drake, *Dialogue Concerning the Two Chief World Systems*)

This is the route by which abstractions are incarnated in reality, that is, the letters of the alphabet transformed into terms that have meaning, colors into eyes and feathers, numbers and geometrical figures into physical beings. But Galileo also ventured down an opposing path. According to this latter method, he proceeded by excarnation, as Yves Bonnefoy would say, in order to extract the general rules of the living flesh of particular cases, knowing full well that this could then lead to dead ends. This is why he wrote in praise of the progressive discovery of reality, in its specific and distinct traits, a discovery that has to go beyond false analogies in order to privilege the faculty of discrimination and that also has to sometimes conclude with a declaration of provisional ignorance. This is well illustrated by the parable of the "man gifted by nature with a perceptive mind and an extraordinary curiosity" (Galileo, "Il Saggiatore: The Assayer," in *The Controversy on the Comets of 1618*. trans. S. Drake and C. D. O'Malley), who at first confuses the song of a bird with the sound of a bird whistle, and

4

Storicismo

➤ HISTORY

Although Italian historicism owes its origins in part to the German *Historismus* of a Ranke or a Dilthey, it quickly acquired its own set of features and its originality, especially with Croce and Gramsci. It is based on the thesis of the absolute historicity and immanence of every human life and expression. History is the product of the objectification and the determinate incorporation of our actions in this unique and incredible world, or rather of the fact that the actions of everyone are inevitably caught up in the great deluge of collective events. Whence the rejection of all teleological thinking, the respect for the implacable nature of facts, and the emphasis on individual responsibility. This position, however, does not imply the acceptance of the ineluctable necessity of the course of history. On the contrary, individuals question the past and thus bring it alive and make it present, pressured by needs that are endlessly renewed and manifest, spurred on by the desire to eliminate the obscurities and phantasms that interfere with action, and to escape servitude and the weight of the past.

It is thanks to reflection and philosophy—which is a *metodologia della storiografia*, "methodology of historiography" ("historiography" signifying here, as Croce explains, *historia rerum gestarum* or "historical account of the past," that is, not events but their interpretation in history books), the knowledge of this "concrete universal" present in each event—that we succeed in understanding the meaning of what has been. The historical investigations of historians—and those that each of us undertakes to reconstruct the meaning of our behavior and our past—ease the route to freedom, which is understood as an awareness of necessity and a knowledge of the real possibilities of action. Historicism consequently excludes both the passive acceptance of events as well as the desire to go beyond the determining factor and limits of the real without confronting them. By converting the past into knowledge, and by understanding everything that stirs dimly within us and within the world, we are ready

to realize who we are, we become creators of history. Only that which is objectified, and which enters into a relation with the activity of others, leaving behind some sign, has any permanent value—and not the feeble attempts, nor the boasts, nor the paralyses of the will that destroy our minds, nor the endless chatter.

The life of the mind consists precisely in this realization of the movement of the whole in the works of the individual, which are merely functions that are subordinate to this totality. For Croce they become immortal, in a secular sense, and only have value if they consciously accept being the construction materials of a history that is unfolding above their heads, beyond their intentions, and in which they nonetheless believe:

> [N]o sooner is each one of our acts completed than it is separated from us and lives an immortal life, and we ourselves (who are merely the process of our acts) are immortals, because we have lived and are still living.

> ("Religione e serenità," *Frammenti di etica*, 23)

In this one, unique world we maybe suffer, but this world alone contains the objects of our desire, of our passion, of our interest, and of our knowledge. We would not, in fact, want any other, for example, the one promised by religions: we are inextricably tied to this immanence (this is the meaning of the expression *storicismo assoluto* [absolute historicism]). We have to immerse ourselves courageously in it, accept the risk, the possibility of suffering, of disappointments, and of sadness:

> [I]s it worth living when we are forced to take our pulse at every moment, and to surround ourselves with useless remedies, avoiding the slightest draft because we are afraid of falling ill? Is it worth loving, when we are constantly thinking about and accommodating love's hygiene, measuring its doses, taking it in moderation,

trying from time to time to abstain from it in order to get better at abstinence, out of a fear of the overwhelming shocks and heartbreaks in the future?

> ("Amore per le cose," in *Frammenti di etica*, 19)

What the Gramscian conception of history aims to do, for its part, is to provide an appropriate theoretical framework for confronting a determinate historical situation of struggle and transition, which is marked by numerous imbalances and tensions, and in which bridgeheads and delays coexist alongside one another. Such a history should in Italy, for example, play a mediating role between the industrial North and the agricultural South, between the high culture of bourgeois tradition and the superstitions or the folklore of the subaltern classes, between philosophy and myth, between the development of productive forces—understood even in the context of a Taylorist system—and the obstacles that come from outmoded or archaic relations of production. By the effort brought about to eliminate the divisions between dominant and dominated, history should be transformed on the basis of a project of collective emancipation, and not contemplated and admired like some unfathomable mystery, rendered cruel by its incomprehensible and eternal essence. Historicism is so radical and immanent that what today is true in this precise situation of historical constraint could well become false, and what is false could, at least to some extent, become true:

> We might even go as far as stating that, while the entire system of the philosophy of praxis could become obsolete in a unified world, many idealist conceptions, or at least certain aspects of these, which are utopian during the period of necessity, could become "truths" after this has passed, etc.

> (*Selections from the Prison Notebooks of Antonio Gramsci*, ed. Q. Hoare and G. Nowell-Smith)

then slowly begins to distinguish this latter sound from the music played by a stringed instrument, and from the sound made by rubbing a finger around the edge of a glass, or by the buzzing of the wings of a fly. Finally, when he tries to understand where the shrill sound of a cicada comes from, "having pulled off the front of its chest and seeing below it a few hard but fine cartilages, and thinking that the chirping

came from their vibration" (ibid.), he kills it by dissecting it, so that "he removed both its voice and its life . . . he reached from this such a point of mistrust vis-à-vis his own knowledge, that if anyone asked him how sounds are made, he replied honestly that he knew a few ways, but felt certain that there could be a hundred other unknown and undreamed of" (ibid.).

In this sense, the logic of discovery for Galileo was open to what was new, and was not yet reducible to the compact unity of a theory:

> I do not want our poem to be restricted to unity to the point where we can no longer give free rein to circumstantial episodes: all they need is to have some link to what we are saying; it is as if we had gathered to tell stories, and I said allow me to say the one that comes to my mind after hearing yours.
>
> (trans. S. Drake, *Dialogue Concerning the Two Chief World Systems*)

The famous statement about the world being written in mathematical characters does not allow us to deduce from these a priori forms any similarly certain knowledge regarding physical space. Let us look at this text again:

> Philosophy is written in this immense book which is always open before our eyes, I mean the Universe, but we cannot understand it if we do no apply ourselves to understanding first of all its language, and to knowing the characters with which it is written. It is written in a mathematical language, and its characters are triangles, circles, and other geometrical figures, without which it would be humanly impossible to understand a single word. Without these, we would just be wandering vainly in a dark labyrinth.
>
> ("Il Saggiatore: The Assayer," in *The Controversy on the Comets of 1618*, trans. S. Drake and C. D. O'Malley)

Galileo was well aware that there is a clear difference between mathematical models and physical reality, even though this reality could and had to be read, ultimately, using these very instruments. The engineers, artisans, and workers at the arsenal in Venice, when they built their ships, for example, learned that there was no correspondence between scale models and real models, between abstract theory and the practice dictated by lived experience. Indeed when Salviati, at the beginning of the *Discorsi e dimostrazioni matematiche intorno a due nuove scienze*, recommends that philosophers and theoreticians of nature go to visit the world of those who know how to build machines, he is certainly not arguing in favor of practice over theory: "The constant activity which you Venetians display in your famous arsenal suggests to the studious mind a large field for investigation, especially that part of the work which involves mechanics; for in this department all types of instruments and machines are constantly being constructed by many artisans, among whom there must be some who, partly by inherited experience and partly by their own observations, have become highly expert and clever in explanation" (trans. Henry Crew and Alfonso de Salvio, *Dialogue Concerning Two New Sciences*). As the character Sagredo observes, the fact that in the construction of ships, scale models are not equivalent to real models implies that "in speaking of these and other similar machines one cannot argue from the small to the large, because many devices which succeed on a small scale do not work on a large scale" (ibid.). So geometry is not applicable *sic et simpliciter* (purely and simply) to physical reality. When one goes from a small-scale model of a ship to the real ship, the same elements of the wooden structure that at first resisted and bore the weight and the strains of the materials that rested on them, could then break because of the change in scale. Consequently, the unchanging nature of properties belonging to geometrical figures does not always apply in physics: "Now, since mechanics has its foundation in geometry, where mere size cuts no figure, I do not see that the properties of circles, triangles, cylinders, cones and other solid figures will change with their size" (ibid.).

The case of Galileo, who wondered why abstract mathematical reason could not have the effects on reality that we might intuitively assume it would have, did not lead to the surrender of rationality in its confrontations with aconceptual practices, but on the contrary, to the birth of a new form of knowledge, as is the (exemplary) case with modern mechanics. In order to grasp the innovative nature of Galileo's propositions in this domain, we need to measure the distance with respect to the long tradition that began in ancient Greece, and continued up until his time. The term *mekhanê* originally meant "ruse," "deception," "artifice," and it had already appeared in the *Iliad* (VIII.177) in this sense of the term. It was only later that it referred to machines in general (in a sense that is close to the connotations of the "appropriate use of an instrument" and of "theatrical machine," from which the expression *theos epi mekanêi* (deus ex machina) is derived, and in particular to simple machines—levers, pulleys, wedges for cutting, inclined planes, screws, and then to war machines, and to automatons.

Mechanics, the knowledge concerned with machines, was thus born with this distinctive trait: it was assigned to the construction of artificial entities, of traps fabricated against nature in order to capture its energy and to channel it to the advantage of humans, and according to their whims. But why do machines have a semantic legacy having to do with ruse and deception? We do not understand, for example, how a lever can lift enormous weights with the minimum of effort, nor how a cutting wedge manages to split stones or gigantic tree trunks. The *Quaestiones mechanichae*, for a long time attributed to Aristotle, provide a testimony to this astonishment when they state clearly that "many marvelous things, whose cause is unknown, happen according to the order of nature, while others happen against this order, produced by *technê* for men's benefit" (847a). When nature is contrary to our own usefulness, we succeed in mastering it by means of artifice (*mechanê*). In this way, technique allows us to conquer nature in circumstances where it would otherwise conquer us. On this strange (*atopos*) genre, the treatise again adds that "these are things by which the least triumphs over the greatest," as in the case of the lever, precisely, which enables great weights to be lifted with little effort.

The mechanical arts, because they belong to the realm of the ruse and of that which is "against nature," are not part of physics, which concerns what belongs to the order of nature. What is more, for the Greeks only mathematics and astronomy are sciences in the true sense of the term, in that they are not concerned with things that can be other than what they are, and that therefore do not have the character of being necessary—this is the case of those things linked to *praxis* (Aristotle, *Nicomachean Ethics*, VI.5.1140a and VI.6.1140b). These sciences thus enjoy the privileges of

necessity and of a priori knowledge, since they are true independently of experience. In the vast debate on the relation between *phusis* and *nomos*, mechanics has been resolutely defined, since its mythical origins with Daedalus and Icarus, as antinature, whereas medicine, which appears, for example, in the treatises *De arte* (On Art) and *De victu* (On Diet) from the Hippocratic corpus, is presented instead as a science that supplements and imitates nature.

With Galileo, we begin to realize that we command nature by obeying it, that it cannot simply be mistreated and that the main responsibility of mechanics is not to astonish us. In order to master nature, we have to serve it, yield to its laws and its injunctions, taking advantage of its knowledge. The concept of ruse, in the sense in which the weakest gets the better of the strongest, and where a man such as Ulysses deceives the obtuse Polyphemus that is nature, loses its pertinence. For Galileo, there is no longer any need to divert nature from its course, to torture it, to put it on the rack so as to force it to reveal its secrets, as Francis Bacon wanted to do, opposing not the ruse to the force of nature, but a counterviolence. Man, "vicar of the Most-High," can and must, according to Bacon, exert violence upon nature, for the surest method when faced with matter, which, like Proteus undergoes continual metamorphoses, is to stop it, to block the process of its changes: "And that method of binding, torturing, or detaining, will prove the most effectual and expeditious, which makes use of manacles and fetters; that is, lays hold and works upon matter in the extremest degrees" (Bacon, *Wisdom of the Ancients*).

For Galileo, this kind of violence disappears, precisely because mechanics ceases to be against nature. The formula PxFxDxV indicates the conquest of rationality by means of product of four "things" that have to be considered in their reciprocal relations: "namely the burden that one wishes to transport from one place to another; the force which has to move it; the distance it has to be moved; and the time of the said movement, because it is used to determine the speed, since it is all the greater if the moving body, or the burden, travels a larger distance in the same time" (trans. S. Drake, *On Mechanics*, 23–24). If we examine the weight necessary to move a body from one place to another, the force necessary for this operation, the distance this body travels, and the time this movement takes (speed), we can clearly see that one parameter gains what another loses. So using a lesser force is compensated by a longer traction time, as in the case of the lever that lifts great weights with little effort.

Galileo showed, by means of true and necessary demonstrations, that mechanics were disappointed when they wanted to use machines in a number of operations that are by nature impossible. We should not give in to the dream of catching nature out (or with its guard down, so to speak), of getting it to bend to our will:

It has seemed well worthwhile to me, before we descend to the theory of mechanical instruments, to consider in general and to place before our eyes, as it were, just what the advantages are that are drawn from those instruments. This I have judged the more necessary to be done, the more I have seen (unless I am much mistaken) the general run of mechanicians deceived in trying to apply machines to many operations impossible by their nature, with the result that they have remained in error while others have likewise been defrauded of the hope conceived from their promises. These deceptions appear to me to have their principal cause in the belief which these craftsmen have, and continue to hold, in being able to raise very great weights with a small force, as if with their machines they could cheat nature, whose instinct—nay, whose most firm constitution—is that no resistance may be overcome by a force that is not more powerful than it. How false such a belief is, I hope to make most evident with true and rigorous demonstrations that we shall have as we go along.

(trans. S. Drake, *On Mechanics*, 147)

From this perspective, it is precisely machines—which will after Galileo be built according to fully rational criteria and calculations, going beyond the "approximate" empirical system, in the sense in which Alexandre Koyré understands it (*From the Closed World to the Infinite Universe*)—that take away from slavery its advantages of efficiency and low cost, and enable it to be virtually abolished. The force of human labor, in the form of a pure expenditure of energy, is no longer indispensable, whereas—and this is one of Galileo's other great intuitions—machines will henceforth substitute for the lack of intelligence of natural forces, and of animals that expend energy. By means of "artifices and inventions," they will be capable of saving people their energy and money, by transferring to inanimate and animate nature the burden of providing the energy that had previously been oriented toward the "desired effect." What is important here, as often in the whole of the Italian tradition, is the idea of a conscious control over partially spontaneous processes (natural or historical). We sometimes intervene in these latter forces by directing them toward the future on the basis of present mutations, following the principle stated in chapter 2 of Machiavelli's *Il Principe*: "sempre una mutazione lascia l'addentellato per la edificazione dell'altra" (for any change always leaves a toothing-stone for further building" [trans. Q. Skinner and R. Price, *The Prince*, 6]).

J

JETZTZEIT (GERMAN)

ENGLISH   at present, present time, the now time
FRENCH   *à présent, temps actuel*

➤ *INSTANT*, and HISTORY, MOMENT, STILL, *TIME*

Although the lexical form of this word existed before Walter Benjamin marked it (it is found, notably in the work of the Romantic poet Jean Paul), Benjamin was the writer who made it into both a heuristic and a philosophico-practical concept. It is not easily translatable. Benjamin seemed to have wanted to emphasize the everyday meaning of "the now-time": its nontechnical, nonscholarly use as a common noun modernized by doubling it up as *jetzt* (now, at present) and *Zeit* (time).

Jetztzeit only appears in Walter Benjamin's late writings, at the end of the 1930s: in his theses "On the Philosophy of History" (often simply referred to as the "Theses") from 1940, in the notes relating to this text, and in the "Notebook N" of the *Passagenwerk* [Arcades Project], which was also devoted to "theoretical reflections on knowledge," in particular critical reflections on the "theory of progress." So it was in a situation of extreme personal and collective danger, and confronted by the imperious need to rethink a potential struggle against a triumphant fascism, that Benjamin attempted to formulate a concept that gives the "time of the now" (one possible literal translation of *Jetztzeit*) a decisive weight, instead of treating it as a vanishing instant, a sort of unrepresentable tipping point between the past (which has gone) and the future (which does not yet exist). This perilous situation and this necessary struggle are also two of the main aspects of this concept. Indeed, the *Jetztzeit* has to enable a construction of history opposed to the "homogenous and empty time" of traditional historiography, particularly that of historicism but also that of the "ideology of progress" denounced in the "Theses." This critical construction proceeds by quite intense interruptions, breaks, and overlapping between the present and the past, accompanied by modernizing political actions:

> Die Geschichte ist Gegenstand einer Konstruktion deren Ort nicht die homogene und leere Zeit sondern die von Jetztzeit erfüllte bildet. So war für Robespierre das antike Rom eine mit Jetztzeit geladene Vergangenheit, die er aus dem Kontinuum der Geschichte heraussprengte.

> (History is the object of a construction whose site is not empty, homogenous time, but time filled with "the now." Thus for Robespierre, ancient Rome was a past laden with "the now," which blasted out of the continuum of history.)

(Thesis 14)

The concept thus has two dimensions: a theoretical dimension, the critique of a spatialized, undifferentiated, and indifferent conception of temporal "unfolding," in which history becomes an infinite accumulation; and a practical and political dimension, interrupting this enumeration, blocking this avalanche (Thesis 17, *Stillstellung*, *stillstellen* [blockage, blocking, halting]) so as to bring about a knowing transformation of the present, which also transforms the image of the past. So even though *Jetztzeit* is close, in its brief and radiant temporality, to *Augenblick* (another frequent term in the "Theses" and which Benjamin translates as "instant"), the word no doubt borrows many of the characteristics of *kairos*: the ideas of a break, of something discontinuous, of a decisive and irreplaceable moment. Benjamin notes in the *Arcades Project* (N, 10, 2): "Definitions of the fundamental concepts of history: catastrophe—to have missed the opportunity." The "time of the now" is precious and unique, and therefore fragile, but also sharp and decisive; it creates a new image of the past and establishes a new configuration between the present and the past. Because it enables one to act, to escape, to block the catastrophe—history as it is and as it continues to be—it is, in Benjamin's theological vocabulary, "a model of messianic time" (Thesis 18), or it even contains "splinters of messianic time" (Er bergründet so einen Begriff der Gegenwart als der "Jetztzeit," in welcher Splitter der messianischen eingesprengt sind) ("Theses," App. A). It is because decisive and just political action, which happens within the time of the now, is urgent, acute, and extremely precarious, since it has to grasp the "right moment" in midflight, that it is comparable to a messianic redemption that no theology of history or any ideology of progress could guarantee.

No temporal determinism can guarantee when *Jetztzeit* will come to pass either. One of the most difficult aspects of this concept is that it emphasizes the subjective dimension of choice and decision, the dimension precisely of being subjects of historical action, and at the same time it cannot be based on any arbitrary resolution because of the risk of thereby losing its radiant effectiveness. It also necessarily depends on a certain temporal objectivity, on a "historic trace," a sign (*index*) that does not refer to a mechanical causality between past and present but to a sort of condensation when a forgotten, lost, perhaps repressed moment from the past can suddenly be deciphered and known by the present and in the present: what Benjamin calls "the Now of knowability [*das Jetzt der Erkenntbarkeit*]" (*Arcades Project*, N, 3, 1). In order to describe more precisely this convergence of subjective decision and the fabric of objective history, Benjamin will have recourse to different models, in particular the Proustian theory of involuntary memory, the Freudian dialectic between dream and unconscious images and the action of the waking consciousness, and the drifting openness to experience of the Surrealists.

Why, then, did Benjamin not adopt, or even modify, the term *kairos* but instead coin the term *Jetztzeit*? Two hypotheses: first, in order to emphasize better the proximity of the concept to Jewish prophetic and messianic traditions (as opposed to Greek or Christian traditions); and second, to insist on the fact, in the very structure of the word, that only in the present can true historical knowledge and the time of just political action be united.

JUSTICE, JUDGMENT

I. Justice and Equity

"Justice" comes from the Latin *justitia*, itself derived from *jus*, which dictionaries translate either as "right" or "justice." In French, as in Latin, justice refers both to the conformity to the law (*droit*; cf. Ger. *Gerechtigkeit*); the justice one dispenses (and which constitutes in modern times one of the three branches of state power, alongside the legislative and the executive); and the sense of equity, the spirit of justice, which is bound up with morality. See LEX, RIGHT/JUST/GOOD, THEMIS, and FAIR, PRAVDA; and cf. ISTINA, POSTUPOK. On equity, refer more specifically to THEMIS, IV; cf. PHRONÊSIS, PIETAS.

II. Justice and Judgment

The judgment (Lat. *judicium*, from *judico*, *judicare*) that justice entails relates to a much broader sphere; it refers as much to the act of judging in the sense of "pronouncing a verdict," as to that of judging in the sense of "forming an opinion of, appreciating, thinking"—and it also designates the "faculty" described by Kant (in the second part of the Analytic of the *Critique of Pure Reason*) as the "power to subsume within rules," which is the source of the latter. The Greek *krinein* [κρίνειν] does not come from the same root (*krinein* comes rather from **krin-ye/o*, which means "to separate out, to sift"; we find **krin* in the Latin *cerno*, and in the French *critique*, *critère*, *crise* [crisis] or *discernement*), but still contains the same breadth of meanings, which range between the judgment of a court and a logical, aesthetic, or moral judgment.

On logical judgment, see BEGRIFF, *CATEGORY,* LOGOS, MERKMAL, PROPOSITION, SACHVERHALT, TRUTH; cf. IMPLICATION, INTENTION, PRINCIPLE.

On aesthetic judgment, see AESTHETICS, GOÛT, STANDARD; see also PERCEPTION, REPRÉSENTATION; cf. INGENIUM.

KÊR [κήρ], **MOIRA** [μοῖρα], **AISA** [αἶσα], **HEIMARMENÊ** [εἱμαρμένη], **ANAGKÊ** [ἀνάγκη], **PEPRÔMENÊ** [πεπρωμένη], **TUCHÊ** [τύχη] (GREEK)

ENGLISH	fate, destiny
FRENCH	destin, fatalité, sort, lot, nécessité, fortune
ITALIAN	fortuna, fato, destino
LATIN	fatum, fortuna
SPANISH	destino

➤ *DESTINY* [SCHICKSAL], and CHANCE, DAIMÔN, DUTY, GOD, EREIGNIS, GLÜCK, *LIBERTY* [ELEUTHERIA], LAW, MOMENT, *OBLIGATION*, PRESENT, THEMIS

Greek uses a considerable number of distinct terms to refer to what the Romance languages generally call "destiny" (Fr. *destin*, Ital. and Sp. *destino*, from the Latin root *destinare*, "to determine, to stop") or "fate" (*fatalité*, *fato*, derived from the Latin *fatum*, from *fari*, "to say"). These Greek terms convey more or less philosophically reinscribed or elaborated representations and images that are still operative today: death (*kêr* [κήρ]); the portion assigned and the lot one draws (*moira* [μοῖρα], *heimarmenê* [εἱμαρμένη], *aisa* [αἶσα]); the thread and the knot (Klôthô, the Moirai or Fates themselves); the good or bad effects of fortune (*tuchê* [τύχη]); the bond and constraints of necessity (*anagkê* [ἀνάγκη]). Each of these expressions attests in its own way to the formation of a relationship between the gods and men, and a relationship of man to himself.

I. The First Paradigms of Destiny

A. *Kêr*: The destiny of death

In Greece, up until the end of the fifth century, destiny casts its formidable and irrepressible shadow over man. Whenever it manifests itself as *kêr* [κήρ], it is literally the "destruction" that threatens human beings. The term is rich in content, as Pierre Chantraine points out (RT: *Dictionnaire étymologique de la langue grecque*, s.v. *kêr*), since it "involves at the same time notions of destiny, or death, and of personal demons." In a famous scene in the *Iliad*, Zeus weighs the *kêres* of Achilles and of Hector (22.209ff.); we do not know whether the two *kêres* are personified or not. Both are described as the "*kêres* of painful death," that is, the destiny of death that each of the heroes has as his double, or phantom, or personal demon. What is curious is that they have a weight, and they can be weighed. Zeus places the two *kêres* on the scales, and Hector's *kêr* drops and falls into the house of Hades. Apollo abandons the hero, and his fate is sealed.

In a play that has been lost, *Psuchostasia*, Aeschylus adapted this scene in the *Iliad*, but he replaced the *kêres* with the souls of Achilles and Memnon (RT: *TGF*, 88–89 N. = 374–77 Radt). Aeschylus clearly interpreted the *kêres* in the *Iliad* as *psuchai*, the sort of psychic doubles or phantoms that live on in Hades after the death of the individual (see SOUL, Box 3). In other cases, however, there is nothing personal about the *kêr*: in *Iliad* 8.69ff., Zeus weighs two *kêres* on the scales, those of the Achaeans and those of the Trojans. This relation to death means that the word *kêr* is also used in the sense of "misfortune"—for example, in tragedy.

B. *Moira, Aisa*: One's lot and the thread of one's life

The term *moira*, used more frequently and more traditionally than *kêr* to indicate destiny, is inscribed within the semantic field of the "part or portion assigned," the "lot" that is attached to a being from birth. *Moira* [μοῖρα] derives from the verb *meiromai* [μείρομαι], "to have one's legitimate part," which in the perfect *heimartai* [εἵμαρται] or the pluperfect *heimarto* [εἵμαρτο] means "is (was) marked by fate," whence *heimarmenê* (*moira*) [εἱμαρμένη (μοῖρα)], "the part that is imparted."

In *Iliad*, 24.209–10, the mother of Hector weeps for the death of her son: "So almighty Destiny [*Moira*] spun with her thread [*epenêse linôi* (ἐπένησε λίνῳ)], from the moment I gave birth to him." Moira is a spinner who spins around the newborn child the portion of life assigned to him. As we can see in this example, *moira* or Moira and Moirai are associated with death. In Homer, we come across the expression, tirelessly repeated: "Death and almighty *moira* [*thanatos kai moira krataiê* (θάνατος καὶ μοῖρα κραταιή)]"; see, for example, *Iliad*, 5.83; 16.334).

This semantic value of the notion of destiny in Greek is confirmed by the term *aisa* [αἶσα], which is a name for "destiny" in the sense of the "portion allocated," the "lot" of one's life, and which is related etymologically to a series of words such as *aitios* [αἴτιος] and *aitia* [αἰτία], "cause," which imply responsibility (*Iliad*, 20.127–28: "After that he will suffer what destiny [*aisa*] / spun with her thread for him at the moment of his birth, / when his mother brought him into the world"). *Aisa* and *Moira* are both personified as spinners, and are sometimes used synonymously (*Odyssey*, 5.113ff.).

These terms emphasize the fact that the fundamental notion of destiny in Greek is linked to the idea that each person's life is a part of a whole, just as *moira* is part of a land, or of a country, or of the honor due to a class of persons, and so on. It is a legitimate, singular part, connected to a subject. Along the line of destiny, every event produces a closure; the line itself, made up of a succession of closures, does not unfold as a "trace." Above these events that affect the subject, that *for that subject* are *hic et nunc*, the dimensions of the *ubique* and the *semper* open up, which is to say the dimensions of the divine (Diano, *Il concetto della storia*, 252ff.). The subject, beneath the vault of this whole, of the divine, feels present there as a gift, offered and taken back by a mysterious force, by the *mysterium tremendum et fascinans*.

■ See Box 1.

1

The double epic and tragic motivation: Determinism and responsibility

There is a strange contradiction in Homer between two orders of interpretation that are applied to individual fate. On the one hand, Homeric heroes embrace and assume control of their own deaths, thereby creating the conditions of their freedom; on the other hand, the *Iliad* entrusts to the gods the practical achieving of the hero's death, whether his destiny is *moira*, *aisa*, or *kêr*. The gods, whether protective or antagonistic, intervene in human affairs via a complex mechanism: they act directly, but also through the Parcae, who weigh up and plan for Zeus (*Dios boulê* [Διὸς βουλή]) and thus embody the complicity between a god and a cursed fate (*oloê moira* [ὀλοὴ μοῖρα]). This paradox has created problems of interpretation that are the source of endless debate.

When a character such as Patroclus says, for example, that the gods bear a heavy responsibility for his fate of death, we can always trace his actions back to the moment when he makes a decision. Patroclus blames Zeus, Apollo, accursed fate, Euphorbus, and finally Hector for his death (*Iliad*, 16.844–50). In this hyperdetermination typical of the *epos*, we do not know which one to choose, but for Achilles there is no doubt about the matter: it is Hector he blames for Patroclus's death, and Hector is the one on whom he will take his revenge. Patroclus could have avoided his death if he had followed Achilles's advice (16.87–96) and not led his army against Ilion. The poet remarks on the gravity of this failure, and apostrophizes his hero, calling him "foolish" or "mad" (*nêpios* [νήπιος]). He adds that Zeus excited his heart and his passion (*thumon* [θυμόν]). With this dual human and divine motivation,

the poet expresses what we would now call the compatibility between determinism and responsibility (see, for example, Bok, *Freedom and Responsibility*, or Derrida, *The Gift of Death*) and presents in his own language the mystery of the fatal, fateful decision. Apollo himself, on four occasions, stops Patroclus and, repeating Achilles's warning, tells him that it is not his destiny (*aisa*) to conquer Troy (*Iliad,* 16.698–709). But Patroclus, addressing Hector, who has just dealt him a mortal blow, refuses to acknowledge his own excessiveness, and prefers instead to produce a list of the agents who have caused his death: he places Hector at the end of this list, a minor agent whom he can thereby humiliate by depriving him of any glory.

Homeric man is free and responsible, although he is represented as being in contact with divine forces: in the case of Patroclus, these forces do not deprive him of this freedom, contrary to what he says, but add nuance by underscoring the excessive nature of his decision. This fate is celebrated by the poet, who attributes glory (*kleos* [κλέος]) to the hero who has chosen to die in the name of such glory, and erects a tomb to him in his immortal song.

The questions that Homer treats are the stuff of tragedy: individual freedom despite fate and the will of the gods. But fate becomes more real and more brutal; the destructive will of the gods becomes more urgent, involving forces such as *atê* [ἄτη], "blindness and destruction" (Aeschylus, *Persians,* 1037); *phthonos* [φθόνος], "the jealousy of the gods" (Aeschylus, *Agamemnon,* 904); *anagkê* [ἀνάγκη], which often refers to a misfortune such as slavery (Aeschylus, *Choephoeri,*

75–78); or the Erinyes, avenging goddesses of family crimes (ibid., 283). The curse of the ancestors (*ara* [ἀρά]: Sophocles, *Electra,* 111) is ineluctable. Prophecy is the text of fate. In Sophocles's *Oedipus Rex*, oracular statements are perceived not only as a form of anticipation, but also as divine will: Oedipus declares that he is the very person Apollo has predicted, the person who will kill his father and marry his mother. Yet human action goes beyond the circle of divine foresight: in blinding himself, Oedipus prevails over his misfortune and, in recognizing himself as a divine victim, acquires a heroic awareness of his destiny. What is more, the divine *telos* [τέλος] is manifest in a series of circumstances constantly referred to as "chances" (*tuchê* [τύχη]): if necessity is helped by chance, is it not that bit less necessary? Chance and necessity cease to be opposed: their juxtaposition is one of the most puzzling innovations of Sophoclean drama.

C. *Fatum*, *destinare*: Word and destination

The semantic field of *moira* and *aisa* contrasts distinctly with that of *fatum*, "fate," in Latin. *Fatum*, from the verb *for, faris, fari, fatus sum*, "to speak," implies precisely the "word" pronounced by fate, or by the oracle: "At si ita fatum erit: nascetur Oedipus Laio" (But if it is according to the "word of fate": "Oedipus will be born to Laius": Cicero, *De fato,* 30). The etymology of *fatum* suggests connections to *fabula* (fable), *fateor* (I confess), *fama* (fame), and so on. *Fatum* has entered into several Romance languages (cf. Fr. *fatal*, Ital. *fato*, Eng. *fate*, etc.).

The Romance languages have also drawn upon another, different semantic field to express the notion of destiny: that of the Latin *destinare* (from *de* and a verbal form linked to *stare*), "to determine, to stop, to assign or destine." Latin itself does not form any words meaning "fate" out of *destinare*, but the Romance languages do: French *destin* (1160 CE),

Italian *destino* (c. 1321), Spanish *destino*—and thence the English "destiny."

II. The Spinners

A. From the "part" (*moira*) to "Moira"

In Greek, the "portion" of one's fate is assigned (*peprôtai* [πέπρωται], from *porô* [πόρω], "to give, to offer") or determined by the gods; sometimes, it "comes upon" or "leaps onto" a human being (like a chance event), but more often it becomes the "thread" of each person's fate. Greek therefore has recourse to the verb *klôthein* [κλώθειν], "to spin," and invents the goddess Klôthô [Κλωθώ], the spinner, making her into a plural, Klôthes [Κλῶθες], the Spinners (*Odyssey* 7.197), or into one of the three Moirai, goddesses of fate, the two others being Lachesis (*lachos* [λάχος], from *lagchanô* [λαγχάνω], which means the "lot," as in drawing lots, for example), and Atropos, "the inflexible one," "the one who cannot be turned

aside." So the etymological meaning of *moira* as a "part" is lost, since in assigning to the Spinners the role of producing this "part," the "part" symbolically becomes a thread made by a distaff, an image of human impermanence and vulnerability. Then, through a sort of personification or metonymy, this *moira* becomes the name not of the thread, but of the spinners who, while belying any etymological link to *moira*, will be called Moirai. The operation is a genuine poetic discovery (Dietrich, "The Spinning of Fate in Homer," 88). This rhetorico-religious shift from *moira* (part) to *Moira* (Spinner) does not exclude the mythological connection of the Moirai with other figures. The Spinners have been compared to, among others, the *Norns* of the Norwegian epic, the Anglo-Saxon *Metten(a)*, and the medieval German *Gaschepfen*, who are magical spinners who endow human beings with skill and talents at birth, even if they are not true goddesses or figures of fate. It seems that in Greece in ancient times, spinning was associated with magic: Homer perhaps worked syncretically to synthesize these popular beliefs and the image of the Moirai (Dietrich, "The Spinning of Fate in Homer," 93ff.).

Moira and the Moirai often preside over the death of a human being, with Aisa sometimes taking the place of Atropos. They are daughters of Night in Hesiod (*Theogony,* 211–20); they appear in funeral inscriptions; during worship, they are sometimes associated with the underworld deities Gê, Dêmêtêr, and Korê. Tragedy refers to them as "ancient goddesses" (*palaigeneis* [παλαιγενεῖς]: Aeschylus, *Eumenides,* 172; Sophocles, *Antigone,* 987); and the motif of the Moirai as spinners of fate remains popular in the religious imagination up until the time of the Romans (Eitrem, *Paulys Real Encyclopädie*, s.v., cols. 2479–93).

By associating the Moirai with a thread that is spun and cut, with death and underworld deities, fate for the Greeks takes on melancholic nocturnal and funerary connotations. Already in Hesiod (*Theogony,* 900–906), however, an Olympian version is evolving that has the Moirai as daughters of Zeus and Themis (see THEMIS). Here the associations are all positive, since they are born in the same bed as the Horai—Eunomia, Justice, and Peace—and receive "the highest honor" from Zeus (*pleistên timên* [πλείστην τιμήν]). They are mentioned for the first time as a triad with their own names and specific function: bestowing good and evil upon men. This concept relates them to other deities sharing the same task: for example, the Muses (*Odyssey,* 8.63), and Zeus in particular (first in the *Iliad,* 14.527ff.). They spin threads, but they are not the only ones to do so, since Homer sometimes uses "to spin" (*epiklôthô* [ἐπικλώθω]) for the other gods when, either collectively (*Odyssey,* 1.17, 8.579, 11.139, 20.196; *Iliad,* 24.525) or individually (*Odyssey,* 4.208, 16.64), they make a decision or hand out portions of good fortune and misfortune to men. The Moirai seem to be the metaphorical model beings used to represent this action.

Zeus and Apollo are referred to as *Moiragetai* [Μοιραγέται], a cultic title that defines them as "those who guide the Moirai" and thus preside over fate. Considered in this light, fate for the Greeks takes on a more positive complexion than in Homer, and is used in the end to signify the arc of a human life (Euripides, *Bacchae,* 99, etc.), marriage (Aristophanes, *Birds,* 1731–35, etc.), the decisive moments in life, and death.

B. The Parcae

The spinners become the preferred image in classical poetry, and find their way to Rome, where they acquire the name Parcae. The term comes from *Parca* (from the verb *pario,* "to procreate") and referred to a goddess of birth who was identified with Moira (probably by a false etymology) and, in the plural, with the Moirai. The Parcae fulfill the same imaginary functions as in classical Greek poetry: they intervene at important moments in one's life (Horace, *Odes,* 2.6.9: "Should angry Fate [*Parcae*] those wishes foil . . ."), and they control the length of one's life (ibid., 2.3.13–16: You will enjoy your banquet "while life, and fortune, and the loom of the Three Sisters yield you grace [*dum res et aetas et sororum fila trium patiuntur atra*]").

As they move from Greece to Rome, the Moirai learn to sing and to write. Catullus (64.321) says that the Parcae "divino fuderunt carmine fata" (expressed oracular words [words of fate] with a divine song); *fata*, because of its connection to the verb *fari* (to speak), gains in semantic force and richness. Of the many examples, we might mention Ovid, who describes the Parcae spinning and singing an oracle in the *Metamorphoses* (8.452ff.).

C. The book of fate

In figurative representations, we often see the Moirai with a scroll (*volumen*) in one hand and a distaff in the other (cf. RT: *LIMC*, s.v. *Moirai*, 643 n. 33, 35, etc.). Although they do not write in the book of the father of the gods, the Moirai and the Parcae nonetheless do write. We read, for example, in a funerary text (RT: *CLE*, 2:1332.2): "vixi bene ut fata scripsere mihi" (I have lived well, as the *fata* had written for me): the *Parcae*, then, produced something in writing that prescribed one's destiny and the quality of one's life.

In becoming something written, fate is no longer a part of life, even when symbolically represented by a thread, nor is it a ghostly double of man (*kêr*), but it is a stone tablet or a scroll that carries oracular signs. This implies that the whole within which the particular prescription takes shape is a text.

The book of fate has become proverbial in the literature and imagination of Europe: Shakespeare, to cite him alone, mentions "the book of fate" (*Henry IV, Part II*, act 3, scene 1, v. 45). However, this vast imaginary and conceptual apparatus, and the incantatory force of these phantoms, never prevented the Greeks from seeing man as naked, responsible for his acts, fascinated and horrified by his own death (Adkins, *Merit and Responsibility*, 17–29).

Philosophy creates its own mythology for the Moirai: in Plato (*Republic,* 617c), they are the daughters of Anagkê (Necessity), and they sit on thrones at the side of the celestial circles, singing with the Sirens: Lachesis the past, Klôthô the present, and Atropos the future.

III. *Tuchê,* Attaining the Event

The word for "chance, luck, fortune" in Greek is *tuchê* [τύχη]. This word is derived from the verb *tugchanô* [τυγχάνω] (in the aorist, *etuchon* [ἔτυχον]). Because *tugchanô* has two different connotations ("to attain or achieve, touch, succeed" and "to happen, to occur by chance"), the semantic field of *tuchê* swings back and forth between meanings: sometimes

success, or good fortune; sometimes the purely accidental nature of things; sometimes unhappy fate. So *tuchê* is the aoristic "event" that happens, *hic et nunc*. In this respect, it is distinct from *moira* and from *heimarmenê* (*moira*) (from the perfect form *heimartai*), both of which imply a notion of continuity and of completion of an action—a predetermination constituted at the moment of the birth of a human being (see ASPECT).

For ancient thought, *moira* as well as *tuchê* come from the gods, that is, from the powers of the polytheistic pantheon. But from the fifth century BCE on, *tuchê* is the name given to an accidental or contingent event. In this way, *tuchê* acquires a clearly secular connotation since, as Euripides says, "If there is *tuchê*, what then are the gods? And if the gods have any power, *tuchê* is nothing" (frag. 154.4–5, in Colinus, *Nova fragmenta Euripidea*). The Stoics will recall this principle, and they will offer instead the notion of *heimarmenê* (see Box 4).

Tuchê, understood as luck and chance, works in philosophical texts from Aristotle to Epicurus as a means of giving man, beyond the necessity that closes off one's life, play enough to be free and to experience pleasure.

■ See Box 2.

2

Tuchê and *automaton* in Aristotle

➤ ART, PRAXIS

It is during his analysis of causes (*aitiai* [αἰτίαι]) in book 2 of his *Physics* that Aristotle elaborates the notion of *tuchê* by distinguishing it from that of *automaton* [αὐτόματον]. "Fortune" and "chance," to use the standard translations, are both motor causes of what happens (*hothen hê archê tês kinêseôs* [ὅθεν ἡ ἀρχὴ τῆς κινήσεως], 7.198a3; cf. *to kinêsan* [τὸ κινῆσαν], as distinct from matter, *hulê* [ὕλη], form, *eidos* [εἶδος], and finality, *to hou heneka* [τὸ οὗ ἕνεκα], 7.198a22–24). However, they are not causes by themselves (*kath' hauto* [καθ' αὐτό]), as is the quality of "being a builder" or "being an architect" that the builder/architect possesses with respect to the house to be built, but rather are causes by accident (*kata sumbebêkôs* [κατὰ συμβεβηκώς]), as is the quality of "being a flute-player" that that builder/architect might well also possess. Their field of action is not the domain of "what always or most often happens" (the necessary and the universal, which are the domain of science), but that of the contingent, the accidental, which is tied to the infinite, indefinite, indeterminate nature (*aoriston* [ἀόριστον]) of an individual (*apeira gar ... tôi heni sumbaiê* [ἄπειρα γὰρ ... τῷ ἑνὶ συμβαίη], 4.196a38ff., "for what can happen to an individual is limitless"). We can understand this as the way in which an accident can befall, *sumb-baiê*, a subject, or the way in which heterogeneous series, involving distinct unities, can happen to intersect—for example, the comings and goings of a debtor and of a lender (*sunebê* [συνέβη], 196b35). This is why they can count "for nothing" in the face of causes by themselves (5.197a14).

Nevertheless, we do notice them. This is because of a second characteristic that they possess: fortune and chance are applied only to "events that occur in view of something [*ta heneka tou* (τὰ ἕνεκά τοῦ)]," or those which manifest some finality and could be fulfilled by thought and by nature (*apo dianoias,* *apo phuseôs* [ἀπὸ διανοίας, ἀπὸ φύσεως], 5.196b18–22). The event occurs, but "it does not originate in a cause that intended this event," it only appears to have been intended (this is how I understand Aristotle's *hotan mê genêtai to heneka allou hekeinou heneka* [ὅταν μὴ γένηται τὸ ἕνεκα ἄλλου ἐκείνου ἕνεκα], 197b24, a difficult text that is often corrected). This is where the extent of the difference in scope between *automaton* and *tuchê* becomes clear. *Automaton* refers to any appearance of finality whatsoever; but we speak of *tuchê* only when the end lets itself be read in terms of a deliberate choice or decision (*proairesis* [προαίρεσις]) that is characteristic of a *praxis*, of a practical agent. The examples speak for themselves: "The tripod fell over *automatos*: it is now upright to be used as a seat, whereas it did not fall over to be used as a seat" (197b16–18). But when the lender who is out for a walk happens upon his debtor "so he can collect his money [*hoion heneka tou apolabein* (οἷον ἕνεκα τοῦ ἀπολαβεῖν)]" (5.196b33), we refer to this as *tuchê*. In both cases, finality seems to be intrinsic, even though it is not in fact, and this is how *automaton* becomes etymologized as *auto-matên* [αὐτὸ-μάτην], literally, "by itself in vain," of which *tuchê* is one kind: "This is what an *automaton* is, and it is so because of its name: each time that it occurs by itself in vain [*hotan auto matên genêtai* (ὅταν αὐτὸ μάτην γένηται)]" (6.197b29ff.).

It is easy to see why the translation of *automaton* as "chance" was not particularly productive (the French word for chance, *hasard,* is borrowed from the Arabic *al-zahar* [الزّهر], "throw of the dice," via the Spanish *azar*; the *DHLF* [in RT] even explains that *zahr* [الزّهر], "flower," referred to the flower on one of the faces of the die). Pierre Pellegrin chose to translate *automaton* into French as *spontané-ité* (spontaneity), and *tuchê* as *hasard* (chance, 4.195b30): "We also say that *le hasard* [*tuchê*] and *la spontanéité* [*automaton*] are among the causes." Henri Carteron has recently translated this into French as: "We also say that *la fortune* [*tuchê*] and *le hasard* [*automaton*] are causes," but this new translation is very problematic. The paradigm of the game of chance is indeed directly opposed to the Aristotelian conception of *tuchê*: a throw of the dice or an accidental fall are certainly neither one nor the other the object of a rational choice. Indeed, the following statement by Aristotle would be incomprehensible if that were the case: "Nothing inanimate, nor even a beast or a small child, does anything that occurs by chance [*ouden poiei apo tuchês* (οὐδὲν ποιεῖ ἀπὸ τύχης)], because they do not have the faculty of rational choice [*hoti ouk echei proairesin* (ὅτι οὐκ ἔχει προαίρεσιν)]; no more than fortune or misfortune can befall them [*oud' eutuchia oud' atuchia* (οὐδ' εὐτυχία οὐδ'ἀτυχία)], unless it is figuratively speaking" (6.197b7–9). It is all the more incomprehensible given that the Greek division of *tuchê* into *eutuchia* [εὐτυχία] and *atuchia* [ἀτυχία] is made inaudible by the difference between chance/fortune and misfortune.

We can also appreciate the difference that is established between this systematic physics (the four causes) and ontology (accidentality and contingency), and the fate of the epic and tragic hero. Fortune becomes an object of *epistêmê* [ἐπιστήμη], not that it is calculated or measured (the mathematics of probability is still a long way off; see CHANCE), but because it is rigorously analyzed in terms of its "as if."

BIBLIOGRAPHY

Aristotle. *The Physics*. Translated by Philip H. Wicksteed and Francis M. Cornford. 2 vols. Loeb Classical Library. Cambridge, MA: Harvard University Press, 1980.

In the fourth century BCE, *tuchê* passed from scholarly texts, where it had become secularized, into more popular forms, and became the goddess Tuchê, with a propensity for benevolence: good Tuchê, good Luck. The goddess Fortuna would be its Latin equivalent.

Fortuna in the Renaissance

➤ VIRTUE, VIRTÙ

Understood in terms of its Latin root, and the entire Romance language tradition, as well as in terms of its retranslation of the Greek and Hellenist tradition, *fortuna* is an equivocal term that designates good or bad luck, or something opportune or accidental, and can mean at the same time chance, necessity, or fate, and Providence. It is a notion whose ambiguity was figured and personified as a near-deity, particularly during the period of humanism from the Middle Ages to the Renaissance. The term *fortuna* at that time did not signify fortune in the sense of *tuchê* (Aristotle, *Physics,* 5), or that which we cannot control (Cicero, Seneca). In Dante, it is still a fluid unity in which a number of contradictory themes are condensed, and refers analogically to divine providential intelligence as a protective power.

The notion undergoes two important changes during the Renaissance: this was the period of its most powerful polymorphousness and greatest mobility, representing by analogy with the fine arts a "plastic compromise formulation" between the term's different meanings, to borrow one of Ernst Cassirer's expressions. It was also the period of its delegitimation: Fortuna fell from the status of a stellar goddess who was nearly omnipotent, to that of a wild animal full of furor that one had to learn to hunt and tame. The term in the end came close to designating either chance, devoid of all intention, or the necessity of nature, that is to say, essentially that with which human "freedom of action" is concerned.

In Machiavelli, the term was considered in strict correlation to *virtù*, and covered the entire spectrum of its meanings, with the exception of that of Providence. This fluidity, which was close to disrupting its conceptual unity, was all the more necessary given that Fortuna pointed toward that which was outside our grasp, and took on the status—which Giordano Bruno would systematize—of an idea that we can only approach figuratively, precisely because what is at issue escapes all determinate form.

> Nevertheless, not to extinguish our free will, I hold it to be true that Fortune is the arbiter of one-half of our actions, but that she still leaves us to direct the other half, or perhaps a little less.
>
> (Machiavelli, *The Prince*, chap. 25, trans. Marriott)

Machiavelli's sentence asserts the equivalence between *fortuna* and *virtù*. It takes away from theoretical judgment the possibility of making a decision by neutralizing all decisive assessment; it forestalls any accusation of excessiveness, and serves as a prescription for action. *Fortuna* is the name of what escapes us at the very moment we need to contain it or hunt it down. In the same way, at the precise moment *virtù* frees itself from Fortune and chooses the path of force (which happens by calling out to fortune as *kairos* [καιρός]; see MOMENT) according to a relation analogous to the masculine-feminine sexual relationship, *fortuna* reminds us of its presence and envelops *virtù*, since *virtù* itself is what *happens* to a subject. The term thereafter comes to name the paradox of the relation between chance, necessity, and freedom in a manner that remains mythical without being a mystification. The term has too often been considered in the sense of a mythological residue (Cassirer), or of a still-representational prefiguration of the conceptual opposition between freedom and the order of the world. If Machiavelli abolished all trace of Providence from the notion, it was not in order to eradicate its necessarily obscure nature, but, in a powerful way, to retain it as a form of intelligibility.

IV. *Anagkê*: The Bonds of Necessity

The etymology of *anagkê* [ἀνάγκη] is disputed, though the term possibly evokes the sense of "embracing" (RT: *Dictionnaire étymologique de la langue grecque*). Since Homer, the word has meant "constraint," from which comes the sense of divine fate (Euripides, *Phoenician Women*, 1000). In *Prometheus Bound* (511–19), the Moirai and the Erinyes govern *Anagkê*; when the chorus asks who governs Necessity, Prometheus replies: "The three Moirai and the Erinyes with their unyielding memory"; he adds that Zeus himself would not be able to avoid their fate (*tên peprômenên* [τὴν πεπρωμένην]). The word plays an important role in the Orphic writings, as attested by Euripides in *Alcestis* (963ff.): "I have found nothing stronger than Necessity [*Anagkê*], nor any remedy [against it] in the Thracian tablets, which the voice of Orpheus has written." Through a Platonic invention, it becomes the mother of the Moirai (*Republic*, 617b–e).

Anagkê plays a role in Parmenides's system. Associated with *moira* and *dikê* [δίκη] (justice, etymologically meaning "indication"; see THEMIS), *anagkê* ties beings in solid bonds. Barbara Cassin has shown how we can find its palimpsest in the immobility of Odysseus tied to the mast in the episode of the Sirens (*Parménide*, 55ff. and 151). Cassin also analyzes (151) the word and the concept of *anagkê*: the least-contested etymology connects the term with the curve of the arm (*agkos* [ἄγκος]), and the word is in fact constantly linked to circularity, to the turning back upon itself of *telos*, to limits, to bonds, to circles, and to the bands that, like the Styx, the Serpent, and the Ocean, encircle everything (see Onians, *Origin of European Thought*, pt. 3, chaps. 2 and 12; and Schreckenberg, *Ananke*).

The constraint of destiny will become a universal theme: Dante speaks of "la forza del destino" (see the opera by Verdi); Shakespeare says: "All unavoided is the doom of destiny" (*Richard III*, act 4, scene 4, v. 218); and Milton has his Almighty say: "What I will is Fate" (*Paradise Lost*, 7.173). In all of these examples, however, the semantic field of destiny is no longer Greek, but Latin, coming from *destinare* or from *fatum*.

The *heimarmenê* of the Stoics, chain and providence

➤ BEGRIFF, Box 1, ELEUTHERIA, Box 2, IMPLICATION, LOGOS

For the Stoics, everything happens according to fate. Fate is the rational organization of events that occur naturally (Diogenes Laertius, 7.149). No event is exempt: nothing happens without a cause.

The Stoics deny that there is such a thing as fortune or luck. They choose necessity, *heimarmenê*, as a principle of the world, reviving at least etymologically the notion of the part of a whole, although the whole is no longer mysterious. Through a series of plays on words, of verbal allusions, and of literary references (particularly to Homer: see Long, "Stoic Readings of Homer"), Chrysippus and the Stoics broaden the scope and extent of the definitions of *heimarmenê*, which becomes *heirmon* [εἱρμόν], "chain," and *logos* [λόγος], "speech" and "reason."

The oneness of a government of destiny is reciprocated with the oneness of the world itself, which is God. "God, Intellect, Destiny and Zeus are but one" (Diogenes Laertius, 7.135); "Common nature and the common reason of this nature are Destiny, Providence, and Zeus" (Plutarch, *Contradictions of the Stoics*, 34.1050b). Our sensations and our representations (*phantasiai* [φαντασίαι]) are our points of access in the whole network of Destiny, God, or Nature, which is an integrated chain of causes and effects, a total present, a code for the universe. Logical articulation is founded on the organization of the world itself, God or Nature, Providence, Destiny, which it reproduces in the order and the import of the utterances it joins together.

Another word for *heimarmenê* in the sense of fate is *peprômenê*, assigning to every thing its limit, *peras* [πέρας], which is its determination, and therefore "finishing and ending" (Plutarch, *Contradictions of the Stoics*, 34.1056b). Cicero (*De divinatione*, 1.55.125) explains the term *fatum* (from *fari*, "to say," *fatum*, "what has been said"—in Arabic, the word is *mektoub*, "what has been written") as the Latin translation of *heimarmenê*:

By "fate," I mean what the Greeks call *heimarmenê*—an ordering and sequence of causes, since it is the connexion of cause to cause which out of itself produces anything.

(fatum autem id appello, quod Graeci εἱμαρμένην, id est ordinem seriemque causarum, cum causae causa nexa rem ex se gignat.)

> (Cicero, *On Divination,* 1.125–26
> [RT: *SVF* 2.291], trans. in RT:
> *The Hellenistic Philosophers*, 337)

In the words of Diogenes Laertius:

Fate is defined as an endless chain of causation, whereby things are, or as the reason or formula by which the world goes on.

> (*Zeno*, in *Lives of Eminent Philosophers*, 7.149, trans. Hicks, 235)

The Stoics identify the greatest good, virtue and happiness, which they define as the fact of living in accordance with the events that happen naturally. Nonetheless, the Stoic theory of Fate is irreducible to the "argument of laziness" (if I am going to be cured of my illness, I will be cured, whether or not I call the doctor) and eradicates neither my action nor my freedom, which it appears to suppress: in the rational economy of the confatalia, or events linked together by fate, my illness is linked to the fact that I call the doctor. Human freedom does not reside so much in the choice of the content of our acts as in the active manner in which we embrace the events that happen to us naturally, and in which we thereby insert ourselves into the system of the world. Fate is irresistible. "The fates guide a docile will; they sweep away the one that resists [ducunt fata volentem, nolentem trahunt]"—this is how Seneca (letter 107.11 in *Letters to Lucilius*) freely translates the lines by Cleanthus that are cited at the end of Epictetus's *Manual for Living*. Our action can nevertheless become conjoined to fate, provided we know how to distinguish between simple facts and facts that are linked (*simplicia* versus *copulata*), between perfect and principal causes and auxiliary and adjacent causes (*causae perfectae et principales* versus *adiuvantes et proximae*):

> "As therefore," he says, "he who pushes a cylinder gives it the beginning of its motion, but does not give it the power of rolling; so a sense impression when it strikes will, it is true, impress and as it were stamp its appearance on the mind, but assenting will be in our power, and, in the same way as was said in the case of the cylinder, it is pushed from outside but for the rest moves by its own force and nature."

> (Cicero, *De fato,* 43, trans.
> Sharples, 87, 89)

By assent (*sugkatathesis* [συγκατάθεσις]), which is in our power and which is not reduced to a passive acceptance, we have the power to participate actively in the network of Providence. The Leibnizian theory of freedom will return to this motif.

KITSCH (GERMAN)

ENGLISH   junk art, garish art, kitsch

➤ AESTHETICS, ART, BAROQUE, CLASSIC, *CULTURE*, GOÛT, NEUZEIT, PEOPLE, SUBLIME

The word *Kitsch* is German in origin and had previously been translated into French as *art de pacotille* (junk art) or *art tape-à-l'œil* (garish art), but the original term has now become firmly established in all European languages. Used as an adjective, *kitsch* or *kitschy* (dis)qualifies cultural products intended for the masses and appreciated by them. As a noun the term designates a category of taste, certainly linked to an aesthetics, but even more so to an ethics whose political consequences are obvious. The subtitles of two works devoted to kitsch (Moles; Dorfles) indicate why some people find it attractive while others judge it severely: it is both an art of happiness and an expression of bad taste.

I. A Question of the Public or of Artistic Value?

The notion of *Kitsch* first appeared in the nineteenth century. It became the object of keen attention when mass society—helped by increased leisure time—had at its disposal a "culture for the masses" that, by its nature, seemed to threaten the very existence of authentic culture. *Kitsch* covers all different means of expression once they abandon rigor in order to cater to a wider public. The art of the chromos, pleasantly eye-catching photographs, the religious keepsakes collected by pilgrims, the souvenirs designed for tourists, but also the popular literature sold in railway stations, the comic theater of the boulevards, or the music that simply creates an ambiance: these are all examples of *Kitsch*. As a kind of debased popularization, it offers a decadent model that is all the more alluring for being so easily accessible. This is, at least, what its detractors say.

Hermann Broch, one of the first critics to write seriously about *Kitsch*, sees it as a form of "radical evil" that destroys value systems, since its essence "is the confusion of the ethical category with the aesthetic category" ("Evil in the Value-System," 33). In search of the pleasing effect, one that offers the most inexpensive seduction, kitsch does not aim to be the product of good work but merely to be an attractive end product. This perverse method means that *Kitsch* uses tried and tested techniques and that it turns its back on creation in order to achieve a risk-free success in its effort to seduce. As Albert Kohn explains in an introductory note to his French translation of Broch's 1955 book *Dichtung und Erkennen*:

> The German word *Kitsch* has no equivalent in French. It refers to all genres of objects in bad taste, of artistically pretentious junk, popularizing commonplace forms through their mass-production, but it also applies to literary, artistic or musical works which aim for easy effects (such as melodrama) and pomposity, and cultivate sentimentality or mindless conformity. For want of being able to use the German word, we have translated it depending on the context as "*art de pacotille*" [junk art] or "*art tape-à-l'œil*" [garish art]. In actual fact, these two meanings are often combined.
>
> (Broch, *Création littéraire*, 17)

There are many disadvantages to translating the term in this way. The two attributes that are substituted for the semantic richness of *Kitsch* greatly reduce its complexity. By devaluing it from the outset, they take as a given what needs to be elucidated. So when Broch writes, "The essence of kitsch is the confusion of the ethical category with the aesthetic category. It is not concerned with 'good,' but with 'attractive' work; it is the pleasing effect that is most important," the translation of *Kitsch* as *tape-à-l'œil* [garish art] is wholly inadequate, first of all because not everything that is "garish" has to do with aesthetics, and then because the second sentence would therefore merely state a banal tautology, namely that the only aim of "garish" art is to produce a "pleasing effect." It is an entirely different matter if we retain the term *Kitsch*. What is more, other linguistic traditions had not hesitated to use the notion in its original language.

Clement Greenberg, for example, published an article in 1939 entitled "Avant-garde and Kitsch" in which he returned to Broch's idea that *Kitsch* borrows "tried and tested techniques," uses "prefabricated signs which, in its hands, solidify into clichés" (11). The merit of Greenberg's article is that he connects the appearance of *Kitsch* to that of another controversial phenomenon, the avant-garde, which also permanently destabilized established aesthetic values. Greenberg contrasts *Kitsch* with the avant-garde. The avant-garde alone seems capable of "continuing to change culture in the midst of ideological confusions and violence" (17):

> In the first place it is not a question of a choice between merely the old and merely the new, as London seems to think—but of a choice between the bad, up-to-date old and the genuinely new. The alternative to Picasso is not Michelangelo, but kitsch. . . . If the avant-garde imitates the processes of art, kitsch imitates its effects.
>
> (Ibid., 13–15)

■ See Box 1.

II. Taste, Effect, or Attitude?

After the war Hannah Arendt reflected upon the mass culture that was developing and of which *Kitsch* remained one of the main components. She pointed to the structural links between the world of aesthetic taste and that of political opinions, which both require a certain persuasiveness. In more general terms culture and politics belong together "because it is not knowledge or truth which is at stake, but rather judgment and decision, the judicious exchange of opinion about the sphere of public life and the common world, and the decision what manner of action is to be taken in it, as well as how it is to look henceforth, and what kind of things are to appear in it" (*Between Past and Future*, 223). Understood from this perspective, *Kitsch* becomes all the more disturbing since, as Hermann Broch had noted, "one cannot work in any art without adding to the mixture a drop of effect" (*Création littéraire*, 361), that is, without adding some drop of *Kitsch*. It was no doubt for this very reason that *Kitsch*, an alarming corruption that could be found even in the most uncompromising works of art, was contested so vigorously.

1

Avant-garde and Kitsch

In his article "Avant-garde and Kitsch" (1939) Clement Greenberg writes:

> Where there is an avant-garde, generally we also find a rearguard. True enough—simultaneously with the entrance of the avant-garde, a second new cultural phenomenon appeared in the industrial West: that thing to which the Germans give the wonderful name of *Kitsch*: popular, commercial art and literature with their chromotypes, magazine covers, illustrations, ads, slick and pulp fiction, comics, Tin Pan Alley music, tap dancing, Hollywood movies, etc., etc. For some reason this gigantic apparition has always been taken for granted. It is time we looked into its whys and wherefores.
>
> The precondition for *Kitsch*, a condition without which *Kitsch* would be impossible, is the availability close at hand of a fully matured cultural tradition, whose discoveries, acquisitions, and perfected self-consciousness *Kitsch* can take advantage of for its own ends. It borrows from that tradition devices, tricks, stratagems, rules of thumb, and themes, converts them into a system, and discards the rest. It draws its life blood, so to speak, from the reservoir of accumulated experience. This is what is really meant when it is said that the popular art and literature of today were once the daring, esoteric art and literature of yesterday. Of course, no such thing is true. What is meant is that when enough time has elapsed the new is looted for new "twists," which are then watered down and served up as kitsch.
>
> (Greenberg, *Avant-garde and Kitsch*)

Over the years the definition of *Kitsch* expanded and became more complex. When Broch returned to the subject in 1951, he stated that he was not talking "truly about art, but about a determinate attitude of life" (ibid., 311) deeply rooted within "kitsch-man." Abraham Moles pursued this logic in his work on *Kitsch*:

> It is not a semantically explicit denotative phenomenon, it is an intuitive and subtle connotative phenomenon; it is one of the types of relationships that human beings have with things, a way of being rather than an object, or even a style. Of course, we often talk of "kitsch style," but as one of the objectifiable supports of the kitsch attitude, and we can see this style becoming more formalized into an artistic period.
>
> (Moles, *Le Kitsch*, 7)

Nevertheless, at a time when pop art was blurring the ordering of established values in the avant-garde world, a new form appeared that staked a claim to *Kitsch*, and this was "camp." This American term is used to describe "something so outrageous or in such bad taste as to be considered amusing" (*Webster's New Ideal Dictionary*, 2nd ed., 1989). Since then, artists in Europe as well as in the United States have been exploiting both the first level—their works are crude, and the second level—they are doing this deliberately, joyously combining what is pleasing to the eye and what is revolting (for example, Jeff Koons). We can no longer tell with such works whether *Kitsch* is simply amusing—there is a kitsch-man perhaps ready to be awakened in every lover of art—or whether it is both funny and critically insightful.

➤ *DISCOURSE*, LOGOS, MANIERA, SIGN, SIGNIFIER/SIGNIFIED, SPEECH ACT, TERM, TO TRANSLATE, WORD

From the unity of *logos* to the multiplicity of Latin terms, by way of the overt binary (for example, the German *Sprache/Rede*), or ternary oppositions (for example, the French *langue/langage/parole*), history shows us that, when referring to relatively circumscribed realities (the speech organ, the faculty of speech, the means of expression particular to a group, the set of terms, the particularity of style, usage) or precise oppositions (individual/common, etc.), the same terms have sometimes been used with opposite meanings, and these shifts of meaning are clear and identifiable. The different theories of language have opted, within the multiplicity, even profusion, that each language offers, for a set of terms that in each case is quite limited. They have defined them in contrastive fashion in order to posit the oppositions they required, and in order thereby to specify the subject of the discipline. There is nothing, moreover, preventing a later theory that starts out with the same set of terms from giving different definitions of these terms.

I. The Emergence of the Differentiation of *Langue/Langage/Parole*

A. From language to the language sciences

The first attested meaning of *lingua, lingue* (ca. 980) was an "organ situated in the mouth," from the Latin *lingua* (which accounts for the metonymy of the French expression *mauvaise langue*, "malicious gossip," from 1260 on, in the sense of "malicious words," then of "malicious person"). The meaning of a "system of expression particular to a group" is attested at the same period, but more in the sense of "shared language," except when the noun is qualified or determined in some way. The French word *idiome* (idiom), a gallicization of *idiomat*, borrowed from the Low Latin *idioma*, also had the meaning of a "language or way of speaking particular to a region," and then much later of a "particularity of style." *Langage* in French, first noted as *lentguage* (ca. 980), designated the properly human faculty of expressing oneself and communicating. But from the

twelfth century on, the word meant "speaking" or "speech," sometimes with pejorative connotations (*bavardage*, "gossip"), with *parole* later taking on this sense. *Langage* in the sense of a "way of speaking particular to a people" would give way to *langue*, but would subsist as a "way of speaking particular to an individual or a group" (cf. "diplomatic language"). Its definition as an organized system of signs used to communicate would enable it to be extended to nonlinguistic systems ("the language of art, of colors") (RT: *DHLF*). The English term "language" was borrowed from the Old French *lenguage* around 1280, in the sense of a "way of speaking," then, of a "national language."

In 1765, Diderot, in the RT: *Encyclopédie*, criticized the common definition of *langue* as a "succession or accumulation of words and expressions" (cf. RT: *Dictionnaire universel*), saying that it in fact described a "vocabulary" rather than a "language," a term that covered not only words and their meanings, but also all the figurative turns of phrase, the connotations of words, the way the language was constructed, and so on. *Langue* would need to be defined more precisely, as the "totality of the usages of the voice belonging to a nation," insofar as one should consider "the expression and communication of thoughts, according to the most universal views of the mind, and the views most common to all men," and not the particularities specific to a nation and the ways it speaks, for which the term *idiome* would be used, with *parole* referring to language in general ("*La parole* is a sort of painting of which thought is the original"). This division allowed for a distinction to be made between *Grammaire générale* (Standard Grammar) considered as a "science" concerned with the "immutable and general principles of the spoken and written word," and "particular grammars" understood as "arts" that study the ways the practical usages of a language are applied to these general principles of spoken language (see Auroux, *L'encyclopédie: "Grammaire" et "langue" au XVIIIe siècle*).

The distinction between *langue* and *parole* drawn in Ferdinand de Saussure's RT: *Cours de linguistique générale* (*Course in General Linguistics*) allows one to distinguish the code from its use, the social from the individual, the essential from the accidental, and thereby enables the science of language to become a stable object, with *langage* referring to the faculty (see section B, below). The same epistemological necessity would lead Chomsky to distinguish between "competence" and "performance," though we cannot superimpose these two conceptual pairs, especially since, if the Saussurean *langue* is envisaged as a "treasure trove," a passive container full of isolated "signs," Chomskean "competence" is in contrast a set of "rules" allowing one to generate an infinite set of possible combinations of a given language, from a universal and innate linguistic faculty. For other linguists, such as Antoine Culioli, *langage* does not fall outside of the field of

linguistics, nor is it the concern of physiology, psychology, or even philosophy (cf. the "philosophy of language"), but it is precisely linguistics' own ultimate object, insofar as it is apprehended on the basis of the diversity of *langues* (whence the plural expression in French, *sciences du langage* "sciences of language," often preferred nowadays to *linguistique*, "linguistics," to describe the discipline).

B. The Saussurean pair *langue/parole* and its translations

1. *Langue/parole*

The terminological pair *langue/parole* has become widely accepted on the basis of the importance Ferdinand de Saussure conferred on it. Indeed, in chapter 3 of the *Course in General Linguistics* we read:

> By distinguishing between the language itself [*la langue*] and speech [*la parole*], we distinguish at the same time: (1) what is social from what is individual, and (2) what is essential from what is ancillary and more or less accidental.
>
> The language itself is not a function of the speaker. It is the product passively registered by the individual. . . .
>
> Speech, on the contrary, is an individual act of will and the intelligence, in which one must distinguish: (1) the combinations through which the speaker uses the code provided by the language in order to express his own thought, and (2) the psycho-physical mechanism which enables him to externalize these combinations.

In fact, Saussure's chapter is marked by a torrent of distinctions. Upstream, we find an initial split being made between *langage* and *langue* (*langage* has to be discarded because this term is too "heterogeneous"). But the presumed "homogeneity" of *langue* requires a new demarcation (or "separation"), one that distances it precisely from *parole*, to the extent that it produces two clearly opposable "linguistics," in the same way the "social" is opposed to the "individual," and even more so, the "essential" to the "accidental." This distinction is reinforced by the term "subordination"—that is, of *parole* to *langue*—such that:

> It would be possible to keep the name linguistics for each of these two disciplines. We would then have a linguistics of speech. But it would be essential not to confuse the linguistics of speech with linguistics properly so called. The latter has linguistic structure as its sole object of study.

It is obvious that we have now left the realm of methodology and are entering that of ontology, which raises a formidable problem. Should the lived experience of a language be the deciding factor here, or should it be the conceptual imposition of the theorist? Is the latter not setting him- or herself up as a supreme judge, who is in danger of forcing the summoned "object" to submit to his decisions as an interpreter and organizer? And a theorist consolidates her authority even more through the power of an undisputed conclusion—indeed, as history will go on to confirm, this distinction between *langue* and *parole* has for a long time now been accepted as an indisputable axiom of any linguistics worthy of the name.

2. Binary or ternary, depending on the language

Saussure's *Course*, however, manifests a certain reticence in this regard:

> [T]he distinctions established are not affected by the fact that certain ambiguous terms have no exact equivalents in other languages. Thus in German the word *Sprache* covers individual languages [*langue*] as well as language in general [*langage*], while *Rede* answers more or less to "speech" [*parole*], but also has the special sense of "discourse." . . . No word corresponds precisely to any of the notions we have tried to specify above. That is why all definitions based on words are vain. It is an error of method to proceed from words in order to give definitions of things.

This is a strange statement for a linguist to make, even more so for one who is an avowed partisan of the "arbitrary nature of the linguistic sign" (unless we hold the editors of the *Course* responsible on this point, and not Saussure himself). Whatever the case may be, if we turn our attention back to words, we have to admit that they do float around without any secure points of anchorage. This is confirmed by Eugen Coseriu who, while stating that this duality works in most languages, is forced to accept that it is displaced and complicated by a second distinction between two varieties of language, that is, those that have only a binary distinction, and those that present a ternary distinction. So we have:

a. Binary type (*langage-langue/parole*)

German	English	Russian	Latin
Sprache	language/tongue	*jazyk* [язьцк]	*lingua*
Rede	speech	*rečʼ* [рець]	*sermo/oratio*

b. Ternary type (essentially the Romance languages)

French	Italian	Spanish	Portuguese	Romanian	Catalan
langage	*linguaggio*	*lenguaje*	*linguagem*	*limbaj*	*llenguatge*
langue	*lingua*	*lengua*	*língua*	*limba*	*llengua*
parole	*favella/ parlare*	*habla(r)*	*fala(r)*	*vorbire*	*parla*

The elements provided by Tullio de Mauro (critical edition of the *Cours de linguistique générale*), however, give a ternary structure also for Polish (*jezyk / mowa / mowa jednostkowa*) and for Magyar (*nyelvezet/nyelv/beszéd*), which relativizes the exclusive privilege accorded to Romance languages. What is more, he stresses the specific complexities of German, English, and Italian, and we can already see a blurring of terms in the table above (there are sometimes several words on the same line, and one could add *govorenie* [говорение] to the Russian *rečʼ*). We can assume, therefore, that the premise of an orderly distribution (between languages, and within each language) has to be significantly qualified. So it is reasonable to formulate the hypothesis that if one looks hard enough, one will always find a way to expand or reduce the desired number of categories. The lists of categories thus end up confirming

the theory of the "arbitrary nature of the linguistic sign": signifiers (*signifiants*) have no fixed meaning, and attempting to distribute them leads to their dispersion, which is consequently followed by a dispersion of signifieds (*signifiés*). Should the distinction between *langue* and *parole* be described, then, as "factitious," in Descartes's sense (*factae*; in *Meditatio*, 3a)?

3. The dynamics of oppositions

We should begin by challenging the rather casual opposition between "factitious" and "innate" (or between "accidental" and "essential"). The concept presented to us in this terminological pair is precisely duality itself, that is, a dynamic relation with no separation or merging of the terms—or, even more radically, with no "subordination" of one term to the other. Such subordination remains the strongest temptation when the schematization of aspects of language is attempted, with the most perverse of effects (we have to put everything into one of the terms—*langue*—so as not to leave a merely insignificant residue in the other, at the expense of their mutual disqualification). We can find a clue if we go further upstream from Saussure, to Wilhelm von Humboldt, who is perhaps his hidden counterpart. The aspect of language that holds and stimulates his interest most keenly is the fact that it appears as both object and subject, in a paradoxical coincidence of opposites (or of terms judged as such by abstract understanding):

> Language is as much an object and independent as it is a subject and dependent. For nowhere does it have . . . any permanent foundation, but it must always be produced anew in one's thought, and consequently come down entirely on the side of the subject: but the characteristic property of the act of this production is to convert it immediately into an object; in so doing it involves at every moment the action of an individual, an action that is already linked in itself by all of its present and past operations.

> (Die Sprache ist gerade insofern Object und selbständig, also sie Subject und abhängig ist. Denn sie hat nirgends . . . eine bleibende Stätte, sondern muß immer im Denken aufs neue erzeugt werden; es liegt aber in dem Act dieser Erzeugung sie gerade zum Object zu machen: sie erfährt auf diesem Wege jedesmal die ganze Erwirkung des Individuums, aber dieser Einwirkung ist schon in sich durch das, was sie wirkt und gewirkt hat, gebunder.)

> (*Schriften zur Sprachphilosophie*
> [*Writings on the Philosophy of Language*])

Humboldt was endlessly fascinated by this interweaving of opposite and complementary poles, and it led him in the end to a famous and obscure pair, which moreover he expressed in Greek: *ergon/energeia*. These, however, could be replaced with other terms, for example, *Macht* (the sheer power of the elements memorized) as opposed to *Gewalt* (the enthusiastic initiative of an individual). Humboldt's investigation of this string of terminological couples led him finally to what is perhaps the most striking and provocative statement in his work:

> [I]t is just as correct to say that the human race only speaks one language as it is to say that every man possesses his own language.

> ([D]aß man ebenso richtig sagen kann, daß das ganze Menschengeschlecht nur Eine Sprahce, als daß jeder Mensch eine besondere besitzt.)

> (ibid.)

The power of language does not allow itself to be distributed into moments (increasing or decreasing, widespread or restricted, essential or ancillary). The universal and the singular exist side by side, or to put it more precisely, they only appear in their reciprocal tension, or their productive interaction (a coordination without subordination).

In the tradition that flows from Humboldt, then, coordination inevitably prevails, even at the expense of more or less happy or loose compromises, which accept the agreement of the reconciled dualities. This is true of the now classic pair *modus/dictum* (see DICTUM). Thus Charles Bally:

> An explicit sentence comprises . . . two parts: one correlates to the process that constitutes representation (for example, rain, a cure); we will call this, following the example of logicians, the *dictum*.

> The other contains the key element of the sentence, namely, the expression of modality, correlative to the operation of the thinking subject. The logical and analytical expression of modality is a modal verb: both constitute the *modus*, which complements the *dictum*.

> Modality is the soul of the sentence, it is constituted essentially by the active operation of the speaking subject. . . .

> . . . the *modus* is the *theme*, and the *dictum* the substance of what is said in an explicit statement. . . . The *modus* and the *dictum* complement one another.

> (Bally, *Linguistique générale et linguistique française*, §§28 and 32)

This is equally true of the pair "type/token" (see PROPOSITION, Box 4). Here, for example, is C. S. Peirce:

> A common mode of estimating the amount of matter in a MS or printed book is to count the number of words. There will ordinarily be about twenty *the*'s on a page, and of course they count as twenty words. In another sense of the word "word", however, there is but one word *the* in the English language; and it is impossible that this word should lie visibly on a page or be heard in any voice, for the reason that it is not a Single thing or Single event. It does not exist; it only determines things that do exist. Such a definitely significant Form, I propose to term a *Type*. A Single event which happens once and whose identity is limited to that one happening or a Single object or thing which is in some single place at any one instant of time . . . such as this or that word on a single line of a single page of a single copy of a book, I will venture to call a *Token*.

> (Peirce, *Collected Papers*, vol. 4, §537)

The same classic distinction informs Chomsky's duality of "competence" and "performance," which the author himself compares to the Saussurean pair:

> Linguistic theory is concerned primarily with an ideal speaker-listener, in a completely homogeneous speech-community, who knows its language perfectly and is unaffected by such grammatically irrelevant conditions as memory limitations, distractions, shifts of attention and interest, and errors (random or characteristic). . . . To study actual linguistic performance, we must consider the interaction of a variety of factors, of which the underlying competence of the speaker-hearer is only one. . . . We thus make a fundamental distinction between *competence* (the speaker-hearer's knowledge of his language) and *performance* (the actual use of language in concrete situations). Only under the idealization set forth in the preceding paragraph is performance a direct reflection of competence. In actual fact, it obviously could not directly reflect competence. . . . The problem for the linguist, as well as for the child learning the language, is to determine from the data of performance the underlying system of rules that has been mastered by the speaker-hearer and that he puts to use in actual performance. . . . The distinction I am noting here is related to the *langue-parole* distinction of Saussure.

> (Chomsky, *Aspects of the Theory of Syntax*)

Chomsky's distinction has the merit of being highly manipulable, and it is strengthened by its assumed close fidelity to its object. One might suspect, however, that this overly harmonious symmetry erases the interactive complexity of the problem that needs to be resolved.

This is why, downstream from Saussure, one of the most interesting studies appears to be the one proposed by Ludwig Jäger, which Thomas Scheerer summarizes as follows: what we are dealing with is a chiasmic classification based on the four concepts "actual/virtual" and "individual/social." So we have:

1. As far as the virtual (*in absentia*) is concerned, the distinction between, on one hand, an "individual" concept of a language (in the sense of subjective, internalized processes), corresponding to the Saussurean concepts of "treasure trove," "repository," "memory," and on the other hand, a social concept of language (in the sense of a social, semiological institution, whose value is intersubjective), corresponding to the Saussurean concepts of "social crystallization," "social secretion," "social product."

2. As far as the actual (*in praesentia*) is concerned, the distinction between, on one hand, an "individual" concept of speech (in the sense of subjective realizations of the possibilities given by the internalized and intersubjective potentials of language), and on the other hand, a "social" concept of speech (in the sense of an intersubjective—dialogical—production endowed with a new meaning, corresponding to the Saussurean concepts of "analogy" and of "parasemic creation").

The interesting aspect of this proposition is the concern to find a middle way, though not a reductive one, between the Saussurean duality proper, with its distinctions and its blind alleys, and the need for an order that does not sacrifice the complexity of the problem. This problem, once it has come to light, remains forever a source of torment, which from time to time generates illuminating conjectures.

II. From the Oneness of *Logos* to the Complexity of the Medieval Semantic Field

The difficulty of translating ancient texts into modern languages is dramatically illustrated by the terminological network that concerns us. On the one hand, we have the almost absolute oneness of *logos* in Greek, which by itself covers all the modern terms referring to the linguistic field, and even beyond, leaving just a small place for *glôssa*. In classical Latin, on the other hand, *logos* scatters into ten or more terms, whose meanings are more or less set. Medieval Latin inherits this diversity, with no real possibility of putting these terms into any order: indeed, it has to deal with a number of real legacies, via the transmission of texts, which come into conflict with specific and new terminological choices. These new choices are linked both to choices of translation in philosophical and religious texts (so, for example, it is *lingua* that appears in the Vulgate Latin as the expression used to talk about the *confusio linguarum*, but it is *locutio* that is retained for translating the famous passage from *De anima*, see section II.B.2, below), to theoretical choices in the elaboration of a particular doctrine (the opposition between *lingua* and *idiomata* in Roger Bacon), and to different uses of terms' former connotations, notably with the aid of some celebrated etymologies (see the one for *idioma*).

A. *Glôssa/logos*: *Langue/langage, parole,* and so forth

In ancient Greek, *logos* [λόγος] was a catchall word covering everything: it referred to a particular language or tongue, language in general, speech, and more generally discourse, but also the faculty of thinking and of speaking, and more generally relation (see LOGOS)—everything, that is, except for the tongue as an organ, for which the term was *glôssa* [γλῶσσα] (in Aristotle's biological treatises, for example). *Glôssa*, however, has the same kind of metonymic extension as *langue* in French: the tongue as an organ that is common to humans and animals (Homer, *Iliad*, 1.249, *Odysseus*, 1.332), and the tongue as an organ of speech (Hesiod, *Works and Days*, 707). So it can mean speaking as opposed to acting (Aeschylus, *Agamemnon*, 813), or feeling or thinking (Euripides, *Hippolytus*, 612; Lucien, *Pro lapsu inter salutendum* [*On a Mistake in Greeting*], 18). Since Homer, the term *glôssa* has also referred to the tongue we speak—understood generically to designate all language when the language spoken is Greek, or restrictively, when it is a foreign or barbarian tongue that is being alluded to, as idiom (*Iliad*, 2.804, 4.438; Herodotus, 1.57). "To speak a language" can be rendered as *glôssan nomizein* [γλῶσσαν νομίζειν], to have it in practice (Herodotus, 1.142), or *chrêsthai* [χρῆσθαι], to use it (4.109); and dialects are seen as "derivations" or "alterations" of a language, *tropous paragôgeôn* [τρόπουςπαραγωγέων] (1.142.8) (see TO TRANSLATE, section I). In rhetoric and poetics, particularly in Aristotle, *glôssai* are archaic or dialectal terms ("signal words" for Hardy, "borrowed names" for Dupont-Roc and Lallot; see WORD, II.B.1), as opposed to the "word" properly speaking

(*kurion* [κύριον]), which can at times elevate the *logos*, and sometimes make it incomprehensible (*Poetics*, chaps. 21 and 22; in particular, 1458a 22–26). Finally, *glôssai* would later refer to the tongues of fire of the Pentecost.

It is worth noting that in Greek *glôssai* and *logoi*, in the plural, do not usually or primarily refer to the same reality as in the singular (*logos*: thought-speech, etc.; *logoi*, propositions, definitions; *glôssa*: tongue as an organ, and one language as distinct from another; *glôssai*: archaisms or obscurities).

Glôssa in the sense of "tongue" is distinct from the universality of the *logos* defining the humanity of humankind, in that it is linked to the differences between languages, and to human diversity. We tend therefore to reserve "language" (*langage*) for *logos*, and "tongue" (*langue*) for *glôssa*. In addition, we might be tempted to say that *parole*, in the Saussurean sense of an individual act, has no equivalent in ancient Greek, but this would be to forget that *logos* is first and foremost discursiveness, act, performance, and thus quite appropriate to designate a speech-act—but only insofar as it is a universally singular act defining the human (see SPEECH ACT).

■ See Box 1.

B. The proliferation of terms for "language" in medieval Latin

■ For classical Latin, see Box 2.

"Fiebat autem res non materno sermone, sed literis" (The conversation took place not in our mother tongue [*materno sermone*] but in Latin [*literis*]). This sentence from Guibert de Nogent's (d. ca. 1125) autobiography, *Monodiae*, allows us to understand at the outset the complexity of this semantic field in medieval Latin.

The notions collectively associated with the term "language" are at the confluence of ten or so words—*elocutio, eloquium, famen, idioma, lingua, linguagium, locutio, loquela, sermo, verbum, vox*—whose various meanings are generally wider than "language." This semantic field was of little interest to medieval lexicologists: it did not give rise to any of those differential verses so highly valued by the masters, nor to any substantial dictionary entries. Of these words, we will focus our attention on the most commonly represented in the medieval corpus.

1. Idiom (*eloquium, lingua, loquela, idioma, locutio, sermo*)

The terms in question share the meaning of "language of a group, idiom": the four privileged words having this meaning are *lingua* (*anglica, arabica, gallica, graeca, latina, romana*, etc.), *sermo* (*anglicus, hebraeus, latinus, maternus, sclavonicus*), *eloquium* (*arabicum, graecum, hebraeum, latinum*), and *idioma* (*arabicum, graecum, teutonicum*), while it is rarer to find *loquela* (*hebraica, latina, saxonica*) and *locutio* (*barbarica, latina*). The specific sense of *idioma*, "distinctive character," comes through in the expressions *idioma linguae, idioma linguae graecae, hebraeae, teutonicae*, and is retained after it acquires the more simplified meaning of "language," even if Robert of Melun (d. 1167) speaks, for emphasis, of *proprietas idiomatis hebraeae linguae*. So too the distinction in Peter Comestor (d. 1178; RT: *PL*, 198, col. 1653B) between *linguae* and *idiomata linguarum*: the apostles get their message across not only because of their mastery of languages, but also because of the dialects that are derived from them.

Idioma is used especially when one wishes to stress the difficulty of translating, whether it involves one of the three sacred languages or a vernacular language.

There is a wide consensus about the synonymy between several of these terms: Pierre Hélie (ca. 1150) uses *genus loquelae* and *genus linguae* indiscriminately, before qualifying them as *graeca, latina*, etc.; Boethius of Dacia (ca. 1270) posits an equivalence between *lingua* and *idioma* (grammatica in una lingua vel in uno idiomate [the grammar of one language or tongue]") but also posits the universality of grammar as a science, when he explains that "all languages are one single grammar [omnia idiomata sunt una grammatica]"; Peter Comestor (RT: *PL*, 198, col. 1623D) asserts an equivalence between *loquela* and *idioma* ("loquela tua id est idioma Galilaeae [and your speech of Galilee, that is to say]") in his commentary on Matthew 26:73. *Lingua* also signifies, by extension, but more rarely, the community formed by those who speak the same language (cf. Revelation 13:7): so Raoul of Caen refers to Tancredo, celebrated by all people (*populos*) in all languages (*linguas*).

2. Language, speech (*sermo, locutio, loquela*)

The meaning of "language" as the human ability to use vocal signs to communicate can be found in *sermo*, which thus translates *logos*—cf. the translation by Chalcidius of Plato's *Timaeus*, 47c: "Propter hoc enim nobis datus est sermo ut praesto nobis fiant mutuae voluntatis indicia" (Language has been given to us so we have a way to conveniently indicate our wishes to others). We also find it in *locutio*, for example, in the answer given by Boethius of Dacia to the question of knowing whether "grammar" is possessed naturally by men ("utrum grammatica sit naturaliter ab homine habita"): men who have never heard a human word spoken (*loquela*) are still naturally able to speak (*locutio vel grammatica*). He makes reference to Psammetichus's famous experiment, reported by Herodotus (for a more detailed history, see Launay, "Un roi, deux enfants et des chèvres," which unfortunately cites only very few texts in the original):

> Si homines aliqui in deserto nutrirentur, ita quod numquam aliorum hominum loquelam audirent nec aliquam instructionem de modo loquendi acciperent, ipsi suos affectus naturaliter sibi mutuo exprimerent et eodem modo. Locutio enim est una de operibus naturalibus, cujus signum est, quod instrumentum, per quod fit locutio, natura in nobis ordinavit.

> (If men were raised in a desert such that they never heard a word spoken by other men, and received no instruction as to how to speak, they would still naturally express their feelings, and in the same way. Language is indeed one of the natural faculties, and the sign of this is that the instrument by which language is produced is given to us by nature.)

> (Herodotus, *Histories*)

There is one universal *modus loquendi* (*idem apud omnes*, an expression that Aristotle applied to mental affects [*pathêmata tês psuchês* (πάθημα τῆς ψυχῆς)]; see SIGN), here attributed to language, with the accidental differences explaining the diversity of languages (*idiomata*).

Sprache/Rede, langue/parole? Heidegger as a reader of the Greeks

Heidegger states, in §34 of *Being and Time*, in the course of an analysis of speech as existential: "The Greeks had no word for *langue* (*Sprache*), they understood this phenomenon 'from the beginning' as *parole* (*Rede*)." The difference established between *Sprache* and *Rede* is by no means self-evident, however—added to this initial difficulty is that of its translations into French, which vary considerably: translations either stress the opposition *langue/parole*, as in the version above by François Vezin, or, on the contrary, they join the terms together, as twin sisters opposed to *Rede*, as in the translation by Emmanuel Martineau: "The Greeks have no word for *Sprache* (*parole*, *langue*), they understood this phenomenon 'from the very first' in the sense of *parler* [act of speaking]."

The distinction *Sprache/Rede* is a classic one in German, and we find it notably in Goethe (*Dichtung und Wahrheit* [*Poetry and Truth*], pt. 2, bk. 10): "Schreiben ist ein Mißbrauch der Sprache, still für sich lesen ein trauriges Surrogat der Rede" (Writing is a misuse of language, reading quietly to oneself is a sad substitute for live conversation). It is to the ancient tradition, still prevalent in the Middle Ages, of reading out loud that Goethe contrasts the *stille für sich lesen = legere in silentio* (Saint Augustine), *tacite legere*, or *legere sibi* (Saint Benedict).

For Heidegger, however, the distinction between *Sprache* and *Rede* only takes on its full meaning after accounting for both (1) the interpretation of *logos* [λόγος] he proposes in the same text (§7) as apophantic, and (2) the existential structure of *Mitsein* (being-with). He is concerned with returning to the conditions of the ontological, and thus existential, possibility of speaking [*la parole*] as an ontological structure of *Dasein*. *Rede* still leaves open the possibility of *Gerede* (§35); of *parlerie*, "gossip" (Montaigne); of *bavardage*, "idle chatter" (Martineau's translation); or of the *on-dit*, "hearsay" (F. Vezin's translation).

The opposition between *Sprache* and *Rede* is so indecisive that the following paragraph (§35) can say: "Die Rede . . . ist Sprache" (La parole . . . est langage parlé [Speech . . . is spoken language], Vezin; or, Le parler . . . est parole [Speaking . . . is speech], Martineau). Other statements from the same period move in a similar direction and join together rather than oppose *Sprache* and *Rede*, as, for example, in the *Gesamtausgabe* (*GA*; vol. 27), where we read:

> The Greeks, like all peoples of Southern Europe, lived far more intensely within the realm of public speech and conversation [*in der öffentlichen Sprache und Rede*] than we are used to. For them, thinking is discussing openly and publicly. Books were of no interest, and even less so newspapers.

For the Greeks, *logos* was not thought of independently from "dialogue" within a space we might call "rhetorical" (§29 of *Being and Time* describes Aristotle's *Rhetoric* as "the first systematic hermeneutics of the everydayness of being-together") and "political," in the sense of the Aristotelian definition of the *polis* [πόλις], in the *Nicomachean Ethics* (2.7), defined as a "community of words and actions." In short, *Rede* lends itself better than *Sprache* to underlining the existential character of speech, insofar as it is experienced in the exchange of spoken words.

What Heidegger emphasizes in his own way is that "language" is not understood in an original, but rather, a derived mode when it is envisaged independently of what one is talking *about*, as well as of those "with whom" one is talking. In other words, the existential structures of being-in-the-world (*In-der-Welt-sein*) and being-with (*Mitsein*) constitute the sole originary ground within which a *langage*, understood as "use of the language to express thoughts and feelings" (RT: *Dictionnaire de la langue française*), can be rooted.

We need to add to this the fact that Heidegger, going against a long tradition, reads in the *Peri hermeneias* of Aristotle something entirely different from a mention of "sounds produced by the voice"—the Latin translation (*ae quae sunt in voce*) is in this case more faithful to the words of the Stagirite (see SIGN, Box 1). The decisive element in the voice, for Heidegger, is not its sonorousness, as in "vocal production"; rather, "the humanity of the voice is primary in relation to the fact that it can convey a message" (Fédier, *Interprétations*).

In *Unterwegs zur Sprache* (*On the Way to Language*), Heidegger expresses wonder at the fact that the Japanese have no word for *Sprache* and are not bound to the "brilliant history of sonority in the human adventure of language" (Hagège, *L'homme de paroles*), or in other words, to phonetics. This is what is expressed by *koto ba* (spoken word): "flower petals of the *koto*—the appropriation that controls all that for which responsibility must be assumed over what grows and blossoms into flowers"), which "names something other than the meaning conveyed by the names which come to us from metaphysics: γλῶσσα, *lingua*, *langue* and *language*" (*GA*, vol. 12).

Lingua and *sermo* in classical Latin

Two words were used to mean "language" in classical Latin: *lingua* and *sermo*. *Lingua*, which originally applied to the organ of speech, referred to the linguistic material of a people, the communication tool everyone possessed because he or she belonged to such and such a community. *Sermo*, which originally applied to meeting and talking, to conversation, to discussion, to exchanging opinions, was used to refer to the perfected, mastered language:

> cum audisset Latronem declamentem, dixit: sua lingua disertus est; ingenium illi concessit, sermonem objecit.

> (after having heard Latronus orate: he speaks, he said, with an eloquent tongue: he agreed he had talent, he objected to his fine language.)

> (Seneca the Elder, *Controversiarum*, 2.12)

There is, however, another opposition between these two terms, which we can at least speculate is present in Varro. The author of, among other texts, two works with similar titles, the *De lingua latina* and the *De sermone latino*, Varro apparently had a bipartite conception of the description of Latin (though it is difficult to assess, insofar as we only have one small part of *De lingua latina*, and just a few slight fragments of *De sermone latino*). If, as the most detailed analyses of the plan of *De lingua latina* show, this treatise was a study of language as meaning, it is tempting to think that *De sermone latino* was, by contrast, a study of the material aspects of language. The rare testimonies we do have of *De sermone latino* do not contradict this hypothesis: they deal with questions of spelling, of accent, of archaic forms, even of meter. Are the two types of opposition compatible? What they

have in common is perhaps the fact that language in its most immediate manifestation (*lingua*) essentially aims at meaning, while language in the aspects that can be mastered (*sermo*) implies an awareness of its form. This hypothesis is, however, entirely conjectural.

Varro, Marcus Terentius. *On the Latin Language*. Translated by Roland G. Kent. 2 vols. Loeb Classical Library. Cambridge, MA: Harvard University Press, 1938.

Abbon de Saint-German discusses the power of speech in his commentary on Proverbs 18:21 ("mors et vita sunt in manibus linguae") and explicitly breaks with the biblical metaphor on *lingua*, translating this expression as "id est in potestate loquele." *Lingua* never in fact appears in this context in the sense of "language"; when it is present in association with *locutio* or *loquela*, it is always confined to the sense of "physical organ." So it is said that the tongue (*lingua*) is the instrument of taste and of speech (*gustum et locutionem*, according to the Latin translation of *De anima,* 420b 5ff.; see WORD, III.B.1).

These three terms—*locutio*, *sermo*, and *loquela*—are also used by extension to designate the human ability to pronounce language distinctly, a faculty of which mutes are deprived (in Bede, Aldheim, Thietmar, Peter the Venerable, and Pierre Riga, among others). *Lingua*, with its double meaning of a physical organ of articulating sounds and of a system of vocal signs, clearly cannot be used in this type of context without misinterpretation or ambivalence.

3. The language of an author,
style (*sermo, eloquium, locutio, lingua*)

The meaning of "a way of speaking, style, expression, language" is assumed by *sermo*, *eloquium*, but also *lingua*. So Remigius of Auxerre gives *sermo* as a synonym for *facundia*, while Hugh of Saint Victor puts it between *vox* and *intellectus*. We also find *sermo vulgaris* (in the sense of an informal language), while Giraud de Barri (*Expugnatio Hibernica*) states that he is renouncing his previous way of writing in favor of a "presentis idioma sermonis," assimilated to a "novus modus eloquentiae." In addition, the style, expression, or "language" of a writer is referred to as, for example, "sermo clarus, sermo nitidu, sermo exquisitus, sermo blandus;

eloquium fluens, eloquium luculentissimum." Both *sermo* and *locutio* are used to characterize verse and prose forms of expression: so one would say *sermo metricus, sermo prosaicus*, and Raban Maur, transposing a verse text into prose, claims he is translating not another language, but another mode of expression (vol. 5 [dated 814]): "interpres . . . non alterius linguae sed alterius locutionis." So it is particularly interesting to find *lingua* in this context, in the sense of "style," "language": Vulfin, the author of the *Life of Saint Martin* (ca. 800), contrasts an expert and erudite language ("diserti eruditique sermonis eloquium") with the poverty of an arid style ("paupertas sterilis linguae"). In the twelfth century, Geoffroy of Saint Victor congratulates Saint Augustine on having used a refined language in expressing himself ("ad eloquentiam linguam das urbanam").

C. The mother tongue (*lingua materna*):
From lost unity to multiplicity/diversity

1. *Nos Latini*

The men and women of letters in the Middle Ages spoke Latin so much that they referred to themselves as "Latins" (*nos Latini*). Latin was felt as such a factor of identity or identification by clerics and scholars that any other language was a foreign language (*lingua aliena*), whether it was one of the erudite languages (Hebrew, Greek, Arabic), or a vernacular language. For this reason, one refers to words transferred or translated (*translata*) into Latin as foreign words, whether they had been assimilated or not, that is, whether they had taken on a Latin ending (*nota*), or not (*peregrina*). Latin, according to Gilles of Rome, was thus an invention of philosophers, who wanted to create for themselves their "own idiom" (*proprium idioma*) as a way of compensating for the

deficiencies of the vulgar language (*De regimine principium*, 2.2.c.7). For some, the divide was clearly located between clerics and lay people: clerics had a language (*ydioma*) that was "the same for all" (*idem apud omnes*—the term *ydioma*, like *modus loquendi* earlier, indicating the specificity of, on the one hand, the social group, and on the other, of the human race), and that one learned at school, whereas lay people had languages made up of words whose meaning was established conventionally (*ydiomata vocum impositarum ad placitum*), and that one learned from one's mother and family. Latin enabled one to return to the unity that was lost with Babel, and this unity was necessary for knowledge, whether profane or sacred. Even though Roger Bacon went as far as to say that he spoke Latin as his mother tongue (*lingua materna*), as he did English or French, the former would generally be set in opposition to the two latter. The mother tongue is, according to Bacon, devalued as a cultural language for the "Latins," because he judges it unable to express particular kinds of knowledge, like logic. But it assumes a surprisingly far higher status for other peoples, when he says, for example, that they turn away from Christianity because it is not preached in their mother tongues, and is thus not able to persuade them convincingly ("quia persuasionem sinceram non recipiunt in lingua materna"; *Opus Majus*, vol. 3). For Bacon, a substantially unified *lingua* is diversified accidentally into different *idiomata* (for example, Greek splits into Attic Greek, Aeolian, Doric, Ionian); if Latin is the same "from the furthest reaches of Puglia to the outer limits of Spain," each idiom has its own distinct traits (*proprietas*), which is precisely why it is called *idioma*, from *idion* (proper), from which the word *idiota* is derived, describing someone who is content with the properties of his idiom. *Idios* [ἴδιος], in Greek, is opposed to *koinos* [κοινός]: anything private is considered "idiot"; or to put it another way, idiom and the idiomatic are different from *logos*, in that the latter opens up human beings to the political (Aristotle, *Politics*, 1.1.1253a 1–18: see PROPERTY, and cf. LOGOS and POLIS). This *proprietas*, this genius that is proper to each idiom, and that includes not just its vocabulary but also its rhythmic and musical properties, makes any literal translation impossible. In certain passages the *idiomata* are seen as dialects, in relation to the mother tongue (and Thomas Aquinas refers in a similar way to *locutiones*), but elsewhere it is simply a matter of different usages, or ways of pronouncing the same language, with the identity of a language being guaranteed by a "substance" that precisely remains independent of its usages.

For Dante, *materna locutio*, which he also calls *vulgaris locutio*, is opposed to Latin (still referred to as *grammatica*), precisely because *materna locutio* has been learned naturally, without rules, by imitating the nurse, whereas Latin has been learned "artificially," that is, according to the rules of art (cf. *Republic*, 1.13). Because it is so difficult to learn, only a few acquire the knowledge of second/secondary means of expression (*locutio secundaria*), and these are only available to a few peoples, such as the Greeks (see ITALIAN, Box 2):

[V]ulgarem locutionem [Italian: *lingua volgare*] appellamus eam qua infantes assuefiunt ab assistentibus cum primitus distinguere voces incipiunt; vel, quod brevius dici potest, vulgarem locutionem asserimus quam sine omni regula nutricem imitantes accipimus. Est es inde alia locutio secundaria nobis, quam Romani gramaticam vocaverunt. . . . Harum quoque duarum nobilior est vulgaris: tum quia prima fuit humano generi usitata; tum quia totus orbis ipsa perfruitur, licet in diversas prolationes et vocabula sit divisa; tum quia naturalis est nobis, cum illa potius artificialis existat.

(I call "vernacular language" that which infants acquire from those around them when they first begin to distinguish sounds; or, to put it more succinctly, I declare that vernacular language is that which we learn without any formal instruction, by imitating our nurses. There also exists another kind of language, at one remove from us, which the Romans called *gramatica*. . . . Of these two kinds of language, the more noble is the vernacular: first, because it was the language originally used by the human race; second, because the whole world employs it, though with different pronunciations and using different words; and third, because it is natural to us, while the other is, in contrast, artificial.)

(*De vulgari eloquentia*, 1.2–4)

This passage poses many questions: Since Latin was in fact the mother tongue of the Romans, an argument Dante will return to precisely in order to legitimize the use of the vulgar tongue, why is Latin a *grammatica*, and more artificial (that is, the product of art) than the vulgar tongue for clerics in the Middle Ages? Moreover, the fact that he asserts here that the "vulgar" is the noblest tongue, whereas he said the opposite in the *Convivio,* 1.5.7–15, has led to extensive commentary, particularly when one needs to remember that the *De vulgari* was written in Latin and the *Convivio* in *volgare* (for a summary of these discussions, see V. Coletti, *Dante-Alighieri*). In the *Convivio*, three reasons are adduced in support of Latin's superiority. The first of these is its "nobility": Latin is perpetual and incorruptible, and this is what allows ancient writings still to be read today. Then, its "virtue": anything that achieves what it sets out to do to the highest degree possible is considered virtuous, and Latin is the vehicle that best allows human thought to become manifest, while the vulgar is unable to convey certain things. And finally, its "beauty": Latin is more harmonious than the vulgar, in that it is a product of art, and not of nature. Latin, or the *grammatica*, is in any case a human creation, thanks to its inventors (*inventores grammatice facultatis*), which is regulated (*regulata*) by a "common consensus" and is therefore impervious to any "individual arbitrary" intervention. This is why it is defined, recalling Bacon's idea of a substantial unity, as "a certain identity of language which does not change according to time and place" (quaedam inalterabilis locutionis idemptitas diversis temporibus et locis; *De vulgari*, 1.9.11). We see, then, how ordinary and everyday variations of different individual ways of speaking (*sermo*) are unable to affect Latin, which remains the same through the ages, this being a necessary condition of the transmission of ancient knowledge.

2. The *vulgaris locutio*

As far as the question of origins is concerned, God, says Dante, created a "certa forma locutionis"—Pézard translates

Dante's phrase into French as "certaine forme de langage" (certain form of language); Coletti's Italian version is "data forma di linguaggio" (given form of language); Imbach, again into French: "forme déterminée du langage" (determinate form of language)—at the same time that he created the first soul. "Form" here covers both the terms for things, the construction of these terms, and the pronunciation of these constructions ("Dico autem 'formam' et quantum ad rerum vocabula et quantum ad vocabulorum constructionem et quantam ad constructionis prolationem"). This original "certa forma locutionis" has been variously interpreted, either as the first language (Hebrew, which Dante also refers to as *ydioma*: "The Hebrew idiom was the one produced by the lips of the first speaker"; *De vulgari*, 6.6), or as a universal pre-linguistic structure enabling the first languages to be generated, or as a type (form) of which concrete languages would have been species. If, according to *De vulgari*, this form of language was the one Adam used, in his *Paradiso* Dante says, on the contrary, that Adam spoke a language that died out before Babel (*Paradiso*, 26). This pre-Babelian form of language would have been used by "all languages of all speakers" (qua quidem forma omnis lingua loquentium uteretur) if there had been no Babel, the "tower of confusion," whereas it was only preserved by the sons of Heber: "After the confusion, it remained with them alone, so that our Redeemer . . . could use not the language of confusion, but the language of grace." After Babel, humans had to invent languages, or rather ways of speaking (*loquelae*) as it pleased them (*ad placitum*) (*De vulgari*, 1.9.6). It is worth noting, however, that in other passages, Adam seemed already to be using a language invented *ad placitum* (*Paradiso*, 26), and that for other writers of the time, this same *ad placitum* characteristic of language happened not after Babel, but after the Fall, as a punishment for man's original sin, and that deprived humans of the ability to use a language that would express naturally the quiddity of things (Henri de Gand).

The many different interpretations of *De vulgari* depend ultimately on the way the different terms of the linguistic semantic field are interpreted. Contrary to the traditional approach (as defended, for instance, by P. V. Mengaldo), which simply attributes this variation in vocabulary to a mere "stylistic variation" on Dante's part, thereby authorizing an analogous "stylistic variation" on the part of the translator, we think, along with M. Tavoni ("Ancora su *De vulgari*"), that Dante's choice of vocabulary is deliberate and plays a crucial role in the treatise, a role that is, moreover, confirmed by its statistical distribution. It is impossible to ignore the fact that *locutio* dominates chapters 1–5, *idioma* chapters 6–9, and *vulgare* chapters 10–19; that *lingua* appears only in the narration of Babel, in the coded syntagmas (8.1: *confusio linguarum*, 6.6: *lingua confusionis*) referring back to those of the Vulgate (Genesis 10 and 11) and those of several exegetes; and that *loquela* in turn is present only in this episode, in order to designate human speech, which starts out unified and is subsequently divided into so many tasks. The first chapters thus seem to be intent on defining the different modes of expression or of speech (*locutiones*), both vulgar and artificial, proper to human expression—what is "proper" to human expression being to manifest one's thoughts to another, according to the common definition (borrowed here) in Plato's *Timaeus*. Dante

then proceeds, with the term *idioma*, to embody historical modes of expression "proper" to an individual or a community, passing from the Hebrew *idiom* of Adam to the first idioms after Babel. We enter after Babel into the realm of vulgar, attested and contemporary historical languages, which are diverse and imperfect, variable and dispersed, and which necessitate two different modes of return to unity. The first is a scholastic mode: unity is regained through the invention, to be determined by scholars, of one, stable language of knowledge, the *grammatica*, or Latin. The second is the "illustrious" mode, through the establishment of the *volgare latium* that Dante first of all promoted in *De vulgari*, and then acted out in the *Commedia*. The different linguistic terms are not to be seen as applying to disconnected realities but as manifesting different points of view about one identical reality: thus Latin is envisaged first of all as an example of a regulated mode of expression (*locutio regulata*); then as an *idioma*, as the proper language of the Romans; and finally as *grammatica*, an artificial invention that comes after the scattering of Latin into the vernacular. Naturally, this tripartite arrangement does not imply any equivalence among these three terms. The difficulty, which the divergent readings of Dante's treatise illustrate remarkably well, is a methodological one: should we understand the vocabulary regarding "language" with reference to other terminological networks of the time, or give it a certain autonomy by weighing the value of each term within the text—or within his work as a whole? In the first case, which terminological networks would we make reference to, assuming we can even determine a coherence for each one: a theological, scriptural network? A Scholastic, philosophical network? A literary, grammatical, or rhetorical network? Such questions have to be considered by every interpreter and every translator, especially when one is dealing (as is the case with Bacon) with authors who are marginal or whose works fall outside conventional, established institutional circuits, and thus languages. What is at stake here is the very understanding of their project itself.

To conclude, we have a constellation of three terms, to return to Saussure's schema, in which one of the terms (*langage*) is charged with a negative role, a pure abstract generality that has to be excluded so as to allow for a free play between the two other terms (*langue/parole*). This play is open, complex, intense, and it works by continuous interaction, without any reduction or exclusion. We might describe this, then, as a complementarity, or even better, a polarity; a richly productive and powerful system, with multiple implications, and which has no need for explicit recollection to reproduce itself.

LAW, RIGHT

FRENCH	*loi, droit*
GERMAN	*Gesetz, Recht*
LATIN	*lex, jus*
SPANISH	*ley, derecho*

➤ *DROIT*, LEX, and CIVIL RIGHTS, FAIR, LIBERAL, POLITICS, RIGHT, RULE OF LAW, STANDARD, THEMIS

Most of the legal notions used in modern political philosophy come from a transcription in vernacular languages of terms originating in Roman law, and from its reception in medieval Europe. This transmission of Roman concepts was accompanied by a significant inflection of their meaning, but the translation conventions have nonetheless been stable enough that basic terms such as *lex* and *jus* have found equivalent terms in every language of continental Europe, and the distinction between *loi* and *droit* in French, for example (or *Gesetz* and *Recht* in German) has remained constant. The situation, however, is fundamentally different for the English language, in which, or in relation to which, translation problems have meant constant difficulties, both in the philosophical vocabulary

as well as in legal texts. In schematic terms, the problem takes the form of a double ambivalence. English distinguishes between "law" and "right," with each corresponding to some of the aspects of *loi* (*Gesestz*) or *droit* (*Recht*), but the extension of the concepts is not the same. "Law" has a wider extension than *loi*, and even if "right" partly overlaps with the polysemy of *jus* or of *droit*, the use of the term "right," in the singular and the plural, refers more often to the specific dimension of *droit* that the French would term *droits subjectifs* (subjective rights; that is, freedom, property, etc.) attached to individual or collective subjects.

I. The Particularities of English Political Right(s)

A. The legal vocabulary of English

In the continental tradition, law (or *la loi* in French) is both a rule and a command given by an authority empowered to enact it; more specifically, *la loi* refers to a certain kind of norm, established by a particular power (legislative power), and regarded as higher than that of other sources of *droit* (regulations, jurisprudence, and so on), in accordance with criteria that can be material or formal. In this context, the basic problem is knowing what founds the higher authority of the law, and what can stem from its intrinsic characteristics (rationality, generality, publicness, and so forth), and from the identity of the founder of the law (the sovereign). The history of law is thus bound up with the parallel history of modern political rationalism and of state sovereignty. The dominant tendency today, particularly clear in France, is to qualify the reverence for the law, because of the threefold effect of the weakening of legislative power, the proliferation of legislative texts, and, above all, the progressive acceptance of the *contrôle de constitutionnalité des lois* (the constitutional review of laws; in other words, for the French *Conseil constitutionnel*, the "law as an expression of the general will" is only a law when it is in accordance with the Constitution, as it is interpreted by the *Conseil*). It is important to note, however, that this evolution is not in itself enough to transform the entire logic of the juridico-philosophical categories. It simply means that the characteristics previously attributed to the law as an "expression of the general will" are transferred to a certain type of law (the Constitution), enacted by a specific legislative power (the "constituent" power or lawmaker), while all of the difficulties associated with the modern doctrine of sovereignty simply take a different form (O. Beaud, *La puissance de l'état*). On the other hand, the extension of the concept of *loi* in French is limited at the outset by its relation to the concept of *droit*, which refers both to the legal order as a whole, and to the right of a subject, which may be defended in a court case; so whatever its position in the hierarchy of norms, *la loi* is only a source of *le droit.* In the English tradition, however, "law" refers to the legal order as a whole (like *le droit*, in other words), but it also retains some of the main connotations associated with *la loi.* Conversely, if "right" can sometimes also be understood in a general sense (if only because the adjective "right" means "just"), it more often has a far narrower sense, when used in the plural or singular, and in consequence it tends to be confused with "subjective" rights (R. Dworkin, *Law's Empire* and *Taking Rights Seriously*).

These difficulties are quite well known and have generated a number of conventional translations, most of which are easy to understand and apply. *Philosophie du droit*, or *Rechtsphilosophie*, is normally translated as "philosophy of law," even if it refuses to make law (ordinary or even constitutional) the primary source of right (but Hegel's *Rechtsphilosophie* is nonetheless sometimes translated as "philosophy of right" out of faithfulness to the German). A law enacted by a lawmaker authorized to rule on such questions becomes "statute law" (which already leads to several oddities: in order to explain the original meaning of article 6 of the "Déclaration des droits de l'homme et du citoyen" ["Declaration of the Rights of Man and the Citizen"] of 1789, for example, we would have to say that in "French law," "statute law" is the expression of the general will). The shortcoming of "statute law," however, is that it suggests too clear a distinction between a legislative power and other authorities, which is not always relevant, either because one is referring to periods in the past when such a distinction did not always have the same importance that it has in the modern age, or because the legal-philosophical reasoning itself leads us to bracket it. This leads to a common and long-standing expedient that consists of reverting to the plural of the word, which almost always refers to the legislative, or nomothetic, dimension of the "law": "the laws" will be one possible translation of *la loi*, of *lex*, or of *nomos*, and the title of Cicero's *De legibus* (On the laws), just as much as Plato's *Nomoi* (*Laws*), do not pose any particular problems of translation.

These conventions are useful, but they do not overcome all the difficulties. As far as ancient notions are concerned, it is unfortunate that both the *lex naturae* of Cicero and the *jus gentium* of Roman law have to be translated as "law." In the modern context, the dual meaning of "law" still poses several problems, as becomes apparent, for example, in reading Locke's *Second Treatise of Civil Government.* For Locke, the state of nature is not a state of lawlessness, because human beings are subjected to the "law of nature" (§6), which in French could be translated either as *droit naturel* (as Bernard Gilson does, in Locke, *Deuxième traité du gouvernement civil*) or as *loi naturelle*: only civil government, however, enables the birth of a "legislative power," which in turn allows the "Commonwealth" to be governed by an "establish'd, settled, known, Law" (§124). The function of statute law, or "establish'd law," will thus be to make "natural law" (*droit naturel*) sufficiently public for it to take on a force of obligation, and ignorance or partiality would deprive it of this force in the state of nature. But statute law cannot itself have any legitimate authority unless it conforms to the natural law instituted by God, which is thus imposed upon human lawmakers as a higher commandment (English translators and authors encounter similar difficulties when, for example, they need to distinguish between *lex naturae* and *jus naturae*, which leads them at times to use "right" as a translation of *jus* so that "law" can be a better equivalent of *lex*). These problems are ultimately encountered at every point in any translation into English or from English: the "history of law" will become "legal history," and the "lawyers" in American cinema are both jurists and men of law, while being very different from Philippe the Fair's *légistes*, the class of jurists charged with renewing Roman law in France and creating from it a uniform and centralized legal code.

So when we go from Latin or modern continental languages to English, we encounter difficulties that flow from a particular legal institution, and that have lasted to this day, as any jurist knows who has ever tried to translate into English a notion such as the German *Rechststaat* (which the French *état de droit* captures perfectly), or to find a continental equivalent of the English "rule of law." To clarify these difficulties, we will begin with a genealogical analysis of the particularities of the English legal lexicon, and then go on to examine the way in which the first modern philosophers adopted or, on the contrary, subverted this tradition, before looking finally at the later transformations of English-language *philosophie du droit*.

B. The spirit of English law

English history is part of the wider history of western Europe, shaped by the development of the modern nation-state, which subordinated political (royal) power to the rationality of law. In England, as in France, this process led on the one hand to the institutionalization of royal power, by distinguishing it from patrimonial or imperial control, and on the other to an increase in the predictability of law, by privileging a law common to the whole kingdom. Generally speaking, then, what is particular to England in this context can be presented in the following way: the courts of the kingdom (notably the Royal Court) played a major role in the unification of English law, producing a law that was both customary and based on case law, and that provided royal power with the centralized structure that was needed in order to govern, but without having to make the positive law decreed by the king the primary source of law. The history of English freedom runs parallel to that of the history of the acquisition by the "barons," and then by all British subjects, of "rights" that are opposable to royal authority, and that form the substance of the different English declarations, from the Magna Carta (1215) to the Bill of Rights (1689). The conceptual system of English law appears at first to be a process of giving form to this singular historical experience, according to a logic that is both very old and extremely durable. In this regard, Frederick Maitland notes that the use among the great English jurists of the twelfth and thirteenth centuries (for instance, Glanvill and Bracton) of Roman terms is itself somewhat uncertain, and that they do not differentiate clearly between *jus* and *lex* (F. Pollock and F. W. Maitland, *The History of English Law*, 1:175). The two senses of "law" refer to the duality of the common law of the courts, and the statute law imposed by the sovereign. Subjects can oppose their "rights" to the political power, but this power nonetheless exercises a legitimate authority over these subjects. So "law" refers to two concurrent conceptions of the formation of norm, with the English constitution ensuring they work together by an endlessly repeated miracle. "Common law" does not at first seem like a "judge-made law," because it is supposed to be simply "revealed" by a judge, who in this sense is the "mouthpiece of the law." This is what distinguishes it from statute law, which is "made" by an authority that is based on its own views concerning justice or the common good, and that requires no other justification than its political legitimacy. Common law is thus presented as a means of formalizing customs, whose long existence is a guarantee of their venerable nature, and it also favors

continuity, since the first rule in making laws is that of the "precedent" (*stare decisis*).

Common law is thus a fundamental element of the Ancient Constitution, which was supposed to have governed the English since time immemorial (and whose prestige would make it possible for the 1688 Revolution to be presented as a restoration of an originary and more authoritative set of laws). The remarkable feat of English history is to have forged its path toward the rationalization of law on this traditional legitimacy. The centralization of judicial decisions allowed a homogenous order to emerge out of the different customs, and the primacy of the precedent encouraged legal security and the predictability of decisions, which constituted the basis of the development of modern society. The authority of the precedent was not always absolute; as the great jurist William Blackstone noted, "[T]he doctrine of the Law is the following: precedents and rules must be followed, unless they are clearly absurd or unjust," which means that on the one hand, judgments must not depend on the opinions of judges but on the laws and customs of the country (*Commentaries on the Laws of England*, 1:69), and on the other hand, that the judge can and must reject "decisions that are contrary to reason (absurd), or to divine law (unjust)" (A. Tunc, "Coutume et 'Common Law,'" 57).

The major effect of this type of elaboration of law, from the point of view of political philosophy, is to have inhibited the full affirmation of the doctrine of sovereignty, which, by contrast, characterized the development of politics in France. While French theorists of the monarchy, such as Bodin, tended to make the sovereign the ultimate, if not sole, source of the law, the English based the authority of political power on an original "common law," while at the same time giving their political community the means for their law to make "progress" toward modernity. This original mechanism explains the political differences between England—where the Crown was unable to appear as the vehicle for progress, and where the 1688 Revolution confirmed the power of the courts—and France, where the actions of successive parliaments had long discredited the idea of judicial power (A. V. Dicey, *Introduction to the Study of the Law of the Constitution*). It also had important philosophical consequences: it limited the rise of modern legislative rationalism based on the idea of a natural affinity between reason and the "law" made by the sovereign, which would by contrast become fully developed within the culture of the French Enlightenment.

But we must also add that the primacy of common law is only one of the two main aspects of the English constitution: although it is based on the tradition of common law, the constitution also presumes "the sovereignty of Parliament" (or of the "King in Parliament"). This sovereignty needs to be understood in the strongest sense of the term: the sovereignty of Parliament is absolute in the sense that no rule of law can oppose an act or a statute of the English Parliament, if this act has been legitimately adopted (cf., for example, W. Blackstone, *Commentaries*, 1:156–57, and Dicey, *Introduction*), and this will become established notably within the courts, where a statute has the power to repeal the rules of common law (Blackstone, *Commentaries*, 1:89) under certain formal conditions. Similarly, "rights" are essentially

subjective rights, which may have appeared within a custom before being integrated into common law or recognized by a statute, but which are as such opposable to political authority.

This paradox of English public law comes from the absence of a written constitution. It originally derived from the primacy of the customary or semicustomary arrangements of the Ancient Constitution (whose spirit in this respect is the spirit of common law), but it also evolved into the affirmation of the full sovereignty of Parliament, the natural counterpart of the flexibility of the constitution. The difficulties are moreover magnified by the fact that modern "constitutionalism" (which implies the subordination of ordinary law to the constitution, through the control by the courts of the constitutionality of the laws) evolved in the wake of the American experience, and in a legal world dominated by English concepts. Nevertheless, a study of the development of the English-language philosophy of law would reveal a permanent opposition between two approaches, whose duality is an expression of the ambivalence of the English tradition. The predominant approach, which goes from Edward Coke to a writer such as Ronald Dworkin, could be seen as a progressive idealization of the experience of common law. However, the very fact that it is a "law," combined with the particular logic of the modern conception of sovereignty, also explains the stubborn persistence of a positivistic current of thought trend that always tends to subvert the dominant vocabulary of English legal philosophy. This positivistic approach, defended by Thomas Hobbes and Jeremy Bentham, survives in Austin and Hart. It should be said, however, that these two traditions have certainly communicated with each other, especially through the affirmation of the liberal concept of freedom as an absence of constraint, a conception that was largely adopted by the advocates of the approach that emerged out of common law, but certain elements of which come from Hobbes. In order to understand this development, while explaining the enduring legacy of untranslatable concepts that English law has transmitted to philosophy, we would do well to begin with common law and the debates to which it gave rise in English political thought.

C. Common law

In its strictest sense, the expression "common law" refers to the first of the three main traditional branches of English law, the other two being equity and statute law. Common law here means a law common to the different regions of the kingdom, a law that, before the courts, must always prevail over particular usage or customs, and that is the indissoluble basis of the authority of the king over all his subjects, while providing these subjects with the advantages of a single system of justice. Common law is first and foremost a customary, unwritten law (*lex non scripta*, as Blackstone puts it), whose authority is tied to its immemorial nature. It is also a scholarly law, whose fundamental rules prohibit any arbitrary modification, and the knowledge of which is acquired through a long and patient study of precedents. But common law is not only an original "legal system": it is also the foundation of the English political regime, insofar as it provides

the basis for understanding the powers and domains of the different political institutions.

The prestige that common law enjoys has made it the foundation of what we might call the English political idiom—and this prestige flows in the first place from common law's ability, over such a long period of time, to resolve in an original manner the main problems England has faced. Thanks to its law, this country with such a troubled history has been able to see itself as the product of a continuous and harmonious history, both profoundly different from that of other European monarchies and called upon ultimately to give lessons in freedom to other civilized nations. Indeed, in a now-classic work—*The Ancient Constitution and the Feudal Law*—J.G.A. Pocock showed how common law constituted the model from which the English elaborated the doctrine of the Ancient Constitution that was to become a point of reference in the seventeenth century for the adversaries of the Stuarts and thus contribute to the victory of a liberal interpretation of the English regime. By emphasizing the continuity of common law before and after the Norman conquest, the effects of this event were minimized, while limiting the rights imposed by force. By making common law the heart of English law, the authority of the empire, along with Roman civil law, was excluded, while the differences between the English monarchy (a "mixed regime") and French absolutism were foregrounded. These ideas were to be more fully developed during the revolutionary period, when the adversaries of the Stuarts readily invoked the permanence of English law and the immemorial nature of the Ancient Constitution to challenge the idea that royal power would be the main source of law, or that this power could change the law in whatever way it wished.

The fundamental premises of the apologists of common law are themselves based on principles that go back a long way. We can already find them, for example, in the work of John Fortescue, who in the fifteenth century distinguished very clearly between the absolute monarchy of the French, and the "limited" monarchy of the English, for whom the royal prerogative was limited by the courts, the main one being Parliament, which was considered to be primarily a court of justice. But it was above all in the seventeenth century that the classic doctrine of common law was formulated, notably around the ideas of Edward Coke, the rival of Sir Francis Bacon and of Matthew Hale (1609–76).

■ See Box 1.

The classic conception of common law implies a certain interpretation of the English constitution, according to which all political or legal institutions must be subject to the law, that is, to the order of the common law, as it is interpreted by the judges of the main courts. Even during Coke's time, though, this orthodoxy met with several objections, drawn from political and legal practice, or from new political doctrine. First of all, there were in fact several elements within the English institutions that appeared to contradict Coke's vision: the Court of Chancery could temper common law through equity; Parliament could change it radically through statutes that replaced the previous law, and the royal prerogative seemed to give the monarch a certain independence with respect to the statutes

1

Edward Coke (1552–1664)

Edward Coke was at the same time a judge, a parliamentarian, and a legal theorist. Several times a Member of the House of Commons, of which he was Speaker in 1592–93, he was also the attorney general in 1593–94, then chief justice of the Court of Common Pleas (1606) and lord chief justice of England. As a parliamentarian, he was opposed to the absolutist tendencies of James I (for which he was imprisoned in 1621), and it was in this context that he was the author in 1628 of the *Petition of Right*, one of the basic documents of "English freedoms."

Coke is generally considered the greatest representative of the common law tradition, which he interpreted as being halfway between the traditional doctrines of limitation of power and the principles of modern liberalism. In the conception of law that Coke advocates, the authority and the knowledge of the judge are simultaneously minimized and magnified. On the one hand, the judge is indeed not a legislator and he does not "make" laws (*judex est lex loquens*); his function is to "state the law" (*jus dicere*). In a sense, even if the identity of the legislator is problematic here, common law is certainly a law, which is acknowledged

by the judges whose authority it founds, and which expresses a higher rationality. On the other hand, we can know this law, and the reason that inspires it, only through the succession of different generations, and this knowledge calls for an "artifical reason" based on accumulated experience, and not only on reasoning. Law is thus a specialized knowledge, which is not to be confused with "natural reason" (*nemo nascitur artifex*), and judges are its privileged guardians. This is why they, and they alone, are in a position to reveal the always identical and always new meaning that common law assumes over time.

themselves. More generally, the traditional English conceptions were also confronted with the contemporary development of the doctrine of sovereignty, which had been familiar to French jurists since Bodin, but which was not entirely unheard of in England itself (where it would be reclaimed by the partisans of the reinforcement of royal power, but also by certain defenders of the Parliament). On this latter point, Coke, who was also a political actor, tended to reject the logic of sovereignty, which he saw as incompatible both with the logic of English law and with the rights acquired by the English since the Magna Carta. As for equity and the statutes, he presented them as complements of common law, revealed by the authorities constituted by common law itself. In this context, Parliament itself appears as a specific jurisdiction, made up of the king, the House of Lords, and the House of Commons, whose supreme status authorizes it to change the law by proposing new statutes, by repealing previous statutes, and even by modifying the content of common law. So while he thereby reaffirmed the superiority of Parliament over the king (the king only being fully legitimate as a "King in Parliament"), Coke managed to reconcile the primacy of Parliament with the "Rule of Law," and with his own antivoluntaristic conception of the making of laws. On the one hand, Parliament had the "power to abrogate, suspend, qualify, explain or make void [legislation that previous parliaments enacted], in the whole or in any part thereof, notwithstanding any words or restraint, prohibition or penalty [in previous legislation], for it is a maxim in the law of parliament, *quod leges posteriores priores contrarias abrogate*," and this power is "so transcendent and absolute, as it cannot be confined either for causes or persons within any bounds" (*Institutes of the Laws of England*, vol. 4). On the other hand, Parliament was simply acting here as a judge, who invoked ancient statutes, that is, "law, this universal law that the English have claimed as their heritage" (ibid.; see also F. Lessay, "Common Law," and J. W. Gough, *Fundamental Law in English Constitutional History*).

■ See Box 2.

D. The philosophical consequences of the doctrine of common law

Beyond the English constitution, the doctrine of common law implies something akin to a general theory or a philosophy of law, which is a priori opposed to *positivist* theories (which recognize as law only "positive law," that is, a law made by the sovereign, or someone authorized by the sovereign), without for all that having the same inflexibility as most theories of "natural law" because it is rooted within a legal tradition that valorizes the role of time and of history in the revelation of law.

As one contemporary historian notes (G. L. Postema, *Bentham and the Common Law Tradition*), the authority of precedent and of custom does not necessarily imply that all common law goes back to furthest antiquity. What is crucial, however, is that one can affirm continuity between the past and the present. Usage and custom have imposed rules by showing that these rules were both acceptable, because they were consonant with the public spirit, and reasonable because they were in accordance with common reason. This affirmation linking historical continuity and "reasonableness" is not without some ambiguity. One could, along with Coke, draw from it a particularist conception of legal reason, which emphasizes the internal coherence of jurisprudence built up patiently through "cases" resolved by judges, or through the law "stated" by judges. As we will see, this aspect of the theory (which is obviously connected to the judicial "corporatism" of Coke, and to his defense of the "artificial reason" of the judge) has been the favorite target of the great modern critics of common law since Hobbes. It is no doubt for this reason that subsequent authors emphasize on the contrary the affinity between common law and natural justice, in order to show that common law includes within it a certain number of the general principles that not only conform to custom, but also translate rational needs linked to the very nature of law. These two conceptions of reason at work within the law have in common the fact that they are a priori opposed to positivist theses, which place positive law, made by a legislator and not revealed by a judge, at

2

Equity

In English law, "equity" refers to one of the three fundamental sources of law (along with common law and statute law): the Court of Chancery can judge "in equity" and thereby protect rights that have not been recognized by ordinary courts (which have to follow the common law rigorously). The English term "equity" sometimes designates the classical philosophical notion (Aristotle's *epieikeia* [ἐπιείκεια]), and at other times a particular right, originally produced by a distinct court. In *A Dialogue between a Philosopher and a Student of the Common Laws of England,* Hobbes plays cleverly on the two senses of the word in order to suggest the superiority of royal justice (against which there is no appeal, since it is directly inspired by natural reason) over the justice of ordinary judges, whose action has to be able to be tempered by the action of the courts of equity.

the forefront of the creation of law. This is why common law, whatever its ambiguities, appears as a privileged adversary of legal positivism, and why critics of this approach are often still led, even today, to repeat and rediscover the typical modes of reasoning of common law.

Conversely, the traditional theory of the English constitution itself offered a foothold for a positivist interpretation, through the idea of the supremacy of Parliament—or of the "King in Parliament." The argument made by Coke, who explained the power Parliament has to change the law by its statutes, and its power to modify these statutes indefinitely, as coming from the authority that it possesses in common law, can in fact quite easily be reversed. If there is an authority that is sufficiently powerful and legitimate to modify the rules of English law, it is difficult not to think that this authority is sovereign, and that its decisions are presumed to be more rational than those made by common judges, who are inspired by their "artificial reason." In addition, if the Chancery Court has the power to correct the rules of common law, and if the king is not entirely subordinate to the statutes, then it does seem that the legal order has a number of holes in it, which common judges are not the only ones able to fill. This observation led certain authors, for different reasons, to develop a number of critiques of common law. These critiques, drawing on the royal prerogative or the sovereignty of Parliament or, even more profoundly, on the idea that some sovereign power is necessary if there is to be any law at all, have brought about a complete overhaul of the doctrine of law. A systematic examination of these discussions is beyond the scope of this entry. Referring readers to the works on this subject by F. Lessay, G. J. Postema, and J.G.A. Pocock , we will simply attempt to show briefly the influence of these critiques of common law on the development of English political philosophy and on the philosophy of contemporary law, where the vocabulary itself echoes these foundational debates.

II. "Law" and "Right" According to Hobbes: Legal Positivism versus Common Law

A. The foundational debate

Chapter 14 of Hobbes's *Leviathan* (1651) opens with a distinction between the Right of Nature (*jus naturale*) and the Law of Nature (*lex naturalis*): whereas the right of nature "is the liberty each man hath to use his own power as he will himself for the preservation of his own nature," a law of nature "is a precept, or general rule, found out by reason, by which a man is forbidden to do that which is destructive of his life, or taketh away the means of preserving the same, and to omit that by which he thinketh it may be best preserved" (*Leviathan*, 1996). The object of this distinction is to show why people are necessarily led to "lay down the Right" they naturally have over all things in their natural condition, without also having to thereby contradict their nature. When they "lay down" their rights, they do not stop seeking to preserve nature and their life; however, taking account of the laws of nature that show us how to preserve ourselves in fact brings with it a radical change, since it marks the transition from freedom to obligation and obedience.

Hobbes is aware of being an innovator when he so clearly distinguishes right and law, as in the following passage:

For though they that speak of this subject use to confound *jus* and *lex*, right and law, yet they ought to be distinguished, because right consisteth in liberty to do, or to forbear; whereas law determineth and bindeth to one of them: so that law and right differ as much as obligation and liberty, which in one and the same matter are inconsistent.

(*Leviathan*)

As has often been pointed out, this transformation of the relationship between right and law places Hobbes at the precise intersection of two fundamental trends in modern politics, which are on the one hand liberalism, and on the other the absolutism expressed by the theory of sovereignty. Hobbes was one of the fathers of liberalism because he prioritized subjective rights and freedom, conceived as the absence of constraint, in his analysis of the constitution of the political bond, which set him in opposition both to the classical tradition and to modern republicanism. But he was also one of the thinkers of the absolute state, because he claimed to show that individuals can attain their primary objective (the preservation of their life) only by transferring almost all of their rights to the sovereign, against whom no resistance is allowed, besides escape or exile. These two aspects of Hobbes's thought are moreover linked, since the

absolute power of the sovereign and his laws goes hand in hand with a transformation of the status of the law, whose function is no longer to guide individuals toward virtue or the good life, but, more modestly, to create the conditions in which subjects will pursue their own ends in order to attain an essentially private, and no doubt worldly, happiness. The function of the absolutist state is to create the conditions of what Benjamin Constant will later call the "freedom of the Moderns" (in "De la liberté des Anciens comparée à celle des Modernes," 1819). Apart from defending the authority of the State against sedition and unrest, of which the first English revolution was a good example, Hobbes's work aimed at a complete transformation of politics, which took the form of a profound change of the status of political philosophy, and a radical subversion of the tradition of common law.

Hobbes's explicit project was to demonstrate the priority of the sovereign and the law in the definition of "right," and this involved a certain devalorization of the role of the judge in favor of the lawmaker. No less remarkable, however, was that this devalorization was part of a larger effort to place the question of right and law within the proper domain of political philosophy. More than anything else, the political philosophy of the author of the *Leviathan* is primarily one of law and right, because it foregrounds the necessity of an impartial third party who is an outsider to the disputes between persons, and who can institute a legal bond between them, thanks to the capacity to impose decisions without contest. In this sense the sovereign, who determines the competence of the other authorities, is indeed a kind of supreme judge, whose function is first and foremost to ensure the reign of law. "The law" is simultaneously "law" and "right," and the higher authorities are indissolubly "jurisdictional" and "legislative" (as were Parliament or the "King in Parliament" in the English tradition). This is what is demonstrated in the continual play between *jus* and *lex* that Hobbes engages in, and of which we find an admirable example in chapter 24 of *Leviathan*: "Of the Nutrition and Procreation of a Commonwealth," that is, the production and distribution of raw materials, as well as the status of the colonies created by a republic in foreign countries. In this chapter, Hobbes defends the thesis that the law and its guarantee depend on the prior protection and authorization of the sovereign, and to support his theory he invokes the authority of Cicero who, although he was known as a "passionate defender of freedom," had to recognize (*Pro caecina*, XXV.70 and 73) that no property could be protected or even recognized without the authority of a "civil law" (*Leviathan*, chap. 24). Now, what Hobbes is translating here is clearly *jus civile*, a "right" rather than a "law," whose relationship to the "law of nature" is somewhat different in Cicero to how the author of the *Leviathan* interprets it. Conversely, this inflection of the classical terminology of *jus civile* to a meaning more favorable to the sovereign authority of the supreme lawmaker is accompanied by a symmetrical transformation of the status of the law, which Hobbes supports very cleverly by referring to the etymology of the Greek *nomos* (law), so as to give "law" back the meaning that *jus* had in Roman law, that is, the function of attributing to everyone what he or she is due (*suum cuique tribuere*), and of thereby guaranteeing justice (*justitia*) in these distributions:

Seeing therefore the introduction of propriety is an effect of Commonwealth, which can do nothing but by the person that represents it, it is the act only of the sovereign; and consisteth in the laws, which none can make that have not the sovereign power. And this they well knew of old, who called that Nomos (that is to say, distribution), which we call law; and defined justice by distributing to every man his own.

(*Leviathan*)

Significantly, this text is cited by Carl Schmitt, who sought to place Hobbes back into an imperial political tradition, foreign to both liberalism and "enlightened" absolutism (Schmitt, *The* Nomos *of the Earth in the International Law of the* Jus Publicum Europaeum).

B. Hobbes and the tradition of common law: The subversion of the English legacy

What are the consequences of this philosophy of right for the English legacy, and especially for the tradition of common law? The clearest text on this subject is without doubt the admirable *Dialogue between a Philosopher and a Student of the Common Laws of England*, in which Hobbes stages the opposition between the tradition of Coke and the new "law-centered" and rationalist philosophy. In this text, Hobbes clearly attributes to Coke the confusion between "law" and "right" (or between *lex* and *jus*), which he had denounced in the *Leviathan*. He also develops a powerful internal critique of the juridical tradition of common law, in order to show that the modern conception of sovereignty (attributed here to the king and not to Parliament) is the only one able to lend true coherence to the English legal system. To support his argument, he quotes Bracton ("the most authentic author of the common law") on several occasions, to show that the king is fully sovereign in the temporal order. He adds that, since England's break from Rome, the spiritual power also lies with the king, and he interprets the expression "King in Parliament" in a way that proscribes any dualism in the civil authorities. The main target of the *Dialogue* is obviously the power of judges under common law, which the dominant tradition claimed was based on the wisdom produced by the "artifical reason" acquired over the course of legal studies, and which Hobbes attacks in the name both of "natural reason" and of the authority of the legislator. On the one hand, there is no other reason than natural reason (*Leviathan*, 29), if it is true that "no man is *born* with the use of reason, yet all men may grow up to it as well as lawyers" (ibid., 38), and the knowledge of judges is no different from that which is used in other arts. On the other hand, the wisdom of judges is not in itself sufficient to give the force of law to their decisions, since "it is not wisdom, but Authority that makes a law" (ibid., 29). The laws of England were not made by law professionals, but "by the kings of England, consulting with the nobility and commons in parliament, of which not one of *twenty* was a learned lawyer" (ibid., 29). Borrowing an expression from the *Leviathan*, "auctoritas, non veritas, facit legem," Hobbes makes it clear that he considers doctrines that valorize laws produced or revealed by English jurisconsults as sophisms of the same kind as those of Platonic philosophers, religious fanatics, or defenders of papism: the claim to make truth or

wisdom the source of the law is nothing other than the mask worn by all those attempting to usurp supreme power. In addition, as the *Dialogue* argues elsewhere, the reasoning of the philosopher appears in the eyes of the lawyer as the product of a privilege unduly conferred on statute law against common law, whereas the philosopher by contrast claims to "speak generally of law" (29) when he discusses the role of the kings of England in making English laws.

The Hobbesian reconstruction of the theory of law thus concludes by prioritizing legislation over any other source of law, and by strongly affirming the sovereignty of the king; the other constituent parts of Parliament are, for Hobbes, merely useful accessories without being in any way indispensable to the adoption of laws. This does not mean, however, that Hobbes abandons the entire former tradition, nor that he refuses judges any role in making laws, since his strategy always consists in starting from an internal critique of the contradictions of tradition in order to show that his own proposals are more likely to achieve the objectives that tradition claimed to be pursuing. First of all, as was noted earlier, the primacy of the legislator itself comes from its ability to state law, and to ensure its reign, by transcending the violent disputes that persist in the state of nature: Hobbes's sovereign (who is for him the king) remains in some ways a judge, just as the English Parliament was in the traditional theories of common law lawyers, and his action is therefore still related to the two senses of law (*Dialogue*, 46: "Since therefore the King is sole *legislator*, I think it also reason he should be sole supreme judge"). Hobbes also adapts the equivalence of reason and the common law to his own ends, even if he ironically reverses its meaning: where Coke's disciples would say that common law was "artificial" reason itself, Hobbes will say that natural reason was the true common law. As for the role of judges, it was certainly severely reduced, but not entirely denied. Hobbes grants the common law judge a certain normative power, which comes from the fact that the sovereign had affirmed from the outset that, "in the absence of any law to the contrary," customary rules, or those based on cases, would have the force of law (in the same way that "civil law," that is, Roman law, could be incorporated into English law, if the king so desired). Moreover, the judge is not necessarily more passive than in the traditional doctrine. In the *Dialogue*, the philosopher goes as far as to acknowledge, against his interlocutor, that the judge can without risk reject the letter of the law, as long as he does not reject its meaning and the intention of the legislator (30). And in *Leviathan*, Hobbes notes that the judge can complete civil law by the law of nature when positive law does not fully authorize a reasonable decision, even if he also has to refer, in the most difficult cases, to the higher authority of the legislator (chap. 26).

III. Two Philosophical Traditions

The greatness of Hobbes comes from that fact that he was the first to grasp what it was in the common law legacy that prevented the modern state from becoming fully developed, at the same time as he understood admirably the indissolubly emancipatory, rationalist, and absolutist nature of the "modern" conception of sovereignty. This is why, in the subsequent history of English-language thought, one finds

a "Hobbesian" logic at work in all the thinkers who want to break with the legacy of common law lawyers, or who want to highlight the similarities between the English system and other forms of the modern state. Conversely, the conceptual schemas of common law reemerge spontaneously in all those who, for different reasons, want to limit the claims of the sovereign and the legislator in order to reaffirm historical rights, or to give the judge a privileged role in the protection of these "rights." This can be seen in the examples of Bentham and Hart, on the one hand, and of Hume, Burke, and Dworkin on the other.

A. Legal positivism in England

Jeremy Bentham (1748–1832) is without a doubt the main heir to Hobbes in England, even if his political opinions are clearly a long way from monarchic absolutism. Utilitarian anthropology is a continuation of the fundamental ideas of Hobbes, through the work of Helvetius and Holbach, and above all, Bentham, who shares the same critical perspective on the English tradition as the author of *Leviathan*. For Bentham, as for Hobbes, the objective is to rationalize English law by reducing the influence of judges in favor of the political authorities. Here again, this planned rationalization takes the form of an affirmation of the rights of natural reason against the judicial culture, by giving priority to the law understood as a commandment, and by a fundamental transformation of the principles of legitimation of the rules and usages of common law. Bentham's attitude is thus similar, *mutatis mutandis*, to that of Hobbes, as is shown by the way in which he interprets the authority of custom, or the rule of *stare decisis*. For traditional lawyers, the historical continuity of custom in itself had authority, whereas for Bentham, custom only truly becomes law when it is legalized, that is to say, sanctioned by the so-called lawgiver: the reasoning is the same as the one that, in Hobbes's *Dialogue*, founded the authority of the English courts on the authorization of the sovereign. Custom and the rule of the precedent have, in addition, a genuine advantage from a utilitarian point of view, which is that they guarantee, thanks to the continuity of law, the *security* that the citizen is looking for in the legal order. But for Bentham, this entails consequences that are the opposite of those drawn by traditional lawyers. For them, the continuity of custom created a presumption of rationality and of legality, but the judge, who would reason on the basis of the principles incorporated in common law, could sometimes break with precedents when it seemed that these precedents would lead to an "unreasonable" decision, which explains how the judge, without "making" a law (since he only "reveals" it), could play an innovative role (for example, Blackstone, *Commentaries*, 1.69–71). For Bentham, however, the judge could not reject a precedent without becoming a legislator, and without thereby creating retrospective laws, which would endanger the security of citizens (Postema, *Bentham and the Common Law Tradition*, 194–97 and 207–10). But the conflict between the letter of the law and the decisions of judges could also be seen as a symptom of the imperfection of the traditional English system, where the inflexibility of the rule of precedent increased the risk of the arbitrariness of judges, which led Bentham to propose a complete reform of English law, in which law-making and

adjudication are each regulated by the principles of utility, in ways that borrow both from the Hobbesian tradition and, paradoxically, from certain elements of the common law tradition (c.f. ibid., 339–464). The same problems will also be addressed by the great English theoreticians of legal positivism such as John Austin (1790–1859) and especially Herbert L. A. Hart (1907–92), whose work has notably paved the way for a "positivist" interpretation of the fundamental elements of English law. In contrast to the classical doctrine whereby the judge only "revealed" the law, common law now appears as a "judge-made law," in which the judge could be led to institute new rules when the existing law does not allow a case to be resolved.

B. The legacy of common law

The main philosophical legacy of the traditional English lawyers is to be found in authors such as David Hume or Edmund Burke. These authors' interpretations of politics can be seen as philosophical transpositions of the models of common law, as is shown by their use of English history, their emphasis on the limits of individual reason, and their search for an "artificial reason" that would be irreducible to the simple application of "metaphysical" rules based on "natural reason" (Postema, *Bentham and the Common Law Tradition*, 81–143, and Pocock, *Politics, Language, and Time: Essays on Political Thought and History*, 202–32). Alongside this tradition—which we might call "conservative"—it is also worth noting the very evident presence of modes of thought based on common law in an author such as Dworkin, whose critique of Hart's positivism is clearly in the service of the great "liberal" causes of our time. Indeed, in Dworkin's view, law cannot be reduced to rules, since it also contains a set of principles that underlie the legal system while expressing a common morality. These are the principles that judges use when they seem to reject precedent or, more generally, when they appear to "create" law, as the "liberal" judges on the Supreme Court of the United States do, and this reasoning is very similar to Blackstone's. In the same way, Dworkin's emphasis on the "continuity" of law above and beyond the "apparent" reversals of case-based law, or even his thesis that every difficult case has only one right response (which assumes that bad decisions can only be "errors"), quite clearly echo the ideas of the great English lawyers. And this work, which is entirely dedicated to the defense of modernity, also reminds us that the success of common law was due to its capacity to present the most radical innovations as the consequences of faithful adherence to tradition.

So there is, in English-language philosophy of law, something irreducible to the other modern trends, which comes from the way it incorporated within philosophy the schemas of reasoning that emerge directly out of the legal tradition of common law. It is almost as if the English experience and the English language carried with them a particular vision of law, irreducible both to positivism and to the most dogmatic versions of natural law. But this tradition is itself shot through by constant internal tensions and has been the object, beginning with Hobbes, of radical critiques based on a projected rationalization of the state and society, which have allowed English thought and the "continental" trends to be brought closer together: Hobbes sometimes appears as a successor to Bodin, and Bentham as a reader of Holbach and Helvetius. Conversely, the schemas that have emerged out of common law are very much alive in authors who are sensitive to the particular role of the judge, whose importance is obvious in the democratic politics and the constitutional law of our times.

LEGGIADRIA (ITALIAN)

ENGLISH grace, beauty
FRENCH   *grâce, beauté, élégance, légèreté*
GERMAN   *Geschicklichkeit*

➤ *GRACE*, and ART, BAROQUE, BEAUTY, DISEGNO, MIMÊSIS, SPREZZATURA

Leggiadria, a now obsolete term referring to an affected elegance, comes from the Latin *levitus* and from Provençal. During the Italian Renaissance *leggiadria* came to express an almost natural grace that was in no way divine but anchored in worldly reality, situated at the point of equilibrium in a tension between the natural and the artificial. It found cognates in other Romance languages (cf. the Spanish *ligereza* and *ligero*, with the additional sense of "inconstant" or "unfaithful"), and would also be translated as *grâce*, "grace," *grazie*, *élégance*, *beauté*, "beauty." Toward the end of the sixteenth century, however, during the time of the Counter-Reformation, and when Italy lost its autonomy, the meaning of the term shifted: *leggiadria* came to mean instead a beauty in which the artificial prevailed over the natural, and thus became one of the most important qualities of the courtier in treatises on how to comport oneself. *Leggiadria* would thereafter refer to the ability to create a social circle at a distance from actual political conflicts, and was presented as a feigned spontaneity whose most appropriate expression was *sprezzatura* (an affected casualness), as in *Il Cortegiano* (*Book of the Courtier*) by Baldassare Castiglione (1528), which was widely read in the courts of Europe. In this new sense, it could be translated as *gaillardise* (high-spiritedness) and *Geschicklichkeit* (artfulness, skillfulness; formed from *Geschick*).

I. The Education of Nature?

The term *leggiadria* had its origins and was used most frequently in love poetry. It referred to feminine beauty, or to the elegance of animals that one could in principle train, since *leggiadria* had to do, in fact, with educating nature—to the point of making what was acquired appear as natural. This nuance of meaning is found throughout poetry written in vulgar language, from Dante to the Baroque poets. In Poliziano, for example, *leggiadria* is the very particular grace of a doe and of a loved woman, who are both characterized by a spontaneous but precious elegance:

Ira dal volto suo trista s'arretra, e poco, avanti a lei, Superbia basta: ogni dolce virtù l'è in compagnia. Beltà la mostra a dito e Leggiadria.

(The fateful anger leaves his face, and Vanity resists a little more when he is before her; every sweet virtue accompanies him. Beauty points to her, and so does *Leggiadria*.)

(*Le Stanze*, I.45; *The Stanze of Angelo Poliziano*, trans. D. Quint)

In the fifteenth century, the term expressed a rather vague oscillation between the natural and the artificial. In the sixteenth century, with the demand for systematizing and classifying literary genres as political systems, a number of treatises on love or poetics were keen to distinguish between beauty, grace, and *leggiadria*. The most striking example is the dialogue entitled *Il Celso. Della bellezza delle donne*. Here, Agnolo Firenzuola, in drawing up a taxonomy of terms used to describe beauty, uses a false etymology in making *leggiadria* derive not from lightness but from law (*legge*):

La leggiadria non è altro, come vogliono alcuni, e secondo che mostra la forza del vocabolo, che un'osservanza d'una tacita legge, fata e promulgata dalla natura a voi donne, nel muovere, portare e adoperare così tutta la persona insieme, come le membra particolari, con grazia, con modestia, con misura, con garbo, in guisa che nessun movimento, nessuna azione sia senza regola, senza modo, senza misura o senza disegno.

(As many people would have it, and as the very force of the word suggests, *leggiadria* is nothing but the observance of a tacit law, which is created and promulgated by you women, so that you can move, carry, and compose your whole body, as well as all the individual parts of your body, with grace, modesty, measure, and discretion, so that no movement is unregulated, nor without manners, measure or design.)

(*Il Celso*, Discourse I)

So *leggiadria* continued to refer to a more than graceful beauty, but it began to lose its lightness, so to speak: it needed to have rules, measure, and *disegno*. The balance between the natural and the artificial thus seemed to tip toward the artificial, or at the very least, toward the construction of a consistent and well-planned order. It was no coincidence that this requirement was particularly marked in the nascent genre of treatises on art, where the principle of the imitation of nature began to compete with the idea of something constructed according to the intentions of the author, and thanks to his artistic skill. Opinions were thus divided, with the emphasis sometimes on the natural, and at other times on the artificial, but humanists seemed to go more in the direction of the latter.

The balance between the natural and the artificial found in earlier uses of *leggiadria* was still retained in Cosimo Bartoli's 1550 Italian translation of Alberti's *De re aedificatoria*: wherever the humanist has used the Latin term *venustas* ("from the goddess Venus," hence the aesthetic quality bound with the pleasure derived from the observation of bodily beauty, and most famously translated into English by Henry Wotton, in the seventeenth century, as "delight") to refer to a certain order obtained by supplementing the inadequacies of nature itself, the translator chose the word *leggiadria*. *Leggiadria* conferred on beauty both its principle of order and harmony, and the power to complete the plans that nature had not been able to complete:

La bellezza è un certo consenso, e concordantia delle parti, in qual si voglia cosa che dette parti si ritrovino, la qual concordantia si sia avuta talmente con certo determinato numero, finimento, e collocatione, qualmente la leggiadria ciò è, il principale intento della natura ne ricercava.

(Beauty is a certain correspondence and harmony between parts, whatever the thing they are part of, this harmony being obtained by a determined measure, by an order, and an arrangement, in other words, *leggiadria*, which is the principal aim of nature.)

(Alberti, *L'Architettura*; It. trans. by C. Bartoli, VI.2)

But if, in Bartoli's translation, nature remains the main point of reference, in the same year Vasari clearly characterized the beauty of *leggiadria* as being, above all, free from any measure: according to him, it exceeds nature and the rules of proportional harmony. Its champions were thus Raphael, Parmigianino, and Pierino del Vaga; those who condemned it were Paolo Uccello and Piero della Francesca, that is, the painters who were the most closely attuned to the "natural" universe.

II. The New Morality and the Virtue of Grace

The shift in *leggiadria*'s meaning toward the sense of "artificial" and even of "artifact" occurred more explicitly in the use of *leggiadria* in manuals for deportment from the second half of the sixteenth century. With Italy's loss of its autonomy, and the Counter-Reformation, a new morality of behavior was evolving within the courts: men of letters elaborated a rhetoric based on the carefully managed distance between one's inner-self and how one displayed oneself in public. *Leggiadria* therefore acquired a meaning close to that of *sprezzatura*, as illustrated by Baldassare Castiglione in *Il Cortegiano* (1528), which consisted of dissimulating the efforts of art behind an appearance of nonchalance. This morality would find its theoretical justification much later in Torquato Accetto's *La Dissimulazione onesta* (1641); for him, disguising spontaneity and one's own opinions was a means of survival. In many treatises during the Counter-Reformation, *leggiadria* in effect became what characterized the space between the private and the public, the innate and the acquired, sincerity and lying, which was also the realm of social savoir-faire, of the carefully negotiated distance where the particular sociability of *leggiadria* reigned, namely, in conversation. In his *Galateo* (1558), Giovanni della Casa thus placed *leggiadria* in the register of good manners. It was always at the heart of the activity of *communicare e usare*, or developing a relationship whereby two men became less of a stranger or enemy to one another. But it was also defined as attending to the imperfections of one's own body: without the elegance of a carefully looked-after body, beauty and goodness become divorced from each other. Jean de Tournes (1598) translated into French the definition of *leggiadria* that figures in the *Galateo*:

> L'élégance [*leggiadria*] n'est en quelque sorte rien d'autre qu'une certaine lumière qui se dégage de la convenance des choses qui sont bien composées et bien divisées les unes avec les autres et toutes ensemble: sans cette mesure, le bien n'est pas le beau, ni la beauté plaisante.
>
> (Elegance [*leggiadria*] is in many ways nothing but a certain light which is given off by the perfection of things which are well arranged and well divided between one another, and as a whole: without this meaure, the good is not beautiful, and beauty is not agreeable.)
>
> (Della Casa, *Il Galateo*; Fr. trans. J. de Tournes)

This was the sense in which *leggiadria* was translated and adapted in high society in the courts of Europe. However, its popularity was short-lived: Heinrich Wölfflin (*Renaissance und Barok*, 1888) saw the disappearance of the world of *leggiadria* (*die graziöse Leichtigkeit*) as one of the major elements of the transition from the Renaissance to the Baroque period: the break with the Renaissance involved a taste for shapes, colors, and spiral forms supplanting the taste for contours, design, and lightness. In the eighteenth century, *leggiadria* was thus completely overshadowed by the distinction between grace and beauty in neoclassical artists such as Antonio Canova, Leopoldo Cicognara, and Ugo Foscolo: for them, art aspired to be almost godlike, and consequently could not be considered worldly. Schiller's aesthetics, in which grace was a matter of beauty in movement, seemed to borrow certain aspects of *leggiadria*—though in fact his notion of grace was intended as a basis for the synthesis between nature and suprasensible freedom. *Leggiadria*, though, makes no claims at all to transcend the real. Anchored in worldly reality, it suspends certain of the world's rules in order to create parallel words, caught within a fragile equilibrium between the artificial and the natural, and not in order to bring about the intervention of divine grace. Like Guido Cavalcanti, who in Boccaccio escapes from being chased by leaping "with great lightness" and landing on the other side of the Orto San Michele, *leggiadria* does not deny the necessity of the real, but merely looks for the supporting points from where it can perform an elegant, light leap, a saving little nothing. Italo Calvino adapts Boccaccio's story in his *Lezioni americane* (1988) when he recommends lightness to writers of the next millennium, as one of the major yet forgotten touchstones of Western literature, heir to the humanism of the Renaissance.

LEIB / KÖRPER / FLEISCH (GERMAN)

ENGLISH	lived-body/body/flesh
FRENCH	*chair/corps*
GREEK	*sôma* [σῶμα] / *sarx* [σάρξ]
HEBREW	*bāsār* [בָּשָׂר]
ITALIAN	*carne/corpo*
LATIN	*corpus/caro*
SPANISH	*carne/cuerpo*

➤ FLESH, SOUL, and ANIMAL, CONSCIOUSNESS, DASEIN, ERLEBEN, GESCHLECHT, *LIFE/LEBEN*, LOGOS, PATHOS, PERCEPTION, QUALE, SUBJECT

Leib has two meanings, which depend on its privileged correlative term: when paired with *Seele* (soul), it corresponds to the currently accepted sense of the body as the home of sensory experience and fits into the common opposition of soul/body. Understood in terms of its relation to its close neighbor, *Körper*, its meaning is inflected and revitalized through its etymological connection to *Leben* (life). *Leben* means the vital, fluid, living, and dynamic side of corporeity, whereas *Körper* refers to the structural aspect of the body, that is, its static dimension. One is thus tempted to translate *Leib* (1) as "flesh" (*chair* in French, *carne* in Italian and Spanish), in order to emphasize this aspect of vital fluidity, and *Körper* as "body," when the two terms are being used together, especially in a Husserlian context; (2) as "body" whenever it is *Seele* that structures the meaning, in more classical contexts. But the problem one runs up against is the re-translation of *chair*—a key term in Merleau-Ponty—in the Germanic languages, where there is a more specific term: *Fleisch* (German), and *flesh* (English), which are usually translated into French as *viande* (meat). (Spanish and Italian present no such difficulty.) In addition, *chair* carries with it theological connotations, which leads one to question the way in which the concept took root in a Greco-Latin, or even Hebrew, context. Indeed, both Greek and Latin have two terms that one could comfortably retain as bi-univocal in translating *chair/corps* or *Leib/Körper*, namely, *caro/corpus* and *sarx/sôma*. But just as the transition from German to French does not allow for a simple transposition of one pair to the other, one is also faced with shifts of meaning in Latin and in Greek, or at any rate, inflections linked to the underlying axiology of each term, in ways that are moreover quite distinct in philosophy and in theology.

I. The Lexical and Etymological Dimensions

In present-day German, *Leib* refers to the stomach or the breast, as, for example, in expressions such as *Nichts im Leibe haben* (to have an empty stomach) and *gesegneten Leibes sein* or *die Mutterleib* (to be pregnant). More broadly, *Leib* corresponds to anything having to do with the intimacy of the body at its most vital: *harten Leib haben* (to be constipated); or sensorial: *am ganzen Leibe zittern* (to tremble all over). *Leib* is also used in expressions that mention the soul (*Seele*) or the heart (*Herz*): *kein Herz im Leibe haben* (not to have a heart), *mit Leib und Seele* (wholeheartedly), and *jemandem mit Leib und Seele ergeben sein* (to be devoted body and soul to someone). This suggests a proximity between *Leib* and the realm of "sensing" or "feeling," whether affective or sensorial.

The etymology reveals a common root between *Leib* and *leben* on the one hand, and *Leib* and *bleiben* on the other, going back to Middle High German (*lîp*, genitive *lîbes*). In the first case, *Leib* conveys the idea of a vital flow, proper to all living beings, which animates an inert body. In the second,

bleiben attests to the link between *Leib* and dwelling, residing, and the intimacy of a place. *Leib* is part of a specific Germanic context: *lîp* are those who have "stayed" (*die Gebleibenen*), who have not fallen on the battlefield, as opposed to *wal*, those who have fallen, that is, heaven's chosen ones (*die Ausgewählten*), the heroes. The life/death polarization of the pair *lîp/wal* follows naturally (the living and the dead), even if it is not constitutive of the primary meaning.

One can therefore find this shared sense between *Leib* and *leben* in many almost tautological idiomatic expressions: *bei lebendigen Leibe verbrannt werden* (to be burned alive), *Leib und Leben einsetzen* (to risk life and limb), *das ist er, wie er leibt und lebt* (that's just like him). In short, the *Leib* aspect of the body is vital and alive: the inert aspect is the becoming-inert of *Leiche* or of *Leichnam* ("corpse" in English, *cadavre* in French), or the inertia of *Körper*, a solid, physical, and material body. So one speaks of "bodies" in the physical sciences, celestial bodies (*Himmelskörper*) in Aristotelian cosmology, and corpuscles (*Körpchen*) in quantum physics. Whenever *Körper* is used in a human context, it signifies an organic structure or a complexion (*Körper-Anlage-Beschaffenheit*), a stature or conformation (*-bau*), comportment or bearing (*-haltung*), and in any case, a static, functional, or quantifiable configuration (*-gewicht*, *-größe*, *-kraft*).

■ See Box 1.

II. *Leib* and Its Entry into Philosophy

This was twofold: first, in terms of *Leib's* paired relation to *Seele* (soul), and second, in terms of its quasi-oppositional relation to *Körper*, and thus its correlation with *Geist* (spirit) (RT: *Historisches Wörterbuch der Philosophie*).

The ways in which *Leib* fits into a Kantian and post-Kantian context, within idealism more broadly, and then into its critical reassessment by Nietzsche, illustrate this pairing: here, *Leib* comes to be linked to subjectivity. Kant's *Opus postumum*, for instance, makes *Leib* a formal a priori of the subject, and Fichte (*Die Tatsachen des Bewußtseins*) asserts that the materiality of the *Leib* is the absolute a priori of self-consciousness. Hegel's *Phenomenology of Spirit*, however, insists on the fact that the body (*Leib*) is the expression of an individual, but that this expression is already mediated; it is a sign produced by the body, but the body is not at the origin of the sign. For Schopenhauer (*Werke*), the *Leib* represents an immediate object and expresses the will. Nietzsche describes it as a "great reason" and even sees it as the vital principle of theoretical reason (*Also sprach Zarathustra*). In short, *Leib* in the German nineteenth century was associated with transcendental subjectivity, or it was related to the individual, physiological, or instinctual subject.

III. *Crux phaenomenologica*: The Disintegration of *Leib* as an Effect of the Diversity of Its Translations

The psychology of the time, which Husserl inherited, also used the term *Leib*, but in the context of a psycho-physical parallelism (as in the work of Fechner, Wundt, and Avenarius), or more precisely, of the reciprocity of the psychic and the physical (Stumpf). Apart from these authors, Husserl borrowed from Theodor Lipps the notion of empathy as an *immediate* sharing of the feelings of others. Rejecting the

1

Lebenswelt and *In-der-Welt-Sein*: "Lifeworld" and "being in the world"

➤ DASEIN, *MALAISE*, WORLD

The emphasis on *Lebenswelt*, or "lifeworld," in the later writing of Husserl corresponds to an internal exigency of Husserlian phenomenology: yet it also seems to correspond to the impact of a return of the writings of the disciple (Heidegger) on those of his master (Husserl), in particular the notion elaborated in *Being and Time* of *In-der-Welt-Sein*.

French translators have preferred to translate Heidegger's expression as *être-au-monde* (being-to-the-world) rather than *être-dans-le monde* (being-in-the-world)

(Sartre). It is indeed best understood with reference to the German *In-sein* (*être à* [to be at/to]), where what is at issue is not so much the localization or placement of being-in-relation-to, as the delocalization, or even "removal" or moving (as in changing residence) (*déménagement*) in the Baudelairean sense: "It always seems to me that I should feel well in the place where I am not, and this question of removal is one that I discuss incessantly with my soul." "To be at/to" is also "to be exposed to," and not being able not to be exposed to, so that

the title of prose poem 48 in Baudelaire's *Le spleen de Paris* captures perfectly both the centripetal and centrifugal tension of "being-in-the-world" (and in a language): "Anywhere out of the world."

---

analogical inference of Benno Erdmann, he conceived of empathy as the mediated (corporeal) manifestation of the lived experience of others.

Leib thus acquired the meaning of "body as it is lived," leading Anglo-Americans to opt for the expression "lived-body." But this translation has the disadvantage of placing corporeality in a reflexive framework (my body, lived by myself), when phenomenology aimed to short-circuit the distinction between inside and outside. We come across similar difficulties with the French expression *corps animé* (animate body), which considers *Leib* from a psycho-physical point of view. We have the reverse of the same difficulty with the translations *corps organique* (organic body) or *corps vivant* (living body), which are relevant for worldly, anthropological phenomenology, but that each time incline *Leib* in the direction of biology.

What are we to make, then, of the *corps propre* (one's own body) that is a theme from Maine de Biran through to the Merleau-Ponty of the *Phenomenology of Perception*, the "subject-body," which is one's own, as opposed to the "object-body," which scientists deal with? This distinction would easily render Husserl's distinction between *Leib* and *Körper*, but such a translation is almost tautological: in fact, a *Leib* is always "mine" (*mein Leib*), or "my own" (*Eigenleib*). Even with the expression *fremder Leib*, it is the other's mode of a belonging to him- or herself that is in play. Likewise, whenever Husserl talks about *Leibkörper* (literally, body of flesh), or about *körperlicher Leib* or *physischer Leib*, or even *Körperleib* (Husserliana, no. 13; Husserliana, no. 15), he does so in order to free subjectivation from the object-body (*Körper*). Although what is one's own is just as much a component of *Leib* as what is quick or living, *Leib* cannot be reduced to this. When Husserl talks about *Eigenleib*, it is so as to specify *Leib* as one's own, not to assimilate the one to the other. The translation of *Leib* by *corps propre* may confirm the links between Husserl and Merleau-Ponty, but it also opens the door to an improper linking of *Leib* with what is properly one's life. The network of composite words we find in Husserl is supplemented by a series of derived terms

(*leiblich/Leiblichkeit/Verleiblichung/körperlich/Körperlichkeit/Verkörperung*); the bi-univocal correspondence between *Leib* and *Körper* proves all the more uneasy, given that the Romance languages use a single term to refer to the everyday meaning and the theological meaning of incarnation, while German speaks, in the latter register, of *Menschwerdung*.

In Husserl, the sphere of "ownness" refers to the first experience in which the lived experiences of consciousness are constituted and engendered: it has a genetic status as the original matrix of our corporeality. In French, the notion of *chair* (flesh) attempts to express the sensible *locus* that is irreducible to objective spatiality But is this use of the term *chair* appropriate to refer to the way *Leib* is inflected? Merleau-Ponty first privileges this term in *Le visible et l'invisible* (1964) in referring not to the body of others, but to the being of the world. To emphasize the carnal dimension of experience is to affirm the world's sensing (of itself). Thus, the French *chair* captures better than the English "being" a certain unity of experience (there is a flesh of being), whereas one's "own" body is individual. The Husserlian *Leib* also contains this unity of the experience that, without appearing, is concretized in the form of everyone's body.

This "non-appearing" or "non-apparent" (*in-apparaissant*) is not something that lies beyond. If *chair* does not appear, it is because we do not perceive it, we are not attentive to it—as happens with small perceptions in Leibniz. This emphasis on the labile, fluid, soft nature of *chair*, which downplays the structured-ness of the body, is unique to French, even though it takes as its point of reference the usual sense of the term (in French, the bones and *la chair* connected to blood are opposed to *la viande* [meat], or the soft substance of the body). *Fleisch* (German) and "flesh" (English) have this sense, and the German translators of Merleau-Ponty have, moreover, translated *chair* in this way, also using the word *Leib*. What is revealed here is the hypersensitive dimension of a human being (*chair* is what can be wounded, or can flourish), the intimate exchange between inside and outside, namely, the skin: only the skin can have *la chair de poule* (goose bumps; literally, chicken skin). What is more, whether we are talking

about a fruit or about the skin's appearance, *la chair* harbors a network that is both mobile and firm, plastic and structured, endlessly reconfigured: the vitality of the body resides in its *chair*.

Michel Henry can thus proclaim this carnal sense of *Leib*, which is a different name for what he calls "auto-affection." And Didier Franck proposes, in his discussion of the analytic of *la chair* in *Chair et corps*, the idea of refusing to give this originary aspect any autonomous status, by articulating the invisible, or the inapparent, as that which constitutes visible appearing. So to translate *Leib* as *chair* brings out the tension between phenomenology and metaphysics, because of the originary non-appearing unity that the term conveys. This articulation that would become the horizon of Husserlian phenomenology, and Merleau-Ponty's thinking toward the end of his life, as well as Michel Henry's perspective, are situated within this framework.

This tension becomes problematic when the metaphysics inherent in *la chair* doubles as instinctual immanence and theological transcendence. As early as the twelfth century, *chair* had a strong theological resonance that is certainly present in the notion of the living body as a glorious body. In addition, *chair* also had an instinctual, even sexual connotation: to speak about a carnal union was to speak in more elegant terms of a sexual union. From the ambivalence of the living body as biological or theological, to the ambiguity of *la chair* as instinctual or spiritual, we remain caught within the duality of immanence and transcendence.

IV. The Horizon of the Ancient World: Latin, Greek, and Hebrew Roots

How are we to arrive at rational grounds for choosing a translation of *Leib* when faced with such a swarm of different decisions taken over the years? It would seem appropriate to reflect on the Greco-Latin roots of the notion. In each case we have a pair (*sarx/sôma* [σάρξ/σῶμα]; *caro/corpus*) that modern languages have transposed into "flesh"/"body," *chair/corps*, or *carne/cuerpo-corpo*. But do the theological or philosophical contexts that the classical sources reveal mitigate the difficulties in translating *Leib*?

A. The equivocality of the contexts of Paul and John: *Sôma, sarx, pneuma*

In his First Epistle to the Corinthians, Paul wavers between flesh (*sarx*) and body (*sôma*): after having distinguished between the different kinds of flesh in the animal world and then having differentiated the bodies in the cosmology of the ancients, he separates the psychic, animal body (destructible, despicable) from the spiritual, pneumatic body (glorious, powerful). *Sôma* is ambivalent, linked to sin, rejected or elevated to the glory of resurrection. Paul's *sôma* has no quality of its own. *Sarx*, however, is defined in the Epistles to the Romans and the Galatians as being opposed to the spirit (*pneuma* [πνεῦμα]), but it is not identified with the somatic body, since as something selfishly closed upon itself, the residue of a sin that is legalized within the law, and the source of death, its meaning is entirely negative (Rom 7:5–14; Gal 5:13–16). *Sarx* is understood in terms of a morality of abstinence, which gives it a worldly and finite meaning. This meaning of "flesh" as a manifestation of human finitude is also one we

find in Matthew 26:41 (or Mk 14:38): the Spirit is filled with love, but the flesh is weak.

In John 3:6, *sarx* and *pneuma* refer to two types of creation: "Flesh gives birth to flesh, but the Spirit gives birth to spirit." *Sôma* alone contains the possibility of a glorious self-transformation. *Sôma* alone can have an individuated and individuating status, while *sarx* is infra-individual: the asthenic flesh is thus contrasted with the force of the spirit. Yet this hypothesis (Husserl, *Thing and Space*) does not hold up, because (a) we are only dealing with one, asthenic, meaning of the flesh; and (b) the axiology of the spirit and of the flesh is supported by that of glory and sin. It is notable, however, that "the Word became flesh" (Jn 1:14) has quite a different valence: the "flesh of life" in John is a redefinition of finitude as the possible power of individuation. The distinction is thus not between flesh and spirit (and also not between Paul and John), but between the flesh of sin and the flesh of glory and life (Cyril of Alexandria, *Deux dialogues christologiques*).

B. The univocality of the philosophical context: *Soma, psuchê, nous*

In the context of Plato and Aristotle, where *sarx* and *pneuma* do not form a conceptual framework, the distinction *sôma/psuchê* [ψυχή], or "animate body"/"intellect" (*nous* [νοῦς]), is the one that prevails, and it is linked to a depreciation of the somatic that would continue through the modern era, up to and including Descartes. *Phaedo* (83d) and *Gorgias* (493a–b) describe *sôma* as a prison cell, a tomb (*sôma* = *sêma* [σῆμα]), whose sign is desire, and understand *psuchê* as a form of exile, its own executioner crucified on the body. Aristotle radicalizes what in Plato was not a duality—but rather the soul's desire through the body, and the soul's exile in the body—by an ontological break that universalizes pure divine thought (*nous*) and individualizes corporeal form: *psuchê* and *sôma* are thus correlates of each other, as "form" (*morphê* [μορφή]) and "matter" (*hulê* [ὕλη]), or "activity" and "passivity" (*De anima*, 430a 5).

This duality reappears in Descartes in the distinction between the *res extensa* and the *res cogitans* (*anima, mens*, and *cogitationes*). In short, the body (*sôma, corpus*) is ontologically insubstantial and is kept at a distance, as passive matter. Heidegger was therefore able to think of corporeality as ontic substantiality, so the Platonic and Aristotelian filiation is not the one we should retain if we wish to see corporeality as something productive.

C. The non-onto-theo-logical (Hebrew) dynamic of the flesh: *Bāsār, rūaḥ, nèfèš*

To understand the theological ambivalence of *sôma/sarx* (or of *corpus/carne*, in Tertullian), and the positive meaning it can have, we might turn to another context: in the Hebrew scriptures, neither the body nor the flesh are valued negatively. The flesh (*bāsār* [בָּשָׂר]), as a human composite of body and soul, is even privileged as a concrete *index* of the spirit (*nèfèš* [נֶפֶשׁ]). A human being is an organic unity sometimes referred to as *nèfèš*, sometimes as *bāsār*, with *rūaḥ* [רוּחַ] (breath, spirit of God, soul) linked to it.

As the RT: *Traduction oecuménique de la Bible* testifies, roughly half of the occurrences of *bāsār* are translated as *chair* (flesh) (137 out of 270), indicating a consistent use of

this term, whereas *corps* (body) does not correspond to any unified conceptual register: it is designated by seventeen Hebrew terms, among them *bāsār* (28/270) and *ḥayyah* [חַיָּה] (2/3), out of a total of seventy-two occurrences. "Flesh," on the other hand, corresponds to only five terms in Hebrew.

Nowhere in the Judaic tradition is "flesh" reduced to the physical or organic body. Its spiritual dimension is even the basis from which a possible glorification of the body itself makes sense. Obviously, this dynamic sense of the flesh pulls it away from substantiality: with respect to this endorsement of the flesh, Christianity will then bear onward this non-onto-theological sense of the body to which the expression in John testifies: "the Word became flesh."

D. How to translate?

We are dealing with four distinct conceptual fields. Christianity and phenomenology emphasize the ambivalence of the corporeal: sinful/glorious (*sarx-caro/sôma-corpus*, and *Körper/Leib*). The two other fields are unequivocal—either positive (Judaism) or negative (philosophy).

In addition, there is no analogical or inverse relationship between one pair (*sarx/sôma*) and another (*Körper/Leib*), in which *sarx* would be to *Körper* what *sôma* would be to *Leib*, since *sôma* also has a negative sense and *sarx* a positive sense. In short, the pair *sarx/soma* (*caro/corpus*) is not on its own a discriminating difference. A further quality polarizes its relevance: the *modal* pair sin/glory. *Sarx* on its own is not evil, but the sin by which Paul qualifies it is, to such a point that this sin then comes to define *sarx*. On the other hand, following the Judaic meaning of "flesh," John makes it the flesh of life, which refers, as in the Old Testament, to the complete person—body, soul, and mind.

In this respect, one decisive historical point of reference is that of the German esotericists (Weigel, Oetinger, Baader), who make *Leiblichkeit* into a *geistige Leiblichkeit*, endowing the body-flesh with a spiritual life that Schelling would turn to his advantage, as the *body-flesh* that phenomenology would reactivate by relieving it of its substantial materiality, and by recasting it as a vital subjective dynamism.

The pair *Körper/Leib* allows for an operative distinction because of the inertia/life or objective/subjective polarities that the Greek and Latin pairs do not offer and that Hebrew alone allows for through the expanded sense of *bāsār*. So it is the *qualities* of *sôma-corpus* (sin/glory) and of *sarx/carne* (death/life) that come to be analogous with the qualities of *Leib/Körper* (subjective lived experience / inert objectivity).

We could say, then, that the *Leib/Körper* polarity is conceptualized without being terminological. In this respect, it is reasonable to follow Paul Ricœur's appeal to the economy of meaning (body/flesh), and the use of a single term to cover the different concepts that *Leib*'s history and uses disclose. If we go along with this principle, we will opt for a minimalistic translation of *Leib* as "body": we could also convey the phenomenological polarity by using the term "flesh," given that Husserl uses *Leib* in a distinctive way, associating it with *Körper*, and articulating it with *Seele*. Distinct terms are thus legitimized according to their usage. Either *Leib* (flesh) works phenomenologically in liaison with *Körper*, or *Leib* (body) is associated with the psychic: in German (*Leib und Seele*), just as in French (*âme et corps*), idiomatic expressions are available that make sense in everyday language.

By working with two usages, one more technical, and the other more everyday, we bring into play a salutary contextualization. By maintaining a distinction between *Leib* and *Körper* in French, one can account for the difference between corporeal appearing and carnal appearing. It is then that the philosophical emerges: the aim of the German compound nouns is to indicate the interweaving that is the only way one can conceptualize unity in difference. Further, does this articulation (as *corps* and as *chair*, or between a technical and an everyday term) not correspond to the double meaning of *Leib* (linked to *Seele*/opposed to *Körper*), which signals *Leib*'s entry into philosophy?

LËV [לֵב], LËVAV [לֵבָב] (HEBREW)

ARABIC	*qalb* [القلب], *fu'ād* [الفؤاد], *lubb* [لبّ]
ENGLISH	heart
FRENCH	*coeur*
GREEK	*kardia* [καρδία]

➤ HEART, and CONSCIOUSNESS, ESSENCE, GEMÜT, GOGO, INGENIUM, INTELLECTUS, SAMOST'SOUL, BOX 4, TO TI ÊN EINAI, TRUTH, UNDERSTANDING

This word is common to Semitic languages. Its usage represents, as with many languages, a remarkable case of the metaphorical use of a part of the body, considered as central, in order to express the moral worth of an individual or the very essence of something.

Arabic has specific words for the heart as an organ (*qalb* [القلب], and less commonly *fu'ād* [الفؤاد]). In Hebrew *lëv* [לֵב] refers less to the organ than to the entire thorax (cf. 2 Sm 18:14ff.), with all of the entrails contained within the cavity that it forms. It is from the heart that the very source of life is said to spring (Prv 4:23; cf. 25:13). It is the seat of life force and the center of the psychic life in all its dimensions (cf. Maimonides, *Guide of the Perplexed*, I, 39). The heart is the source of perceptions (Dt 29:3), memory (Is 46:8 etc.; Jer 3:16, etc.), feelings, and desire—including courage (Ps 40:13), in the sense in which Rodrigue in Corneille's *Le Cid* is asked "*As-tu du coeur?*" (Do you have the heart?). There is nothing specifically Semitic about this. In Aristotle, too, the "heart" (*kardia* [καρδία]) is the end point of sensations, and the starting point of the movements of the organism (cf. RT: *Index Aristotelicus*, 365b 34–54). And in Egypt, from the Middle Empire on, a heart would be weighed postmortem, a procedure that was supposed to assess the moral worth of the dead person and thus to determine his fate in the afterlife. Attributing higher intellectual functions to the heart is something we find in Latin (cf. Cicero, *Tusculanes*, I, 9, 18), but this is not at all the case in Greek. The Bible talks about a wise and intelligent heart (Ps 90:2; Prv 15:14). In the Qur'ān, people who "have a strong heart" (*'ūlū 'l-albāb* [أولو الألباب] are those who are intelligent enough to decipher the signs of creation and to see in them traces of the presence of Allah (III, 190).

The meaning of "the innermost core," which allows one to speak of the "heart of something," is discreetly present in the Bible, which mentions, for example, the "heart" of an oak tree (2 Sm 18:14); it develops in medieval Hebrew and takes on a laudatory meaning under the influence of the Arabic *lubb* [لبّ], which can refer to the pit of a fruit and also to what is most pure about a thing, its quintessence.

LEX / JUS (LATIN)

ENGLISH	right, law
FRENCH	*loi, droit*
GERMAN	*Recht*
GREEK	*nomos* [νόμος]
ITALIAN	*diritto*
SPANISH	*derecho*

➤ LAW, TORAH, and CIVILTÀ, *DROIT* [THEMIS], DUTY, FAIR, MORALS, PIETAS, RELIGIO, RIGHT/JUST/GOOD, *RULE*, SOLLEN

The Greek *nomos* [νόμος], implying at the same time the notions of sharing, or division, of the law, of right, and of obligation (see THEMIS), has no corresponding term in modern languages. The exception is present-day Greek, in which two distinct lexical terms still designate the law and division (more precisely "law" and "department": cf. RT: Mirambel, *Petit dictionnaire français-grec*, and RT: Pernot, *Dictionnaire grec moderne–français*)—and in which the root of the word *nomos* is declined as a series of terms referring to the law (so we have *nomiki*, the science of law [cf. RT: Kyriakides, *Modern Greek-English Dictionary*]; *nomika*, the study of law [cf. RT: Mirambel, ibid.]; *nomikos*, a lawyer [cf. RT: Mirambel, ibid., and RT: Pernot, ibid.]; and *nomodidaskalos*, a law professor [cf. RT: Alexandre et al., *Dictionnaire français-grec*]). The Romans, aware of the correspondence between *lex* and *nomos*, emphasized the fact that the Latin word referred to a free choice and not to an imposed division. Thus *lex* prefigures *jus* in that it expresses a political will linked to Roman

imperialism. As for *jus*, it acquires its full meaning in its interaction with *directum* (the straight path, the correct way)—which through its popular usage produced, among other terms, "right," *droit*, *diritto*, *derecho,* and *Recht* (considered unhesitatingly as translations of *jus*)—and with *rex*, the one who draws lines and angles and who thus determines what is inside and outside, allowing for the construction both of the architectural town and of the city as Republic: hence *rex*, the "sovereign," the "king." In the context of the Roman Empire's military and political victory in Greece, we can see why the Greek *nomos* succumbed to the Latin *norma* (square), a linguistic phenomenon indicating a true Roman "squaring off" of ancient civilization.

I. From *Nomos* to *Norma*

The Greek *nomos* [νόμος] does not explicitly designate the law but rather the "portion assigned" (*nemein* [νέμειν], "to distribute"; see THEMIS) to something or someone, particularly in terms of its species or genus. So men, unlike animals, are assigned *dikê* [δίκη], "justice," and not violence ("So listen to justice [*dikês*], forget violence [*biês* (βίης)] forever: this is the law that the Cronid assigned [*nomon dietaxe* (νόμον διέταξε)] for men"; Hesiod, *Works and Days*, 275–76).

There is no distinction between the *nomoi* that regulate the universe and the *nomoi* of the city: indeed, the normative process that makes a certain type of mammal into a political animal takes the form of a determining structure of authority in which man is domesticated by the home before being civilized by the city. It is a matter of being shaped by the laws (*nomoi*) of the home (*oikos*; see ECONOMY and OIKONOMIA). Submission to the "laws of the home" was for pre-Christian antiquity the first stage of managing living beings, whether human, animal, or vegetable. The *oikos* (the *domus* in Latin) *domesticates* living beings, with only humans able subsequently to undergo the selective process of insertion into the city (Baud, *Le droit*). On the essential function of the laws of the home, one only need recall that the confrontation between Creon and Antigone, the most famous passage in ancient literature on the opposition between divine laws and those of the city, concerns the laws of the home that are dominated by funerary worship, which is ultimately related to the law of Zeus (Sophocles, *Antigone*, lines 440–601).

Linguistically, there is no relation between *nomos*, *lex*, and *jus*. The contact between Greek and Latin is indeed somewhat perverse, since the transition occurs by way of instruments of measure. In fact, the Greek *gnômôn* [γνῶμων] (which refers specifically to a sundial and a ruler) is the source of the Latin *norma*, a square, a term no doubt borrowed, via the Etruscan language, from the accusative of *gnômôn* (see RT: Ernout and Meillet, *Dictionnaire étymologique de la langue latine*, s.v.). *Nomos* is what is attributed through an act of sharing or division and designates justice as first of all the justness of a measure. Measuring tools, designed to be used by a builder, are the true interface between justness and justice. What we find here in the Greco-Roman world is clearly expressed in the Bible: "You shall do no wrong in judgment, in measures of length or weight or quantity. You shall have just balances, just weights, a just *ephah*, and a just *hin*" (Lv 19:35–36; an *ephah* was "a dry measure having the capacity of about 3/5 of a bushel or about 22 liters," and a *hin* was "a liquid measure having the capacity of about 1 gallon or about 3.8 liters";

RT: *Holy Bible, New International Version*). Neither should we forget the weight and name for money (*nomisma* [νόμισμα] in Greek, from *nomos* precisely, a point that Aristotle underlines in the *Nicomachean Ethics*, 5.8.1133a. 30ff.). This is why the balance, or set of scales, has become firmly established as an allegorical figure for human justice. It should come as no surprise that in ancient Roman law a transfer of property required the ritual presence of a bronze ingot and a set of scales (one acquired property *per aes et libram*, "with bronze and balance") nor that, in light of the intermediary situation of the laws of the home, an obligation could be created simply by writing in the account book of the father of the family (known as *expensilatio*).

The emergence of the "urbanistic" laws of the *urbs* and the "civic" laws of the *civitas* is thus identified with the addition of a metaphorical meaning to instruments that were first used to apprehend the physical world scientifically, then to organize space, and finally to build houses and design towns. In the city of the Republic, *norma* became a virtual form thanks to which man could make law out of the matter constituted by the society of animals already domesticated by the laws of the home. As for the *forma*, also derived from the Greek *gnômôn*, this referred to the mold, and especially the small mold, the *formula*, which gave a legal form to human relations: in classical Roman law, one could not bring about an action because one possessed a right, but one could have one's right recognized because a lender had anticipated the small mold of the *formula* and had placed a legal claim relating to the dispute within it.

There was thus a logical chain, but one that went from Greek to Latin, linking *nomoi* to *normae*, the norms of a civilization that agreed on its laws, and also, more generally, on what was beautiful, good, and just—these norms establishing within the city, through various sanctions (critique, ridicule, reprobation, banishment, and finally passing legal sentence), a system that frames society using squares and formulas.

■ See Box 1.

The *norma* became a linguistic vampire. Although it referred solely to the normative world, that is, the world of human activity, it became in modern languages the happy rival of *nomos*. *Nomos* is, of course, present in terms such as "economy" and "autonomy," as well as in a few neologisms in scientific jargon, but "anomaly" still seems almost a grammatical error when opposed to the formidable army of terms like "norms," "normal," "normality," "normalization," and so on. The linguistic failure of *nomos*—which conceals its conceptual permanence—could be explained by the political domination of the Greek world by a Roman civilization founded on the preeminence of law and which was determined that the wisdom of law (*jurisprudentia*) should prevail over every school of Greek philosophy.

II. *Lex*

Although *jus* and *lex* were unrelated to Greek vocabulary, the proximity of *lex* to *nomos* was not difficult for the Romans to perceive, and this was what allowed them to claim *jus* as something truly their own. In other words, what we call law always expressed, at a time when the Roman Empire referred to itself as the West, a normative system that constituted the

1

Gnômôn, metron, kanôn

➤ TRUTH, Box 2

A large number of nouns are derived from *gignôsko* [γιγνώσκω], "to learn to know by dint of effort" and, in the aorist, "to recognize, discern, understand" (RT: Chantraine, *Dictionnaire étymologique de la langue grecque*), such as *gnôsis* [γνῶσις] (search, enquiry, knowledge, gnosis), *gnômê* [γνώμη] (intelligence, judgment, decision, intention, maxim; the composite term *suggnômê* [συγγνώμη] signifies forgiveness; see PARDON), and *gnôma* [γνῶμα] (a sign of recognition). One of these terms, *gnômôn* [γνώμων], as an adjective described someone who discerns, understands, and judges; as a noun, *gnômôn* refers to "that which regulates or rules." It had many technical uses, whether it was a question of people, experts, inspectors (*hoi gnômones* [οἱ γνώμονες] are the guardians of the sacred olive trees; Lysias, *Orations* 7), or, especially, things or instruments that measured time and space: the needle on a sundial and the dial itself (Plutarch, *Morals*, 1006e; Herodotus, *Histories*, 2.109), a clepsydra or water clock (Athenaeus, *Deipnosophistae*, 42b), the sharp edge of a forest (Apollodorus of Damascus, *Poliorcetics*, 149.4), and above all a carpenter's square, which the Pythagoreans used to explain through representation how numbers are generated (a square [*gnomon*], that, as Aristotle emphasizes in the *Categories*, "surrounding a square, magnifies it without altering it" [15a 30]). It was the tool par excellence of astronomy, of geometry (the *gnômôn* in Euclid is the complementary parallelogram of another parallelogram or of a triangle), of arithmetics (the *gnômôn* is the odd factor of an even number, as 3 is in relation to 6), and the tool in ancient mathematics of the co-constitution of arithmetic and geometry. We switch with this single word from the most intellectual to the most concrete (the *gnômônes* are also the teeth by which one determines the age of a horse or a donkey; Xenophon, *On Horsemanship*, 3.1), from the operations of the mind to the instruments by which it is inscribed in the world.

The same type of semantic extension is true of the canon and the measuring stick.

Metron [μέτρον], "measure," from the same family as *mêtis* [μῆτις] ("cunning": see MÊTIS), refers equally to a measuring instrument (the surveyor's stick [*Iliad*, 12.422]); the measures of wine and water [*Iliad*, 7.471]), the factor in a product (Nicomachus of Gerasa, *Introduction to Arithmetic*, 83–84), as well as to the quantity measured, space, or time (sea, youth), in particular a verse or meter (as distinct from *melos* [μέλος] and *rhuthmos* [ρυθμός]; Plato, *Gorgias*, 502c, and *Laws*, 2.669d). Above all, as "measure" it means a just measure (after Hesiod, *Works and Days*, 694, it is linked to *kairos* [καιρός]; see MOMENT). Aristotle emphasizes, for example, that "there is a *metron* for the size of a city, as for everything else, animals, plants, organs" (*Politics*, 7.4.1326a, 35–37)—in this case the size being equal to the distance a voice will carry. *Metron* as a (just) measure and *metriotês* [μετριότης], "moderation," are thus linked to *meson* [μέσον] and to *mesotês* [μεσότης], the (exact) middle, which are used to define virtue (*arêtê* [ἀρητή]; see VIRTUE; cf. Aristotle, *Nicomachean Ethics*, 2.1106b 24–28). From metric system to just measure then, mathematics and morality, via poetry and music, are intrinsically linked. But a more telling testimony than anything else of the impact in ancient times of the *metron* and the art of measuring (*metrêtikê* [μετρητική]; Plato, *Protagoras*, 356–357) is the celebrated phrase of Protagoras about man as measure and his violent reinterpretations: "man is the measure of all things [*pantôn chrêmatôn metron estin anthrôpos* (πάντων χρημάτων μέτρον ἐστὶν ἄνθρωπος)], of those which are that they are, and of those that are not that they are not" (80 B1 DK = Sextus, *Adversus mathematicos*, 7.60; see RES, Box 1; cf. Cassin, *L'effet sophistique*, 228–31 and 261–63). For the Plato of the *Laws*, it is God who is the measure (4.716c), and for the Aristotle of the *Nicomachean Ethics*, it is the *spoudaios* [σπουδαῖος], the good man, who

is in himself *kanôn* [κάνων] and *metron* (5.11.1136a 32–33).

With *kanôn*, we move this time from matter to operation. The *kanôn* is the stem of a reed or the stalk of a rush (*kanna* [κάννα]) and refers to any long and straight bar made of wood (the bars or handle of a shield, the keel or the centerboard of a boat, the stick of a distaff, the beam of a set of scales, the key of a flute, the posts of a bed), particularly the ruler and line of woodworkers and carpenters (Euripides, *Trojans*, 6; Plato, *Philebus*, 56b), from which we get rules, models, principles (Euripides, *Hecuba*, 602: "we know evil, when we have learned good as *kanôn*"). Bailly (RT: *Dictionnaire grec-français*) explains that in music, *kanôn* refers to a kind of tuning fork; in history, to the different ages; in grammar, to the rules and the model of verb declensions and conjugations: in short, from the canon of Polycletus to the classical catalogue of alexandrines, by way of the logic (*to kanonikon* [τὸ κανονικόν]) of the Epicureans, a canon always provides the rule. The word was borrowed by administrative Latin to designate a tax, and by the language of the church to refer to a rule, or a canon (RT: Chantraine, *Dictionnaire étymologique de la langue grecque*).

This set of terms, which explains why "no-one may enter if he is not a geometrician"—the words engraved above Plato's Academy—attests to the close relationship in Greek between mathematics and morality. The Latin synergy between architecture and law constitutes one of the possible triumphs of this Greek relation.

foundation of civilization. Since Romans had agreed to refer to the art of "being together" as "civility" (*civilitas*) (Duclos, *De la civilité*), including being together within their civil law, the French elaborated, one after the other in the sixteenth and seventeenth centuries, the terms *civiliser* (to civilize) and *civilisation* (civilization) in order to refer, respectively, to a procedural act and to a legal situation: the fact of entering, and then of being within, a civil law (Starobinski, "Le mot civilisation"; see also CIVILTÀ). The romance languages followed suit, and

English registers the first usages of "to civilize" in this sense in the last years of the sixteenth century.

A. Inscribing *lex*

The Greeks also respected "unwritten laws," those *agraphoi nomoi* [ἄγραφοι νόμοι] that came down directly from a divine being and that were consonant with natural law, like those unprescribed laws of the family that Antigone obeys in disobeying Creon, and that, unlike written laws, could not

be usurped by any tyrant (Aristotle, *Rhetoric*, 1.1373b 4–15; cf. Hoffmann, "Le *nomos*, 'Tyran des hommes'") On the other hand, the Romans inscribed within the West the mystique of the founding text, even before it was reinforced by their own adherence to a "religion of the Book."

Although it originally referred to a religious law, *lex* retained only traces of this origin in a few rare phrases. Unlike *jus*, the *lex* of the Romans was essentially human, first of all because it required some human work to give it its lapidary form (in the broad sense of what is engraved in stone or bronze), and because later on the Romans conceived that it could be incarnated by one man, the emperor. Unlike custom (*mos*), which presupposed a tacit common understanding, *lex* was what had to be engraved and displayed in the town. *Legem figere* means "to engrave the law in bronze or stone and display it in the forum"; *legem delere, perrumpere, perfringere* is "to erase," "get rid of," or "break the law" (RT: Ernout and Meillet, *Dictionnaire étymologique de la langue latine*, s.v. *lex*). *Lex* thus functioned as a kind of hinge connecting the materiality of the town (*urbs*) to the immateriality of the city (*civitas*), thereby confirming the link between architecture and law suggested by *norma.*

The most important *lex* for the Romans was the Law of the Twelve Tables, a written record from the fifth century BCE of the customs of a primitive and superstitious rural society, yet which Cicero presented as containing more wisdom than all of the schools of Athens (Cicero, *On the Orator*, 44). The Romans did claim to respect a natural law that could be discovered by "correct reason" (Cicero, *On the Republic*, 3), but they never missed an opportunity to point out that nothing was closer to correct reason than Roman law. With the Law of the Twelve Tables, the Romans went from engraving in stone to writing "within the heart." Indeed, Romans in Cicero's time learned the Law of the Twelve Tables as a rhyme (Cicero, *On the Laws*, 2.4), despite the fact that it had become an archaic text whose meaning was only understood, and even then imperfectly, by a small minority of scholars. Even though in the second century CE writers were still defending its wisdom (Gellius, *Attic Nights*, 30.1), the most important thing for the Romans was that the Law of the Twelve Tables was inscribed within the materiality of the town as well as in the legal truth of the city.

Engraved on the walls of the town, then in the hearts of the Romans, the *lex* was finally marked upon the emperor's body. Drawing the consequences from the fact that the emperor of the late Roman Empire had become the cornerstone of Roman law, and reappropriating a phrase that the Hellenistic monarchies had popularized (*nomos empsuchos* [νόμος ἔμψυχος]), Justinian's compilation transmitted to the West the idea that the emperor (and, thereafter, the pope, the king, the state, etc.) was a "living law" (*lex animata*; Justinian, *Corpus juris civilis*, *Novellae* 105.2, §4), which medieval jurists completed by adding that he had "all the archives in his heart" (a recurring theme in the entire work of Pierre Legendre; see in particular *L'empire de la vérité*).

B. *Nomos* and *lex*

Cicero thematized the relationship between *nomos* and *lex*. Like all Romans, and like everyone in the ancient world, his admiration for Plato knew no bounds, but it was not so great as to temper the pride he felt when he contemplated a Roman culture based on law and that, sustaining as it did an empire which had conquered Greece, could claim that its science and wisdom in law, or *jurisprudentia*, was a match for Greek philosophy (Cicero, *On the Orator*, 1.34.195, and *On the Republic*, 1.22 and 2.15). This was why he wanted to draw a clear distinction between *nomos* and *lex.* For him, then, the Greek *nomos* was a process of distribution, whereas the Roman *lex* was a deliberate choice:

> And so they believe that law is intelligence, whose natural function it is to command right conduct and forbid wrongdoing. They think that this quality has derived its name in Greek from the idea of granting to every man his own [*Graeco . . . nomine nomon suum cuique tribuendo appelatam*], and in our language it has been named for the idea of choosing [*ego nostra a legendo*]. For as they have attributed the idea of fairness to the word law, so we have given it that of selection [*ut illi aequitatis sic nos delectus vim in lege ponimus*], though both ideas properly belong to law.
>
> (Cicero, *On the Laws*, in Santangelo,
> "Law and Divination," n. 15)

Through its laws, Rome asserted itself as master of its destiny, an imperial destiny, which declared as one of its duties that of giving laws, *leges datae*, to the nations its conquered. The victorious general, or the governor appointed to administer the conquered territory, would generally give an engraved, public law, and the nations making up the empire were progressively identified by a *lex*, either original or given. Rome was sovereign judge of all other laws. So Justinian declared in 553, in *Novella* 146 of *Corpus juris civilis* that the Jews indulged in "senseless interpretations" of the Bible. Since it could not be linked to the "correct reason" of natural law, the Torah placed Jews outside the law. This is where we can locate the origin of Western anti-Semitism (Legendre, *Les enfants du texte*).

This ancient trajectory of the word *lex*, which led to its inscription within the *body* of the emperor, while also inversely pointing to an ethnic identity, explains why, as it traversed the Middle Ages, it could on the one hand refer to any fragment of what the medieval university called the Body of Roman Law (Justinian's *Corpus juris civilis*), and on the other hand could refer during the Frankish period to that which distinguished one people from another (the *lex* of the Salic Franks—the *Lex Burgundionum*, or Burgundian Laws—not to mention the *lex* of the different Gallo-Roman groups . . . and thereafter written by the barbarian king, whose subjects they had become!).

III. *Jus*

Finally, why do we talk about "law" (*droit*) when we are dealing with what is "legal" (*juridique*)? This important lexical question resists attempts to obscure it.

A. Of a so-called *jus naturale*

A great deal has been written by lexicographers on the origins of *jus*, which is so intimately bound up with Roman cultures (RT: Ernout and Meillet, *Dictionnaire étymologique*

de la langue latine, s.v. *jus*; RT: Benveniste, *Le vocabulaire des insitutions indo-européennes*, vol. 2, chap. 3: "*Jus* et serment à Rome"). The indisputable connection to an oath (*jusjurandum*) firmly designates a religious expression that has the force of a law and a sacred expression of commitment. The desacralization of *jus* occurred over a long period of time. This took the form initially of making within the law a separate public law (*jus publicum*) containing everything to do with "sacred things, the priesthood and the public offices" (Justinian, *Corpus juris civilis*, *Digest*, 1.1.1, §2: "Publicum jus in sacris, in sacerdotibus, in magistratibus consistit"), and then by the medieval elaboration of canon law, which restricted public law to anything to do with public offices (Chevrier, "Remarques"). In addition, and quite understandably, imbuing *jus* with a religious meaning gave to the word, which expressed the law, an important political force. Linking the founding of a town to the existence of a city that had become an empire, Roman legal advisors created an indissoluble bond between *jus* and the political existence of Rome. Historians and Roman jurists transcribed the Ciceronian theory, according to which *lex* was at the origin of *jus*, into a patriotic register—thereby confirming our critical attitude when confronted by the bravura passages of the philosopher lawyer—and they have always emphasized the fact that the Law of the Twelve Tables was the sole "source of law," the *fons juris* of Rome, and of this empire that made the West.

The transition in Latin from *nomos* to *norma* established as a first principle that law, unlike justice, but like architecture, was necessarily man-made. This is why it is imperative to understand what Romans meant when they, before anyone else, talked about "natural law."

According to the author of Justinian's *Institutes* (1.2), which was written in 533 to train future jurists of the empire, "natural law is that which she has taught all animals" (*jus naturale est, quod natura omnia animalia docuit*) and "a law not peculiar to the human race, but shared by all living creatures, whether denizens of the air, the dry land, or the sea" (*nam jus istud non humani generis proprium est, sed omnium animalium quae in coelo, quae in terra, quae in mari nascuntur*; *Institutes of Justinian*, trans. modified—Ed.). As for what this *jus naturale* consists of, he only makes allusion to the union of male and female, to procreation, and to the education of the young. One essential text proves that we are dealing here not with what we would call law, but with what the Greeks referred to as the *nomos* that we have in common with animals: Demosthenes's *Against Aristogiton* (*Orations*), in which he defined as a *nomos* of nature [τῆς φύσεως νόμος] the fact that humans love their parents just as much as animals do (25.65).

So the *jus naturale* that Justinian's *Institutes* discusses does not belong to the normative world in which what we call the law operates but rather to the sphere of the most elementary of human observations. For *jus naturale* to come into the sphere of law properly speaking, one would have to have granted animals the legal status of persons. It is true that the philosophers of pre-Socratic antiquity, especially within the Pythagorean school, reflected deeply on the way in which one could conceive of justice between humans and animals (see on this point the groundbreaking work of Fontenay, *Le silence des bêtes*), but law has never taken this into account. Noxal surrender, whereby an animal that had caused injury was handed over to the victim of that injury, was nothing other than the vestige of the archaic principle according to which any living body could be materially committed to another in a relationship of obligation. However, because they considered that humans were clearly distinct from other animals, Roman legal advisors agreed that the child of a slave should never be kept by a usufructuary, yet the latter was perfectly entitled, at the end of his contract, to return the cow or mare but to keep the calf or the colt (Terré, *L'enfant de l'esclave*).

Justinian's *Institutes* was a pedagogical work that moved from the general to the particular in order to arrive at the real object of the study: Roman civil law. This didactic operation starts out with the *nomos* common to men and animals, for which there is only the noun *jus*, since the ultimate objective is *jus civile*. So natural law (*jus naturale*) is retained, although to be more precise, it only appears in the introduction to the rubrics (bk. 1, title 2), announcing what are in a sense the real legal topics, which are then defined in the first paragraph with a gradation in their relevance: "[L]aw is divided into the law of the people (common to all men) and civil law (particular to a given city)" (*jus autem civile vel gentium ita dividitur*). As we can see, true law excludes the *nomos* of nature, translated as *jus naturale*, and only comprises two parts: the law of the people (comprising the most common contracts), and civil law, the real subject of the treatise, which can finally be achieved through the rhetorical operation of going from the general to the particular. Indeed, even though the *Institutes* concede that the laws of Solon and Dracon might have once been considered as the civil law of the Athenians, it goes without saying that, in the spirit of the work, the true civil law is that of the Romans. This is testimony to the often scornful condescension that Roman legal advisors showed, much as Cicero himself had done (*On the Orator*, 1.44.97), whenever they mentioned the law of other cities, but it is also a consequence of the fact that, since Caracalla's edict of 212, all those living within the empire had become Roman citizens.

"What we call law has nothing 'natural' about it," writes Pierre Legendre, "any more that it constitutes an 'objective' phenomenon whose universal character is self-evident" (*Sur la question dogmatique*). Neither in Greek literature nor in Roman law do we find anything that is truly natural law. Whether it is a question of the unwritten laws (*agraphoi nomoi*) of the Greeks or of the *jus naturale* of the Romans, what we see is nothing more than a natural order guaranteed by a deity. Antigone appealed to Zeus's law in opposing Creon, and the Christianized empire of Justinian's time attributed "natural laws" to divine Providence, using a plural that reinforced the allegiance to the unwritten laws of the Greeks: "naturalia quidem jura . . . divina quadam providentia constituta" (the laws of nature. . . are established by divine providence; Justinian, *Institutes*, 1.2, §11). So quite logically, therefore, in 1140, the *Decree of Gratian*, the founding text of the new discipline of canon law (*jus canonicum*), opens with the following definition of natural law: "Natural law is what is contained in the Law [the Law of Moses: the Old Testament] and the Gospels" (*Jus nature est, quod in Lege et in Evangelio continetur*; *Decree of Gratian*, 1 d.a.c. 1). And following this same logic, Thomas Aquinas made natural law

the means by which men approached a divine law that was beyond their intellect (Strauss, *Natural Right and History*).

B. *Jus* and *directum*

So in antiquity and in the Middle Ages in the West, divine laws (*lois divines*) absorbed natural law (*droit*) because law, properly speaking, was considered to be man-made. It was a necessarily human product because it was made using a ruler and a square. This was why the Roman *jus*, which was in fact visibly present as the root of several words associated with the "juridical," gave way to *directum* (RT: Du Cange, *Glossarium mediæ et infimæ latinitatis*, vol. 3, s.v. *directum*), from which were formed most of the terms in the West that refer to the law: *diritto* (Ital.), *derecho* (Sp.), *diretto* (Port.), *droit* (Fr.), *Recht* (Ger.), *right* (Eng.), and so on. Light is shed on the mystery if we take into consideration that the *Digest*, this monumental work that Justinian's compilers devoted to legal doctrine, ends with a concluding title (50.17), the "Rules of Ancient Law" ("De regulis juris antiqui"), and if we understand that the king (*rex*) is what links *regula* to *directum*. *Gnômôn* and *norma* opened up and circumscribed the space of norms, within which the *rex* designated rules, and prepared the way for what we today call law (*droit*). Before being a king, the *rex* is first and foremost the one who draws straight lines (RT: Benveniste, *Le vocabulaire des insitutions indo-européennes*, vol. 2, s.v. *Rex*), the one who makes a *directum*, that is, a straight line, using a *regula* or a ruler, the tool enabling one to rule (*regere*), that is, to "direct in a straight line," and then to "be a director or a commander" (RT: Ernout and Meillet, *Dictionnaire étymologique de la langue latine*, entry *rego*). The *rex* Romulus ploughed the first straight furrow, from which the town (*urbs*) and the city (*civitas*, the place of civil law) were built.

By distinguishing what was sacred from what was profane (at Rome there was a sacred inner space, the *pomoerium*, that one could not enter armed) and also by distinguishing what was Roman territory from what was not, the *rex* defined as well the extendable site of civil law within which the West was formed.

LIBERAL, LIBERALISM

➤ CIVIL RIGHTS, CIVIL SOCIETY, ECONOMY, LAW, *LIBERTY*, LIGHT, PEOPLE, POLITICS, *POWER*, *STATE*, WHIG

The English term "liberalism" evokes a political and cultural tradition that has no real French equivalent, which makes the word difficult not so much to translate as to use correctly. There have, of course, been French liberals, but when all is said and done, they have been fairly distant from the English model, and ended up abandoning what constitutes its core feature, namely the individual. With its origins in the Glorious Revolution and in the work of John Locke, liberalism in the sense of an affirmation of the priority of individual liberties, and their protection against the abuses of the sovereign or the collectivity, represents a national cultural tradition that spread across the rest of Europe, and has found its fullest expression in the American Constitution. But it is not easy to grasp its meaning outside of this context. It refers to a set of attitudes and convictions rather than a doctrine whose contours are well defined. This can lead to complete misunderstandings: thus, liberal designates a progressive or social-democratic attitude in the United States, but in France the word signals an opposition to the welfare state. It seems perhaps more satisfactory to draw a distinction between the acceptance and the refusal of a certain modernity: "liberalism" would then designate an acceptance of market capitalism, of individualism, of permissive morals, and a refusal of nationalism and of the all-powerful state. Given the ideological and emotional charge of this language, we should perhaps content ourselves with

describing certain of its contemporary usages that translators need to be aware of, and between which they will have to choose. For the sake of convenience we will make a distinction between a liberal "philosophy"; the political positions that lay claim to this philosophy; economic liberalism; and finally, a rather vaguely defined social and cultural attitude particular to the Anglophone world and to northern Europe.

The word "liberal," identical in contemporary English and French, is derived from the Latin *liberalis*, which designates that which relates to a person who is free (in contrast to a slave), and his physical or moral qualities ("noble, gracious, honorable, beneficent, generous"), as exemplified by the "liberal arts": see especially ART, II, BILDUNG, CIVILTÀ, *CULTURE*. The entry ELEUTHERIA has a discussion of the different paradigms used to think and express liberty, including the one derived from the French *liberté* (as opposed to "freedom"), from the root **leudh* (to believe), which is a root common to the Greek *eleutheria* [ἐλευθερία], the Latin *liberi* (children), *liberty*, or *liberal*. On the network freedom-nobility-virtue, see BEAUTY, Box 1, VIRTÙ, Box 1; cf. *LIBERTY*.

Politically, the term "liberal," which originally referred to the virtue of liberality, has only come into usage fairly recently; what has been called liberal since the nineteenth century are those political movements that defend the legacy of the English and American revolutions, that is, limiting the powers of the state in the name of the rights of the individual. This limitation is by way of various institutional arrangements, such as representative government, and the separation of powers, and always presumes a clear distinction between the "state" and "civil society." Liberalism in this sense rejects any integral political control of the economy, but does not rule out a certain redistribution of income. The French term *libéral*, which does not refer to the same tradition, cannot, of course, be superimposed on the English term: see below, and WHIG; see also *CONSERVATIVE,* and cf. CIVIL SOCIETY, LAW, POLITICS.

I. The Origins of Liberalism

As a complex cultural and political reality, liberalism seems to have a certain consistency at an intellectual level. But the myth of liberalism's intellectual unity has been shattered, and we now talk instead of liberalisms. We can at least distinguish between two historical forms, the second of which is better known. The first liberalism was the "liberalism of diversity" (W. Galston, "Two Concepts of Liberalism"), a legacy of the Protestant Reformation and the War of Religions, which took the form, particularly in Locke, of an appeal for tolerance with respect to the diversity of religious beliefs. It was based on a fear of civil war, whence the expression "liberalism of fear" (J. Shklar, *Ordinary Vices*), rather than on the idea of tolerance as a positive ideal. The second liberalism, "the liberalism of autonomy," emerged out of the Enlightenment and out of Kant's work. He justified tolerance in terms of an appeal to universal reason, as a factor that could ultimately unify humankind. So it would be wrong simply to equate liberalism with the Enlightenment. Beyond these distinctions, however, we can identify several constant features within liberal philosophy as it was championed, in different ways, by Kant, Humboldt, Benjamin Constant, John

Stuart Mill, Tocqueville, and, more recently, Isaiah Berlin, Karl Popper, and John Rawls.

Its most characteristic feature is the priority of individual freedom. In opposition to the ancient ideal of direct or participatory democracy, as exemplified by the thought of Jean-Jacques Rousseau, liberalism would instead represent modernity, with the "freedom of the Moderns" or the protection of the private sphere of individuals against any abusive interference, and it would defend the sovereignty of the individual for reasons that were both epistemological and moral. The epistemic foundation of liberalism, inherited from Locke and then redefined by Mill and Kant, and later by Popper, can be located in the affirmation of an intrinsic relation between the values of truth and of individual freedom. The access to truth appeared to be essentially linked to the individual's freedom of judgment and of inquiry, and to the absence of barriers inhibiting dialogue and discovery. The origin of this idea is to be found in Greek philosophy, in the Socratic ideal of the free man, of which liberalism is the direct descendant (certainly in Mill, at any rate). Far from being a society like any other, the liberal world will claim to establish an essential link to truth and reason. Its moral basis lies in the conception, inherited from Kant, of the person and of his or her inalienable rights, a conception that leads an author like Rawls to place justice and rights at the heart of liberalism:

> Each member of society is thought have an inviolability founded on justice or, as some say, on natural right, which even the welfare of every one else cannot override. . . . Therefore, in a just society the basic liberties are taken for granted and the rights secured by justice are not subject to political bargaining or to the calculus of social interests.
>
> (*A Theory of Justice*)

This priority of freedom leads to the defense of the theory that the power of the state and of government should be limited through the existence of a "Bill of Rights"; by establishing "checks and balances," the best known of which is "judicial review"; by the separation of church and the state; and by the secularization of political power—even when there is an "established" religion in place, as in Great Britain.

■ See Box 1.

It is only in recent times that liberalism has moved closer to democratic ideals. Indeed, liberalism traditionally mistrusted democracies, and was suspicious of the "despotism" of majorities, a mistrust that was articulated eloquently by Tocqueville. Since popular and electoral forms of democracy had shown themselves to be powerless in the face of the rise of fascism and totalitarianism, they were rejected in the twentieth century by liberalism as carrying within them the seeds of tyranny and of antiliberalism, as conveyed by the debatable notion of "popular sovereignty." This gave rise to the conception of a liberal democracy, in which constitutionalism tempers the errant behavior of elected majorities. But the weak point of liberalism, in contrast to the Republican ideal, remains therefore its failure to leave room for political participation (the "liberty of the Ancients"). It can lead only to social atomism, since its individualism deprives it of any true doctrine of citizenship, or of political community.

1

Checks, balances, and institutional restraints in the Anglo-Saxon world

➤ *JUSTICE*

a. Checks and balances

To the classic doctrine of the simple separation of powers (Montesquieu), the British constitutional practice has, since the eighteenth century, added the idea of the balance and control of powers by each other. The term "check" (untranslatable into French) refers to the capacity of control and prevention leading to an equilibrium, or to "balances." In the American Constitution, this principle of checks and balances has given the president the power, among others, to block legislation and to nominate judges to the Supreme Court; the Senate can ratify treaties; and the House of Representatives can itself initiate the process of impeaching the president, etc.

b. Judicial review

"Judicial review" first appeared at the beginning of the nineteenth century, as a typically American constitutional conception, and it has come to be part of most contemporary democratic regimes. Whenever there is a conflict between the executive, legislative, and judiciary powers, or between the regions (or states) and the central (or federal) power, or even between the citizens and the state, there is a higher moral authority (the Supreme Court, the Constitutional Council, etc.), which has the power to decide and to judge whether laws (or actions of the state, etc.) comply or not with the Constitution.

c. Judicial activism / judicial restraint

This concerns a fundamental dilemma of any constitutional philosophy, which could be expressed as follows: when should one accept the verdict of an election, and when should one intervene and defend what one believes to be the "principles" of the Constitution? Divided between activism (for example, at the time of the New Deal, which judges had condemned as anticonstitutional) and the duty to restraint with respect to legitimately elected powers, or of laws voted in Congress, magistrates in constitutional courts cannot lay claim to objectivity, and consider themselves as simple interpreters of the Constitution and of the fundamental laws. It is in this sense that one should understand the question of the "power of judges."

II. Liberalism as a Political Reality: "Radicals," "Conservatives," and "Liberals"

It is important to note, at the outset, that the term "liberalism" has only a relational meaning, as a function of the existence or absence of other political or social movements, in particular long-standing worker movements, and communist or socialist parties, which were established in the nineteenth century. In the exemplary case of the United States, where the three political families (conservatism, liberalism, radicalism) are different from those in Europe, and can only really be defined through their relations to each other, liberalism clearly occupies more or less the ground of the political left as it is understood in Europe.

Conservatives or, more recently, neo-Conservatives, correspond roughly to the European right wing, but with nuances that have to do with particularities of American history. There is no place in the imaginative world of this history for the ancien régime: while religion, notably Protestantism, plays a central role, even though the Constitution has broken away from the idea on any established religion. So American conservatives very much favor security and tough penal politics ("law and order"); they distrust the welfare state, in the name of both individual property and individual responsibility; they are worried about the difficulties that the institution of the family is undergoing, or about the decline of churches, and some of them are even inclined to support the positions of the religious right on questions such as abortion, prayer in school, or the anti-Darwinian teaching of creationism.

Radicals, in contrast to liberals, would correspond to the European extreme left, but their lack of a Jacobin tradition, and especially of any Leninist ideology, means they are most often fervent democrats who are very attached to the "formal liberties" (to certain of these, at any rate) that most of the "leftist" tendencies of the Old World do not really value. There is, moreover, a specifically American genealogy of radicalism, which aims to revive the democratic elements of the national tradition by harking back to figures such as Thomas Paine (during the Revolutionary era), or even the abolitionist Garrison: on closer examination, it becomes apparent that this radicalism owes a great deal to the "liberal" and puritanical roots of American democracy—hence, the quite accurate characterization of the American Revolution, by the historian Gordon S. Wood (*The Radicalism of the American Revolution*), as a "radical" revolution. In this context, we could justifiably see "liberals" as representing a moderate left. The following are, or were, all liberals: supporters of Franklin D. Roosevelt's New Deal, lawyers who have defended the rights of women and of blacks, advocates of a security policy that is more preventive than punitive, or even all those who accepted the profound changes that have affected the American way of life since the 1960s.

It goes without saying that, as is also the case with the original French distinction between right and left, the relational nature of these definitions means that the respective positions of the "liberals," "conservatives," and "radicals" on any specific problem can vary. Thus, for example, a certain activism on the part of the Supreme Court justices, which came across as conservative during the time when it blocked reforms deemed to be progressive, belongs now, on the contrary, to the shared "liberal" culture of the present age, marked by the historic role played by Chief Justice Earl Warren and his immediate successors (the fight against racial segregation, making abortion a constitutional right, and so forth); and conversely, most conservatives today

would say they are in favor of a certain "judicial restraint" (see Box 1.c). The fact that liberalism is also a philosophical movement whose definition is itself an important matter of debate can complicate things even further, since politically conservative movements can be led to present themselves as liberal (see A. Bloom's foreword to L. Strauss, *Liberalism, Ancient and Modern*). Moreover, one could legitimately think that the respective positions are always essentially situated within a broader context, which remains that of liberalism in the wider sense, which is to say, a politics inscribed within the constitutional framework of a representative government.

The situation is obviously quite different in Europe, and particularly in France, where liberalism is historically the movement that has, one might say, *consciously* pursued the development of a "modern regime" based on the defense of individual freedoms and rights, while resisting the democratic excesses of the "tyranny of public opinion" and, above all, of socialism. Although it has its origins in England, it also had a number of very eminent representatives in France (Montesquieu, Constant, Tocqueville) and even in Germany (Wilhelm von Humboldt). Its golden age was in the nineteenth century, and it has appeared to be on the wane since then, with the progress of socialism, the establishment of worker and trade union traditions, and the rise of the post-war welfare state, all of which has led European liberalism to be more closely aligned with the conservative right. Margaret Thatcher's new right in Great Britain appropriated the term "liberal" and gave it a new meaning in order to wage war on both the welfare state and the paternalism of traditional conservatives. She thus introduced so-called liberal deregulatory and monetarist economic policies, which did not prevent her from reinforcing and centralizing the state in a way that was totally opposed to the liberal conception of politics. Liberals everywhere came to occupy a rather vague middle ground, along with the more moderate tendencies of the Christian Democrats (liberal parties can act as bridge parties, as in Germany—or be prevented from doing so because of the electoral system, as in Great Britain). Within a broader context, the situation in France is rather unique,

since liberals there have been led more and more to efface the individual from their preoccupations, and to come round ultimately to republicanism and statism (L. Jaume, *L'individu effacé*). If French "radicals" could no doubt place themselves somewhere between their American homonyms and "liberals," a further "leftism" (*sinistrisme*), to borrow René Rémond's expression, pushed them more toward the right with the development of socialist, and then communist, political parties.

It is clear in any case that, until quite recently, one had to be very cautious about transferring the American categories of "conservatism," "radicalism," and "liberalism" to discussions of French politics. Conservatism was weakened because many of its themes were taken over by the far-right party Action Française: the most liberal republicans, in the European sense of the term "liberal," certainly formed an important trend during the Third Republic, but they had no successors within subsequent political movements (only a few politicians aligned themselves with their politics).

III. Liberalism and the Market

Would it clarify matters, then, to link liberalism to a conception of society in which the market and "civil society," in Hegel's sense, would be the true agents of social organization, thereby making the role of the state secondary? This approach is tempting, since if we make the role of the state definitive, we end up with a split between individualist liberals and interventionist and centralizing antiliberals, on both the left and the right, which would perhaps correspond better to present-day transformations in French democracy and society. The market has, indeed, been conceived by some authors, the most famous of whom is Friedrich von Hayek, as a political principle that limits power, and thus as the source of a greater freedom of choice for individuals. But this conception has led to further confusions, and for this reason in English the term "libertarianism" is preferred to "liberalism."

■ See Box 2.

On the other hand, for social-democratic liberals, best represented by the philosopher John Rawls—but the economist

---

2

Libertarianism

Libertarianism represents the position that goes furthest in defending the minimal state, advocating a principle of nonintervention and of nonredistribution for the most disadvantaged, based on a theory of alternative justice—one of entitlements or freely acquired property rights (Nozick, *Anarchy, State, and Utopia*), without a principle of justice (for instance, a principle that would affirmatively mandate equality of opportunity, or that would establish the principle that certain needs are basic, and their fulfillment

equally so) that would act as a corrective of this initial distribution. A position such as this is inspired by the idea of the self-regulation of economic and social change, illustrated by the metaphor of the "invisible hand" of Adam Smith. It leans upon Vilfredo Pareto's principle of "optimality," that is, the existence of points of equilibrium in the market, and argues that the market by itself provides the criteria of justice: a distribution is optimal or just when there is one single individual whose position would be worsened

if distribution were modified to compensate for the situation of the most disadvantaged. Freedom of exchange is thus sufficient to ensure its justice, with any intervention of the state being unjust because it limits individual freedoms.

BIBLIOGRAPHY

Van Parius, Philippe, *Qu'est-ce qu'une société juste?* Paris: Seuil, 1991.

John Harsanyi would also be a good example—it should be possible to reconcile social justice and the respect for individual freedoms. The market cannot by itself be the source of a principle of justice or redistribution; in order to respect equal freedoms for all, such a principle needs to be the object of an agreement on the part of those who can hope to profit from it, as well as of those who would see their benefits diminish. Liberalism has no hesitation, then, in placing itself within the great tradition of the social contract in arguing that the principles of economic justice (Rawls' second principle) are just if they can be the object of unanimous consent (that is, of a contract), and can be shown to benefit the most disadvantaged. Far from being subject to the laws of the market, contemporary liberalism justifies its limits in the name of social justice:

> A social ideal in turn is connected with a conception of society, a vision of the way in which the aims and purposes of social cooperation are to be understood.

> (Rawls, *A Theory of Justice*)

What is common, however, to the different expressions of the vague concept of economic liberalism is, as Bernard Manin has clearly shown, the idea of an order that would not result from a central power, and that would even in a way come to take its place, in order to free individuals from oppression. If the market is well used, it would appear as a source of emancipation like other dimensions of civil society, whose field of action extends well beyond the satisfaction of economic needs.

■ See Box 3.

IV. A Liberal Culture?

The term "liberalism" ultimately describes a cultural tradition that emphasizes the autonomy of individuals, their spirit of enterprise, their capacity for self-government, without the need to refer to a central power, certainly at an economic level, but no less at a social level, in the tradition of eighteen-century civil society in the English sense. This liberal conception of civil society is not the same as the *bürgerliche Gesellschaft* execrated by Marx, but conforms more closely to the *zivile Gesellschaft*, that is, the "public forum" within which citizens of a democracy organize themselves, communicate, act together, cooperate, and develop their potential, without necessarily going through the structures of the state, or through a centralized bureaucracy. This is a culture for which the world of associations, far from being marginal, is at the heart of the full development of the individual, and of his or her peaceful relationships with others. This social dimension of liberalism is often overlooked by those who understand individual freedom solely in terms of its tension with an external authority, as the "freedom to say no." This misunderstanding corresponds to a religious division within Europe, and the question can be clarified if we consider liberalism in light of Protestant values, in the sense in which an individual, according to these values, is conceived of as morally responsible for his choices, and as having no other judge for his acts than his own conscience. Permissiveness and individualism in liberalism are inseparable from what one could appropriately call an interiorized "moral code based on principles," as opposed to a "moral code based on authority," whereby the law is always external, and overshadows the agent. Depending on whether one admires or detests this tradition, whether one condemns it as permissive and as the source of social fragmentation and anomie, or whether one thinks of it as providing new sources of happiness and fulfillment, the term "liberalism" will be used with pejorative or positive connotations, and it is set in opposition either to totalitarianism and state violence or to the republic and social democracy, or even to "libertarianism" and the dangers of the anarchic development of the postmodern individual, as the American or Canadian "communitarians" emphasize.

3
Communitarianism

➤ *COMMUNITY*, GENDER

An important critical movement in the United States and Canada has emerged to challenge classical liberalism: it is known as "communitarianism," a term one could translate into French, though awkwardly, by the neologism *communautarisme*. This movement aims not to defend traditional communities per se, but to recognize the modern individual's need for rootedness and identity. Just as the abstract and universalist philosophy of the Enlightenment was rejected by Hegel and by the political romanticism of Herder and Schleiermacher in the name of the value of traditions, community, *Gemeinschaft*, and a sense of history, so the contemporary communitarian critique of liberalism emphasizes the importance of individuals being rooted in communities, and of the concrete diversity of cultures, as well as of gender differences (feminist critiques).

LIBERTY

I. Domains and Models

1. The polysemy of the word "liberty" is a source of considerable difficulty. The adjective "free" (Fr. *libre*) covers a spectrum of nuances: it can be a synonym for "spontaneous," "unconstrained," "uninhibited" (so a body, for example, can be in "free fall"; see FORCE), and also for "independent," "autonomous," even "autarchic"; it can have the more technical sense of "indeterminate" or "indifferent," and so one might talk of a free choice that makes no difference either way, or of free will. One finds just as many nuances in most modern languages.

2. The question of liberty is a determining one for the constitution of subjectivity, and subsequently for psychology, even down to the word "subject" itself (in which one hears "subjection"); see SUBJECT and WILL, WILLKÜR; cf. CONSCIOUSNESS, DRIVE, ES, I/ME/MYSELF, UNCONSCIOUS.

3. For the moral dimension of liberty, see PRAXIS; cf. *DESTINY*, DUTY, MORALS, *OBLIGATION*.

4. The sense of "liberty" informs the political and social domains from the outset, beginning with the difference between free individual and slave: see in particular LIBERAL and BILDUNG, Box 1; see also CIVIL SOCIETY, HERRSCHAFT, LAW, POLIS, POLITICS, *POWER*, WORK.

Refer to ELEUTHERIA, I and Box 1 for the different clusters of meaning within the main linguistic networks: nature and growth; or culture and belonging to a group of friends; see also SVOBODA, one of the ways of saying "freedom" in Russian, which is formed from the Slavic possessive *svoj* [СВОЙ], analogous to *suus*.

II. From Greek to Latin

The main focus here, however, will be on two problems of translation from Greek to Latin, which allow for a better understanding of a certain number of particularities within the networks of modern languages.

A. From the Greek *eleutheria* to the Latin *libertas*

1. How does one get from the regulated development that characterizes the Platonic *eleutheria* [ἐλευθερία] to *libertas*, conceived of as the freedom of the will, when the very notion of "will" has no direct equivalent in Greek? Two entries respond to this question: ELEUTHERIA, which discusses the translation of Greek meanings of "freedom" in the Latin of the Church Fathers and of Scholasticism; and WILL, which reconstructs the medieval history of the formation of a terminological equivalent to the Greek *thelêsis* [θέλησις]: *voluntas* as the freedom to agree to or to reject the content of a judgment, or to act rationally for the general good. The secularization of this notion of will leads to the modern, Cartesian notion that "[t]here is no one who does not feel and does not experience will and freedom as one and the same thing, or rather that there is no difference between what is voluntary and what is free" (Descartes, *Meditationes de prima philosophia*, "Réponses aux troisièmes objections," in *Œuvres* [AT], 7:191.I.10–14).

2. On the changes that the vocabulary of the will undergoes in contemporary Anglo-Saxon philosophy, refer to WILL, Box 1; cf. CONSCIOUSNESS and SOUL.

B. The translation of *to autoexousion* by *liberum arbitrium*

1. The Latin *liberum arbitrium* (free will) replaced the Greek notion of authority over oneself with that of an indifferent choice between opposites, and thus locates the entire concept of liberty in this indifference of choice. In other words, the two determinations of "freedom," which, for us moderns, seem to be self-evident are as follows: a) the near synonymy of "free" and "voluntary," which means that any form of freedom is fundamentally determined as freedom of (the) will; b) the fact that the proper locus of freedom is to be found in election, that is, in a choice between opposites, such that freedom itself can be understood as freedom of the will (cf. Thomas Aquinas: "The proper act of free will is choice. For we may say that we have a free will because we can take one thing while refusing another. And this is to choose." *Summa theologica*, I, quarto 83, article 3, reply).

2. In this respect, the translation of the question of free will in turn leads to several decisive choices. In German, the term *Willkür* links from the start the matter of the freedom of the will to the autonomy of the will: The discussion of the Kantian problematic, which is inherited by our terminology, can be found in the entry WILLKÜR.

In Russian, the semantic play between the two words for "freedom"—*svoboda* [свобода] and *volja* [воля]—offers a different coupling of the relationship between the infinite nature of the will and the affective naturalness of motives,

while the term *postupok* [поступок] refers to a free act, insofar as it can take the form of a commitment: see POSTUPOK and SVOBODA.

➤ *ACT*, PEOPLE, RIGHT/JUST/GOOD

LIE

The French word for "to lie," *mentir* (derived from the Latin *mentiri*; the etymologies do not tell us much, including those related to Anglo-Saxon, English "lie," German *Lüge*), means to say something false with the intention of deceiving. Lies thus refer to the articulation of the true and the real, the logical and the ontological, but they involve an ethical register. One can find under TRUTH (in particular TRUTH, IV; see also, for the Russian, ISTINA and PRAVDA) a discussion of the antonyms of truth, one of which is the lie. The main dividing line falls between languages and traditions that fail to distinguish between error and lie (the Greek *pseudos* [ψεῦδος] might be from the root *bhes-, "to breathe," like *psuchê* [ψυχή], "the soul," or *phêmi* [φημί], "to say"), and do not reflect the Latin, then Christian, differentiation between the two.

I. Logic and Ontology

Refer to *FALSE* for the articulation between these two registers.

II. Ethics

Lying is a discursive act (see SPEECH ACT; cf. *ACT*) that makes a willful use of something false. The problem of intention, good or bad, is central: are there "good lies"? Is there a "right to lie"? See INTENTION, WILLKÜR. Lies are in this sense connected to a will that is judged from the outset as condemnable (see *GOOD/EVIL,* MORALS, *VALUE*), unlike aesthetic illusion (which is not): see *FICTION,* and cf. *APPEARANCE* (particularly DESENGAÑO, LEGGIADRIA, MIMÊSIS).

A "lie" brings into play the belief of the listener: see *FAITH,* GLAUBE; cf. CLAIM.

The devil is the "liar" par excellence: see DEVIL.

LIEU (FRENCH)

The Latin *locus*, which means not only "place, location, site" but also "rank, situation," translates the Greek *topos* [τόπος]. In French, the word for place, *lieu*, has come to be used in a range of technical senses, particularly medical ("sick region," "genitalia") and rhetorical (*lieu commun*, or commonplace).

1. In aesthetics, refer to IN SITU, which reappropriates an archeological term to mean the fundamental trait of a work of art conceived in terms of its site. On the ontological relationship between a work of art and its place, see in particular LIGHT, Box 2, and cf. *IL Y A*.
2. On the rhetorical *topos*, see COMMONPLACE; cf. ANALOGY, COMPARISON, *IMAGE,* MIMÊSIS, TROPE, and more broadly, *DISCOURSE,* LOGOS, SPEECH ACT.

3. On place in relation to space and physics, see FORCE, MOMENT, NATURE, *TIME, WORLD*.
4. On place conceived of as an originary place of one's own, see HEIMAT, *IL Y A,* OIKEIÔSIS, PROPERTY, and SEHNSUCHT, Box 1, cf. *MALAISE*; see also DASEIN, LEIB, WELTANSCHAUUNG (*WORLD, 5, 6*); cf. PEOPLE/RACE/NATION and PRINCIPLE.

➤ SEIN

LIFE / LEBEN

The French *vie* (life), deriving from the Latin *vita*, serves to designate existence, the type of life (a creature's ways of living and means of existence), the life story, biography, or model for living.

1. In the German ERLEBEN, as distinguished from *Leben*, one finds a reflection on how to separate out natural life—the Greek *zôê* [ζωή], see ANIMAL—from the reflective life that enables human experience and existence—the Greek *bios* [βίος], in the sense of mode or "species of life," and *aiôn* [αἰών], "the span of life." In addition, see AIÔN, DASEIN, ERLEBEN, *EXPERIENCE,* LEIB, cf. OLAM.
2. For the relation to death, as tied to human consciousness, see also CONSCIOUSNESS, *DESTINY, MALAISE.*
3. On the relationship between the mode of life and the means of existence, see BERUF, ECONOMY, ENTREPRENEUR, OIKONOMIA, *WISDOM.*
4. On the relation of "life" (*vie*) to narrative, to models, and to history, see HISTORY, *RÉCIT,* VIRTÙ; cf. SPECIES.

➤ GESCHLECHT, GOD, *HUMANITY*, PATHOS

LIGHT / ENLIGHTENMENT

DANISH	*lys*
DUTCH	*licht*
FRENCH	*lumière, Lumières*
GERMAN	*Licht*; Old High German, *lio(t)ht; Aufklärung*
GREEK	*leukos* [λευκός]*, phôs* [φῶς]
HEBREW	*haśĕkālâ* [הַשְׂכָּלָה]

LATIN	*lux, lumen*
RUSSIAN	*svet* [свет]
SPANISH	*luz, Luces/Ilustración*

➤ BILDUNG, DOXA, ERSCHEINUNG, *IDEA*, ITALIAN, MADNESS, MIR, *REASON*, SVET

The Indo-European vocabulary for "light" refers to what is brilliant or resplendent, based on the idea of a free, clear space in the open air as opposed to a wooded and enclosed space.

Closely related to sight, a bodily sense granted privilege in the Western tradition, "light" serves as a paradigm for knowledge and reason. The term's use to describe the European movement known as the Enlightenment derives from Novalis, who employed it having in mind the new status of light in modern physics.

I. The Indo-European Vocabulary of Light

The set of terms expressing "light" in the modern European languages comes from the Indo-European root *leuk-*, which gives us the Greek *leukos* [λευκός], "a luminous, brilliant white," and the Latin *lucere*, "to shine"; *lustrare*, "to illustrate"; and *luna*, "moon." The Indo-European vocabulary of light shows a remarkable proximity between the Greek, Romance, and Germanic families, even if the Greek only happens to be represented by *leukos* and its derivations (but see also Box 1).

■ See Box 1.

The adjective *leukos* [λευκός], like all those that in ancient Greek have to do with the vocabulary of color, refers less to whiteness itself than to its intensity, its brilliance. It describes marble, and "when the notion of brilliance is used it indeed seems to be related to *hêlios* [ἥλιος], [sun] [(*Iliad*, 14.185) and in the expression λευκὴ φωνή = λαμπρὰ φωνή [*leukê phônê = lampra phônê*], 'ringing voice' in Aristotle (*Topics*, 106a)" (RT: *Dictionnaire étymologique de la langue grecque*). We might compare this to *argos* [ἀργός] (from which the Latin *argentum* is derived), which is also used to describe the sheen of white (clay, the white of the eyes), expressed in this case as a rapid flash (lightning, horses, Ulysses's dog) and from which the Greek name "Argonauts" is formed (cf. RT: *Dictionnaire étymologique de la langue grecque*, s.v. *argos*).

In Latin, *lumen, -inis* (neut.; from *leuk-s-men* > *louksmen* > *lousmen* > *lumen*) differs from *lux, lucis* (fem.) in that it must have originally referred to a means of lighting, a "light," with the concrete sense that the suffix *-men* gave to the formation. *Lux*, write Ernout and Meillet (RT: *Dictionnaire étymologique de la langue latine*), is light "considered as an activity, an active and divine force, particularly as the 'light of day' . . . . [L]ux is a more general term than *lumen*, and their uses do not overlap."

Under *leukos*, Chantraine (RT: *Dictionnaire étymologique de la langue grecque*) makes a connection to the Latin *lucus*, originally a "clearing," literally *laûkas*, "field" (Old High German *loh*, "clearing"). Ernout and Meillet (RT: *Dictionnaire étymologique de la langue latine*) note under *lucus*, with reference to the *lux* group (cf. also the possible but contested etymology of the French word *lucerne*, "skylight"; RT: *Dictionnaire étymologique du français*), that "[t]his Indo-European word designated a free and clear space, as opposed to a wooded one—woods and covers being the main obstacles to man's activity." These connections between the bright space of a clearing and the clarity of light are not self-evident. The English "light" (Lat. *lux*) is more strictly distinguished from its homonym "light" (Lat. *levis*), which is related to the German *leicht*, *lichten*, *Lichtung*, than in Continental cognates. Heidegger's thought can help us to think of lightness as a condition of light.

■ See Box 2.

1

***Phôs, phainô, phêmi* (light, showing [oneself/itself], speaking): An ultra-phenomenological Greece**

➤ ERSCHEINUNG, *PHÉNOMÈNE*, PROPOSITION

Even though the term "phenomenology," as Heidegger remarks, does not appear historically until the eighteenth century (in Johann-Heinrich Lambert's *Neues Organon* of 1764), it belongs to the Greek epoch. *Phainomenon* [φαινόμενον], the middle participle of *phainô* [φαίνω], "what appears, by itself, from itself," and *logos*, "to say." In paragraph 7 of *Being and Time*, Heidegger recalls that *phainô* comes from *phôs* [φῶς], "light." But in truth, there is an even tighter etymological knot to be tied here. Chantraine (RT: *Dictionnaire étymologique de la langue grecque*) notes that *phainô* is formed from the Sanskrit root *bha*, which is semantically ambivalent, since it means both "to enlighten," "to shine" (*phainoi, phami*), and "to explain," "to speak" (*phêmi* [φημί], *fari* in Latin); in other words, "saying" and "shining" are already mutually interdependent; there is already a phenomenology in the phenomenon itself.

Finally, *phôs* [φώς], the same word as "light" aside from the accent (acute instead of perispomenon), also refers to a man, a hero, a mortal and was a common term in Homer's time. Its etymology is "obscure," Chantraine tells us (RT: *Dictionnaire étymologique de la langue grecque*). Yet, "if the dental inflection is secondary, there is a formal identity between the Greek nominative and the Sanskrit *bhas*, light, brilliance, majesty." "But," he adds, "from the semantic point of view, the connection is not so easy to make." Phenomenologically, it is, however, too good to be true: etymological evidence that joins together in the same dazzling term "light," "phenomena," and "man." Greek man is then the one who sees, as a mortal, the light (that of the day of his birth, of the return, of death), what appears in the light, phenomena, and the person who enlightens them by expressing them. The play on words between *allotrion phôs* [ἀλλότριον φῶς], now a perispomenon, from fragment 14 of the poem by Parmenides ("light from elsewhere," that is, the light that the moon has by borrowing it from the sun), and *allotrion phôs* [ἀλλότριον φώς], with an oxytone accent, "the man from elsewhere," "the stranger" of the Homeric poems (for example, *Iliad*, 5.214, or *Odyssey*, 16.102, 18. 219), and its fate in Empedocles (fr. 45; RT: DK), are sufficient to confirm that the etymology, whether Cratylean or not, was understood. The two words resonate within each other, as they do in Homer's *Parmenides*, the epic poem on cosmology and philosophy.

We have here the common matrix of perception in Greece, both classical and romantic, and the theme that interested Heidegger so keenly: truth—if it is a mutual interdependence of appearing and of saying in human *Dasein*, both openness and finitude—seems to be a copy of, and a meditation on, this etymology.

2

Lichtung, "clearing," "bright space," "lightness"

Contrary to appearances, the German *Lichtung* does not come from *Licht*, "light," but from *leicht* (cf. Eng. "light"), which is from the verb *lichten*, "to lighten," "clear," "free." So the *Lichtung* in question in section 28 of *Being and Time* ("To say that it is 'illuminated' [*erleuchtet*] means that as Being-in-the-world it is cleared [*gelichtet*] in itself") in no way places *Dasein* within a "photological" tradition, nor does it take up again the Platonic metaphor of light. Returning in 1965 to these questions, in the text that would appear in 1984 as *Zur Frage nach der Bestimmung der Sache des Denkens*, Heidegger states:

> The presence of what-is-present has as such no relation to light in the sense of brightness. But presence is referred to light [*das Lichte*] in the sense of the clearing [*Lichtung*].
>
> What this word gives us to think about may be made clear by an example, assuming that we consider it sufficiently. A forest clearing is what it is, not because of brightness and light, which can shine within it during the day. At night, too, the clearing remains. The clearing means: At this place, the forest is passable.
>
> The lightening [*Das Lichte*] in the sense of brightness and the lightening of the clearing [*Lichtung*] are different not only regarding the matter, but regarding the word as well. To lighten [*Lichten*] means: to render free, to free up [*freigeben*], to let

free. To lighten belongs to light [*leicht*]. To render something light [*Leichtmachen*], to lighten something means: to clear away obstacles to it, to bring it into the unobstructed, into the free [*ins Freie*]. To raise [*lichten*] the anchor says as much as: to free it from the encompassing ocean floor and lift it into the free of water and air.

Or again, in a seminar held jointly with Eugen Fink in 1966–67:

> Haben Lichtung und Licht überhaupt etwas miteinander zu tun? Offenbar nicht. . . . Die Lichtung dürfen wir nicht vom Licht her, sondern müssen sie aus dem Griechischen heraus verstehen. Licht und Feuer können erst ihren Ort finden in der Lichtung.
>
> (Do clearing and light have anything to do with one another? Evidently not. . . . We must not understand clearing from light, but we must understand it from the Greek. Light and fire can only find their place first in a clearing.)
>
> ("Seminar in Le Thor," *Gesamtausgabe*)

It is therefore a matter of going back from light to its nonvisual condition of possibility, which no longer has anything to do with the opposition of light and dark but precedes it as its a priori, as a "lightness of being" (as A. Schild's translation into French of Heidegger's expression in *Zur Frage nach der Bestimmung*

has it: "légèreté de l'être"). The French translation of *Lichtung* as *allégie* (F. Fédier's translation), unlike *Lichtung*'s translations into French as *clairière* (clearing) or *éclaircie* (bright space) or into Spanish as *claridad* and *claro*, frees the term from the register of light, in accordance with Heidegger's indications.

II. Light, Sight, and Idea

In the vocabulary of Western thought, light enjoys an equally privileged position as the one that sight occupies among the five senses, to the point where sight serves as a common denominator of the other senses, as Saint Augustine noted:

> Ad oculos enim videre proprie pertinet. Utimur autem hoc verbo etiam in ceteris sensibus, cum eos ad cognoscendum intendimus. Neque enim dicimus: audi quid rutilet, aut: olefac quam niteat, aut: gusta quam splendat, aut: palpa quam fulgeat: uideri enim dicuntur haec omnia. Dicimus autem non solum: uide quid luceat, quod soli oculi sentire possunt, sed etiam: uide quid sonet, uide quid oleat, uide quid sapiat, uide quam durum sit.

> (Vision belongs properly to the eyes. But we use this term even for the other senses when we apply them to knowing. Yes, we do not say: "Listen to how this shines," nor: "Feel how this glows," nor: "Taste how resplendent this is," nor "Touch how bright this is." It is "see" that we use, indeed, in all these cases. Not only do we say: "See how this shines"—and the eyes alone can perceive

this—but also: "See how this sounds, see how this feels, see how tasty this, see how hard it is.")

> (*Confessions*, 10.35, 54)

What is expressed here is the primacy of sight, illustrated and reinforced by a common means of expression; we might even say a "photological" tradition. The brightness of the sun, called *leukos* [λευκός] by Homer (see above), will become, in the famous allegory of the cave in Plato (*Symposium*, 7), the analog of light received from the Idea of the Good, as opposed to the darkness, which reigns in the cave.

The light of the sun will remain in Descartes's programmatic text the paradigm for knowledge:

> . . . cum scientiae omnes nihil aliud sint quam humana sapientia, quae semper une et eadem manet, quantumvis differentibus subjectis applicata, nec mejorem ab illis distinctionem mutuatur, quam Solis lumen a rerum, quas illustrat, varietate . . .

> (. . . just as all sciences are nothing other than human wisdom, which always remains one and identical to itself, however different the subjects to which it is applied

may be, and it receives no more diversity than the *light of the sun* from the variety of things its *illuminates . . .*)

(*Regulae ad directionem ingenii*, 1; my italics)

(On the sources of the "metaphor of a radiant sun to signify the universality of an omniscient understanding," cf. Jean-Luc Marion, in *Règles utiles et claires*: "Should we conclude that the 'solar' relationship of understanding to its truths is transposed, with Descartes, from the divine to the human?") It is not accidental that Descartes mentions the *naturali rationis lumen* (natural light of reason) at the end of the same Rule 1: a decisive shift occurs, in fact, from external light to the light of the human mind, as *lumen naturale = ratio*. This is the "light of reason" (Descartes), "the daylight of reason" (Boileau, *Art poétique*, 1.19), "the natural light of reason" (Leibniz, *Théodicée*, §120)—which is alone capable of lighting "someone who walks alone in the dark" (Descartes, *Discours de la méthode*). "Tremble in case the light of reason does not come," Voltaire will say in the following century (RT: *Dictionnaire philosophique*, "Abbé").

III. The *Aufklärung*/"Enlightenment"

A. The emergence of a *terminus technicus*

Combined with the advent of modern rationalism, the determination of reason as *lumen naturale* would lead to the characterization of the eighteenth century as the "age of Enlightenment" (Sp. *El siglo de las luces* and *Ilustración*; Ital. *Lumi/Illuminismo*; Fr. *Lumières*; but Ger. *Aufklärung*, from the adj. *klar*; Lat. *clarus*; Eng. *clear*). The expression *es klart auf* (*aufklaren*, with no vocalic alternation) is used first of all to describe the weather brightening up, the sky clearing, through a borrowing of the German from Dutch sailors (cf. RT: *Duden: Das Herkunftswörterbuch*). This was the origin of the transitive verb *aufklären*, in the sense of the English "to enlighten" (an *Aufklärer* is not only someone with an enlightened mind or a philosopher of the Enlightenment, but also someone who "lights the way" in the military sense of reconnaissance), and leads to the formation in the eighteenth century of the term *Aufklärung* as a philosophical concept, *terminus technicus*. In 1784, Moses Mendelssohn still felt the term was a neologism. This is how he puts it in his essay "Ueber di Frage: Was heißt aufklären?":

Die Worte *Aufklärung, Kultur, Bildung* sind in unsrer Sprache noch neue Ankömmlinge. Sie gehören vor der Hand bloß sur Büchersprache. Der gemeine Haufe versteht sie kaum. (3)

(The words "enlightenment," "culture," "education" are still newcomers to our language. At the present time they belong merely to the language of books. The common masses scarcely understand them.)

The term *Aufklärung*, however, still retains a close semantic, even lexical, relation to "light," as shown by the definition Wieland gives of it ("Sechs Fragen zur Aufklärung"):

Was ist *Aufklärung*?

Antwort: Das weiß jedermann, der vermittelst eines Paars sehender Augen erkennen gelernt hat, worin der

Unterschied zwischen Hell und Dunkel, Licht und Finsternis besteht.

(What is *Aufklärung*?

Answer: this is what everyone knows who, *having eyes to see*, has learned by using them to recognize the difference between the bright and the dim, between *light* and darkness.)

(my italics)

Or again, in this statement by Lichtenberg:

Man spricht viel von Aufklärung und wünscht mehr Licht. Mein Gott, was hilft aber alles Licht, wenn die Leute entweder keine Augen haben, oder die, die sie haben, vorsätzlich verschließen.

(One talks a lot about *Aufklärung*, and one wishes for more light, but my God, what is the use of all the light you can wish for, if people either have no eyes to see, or if they do, close them on purpose.)

(Lichtenberg, *Sudelbücher*, 1:201)

It is proper for the light of reason to cast itself everywhere and thus to reject prejudices and superstitions in respect of which the *Aufklärung* claims to be a liberation (Kant, *Was ist Aufklärung?* 1783). The light of enlightened reason against the darkness of obscurantism—indeed, in German, the counterconcept of *Aufklärung* is *Schwärmerei*, a tricky word designating excessive, sometimes infantile, perhaps misguided enthusiasm or adulation.

▪ See Box 3.

B. Critique of the Enlightenment and the reductive conception of light in modern physics

Novalis, who was the author of *Apologie der Schwärmerei* (1788) and who thus of his contemporaries set himself apart from the *Aufklärer*, made a highly original link between the French, then German, movement of the Enlightenment and the new status of light being defined by modern physics as a mathematical science of nature. He thereby anticipated the critiques that Merleau-Ponty, in his *Eye and Mind* (chap. 3), would subsequently direct at Descartes's *Dioptrics*:

Das Licht war wegen seines mathematischen Gehorsams und seiner Frechheit ihr Liebling geworden. Sie freuten sich, daß es sich eher zerbrechen ließ, als daß es mit Farben gespielt hätte, *und so benannten sie nach ihm ihr großes Geschäft, Aufklärung.*

(Light had become their favorite theme because of its obedience to mathematics, and because of its insolence. They rejoiced at seeing that it is refracted rather than being iridescent [playing with its colors], *and it is from this that they gave the name Aufklärung to their great affair.*)

("Die Christenheit oder Europa," 1799)

Descartes indeed stated in Discourse 1 of his *Dioptrics* (6:85, ll. 1–4) that "in the bodies we name colored, colors are nothing but the different ways in which these bodies receive it [light] and send it back to our eyes."

3

Haśĕkālâ [הַשְׂכָּלָה]

Haśĕkālâ, [הַשְׂכָּלָה] sometimes retranscribed as *Haskālā*, comes from *śekel* [שֶׂכֶל], "reason," "intellect," "discernment," "culture." Formed from a Hebrew root, this term is not strictly speaking a Hebrew translation of the German term *Aufklärung* nor of the English "Enlightenment," even if it refers to a movement closely associated with the Enlightenment. "Even though it is inspired by Enlightenment philosophy, its roots, its particular character, and its development, are entirely Jewish" (RT: *Dictionnaire du judaïsme*). The name "Age of Enlightenment" would in Hebrew be almost blasphemous, if only because of verses 3–5 of *bĕrēʾšīt* (Genesis), where it falls not to man but to God to say of (and to) the light (*ʾôr* [אוֹר] "light," "sun," "morning," "brightness") that it be—Septuagint: [Γ ενηθήτω φῶς]; the Vulgate: "Fiat lux"; Luther (RT: *Die Bibel nach der Übersetzung Martin Luthers*): "Es werde Licht"; RT: *The Bible: Authorized King James Version*: "Let there be light"; Le Maistre de Sacy: "Que la lumière soit faite." The term "Haskalah," which is foreign to biblical Hebrew, first appeared in Germany in the 1760s and referred to a social and cultural movement in Judaism in Central and Eastern Europe that grew from the middle of the eighteenth century through the nineteenth. It expressed a more open attitude among Jews regarding their values and the way of life of their non-Jewish neighbors; the desire to emerge from the ghetto; and the rejection of what we might today call a withdrawal into ethnic identity. In place of these, Haskalah favored an emancipation, even assimilation, that opposed both orthodox Judaism and Hasidism. Its emblematic figure was Moses Mendelssohn (1729–86), the author—notably—of a German translation of the Torah, yet one that was printed in Hebrew characters.

It was out of the Haskalah movement in Germany that a *Wissenschaft des Judentums*, or "science of Judaism," was born and was according to Steinschneider able to develop alongside an agnostic, even atheistic, position. Steinschneider, as Gershom Scholem asserts, "did not hide the fact that in his eyes the function of the science of Judaism consisted in burying the phenomenon with dignity." (Scholem had planned to write an article, which would in fact never appear, to be titled "Sebstmord des Judentums in der sogenannten Wissenschaft des Judentums" [The suicide of Judaism in what has been called the science of Judaism].) We should no doubt take into account, in this uncompromising judgment, Scholem's own position on what came to be known as the *Deutschjudentum*, a Judeo-German symbiosis, of which Hermann Cohen would become the most celebrated representative. How, though, was the sometimes frenzied anti-Judaism of the Enlightenment, sadly exemplified by Voltaire, compatible with a knowledge of Judaism and with a recognition of the status (social, political, and legal) of European Jews? This was one of the inherent tensions of the Haskalah—at the same time, it was a dissemination of Jewish culture, even if it was in a vernacular language other than Hebrew or Yiddish, and the sowing of the seeds of an ideology that would come to deny it, embalming it if necessary and placing it outside the realm of the properly scientific. How could a "religion of reason," or a "religion considered within the limits of pure reason" (Kant), acknowledge the attested Revelation of Judaism, which we commonly refer to as Judeo-Christian? Cohen would attempt heroically to overcome this contradiction in his *Religion der Vernunft aus den Quellen des Judentums* (*Religion of Reason: Out of the Sources of Judaism*).

Elsewhere (in a letter to Mersenne from December 1638, *Correspondance*, 2:469, ll. 1–2), Descartes would define light as a propulsion (*poussement*): "it is only this propulsion in a straight line which is called *Light*." So Novalis constructed a genealogy of the project of the *Aufklärung*, the Enlightenment, as well as of the name claimed for it, with reference to the history of the sciences, that is, by connecting this project to the new way in which modern physics was approaching the phenomenon of light. In French, the Enlightenment (*Les Lumières*) was also sometimes called *la lumière* (RT: *Dictionnaire de la langue française*, s.v. "*lumière*," meaning 13), as is attested by this statement from Voltaire (letter to Gallitzin, 14 August 1767, *Correspondance*), which is a counter-illustration to the genealogy proposed by Novalis: "It pleases me to see that an immense republic of cultivated minds is being formed in Europe: *light is communicating from all sides* [*la lumière se communique de tous côtés*]" (my italics).

So in the eyes of Novalis, it was on the basis of a simplistic (and reductive) conception of light, an optical narrowing particular to modern physics, that the word and the idea of the Enlightenment were able to germinate and flourish. Going against the grain of the very project of modern science as a mathematical science of nature, Novalis remained here a witness to a Platonic, even Neoplatonic, or Plotinian understanding of light. He was not alone: Goethe exclaims, in a reply to Schopenhauer, "What are you saying! Light only exists when you see it? No! It is rather you who would not be there if light itself didn't see you" (*Gespräche*, 2:245).

Indeed, according to Plotinus, "What the soul must see is the light by which it is illuminated. For neither is the sun seen in another's light. How is this achieved? Take everything away" (*Ennead*, 5.3, 17, 28). "What we must see is what enables us to see; it is light which is the source of our gaze" (Hadot, *Plotin*), and not only its object. This is what is "solar" (*sonnenhaft*) about the eye, as Goethe will say at the beginning of a celebrated quatrain:

Wäre nicht das Auge sonnenhaft,
Wie könnten wir das Licht erblicken?

(If the eye were not sun-like,
How could we perceive light?)

(*Zur Farbenlehre*; translation modified)

One of the other repercussions of this shift from external, solar light to the "enlightenment" of the human mind would be a singular reevaluation of the light that is not produced by

the human mind, or by reason: Swedenborg, Saint-Martin, and the *illuminism* movement would still use light as a frame of reference but in a completely different way.

LOGOS [λόγος] (GREEK)

ENGLISH	discourse, language, speech, rationality, reason, reasoning, intelligence, foundation, principle, proportion, count, account, recount, thesis, tell, tale, tally, argument, explanation, statement, proposition, phrase, definition
FRENCH	*discours, langage, langue, parole, rationalité, raison, intelligence, fondement, principe, motif, proportion, calcul, rapport, relation, récit, thèse, raisonnement, argument, explication, énoncé, proposition, phrase, définition, compte/conte*
GERMAN	*Zahl, Erzählung*, cf. *legen/liegen/lesen*
HEBREW	*dāvār* [דָּבָר]
LATIN	*ratio/oratio, verbum*

➤ *DISCOURSE*, *REASON* and GREEK, HOMONYM, LANGUAGE, MADNESS, PREDICATION, PROPOSITION, RES, SENSE, SIGNIFIER/SIGNIFIED, SPEECH ACT, WORD

The Greek word *logos* [λόγος] has such a wide range of meanings and so many different usages that it is difficult to see it from the perspective of another language except as multivocal, and in any case it is impossible to translate it except by using a multiplicity of distinct words. This polysemy, sometimes analyzed as homonymy by grammarians, has usually been considered by modern commentators as a characteristic of Greek language and thought that relates, before all of the technical meanings, to the primordial meaning of the verb *legein* [λέγειν]: "to assemble," "to gather," "to choose." What is untranslatable here, paradigmatically, is the unity beneath the idea of "gathering together," a series of concepts and operations—mathematical, rational, discursive, linguistic—that, starting with Latin, are expressed by words that bear no relationship to one another.

One authoritative way of indicating this lost unity is to see it as inscribed within a play on words that incorporates this relationship etymologically, or even simply at the level of signifiers, as in the Latin *ratio/oratio* (the first comes from *reor*, which, like one part of *legein*, means "to count" then "to think"; the second, which according to a popular etymology is derived from *os*, *oris*, the "mouth," complements the first with the meaning of "speech"). In French the play is on *compte/conte*, which are both derived from *computare* but were certainly not distinguished from one another until the seventeenth century; in English there is an analogous play on "count"/"account"/"recount" and also on "tell"/"tale"/"tally"; in German, on *Zahl/Erzählung* and also on *legen/liegen/lesen*.

The other way one could proceed, which is not an alternative, is to import the word into one's own language: this culminates in the Heideggerian usage, which bears witness to philosophy's debt to Greek. Finally, to get the full measure of the polysemy of *logos* in the course of the word's history, we have to trace the connection between the first branching into *ratio/oratio* (or "reason"/"speech") and the *Logos* in John's Gospel, translated as *Verbum*, which refers back to the Hebrew *dāvār* [דָּבָר], and which means both the word and the thing, in this case, Christ as the word made man.

I. The History of the Language and Lexicography

The multiplicity of meanings of *logos* [λόγος] poses for the language historian the question of knowing whether we are dealing with a phenomenon of polysemy properly speaking

(the proliferation of meanings that begins with a single etymological root) or of homonymy (a formal convergence that is produced from several homophonic etymological roots). As always in such cases, the question generates different answers depending on whether one looks at it from a synchronic perspective (how did the language users experience things?) or a diachronic perspective (what do we learn from an etymological investigation?).

■ See Box 1.

The unanimous view of modern etymologists is that what can appear from a synchronic point of view as a more or less accidental semantic convergence between homophonic roots (homonymy) must on the contrary be described as the effect of a diachronic differentiation in the original meaning of a single root λε/ογ-, thus as a phenomenon of polysemy. Where *logos* is concerned, a philological analysis of the occurrences in ancient Greek of the terms, both noun and verb forms, that are based on this root and comparison with the Latin leads us indeed to think that the fundamental sense of λε/ογ- is that of "collecting," "gathering," and "assembling" and that the use of the Greek verb *legô* [λέγω]—Latin, *lego*—in specific contexts is, for each of the languages, the source of differentiations that a priori are unforeseeable but that are in fact very real.

In Latin, it seems plausible that a syntagma like *legere oculis* (to take in with a glance) as applied to the graphic signs of a text or the names of a list gives us the origin of the meaning of "to read," which *lego* acquired in this language

---

1

Compound words and derivations: One or two roots?

In addition to the word λόγος itself, ancient Greek has more than two hundred compound nouns with -λογος/-λόγος as the second element. The sheer number, as well as the open-ended proliferation of this lexical group, suggest that the group itself is a good, if indirect, way of approaching an analysis of the term.

From a semantic point of view, this set of terms can easily be divided into two groups:

– In the first, -λογος refers to the notions of "gathering together," so we have σύλλογος: "gathering," "meeting," assembly"; and λιθολόγος: "stonemason" (who puts stones together).
– In the second, -λογος refers to the notion of "word," "speech," so we have διάλογος: "conversation," "dialogue"; and μυθολόγος: "storyteller."

In both cases, -λογος is clearly related to the verbal root λεγ-, which is able to convey the two meanings identified in the compound nouns: so σύλλογος} is related to συλλέγειν, "to gather," and διάλογος is related to διαλέγεσθαι, "to have a dialogue." Faced with this lexical range, a speaker of Greek might feel that his language had two homophonic roots of the form λε/ογ-, one meaning "to gather"—hereafter referred to as λε/ογ-1; and the other, "to speak," "to say"—hereafter referred to as λε/ογ-2.

Morphologically, the compound words with the ending -λογος can be separated, according to the general rules of Greek, into two conceptual categories:

a. those ending in -λογος, in which the unaccented λ can be interpreted as an *action noun*, for example, διάλογος, "conversation," "dialogue" (λε/ογ -2); σύλλογος, "act of putting together," "the result of

this act" (λε/ογ-1); φιλόλογος, this word having a "possessive" sense: "someone who cherishes the λ," "a lover of literature, a philologist" (λε/ογ-2); and
b. those ending in -λόγος, in which the accented λ can be interpreted as an *agent noun*, with the compound X-λόγος meaning "(someone) who λέγει X"; for example, μυθολόγος, "(someone) who tells stories" (λε/ογ-2); and λιθολόγος, "(someone) who puts stones together" (λε/ογ-1).

So it is the accent that allows us to determine that the "philologist" is a lover of language rather than someone who talks about love.

As we can see, the two types (a) and (b) allow for the two meanings identified of the root λε/ογ-. Moreover, all of those compound terms that are used to designate an agent—all of group (b) in theory, and several of the representatives of group (a)—in turn quite naturally provide the basis of a verb derivation ending in -εῖν (-εῖσθαι) and of an abstract noun derivation ending in -ία, designating the activity of the agent; for example:

– φιλόλογος → φιλολογεῖν, "to devote oneself to the study of literature" and φιλολογία, "the study of literature, philology"
– μυθολόγος → μυθολογεῖν, "to tell stories" and μυθολογία, "(*the act of telling stories)", whence "imaginary story"
– λιθολόγος → λιθολογεῖν, "to build by putting stones together" and λιθολογία, "the activity of a stone-mason"

The uniformity of the derivations produced in this series, which culminates in a

relatively technical vocabulary often designating activities relating to professions of one kind or another, undoubtedly helps to give a semantic unity to this range of terms containing the root λε/ογ- and in which the initial opposition we envisaged between λε/ογ-1 and λε/ογ-2 is blurred. Alongside the series of terms—such as, on the one hand, κακολόγος (a malicious gossip [person]), κακολογεῖν (to speak ill of someone), κακολογία (malicious gossip [noun]) and ἀντίλογος (someone who contradicts), ἀντιλογεῖν (to contradict), ἀντιλογία (contradiction) (λε/ογ-2); and on the other hand, ποιολόγος (a haymaker), ποιολογεῖν (to make hay), ποιολογία (haymaking), βοτανηλόγος (a botanist), βοτανηλογεῖν (to collect plants), βοτανηλογία (plant collecting) (λε/ογ-1)—where the two semantic fields are quite distinct, it is likely that for the linguistic sensibility of Greek speakers of different periods, the semantic values associated with -λογεῖν/-λογία fluctuated more or less whenever the designated activity linked the notion of "collecting," "assembling," "recording" (λε/ογ-1) with the notion of "a discourse on . . . ," a theory of . . . " (λε/ογ-2). This was manifestly, and tendentiously, the case for "scientific" activities, in which a learned person with specialist knowledge would give a more or less theorized *discourse* on the objects or facts he had *collected*. Could we not say that the occupation of ἀστρολόγος, someone who tells us about the stars, is also to record them for us? Or that the ἐτυμολόγος, who shows us through a kind of second-level discourse the ways in which words "say the truth," is not also a collector of *etymons*, and potentially, a compiler of ἐτυμολογικά (lists of etymologies)? And that the γενεαλόγος has to record previous generations before telling me my own ancestry?

without, however, losing its original meaning. This polysemy was retained all the way through to the Romance languages, in which—to give the example of French—*lire* (read), *relire* (reread), *élire* (elect), *dialecte* (dialect), and *collecte* (collect) sit happily alongside one another. In Greek, the Homeric uses of *legô*—*ostea legômen* [ὀστέα λέγωμεν], "let us gather up the bones" (*Iliad*, 23.239); *duôdeka lexato kourous* [δυώδεκα λέξατο κούρους], "he chose/assembled/counted twelve young men" (*Iliad*, 21.27); *leg' oneidea* [λέγ' ὀνείδεα], "reeled off / uttered curses" (*Iliad*, 2.222); and *su de moi lege theskela erga* [σὺ δέ μοι λέγε θέσκελα ἔργα], "gather together for me/enumerate for me / recount to me / tell me your marvelous exploits" (*Odyssey*, 11.374)—allows us to see clearly how the already frequent use of this verb in Homer (meaning "to assemble") and complemented by terms referring to linguistic entities (curses) or lending themselves to linguistic form ("accomplished exploits" → "things recounted") could have led to its more specific designation as a spoken *word*: "gather together" → "put into a row" → "count (out)" / "enumerate" → "(re)count" → "say." The compound Homeric verb *katalegein* [καταλέγειν] (and later on its nominal derivations *katalogos* [κατάλογος], then *katalogê* [καταλογή], "record," "register," "list," "catalogue") illustrates particularly well the flexibility and the contextual conditions in which the initial semantic value of the root λε/ογ- is modulated. An epic expression such as ἀλλ' ἄγε μοι τόδε εἰπὲ καὶ ἀτρεκέως κατάλεξον, "come now, tell me this, record / enumerate / recount calmly" (*Iliad*, 24.380 and 656; *Odyssey*, 1.169, etc.) is certainly a precious example of these "linguistic" contexts that, beginning with the prehistory of the Homeric text, have oriented the semantic evolution of the root λε/ογ.

These historical data, now well established, enable us to consider from a more accurate perspective the somewhat flexible and ultimately uncertain polysemy manifest in the Greek words belonging to the semantic family of *logos.* One point is worth emphasizing. The Greek *logos* retains, from the basic meaning "to gather" of the root λε/ογ- and as an almost indelible connotation, the semantic feature of being syntagmatic. Of all the well-known semantic variations of *logos*—"conversation," "speech," "tale," "discourse," "proverb," "language," "counting," "proportion," "consideration," "explanation," "reasoning," "reason," "proposition," "sentence" (see Box 3)—there is barely a single one that does not contain the original sense of "putting together": the constitution or consideration of a series, of a notionally complex set. As "counting" or "proportion," *logos* is never an isolated "number"; as "tale," "discourse," "proverb," "proposition," or "sentence," it is never (or only ever marginally) a "word," and so on. One only has to consider the relative semantic poverty of another root related to "saying," *Ϝεπ- (cf. *epos* [ἔπος], *eipein* [εἰπεῖν]), which is closely related to λεγ- in the auxiliary inflection of the verb *legô*, to understand how much the extraordinary richness of λε/ογ- owes to this "syntagmatic" dimension of its semantic field. Even if, as we know, etymology does not control indefinitely and absolutely the meaning that words can take on in the course of their history, it is important to keep in mind that the Greek *logos* is connected to a polysemic etymon in which the sememes "to gather" and "to say" are closely related. This has to be the starting point of any reflection on the history of *logos* as a philosophical term.

■ See Box 2.

2

How do dictionaries translate *logos*?

Dictionaries, whether etymological or not, distinguish between two verbs: *legô* and **legô, étendre* (RT: Bailly, *Dictionnaire grec français*), "lay" (RT: LSJ) [by contrast, see Box 6]. The LSJ then gives for the first a single entry, divided into three main meanings: 1. "pick up," 2. "count, tell," and 3. (with the future and aorist 2) "say, speak."

The Bailly dictionary, basing its definitions on the distribution of usual moods and tenses, lemmatizes two verbs formed from the same root **leg-*, *rassembler* (to gather): the first means 1. "to gather," 2. "to pick," from which we get "to collect," "to sort out," "to count," and only later, "to enumerate," "to say one after the other"; the second straightaway means: 1. "to say," in the sense of "to speak," "to declare," "to announce," 2. "to say something," "to speak reasonably," 3. "to designate," and 4. "to signify"—before giving a number of more technical meanings ("to praise," "to recite," "to read out loud," "to organize," "to speak like an orator," "to move

a vote," etc., until 11. "to have someone say"). This series of dissonant meanings, entirely motivated by English dictionaries' desire for simplicity, is a symptom of the modern difficulty of discursively binding together a rational trajectory with a wide range of verbal statements. In French, the adjective *discursif* denotes both a rigorously ordered series, as well as a digression (RT: *Le nouveau petit Robert*), while *discursivité* is only first attested in 1966 in Michel Foucault's *Les mots et les choses* (RT: *DHLF*, vol. 1).

As for the noun *logos*, Bailly makes a distinction between two broad semantic fields, which become increasingly complex: A. *parole* (speech); B. *raison* (reason). The RT: LSJ, on the other hand, juxtaposes a series of entries: 1. "computation, reckoning"; 2. "relation, correspondence, proportion"; 3. "explanation"; 4. "inward debate of the soul"; 5. "continuous statement, narrative"; 6. "verbal expression or utterance"; 7. "a particular utterance, saying"; 8. "thing spoken of, subject matter." It is

noticeable that there is a transition from the mathematical (1–2), to the rational (recounting to the other and to oneself, 3–4), and then the linguistic (statement, utterance, or reference). In one case we start with speech and arrive, via reason, with its capacity to judge and evaluate, at the mathematical sense of "relation, proportion, analogy" (B.III.4 of Bailly, 4th and final sense in RT: Bonitz, *Index aristotelicus*); in the other, it is the mathematical that provides the starting point (RT: LSJ). The essential dissonance could thus be expressed as a double question: as the history of the language suggests (see above), was the mathematical sense primary, with relationality and proportionality serving as a paradigm, even a matrix, of a syntagmatic structure in general, in a line that ran from Pythagoras to Plato and then Neoplatonism? Or rather, from a structural perspective that is no doubt more Aristotelian (Bailly, Bonitz), is mathematical technique simply one application of the human *logos*?

II. The Polysemy of *Logos* Thematized and Used by the Greeks Themselves

The history of Greek philosophy can be described as a series of reinterpretations of the meaning of *logos* against a background of a still-active polysemy. What we find is a shift from one doctrine or systematics to another through a strategy of refocusing. From the pre-Socratics and the Sophists to Plato, from Plato to Aristotle, from Aristotle to the Stoics, and so on, the polysemy of *logos* is reorganized each time around a different matrix of meaning. We offer here merely a few examples.

A. From the power of speech (*logos*) to the correctness of the statement (*logos*)

From the Sophists to Plato, the sense of "speech" is very clearly devalued in favor of that of "rational statement." In his *Gorgias*, subtitled *On Rhetoric*, Plato shifts *logos* away from the field of discursiveness, which he assigns to rhetoric, and toward that of the rationality and correctness of statements, which he reserves for philosophy.

The Sophist Gorgias, in the *Encomium of Helen*, a famous speech that had the effect of absolving her before the whole of Athens of any blame for the Trojan war, defined *logos* as "a great sovereign [*dunastês megas* (δυνάστης μέγας)] who, with the smallest and most inapparent of bodies, accomplished the most divine acts [*theiotata erga apotelei* (θειότατα ἔργα ἀποτελεῖ)]" (82B11 DK, §8). The power of *logos*-as-speech (*discours*), which is greater than that of force, is thus linked to its performative effectiveness. More than simply saying what is, in accordance with the movement of revealing and of representational adequacy proper to ontology, *logos*-as-speech enacts what it says, and in particular produces the *polis* (see POLIS), the city, as a continuous discursive exchange and creation of consensus, which characterizes that political animal endowed with *logos* that is man (see *epideixis* in SPEECH ACT, I).

Socrates, in dialogue with Gorgias, begins with an apparently banal definition of rhetoric as the "art of speaking" (*technê peri logous* [τέχνη περὶ λόγους]; 450c). However, when he examines rhetoric more closely, he refuses to call it an art, describing it instead as *alogon pragma* [ἄλογον πρᾶγμα] (465a), an expression that we are compelled to translate, following Alfred Croiset (in his 1974 translation into French of *Gorgias* and *Meno*), as a practice or a thing "devoid of reason": that *logoi*-as-speech can redeem or recall the *alogon*-as-irrational is the mark of the Platonic operation that devalues and excludes from philosophy one meaning of *logos* in favor of another. Within this shift from one sense of *logos* to another a war is waged between philosophy and rhetoric, which constitutes one of the key points of access to the Greek world: "The most immoderate presumption of being able to do anything, as rhetors and stylists, runs through all antiquity in a way that is incomprehensible to us" (Nietzsche, "The History of Greek Eloquence").

The Platonic dialectic then reinvests each of the accepted senses of *logos* with new meaning. As the art of asking the right questions and giving the right answers to them, it is also the art of defending a thesis (*logos*), in which the musical sense of setting the tone, of finding the key or the dominant, is still resonant: it is the art of "reasoning" and "accounting for" (*logon didonai* [λόγον δόδιναι]); *logos*, or discourse as argumentation, is opposed to *muthos* [μῦθος], or discourse as narration. The ploysemy of *logos* is thus placed under the yoke of correct or rigorous statement (*orthos logos* [ὀρθὸς λόγος]), or of reasoning, as the very medium of philosophy: "[W]hen we ask men questions, and if we ask questions in the right way, these questions say by themselves everything as it is. Now if knowledge and correct reasoning [*orthos logos*] were not present within them, they would not be able to do this" (*Phaedo*, 73a8). This is the turn that Socrates thematizes in *Phaedo* (99e), when he declares himself tired of the materialist examination of existing things and maintains that one has to "take refuge in reasoning [*eis tous logous* (εἰς τοὺς λόγους)] and, within this reasoning, examine the truth of beings" (M. Dixsaut's French translation is "*raisonnement*," which she describes as a *cache-misère* [respectable outer garment, or better: a fig-leaf; *Platon: Phédon*], but this is nevertheless preferable to "proposition" [Hackforth, *Plato's Phaedo*]; *idées* [ideas] or *notions* [notions; Robin, Plato's *Œvres Complètes*], or "definitions" [Bluck, *Plato's Phaedo*]).

Logos, as a rational statement, entails analysis: "grammatical" analysis before it was invented—inseparable from dialectical activity with respect to forms and the five basic genres—is linked in the *Sophist* to the logical analysis of truth. *Logos* is the "first combination" (*hê protê sumplokê* [ἡ πρώτη συμπλοκή]; *Sophist*, 262c 5–6) made up of a noun and a verb and could be either true or false (263b): the meaning of *logos* as "statement" was therefore set at exactly the same time as the meaning of *onoma* as "name" (until then, *onoma* had meant, rather, a "word") and the meaning of *rhèma* [ῠῆμα] as "verb." Understood in this way, *logos* is perhaps the best way of designating definition itself: for the word or name "circle" (*onoma* [ὄνομα]), there is a corresponding *logos* made up of nouns and verbs: "something whose extremities are all at a perfectly equal distance from the center" (*ex onomatôn kai rhêmaton* [ἐξ ὀνομάτων καὶ ῥημάτων]; Letter 7, 342c).

B. The network of meanings of *logos* in Aristotle

In the philosophical "dictionary" that Aristotle proposes in Book Δ of his *Metaphysics*, there is no entry entitled *logos* that records and clarifies the uses of this word. Yet the word is caught within a multiplicity of networks that, even if they are primarily anchored in different places of his work, are used (without being thematized) within one and the same treatise. This is particularly true of *De anima*, and in analyzing these networks, we gain a better understanding of the extreme difficulty of a classic work such as this. Any interpretation of Aristotle is always faced with the the choice of two approaches to the networks in which a work's key terms are embedded: either exploring the differences and revealing the gaps and conceptual shifts by using a multiplicity of heterogeneous translations (so Hamlyn, for example, states in the preface to his edition of *De anima*: "to prevent misunderstanding I have flagged all occurrences of the word by providing the translations with the subscript '_L'") or attempting to "make . . . available the source which motivates the different ways of meaning" (Heidegger, *Phänomenologische interpretationen*) by reinventing the scope of the Greek language within the target language.

A first network (*De anima*, 1 and 2), thematized in Book Z of the *Metaphysics*, links *logos* to *eidos* [εἶδος] ("form" as opposed

to "matter"), to *to ti ên einai* [τὸ τί ἦν εἶναι] (quiddity, quintessence), and to *entelecheia* [ἐντελέχεια] ("act" as opposed to "power"), as well as to *horos* [ὅρος] (definition). So the soul is the *logos* of the body, as (for instance) ax-ness is the *logos* of the ax—and we should add that it is the *logos* of the soul to be *logos* of the body (see 412b 11–16). *Logos*, designating what gives form to a thing, thereby constitutes its definition: it is simultaneously "essence," "finality," "raison d'etre," "definition," and "account" (as the swarm of translations at 412b 10 testifies: "this is what the soul is," that is, *ousia . . . hê kata ton logon* [οὐσία . . . ἡ κατὰ τὸν λόγον]: "a substance . . . in the sense of form" [Barbotin]; "substance, that corresponding to the principle L" [*De anima*]; "substance as that which corresponds to the account of a thing" [Durrant]; "the substance which corresponds to reason" [Bodéüs]; "the essence insofar as it is expressed" [cf. Heidegger, *Questions II*]). Being par excellence and the expressible par excellence, physics and metaphysics, are thus onto-logically bound together and open the *Metaphysics* out onto the *Organon*.

A second network connects *logos*, "voice," "discursiveness," and "rationality" (*De anima*, 2.8 and 3.3) in several statements that make *logos* something proper to man. This network remits to two kinds of analysis: one is based in anatomy and physiology and specifies the type of linguistic articulation proper to the human *logos* (*The History of Animals*, 9.535a, 28–30, for example); the other, via the elaboration of expressiveness as articulated in the *Peri hermeneias* (4.16b 26: *logos . . . esti phônê sêmantikê* [λόγος . . . ἐστι φωνὴ σημαντική], "a vocal sound that has a conventional meaning") relates, by virtue of their connections to the right and the good and to living well, man conceived as an "animal endowed with *logos*" and man conceived as a "political animal" (*Politics*, 1.1.1253a 7–15). With the *phantasia logistikê* [φαντασία λογιστική] ("representation"—though not *aisthêtike* [αἰσθητική], "representation with the senses," as is the case with animals—but "rational" [Barbotin, among others], "calculating" [Bodéüs], or better still, "discursive," *De anima*, 3.10.433b 29–30), which conjoins imagination and persuasion, *De anima* brings together under the term *logos* domains that we would separate under the headings of, on the one hand, anatomy and physiology, and on the other, politics and ethics, but also rhetoric and poetics.

The third, more specific, network in the *De anima* defines "sensation" as a *logos*, in the mathematical sense of "relation," "proportion," a *ratio*: sensation (*aisethêsis* [αἴσθησις]), the name for the actual coincidence between a sensory organ (*aisthêtêrion* [αἰσθητήριον]) and an object sensed (*aisthêton* [αἰσθητόν]), is nothing other than the calculation of an average between contrasting qualities—for example, white/black to make gray. This is why "an excess of objects sensed destroys the sensory organs: for if the movement is too strong for the organ, the *logos* [the relation] is broken, and this is sensation" (*De anima*, 2.12.424a 30–31; cf. 3.2.426a 27–b 8). But the fact that *logos* is frequently translated as "form" (Barbotin) or "reason" (Bodéüs) does not facilitate this understanding, or our understanding generally.

The fourth network involves a semantic field that is barely distinct from the second network: at most it gives *logos*, when joined to *phasis* [φάσις] and *apophasis* [ἀπόφασις] ("affirmation" and "negation"), the specific meaning of "statement."

But what is new has to do with the subject capable of *legein*, of making statements: not man, but *aisthêsis* itself, including that of the *aloga*, or "beasts," *legei*. Sensation states what it senses by itself; sight says what it sees (white), but still it does not speak, it does not produce *logos*, that is, a grammatical statement, a predicative sentence ("Socrates is white"). So the perplexity remains as to which part of the soul it is that senses, and "one could not easily class it as *alogon*, nor as *logon echon* [λόγον ἔχον]" (*De anima*, 3.9.432a 15–17).

This survey of the meanings of *logos* makes their disjunction, as well as their systematization, apparent: so a gap remains between the mathematical *logos*, which calculates sensation, and the *logos* proper to man, who makes statements, constructs arguments, and unites and persuades citizens. It is as if the Greek language contributed to confusing, and thus to foreclosing, a certain number of questions that Aristotle, "compelled by truth," nevertheless persisted in asking.

C. *Logos* and Stoic systematics

The Stoics, unlike Aristotle, turned the polysemy of *logos* into a principle of their systematics. For them, *logos* thematically organized and unified the three parts of the philosophical *logos*: physics, ethics, and logic.

Physical *logos* is the rational and immanent order of the world (*kosmos* [κόσμος]), which is fully determined by causal relations without exception. The Stoics made a distinction between two fundamental cosmological principles that reproduced the strict division between acting and suffering: between matter (*hulê* [ὕλη]), which is a pure indeterminate principle, the absolute capacity to undergo, and *logos*, which is the source of the determination of everything. They called this *logos* "god," insofar as they considered it the demiurge, a driving force and formative power. Its physical name was "fire," a legacy of the Heraclitean *logos*: so for Zeno, this god was "an artistically working fire, going on its way to create; which is equivalent to a fiery, creative, or fashioning breath" (Diogenes Laertius, *Lives of Eminent Philosophers*). In addition, each living being, each body, each individual in the physical world, contained *logoi spermatikoi* [λόγοι σπερματικοί], seminal reasons, from which he developed, each one representing the singular reason of the fatal law according to which he would develop, provided the conditions he encountered were favorable. *Logos* justified the Stoic identification of nature—common nature as nature proper, fate, providence, and Zeus: it was well known the world over that, in Plutarch's words, "common nature and the common reason of this nature [ἡ κοινὴ φύσις καὶ ὁ κοινὸς τῆς φύσεως λόγος] are Fate, Providence and Zeus" (Plutarch, *Contradictions of the Stoics*, 34.1050b.

This identity was also a principle of Stoic ethics, a rational ethics that affirmed an identity between virtue, happiness, and the sovereign good. For Zeno, the end is a way of living in accordance with nature, itself identified as a way of living according to virtue, that is, a "way of living in accordance with the experience of the events which occur naturally." The order of the events is nothing other than fate, which is *logos* (Plutarch, ibid.).

In logic, *logos* was the faculty of reasoning that distinguishes men from animals. This is the faculty of giving

reasons or providing causal relations or of accounting for (*logon didonai*) what we perceive by formulating our perceptive data, or of providing logical representations (*phantasiai logikai* [φαντασίαι λογικαί]) between them. In every case, what the faculty furnishes are human representations as distinct from animal representations; throughout, *logikos* indissociably means both rational and discursive.

■ See Box 3.

III. From Greek to Latin

A. *Logos / ratio, oratio*

The Latin term *ratio* does not cover all the senses of *logos*: it has neither the meaning of "gathering" nor the meaning of "speech." From the verb *reor* ("to count," "to calculate," and in popular usage "to think," "to estimate," "to judge"), and used less frequently than *puto* or *opinor*, the noun *ratio* did not produce many compound terms: *ratiocinor* is rare, and the adjective *rationalis* was not used before Seneca. It was out of the meanings of "counting" and "calculation," which *ratio* has in common with *logos*, and from the time of

Plautus (300 BCE), that all of the uses attesting to the values of "reasoning," "method," and "explanation" developed. This was why, when Cicero and Lucretius translated and expounded Greek philosophical doctrines, *ratio* was available to them as a term that was able to convey a large number of the meanings of *logos*. A given meaning could be made clearer with another noun, which was not added to *ratio* but qualified it, in pairs such as *ratio et consilium* (the plan, intention), *ratio et mens* (intelligence, the faculty of reason), *ratio et via* (method). To convey the sense of "speech," the term *oratio*, which is not etymologically related to *ratio* but is a remarkable homophone, allows us to hear the polysemy of *logos*, especially when it is paired with *ratio*.

1. The new coherence of Lucretius

The uses of the term *ratio* in the poem *De rerum natura* (*On the Nature of Things*) by Lucretius tended to reduce the polysemy of the term in order the reinforce the coherence of the Epicurean method and the didactic effectiveness of his exposition; this movement of reduction and unification of meaning is marked on the one hand by a recurrence of the

The polysemy of "logos" according to Greek grammarians

A marginal scholium of a manuscript of the *Technê grammatikê* by Dionysius Thrax, the text below should be taken for what it is: a more or less careful (there are several redundancies) and byzantine compilation of notes of different sources and dates. It does not, therefore, call for the same kind of exegesis as a deliberately constructed text. We offer it here as a kind of "exhibit" in a trial to show the extent to which the polysemy of *logos*, described here as equivocal or as a homonym, had struck Greek grammarians. In this respect, the zealous manner in which our scholiast provided as long a list of meanings as possible, even at the cost of occasionally repeating himself, is in itself a noteworthy symptom:

<Heliodorus>

Logos is used in many different senses: it is an equivocal word that can signify many things. *Logos* can mean

1. the rational capacity (ἐνδιάθετος λογισμός) that makes us reasonable, thinking beings (λογικοί καί διανοητικοί);
2. concern (φροντίς), cf. the expressions "it is not worthy of *logos*" or "I do not feel any *logos* about him";
3. consideration (λογαριασμός), cf. "the commander feels *logos* for his lieutenants";
4. justification (ἀπολογία), cf. "He gave a *logos* for that";

5. the general (*logos*) [ὁ καθόλου] that encompasses all parts of speech (μέρος λόγου);
6. definition (ὅρος), cf. "sentient living being," as the answer to the question "give the *logos* for animal";
7. the juxtaposition of words which express full meaning, that is syntactical *logos*, cf. "finish your *logos* [sentence]";
8. (*logos*) of expenses, sometimes called *logos* of the bank;
9. the (*logos* [relation]) of geometry, cf. "there is the same *logos* between two cubits and four cubits, as between a half and one cubit";
10. proportion (ἀναλογία), cf. "the *logos* of four to three is four thirds";
11. a good reason (τὸ εὔλογον), cf. "he did not do that without a good *logos*," meaning "with good reason" (εὐλόγως);
12. the conclusion that follows from premises [he then gives an example of a syllogism];
13. the fact of being rationally endowed (λογικὴ κατασκευή), when we say that men are endowed with *logos*, but not beings that are devoid of reason (ἄλογα);
14. potentiality (δύναμις), when we say that it is by virtue of a natural *logos* that animals have teeth and a beard, in other words, by virtue of natural and seminal potentialities;
15. the vocal form that is coextensive with thought (ἡ συμπαρεκτεινομένη φωνὴ τῷ διανοήματι), cf. ἄπελθε [go away], which is a word (λέξις), insofar as it has a

meaning and also a *logos* because of the sense of the thought content that completes it;
16. that which expresses self-sufficiency (ὅ δηλοῖ τὸ αὐτοτελές), cf. what one says when something is missing from a statement: "finish your *logos*";
17. extension (*logos*), as a given type of completion, cf. "the *logos* of Demosthenes against Midias is beautiful";
18. book (βιβλίον), "lend me the book *Against Androtion*" [a speech by Demosthenes];
19. the relation between sizes (σχέσις τῶν μεγεθῶν), when we say that one size has the same *logos* in relation to another size, as some other size has in relation to some other size;
20. subject (ὑπόθεσις) [i.e., the summary of the plot], cf. "I am now going to read out the *logos* of the play and its didascalic [comic fragment]";
21. cause (αἰτία), cf. Plato [*Gorgias*, 465a]: "I do not call art an activity devoid of *logos* [ἄλογον πρᾶγμα]";
22. God, par excellence (κατ᾽ ἐξοχὴν ὁ θεός), cf. Jn 1.1: "In the beginning was the *logos*, and the *logos* was with God"; in other words, "the son of God, in the beginning, was exactly the same and equal to his Father."

(Dionysius Thrax, *Scholia in Dionysii Thracis artem grammaticam,* in *Grammatici Graeci,* vol. 1, fasc. 3)

vera ratio, and on the other by a number of uses that cover several different Greek compound nouns that are based on *logos*: *logismos* [λογισμός], *epilogismos* [ἐπιλογισμός], *phusiologia* [φυσιολογία].

Vera ratio describes the Epicurean doctrine (see, e.g., *On the Nature of Things*, 1.498; 5.1117), whose truthfulness is proclaimed in opposition to the erroneous theories of Heraclitus (1.637) and of Anaxagoras (1.880). It is "just reasoning" that allows us to account for the movement of atoms (2.82; 2.229), and it is the advent of an explanation that will reveal a new aspect of the world:

> Now, pay attention to the true doctrine.
> An unheard of discovery will strike your ears.
> A new aspect of your universe will be revealed.

> (Nunc animum nobis adhibe veram ad rationem.
> Nam tibi vehementer nova res molitur ad auris.
> Accidere, et nova se species ostendere rerum.)

<div align="center">(Lucretius, On the Nature of Things, 2.1023–1025)</div>

In these uses, *ratio* covers almost the only sense of *logos* that it does not have in Latin, that is, the sense of "speech"; it is the master's speech, the revealed word, this *logos* that, at the end of the *Letter to Herodotus* (Diogenes Laertius, 10.83), refers to the synthesis of the main points of this doctrine, which can lend a certain force to anyone who has memorized it.

On the other hand, *ratio* unifies several aspects of Epicurean natural science (*phusiologia*), whose objective is to "explain the causes of phenomena" (Diogenes Laertius, ibid., 10.78): *ratio* is thus often paired with *causa* (4.500, 6.1000), and sometimes replaces it (7.1090; the *ratio* of an epidemic). *Ratio* covers all natural laws (2.719) and, for this very reason, provides a general principle of explanation of nature: *ratio* is thus closely associated with *natura* in the expression *natura haec rerum ratioque*, which refers to the recent discovery by Epicurus of the system of nature and its explanation in Latin by Lucretius:

> Lastly, this recent discovery of the system of nature, and today, indeed, I am the very first able to translate it into the language of our fathers.

> (Denique natura haec rerum ratioque repertast nuper, et hanc primus cum primis ipse repertus nunc, ego sum in patrias qui possim vertere voces.)

<div align="center">(Lucretius, On the Nature of Things, 5.335–337)</div>

The importance of this use is indicated in the syntagma that appears as a refrain four times in the poem (1.148, 2.61, 3.93, 6.41), *natura species ratioque*, "the sight and explanation of nature," or more precisely, "the explanation that accounts for phenomena" (*naturae species*, what nature makes manifest), but also "the explanation that proceeds by reasoning on the basis of phenomena." These glosses, which are not translations, are intended to remind us that *ratio* refers here to *logismos*, the reasoning by which the lessons of nature are explained (Diogenes Laertius, 10.75), or to *epilogismos*, through which we understand the end of nature (10.133). Two fundamental aspects of this methodical reasoning are thus conveyed by the single term

ratio. Nonetheless, the understanding of invisible things, perceived *dia logou* [διὰ λόγου] (10.47, 10.59, 10.62), is not expressed by *ratio*, but by *mens* (6.77) or by *injectus animi*, the mind's projection. Rational activity, when it covers any kind of perception, is thus directly related to the thinking and feeling subject, which no compound of *ratio* could express.

2. The nodal points of translation in Cicero

The uses of *ratio* in the Ciceronian corpus reveal at least two "nodes" of translation, which stand out against the banalization of the term as a result of what we might call a diffuse Stoicism. We find an example of this banalization in the brief exposition of the physical doctrine of Anaxagoras (*De natura deorum*, 1.26): the ordering of the world produced by the *nous* (fr. A38 RT: DK), the *diakosmêsis* [διακόσμησις], is translated by a phrase in which the group of words *vis ac ratio* describes the rational process set in motion, as if the *diachosmêsis* of Anaxagoras were the unfolding of an immanent rationality, the one postulated by the Stoics ("Anaxagoras . . . was the first to argue that the well-ordered organization of all things was a result of an infinite intelligence which had perfected their composition by proceeding *rationally* [*omnium rerum discriptionem et modum mentis infinitae* vi ac ratione *dissignari*]").

A first node occurs around the translation of *logikê* (*technê*) [λογική (τέχνη)], "logic": "in altera philosophiae parte, quae quaerendi ac disserendi quae logikê dicitur" (in the second part of philosophy, concerning the search for and exposition of arguments, which is called "logic"; *De finibus*, 1.22). We note here that *ratio* is not what technique is concerned with, but rather the method itself of *quaerere* and *disserere*: "logikên quam rationem disserendi voco" (*De fato*, 37).

The sense of "gathering," well attested for *logos* but not for *ratio*, is thus conveyed by the term *disserere*, "to connect words together, in the right order." *Ratio* has to do more with the unfolding, with the method of the process, as is made clear by this definition of *apodeixis* [ἀπόδειξις], or demonstration, translated as *argumenti conclusio* (giving form to an argument): "ratio quae ex rebus perceptis ad id quod non percipiebatur adducit" (the method that leads from perceived things to what was not perceived; *Academica*, 2.26).

According to another translation choice (which we find relates to the doctrine of Antiochus; *Academica*, 1.30–32), *ratio* is given a meaning that is closer to the sense of *logos* as "reason and discourse": logic is defined as "philosophiae pars, quae erat in ratione et in disserendo" (the part of philosophy that concerns the methods of reasoning and its exposition), and the object of dialectics is said to be "oratio ratione conclusa," discourse governed by the rules of argumentation.

The homophonic play of words *ratio*/*oratio* allows us to resolve, from a point of view that is here clearly marked by Stoicism, the impossible translation of the object of logic. However, the occurrences of this nonetymological pair (but which must have been perceived as etymological, to judge by Cicero's uses of the terms) help us to understand where the second difficulty lies.

When *ratio* and *oratio* are used together, they emphasize a mythical kind of coherence: the origins of eloquence in *De inventione* (1.2) and of the social bond in *De officiis* (1.50), are explained by the ability to handle *ratio* and *oratio*, whether

in teaching or learning. This coherence is also the one that Stoic discourse aspires to, over and against moral suffering (*Tusculanes*, 4.60). But the dissociation between the two terms highlights their irreducible distinction, or the trap of the Stoic conception of language. When arguing against the Stoic Cato, Cicero states his disagreement at the level of words, *oratio*, while claiming to be in agreement with Cato about the main points of doctrine, the *ratio*: "Ratio enim nostra consentit, pugnat oratio" (we agree on doctrine, it is language which opposes us; *De finibus*, 3.10). Similarly, in Cicero's translation of the *Timaeus*, the inadequacy of all language, other than by "resemblance," to translate anything to do with gods and the creation of the universe (29c) is clearly marked thanks to the distinction between the *ratio* of the demiurgical god and the *oratio* that gives us its image—and yet both terms serve to translate *logos.*

The uses of *ratio* in Seneca's language are marked by an interpretation of the doctrine that limits man's participation in the reason of the world: the *animus* of god is wholly *ratio*, that of man is possessed by *error* (*Natural Questions*, preface, 14). Man's rationality is constitutive, and Seneca coins the adjective *rationalis*, which essentially covers the first manifestation of *logos* through the mastery of the spoken language: *infans irrationalis, puber rationalis* (the newborn infant is without reason [without speech], the child possesses reason; *Epistles*, 118.14). But if ratio is the *imitatio naturae* (ibid., 66.39), the conditions of this imitation are made more difficult by a general blindness that prevents us from perceiving the rational principles at work in nature and in the nature proper to man (ibid., 95). So the construction of the rational subject does not coincide with a progressive reinforcement of reason, but with a process of curing this blindness (ibid., 50). This interpretation, which systematically treats errors of judgment as an illness, privileges the vocabulary of care, and of the willingness or disposition to be cured (hence Seneca's interest in *bona mens* and *voluntas*).

B. From *Logos* to *Verbum*: The Gospel according to John

1. The *Logos*: Son of God, *ḥokmah* (wisdom) or *dāvār* (the spoken word)?

Logos appears seven times in the Gospel according to John in the New Testament (four times in the prologue to the fourth Gospel 1:1, 14; twice in John 1 1:1, 5:7; once in Rv 19:13). The term is translated canonically as "Word," or *Verbe* in French, which is a calque of the *Verbum* of the Vulgate.

John says that the *Logos* was "in the beginning" (John 1 1:1), even before the creation of the world, and it was through it that God created all things (1:3: "all things were made through him"). The *Logos* "was God" (1:1), as well as being a person distinct from God (1:2: "the Word was with God"). It is also called the "only Son" of God (1:14). What is specific to John's *Logos* is that it "became flesh and dwelt among us" (1:14): incarnation confers upon *Logos* the mission of communicating with men and of revelation to them, which is related to its current sense of "spoken word" in common Greek. We go from the organic nature of the *logoi spermatikoi* (seminal reasons) of the Stoics, a legacy of Aristotelian form, to the economy of persons and of filiation.

The ancient exegetes (e.g., Origen, Saint Augustine) were convinced early on of the continuity between the two Testaments. In this perspective, it was first of all the Wisdom of the Old Testament (*ḥokmah* [חָכְמָה]), translated as *Sophia* in the Septuagint), which prefigured the *Logos* of John: Paul (1 CE) was thus already calling the Son of God "wisdom of God" (1 Cor 1:24). There are many points that Wisdom and *Logos* have in common that allowed for this assimilation: both are created by God (Prv 8:22; cf. Jn 1:4); both represent life (Wisdom declares "for he who finds me finds life and obtains favor from the Lord" [Prv 8:35]; cf. the *Logos*: "in him was life, and the life was the light of men" [Jn 1:4]); both preexist creation ("The Lord created me at the beginning of his work, the first of his acts of old" [Prv 8:22]); and both constitute the means of creation (Wisdom is the worker, *technitis*, who makes everything that is [Prv 7:21 and 8:6]; and Jn 1:3 says of *Logos* that "all things were made through him"). Wisdom is even presented as spoken "from the mouth of the Most High" (Eccl 24:3), and in that regard, it reconnects with the usual meaning of *logos* and its communicative function.

Despite these convergences, John did not use *Sophia*, which is a translation of *ḥokmah*, to designate the Son of God but rather *Logos*, which is a translation of *dāvār*. Beside the difference in gender of the nouns (*Sophia* is a feminine term, unlike *Logos*, which is masculine and then appropriated as the Son of God), *Logos* covers a much greater semantic field than Wisdom, which is associated in Rabbinical tradition with the Torah, the written Law (cf. Eccl 24:23). *Dāvār* is, like *Logos*, the means of revelation (cf. Ex 3:14, where God reveals himself to men through his Word as the One and Only God), and above all, it is an active power.

■ See Box 4.

2. *Logos*: *Verbum, sermo, ratio*, or *causa*?

a. *Logos, verbum*, and *sermo*

In the Latin versions of the Bible, two concurrent translations for the *logos* of the prologue of Jn 1:1 are attested depending on the geographical region: in North Africa, *sermo* was used (cf. Cyprian, *Ad Quirinum testimoniorum*, 2.3: "In principio fuit Sermo et Sermo erat apud Deum et Deus erat Sermo"). In Europe, however, it was *verbum* that prevailed (Novatian, *De Trinitate*, 30). Whether the term that was kept to translate *logos* was *verbum* or *sermo*, Christ was the spoken word. But *verbum* was more suited than *sermo*, which had strong connotations of internal plurality, for the unity and uniqueness of the Son of God. So in his *Tractatus in Johannis Evangelium* (*Tractates on the Gospel of John*, 108.3), Augustine comments on the passage from John 17:17 in the following terms:

"Your discourse [*Sermo*]," he says, "is truth." What else did he say than "I am the truth"? For indeed, the Greek Gospel has *logos*, that which is also read there where it was said, "In the beginning was the Word [*Verbum*] and the Word was with God and the Word was God." And of course we know that the Word itself is the only-begotten Son of God, who "was made flesh and dwelt among us [*Et utique Verbum ipsum novimus unigenitum Dei Filium quod caro factum est et habitavit in nobis*]." And because of this [*verbum*] it could also be put here and in some codices has been put: "Your Word [*Verbum*] is truth," as in some codices even there it was written "In the beginning was the Discourse [*Sermo*]." But in the Greek,

4

The ambiguity of the Hebrew *dāvār* [דָּבָר], spoken word

The Hebrew word *dāvār* [דָּבָר] presents an interesting ambiguity, since it means both "word" and "thing"—this last, first of all in the sense of "fact," "event." This Semitic substratum explains certain oddities of the early Gospels, such as the angel's expression to Mary "no word [*rhêma* (ῥῆμα)] is impossible for God," or the words of the shepherds at the Nativity: "let us go see this word which has happened" (Lk 1:37 and 2:15). The same ambiguity exists in Arabic, where *amr* [الأمر] sometimes refers to the "matter at hand" (pl. *umūr* [أمور], sometimes to the command given (pl. *awāmir* [أوامر]). In French, *chose* (thing) is a doublet of *cause* (cause, reason, case): *la chose* (thing) is what is *en cause* (the case) in a legal debate, and the thing one is talking about (*ce dont on cause*). The words *Ding* in German and "thing" in English both recall the *thing*, which was the name for an assembly of people where certain "things" would be on the agenda.

The ambiguity of the word makes sense in terms of the representation of creation as having issued forth from a divine command.

This idea is found in the ancient Near East, perhaps as a result of the idea of thunder as a divine voice (cf. Sumerian *ENEM* = Akkadian *awātum*). It appears in the Bible: "By the word [*dāvār*] of the Lord the heavens were made" (Ps 33:6). It is implicit in the first story of creation at the beginning of Genesis. This creative word is hypostasized in Philo, who gives it the name *logos*. The term is used in John's Gospel to designate the word in which all things were created and that became flesh. The Latin translates this as *Verbum*, which refers in theology to the second person of the Trinity before his incarnation as Jesus Christ. The emphatic usage of "word" to refer to the poetic word, sometimes with a capital letter, represents a secularization of the idea.

A further representation comes to be grafted on to this meaning, whereby the word can *magically* act upon reality. To know the "answer to a mystery," or *mot* (word) *de l'énigme* in French, enables one to change things by returning to their verbal source. Things are like frozen words, which one can free up. This idea is echoed, finally, in a

quatrain by Eichendorff: "a poem [*Lied*] lies dormant in all things" ("Wünschelrute"), and in Proust: "[W]hat lay hidden behind the steeples of Martinville must be something analogous to a pretty phrase" (*Swann's Way*, chap. 1).

One of the most famous plays on words in Western literature is based on the ambiguity of *dāvār* [דָּבָר]. In the first *Faust*, Goethe has his hero retranslate the opening of the prologue to John's Gospel: "in the beginning was *logos*." He rejects *Wort* (word), then *Sinn* (meaning), then *Kraft* (power), to settle in the end on *Tat* (act) (vv. 1224–37). This choice seems arbitrary, unless we understand that Faust begins with an implicit retroversion of his text, which is attentive to its Semitic substratum.

---

without any variation, both there and here, is *logos*. And so in truth, that is, in his Word, in his Only-Begotten, the Father sanctifies his own heirs and his coheirs [*Sanctificat itaque Pater in veritate, id est in Verbo suo, in unigenito suo, suos heredes ejusque coheredes*].

(*Tractates on the Gospel of John*)

The association made at the end of this passage between *Verbum* and *veritas* (truth) is not coincidental. It points to a popular etymology, traditionally attributed to Varro and that Saint Augustine adopts when he links *verbum* (the word) either to *verum* (true) or to *verum boare* (to proclaim what is true) (*De dialectica*, 6). One can probably see here another factor explaining the translators' choice of *Verbum* to translate the *Logos* of John.

b. *Logos* and *ratio*

Yet the church fathers would continue to question the possible translation of *Logos* by *Ratio*, which pointed to the divine Reason of the creative God.

For Tertullian (verses 150–222), who possessed an African version of the Bible in which the translation of *logos* as *sermo* was preferred, *logos* does not correspond to the Latin *verbum* but instead to the combination of *ratio* (reason) and *sermo* (speech). Indeed, although it is true (Tertullian maintains) that thought precedes the spoken word, that reason (*ratio*) is the substance of this spoken word (*sermo*), *ratio* is nonetheless expressed in the form of an inner spoken word.

This [reason] the Greeks call *Logos*, by which expression we also designate discourse [*sermo*]: and consequently

our people are already wont, through the artlessness of the translation, to say that Discourse [*sermo*] *was in the beginning with God*, though it would be more appropriate to consider Reason of older standing, seeing that God is [not] discursive [*sermonalis*] from the beginning but is rational [*rationalis*] even before the beginning, and because discourse itself, having its ground in reason, shows reason to be prior as being its substance. Yet even so it makes no difference. For although God had not yet uttered his Discourse [*sermo*], he always had it within himself along with and in his Reason [*ratio*], while he silently thought out and ordained with himself the things which he was shortly to say by the agency of Discourse: for while thinking out and ordaining them in company of his Reason, he converted into Discourse that which he was discussing in discourse. [*Cum ratio enim sua cogitans atque disponens sermonem, eam efficiebat quam sermone tractabat*].

(*Tertulliani adversus Praxean*, §5)

In Augustine we find an analogous opposition between *Verbum*, as the creative Word of the Father, and *Ratio*, as the Reason immanent to God independently of all creation. But Augustine prefers *verbum* to *sermo* as a translation for *logos*, since the former term for him emphasizes, better than *ratio*, the notion of an effective Word, as we can see in the *De diversis quaestionibus* (*Eighty-Three Different Questions*, question 63):

"In the beginning was the Word." The Greek word *logos* signifies in Latin both "reason" [*ratio*] and "word"

[*verbum*]. However, in this verse the better translation is "word" [*verbum*], so that not only the relation to the Father is indicated, but also the efficacious power with respect to those things which are made by the Word [*Sed hoc loco melius verbum interpretamur, ut significetur non solum ad Patrem respectus, sed ad illa etiam quae per Verbum facta sunt operativa potentia*]. Reason, however, is correctly called reason even if nothing is made by it.

In the *Tractatus in Johannis Evangelium* (1.10), Augustine considers this translation to be established, in spite of the potential ambiguity of the word *verbum*, which refers equally to the Word and to human spoken words. Rather than suggesting a better translation, the author is content to underline the difference between the *Verbum* of the Father and our human words (*verba*): "And whenever you hear: *In the beginning was the Word* [*In principio erat Verbum*], so that it does not make you think of something of little value—as you normally do when you hear talk of human words [*cum verba humana soleres audire*]—this is what you must think: *the Word was God* [*Deus erat Verbum*]."

c. *Logos* and *causa*

In the ninth century, John Scotus Erigena (810–877) also reflected on the notion of *Logos* in his *Periphyseon* (*On the Division of Nature*). In this text, he blends a number of Neoplatonic elements with his own Christology and argues that within the Word reside Ideas, that is, the first causes from which all things were created:

> The most primary reason of all things, which is simple and multiple, is God the Word. For it is called by the Greeks *logos*, that is, Word [*verbum*] or Reason [*ratio*] or Cause [*causa*] [*Nam a Grecis* logos *vocatur, hoc est verbum vel ratio vel causa*]. Therefore, that which is written in the Greek gospel, *en archêi în ho logos*, can be interpreted "In the beginning was the Word," or: "In the beginning was the Reason," or: "In the beginning was the Cause." For nobody who makes any one of these statements will be deviating from the truth. For the only-begotten Son of God is both Word and Reason and Cause, Word because through Him God uttered the making of all things [*verbum quidem quia per ipsum deus pater dixit fieri Omnia*]—in fact He is the Utterance of the Father and His Saying and His Speech [*immo etiam ipse est Patris dicere et dictio et sermo*], as He Himself says in the gospel, "And the speech which I have addressed to you is not Mine but His that sent Me" [*et sermo quem locutus sum vobis non est meus sed ipsius qui misit me*]. . . . Reason because He is the principal Exemplar of all things visible and invisible, and therefore is called by the Greeks *idea*, that is, species or form [*ratio vero quoniam ipse est omnium visibilium et invisibilium principale exemplar ideoque a Grecis* idea*, id est species bel forma dicitur*]—for in Him the Father beholds the making of all things He willed to be before they were made—; and Cause because the origins of all things subsist eternally and immutably in Him [*causa quoque est quoniam occasiones omnium aeternaliter et incommutabiliter in ipso subsistunt*].

(2.642b–642c)

With Meister Eckhart, the theology of the Word become even more complex. He devoted paragraphs 4 to 51 of his *Commentary on the Prologue of the Gospel of Saint John* to an exegesis of the expression *in principio erat Verbum*. Following Augustine, he proposed the equivalence between *Logos* and *Verbum et ratio* (§4). For him, *logos* is the first cause of all things (§12: "causa prima omnis res ratio est, logos est, Verbum in principio" [the first Cause of all things is Reason, Logos, the Word in the Principle]). He emphasizes the intellective nature of the Word (§38: "Verbum, quod est ratio . . . in intellectu est, intellegendo formatur, nihil praeter intellegere est" [the Word, which is reason . . . is in the intellect, is formed by knowing, is nothing but knowing]). Man, as intellect, can find himself again in the Word and can be reborn to his true divine nature, while the Father creates his Son in the human soul.

This use of *logos* in the language of theology to refer to the Son of God, the second person of the Trinity, is strikingly original. John deflected the term by wresting it from its usual noetic domain and dwelling on the Incarnation. Thereafter followed a period when the notion of causality, which was essential to the Christian conceptualization of creation, was eclipsed. Then the Latin of the medieval theologians reinvested *logos* with the profane values of Greek philosophy (the Platonic idea and the Stoic cause).

■ See Box 7.

IV. Vernacular Puns

A. English: "Tell," "tale," "tally"; "count," "account," "recount"

"Say," the most common word in English to express "saying," is not really polysemic and can only ever translate one of the meanings of *legein*. It competes with other families of words, in particular those around the verbs "tell" and "count," which like *legein*, open out onto more complex usages that are at once arithmetical, discursive, and performative.

(a) A first important and rather archaic meaning of "tell," which is still present, was that of "counting" or "enumerating"—saying or "telling" out the numbers one by one (one, two, three, etc.), a first form of counting that also interested Wittgenstein in the *Philosophical Investigations*. We find this usage in *Robinson Crusoe* in the following:

> He could not tell twenty in *English*; but he numbered them by laying so many Stones on a Row, and pointing to me to tell them over.

(Daniel Defoe, *Robinson Crusoe*, chap. 15)

This is what one does when one counts out coins, for example, or banknotes, and a "teller" in English is both someone who tells tales, as well as someone who counts money in a bank. (Automatic tellers dispense cash or tell customers the balance in their bank accounts.) The idea of counting is associated with the idea of saying (stating the numbers, one by one), and arithmetic is the ability to follow a series out loud, such as two, four, six. Conversely, the association of "tell" with "count" defines narration; hence, a "tale," as derived from a primary form of counting, like a series with stages that can be enumerated and well defined: serialized tales are of this kind.

"Tell" is specifically oriented toward the effect or intention of the spoken word and has the dimension of a speech *act*: "telling" is always something other than describing or stating and does not refer, as "say" almost always does, to a statement. So rather than "say," one will "tell a lie" or "tell the truth," and "tell" adds to the simple idea of speaking, the fact of pointing out (to tell the time), of announcing or informing, correctly or not; of letting others know. "Tell" also means to narrate or relate, as in to "tell tales" (the two words being closely linked). "Tell" sometimes suggests, again going beyond a descriptive use of language, confession or revelation, as in "to disclose," "to reveal" (cf. the expression "tell all"). Its usage also extends to cases where it is a matter of making distinctions, of showing discernment, as one *speaks* (tell friend from foe, tell right from wrong). So "telling" is distinct from the notion of stating and means "to *make* or *see* a difference" and "to have some criterion for" ("I can tell," or "How can you tell it's a goldfinch?" the example given by J. L. Austin in "Other Minds").

So we can identify two directions in the verb "tell": that of narrating or recounting and that of enumerating or counting (cf. the verb "tally"). The usages of the verb "tell" suggest two dimensions of *logos* that go beyond the simple description of what is: the "telling," the narrative saying, which is intended to have an effect on others (what Austin, in *How to Do Things with Words*, defined as the perlocutionary dimension of what is said); and the act of counting implied in any statement (which would be its illocutionary dimension). Whatever the case, it seems that the verb "to tell" and its usages highlight more than "to say" and more than its French equivalents, a performative dimension of spoken language that is inseparable from a conception of *logos* as performance.

(b) This duality, to which the false French pair *conter* (to tell) / *compter* (to count) curiously enough corresponds, is to be found in the compound words based on "count" (recount, account). (Romance languages in general play on this pun: see, for instance, Cervantes, *Don Quixote* 1.28, where Dorotea refers to the sad account of her woes: "el cuento, que no le tiene, de mis desdichas" (the story [*cuento*], which is uncountable [*que no tiene cuento*], of my sorrows). "To recount" in the strict sense means "to count again," but also "to narrate." "Account" can be used not only in the sense of "counting" (money) but also in the sense of "giving an account of" something or of "accounting for" (as in the Greek *logon didonai*, the "day of reckoning" is the last judgment). This is precisely how Locke uses the noun "account," which is why in the French translation, Pierre Coste (*Essai philosophique*) alternatively uses *compte* (tally) and *récit* (tale). This, of course, then poses the problem of translating into French the expression "accountable" for one's actions, where the French for "accountable" should be not, as Coste translates it, *responsable* (responsible), but rather *comptable* (countable) (as Étienne Balibar proposes in his version, in "Points-bilingues"). We can see here, then, how moral philosophy during this period of English philosophy is defined in economic terms.

The pairs "count"/"account" and "tell"/"tally" thus articulate a remarkable link connecting counting, saying, and debt. Stanley Cavell identifies a Shakespearean source of this problematic that links the economic to the moral. In his

essay on *A Winter's Tale* entitled "Recounting Gains, Showing Losses," he shows how Shakespeare's vocabulary is saturated with these double usages of "tell" and of "count," "account," "loss," "gain," "owe," "debt," "repay," etc. We can see how rich the economic lexicon already is in Shakespeare's language, but counting, or rather the impossibility of counting, takes on an added dimension, that of the inability to say, to express oneself, or to "tell." Leontes in *A Winter's Tale* is thus "unable to tell anything," to know and to say what counts, and Cavell, returning to the dual sense of *saying* and *knowing* in "telling," sees in this attitude an expression of skepticism itself—the impossibility of expression repeating the inability of counting, and of counting for others.

This usage of the pair "tell"/"count" closely links "saying" to categorizing, as in the expression "to count as." To "count something as" is to put it in a category or a semantic unit. Here again is Cavell: "how we determine what counts as instances of our concepts, this thing as a table, this other as a human. To speak is to say what counts" (*In Quest of the Ordinary*). To see a thing as this or that is to "count" it, in the literal sense, as one of these words (or concepts), or as one of those others. In *This New Yet Unapproachable America* (1989), Cavell reads Kantian, but also Emersonian, categories as the means by which we count things, that is, count a given thing as falling under a given word, and thereby, he concludes, "recount our condition." The term "recount" thus becomes untranslatable. (The French translation is forced to invent the verb *ra-compter* for "to recount"). The linguistic play surrounding "tell"/"count" would thus allow for a new definition of the categories (that is, of the application of concepts and words to the world) by the invention of a conception of *logos* that would at the same time, and indissolubly, be a narrating (recounting), a counting out of differences, and an accounting. So it is through the English language and its usages that the irreducibility of *logos* to a simple description of the world, or the irreducibility of description to statement, becomes apparent in very concrete ways.

B. German: *Legen, liegen, lesen*

The difficulty of translating *legein* and *logos* is a cornerstone of Heidegger's reflection on Greece, on language, and on philosophy, and it prompts a complex linguistic play in German. One of the starting points of this reflection is Heraclitus's fragment 50.

■ See Box 5.

In discussing this fragment, Heidegger proposes retranslating *logos* and *homologein* by taking as a pivotal term the "literal" or "authentic" (*eigentlich*) meaning of *legein*.

Wer möchte leugnen, dass in der Sprache der Griechen von früh an λέγειν reden, sagen, erzählen bedeutet? Allein es bedeutet gleich früh und noch ursprünglicher und deshalb immer schon und darum auch in der vorgenannten Bedeutung das, was unser gleichlautendes "legen" meint: nieder- und vorlegen. Darin waltet das Zusammenbringen, das lateinische legere als lesen im Sinne von einholen und zusammenbringen. Eigentlich bedeutet λέγειν das sich und anderes sammelnde Nieder- und Vor-legen. Medial gebraucht, meint λέγεσθαι: sich niederlegen in die Sammlung der Ruhe; λέχος ist das

5

Translating a pre-Socratic (Heraclitus, fragment 50)

A "fragment" is surrounded by an aura of meaning and depends on an interpretation of the whole that is more wished for than guaranteed. This is true of the very famous fragment of Heraclitus:

οὐκ ἐμοῦ ἀλλὰ τοῦ λόγου ἀκούσαντας ὁμολογεῖν σοφόν ἐστιν ἕν πάντα εἶναι

(Not after listening to me, but after listening to the account [*logos*], one does wisely in agreeing that all things are one.)

(Heraclitus, *Fragments*)

– A more rationalist interpretation understands *logos* in the sense of *Sinn*, "sense," "reason," and founds a pre-Stoic cosmic physics, in which *logos* produces the unity of the world; this is how we might read the German translation by Diels Kranz (RT: DK): "Haben sie nicht mich, sondern den Sinn vernommen, so ist weise, dem Sinne gemäss zu sagen [to say according to the meaning], alles sei eins." Dumont proposes, in French: "Si ce n'est pas moi, mais le Logos que vous avez écouté, il est sage de convenir qu'est l'Un-Tout" (If it is not me, but *Logos* that you listened to, it is wise to agree that One is All).

– A more discursive interpretation, defended for example by J. Bollack and H. Wismann, emphasizes the difference between signifier and signified, between saying and what is said: "L'art est bien d'écouter, non moi, mais la raison, pour savoir . . . dire en accord toute chose-une" (Art is indeed listening, not to me, but to reason, to know how . . . to say in agreement all one-thing). The commentary does not "rationalize"; quite the opposite: "To allow the signifier to act, Heraclitus asks that we listen to what is being said, without being limited by the intention of the speaker" (ibid.).

– An ontological interpretation, like the one Heidegger proposes, links *logos* to the unveiling of being: "Nicht mir, aber der Lesende Lege gehörig: Selbes liegen lassen: Geschickliches west (die lesende lege): Eines einend Alles [Belonging and lending an ear, not to me, but to the gathering Posing: leaving the Same laid out: something well-disposed spreads out its being (the gathering Posing): One uniting All]" ("Logos [Heraklit, Fragment 50]").

Ruhelager; λόχος, ist der Hinterhalt, wo etwas hinterlegt und angelegt ist.

(Who would want to deny that in the language of the Greeks from early on λέγειν means to talk, say, or tell? However, just as early and even more originally, and therefore already in the previously cited meaning, it means what our similarly sounding *legen* means: to lay down and lay before. In *legen* a "bringing together" prevails, the Latin *legere* understood as *lesen*, in the sense of collecting and bringing together. Λέγειν properly means the laying-down and laying-before which gathers itself and others. The middle voice, λέγεσθαι, means to lay oneself down in the gathering of rest; λέχος is the resting place; λόχος is a place of ambush where something is hidden, poised to attack.)

("Logos [Heraklit, Fragment 50]")

There are several comments one might make here.

In the first place, with regard to the Greek. Heidegger makes no distinction (in contrast with the standard etymology given by Frisk [RT: *Griechiches etymologisches Wörterbuch*] and by Chantraine [RT: *Dictionnaire étymologique de la langue grecque*]), between *λέγω, from the Indo-European root *legh-* "to be lying down" (from which we get λέχος and λόχος, as well as *legen, liegen*, or the French *lit*) and λέγω, from *leg-*, "to gather." This fusion or confusion is an essential part of his argument. Here the onto-logical privileging of the Greek *Logos* takes root by his raising the following question: "How does λέγειν, whose literal meaning is to lay out (*legen*), come to mean saying and speaking (*sagen und reden*)?" The answer concerns the being of language:

To say is λέγειν. This sentence, if well thought, now sloughs off everything facile, trite, and vacuous. It names the inexhaustible mystery that the speaking of language comes to pass from the unconcealment of what is present [*der Unverborgenheit des Anwesenden*], and is determined according to the lying-before of what is present as the letting-lie-together-before [*dem Vorliegen des Anwesenden als das beisammen-vorliegen-lassen*].

("Logos [Heraklit, Fragment 50]")

Logos, which is thus linked to the unveiling of *alêtheia*, is what allows the phenomenon to show itself as itself (*apophainesthai*; cf. *Sein und Zeit*, §7B).

What would have come to pass had Heraclitus—and all the Greeks after him—thought the essence of language expressly as Λόγος, as the Laying that gathers! Nothing less than this: the Greeks would have thought the essence of language from the essence of Being [*das Wesen der Sprache aus dem Wesen des Seins*]—indeed, as this itself. For ὁ Λόγος is the name for the Being of beings [*das Sein des Seienden*]. Yet none of this came to pass.

("Logos [Heraklit, Fragment 50]")

With *Logos* (and its capital letter), the Greeks "*inhabited* this being of language," but they never *thought* it, not even Heraclitus, who made it appear "for the time of a lightning flash."

In German, the same fusion/confusion is repeated, now pertaining to *legen* and *lesen*: "To lay [*legen*] means to bring to lie [*zum Liegen bringen*]. Thus, to lay is at the same time to place one thing beside another [*zusammenlegen*], to lay them together. To lay [*legen*] is to gather [*lesen*]" (ibid.). The present day meaning of *lesen* in German, "to read" (like the Latin *legere*), is therefore only a variation of the *lesen* that gathers together, gathers up, and shelters (cf. *Ährenlese*, "gleaning"; *Traubenlese*, "grape harvest"; *Lese*, "crop," "harvest"; *Auslese*, "selection"; *Erlesen*, "election"; *Vorlese*, "preselection"; etc.). Heidegger's German articulates the being of saying and the being of holding forth as a laying out, exactly as the Greek does.

Vernunft ist Sprache, λόγος: The three senses of *Wort*

If I were as eloquent as Demosthenes I would yet have to do nothing more than repeat a single word three times: reason is language, *logos*. I gnaw at this marrowbone and will gnaw myself to death over it. There still remains a darkness, always, over this depth for me; I am still waiting for an apocalyptic angel with a key to this abyss.

(Letter from Hamann to Herder, 8 August 1784, Heidegger, "Language")

The famous passage quoted by Heidegger, "Reason is language, λόγος," in the essay "Language" is dated 8 August. Hamann addresses Herder by putting himself in the position of Job in his mire (Job 30:6ff.); he refers to Herder's later *Ideas on the Philosophy of the History of Mankind*, which he has just received, as a *Lustgarden* (garden of pleasures) and only feels directly concerned by book 4, on the divine origin of language and the role of religion in the life of mankind. "*Vernunft ist Sprache*, λόγος" refers to the entire conception of creation in its two aspects—nature and history—as the word of God, in accordance with his reading of Genesis. This clear "language" that God speaks is made obscure (*finster*) by the fall; this is why intelligence only comes at the end of time, with the angel of the apocalypse, who will reveal its meaning, and not with a human *Clavis Scripturae* (*kritische Grübeley*). Reason is in the abyss of language, which is itself the veiled speech of God, a divine proffering that is the model of all creation. Herder's explanation is thus somewhat too short for Hamann; although it reintegrates reason with language, it does not see the divine word as being within language, whereas for Hamann the three are inseparable, and the logic of specialization that is particular to the modern world is unaware of this. To counter this logic of specialization (which Herder embodies, despite his critical stance toward it), Hamann suggests that we need to return to the three senses of *logos*, which are to be found also, he says, in the German *Wort*: reason (*Vernunft*), speech (*Sprache*), word (*Logos*). According to Hamann, this strategy could be put in terms of the rhetoric of Demosthenes, as *actio*, *actio*, and *actio* (adapting a passage in Cicero he was fond of, *De oratore*, 3.56.213; cf. *Orator*, 27.56). Through Luther's translation of the *Logos* in John's Gospel, Hamann sets out to rediscover the unity of reason and language, but especially their shared origin in the word of God. The reason of Modernity is absorbed in the divine word, *Wort* expressing simultaneously, in Protestant cultures, revelation and language. The defense of natural language is thus for Hamann a way to contain reason (*Vernunft*) and to subject it to the word. So for him, *Wort* is more a strategic reduction of *Logos* than an adequate translation, but it allows him to intervene in the three domains covered by this term.

Glossolalia: From the unity of the word to plurality of tongues

"Glossolalia" is a technical expression referring to a variety of speech act whose name derives from the Greek term for speaking in tongues. Saint Paul may have been the first to define this linguistic practice. In his first letter to the Corinthians, he enjoins his addressees not to "speak into the air" (1 Cor 14:1–25). To "speak in tongues," Paul suggests, is how to forget the meaning of one's words. It is to abandon one's tongue for "tongues" and "obscure expressions," such that one becomes a "child in understanding" and a "barbarian . . . that speaketh unto a barbarian." In *The End of the Poem: Studies in Poetics*, Giorgio Agamben has commented that such speech consists not so much in the "pure uttering of inarticulate sounds" as in a "'speaking in *gloss*,' that is, in words whose meaning one does not know." To hear such sounds is to know they mean something without knowing exactly what such a "something" might be; in other words, it is to discern an intention to signify that cannot be identified with any particular signification. Agamben notes that the traditional translations of the Greek text of Paul's letter fail to capture the full radicalism of the linguistic "barbarism" that it clearly describes. Whereas the King James version, following the Vulgate, has "If I know not the meaning of the voice, I shall be unto he that speaketh a barbarian, and he that speaketh shall be a barbarian unto me," a literal rendition would read otherwise on a single, decisive point: "If I know not the

meaning of the voice, I shall be unto he that speaketh a barbarian, and he that speaketh shall be a barbarian *in* me [*en hemoi*]." "The text's *en hemoi*," Agamben writes, "can only signify 'in me,' and what Paul means is perfectly clear: if I utter words whose meaning I do not understand, he who speaks in me, the voice that utters them, the very principle of speech in me, will be something barbarous, something that does not know how to speak and that does not know what it says."

One might well conclude that to speak in tongues is therefore to speak without speaking. For glossolalia begins where the canonical determinations of language end: at the point at which speech is irrevocably loosened from both its significance and its subject, as one experiences, within oneself, "barbarian speech that one does not know." It is an "unfruitful" state, in Paul's words, since it is one in which language is sundered from its semantic and intentional ends, suspended, "in unknown tongues," without the "profit" of a definite sense or purpose. But it is precisely this semantic sterility that also renders glossolalia stimulating for thought. What is speech loosened from its adherence to the rules of a particular language, from the will of an individual speaker, from the conventions of adult and native discourse? Giorgio Agamben may be the contemporary philosopher who has considered these questions with the greatest acuity, and he has suggested more than once that in such glossolalia one may discern

a fundamental dimension of language all too seldom considered as such: communicability without content, or, more simply, "gesture."

LOVE / LIKE

CATALAN	*amistança*
FRENCH	*aimer, amour, amitié*
GERMAN	*lieben, mögen, Minne*
GREEK	*eran* [ἐρᾶν], *agapan* [ἀγαπᾶν], *philein* [φιλεῖν], *erôs* [ἔρως], *philia* [φιλία], *agapê* [ἀγάπη]
HEBREW	*'āhëv* [אָהֵב], *'ahavāh* [אַהֲבָה]
ITALIAN	*amare, voler bene a, piacere a*
LATIN	*amare, diligere, amicitia, caritas*
SPANISH	*amar, amistad*

➤ MORALS, NEIGHBOR, PATHOS, PLEASURE, SENSE, SOUL, VERGÜENZA, *VIRTUE*

Our present-day languages deriving from Indo-European ones are connected mainly with two major etymological types: for Romance languages, the Latin verb *amare*, which may be based on *amma* (mother), and for the Germanic group (with *lieben* and "love"), a Sanskrit root that has sometimes been associated with the Greek *eros* [ἔρως], as well as with the Latin *libido*. But whatever the etymology may be, the various words all have a generic sense of equivalent extension, unless they are inserted into a system of opposition: the pair to "love" / "to like" in English; *mögen/lieben* in German. In French, *aimer* designates a whole spectrum of relationships and affects that ranges from sexuality and eroticism to more or less sublimated relationships between people, values, things, or behaviors (when one "loves" [*aime*], one can "make love," "be in love," "cherish," "like," etc.). The semantic indetermination that consequently characterizes these terms forces us to resort to complements or to circumlocutions that enable us to determine which kind of affect we are dealing with (in French, *aimer d'amitié* vs. *aimer d'amour*), and these complicate translation accordingly. This indetermination also leads to the reinvestment or invention of new words to specify a kind of love or object (in the New Testament, *agapê* [ἀγάπη], and its translation by *caritas*, the Germanic *Minne*, and in Catalan, Raymond Lully's *amistança*). From this point of view, the first of modern languages is Latin, since it combines in *amare* what are in Greek two completely distinct poles: on the one hand, *eran* [ἐρᾶν], *aimer d'amour*, "to (be in) love," a disymmetric relation of inequality and dissimilarity (active/passive)—a Platonic word whose extension determines an erotics of philosophy; on the other hand, *philein* [φιλεῖν], *aimer d'amitié*, "cherish," a relation of equality or commensurability and resemblance—an Aristotelian word that characterizes ethical and political bonds.

I. The Bipolar Schema: In Modern Languages, "to Love" Means Everything

The different affective modalities covered by the verb "to love" (or *aimer*, *lieben*, etc.) are located between the extremes of a bipolarity ranging from sensuality to intellect: depending on the context, the period, or the author, the meaning moves, in each language, now toward one extreme, then toward the other. To determine which of these two poles we are referring to, we are often obliged to resort to several kinds of qualification that take into account especially the nature of the affect involved, its intensity, or its object (one can love God, one's neighbor, one's wife, one's sexual partner, one's child, a close friend, something one will never see again, a landscape, chocolate, staying home). Thus the differentiation will be made by means of epithets, complements, expressions of modality (e.g., with sensual desire, eroticism, libido, or inversely, with respect, tenderness, friendship, sympathy, charity). But the dichotomy can also manifest itself as an antithesis between two different semantic fields: in German, *lieben* (love) and *mögen* (like), or *Liebe* and *Minne* (a poetic type of love); in Italian, *amare* and *voler bene a* (which includes the idea of a strong desire); whereas in French, *aimer* means both "love" and "like" and thus sometimes has to be further specified (*aimer d'amour*, *aimer bien*). However, even this antithesis is not always maintained. Thus, although the disjunction between "love" and "like" works for the differentiation by affect (I love you, *je vous aime* / I like her, *je l'aime bien*), the same is not true when it is a matter of intensity: to the question "Do you like cabbage?" one may very well reply "I love it" ("*J'adore ça!*" French says, using the same verb as for God) or "I am fond of it."

A. Dichotomies based on the nature and modalities of the affect

The bipolar character of the vocabulary of love is manifested especially through a series of pairs of opposites, the most common of which are those that distinguish between eroticized, sensual, or carnal love and romantic, tender, spiritual love, two affects whose interaction was analyzed by Freud; "concupiscent love" and deep affection for a friend (*amour d'aimitié*), a classical distinction, especially since the time of Aristotle, Cicero, and Descartes; love as *affectus* and love as esteem, an opposition close to the one Malebranche establishes between "instinctual love" (*amour d'instinct*) and "rational love" (*amour de raison*); "pathological love" and "practical love," which Kant radically opposes to each other. We can add the dichotomy proposed by Pierre Rousselot regarding medieval authors: "physical love," which is governed by natural tendencies (*phusis* [φύσις]) that lead every being to seek its individual happiness, versus "ecstatic love," violent, independent of natural appetites, foreign to any personal interest and to any selfish inclination. This distinction is related to the one, also concerning the love of God, on which Fénelon and quietism base themselves when they oppose "mercenary love" to a "pure love" that pushes contempt of self and disinterestedness to the point of showing itself to be indifferent to the "impossible supposition" of damnation itself.

1. Sensual love and romantic love

Liebe, on the one hand, and *amour*, on the other, conjoin in their generic meaning the *amor/libido* bipolarity that the Latin substantives perfectly distinguish. But they do not proceed from the same source. When Freud opposes two

forms of love that are expressed, one by tender or romantic feelings, and the other by directly sexual tendencies, he has no trouble in discerning, beneath *Liebe*, the force of the *libido*, sexual desire, which organizes itself, invests itself, transfers itself, sublimates itself (see DRIVE). On the other hand, for Lacan, *amour* is radically opposed to desire.

■ See Box 1.

2. From love to *tendresse* and sentimentality

In translating the opposition that Freud establishes between *sinnliche Liebe* and *Zärtlichkeit*, French translators render the latter term as *tendresse* (tenderness). *Tendresse* came into common use only in the seventeenth and early eighteenth centuries, being limited to the sense that it currently has, amorous feeling, whereas *amour* was also applied to sexual or eroticized love. The vocabulary of *tendresse* came to replace that of friendship (*amitié*), which had had since the sixteenth century the strong sense of "love" (*amour*), following on the adjective *tendre* (tender)—which, like the Latin *tener*, expressed the idea of youth, freshness, or delicacy, in the sense in which one speaks of "tender years" (*âge tendre*). In the French classical period, *tendre* was even used as a masculine noun to designate the love relationship, in particular in Mlle. de Scudéry's famous "Carte du Tendre" (Map of the Land of Tenderness).

■ See Box 2.

3. Bipolarities from the Middle Ages to Kant

Christian authors of the Middle Ages base themselves partly on Aristotle (*Nicomachean Ethics*, 8.2) and Cicero (*De amicitia*, §6) to oppose "concupiscent love" (*amor concupiscentiae*) to "the love of friendship or good will" (*amor amicitiae seu benevolentiae*). The former, which ranges from the desire for the pleasures of the senses to the desire for divine benefits (which is related to what Kant was later to call *amor complacentiae*), consists in a selfish attraction to objects that provide us with delight or enjoyment and that we want to possess. The latter, whose definition is reminiscent of the Greek *eunoia* [εὔνοια], draws us toward a being whom we love for himself, whom we wish well, or whom we are happy to see possess this good. In his *Passions of the Soul* (§81), Descartes says that this "distinction" is traditional, but he thinks that "it concerns solely the effects of love" and that this does not imply a genuine duality in the essential definition of the latter, which is always, whatever its effects or objects might be, a mixture of concupiscence and good will. In the 1950s, in order to translate this distinction into contemporary language, some psychologists popularized the opposition between *amour captatif* and *amour oblatif* ("the desire to have and possess the object, to assimilate it and identify it with oneself," as opposed to the "desire to give oneself and lose oneself in the love object, to identify with it"; Maggini, Lundgren, and Leuci, "Jealous Love"). The latter is characterized by an altruistic propensity to sacrifice oneself in which Jacques Lacan discerned a form of egocentric aggressivity.

The resort to the bipolar schema was also established in the context of a question that remained acute throughout the history of conceptions of love, that is, the question of whether love is essentially a matter of sentiment and affectivity to the point of culminating in an absence of any moderation and the most irrational passion, or whether it must necessarily be in accord with reason and knowledge. Some medieval theologians had already adopted the traditional idea, which began with Origen and Saint Augustine and continued to Leibniz and Malebranche and which sees true love as having to be based on an exact appraisal (*aestimatio*) or discernment (*discretio*) of the value of its object. This intellectualist program, which finds its application particularly in the case of "ordinate love" ("Ille autem iuste et sancte vivit qui rerum integer aestimator est; ipse est autem qui ordinatam dilectionem habet" [Now he is a man of just and holy life who forms an unprejudiced estimate of things, and keeps his affections also under strict control]; Augustine, *On Christian Doctrine*, bk. 1, chap. 28). This thesis is in contrast to the doctrinal orientation of Bernard of Clairvaux, the bard of love as *affectus* and as the impulse of the heart escaping not only all measure but also all rational control. However, his friend and disciple William of Saint-Thierry elaborated a theory of "love-intellection," that is, a love regulated by knowledge. We find this idea, which was fairly widespread in the seventeenth century, in Descartes and especially in the works of Corneille. Descartes emphasizes, in fact, the importance of an intellectual appraisal of the value of the different objects of love. Thus he observes that love differs from other affections "by the esteem one has for what one loves, in comparison with oneself" (*Passions of the Soul*, §83) and that it is governed by "judgments that also lead the soul [*âme*] to join itself willingly with things that it considers good and to separate itself from those that it considers bad" (ibid., §79).

With Spinoza, we find once again, in a more original form, the idea of the rationality of the order of love, notably with regard to *amor Dei intellectualis*, which is for him the crowning achievement of reason. This love goes beyond reason itself and beyond law. It represents the plenitude of knowledge that prevents the soul from getting lost in the fog of affectivity or passion, a torment that Romanticism later magnified under the name of *Leidenschaft* (an ambiguous composite derived from *leiden*, "to suffer"—the substantive *Leiden* designating the Passion of Christ), whereas affectivity itself, developing in it as legitimately as that other natural force constituted by the imagination, permits it to overcome pure intellectualism.

■ See Box 3.

B. Dichotomies based on the object: The invention or reinvestment of other words

To the various binary oppositions we have just mentioned as enabling us to clarify the meaning, obviously so ambiguous, of the word "love" (and *amour*, *Liebe*, or *amore*), one can add others that take into account not the nature or modalities of the affect, but rather the object loved or its specific qualities. For example, the following: love of God / love of one's neighbor or oneself; filial love / love of country; earthly love / heavenly love (cf. Lucien's work on Marguerite de Navarre published under this title); self-love (egocentric love; Aristotle calls it *philautie*, Hugo of St. Victor calls it *amor privatus*) / altruistic love (according to Gregory the Great); homosexual love / heterosexual love. But the invention of other words is made necessary precisely when the object cannot

1

The Freudian and Lacanian dichotomies

In *Group Psychology and the Analysis of the Ego* (*Massenpsychologie und Ich-Analyse*, 1921), chap. 8, "Being in Love and Hypnosis" ("Verliebtheit und Hypnose"), Freud points out that the affective relationships that we designate by the term "love" (*Liebe*) represent such a vast "scale of possibilities" that the term is full of ambiguities: it can designate "the object-cathexis on the part of the sexual instincts with a view to directly sexual satisfaction . . . , what is called common, sensual love," as well as feelings of "affection" (*Zärtlichkeit*). At a certain stage of development, the latter are grafted onto the original libidinal current, inhibiting its drives toward sexual aims. In adolescence, the sensual current (*sinnliche Strömung*), which reappears with a certain intensity, enters into competition with "affectionate trends of feeling that persist" in such a way that the subject's future destiny will be marked by the existence between these two currents of either a genuine schism or a sort of harmony. In the first case, "A man will show a sentimental enthusiasm for women whom he deeply respects but who do not excite him to sexual activities, and he will only be potent with other women whom he does not 'love' and thinks little of or even despises" (cf. "A Special Type of Choice of Object Made by Men" ["Über einen besonderen Typus der Objektwahl beim Manne," 1910]). In the second case, a synthesis regarding the same erotic object is produced "between the unsensual, heavenly love and the sensual, earthly love," so that "[t]he depth to which anyone is in love, as contrasted with his purely sensual desire, may be measured by the size of the share taken by the aim-inhibited instincts of affection."

In his article of 1912 that was reprinted in *Contributions to the Psychology of Love* and called "On the Universal Tendency to Debasement in the Sphere of Love" ("Über die Allgemeinste Erniedrigung des Liebeslebens"), Freud mentions the rift observable in some men between the current of sensuality and that of affection. He states that psychoanalysis should allow such men to arrive at "a completely normal attitude in love" harmoniously combining the two tendencies. In reference to the last of the stages of libidinal development (after the oral, sadistic-anal, and phallic stages), some of Freud's disciples have theorized this as "genital love"—a notion that Jacques Lacan criticized, targeting those who, without regard for "the fundamentally narcissistic nature of all being in love (*Verliebtheit*) were able to so utterly deify the chimera of so-called 'genital love' as to attribute to it the power of

'oblativity,' a notion that gave rise to so many therapeutic mistakes" (*Écrits*). Perhaps it is because of such criticisms that the French often use the English term "genital love," as if to remind themselves that this "illusion" seduced chiefly Anglo-Saxon psychology.

Lacan adopted Freud's distinction but inflected it in the form of a radical opposition between *amour* and *désir*, the former being rigorously defined as "ignorance" of the latter and as being nothing more than "what substitutes for the sexual relationship." However, Freud maintained a link between the two, asserting that love is what enables the sexual appetite to revive after a certain period of non-desire following satisfaction, after what he calls "an interval free of desire." In Lacan, the word *amour* is thus made unequivocal by the fact that it signifies nothing other than de-eroticized sentimentality. Thus he posits a difference in nature between love thus defined and what has been excluded from it: desire. For Freud, on the contrary, what is called "spiritual love" is merely erotic love metamorphosed, in the best of cases, by sublimation, a process that redirects the infantile libido toward nonsexual cultural goals.

This radical Lacanian dichotomy is nonetheless tempered by the fact that for psychoanalysis, "love" designates not only the "choice of object" (*Objektwahl*) but also "transference love" (*Übertragungsliebe*), a phenomenon that is fundamental for the functioning of analytical procedures. It was after the failure of his treatment of his first hysterical patients that Freud theorized transference and, more precisely, transferential love as "resistance" to analysis. This love is transformed into an "indispensable requirement," its manipulation allowing the analyst to make "the patient's buried and forgotten love-emotions actual and manifest" (*die verborgenen und vergessenen Liebesregungen*)" ("The Dynamics of Transference" ["Zur Dynamik der Übertragung," 1912]; see also "Postscript," in *Fragment of an Analysis* [Dora]).

We can thus say that Lacan qualifies, on this subject, his opposition between *amour* and *désir*. While on the one hand he defines love as nothing more than "ignorance" of desire and the sexual, on the other hand he posits that love itself, as the motive force of transference, is a necessary condition for the analytical process: "At the beginning of the analytical experience, let us recall, was love" (*Le transfert*). Thus, this same seminar of 1960–61 was devoted almost entirely to the question of love. A minute analysis of Plato's *Symposium* provided Lacan with an opportunity to theorize the relations between *amour* and *désir* differently. From

the myth of the birth of the *daimon* Erôs, as he is mentioned in Socrates's and Diotima's speeches (*Symposium*, 202a), Lacan takes the formula "Love is giving what one does not have" (*Le transfert*), declaring: "We can say that the dialectical definition of love, as it is developed by Diotima, rejoins what we have tried to define as the metonymic function in desire" (ibid.).

2

Affectionate, affection, sentimental

Starting from *tendresse* (tenderness) (or from the related forms *tendreur* and *tendreté*), which was initially understood literally—Vauvenargues still preferred the literal meaning, for example, regarding the "tenderness of meat"—the classical French language came, through the compassion inspired by the delicate or fragile nature of an object, to an attitude corresponding, in the subject, to a penchant henceforth designated by the word *tendresse* in the affective sense. In other languages this semantic shift took place on the basis either of the same Latin adjective *tener* (as in English with "tenderness," in Italian with *tenerezza*, and in Spanish with *ternura*) or of another word that had as its primary meaning the idea of weakness or delicacy (like *zart* in German, from which *Zärtlichkeit* is derived). Nevertheless, Kant, precisely in referring to the fragility of the feeling of friendship (*teneritas amicitiae*) in his "Doctrine of Virtue" (*The Metaphysics of Morals*, pt. 2, §46), paradoxically brings us back to the literal, pre-seventeenth-century sense of the French word *tendresse*. He states that "[f]riendship . . . is something so *tender* that if it is based on feelings [and not on principles and rules] it cannot for an instant be guaranteed against interruptions."

The semantic development of the French word *tendresse* can in fact be explained in two ways: either the object affected by tenderness in the pre-seventeenth-century sense of "weakness" inspires a sympathetic attention in others that is called upon to transform itself into a dynamics of love that will assume the name of *tendresse* in the affective sense; or such a passionate fire in the heart flaring up independently of any previous emotion is perceived as a typically feminine feeling, that is, one related to the sensitivity of the "weaker sex." But in both cases, we are dealing with the register of weakness, of inclination, that is, of *pathein* [παθεῖν], or what Spinoza calls the *animi pathema*, and even of defectiveness, for example, when one is said to have weakness for a person, an expression that corresponds to *prendre quelqu'un par son faible* (to attack someone at his weak point) and that leads to the notions of attraction, the traps of seduction, and charms from which someone suffers.

This avatar of the word *tendresse* is related to the modern meanings that were acquired at the same period by the noun *sentiment* and the epithet *sentimental*. The latter made its entrance, with the meaning it now has, through the 1769 translation of Laurence Sterne's *A Sentimental Journey*. The translator explained the word this way: "It has not been possible to render the English word 'sentimental' in French by any expression that might correspond to it, and it has therefore been left in English. Perhaps in reading it will be found that it deserves to be made part of our language." The adjective "sentimental" had only very recently appeared in English, in 1749, by derivation from "sentiment" (which had itself been borrowed from French in the fourteenth century), with its double meaning of opinion based on an evaluation that is more subjective than logical (according to the meaning that is found, for example, in David Hume's work) and a disposition belonging to the register of the heart and affectivity (and sometimes given a pejorative connotation, particularly emphasized in what is called *ressentiment*). German has adopted the epithet *sentimental* and the noun *Sentimentalität*, which has the meaning of "sentimentality" when it is preceded by the adjective *affektiert*.

"Pathological love" and "practical love" in Kant

The pair "pathological love" / "practical love" introduced by Kant at the beginning of the *Groundwork of the Metaphysics of Morals* (RT: Ak., 6:399), illustrates once again the bipolarity of the notion of love and the necessity of resorting to epithets. Kant's problem is the following: love seems to depend on sensibility alone, and as such it should be excluded from an ethics that posits that in principle an act has no moral value unless it is done out of duty. What then should we do with the duty of love expressed in the Old Testament: "You shall love your neighbor as yourself" (Lv 19:18; cf. Mt 22:39)? Kant was forced to recognize in "The Metaphysical Principles of Virtue" (pt. 2 of the *Groundwork*) that "a *duty to love* makes no sense" (RT: Ak., 6:401–2). The solution to this problem involves a distinction opposing "practical" love, which can be the object of a duty insofar as it resides in the will, to a "pathological love" depending on sensibility. "The Metaphysical Principles of Virtue" makes use of a parallel distinction between "charity" (*amor benevolentiae*) and "kindness" (*amor complacentiae*). In each case the distinction seeks to bring the principles of Kant's moral doctrine into conformity with the Scriptures: this attempt was given particular attention by the neo-Kantians, who in the early twentieth century reexamined the question of Kant's Christianity (cf. Bauch, "Luther und Kant").

be confounded with any other, as for example, in the case of God or a person loved with an incommensurable love.

1. Conjugal *fides* and courtly love

In his famous book *Love in the Western World*, Denis de Rougemont opts to harden the opposition that manifested itself in the twelfth century between two forms of love: on the one hand, the love between Christian spouses, founded on a mutual *fides*, and on the other hand, "courtly love" (or *fin'amor*, "refined love," or "pure love" in Occitan), which he assimilates to the adulterous, murderous passion felt by the troubadour or the hero (notably Tristan) with regard to the "lady of his thoughts." However, the expression "courtly love" appeared in French only very lately, around 1880, in the work

of Gaston Paris, whereas, to designate such a form of love, German had long had the untranslatable noun *die Minne*.
