Philosophy in Translation

A massive translation exercise with encyclopedic reach, the *Dictionary of Untranslatables: A Philosophical Lexicon*—first published in French under the title *Vocabulaire européen des philosophies: Dictionnaire des intraduisibles*—belongs in a genealogy that includes Diderot and d'Alembert's *Encylopédie* (1751–66), André Lalande's *Vocabulaire technique et critique de philosophie* (1902–23), Émile Benveniste's *Le Vocabulaire des institutions indo-européennes*, Laplanche and Pontalis's *The Language of Psycho-Analysis* (1967, classified as a dictionary), *The Stanford Encyclopedia of Philosophy* (an online resource inaugurated in 1995), and Reinhart Koselleck's *Geschichtliche Grundbegriffe* (a dictionary of political and social concept-history, 2004). Along another axis, it recalls Raymond Williams's short compendium of political and aesthetic terms, *Keywords*, informed by British Marxism of the 1960s and '70s. Unlike these works, however, the *Dictionary* fully mobilizes a multilingual rubric. Accordingly, entries compare and meditate on the specific differences furnished to concepts by the Arabic, Basque, Catalan, Danish, English, French, German, Greek (classical and modern), Hebrew, Hungarian, Latin, Polish, Portuguese, Romanian, Russian, and Spanish languages.

The book was the brainchild of its French editor, Barbara Cassin, herself a specialist of classical philosophy. In 1998, in the introduction to her translation of Parmenides's poem *On Nature*, Cassin had already ascribed the "untranslatable" to the interminability of translating: the idea that one can never have done with translation. In her writings on the pre-Socratics and the Sophists, she tethered the untranslatable to the instability of meaning and sense-making, the performative dimension of sophistic effects, and the condition of temporality in translation. Translation's "time," in Cassin's usage, was associated with the principle of infinite regress and the vertiginous apprehension of infinitude.

Working with assembled teams of scholars from multiple countries and languages, and drawing on the expertise of more than 150 contributors, Cassin coordinated and supervised the *Dictionary* project over a period of eleven years. Published by Éditions du Seuil in 2004, this curious and immensely ambitious book, weighing in at a million and a half words, was a surprise hit with the public. What made it unique was its attempt to rewrite the history of philosophy through the lens of the "untranslatable," defined loosely as a term that is left untranslated as it is transferred from language to language (as in the examples of *polis, Begriff, praxis, Aufheben, mimesis,* "feeling," *lieu commun, logos,* "matter of fact"), or that is typically subject to mistranslation and retranslation.

Despite the redoubtable scale of its erudition and the range of its philosophical ambition, the French edition of the *Dictionary* resonated with a heterogeneous readership: philosophers, scholars in all fields of the humanities, and everyone interested in the cartography of languages or the impact of translation history on the course of philosophy. The work's international reception was then enlarged by its translations (some still under way) into Arabic, Farsi, Romanian, Russian, and Ukrainian. When Princeton University Press committed to publish an English edition, the editors confronted a daunting and very particular set of challenges: how to render a work, published in French, yet layered through and through with the world's languages, into something intelligible to Anglophone readers; how to translate the untranslatable; how to communicate the book's performative aspect, its stake in what it means "to philosophize in translation" over and beyond reviewing the history of philosophy with translation problems in mind.

A group of three editors supervised and edited the English version: Emily Apter (a specialist in French, comparative literature, translation studies, Continental philosophy, and political theory); Jacques Lezra (a literary comparatist with special strengths in Spanish, early modern literature and philosophy, contemporary theory, and Anglo-American philosophy); and Michael Wood (a British comparatist, distinguished as a critic of literary modernism and contemporary cinema with professional expertise as a staff writer for the *London Review of Books*). Cassin and her close associate, the

philosopher Étienne Balibar, were de facto coeditors, because the U.S. editors consulted with them at every stage. The collective affiliated with the U.K.-based journal *Radical Philosophy* was also integral to the project's gestation. The journal published a special issue devoted to the book in 2006, including English translations of selected entries by the late David Macey. We have included Macey's translation of the entry SUBJECT in this volume both because it is a strong translation and because it allowed us to acknowledge, albeit only indirectly, *Radical Philosophy*'s abiding commitment to a practice of philosophical translation that would shake up the teaching of philosophy in departments dominated by the normative strictures of the Anglo-analytic philosophical tradition.

The *Dictionary of Untranslatables*, like its French predecessor, and like the editions published or under way in other languages, was a labor of many. The translators—of which there were five (Christian Hubert, Jeffrey Mehlman, Steven Rendall, Nathanael Stein, and Michael Syrotinski)—became contributors on every level. Their queries and suggestions, along with those of the copy editors, each of whom had special language proficiencies, proved crucial to the editing process and served as a constant reminder that to translate is an act of rewriting, and, in this particular instance, of assisting words in their becoming philosophical. A broad network of colleagues and specialists generously provided corrections and revisions, and yet another layer of collaboration was provided by graduate student assistants who checked citations and compiled new bibliographies.

The bibliographical revisions were by no means a minor part of remodeling the French edition for an Anglophone audience. In addition to English translations of canonical philosophical texts and standard reference works in English on concepts and philosophers, we added selections from a critical literature that contributed to the *Dictionary*'s acknowledgment of what is referred to in the Anglophone world as theory. "Theory" is an imprecise catchall for a welter of postwar movements in the human sciences—existentialism, structural anthropology, sociolinguistics, semiotics, history of *mentalités*, post-Freudian psychoanalysis, deconstruction, post-structuralism, critical theory, identity politics, postcolonialism, biopolitics, nonphilosophy, speculative materialism—that has no equivalent in European languages. What is often referred to as "theory" in an Anglophone context would simply be called "philosophy" in Europe. The *Dictionary of Untranslatables* acknowledges this divergence between "theory" and "philosophy" not at the expense of how the editors of the French edition defined philosophy (which, it must be said, was already noncanonical in the choice of terms deemed philosophical), but as a condition of the work's reception by Anglophone readers accustomed to an eclectic "theory" bibliography that not infrequently places G.W.F. Hegel, Friedrich Nietzsche, Martin Heidegger, Walter Benjamin, Theodore Adorno, Michel Foucault, Jacques Derrida, Jacques Lacan, Gilles Deleuze, Julia Kristeva, Jean-Luc Nancy, Antonio Negri, Hélène Cixous, Kojin Karatani, Alain Badiou, Giorgio Agamben, Jacques Rancière, Bruno Latour, and Slavoj Žižek in the same rubric with Stuart Hall, Homi Bhabha, Donna Haraway, Henry Louis Gates, Judith Butler, Eve Kosofsky Sedgwick, Friedrich Kittler, Gayatri Chakravorty Spivak, Edward Said, Fredric Jameson, and Paul Gilroy.

Bearing in mind, then, that the word "philosophy" in the original French title was already an untranslatable insofar as it defaulted to "philosophies" that might line up more easily with "theory" in an Anglophone (and especially U.S. American) context, one of our initial debates focused on how to translate the book's title. There was a doubling of genre announced in the French. Is it a "vocabulary" or a "dictionary"? For Cassin (following Benveniste's *Le Vocabulaire des institutions indo-européennes*), "vocabulary" underscored a non-exhaustive ensemble of terms chosen for their common linguistic "symptoms," while "dictionary," designating an aspiration to impossible completeness, was meant to stand alongside "vocabulary" as an ironic complement. Together, in Cassin's view, they posed the problem of the form of the work as an oxymoron. Such subtle distinctions could, however, easily be missed. Broadly speaking, a dictionary contains an alphabetical list of words with information about them, whereas a vocabulary, the generic term for sets of words that persons are familiar with in a language, is similarly used to describe alphabetized and explained word ensembles, usually for a pedagogical purpose relating to a special field. In France, the long tradition of dictionaries could be bracketed by Pierre Bayle's seminal *Dictionnaire historique et critique* (1697), which privileged biographies and historical events, and the Presses Universitaires de France dictionaries covering such diverse fields as cinema, psychoanalysis, work, sociology, violence, and the human sciences. Given, then, the relative interchangeability of "vocabulary" and "dictionary,"

we replaced the former with the latter in the main title, and added "lexicon" to the subtitle in the spirit of the expression "terms entering the lexicon," which captures (in a manner that brings out the original work's underlying intention) how live languages incorporate new or non-native elements.

Although some of us worried about a certain awkwardness in the use of the adjective "untranslatable" as a noun, by foregrounding it in the English title we signaled its important role as an organizing principle of the entire project. We also decided to eliminate the reference to Europe. This was a difficult call, as the European focus of the book is undeniable. Removing the emphasis on "European philosophies" would leave us open to criticism that the *Dictionary* now laid claim to being a work of world philosophy, a tall order that it patently did not fill. Our justification on this score was twofold: so that future editions of the *Dictionary of Untranslatables* might incorporate new entries on philosophy hailing from countries and languages cartographically zoned outside of Europe; and because, philologically speaking, conventional distinctions between European and non-European languages make little or no sense. Moreover, it was our sense that the adjective "European," often assumed to refer to a common legacy of Christendom, humanism, and Enlightenment principles, actually misrepresents the complexity of identifying "Europe" culturally and geopolitically at any given moment in history.

Notwithstanding concerns about the global hegemony of English (and more pointedly still, about those forms of standardized, Internet-inflected, business English commonly dubbed "Globish" that are frequently associated with financial "outcomes" and "deliverables"), we assume that the book, by dint of being in English, will disseminate broadly and reach new communities of readers. The book's diffusion in Asia, South Asia, Africa, the Middle East, and Latin America will lead, we hope, not only to more translations in other languages, but also to spin-off versions appropriate to different cultural sites and medial forms. We hope that the English edition, in its current and future iterations, will help to advance experimental formats in research, data-mining, and pedagogy, as well as models of comparativism that place renewed emphasis on the particularities of idiom. Philosophical importance, in this case, is accorded to how a term "is" in its native tongue, and how it "is" or "is not" when relocated or translated in another language. Idiomatic and demotic nuance are fully recognized as constitutive of philosophy, prompting

a shift from concept-driven philosophical analysis to a new kind of process philosophy, what Cassin calls "philosophizing in languages."

In promoting revivified connections among philosophy, translation, linguistics, and philology, the *Dictionary* encourages curricular initiatives in the form of courses, colloquia, and cross-institutional degree programs. The *Dictionary* proves useful for teaching in myriad ways, especially at advanced undergraduate and graduate levels. In an era in which countries all over the world are adopting policies—often in line with the European Union's endorsement of English as its *lingua franca*—that would make English the official language of instruction in scientific and technical fields (if not the social sciences, area studies, and the humanities as well), students increasingly naturalize English as the singular language of universal knowledge, thereby erasing translation-effects and etymological histories, the trajectories of words in exile and in the wake of political and ecological catastrophes. In the *Dictionary* there is a consistent effort to communicate the political, aesthetic, and translational histories of philosophical keywords. The Russian term *pravda*, for instance, is arrayed alongside the Greek *dikaiosunê*; the Latin *justitia*; and the English "righteousness," "justice," "truth," and "law"—as well as *vérité, droit, istina, mir, postupok, praxis, sobornost'*, and *svet*. The article speculates that *pravda*'s absence in the Russian *Encyclopedia of Philosophy* is attributable to its being too ideologically marked as the name of the USSR's official government-controlled newspaper. *Pravda* thus comes into its own as that which is philosophically off limits in its home country. The article also locates *pravda* in an extremely complex semantic field, in the "hiatus" between legality and legitimacy, justice and truth, ethics and praxis. It is traced to the short-circuiting of pardon by vengeance, and vice versa. The word's geo-philosophical trajectory unfurls into a narrative marked by the themes of exile, solidarity with persecuted minorities and refugees, Russian Saint-Simonianism, and Russophilic worldviews.

Though it is not set up as a concept-history, the *Dictionary* lends itself to pedagogical approaches that explicate how concepts come into existence in, through, and across languages. Using the *Dictionary* as a tool to teach Freud's *Beyond the Pleasure Principle* (*Jenseits des Lustprinzips*), for example, reveals how important the German term *Lust* was to the specificities of Freud's theory, better enabling comprehension of how Freud derived from the word constructs of the death-drive,

sublimation, and thought as such. From the *Dictionary*'s entry PLEASURE one gleans a whole new appreciation of the disparate meanings acquired by Freud's fundamental psychoanalytic concepts, depending on their languages of translation:

> The initial meaning of the German word *Lust* does not seem to have been "pleasure." Like the English "lust," it derives from the Indo-European *lutan*, which means "to submit," "to bend" and is supposed to have originally designated only a more or less resistible inclination. But whereas English "lust" has retained the restricted meaning of "unbridled desire," "cupidity," or "craving," the semantic range of the German term extends from "appetite," "sexual desire" . . . or "fantasy" to all the forms of satisfaction. In short, the semantic field of *Lust* extends beyond the sensible affect of pleasure to designate the desire that is *Lust*'s origin and effect.

If the *Dictionary* enhances attunement to linguistic difference in the reading of psychoanalysis or philosophy, it also facilitates a philosophical orientation within literary analysis. While working as an editor on the *Dictionary*, for example, Michael Wood found himself sensitized to the way Proust used the word "justice" when writing about the Dreyfus affair. The *Dictionary* entry RIGHT/JUST/GOOD focuses on semantic discrepancies between English and French. Two French words for good, *bien* and *bon*, have similar meanings; in English, however, *bien* can be translated as either "right" or "good," with distinct meanings. And while French clearly distinguishes between "the good" and "the just," with the former designating individual interest or collective good and the latter universal moral law, English is fuzzier on the difference between these terms.

Bearing this in mind, Wood found the difference between French *justice* and English "justice" all the more striking, because the word looks the same in both languages. Reading Proust, reading Proust scholars, testing words in varying contexts, and questioning native speakers, he began to sense that *justice*, in French, unless otherwise qualified, very often has the primary meaning of fitting the punishment to the crime, as in "to do justice," or "to see that justice is done." Although *justice* in French, as in English, has three main meanings—conformity with the law, the practice of justice (the judiciary branch of government), and justice in the sense of equitableness (justice in the moral sense)—the question is which of these meanings is in play at any given time.

Do we know which? Does the speaker know which? The stakes are serious enough for a major French scholar to say, almost without surprise, that Proust does not believe in the rule of law. How can this be? Proust spent a good portion of his life worrying about the miscarriage of justice in the case of Alfred Dreyfus. Still, at one point he has the narrator of *In Search of Lost Time* say "the sense of justice was absent in me, to the point of complete moral idiocy. In the depths of my heart I was immediately on the side of the underdog, of whoever was unhappy."[1] We may want to say at once that he's obviously not talking about justice. But he is.

What is needed, to get a comparative sense of things, is not a firmer or clearer translation of difficult words, but a feeling for how relatively simple words chase each other around in context. Wood pictures the situation as something like a traffic system. Three or four vehicles carry whatever is needed in any language, but the vehicles circulate differently in different places, and divide their loads differently. Thus, to take a simple example, where (with respect to the Proust translation just cited) English uses the word "law" four times—law court, law school, rule of law, force of law—the original French uses *justice* once, *droit* twice, and *loi* once. The same ideas circulate in each case: law, justice, rights, rightness, fairness, and so on. But it's easy to follow the wrong vehicle.

Wood's example of how to read "justice" in Proust through the lens of the untranslatable (an untranslatability rendered more acute in this case because French *justice* and English "justice" are homonymic "false friends"), opens up a world of literature that is alive to the "abilities" of untranslatability. In this picture, what is lost in translation is often the best that can be found, as readers find their way to a *Denkraum*—a space of thinking, inventing, and translating, in which words no longer have a distinct definition proper to any one language.

This said, it is by no means self-evident what "untranslatability" means. This is how Jacques Derrida's *Monolingualism of the Other* approaches the term (in Patrick Mensah's translation):

> Not that I am cultivating the untranslatable. Nothing is untranslatable, however little time is given to the expenditure or expansion of a competent discourse that measures itself against the power of the original. But the "untranslatable"

---

remains—should remain, as my law tells me the poetic economy of the idiom, the one that is important to me, for I would die even more quickly without it, and which is important to me, myself to myself, where a given formal "quantity" always fails to restore the singular event of the original, that is to let it be forgotten once recorded, to carry away its number, the prosodic shadow of its quantum. . . . In a sense, nothing is untranslatable; but *in another sense*, everything is untranslatable; translation is another name for the impossible. In another sense of the word "translation," of course, and from one sense to the other—it is easy for me always to hold firm between these two hyperboles which are fundamentally the same, and always translate each other.[2]

As Jacques Lezra notes, one sense of the term "translatable," then, is signaled by the articulation between geometry and rhetoric provided by the concept of hyperbole. Here, tendentially, "to translate" means to map one point or quantum onto another according to an algorithm: translation is understood as mechanics, as a function, as measure or common measure. This sort of "translation" requires us to understand natural languages as if they were mapped onto a mathematical, or mathematizable, or quantifiable space: what one might call the monadic or mapping or isomorphic definition of translation. Both word-for-word translation and sense-for-sense translation, those archaic Cain-and-Abel brothers of the translational pantheon, can be imagined according to this sort of mathematical, functional paradigm. But what happens when we "translate" this sort of functional translation from the domain of quanta to the domain of rhetoric, even of philosophical rhetoric, where hyperbole has a quite different sort of standing? Here nothing like a smooth, mathematizable space prevails outside of the fantasy of a certain Neoplatonist.

Editorial Liberties

In shifting the *Dictionary*'s language of address, we felt compelled to plug specific gaps, especially those pertaining to "theory," understood in the Anglophone academic sense of that term. We added material by Kevin

McLaughlin to clarify Walter Benjamin's distinction between *Erinnerung* and *Gedächtnis* in the entry MEMORY; by Leland de la Durantaye on Giorgio Agamben's marked use of the expressions *Homo sacer* and "bare life" in the entry ANIMAL; by Étienne Balibar on Jacques Lacan's fungible use of *instance* as a term for "moment," "instantiation," "agency," in the entry WILL; by Immanuel Wallerstein on Ferdinand Braudel's concept of *longue durée* in MOMENT; by Daniel Hoffman-Schwartz on Alain Badiou's reliance on the "forced" relationship between "forcing" and *forçage* in MACHT; and by Michael LeMahieu on Willard Quine's use of *quine/qualia* in OBJECT. Though the book included passages here and there on fancy, imagination, feeling, passion, emotion, sentiment, affection, senses, and sense, we reinforced these terms with dedicated discussions of "fancy" and "feeling" (both by Susan Wolfson) included in the entries FANCY and SENSE. Topical additions on language, translation, and humanism included supplements on "glossolalia" (by Daniel Heller-Roazen), in the entry LOGOS; Leonardo Bruni's humanist practice of translation (by Jane Tylus) in TO TRANSLATE; and "the humanities" (by Michael Wood) in BILDUNG. These highlights were intended to enhance the *Dictionary*'s relevance to literary theory and comparative literature. In response to a raft of recent interdisciplinary debates around surveillance, security, care, and cure, we solicited an entry on the wildly ramified cognates of SECURITAS by John T. Hamilton. What began as a new supplement by Kenneth Reinhard to MITMENSCH grew into a separate entry, NEIGHBOR. We also felt compelled to do more with the cluster of semes associated with "sex" and "gender." While both terms were represented in the original, and entered into dynamic relation with *genre* and *Geschlecht* (and thus to related concepts discussed in those entries, such as "species," "kind," "race," and "people"), we were able to turn this word grouping into a site of critical cross-examination. In this case, Judith Butler on "gender trouble" and Stella Sandford on the French de-sexing of "sexual difference" in English, invite being read in colloquy with Monique David-Ménard and Penelope Deutscher on GENDER and Geneviève Fraisse on SEX.

Other additions include media theory (there is now an entry, MEDIA/MEDIUM, written by Ben Kafka, with an insert on *ordinateur*/"computer"/*numérique*/"digital" by Antoine Picon); CHÔRA in deconstructive architectural theory and practice (courtesy of Anthony Vidler); postcolonial theory (there are new inserts by Robert Young on *colonia* and *imperium*, and by Emilienne Baneth-Nouailhetas on "postcolonialism,"

---

[2] Jacques Derrida, *Monolingualism of the Other,* trans. Patrick Mensah (Stanford, CA: Stanford University Press, 1998), 56–67.

in STATO; and by Gayatri Chakravorty Spivak on "planetarity" in WELT); and central keywords in Arabic (Souleymane Bachir Diagne contributed pieces on *rabita*, in SEIN; *Qur'ān*, in TO TRANSLATE; and *ijtihad*, in BELIEF). Though each of these examples could have been supplemented by countless others, we were restricted by page limitation, deadline, and expediency to make certain choices, albeit somewhat arbitrary ones, given certain obvious candidates that we hope will make their way into a future revised and expanded edition. Inevitably, the *Dictionary* lends itself to the parlor game of identifying terms undeservedly left out. But as Cassin has often remarked, if one were to be rigorously inclusive, Greek philosophical terms alone would overflow the entire volume.

If the selection of additional entry topics had a lot to do with the heat of a conversation among the editors or a casual encounter, there was less contingency governing what to delete. We occasionally found ourselves questioning the French editors' choice of untranslatables, some of which struck us as nonphilosophical or whimsically highlighted. Such terms as "multiculturalism," "happening," "judicial review," and "welfare" were interesting samples of what European thinkers might regard as untranslatable, but they struck us as having insufficient traction on this score for English speakers. A term such as *Syntagorem*—important though it was as a conceptual prong of medieval Scholasticism—was sacrificed because it was densely technical and ultimately uneditable. For the most part, however, we preserved original entries even when they were highly resistant to translation.

Though we were dealing with a French text, the extent of our translation task became clear only when we realized that a straightforward conversion of the French edition into English simply would not work. Almost every aspect of the translation had to be rethought, starting with the entry terms themselves. Which ones should remain in their original language? Which should be rendered in English? *Bien-être* was retained in French, but *bonheur*—which also carries French Enlightenment freight—was converted to "happiness." It is difficult to reconstruct the rationale for all these decisions: suffice it to say, we had our reasons, even if they fell short of being airtight justifications. Another extremely thorny issue concerned how to revise entries to reflect an Anglophone orientation without reverting to rank Anglocentricity. To give one example, under the entry for the French term *mot*, we discovered that the English term "word" never appeared. We had to rectify this absence in the English

edition by re-framing the entry for WORD to emphasize why the word *mot* was a French untranslatable. The term *Willkür* presented another kind of problem. The entry focused on a tension, essentially grounded in Kant's reworking of a Cartesian legacy, between *libre arbitre* (a free and independent arbitrator, capable of introducing an outcome neither determined nor necessary) and (*freie*) *Willkür* ("free will," understood in terms of the highest exercise of reasoning; a "freedom" expressive of the highest autonomy of the will). According to the entry as written by Pierre Osmo, Kant's use of the term included additional connotations in German of "arbitrariness" and "caprice." Osmo argues that when Kant used the expression *freie Willkür* (often rendered in English as "free power of choice"), it retained its capricious potential. But this potential typically failed to register in French, in which, according to Osmo, the expression *libre arbitre*, routinely used to translate both *Willkür* and *freie Willkür*, flattened Kant's intentions and originality.

For the English translator of Osmo's article these points proved particularly difficult to convey. The standard English translation of Kant's *Willkür* was "choice" or "free choice," which deflects Osmo's philosophical point about the lost capriciousness of *Willkür* in French translations of Kant. The tensions articulated by Osmo between French and German philosophy (predating and postdating Kant), over conceptions of volition, freedom of the will, the arbitrary exercise of freedom of choice, and the morally, rationally authorized decision were thrown off course by English. Once English intervened at the level of translating a French translation of German, one could say that "meta" untranslatability reared its head, which is to say, an interference at the level of translating unforeseen by the article's author and at odds with her or his argument about a given term's untranslatability in a specific linguistic context.

Specters of National Subjects

Though the original language of the *Dictionary* was French, and the orientation was toward the Hellenic, Scholastic, Enlightenment, and German European tradition, Cassin was interested in what she called a "metaphysics of particles."[3] She referred here to the

---

[3] Barbara Cassin used this expression in discussing the *Vocabulaire* at New York University's Humanities Initiative, February 11, 2010.

shape-shifting capacities of linguistic particulates within a particular language (as in the way German prefixes and suffixes become operative as building blocks of new words). Each language, she maintained, "contains within itself the rules of its own invention and transgression."[4] The book emphasizes the singular philosophical nuances of discrete languages not because Cassin was committed to resurrecting fixtures of "ontological nationalism" (whereby languages are erected as stand-ins for national subjects), but rather because she wanted to emphasize the mobile outlines of languages assuming a national silhouette or subsiding into diffuse, polyglot worlds.

Opposed to the model of the dictionary as a concept mausoleum, Cassin treated words as free radicals, as *parole in libertà*. She devised the construct of *lemmes* (directionals, or signposts) as navigating mechanisms. The directionals would prompt readers to pursue philological links, logical arguments, and conceptual lines of flight revealed by a term's history of translation that would not be apparent in a cross-referencing index. Sometimes these directionals resemble miniature articles unto themselves. Signaling where terms congregate, form star clusters, or proliferate in multiple languages, they contour preponderant overarching ideas and recurrent story lines. These include (but are obviously not limited to) the logic of classical orders; theologies of the law; metaphysical transcendence; aesthetic and domestic economy; sense and signification; human versus nonhuman; gender and species; materialism (both realist and speculative) and phenomenological experience; orders of sovereignty in the naming of polity and political institutions; utopian theories; dialectical thinking; *Dasein*, self-consciousness, and intersubjectivity; temporality and history; memory, cognition, and the intuition of intelligence; creative originality; free will and moral autonomy; rational self-interest and analytic reason; possessive individualism; and the emergence of the modern liberal subject. Notably underplayed, as Howard Caygill has pointed out, was the "divergence between philosophy and science in the modern period," and more specifically, the impact of natural philosophy, Darwinism, evolutionary theory, and genetics.[5]

What the *Dictionary* does best, perhaps, is produce a cartography (Caygill called it a "geo-philosophy") of

linguistic diaspora, migration, and contested global checkpoints from early empires to the technologically patrolled and surveilled post-9/11 era. National languages are profiled not as static, reified monuments of culture, nor as technologies of signification stripped of political consequence, but as internally transnational units, heterodox micro-worlds.

This said, the *Dictionary* is not without its nationalist hauntings. Nowhere are such hauntings more evident than in the entries devoted to languages themselves. Despite the editors' express intention to undercut national language ontologies, there is recidivism in these entries. PORTUGUESE becomes a hymn to the sensibility of the baroque, with *Fado* (fate, lassitude, melancholia) its emblematic figure. GERMAN hews to the language of Kant and Hegel. GREEK is pinioned by the Athenian efflorescence and Heidegger's homage to Greek as the *Ursprache* of philosophy. ITALIAN remains indebted to Machiavelli's notion of "the effective truth of things," Vico's philological historicism, and clichés of expressive *sprezzatura*. In tracing how French came to be globally identified as a preeminent language of philosophy, Alain Badiou both criticizes and mythifies the national language when he insists that for Descartes, Bergson, Sartre, Deleuze, and Lacan, to philosophize is merely to think openly and democratically. Obscurity itself results (or may result) from the need of French philosophers to be French *writers*. Unlike German, whose truth is attained through verbal and syntactic unraveling, French syntax is notionally transparent to truth. Close to being an Adamic language in Badiou's ascription, it lends itself to logical formalism, axioms, maxims, and universal principles. Above all, for Badiou, the French language is conducive to the politicization of expression, unseating predicates through the play of substitutions and the art of the imperious question (what Lacan called the "denunciatory enunciation"). Though national ontology is, strictly speaking, anathema to Badiou, one could say that because he does not historicize the myth, only playfully deploys it, he backhandedly returns it to linguistic nominalism. Such ontologies are, of course, impossible to purge entirely from language-names, for they lend coherence to the world map of languages; they triage and circumscribe the verbal grammatical protocols that qualify for naming as a discrete language.

Even the term "translation," which signifies language in a state of non-belonging, turns out to be nationally marked. The entry TO TRANSLATE notes that *dolmetschen*, an anachronistic verb whose origins go

---

[4] Barbara Cassin, *Plus d'une langue* (Paris: Bayard Editions, 2012), 43. Translation is my own.

[5] Howard Caygill, "From *Abstraction* to *Wunch*: The philosophies," *Radical Philosophy* 138 (July/August 2006): 13–14.

back to Martin Luther's translation of the Bible into German, renders "to translate" as, literally, "to render as German" or "to Germanize." Schleiermacher was instrumental in replacing *dolmetschen* with *übersetzung* on the grounds that *dolmetschen* referred to the functional work of the interpreter, whereas *übersetzung* referred to the loftier challenge of rendering thought. From this perspective, *übersetzung* is the name of a disavowed Germanocentrism that clings to the history of the word "translation."

Cassin's dictionary was equipped from its inception to do battle with the ontological nationalism of German theories of the subject even while providing wide berth to entries for terms such as *Aufhebung* or *Dasein*. More pointedly, it offered a direct challenge to the preeminence of Anglo-analytic philosophical traditions. In her introduction, Cassin notes analytic philosophy's inveterate hostility to its Continental counterpart, its zeal for (to borrow Cassin's vivid expression) "the puncturing of the windbags of metaphysics" (dégonfler les baudruches de la métaphysique). One way to approach the *Dictionary* is as an attempt to combat analytic philosophy's dismissiveness toward Continental philosophy. Ordinary language philosophy, along with the names of its avatars—Wittgenstein, Russell, Austin, Quine, and Cavell—was represented in the French edition, to be sure, but in general, the imperium of English thought was strategically curtailed. This was especially evident with respect to the tradition of British empiricism, which has no dedicated entry. "Sensation" or "sensationalism"—bulwarks of British empiricism normally accorded substantial amounts of space in standard histories or encyclopedias of philosophy—were subsumed under entries on SENSE (*sens*), CONSCIOUSNESS (*conscience*), and FEELING. Francis Bacon, Thomas Hobbes, John Locke, George Berkeley, and David Hume received scant attention, especially in contrast to Kant, Hegel, and Husserl. As editors, we decided to preserve this skewed distribution of emphasis because it was clearly an important part of the polemical raison d'être of the French original.

Tasks of the Translators

Over and over, as editors, we confronted the task of "translating the untranslatable." This involved at once a plunge into the Benjaminian problematic of translatability as such, qualified by Samuel Weber in terms of Walter Benjamin's activation of translation's

"-abilities" (the "*barkeit*" part of *Ubersetzbarkeit*), and a trial (*épreuve*, endurance test) requiring the conversion of translation failure into something of value and interest. We became increasingly drawn to the paradoxical premise of the book, namely, that of the untranslatable as the interminably (not) translated. One of the risks of the casual use of "untranslatable" is the suggestion of an always absent perfect equivalence. Nothing is exactly the same in one language as in another, so the failure of translation is always necessary and absolute. Apart from its neglect of the fact that some pretty good equivalencies are available, this proposition rests on a mystification, on a dream of perfection we cannot even want, let alone have. If there were a perfect equivalence from language to language, the result would not be translation; it would be a replica. And if such replicas were possible on a regular basis, there would not be any languages, just one vast, blurred international jargon, a sort of late cancellation of the story of Babel. The untranslatable as a construct makes a place for the private anguish that we as translators experience when confronted with material that we don't *want* to translate or see translated. A certain density or richness or color or tone in the source language seems so completely to defy rendering into another language that we would just as soon not try: the poverty of the result is too distressing, makes us miss the first language as we miss a friend or a child. This may be true at times, but we can make a virtue out of seeing differences, and the constant recourse to the metaphor of loss in translation is finally too easy. We can, in any case, be helped to see what we are missing, and that is what much of this book is about.

Over the course of five years we found ourselves engaged in a hands-on way with an encyclopedic project: one that is built on translation and perforce prompts a rethinking of the relation between translation and knowledge-production at every turn. To work on anything encyclopedic is to encounter frustration and exhilaration. At every moment, we had to balance the temptation of disappearing down the rabbit hole of philosophy against the need to withdraw from content so as to concentrate on the material management of the text. Editing, triage, relaying the right version; such mundane tasks were much harder to master than writing or speaking about the project. At one point we mislaid the translated version of *inconscient*. The irony of "losing" the text's "unconscious" hardly needed comment, as it so closely paralleled the at times very

conscious wish to lose the albatross of this massive endeavor.

If there is one thing we have come away with, however, it is a deep excitement about using philosophical translation as a way of doing philosophy or "theory," or literary criticism. We see the book as a major contribution to a renewed philosophical turn in translation theory and practice. It occasions reflection on how "untranslatable" carries within it a philosophy of "languages together." What we find in this book, in a sense, is philosophy cast as a political theory of community, built up through the transference and distribution of irreducible, exceptional, semantic units. The places where languages touch reveal the limits of discrete national languages and traditions. We obtain glimpses of languages in paradoxically shared zones of non-national belonging, at the edge of mutual unintelligibility. Such zones encompass opacities at the edges of the spoken and written, a bilingualism that owns up to the condition of un-ownable, unclaimable language property, and perverse grammatology. Untranslatables signify not because they are essentialist predicates of nation or *ethnos* with no ready equivalent in another language, but because they mark singularities of expression that contour a worldscape according to mistranslation, neologism, and semantic dissonance.

Emily Apter

Acknowledgments

A translation of this breadth and ambition would have been impossible to carry off without the vital help and support of many colleagues, students, friends and editorial professionals. We must first thank Barbara Cassin, whose conception of the *Dictionary of Untranslatables* as a philosophical project and whose constant engagement with every step of the English translation, inspired us from beginning to end. Etienne Balibar, one of the major contributors to the French edition, was also an integral member of our editorial group and crucial to the English edition when it was an emergent and transitional object. Eric Alliez, Peter Osborne, and Stella Sandford of the Centre for Research in Modern European Philosophy, now at Kingston University, London, took the first steps toward an English edition. We thank them, the late David Macey, and the journal *Radical Philosophy* for permission to draw on their inaugural work.

We were fortunate to enjoy the constant support of two editors at Princeton University Press: Hanne Winarsky, who recognized the intrinsic interest of the project and arranged to have the book published in the *Translation/Transnation* series, and Anne Savarese, executive editor, who supervised every stage of the complex production process and offered invaluable suggestions on how to make the volume stronger as a research and reference tool. The corps of editors at Princeton who oversaw revision was exceptionally dedicated and proficient. Our special thanks to Karen Fortgang, senior production editor, who kept all of us on track; Ali Parrington, associate production editor; Beth Gianfagna, Aimee Anderson, Maria den Boer, Gail Schmitt, Linda Truilo, Sherry Wert, copy editors (all of whom gave us the benefit of their diverse linguistic expertise); and Natalie Baan and Laurie Burton, proofreaders.

We are profoundly grateful to all the translators—Steven Rendall, Jeffrey Mehlman, Michael Syrotinski, Christian Hubert, and Nathanael Stein—who had the courage to take on this formidable task by transforming philosophical translation into praxis. We were also lucky to have two remarkable research assistants on board: Manoah Finston, executive editorial assistant, who lent us his skills as an organizational powerhouse, and Kevin McCann, whose reflections on entries and help with German and French translations proved crucial at many turns. Other graduate students made important contributions to translation corrections and bibliography: Zakir Paul, Kathryn Stergiopoulos, and Dora Zhang from Princeton University, and Katherina Natalia Piechocki from New York University. Omar Berrada and Souleymane Bachir Diagne offered generous help with queries pertaining to Arabic.

A special note of gratitude must be expressed to Jane Tylus, who wrote for the English edition and provided a forum for discussions of the *Dictionary of Untranslatables* at the Humanities Initiative of New York University. We would also like to acknowledge institutional support from the Office of the Dean of

Introduction

One of the most urgent problems posed by the existence of Europe is that of languages. We may envisage two kinds of solution. We could choose a dominant language in which exchanges will take place from now on, a globalized Anglo-American. Or we could gamble on the retention of many languages, making clear on every occasion the meaning and the interest of the differences—the only way of really facilitating communication between languages and cultures. The *Dictionary of Untranslatables* belongs to this second perspective. But it looks to the future rather than to the past. It is not tied to a retrospective and reified Europe (which Europe would that be, in any case?), defined by an accumulation and juxtaposition of legacies that would only reinforce particularities, but to a Europe in progress, fully active, *energeia* rather than *ergon*, which explores divisions, tensions, transfers, appropriations, contradictions, in order to construct better versions of itself.

Our point of departure is a reflection on the difficulty of translating in philosophy. We have tried to think of philosophy within languages, to treat philosophies as they are spoken, and to see what then changes in our ways of philosophizing. This is why we have not created yet another encyclopedia of philosophy, treating concepts, authors, currents, and systems for their own sakes, but a *Dictionary of Untranslatables*, which starts from words situated within the measurable differences among languages, or at least among the principal languages in which philosophy has been written in Europe—since Babel. From this point of view, Émile Benveniste's pluralist and comparatist *Vocabulary of Indo-European Institutions* has been our model. In order to find the meaning of a word in one language, this book explores the networks to which the word belongs and seeks to understand how a network functions in one language by relating it to the networks of other languages.

We have not explored all the words there are, or all languages with regard to a particular word, and still less all the philosophies there are. We have taken as our object *symptoms* of difference, the "untranslatables," among a certain number of contemporary European languages, returning to ancient languages (Greek, Latin) and referring to Hebrew and Arabic whenever it was necessary in order to understand these differences. To speak of *untranslatables* in no way implies that the terms in question, or the expressions, the syntactical or grammatical turns, are not and cannot be translated: the untranslatable is rather what one keeps on (not) translating. But this indicates that their translation, into one language or another, creates a problem, to the extent of sometimes generating a neologism or imposing a new meaning on an old word. It is a sign of the way in which, from one language to another, neither the words nor the conceptual networks can simply be superimposed. Does one understand the same thing by "mind" as by *Geist* or *esprit*, is *pravda* "justice" or "truth," and what happens when we render *mimesis* as "representation" rather than "imitation"? Each entry thus starts from a nexus of untranslatability and proceeds to a comparison of terminological networks, whose distortion creates the history and geography of languages and cultures. The *Dictionary of Untranslatables* makes explicit in its own domain the principal symptoms of difference in languages.

The selection of entries arises from a double labor of exploration, both diachronic and synchronic. Diachrony allows us to reflect on crossings, transfers, and forks in the road: from Greek to Latin, from ancient Latin to scholastic then humanist Latin, with moments of interaction with a Jewish and an Arab tradition; from an ancient language to a vernacular; from one vernacular to another; from one tradition, system, or philosophical idiom to others; from one field of knowledge and disciplinary logic to others. In this way we reencounter the history of concepts, while marking out the turnings, fractures, and carriers that determine a "period." Synchrony permits us to establish a state of play by surveying the present condition of national philosophical landscapes. We are confronted with the irreducibility of certain inventions and acts of forgetting: appearances without any equivalent, intruders, doublings, empty categories, false friends, contradictions, which register within a language the crystallization of themes and the specificity of an operation. We then wonder, on the

basis of the modern works that are both the cause and the effect of the philosophical condition of a given language, why the terms we ordinarily consider as immediate equivalents have neither the same meaning nor the same field of application—what a thought can do in what a language can do.

The space of Europe was our framework from the beginning. The *Dictionary* has, in fact, a political ambition: to ensure that the languages of Europe are taken into account, and not only from a preservationist point of view, as one seeks to save threatened species. In this respect, there are two positions from which we clearly distinguish our own. The first is the all-English one, or rather the all-into-English one—that official English of the European Community and of scientific conferences, which certainly has a practical use but is scarcely a language ("real" English speakers are those that one has the most difficulty in understanding). English has imposed itself today as an "auxiliary international language," as Umberto Eco puts it. It has assumed its place in the chronological sequence of instrumental languages (Greek, Latin, French): it is at once the universal language of the cultured technocracy and the language of the market; we need it, for better or for worse. But the philosophical situation of English as a language deserves a slightly different examination. In this case, English is rather in the line of the *characteristica universalis* that Leibniz dreamed of. Not that English can ever be reduced to a conceptual calculus on the model of mathematics: it is, like any other, a natural language, that is to say the language of a culture, magnificent in the strength of its idiosyncrasies. However, for a certain tendency in "analytic philosophy" (it is true that no terminological precaution will ever suffice here, because the label applies, via the "linguistic turn," even to those who teach us again to question the language, from Wittgenstein to Austin, Quine, or Cavell), philosophy relates only to a universal logic, identical in all times and all places—for Aristotle, for my colleague at Oxford. Consequently, the language in which the concept finds its expression, in this case English, matters little. This first universalist assumption meets up with another. The whole Anglo-Saxon tradition has devoted itself to the exclusion of jargon, of esoteric language, to the puncturing of the windbags of metaphysics. English presents itself, this time in its particularity as a language, as that of common sense and shared experience, including the shared experience of language. The presumption of a rationality that belongs to angels rather than humans and a militant insistence on ordinary language combine to support a prevalence of English that becomes, in the worst of cases, a refusal of the status of philosophy to Continental philosophy, which is mired in the contingencies of history and individual languages.

Neither . . . nor. The other position from which we wish to distinguish our own is the one that has led philosophy from the idea of the spirit of language, with all its clichés, to an "ontological nationalism" (the expression is that of Jean-Pierre Lefebvre). The position finds its image in Herder, at the moment when he determines that translation, as imitation and transplantation, is the true vocation of the German language: "If in Italy the muse converses in song, if in France she narrates and reasons politely, if in Spain she imagines chivalrously, in England thinks sharply and deeply, what does she do in Germany? She *imitates.* To *imitate* would thus be her character. . . . To this end we have in our power an admirable means, *our language*; it can be for us what the *hand* is for the person who imitates art" (Herder, *Briefe*). The position is also represented by a certain Heideggerian tradition of "philosophical language," that is to say, the language best suited to speak faithfully for being, which occupies a predominant place in the history of this so Continental Western philosophy. Martin Heidegger thinks that Western thought is born less in Greece than in Greek and that only the German language rises to the level of Greek in the hierarchy of philosophical languages, so that "untranslatability finally becomes the criterion of truth" (Lefebvre, "Philosophie et philologie"). "The Greek language is philosophical, i.e., . . . it philosophizes in its basic structure and formation. The same applies to every genuine language, in a different degree, to be sure. The extent to which this is so depends on the depth and power of the existence of the people and race who speak the language and exist within it. Only our German language has a deep and creative philosophical character to compare with the Greek" (Heidegger, *Essence of Human Freedom*). Even if it is "true" in one sense (Greek and German words and forms are obligatory places of passage for many articles in the *Dictionary*), this is not the truth we need. Our work is as far as could be from such a sacralization of the untranslatable, based on the idea of an absolute incommensurability of languages and linked to the near-sanctity of certain languages. This is why, marking our distance from a teleological history organized according to a register of gain and loss, we have not conferred a special status on any language, dead or alive.

Neither a logical universalism indifferent to languages nor an ontological nationalism essentializing the spirit of languages: what is our position in relation to these alternatives? If I had to characterize it, I would speak Deleuzian and use the word "deterritorialization." This term plays off geography against history, the semantic network against the isolated concept. We began with the many (our plural form indicates this: "dictionary of untranslatables"), and we remain with the many: we have addressed the question of the untranslatable without aiming at unity, whether it is placed at the origin (source language, tributary words, fidelity to what is ontologically given) or at the end (Messianic language, rational community).

Many languages first of all. As Wilhelm von Humboldt stresses, "language appears in reality solely as multiplicity" (*Uber die Verschiedenheiten des menschlichen Sprachbaues*). Babel is an opportunity, as long as we understand that "different languages are not so many designations of a thing: they are different perspectives on that same thing, and when the thing is not an object for the external senses, those perspectives become so many things themselves, differently formed by each person" (*Fragmente der Monographie über die Basken*).

The perspectives constitute the thing; each language is a vision of the world that catches another world in its net, that performs a world; and the shared world is less a point of departure than a regulatory principle. Schleiermacher throws an exemplary light on the tension that exists between a concept, with its claim to universality, and its linguistic expression, when he asserts that in philosophy, more than in any other domain, "any language . . . encompasses within itself a single system of concepts which, precisely because they are contiguous, linking and complementing one another within this language, form a single whole—whose several parts, however, do not correspond to those to be found in comparable systems in other languages, and this is scarcely excluding 'God' and 'to be,' the noun of nouns and the verb of verbs. For even universals, which lie outside the realm of particularity, are illumined and colored by the particular" ("On Different Methods of Translating"). It is that "scarcely excluding" we must underline: even God and Being are illumined and colored by language; the universality of concepts is absorbed by the singularity of languages.

Multiplicity is to be found not only among languages but within each language. A language, as we have considered it, is not a fact of nature, an object, but an effect caught up in history and culture, and that ceaselessly invents itself—again, *energeia* rather than *ergon.* So the *Dictionary*'s concern is constituted by languages in their works, and by the translations of these works into different languages, at different times. The networks of words and senses that we have sought to think through are networks of datable philosophical idioms, placed by specific authors in particular writings; they are unique, time-bound networks, linked to their address (exoteric or esoteric), to their level of language, to their style, to their relation to tradition (models, references, palimpsests, breaks, innovations). Every author, and the philosopher is an author, simultaneously writes in a language and creates his or her language—as Schleiermacher says of the relation between author and language: "He is its organ and it is his" ("General Hermeneutics"). The untranslatable therefore is also a question of case by case.

Finally, there is multiplicity in the meanings of a word in a given language. As Jacques Lacan says in *L'étourdit*, "A language is, among other possibilities, nothing but the sum of the ambiguities that its history has allowed to persist." The *Dictionary* has led us to question the phenomenon of the homonym (same word, several definitions: the dog, celestial constellation and barking animal) in which homophony (bread, bred) is only an extreme case and a modern caricature. We know that since Aristotle and his analysis of the verb "to be" that it is not so easy to distinguish between homonymy and polysemy: the sense of a word, also called "meaning" in English, the sense of touch, *sens* in French meaning "direction"—these represent traces of the polysemy of the Latin *sensus*, itself a translation from the Greek *nous* (flair, wit, intelligence, intention, intuition, etc.), which from our point of view is polysemic in a very different way. Variation from one language to another allows us to perceive these distortions and semantic fluxes; it permits us to register the ambiguities each language carries, their meaning, their history, their intersection with those of other languages.

In his introduction to Aeschylus's *Agamemnon*, which he considers to be "untranslatable," Humboldt suggests that one should create a work that studies the "synonymy of languages," and records the fact that every language expresses a concept with a difference: "A word is so little the sign of a concept that without it the concept cannot even be born, still less be stabilized; the indeterminate action of the power of thought comes together in a word as a faint cluster of clouds gathers in a clear sky." "Such a synonymy of the

principal languages . . . has never been attempted," he adds, "although one finds fragments of it in many writers, but it would become, if it was treated with intelligence, one of the most seductive of works" (*Aeschylos Agamemnon*). This work that is among "the most seductive" is perhaps our *Dictionary.* I hope it will make perceptible another way of doing philosophy, which does not think of the concept without thinking of the word, for there is no concept without a word.

The *Dictionary* aims to constitute a cartography of European and some other philosophical differences by capitalizing on the knowledge and experience of translators, and of those translators (historians, exegetes, critics, interpreters) that we are as philosophers. It is a working implement of a new kind, indispensable to the larger scientific community in the process of constituting itself and also a guide to philosophy for students, teachers, researchers, those who are curious about their language and that of others. It is also the collective work of ten or more years. Around a supervisory team of scholars—Charles Baladier, Étienne Balibar, Marc Buhot de Launay, Jean-François Courtine, Marc Crépon, Sandra Laugier, Alain de Libera, Jacqueline Lichtenstein, Philippe Raynaud, Irène Rosier-Catach—it assembled more than 150 contributors, with the most varied linguistic and philosophical domains of competence. The truly collective work (long, difficult, frustrating, to be redone, to be continued) did in any case seduce each of us, drove us back to the drawing board and to consider from other perspectives what we thought we knew in philosophy, of philosophy. Everyone gave more than his or her share of time, energy, knowledge, inventiveness, for something that expresses both our friendship and our sense of adventure, and that is beyond all possible expression of gratitude.

How to Use This Work

The *Dictionary of Untranslatables* offers three types of entries.

(1) Among the "word-based" entries, some start from a single word in a single language, taken as "untranslatable," revealing a given constellation in time and/or space, such as LEGGIADRIA, which initially expresses the gracefulness of women in the Italian Renaissance and evokes for us the smile of the *Mona Lisa*; or MIR, which in Russian means "peace," "the world," and "peasant commune."

Other of these entries present one or more networks and seek to bring out their particularities: for example, under POLITICS we consider both "politics" and "policy"; with STRUCTURE we proceed to a comparison with "pattern" and *Gestalt*; and under SENSE we treat all the senses of "sense," from their complex Latin thread (the unifying *sensus*, which renders the Greek *nous*, literally "flair, intuition," but also refers to the meaning of a word or a text) to the Anglo-German tangle of *Sinn, Bedeutung*, "sense," and "meaning," which is complicated in French translations as *dénotation* or *référence*. The words in various languages that are listed just below the lemma for an entry make no claim to being translations, good or bad: they are the equivalents, approximations, analogues actually discussed in the article.

(2) The more general, "thematic" entries, meta-entries in a fashion, examine the way in which one language or another works overall by starting with a crucial characteristic: for example, the difference between *ser* and *estar* in philosophical Spanish (see SPANISH) or diglossia in Russian (RUSSIAN). Some of them engage a major problem, like the order of words (WORD ORDER) or the mode of expressing time and aspect (ASPECT), which are immersed in the different languages.

The longest entries are generally the result of a collaboration, and the boxes (which are signed when they are not written by the authors of the corresponding articles), represent so many beams of light brought to bear on a text, its translation, a terminology, or a tradition.

(3) Finally, the unsigned "directional" entries serve to guide readers. They point toward the relevant entries in foreign languages (*WORLD* and *PEACE* direct us to the Russian MIR, and *MALAISE* sends us to individual ways of designating the dysfunction of body and soul and its implications for existence, ACEDIA, DESENGAÑO, DOR, MELANCHOLY, SAUDADE, SEHNSUCHT, SORGE). They also propose a synthesis of difficulties and differences (*NOTHING, TIME*). When they are referred to, as correlatives, within other entries, they are marked by italics.

In all these kinds of entries, a web of general cross-references is signaled by the symbol (➤). The terms cross-referenced are listed alphabetically. When appropriate, a distinction is drawn in these lists: the principal cross-references appear first; following these is a second group of terms, more distantly related to the first; and a third group of terms (in brackets) are entries to which the cross-references in either of the first two groups refer when discussing the cross-referenced term. When an asterisk precedes a word in the text, it indicates that the word is reconstructed, rather than directly attested (established by written record).

In addition to the individual bibliographies at the ends of articles and boxes, this volume also contains a separate list of general reference tools. When any work contained in this list is cited in the text, it is preceded by the abbreviation "RT," which indicates that the full reference will be found in the reference tools section at the end of this book.

ABSTRACTION, ABSTRACTA, ABSTRACT ENTITIES

FRENCH	*abstraction*, *abstrait*
GERMAN	*Abstraktion*, *Entbildung*
GREEK	*aphairesis* [ἀφαίρεσις]
LATIN	*abstractio*, *ablatio*, *absolutio*, *abnegatio*; *separata*, *abstracta*

➤ CATEGORY, EPOCHÊ, ESSENCE, *FICTION, IMAGINATION,* INTELLECTUS, INTENTION, *NEGATION, NOTHING,* REALITY, RES, SEIN, SUBJECT, UNIVERSALS

While the meaning of the term "abstraction" is not a problem in formal logic, where it refers to the operation that makes it possible to construct, using an "abstractor," a so-called "abstract" expression on the basis of another expression containing one or more free variables, the term's semantic field in philosophy and the theory of knowledge is more difficult to organize. When Condillac (*L'Art de penser* I.viii) denounces "the abuse of constructed abstract notions," and "in order to avoid this problem" asks that we look back to "the generation of all our abstract notions, … a method that has been unknown to philosophers, … who have sought to make up for it by means of definitions," his aim is different from that of Aristotle when the latter mentions, under the rubric "abstract entities" or "things that exist in the abstract [τὰ ἐξ ἀφαιρέσεως]," the forms that mathematical science deals with "by abstracting from their inherent matter" (Aristotle, *De anima*, 431b.13–17), and from that of Dionysius the Areopagite when he asks to be raised by thought to the superessential "through the *aphairesis* [ἀφαίρεσις] of all beings." Thus when speaking of "abstraction" we must distinguish the problem of the generation of abstract ideas insofar as it involves that of universals, that of the existence or nonexistence of general objects, and that of the practice of abstractive negation in the diverse fields—loglcal, epistemological, theological—where it occurs. The broad range of the term "abstraction" is well illustrated by the modern English usage of the terms "abstracta" and "abstract entities," which are more or less synonymous with "universals," and whose extension includes mathematical objects (numbers, classes, sets), geometrical figures, propositions, properties, and relations. Although English-language historiography has a tendency to regard Plato's Ideas or Forms as the first occurrence of real, non-spatio-temporal "abstract" entities, instantiated or participated in by spatio-temporal objects, it seems more precise to reserve this term for "Aristotelian" ontology by distinguishing, as was done during the Middle Ages, separate entities (*separata*) from abstract entities (*abstracta*).

I. *Epagôgê* and *Aphairesis*, Two Models of Abstraction according to Aristotle

There are two models of abstraction in Aristotelianism. The first is that of "abstractive induction" (*epagôgê* [ἐπαγωγή]), which Aristotle describes this way:

> So out of sense-perception comes to be what we call memory, and out of frequently repeated memories of the same thing develops experience; for a number of memories constitute a single experience. From experience again—i.e. from the universal now stabilized in its entirety within the soul, the one beside the many which is a single identity within them all—originate the skill of the craftsman and the knowledge of the man of science, skill in the sphere of coming to be and science in the sphere of being.

> (trans. G.R.G. Mure, *Posterior Analytics*, II.§19)

The second model is that of mathematical (chiefly geometrical) abstraction, which consists not in "bringing together" (*epagein* [ἐπάγειν]) similar elements and grouping them under a single concept, but in "stripping" (*aphaireisthai* [ἀφαιρεῖσθαι]) the image or representation of a thing of its individualizing characteristics (essentially material).

The conflict between these two models is a structural given, a major tendency in Aristotelianism, whose effects made themselves felt throughout the Middle Ages. Philosophers have never ceased to vacillate between the registration of resemblances (the basis of "resemblance nominalism") and the neutralization of individualizing characteristics that are not pertinent for the type, though some have sought to find unlikely compromises between these poles.

■ See Box 1.

II. The Peripatetic Theory of *Aphairesis* and Its Medieval Extensions: "Abstractionism"

A. The classification of the sciences

In his treatise *De caelo* (III.§1.299a 15–17), Aristotle uses the term "abstraction" to distinguish between "mathematical objects" (*ta ex aphaireseôs* [τὰ ἐξ ἀφαιρέσεως], lit. "proceeding from a subtraction") and "physical objects" (*ta ek prostheseôs* [τὰ ἐκ προσθέσεως], lit. "proceeding from an addition"). Nonetheless, it is only in *De anima* (III.§7.431b.12–16) that Aristotle explains how the intellect conceives abstractions:

> As for so-called "abstractions" (*ta en aphairesei legomena* [τὰ ἐν ἀφαιρέσει λεγόμενα]), the intellect thinks of them as one would think of the snub-nosed (*simon* [σιμόν]): qua snub-nosed, one would think of it not as separate (*ou kechôrismenôs* [οὐ κεχωρισμένως]) but as concave (*koilon* [κοῖλον]), if one thought of it in action (*energeiai* [ἐνεργείᾳ]), one would think of it without the flesh in which the concavity is realized (*aneu tês sarkos an enoei en hêi to koilon* [ἄνευ τῆς σαρκὸς ἂν ἐνόει ἐν ᾗ τὸ κοῖλον]): so is it when the intellect thinks of abstract terms, it thinks of mathematical things as if they were separate, even though they are not separate

1

Aphairesis/Entbildung/Abstractive Negation in mystical theology

The term *aphairesis* [ἀφαίρεσις] has a mystical or at least spiritual use in Neoplatonism. Pseudo-Dionysius the Areopagite defines it as the instrument of unknowing knowledge (Nicholas of Cusa's *docta ignorantia*):

> For that is what it means, in truth, to see and know and sing superessentially, in a hymn, the Superessential, *through the abstractive negation of all beings* (*pantôn tôn ontôn aphaireseôs* [πάντων τῶν ὄντων ἀφαιρέσεως]), just as those who cause to emerge from a block of marble the statue that was latent in it remove all that prevented, by masking it, the pure vision of the hidden form, and cause the hidden beauty to show itself simply by taking away (*kai auto eph' heautou têi aphairesei monêi* [καὶ αὐτὸ ἐφ᾽ ἑαυτοῦ τῇ ἀφαιρέσει μονῇ]).

The example of the "internal statue" is also attested in this context in Plotinus's *Enneads* (I.6, 9):

> But how are you to see into a virtuous soul and know its loveliness? Withdraw into yourself and look. And if you do not find yourself beautiful yet, act as does the creator of a statue that is to be made beautiful: he cuts away here, he smoothes there, he makes this line lighter, this other purer, until a lovely face has grown upon his work. So do you also cut away all that is excessive, straighten all that is crooked, bring light to all that is overcast, labour to make all one glow of beauty and never cease chiselling your statue, until there shall shine out on you from it the godlike splendour of virtue.

> (trans. S. MacKenna, *The Enneads*)

Although the translation of *aphairesis* as "abstractive negation" may seem ambiguous, medieval Latin offers at least four terms—*ablatio, abstractio, absolutio,* and *abnegatio*—that correspond to the meaning of the Greek term. In the Latin versions of *Mystical Theology* (RT: *PG*) the term *ablatio* is used to render (*a*) *pantôn tôn ontôn aphaireseôs* and (*b*) *kai auto eph' heautou têi aphairesei monêi*. Hilduin: (*a*) per *omnium existencium ablacionem* and (*b*) *et hoc in sui ipsius ablacione sola*. John Scotus Erigena: (*a*) *per omnium existentium ablationem* and (*b*) *et ipsam in seipsa ablatione sola*. Jean Sarrazin: (*a*) *per omnium exsistentium ablationem* and (*b*) *et ipsam in se ipsa ablatione sola*. Robert Grosseteste: (*a*) *per omnium entium ablationem* and (*b*) *et ipsam in se ipsa ablatione sola*. The transition to the vernacular was accompanied by a few remarkable formulations. In Master Eckhart, the Latin *ablatio* becomes the Middle High German *Entbildung*. This is less a translation—*ablatio* does not "mean" *Entbildung*—than a transposition of the problematics of *aphairesis* to a new context, that of the image and the "form," through the mediation of the term *ablatio* and its Latin synonyms. The stripping away of all images, the baring of the soul through "negative" askesis, the passage through images and mental copies, all converge under the term *Entbildung*, so confusing for the inquisitors during Eckhart's trial that it was translated by a periphrasis, *imagine denudari*.

(*ou kechôrismena hôs kechôrismena* [οὐ κεχωρισμένα ὡς κεχωρισμένα]).

In Michael Scot's Latin translation of Averroës's long commentary on *De anima*, the expressions used in *De anima* III.§4.429b.18–22 and III.§7.431b.12–16 are rendered respectively by "things that exist in *mathesis*" and "things that are said negatively." Averroës notes that by "things that are said negatively" Aristotle "means mathematical things," the word *negation* meaning "separation from matter." Negation being, along with separation, ablation, suppression, and abstraction, one of the possible meanings of the Greek *aphairesis*, Averroës's exegesis shows that he sees Aristotle's thought as characterized by a kind of equation: things said negatively = beings separated from matter = mathematical entities.

However, mathematical entities are not the only abstract entities. There are also universals, especially the universals of genus, species, and difference. How should we distinguish, from the point of view of abstraction, mathematical entities from universals? This problem occupied Aristotle's commentators and interpreters from antiquity to the Middle Ages.

As they are defined in the *Metaphysics* (VI.§1.1026a.10–16), the theoretical sciences can be classified in a combinatory manner, depending on whether the entities they concern are "movable" or "immovable," on the one hand, and "separable" or "inseparable" from matter, on the other hand.

But if there is something which is eternal and immovable and separable, clearly the knowledge of it belongs to a theoretical science—not, however, to physics (for physics deals with certain movable things) nor to mathematics, but to a science prior to both. For physics deals with things which exist separately (*achôrista* [ἀχώριστα]) but are not immovable, and some parts of mathematics deal with things which are immovable but presumably do not exist separately, but as embodied in matter (*hôs en hulêi* [ὡς ἐν ὕλῃ]); while the first science deals with things which both exist separately and are immovable (*chôrista kai akinêta* [χωριστὰ καὶ ἀκίνητα]).

> (trans. W. D. Ross, *Metaphysics*, in *The Basic Works of Aristotle*)

In the eighteenth century, an anonymous work providing an introduction to philosophy, *Philosophica disciplina*, presents the same tripartite classification in an order that later became standard, an order of increasing "separation" determined by the "ontological value" of its objects: physics, mathematics, metaphysics.

> The things . . . dealt with by speculative philosophy are either connected with (*conjuncte*) movement and matter in accord with being and knowledge, or are completely (*omnino*) separate. If they are considered in the first

way, then we have natural philosophy; if in the second way, mathematics; if in the third way, metaphysics. And that is why there are only three speculative sciences of things.

(C. Lafleur, ed., *Philosophica disciplina*, in *Quatre Introductions à la philosophie au XIIIe siècle*)

Whatever the classification adopted, one fact emerges: metaphysics deals with "separate" entities (separate substances or "intelligences," God, "thought about thought," even intellects traditionally called "poietic" or "active" and "hylic" or "possible"); mathematics deals with "abstract" entities. Where should universals be located in such a scheme? The answer is given, in an epoch-making manner, by Alexander of Aphrodisias, who formulated a doctrine that was to become part of the common Peripatetic language, and that modern interpreters designate by the term "abstractionism."

B. Abstractionism

Abstractionism's starting point is a thesis (extrapolated from *De anima* III.§7.431b.12–16) stipulating that abstraction is a mental operation that consists in conceiving as separate from matter things that are nonetheless not separate from matter. Two of Alexander's texts, *Peri psuchês* [Περὶ ψυχῆς] (*De anima liber cum mantissa*) and *Quaestiones naturales et morales*, give a precise elaboration of this thesis in the framework of an opposition between "incorporeal forms that are by themselves immaterial" (for Alexander, the separate Intellect, the unmoved First Mover) and "forms embodied in matter." The latter, not being "by themselves" intelligible, become intelligible because an intellect "makes them intelligible by separating them from matter through thought, by apprehending them as if they were [separate] by themselves." Alexander's thesis does not bear *prima facie* on mathematical objects, but rather on all sorts of so-called "material" forms (that is, those that are embodied in matter). This is a generalization of the theory in *De anima* III.§.7, outside the context of mathematics, or rather geometry. This generalization, "abstractionism," is made possible not only because geometrical possibilities are among abstract intelligibles in general, but also because geometrical intelligibles usually function as examples of abstract intelligibles.

Regarding abstract universals' mode of existence, Alexander of Aphrodisias formulates the main theorem of "abstractionism" this way: "The universal [that is] in all [particulars] does not exist in the same way that it is conceived." The universal has two modes of being: one in things, the other as conceived. This distinction corresponds to that established by Scholasticism between the universal *in re* and the universal *post rem*. It seems to be based on a difference between "being" and "existing," whose significance and scope remain to be historically determined, and which Alexander expresses, generally, by saying that universals have "being" (*einai* [εἶναι]) in thought, while *hupostasis* [ὑπόστασις] / *huparxis* [ὕπαρξις] has being in particulars (for *hupostasis*, see *Quaestiones naturales et morales*, 59, 7–8, and his *In Aristotelis Topicorum libros octo commentaria*, II.2, and for *huparxis*, see *De anima liber cum mantissa*, 90; see also SUBJECT and ESSENCE).

At the dawn of the Middle Ages, Boethius, a Latin translator and commentator on Aristotle, formulated the second

thesis on which abstractionism is based, explaining that "all concepts derived from things that are not conceived as they are arranged are not necessarily empty and false" (RT: *PG*, t. 64, col. 84B11–14). The problem assumed here is the one that thirteenth-century Aristotelians would later formulate in the Scholastic adage "Abtrahentium non est mendacium" (Abstraction is not a lie). In the context with which Boethius's thesis is concerned, the opposition is the Neoplatonic one between authentic concepts (which have a basic reality) and empty or false concepts. The respective paths of abstraction and fiction thus intersect, in accord with an argumentative schema that continues down to the modern period. For Boethius, there is "false opinion" if and only if things are "composed by thought" that cannot exist "naturally joined." That is the case, for example, when one combines in imagination a man and a horse to produce a Centaur (a traditional example of *phantasia* [φαντασία] among Greek commentators).

Si enim quis componat atque conjungat intellectu id quod natura jungi non patiatur, illud falsum esse nullus ignorat: ut si quis equum atque hominem jungat imaginatione, atque effigiet Centaurum.

(If in fact something is composed or combined by thought whose junction nature would not allow, everyone knows that it is false: for example, if the imagination combines a horse and a man, a centaur would be obtained [that is, something false = something that does not exist].)

(RT: *PG*, t. 64, col. 84)

But for all that, every concept of a thing "conceived differently from the way it is composed" is not a false concept. Therefore we must distinguish between a false concept and a concept derived from things by abstraction. A false concept, like that of the centaur, does not proceed from a thing conceived in a way different from that in which it is composed. It is not, strictly speaking, a derived concept. On the contrary, resulting from a mental combination of what "cannot" exist combined in nature, one can and must say that it is not derived from any "thing." In contrast, in the case of a concept derived from things by abstraction, we are dealing with a derived concept that proceeds from a "division" or "abstraction" carried out on an authentically existing thing. Boethius's abstraction is thus, as in Alexander of Aphrodisias, a separation or dissociation bearing on "incorporeals" (a Stoic term characteristic of Alexander's syncretic Peripateticism): it is the act carried out by thought when, "receiving the incorporeals mixed with bodies, it divides the former from the latter in order to consider and contemplate them in themselves" (Boethius, ibid.).

C. Discriminating attention: *Intentio/attentio*

In the twelfth century, Peter Abelard introduced a theme that was to become central in modern empiricist and nominalist theories of abstraction: attention (*intentio, attentio*). For Abelard, the role of attention is determined on the basis of the hylemorphic ontology inherited from Aristotle, Porphyry, and Boethius. Matter and form never exist in isolation:

they are always "mixed" with one another (Abelard, *Logica, Super Porphyrium*). However, the mind, or rather the reason, can consider them in three ways. It can "consider matter in itself," "focus its attention on the form alone," or "conceive the two as united." The first two types of intellection are carried out "through abstraction," the latter "through junction."

In Abelard, Boethius's "abstractionist" thesis is reformulated: intellection through abstraction is not empty. Two new arguments are advanced: (1) this type of intellection does not attribute to a thing properties other than its own; (2) it limits itself to abstracting from some of them.

> Such understandings by "abstraction" perhaps seemed to be "false" or "empty" because they perceive the thing otherwise than as it subsists. . . . But that is not so. If someone understands a thing otherwise than as it is in the sense that he attends to it in terms of a nature or characteristic that it does not have, that understanding is surely empty. But this does not happen with abstraction.

> (P. Abelard, *Logica*, *Super Porphyrium*, 25.5–22; trans. P. Spade, "Glosses on Porphyry")

Thus here *abstraire* means "abstract from, set aside"; or in ordinary language, "ignore" or "not take into account." This common acceptation of an act that is elsewhere described in terms of the extraction of "incorporeals" from the matter in which they are entangled makes Abelard's descriptions of the act of abstraction look like anticipations of John Stuart Mill's.

Thus Abelard opposes to the model of extraction basing itself on the presentation of abstraction as abstractive induction, a registration of resemblances or a coincidence of images, and surreptitiously drawing on canonical passages of the *Metaphysics* and *Posterior Analytics*, a second model of discriminating attention that is present from the outset in the Peripatetic tradition but has been usually supplanted by the first model. It is clear that the model of attention has played a role in certain non-"inductivist" formulations by medieval philosophers, commentators on Aristotle arguing against the thesis of abstraction-induction and for an act of forming or producing the general "in a single example." This thesis, attested in Averroës, consists in characterizing abstraction as a "neutralization" of a certain set of nonpertinent traits and a "focusing" on a single "pertinent" trait enabling the perception of a "co-specificity" among individuals of the same "type." In this theory, the intelligible is not drawn from the perception of resemblances among images, it is the product of the "stripping-down" of a particular image. I do not produce the concept of man by abstracting from a plurality of images of particular men, but by stripping a particular image of everything that makes it particular. Averroës's theory is continued by all the authors who conceive abstraction as possible "on the basis of a single example." One of its major problems is the obscurity of the analysis of the respective roles of sensation, imagination, the "cogitative" faculty (see INTENTION, Box 2), and the intellect (possible and active) in the process of "stripping down" the sensible "intention." As Abelard describes it, the act of abstraction is simpler and less problematic than it is in the Averroist psychology. Here, for once, Abelard is close to common empirical intuitions. His first observation is that if I consider a given individual man as a substance or as a body, without at the same time considering him as an animal, man, or grammarian, my intellection bears only on characteristics that are part of his nature. However, and this is the second observation, in these cases my intellection does not bear upon all the characteristics present "in": it ignores some of them in order to make itself present "to." Thus for Abelard, abstraction is indeed the product of a movement of "focusing attention," so that "directing one's attention" toward this or that property of a nature implies that "attention is diverted" from others. This movement of attention has no ontological significance:

> When I say that I attend to the nature "only" insofar as it has this or that feature, the term "only" refers to the attention and not to the mode of subsisting.

> (P. Abelard, *Logica*, *Super Porphyrium*, 25; trans. P. Spade, "Glosses on Porphyry")

If the word "only" concerned nothing other than the mode of being, my intellection would be empty. But this is not the case: the way in which my intellection takes place does not imply that a given nature "possesses only" a given quality, it means that I "consider it only" insofar as it possesses that quality.

Thus we can say with Boethius that in a sense abstractive intellection conceives a thing in a certain way other than it is, that is to say, not in the sense in which it would be conceived with another status, that is, another structure than its own, but in the sense in which the mode of its intellection is different from the mode of its subsistence. Now, intellection depends on *my* operation. Therefore we have to distinguish (1) the fact of being considered "separately" from that of being considered as "separate," and (2) the fact of being "considered" separately from that of "existing" separately.

III. The Modern Empiricist Critique of Abstraction

A. Locke's "general triangle"

The problem of the origin of "ideas" or "abstract notions" is one of the special loci for the expression of "resemblance nominalism," which is based on the elaboration of the supposed relationship between the use of "names" and the registration of "resemblances." The standard formulation of resemblance nominalism is given by John Locke in a frequently discussed passage of the *Essay Concerning Human Understanding* (ed., P. H. Nidditch, 415):

> But yet I think we may say, the sorting of them under names is the workmanship of the understanding, taking occasion, from the similitude it observes amongst them, to make abstract general ideas.

To this description David Hume adds the idea of the name's "abbreviative" function in relation to the plurality of particular ideas:

> When we have found a resemblance among several objects, that often occur to us, we apply the same name to all of them, whatever differences we may observe in the degrees of their quantity and quality, and whatever other differences may appear among them. After we have acquired a custom of this kind, the hearing of

that name revives the idea of one of these objects, and makes the imagination conceive it with all its particular circumstances and proportions. But as the same word is suppos'd to have been frequently applied to other individuals, that are different in many respects from that idea, which is immediately present to the mind; the word not being able to revive the idea of all these individuals, but only touches the soul . . . and revives that custom, which we have acquir'd by surveying them. . . . The word raises up an individual idea, along with a certain custom; and that custom produces any other individual one, for which we may have occasion. But as the production of all the ideas, to which the name may be apply'd, is in most cases impossible, we abridge that work by a more partial consideration, and find but few inconveniences to arise in our reasoning from that abridgment.

(*A Treatise of Human Nature*, ed. L. A. Selby-Bigge and P. H. Nidditch)

Thus we can say that Locke and Hume defend the same thesis regarding the empirical origin of general abstract ideas. On the other hand, the two philosophers differ on the second problem: the status of "general objects." In the *Essay*, Locke refers to a "general idea of a triangle" that is supposed to have apparently incompatible properties:

For example, does it not require some pains and skill to form the general Idea of a Triangle (which is yet none of the most abstract, comprehensive, and difficult), for it must be neither Oblique nor Rectangle, neither Equilateral, Equicrural, nor Scalenon; but all and none of these at once.

(*An Essay Concerning Human Understanding*, IV, VII.§9, ed. P. H. Nidditch)

Locke does not claim that such an object exists. On the contrary, he notes that characterized in this way, a general triangle "is something imperfect, that cannot exist," and adds that it is "an Idea wherein some parts of several different and inconsistent Ideas are put together" (it is noteworthy that Coste's French translation of the *Essay* omits this passage). Locke's general abstract triangle, an object that is imperfect in one case, contradictory in another, does not make a claim for existence, to use a concept found both in Leibniz (*ad existentiam pretendere*) and in Bolzano ("Anspruch auf Wirklichkeit machen," in *Paradoxien des Unendlichen*, §13). However, "Locke's general triangle" has become an obligatory philosophical reference point for all theoreticians of abstraction, drawing toward itself the most diverse critiques from Berkeley and Hume to Husserl.

B. Junction, separation / power of representation: Berkeley and John Stuart Mill

In his introduction to the *Principles of Human Knowledge* (§13), George Berkeley transposes the problem raised by Locke's general triangle onto a strictly empirical ground, pretending to inquire whether anyone "has, or can attain to have, an idea that shall correspond with the description that is here given of the general idea of a triangle, which is 'neither oblique nor rectangle, equilateral, equicrural nor scalenon,

but all and none of these at once?'" He replies that "when I demonstrate any proposition concerning triangles, it is to be supposed that I have in view the universal idea of a triangle; which ought not to be understood as if I could frame an idea of a triangle which was neither equilateral, nor scalenon, nor equicrural. . ." (§15), and that it is in any case *impossible* to form an abstract general idea of the triangle on the basis of incompatible elements (§16). There is not and cannot be a general idea of the triangle that is "neither oblique nor rectangle, neither Equilateral, Equicrural, nor Scalenon; but all and none of these at once" because the conjunction "oblique + rectangular + equilateral + isosceles + scalene" is an "inconsistent idea" (§16).

To argue his claim, Berkeley stresses, in the process that Locke incorrectly describes as leading to the formation of a general abstract idea, a different element: attention. We must not confuse "forming a general abstract idea" with paying attention to some quality of a particular figure at the expense of another, producing a theoretical monster by combining the properties of different objects, all of which no one of them could possess, and isolating or setting aside from an object some of the properties that it in fact possesses.

And here it must be acknowledged that a man may consider a figure merely as triangular, without attending to the particular qualities of the angles, or relations of the sides. So far he may abstract; but this will never prove that he can frame an abstract, general, inconsistent idea of a triangle. In like manner we may consider Peter so far forth as man, or so far forth as animal without framing the aforementioned abstract idea, either of man or of animal, inasmuch as all that is perceived is not considered.

(*Principles of Human Knowledge*, §16)

That is, Berkeley acknowledges the existence of

a faculty of imagining, or representing to myself, the ideas of those particular things I have perceived, and of variously compounding and dividing them. I can consider the hand, the eye, the nose, each by itself abstracted or separated from the rest of the body. But then whatever hand or eye I imagine, it must have some particular shape and colour. Likewise the idea of man that I frame to myself must be either of a white, or a black, or a tawny, a straight, or a crooked, a tall, or a low, or a middle-sized man. I cannot by any effort of thought conceive the abstract idea above described.

(Ibid., §10)

The terms "combination" and "separation" refer to the very origins of the notion of abstraction as elaborated in the Middle Ages from Boethius to Abelard, in the wake of Aristotle and Alexander of Aphrodisias. Berkeley's rejection of Lockean abstraction remains in fact immanent in the sphere of what might be called Peripatetic "abstractionism," so that paradoxically, and obviously without his realizing it, Berkeley opposes to abstraction according to Locke a weak version of the theory proposed by Boethius and his medieval successors.

Recognizing that he is capable of abstracting in a certain sense (*Principles*, §10), Berkeley distinguishes between two kinds of abstraction: authentic abstraction and pseudo-abstraction (the latter being, for him, the one that in Locke presides over the formation of general abstract ideas). Authentic abstraction occurs "when I consider some particular parts or qualities separated from others, with which, though they are united in some object, yet it is possible they may really exist without them." Pseudo-abstraction occurs when I claim to abstract one from the other or to represent to myself separately qualities that could not exist separately from one another (*Principles*, §10).

The same theory of attention is adopted, *mutatis mutandis*, by John Stuart Mill. In his book *An Examination of Sir William Hamilton's Philosophy*, Mill explains that abstraction is not a mental act consisting in the separation of certain attributes that are supposed to compose an object in order to conceive them as detached from all others, but rather an act that, assuming these attributes are conceived as parts of a larger whole, focuses attention on them to the detriment of the others with which they are combined. In his *Lectures on Metaphysics and Logic* (III.132–33), Hamilton defines the process of attention as antithetical and complementary to abstraction:

> an act of volition, called Attention, concentrates consciousness on the qualities thus recognised as similar; and that concentration, by attention, on them, involves an abstraction of consciousness from these which have been recognised and thrown aside as dissimilar; for the power of consciousness is limited, and it is clear or vivid precisely in proportion to the simplicity or oneness of the object.

For Mill, who prefers to speak of "complex ideas of objects in the concrete," rather than of "general concepts," abstraction consists in attending "exclusively to certain parts of the concrete idea" (*An Examination of Sir William Hamilton's Philosophy*, 42).

Hume's critique of Locke follows more or less the same argument as Berkeley's. However, Hume does not attribute to Locke the whole of the position considered absurd by all the adversaries of the "general triangle." According to Hume, Locke did not maintain that it is possible to form an idea of an object constituted by the conjunction of quantitative or qualitative ideas that are mutually incompatible and represent them all, but rather than since that is impossible, and since there are nonetheless general abstract ideas, we have to accept the second part of the thesis: the possibility of forming an idea of an object stripped of all its characteristics, or rather an idea of an object that represents none of its quantitative or qualitative properties. The abstract idea of a man represents men of all sizes and qualities, and it can do so only by representing at once all possible sizes and qualities, or none of them in particular. Now, since it has been judged absurd to maintain the first proposition, because it implies an infinite capacity of the mind, writers usually have concluded in favor of the second proposition, and it has been supposed that our abstract ideas represent no particular degree of quantity and quality:

> The abstract idea of a man represents men of all sizes and all qualities; which 'tis concluded it cannot do, but either by representing at once all possible sizes and all possible qualities, or by representing no particular one at all. Now it having been esteemed absurd to defend the former proposition, as implying an infinite capacity in the mind, it has been commonly infer'd in favour of the latter: and our abstract ideas have been suppos'd to represent no particular degree either of quantity or quality.

(Hume, *A Treatise of Human Nature*, I.§1, chap. 7)

In opposition to this fiction, Hume asserts that while "the mind cannot form any notion of quantity or quality without forming a precise notion of degrees of each," the mind is capable of forming "a notion of all possible degrees of quantity and quality, in such a manner at least, as, however imperfect, may serve all the purposes of reflection and conversation" (*Treatise of Human Nature*, I.§1, chap. 7). The first pseudo-requirement of the general abstract idea is thereby met, on a terrain different from that of Lockean abstraction, whereas, by a kind of mirror effect or reversal, the second is abandoned. Hume takes the opportunity to clarify the problem of the genesis of so-called general ideas, explaining how an idea particular in its nature becomes general in its power of representation. This is the place of custom, designated here by its Latin name *habitus*, through which Hume's thesis connects both with the medieval thesis of "habitual knowledge" (*notitia habitualis*) and with its foundation in Ockhamist nominalism: the role of general terms in language as instruments recalling particular contents established by an enduring association and "re-mobilizable" in the form of the connected term:

> 'tis certain *that* we form the idea of individuals, whenever we use any general term; *that* we seldom or never can exhaust these individuals; and *that* those, which remain, are only represented by means of that habit, by which we recall them, whenever any present occasion requires it. This then is the nature of our abstract ideas and general terms; and 'tis after this manner we account for the . . . paradox, *that some ideas are particular in their nature, but general in their representation*. A particular idea becomes general by being annex'd to a general term; that is, to a term, which from a customary conjunction has a relation to many other particular ideas, and readily recalls them in the imagination.

(Hume, *Treatise of Human Nature,* I.§1, chap. 7)

| ABSURD

The absurd is what is dissonant or is *not heard* (cf. Lat. *surdus*), and is defined as a discord or disagreement with the understanding or reason, or with meaning, including the meaning of life. The term thus provides access to three main networks—logical, linguistic, and psychological. We will refer first to the English term "nonsense," in which these three networks intersect, because it forces us to think about the positive dimension of this dissonance: see NONSENSE.

I. The Absurd and Reason

The absurd is contrary to reason as a faculty of the mind (see *REASON* and parts of the articles LOGOS and MADNESS). But beyond this general definition, the absurd designates an actual manifestation of the absence of reason; therefore to define it we have to specify the criteria of the rational, regarding either logical requirements (thus arguing "from the absurd" and *reductio ad absurdum* are based on noncontradiction; see PRINCIPLE) or practical values (see PRAXIS, *PRUDENCE,* and parts of PHRONÊSIS). The absurd is thus neither simply the false (see *FALSE,* TRUTH) nor the absence of good sense (see COMMON SENSE). It designates a radical disconnection with the facts (see MATTER OF FACT, SACHVERHALT).

II. The Absurd and Meaning

Beyond the logical question of contradiction there is that of the rules of language and the criteria of meaning (see SENSE, HOMONYM, SIGNIFIER/SIGNIFIED). The possession or endowment of meaning depends in particular on a syntax; apparently correct sentences can be nonsensical (*unsinnig*, as opposed to *sinnlos* [meaningless]). This is the case for metaphysical utterances, according to some philosophers (Wittgenstein, Carnap) who make critical use of nonsense, doing away with propositions and sentences that say nothing (see PROPOSITION).

III. The Absurd and Existence

The absurd, as a sensation of the absence of meaning, is also something experienced (see ERLEBEN). Defined by Albert Camus as the "mystery and strangeness of the world," it belongs to the French vocabulary of existentialism, which we have explored in its German source (see DASEIN). It is an ontological affect broadly described in the works of Schelling, Kierkegaard, Freud, and Heidegger (see ANXIETY and, more generally, *MALAISE*) in connection with "facticity" (see TATSACHE, Box 1).

In a specific, positive way, the three components of the absurd—logical, linguistic, and existential—are at work in the French word *esprit*; "nonsense" refers to a specific form of humor related in English to "wit" and in German to *Witz* (see NONSENSE, *WITTICISM*).

➤ BELIEF, *NOTHING*

ACEDIA (SPANISH)

FRENCH	*tristesse, acédie*
GREEK	*akêdeia* [ἀκήδεια], *akêdia* [ἀκηδία]
LATIN	*taedium*

➤ *MALAISE* [MELANCHOLY, SPLEEN], and DASEIN, DESENGAÑO, OIKEIÔSIS, SORGE, VERGÜENZA

Through the intermediary of monastic Latin, *acedia*, "weariness, indifference" (Cassian, *De institutis coenobiorum,* 10.2.3; RT: *PL*, vol. 49, cols. 363–69), the rich Greek concept of *akêdeia*, a privative formed on *kêdos* [κῆδος], "care," and bearing the twofold meaning of lacking care (negligence) and absence of care (from lassitude or from serenity), established itself in the Spanish language in such a way as to create through three phonetic variations of a single term—*acedia, acidia, accidia*—a concept that belongs simultaneously to the communal and the moral registers. The Greek was originally associated with social rituals; in philosophical Latin from Seneca on, it was related to the moral virtue of intimacy, but its contemporary usage has returned it to a collective dimension.

The Greek *akêdeia* is simultaneously part of the register of the obligations owed to others and part of the register of self-esteem: this breadth of meaning determines the later variations. On the social level, the substantive *kêdos*, "care, concern," is specialized as early as Homer in two particular uses: mourning, the honors rendered to the dead, and union, family relationship through marriage or through alliance; *kêdeia* [κήδεια] (adj. *kêdeos* [κῆδεος]) is the attention that must be paid to the dead, as well as the concern and care for allies, characteristic of this relationship of alliance, which is distinct from that of blood and also contributes to *philia* [φιλία], to the well-being of the city-state (Aristotle, *Politics*, 9.1280b 36; see LOVE and POLIS); *ho kêdemôn* [ὁ κηδεμών] refers to all those who protect, for example, tutelary gods (Xenophon, *Cyropaedia*, 3.3.21). *Akêdês* [ἀκηδής] qualifies in an active sense, in a positive way, someone who is exempt from care and anxiety (Hesiod, *Theogony*, 5.489, apropos of the "invincible and impassive" Zeus, but also, negatively, the serving woman or negligent man; Homer, *Odyssey*, 17.319; Plato, *Laws*, 913c); in the passive sense,

it designates a person who is neglected (*Odyssey*, 20.130) or abandoned without burial (like Hector, *Iliad*, 24.554). How can the lack of care, *akêdeia*, become a virtue of the reflexive type?

The twofold sense of the term (transitive: care for others; reflexive: care for oneself) is maintained in the meaning of the Spanish word *acedia*. The first movement toward the ethics of intimacy is determined by practical philosophy's reflection on the finitude of human life. The event represented by death produces a sadness that seems to have no consolation. The moral reaction to situations in which one finds oneself fearing such a finitude is presented in an active and critical way in the ethics developed by Seneca in the *Consolations*. Grace and purity can temper sadness ("Marcum blandissimum puerum, ad cujus conspectum nulla potest durare tristitia" [Marcus, this boy, so gentle, before whom no sadness can last]; *De consolatione ad Helviam*, 18.4). But above all, it is the effort of reason and study that can overcome any sadness ("liberalia studia: illa sanabunt vulnus tuum, illa omnem tristitiam tibi evellent" [these studies will heal your wound, will free you from any sadness]; *De consolatione ad Helviam*, 17.3). This view of internal control is foundational for a style rooted in the culture of the South: the sober acceptance of death, and more generally, of finitude. *Acidia* is conceived as having a twofold psychological and theological meaning. First of all, it is a passion of the *animus* and is therefore one of the four kinds of sadness, the other three being *pigritia*, "laziness," *tristitia*, "sadness" properly so called, and *taedium*, "boredom."

In Christian monasticism of the fourth and fifth centuries, especially in Cassian and the eastern desert fathers, *acedia* is one of the seven or eight temptations with which the monks might have to struggle at one time or another. Usually mentioned between sadness and vainglory in a list that was to become that of the "seven deadly sins," it is characterized by a pronounced distaste for spiritual life and the eremitic ideal, a discouragement and profound boredom that lead to a state of lethargy or to the abandonment of monastic life. It was designated by the expression "noonday demon," which is supposed to come from verse 6 of Psalm 91. Thomas Aquinas opposes *acedia* to the joy that is inherent in the virtue of charity and makes it a specific sin, as a sadness with regard to spiritual goods (*Summa theologica*, IIa, IIae, q. 35). Fray Luis de Granada adopted this idea (*Escritos espirituales*, chap. 13), placing *acedia* among the seven deadly sins. If it is equivalent to the more widespread terms *tedio* (*taedium*) and *pereza* (*pigritia*), that is because it is the result of an excess of dispersion or idle chatter, and of the sadness and indifference (*incuria*) produced by the difficulty of obtaining spiritual goods. Thus *desolación* (*desolatio*) is supposed also to be a term related to *acedia*, and is often employed in spiritual and mystical literature—from Saint John of the Cross to Ignatius of Loyola—and it subsists in the vocabulary of moral sentiments.

The secular sense that the word has acquired in modern Spanish can make *acidia* or *acedia* the result of a situation of crisis and social conflict. In his *Historia de España*, Juan de Mariana connects the common sense of *acedia* (derived from the adjective *acedo*, from Lat. *acidus*, "bitter, acid") with the deprivation and need to which the poor are subject. The opposition between *acedia* and *amor* is often found in writers of the golden age, notably Cervantes:

> Mírala si se pone ahora sobre el uno, ahora sobre el otro pie, si se repite la respuesta que te diere dos veces, si la muda de blanda en áspera, de aceda en amorosa.

> (Should she be standing, observe whether she rests now on one foot and now on the other, if she repeats her reply two or three times, if she passes from gentleness to austerity, from asperity to tenderness.)

Among the Spanish moralists of our time, Miguel de Unamuno and Pío Baroja seem to be the last to use the term *acedia* in this way, while at the same time situating it among those that express collective feelings of distress or spiritual decline: the absence of care for oneself thus appears as a phenomenon of society and culture that does not dare to confront the demands of the transformation of modern identity. This crisis situation makes *acedia* an equivalent of routine, the outcome of a tradition received in an uncritical way, incapable of bringing new personal and collective resources to bear on it. The *tristeza de las cosas*, the "sadness of things," an expression of the feeling of ephemeralness, is a formula that, even though it goes back to late romanticism in Francisco Villaespesa, adds an aesthetic dimension. It involves the naturalization or loss of *aura* discussed by Walter Benjamin, who draws on Baudelaire's notion of "spleen" and on the phenomenology of the consciousness of loss or collective distress that follows the great upheavals of modernization (*Das Passagen-Werk*). The sociological reception of *acedia* moves, starting with the interwar period, in two directions: the first works on the economic causes of contemporary distress and on the forms of revolt that follow from it (Deleito y Piñuela), the other on postmodern aesthetic pleasure (Eugenio d'Ors), with notions such as *tedio opulento* (opulent boredom).

ACT

"Act" comes from Latin *actum*, the nominalized passive past participle of *agere*, which means "to push ahead of oneself," like the Greek *agein* [ἄγειν] (cf. *agôn* [ἀγών], struggle, trial); the Latin verb is differentiated, on the one hand, from *ducere*, "walk at the head of" (like Gr. *archêin* [ἄρχειν]; cf. PRINCIPLE), and on the other hand from *facere*, "to do," insofar as it implies duration, activity, and achievement rather than specific, instantaneous action (thus *agere aetatem, vitam*, pass time, life). *Actus*, the fact of moving, an action or the result of action, is a doublet of *actio* (same etymology), but the duality allows significant specializations: *actus* designates the action of a play (which Aristotle designates by the words *prattein* [πράττειν] or *pragmata* [πράγματα]) or its subdivision into acts, whereas *actio* is juridical and rhetorical (court action, oratorical action, pleading). Thus "actor" refers both to the character in a play and the person who plays that character: see ACTOR; cf. MIMÊSIS, *PASSION*.

The vocabulary of "act" is drawn from three great pairs of oppositions—ontological, ethical, and pragmatic—which constantly intersect with each other.

I. Ontology: Potential and Act

1. In Latin, the distinction between *potentia* and *actus* is used to translate the Aristotelian distinction between *dunamis* [δύναμις] and *energeia* [ἐνέργεια]. *Actus* translates the two terms of the Greek differentiation between *ergon* [ἔργον] and *energeia* [ἐνέργεια], which French has difficulty rendering without using two roots, *œuvre* for *ergon* (from **werg-*; cf. Ger. *Wirkung*) and *acte* for *energeia*: for the Greek, see FORCE, Box 1, PRAXIS, Box 1, ESSENCE, *TO BE,* WORK.

2. On the ontological gradation between potential and act, see, in addition to the Aristotelian definition of movement (FORCE, Box 1): ESSENCE, ESTI, *TO BE,* PROPERTY; cf. TO TI ÊN EINAI and *DYNAMIC*. It culminates in the conception of god as "pure act"; see INTELLECTUS, and cf. GOD.

   On the way in which the Latin vocabulary of actuality is thus transposed into the register of reality, see REALITY (with the study of the doublet *Realität/Wirklichkeit*) and, for the Italian system, ATTUALITÀ; cf. RES.

3. Moreover, *dunamis* signifies both "potentiality" as the "not yet" of the act, and the "power" that results from it: on this difference, which Latin renders by means of the two terms *potentia* and *potestas*, see *DYNAMIC* and *POWER* [MACHT; cf. HERRSCHAFT].

4. Potentiality can thus become not the absence of the act, but rather its eminent quality and the mark of the human, which makes the act a work. As for the "failed act" whose success depends precisely on the fact that it is failed, see INGENIUM, Box 3; cf. UNCONSCIOUS, *WITTICISM* [NONSENSE].

II. Ethics: Action and Passion

1. The distinction between action and passion has been one of the matrices of ethical thought ever since the philosophical schools of antiquity, which privileged the first term, though they sometimes interpreted it differently (one can be active with regard to oneself in the form of peace of mind); see PATHOS, *PASSION,* and cf. LOVE, *WISDOM.* The emergence of the vocabulary of the will as a desiring faculty intersects with the same problematics; see WILL, WILLKÜR, and *LIBERTY* (ELEUTHERIA, Box 2).

2. An exploration of the main systems valorizing action by extending moral action to historicity and politics will be found under PRAXIS and VIRTÙ. The Russian *postupok* [поступок] designates the ethical act carried out by a person (*ličnost'* [личность]; see RUSSIAN), and is characterized by responsibility and commitment; see POSTUPOK. Finally, the Fichtean neologism *Tathandlung*, which is irreducible to an *Akt*, beyond the simple paradigms of *tun*, *handeln*, and *wirken* (do, act, work), and beyond the Kantian *Faktum* (fact), reduplicates the posing of an act/fact by the achievement of what is posed, in accord with the equation I = I (see TATSACHE) and opens the way to pragmatics.

III. Pragmatics: Speaking and Acting

1. Contemporary developments, in particular, in analytical philosophy, have led to a reorganization of fields and disciplines around a problematics of action that owes much of its power to the polysemy of the English term "agency"; see AGENCY; see also AFFORDANCE. The domain of thought and language is its necessary condition and element; see SPEECH ACT; cf. INTENTION, SENSE, TRUTH.

2. On the way in which a philosophical idiom tends to develop its own pragmatics, we might refer to the example of Italian, which, even when it translates German idealism, preserves or renews a thematics of the actual (*effetuale*) truth of the thing that refers to its event-character rather than to its universal historicity or the performativity of discourse; see ATTUALITÀ.

➤ DASEIN, *FACT,* SOUL

ACTOR, THESPIAN, COMEDIAN

FRENCH	*acteur, personnage, comédien*
GERMAN	*Schauplatz, Schauspieler, Akteur, Person*
GREEK	*prosôpon* [πρόσωπον], *hupokritês* [ὑποκριτής]
ITALIAN	*attore, comico, maschera*
LATIN	*persona, actor, histrio*

➤ *ACT,* MIMÊSIS, PATHOS, *PERSON,* PRAXIS, SUBJECT

In seventeenth-century French, the word *acteur* still referred both to the dramatic character who acts and whose actions the play "represents" (in conformity with the notion of *mimêsis praxeôn* [μίμησις πράξεων] in Aristotle's *Poetics*), and to the person who plays the character onstage and whom we call the "actor." The character was subsequently differentiated from the actor. In Italy, it was only in the eighteenth century, under the probable influence of the development in French, that the word *attore*, which up to that point had signified solely the character who acts, took on the meaning of a stage actor, whereas the word *personnaggio* was established to

designate what French calls a *personnage* and English a "character." All of these shifts in meaning take place within the semantic field of the Latin language as it was constituted in the domain of rhetoric. The ambiguity and evolution of the word "actor" are in fact related to the term's double heritage, theatrical and rhetorical: on the stage, the actor is the person who puts on a voice-amplifying mask (*prosôpon* [πρόσωπον]) and thus takes on the traits of the character he represents. In this sense, his action is a passion, he is inhabited by a character. But the actor is also an orator, whose *actio*, gestural and vocal, is an esteemed art: he acts out his text and his character, which without him would have no effect. He is then an actor in the active sense of the term, the coauthor of the effect produced.

I. *Actio* and *Hupokrisis*

Latin has several terms to designate the stage actor: *histrio*, *actor*, *comoedus*, *tragoedus*, etc. *Histrio* already includes all the pejorative values of the French word *histrion* or the English "histrionic." It is opposed to *actor*, the stage actor who is trained in the great discipline of rhetoric and who can serve as a model for the orator. We see this in Cicero's esteem for the actor Roscius, for whom he composed a plea. These exchanges between oratory art and dramatic art "reformed" in accord with rhetoric were implied by the identity of the terms that Latin used in referring to the theater and the courtroom. *Actio* designates the art of the actor, that of the orator, and a legal suit; *actor* designates the actor ennobled by his rhetorical training and the plaintiff in a legal case; *agere* is applied both to a procedure (*agere causam*) and to a theatrical role (*agere fabulam*), or to a social role assumed with responsibility and vigor.

Actio (delivery), in the rhetorical sense of the term, belongs to what might be called corporeal eloquence. Cicero defines it this way: "Est enim actio quasi corporis quaedam eloquentia, cum constet e voce atque motu" (In fact, delivery is a kind of elocution of the body, since it consists in voice and gesture, *De oratore* 17.55). Even though delivery is only one of the five parts of rhetoric (the four others being invention, disposition, elocution, and memory), Cicero accords it first place among the means of persuasion: "Actio, inquam, in dicendo una dominatur. Sine hac sumus orator esse in numero nullo potest" (Delivery, I assert, is the dominant factor in oratory; without delivery the best speaker cannot be of any account at all, *De oratore* 3.56.213). It is through *actio* that the orator succeeds in moving his audience, in acting upon it, and thus in winning its support. The role attributed to oratorical *actio* is thus inseparable from the place accorded in Ciceronian rhetoric to *movere*, that is, to emotion or passion. To the emotionally moving body of the orator corresponds the deeply moved body of the audience. In this sense, the orator has much to learn from actors, as Cicero recognizes in speaking of Roscius. But the orator is not only an *actor*, he is also an *auctor*. As the author of his discourse, he is not a simple imitator who limits himself to reproducing gestures and intonations. His *actio* is effective only because it is the expression of a passion whose effects the orator is the first to feel.

In this conception of rhetorical *actio*, we see the mark of Aristotle's influence. As Cicero defines it, *actio* corresponds to what Aristotle calls *hupokrisis* [ὑπόκρισις], the art of the tragic actor. The term comes from *hupo-krinomai* [ὑπο-κρίνομαι], "to reply," which initially designated a rejoinder in a play, then came to indicate declamation and dissimulation:

> [Delivery (*autê*, sc. *hê hupokrisis*)] is, essentially, a matter of the right management of the voice to express the various emotions—of speaking loudly, softly, or between the two; of high, low, or intermediate pitch; of the various rhythms that suit various subjects . . . and just as in drama the actors now count for more than the poets, so it is in the contests of public life, owing to the defects of our political institutions.

> (Aristotle, *Rhetoric* 3.1, 1403b26–35,
> in *Complete Works*, ed. Barnes)

But this definition concerns only the forms of vocal expression, and not gestures, whose importance Aristotle recognizes, including among the poets:

> The poet should remember to put the actual scenes as far as possible before his eyes [*pro ommatôn* (πρὸ ὀμμάτων)]. . . . As far as may be, too, the poet should even act his story with the very gestures [*tois skêmasin* (τοῖς σκήμασιν)] of his personages. Given the same natural qualifications, he who feels the emotions to be described will be the most convincing; distress and anger, for instance, are portrayed most truthfully by one who is feeling them at the moment.

> (Aristotle, *Poetics* 1455a22–32,
> in *Complete Works*, ed. Barnes)

This helps to explain a certain hesitation among Latin authors regarding the term best suited to render this form of eloquence specific to rhetorical *actio*. *Pronuntiatio*, Quintilian notes, is generally considered equivalent to *actio*, but the former seems to refer to the voice (*voce*), the latter to gesture (*gestu*), for Cicero defines *actio* sometimes as "a form of speech" (*quasi sermonem*), and sometimes as "a kind of physical eloquence" (*eloquentia quandam corporis*). However, in his *Institutio oratoria* (11.3.1), Quintilian distinguishes within *actio* two elements that are the same as those found in oratorical delivery (*pronuntiationis*): voice and gesture (*vocem atque motum*). Thus the two terms can be used interchangeably. But starting with *De oratore*, Cicero uses chiefly *actio*, a preference that corresponds to the importance he places on visible and thus silent forms of physical eloquence in the techniques of persuasion.

Redeveloped on the basis of a different conception of the action/passion pair that comes out of Descartes, the problematics of the rhetorical delivery were to play a fundamental role in a seventeenth-century theory of art. Theoreticians of art constantly use the word "action" in a technical, rhetorical sense, that is, in the sense of a physical *actio*, as in Charles Le Brun's lecture on the expression of the passions: "Since it is true that most of the passions of the soul produce bodily actions, we must discover what physical actions express the passions, and what an action is" (lecture delivered on 7 April 1668, in Mérot, *Les conférences*).

1

Prosôpon, persona: From theater to grammar

➤ I / ME / MYSELF, Box 1; SUBJECT, Box 6

Since Homer, *prosopon* [πρόσωπον], etymologically "what is opposite the gaze," has designated the human "face" in particular, and then, metaphorically, the "façade" of a building, and synechdochically, the whole "person" bearing the face. Another remarkable semantic extension is that of the theatrical "mask" (Aristotle, *Poetics* 1449a36), leading in turn to the meaning "character in a drama" (Alexandrian stage directions for dramatic works regularly included the list of the *prosôpa tou dramatos* [πρόσωπα τοῦ δράματος]), and then to a narrative. Its Latin equivalent, *persona*, refers in its turn to the mask that makes the voice resonate (*personare*), before it designates a character, a personality, and a grammatical person (Varro).

The meaning of the compound *prosôpopoiein* [προσωπο-ποιεῖν]—"to compose in direct discourse," that is, to make the characters speak themselves—clearly shows that the dramatic meaning of *prosôpon* had a particularly great influence on the history of the word. In any event, it seems quite likely that when grammarians adopted *prosôpon* to designate the grammatical "person," they were thinking of the dialogue situation characteristic of the theatrical text, which makes use of the alternation "I-you": the face-to-face encounter between person(age)s is rooted in the category of the "person" (see SUBJECT, Box 6).

Whereas terms like "tense" (*chronos* [χρόνος]) and "case" (*ptôsis* [πτῶσις]) are attested before they appear in strictly grammatical texts, this is not the case for *prosôpon* used to refer to the "person" as a linguistic category. On the other hand, in the earliest grammatical texts, and in a way that remains perfectly stable later on, *prosôpon* is adopted to describe both the *protagonists* of the dialogue and the *marks*, both pronominal and verbal, of their inscription in the linguistic material. In fact, the main difficulty encountered by grammarians regarding the notion of *prosôpon* seems to have been how properly to articulate reference to real persons occupying differentiated positions in linguistic exchange (speaker, addressee, other) with reference to the person as a grammatical mark. This difficulty occurs notably in a quarrel about definition. In the *Technê* attributed to Dionysius Thrax (*Grammatici Graeci* 1.1 [chap. 13, p. 51.3 Uhlig = 57.18 Lallot]), the verbal accident of *prosôpon* is defined as follows:

> Prosôpa tria, prôton, deuteron, triton; prôton men aph' hou ho logos, deuteron de pros hon ho logos, triton de peri hou ho logos [Πρόσωπα τρία, πρῶτον, δεύτερον, τρίτον· πρῶτον μὲν ἀφ' οὗ ὁ λόγος, δεύτερον δὲ πρὸς ὃν ὁ λόγος, τρίτον δὲ περὶ οὗ ὁ λόγος].

> There are three persons: first, second, third. The first is the one from whom the utterance comes, the second, the one to whom it is addressed, the third, the one about whom he is speaking.

This minimal definition clearly sets forth the two protagonists of the dialogue, distinguishing them by their position in the exchange, and introduces without special precaution a third position, characterized as constituting the subject matter of the utterance. The parallelism of the three definitions—a simple pronoun for each "person"—masks the lack of symmetry between the (real) first and second persons and the third person; the latter, as Benveniste pointed out (*Problèmes de linguistique générale*, 228), may very well not be a "person" in the strictest sense.

This definition, which remained canonical for several centuries, was attacked by Apollonius Dyscolus, who completed it as follows (I adopt the formulation in Choeroboscos [*Grammatici Graeci* 4.2 (p. 10.27 Uhlig)], a Byzantine witness to the Alexandrian master):

> Prôton men aph' hou ho logos peri emou tou prosphônountos, deuteron de pros hon ho logos peri autou tou prosphônoumenou, triton de peri hou ho logos mête prosphônountos mête prosphônoumenou [πρῶτον μὲν ἀφ' οὗ ὁ λόγος περὶ ἐμοῦ τοῦ προσφωνοῦντος, δεύτερον δὲ πρὸς ὃν ὁ λόγος περὶ αὐτοῦ τοῦ προσφωνουμένου, τρίτον δὲ περὶ οὗ ὁ λόγος μήτε προσφωνοῦντος μήτε προσφωνουμένου].)

> The first person is the one from whom the utterance comes *meaning me, the speaker*, the second, the one who to whom the utterance is addressed *meaning the addressee himself*, the third the one about whom the utterance speaks *and who is neither the speaker nor the addressee.*

Apollonius's arrangement contributes useful explanations: (a) each "person," including the first two, can be the subject of the utterance; (b) the third is defined negatively as being neither the first nor the second (which implicitly opens up the possibility that it is a "person" only in an extended sense, insofar as it does not need to be competent as an interlocutor); (c) the overlap of enunciation and enunciated is explicit: there is a first person when the utterance refers to the enunciator-source, a second person when it refers to the addressee, and a third when it refers to someone or something else.

Despite the incontestable advance represented by Apollonius's revision, it nonetheless leaves an ambiguity regarding the *designatum* of *prosôpon*: are we talking about extralinguistic entities, "persons" engaging in dialogue or not, or are we talking about linguistic entities, "accidents" of the conjugated verb and the pronominal paradigm (personal pronouns)? Apparently the former, which is surprising coming from a grammarian who prides himself on correcting another grammarian. In fact, there is hardly any doubt that in Apollonius, the ambiguity I mentioned is still attached to the term *prosôpon*. Consider the following text, taken from Apollonius's *Syntax* 3.59 (*Grammatici Graeci* 2.2 [p. 325.5–7 Uhlig]):

> Ta gar meteilêphota prosôpa tou pragmatos eis prosôpa anemeristhê, peripatô, peripateis, peripatei [τὰ γὰρ μετειληφότα πρόσωπα τοῦ πράγματος εἰς πρόσωπα ἀνεμερίσθη, περιπατῶ, περιπατεῖς, περιπατεῖ].

> The persons who take part in the act [of walking] are distributed into persons: I walk, you walk, he/she walks.

We can interpret this to mean that in a group of persons—extralinguistic entities—who are walking, every utterance concerning the walk will elicit the appearance of verb endings distributing the walkers among the three grammatical persons: such is the alchemy of Apollonius's *prosôpon*.

II. The Actor: Character and Thespian

In seventeenth-century France, an *acteur* was primarily the character who is active, who is involved in a dramatic action (in accord with the etymology: *acteur* is derived from the Latin *agere*, "to do"). He is thus the "dramatic character" as such. It is in this sense that the words *acteur* and *personnage*, used more or less interchangeably, appear at the head of the list of the dramatis personae at the beginning of each play, but with a clear preference for the word *acteur*. In contrast to the imaginary *acteur* conceived by the author, the thespian is the person who mounts the boards and whose craft consists in acting out the drama in the broad sense of a "theatrical play composed in accord with the rules of the art" (RT: Furetière, *Dictionnaire universel*) that the seventeenth century accorded to this expression.

It is striking to see that it is precisely in the seventeenth century that the word *acteur* appears in French—though rarely as a synonym of *comédien* (actor). The word *comédien* remains connected with the profession of representing onstage, whereas the word *acteur* refers to the character involved in the dramatic action as well as to the person who plays him. Pierre Corneille employs both *acteur* and *personnage* in speaking about the characters in his plays, and François Hédelin, abbé d'Aubignac, in his book *La pratique du théâtre*, entitles one of the chapters "Des personnages ou Acteurs, et ce que le Poète doit y observer" (251).

The art of the thespian, the playwright, and theatrical literature in general was greatly stimulated by the rediscovery of Quintilian's *Institutio oratoria* and the cult of Cicero, as well as by the seventeenth-century *renovatio studii*. This powerful network of Jesuit schools, which based its pedagogical activity on a Christianized version of Quintilian's *Institutio oratoria* and on the *Ratio studiorum*, the basic document of Jesuit education, trained an audience familiar with the rhetorical disciplines. Eager to win the esteem of courts and academies, the thespians of the seventeenth century tried to distinguish themselves from more primitive players by emphasizing their complete mastery of oratorical delivery.

A French thespian of the seventeenth century, and especially a tragedian, found himself in a situation analogous to that of the orator: not having a mask, he had to rely solely on the evocative magic of verbal figures to play his role. By studying characters and their bodily expression, gestural expression was also governed by customs of an ethological nature. Moreover, the ascetic simplicity of the tragic stage between 1630 and 1660 coincided with an increasing interest in questions of eloquence and rhetoric. The stage became a testing site for the powers of rhetorical discourse left to its own devices. The thespian's delivery was thus almost as important as the power of the verbal figures that the playwright put into the text for him. This emphasis on delivery reveals the idea of an imminent power in the text that is reflected in the distribution of roles; only an excellent actor would be capable of realizing this potential in performance. But if the character's written part contains a potentiality that has to be actualized, the thespian has to exhibit onstage this passage from written words to his body. Both the character and the thespian are therefore *acteurs* in the strong sense of the term. One of them acts on the other. Thus the fictive

unity of the character represented by the thespian onstage is always interrupted by the reminder of the invisible text, and the thespian, by his bodily presence, recites and plays the text of another, absent person—of an author who has created the character.

This vague and troubling difference between the thespian and the character is at the heart of Jean Rotrou's *Véritable Saint Genest* (staged in 1645), a play written in the tradition of the play-within-a-play. A pagan thespian, Genest, plays the role of a Christian martyr, Adrian, in a play. In the scene where he represents Adrian's conversion, the thespian suddenly becomes the character he is playing. "Heaven . . . has made me its actor [*acteur*]," he says, the word *acteur* having here the twofold sense of someone who acts on behalf of an idea or a religious belief, and of a thespian who acts on the scene of the great theater of the world. Struck by grace, the thespian leaves his role to express himself in his own name: "This is no longer Adrian speaking, it is Genest who is expressing himself; / This play is no longer a play, but a truth / . . . Where, myself the object and the actor [*acteur*] of myself, / . . . I profess a law" (vv. 1324–30). The thespian becomes the author of his own text at the very moment in which he is acted upon by another text and speaks in the name of another author, the divine author. Playing on the reflexive structure of the play-within-a-play, Rotrou was able to represent in this drama the indeterminacy that characterizes all relations between the thespian and his character, as well as the considerable stakes that flow from this and that go so far as to involve, as an absent character, the supreme author.

III. The *Inventio* of Italian Actors: *Attore, Comico, Maschera*

At the beginning of the seventeenth century, *attore* still indicated the person who acts, who does things. The *Vocabolario degli accademici della Crusca* (1612) gives *facitore* as a synonym of *attore*, with, on the one hand, a reference to God as the "attore della batitudine" (the author or origin of beatitude), and on the other hand, a reference to the plaintiff, the person who pleads a case—a meaning still in use in modern Italian.

One of the reasons that the Italian language of the sixteenth and seventeenth centuries did not actualize the meaning contained in the Latin word *actor* to designate the thespian has to do with the existence, starting in the middle of the sixteenth century, of troupes of professional thespians who wrote their own texts. The formation of these troupes is connected with the birth of the *commedia dell'arte*. These thespians had left the limited domain of *actio* in order to practice in that of *inventio* as well. In fact, the expression *il comico*, whose initial meaning indicates a relationship to the theater, includes the productive aspect of theatrical texts. In their work, these thespians practiced *dispositio*, *elocutio*, and *memoria*, thus covering the whole range of rhetorical creation. In addition, they were capable of representing on the stage any of the period's theatrical genres. That was what distinguished them from the cruder players called *buffoni*, *mimi*, *istrioni*, and *comedianti*. Several theoretical texts written by professional thespians, such as Francesco Andreini's *Le bravure del Capitano Spavento* (1607) or Niccolò Barbieri's *La supplica* (1634), emphasize this difference, seeking to

ennoble the thespian's profession and to present him in a positive light as an expert in the rules of rhetoric.

The constraints of the theater market did not allow these professional thespians to produce the same play at the same place over an extended period of time. They were forced to produce new kinds of show. This is what was called at the time playing *all' improvviso* or *a soggeto*. This technique clearly distinguished the Italians from other European troupes. The Italian thespians were accustomed to raiding and dismembering rhetorical treatises or literary texts in order to extract from them *parti*, roles, which they would then slip into a kind of personal collection that each thespian kept concerning a single type of character (*primo amoroso*, servant, old Venetian merchant, etc.). They distinguished two aspects in the character, one that changed from one play to the next, and another that remained invariable and was called *la maschera*. The use of half-masks in leather emphasized the fixed aspect of characters. The masks determined the way a personage dressed, spoke, gestured, and so on, but not the character traits, which varied in each representation, depending on the different plots and the agreement of the other thespians. The secret of the "masks" of *commedia all'improvviso* resided in a constantly varying, subtle equilibrium between the indetermination of the character of a personage and the rigid predetermination of all the other elements. Thus the thespian becomes the author of a text that is created at the very moment of its representation and vanishes immediately afterward. His representation consists in verbal action similar to that of the orator, where what is said is both subject to strict rules and completely uncertain. We can understand why Molière and Shakespeare took such an interest in the technique of thespians who were able to combine the repetitive elements of dramatic characters with a great versatility of forms.

But soon the creative conjunction of the thespian and the author tended to become no more than an empty form. That is when there emerged a new conception of the thespian as *attore*, that is, as someone whose craft consisted in representing a text given in advance. Thus Carlo Goldoni, in his preface to the first collection of his comedies published in 1750, reproaches "mercenari comici nostri," that is, the professional thespians in Italian troupes, for altering and disfiguring texts "recitandole all'improvviso" (Goldoni, *Commedie*, 66). Goldoni was one of the first to speak of *attori*, clearly distinguishing the latter from *comici*. In his comedies, he reintroduced individual psychology in his characters by doing away with the fixed character traits of the *maschere*. The theatrical reform begun by Goldoni gave the Italian theater a literary and "authorial" orientation; the thespian came after the fact to incarnate and actualize a text written by an author.

From that point on, the word *attore* designates the thespian in general, the expression *il comico* being reserved for actors playing comic roles. Yet the productive aspect of the person who writes a comic theatrical text has remained. This meaning is preserved in the English "comedian," which designates a particular type of actor-author who performs alone on a stage, with "actor" designating those who perform in works made for the theater or the cinema—but there are many actors who lay claim to the tradition of the comedian, such as Woody Allen.

IV. *Schauplatz, Schauspieler, Akteur, Person*

Unlike French and Italian, German accentuates, in the word *Schauspieler*, the idea of the person who creates and shows a play, a theatrical illusion. The word has been used in German since the seventeenth century. In the seventeenth century, the actor was also designated by the expression *die darstellende Person*—the representing person. Starting in the first half of the eighteenth century, in German as in Italian, under the influence of French, the expressions *der Akteur* and *die Aktrice* were used, replacing the word *Komödiant*, which had taken on the pejorative sense of a person who feigns. But this use of the word *Akteur* is lost in modern German, where it still designates the person who is at the head of a political action.

The word *Schauspieler* was definitively established by the beginning of the nineteenth century. It derives from *Schauspiel*, used since the end of the sixteenth century in the general sense of shows presented before an audience, but also in the more restricted sense of theatrical representation. *Schauspiel* is connected with the word *Schauplatz*, which translates the Greek *theatron* [θέατρον], designating a platform set up and intended for juridical activities, plays, or ceremonies. Since the seventeenth century, this word has also had the sense of a dramatic setting. Thus at the beginning of Andreas Gryphius's *Leo Armenius* (1646): "Der Schauplatz ist Constantinopel" (The scene is Constantinople). In the same period, the word *Schaubühne* was used to designate a wooden scaffolding or platform set up for a show. But in the seventeenth century, people spoke simply of *Bühne*. In religious history, *Schauplatz* means "Calvary," and its eschatological sense refers to the earthly site where the end of the world will be revealed. In his *Origin of German Tragic Drama*, Walter Benjamin wrote a few famous pages on this last meaning. The *Schauplatz* of the baroque period is for him the place where history is secularized and where the temporal process settles into a spatial image.

As for the theatrical character, from the beginning of the sixteenth century, it is called *die Person, die spielende Person*. According to the Grimms, this usage derives from translations of the word *persona*, "mask," which appears in Latin comedy (RT: *Deutsches Wörterbuch*, s.v.). German thus does not distinguish between the real person and the fictive person.

AESTHETICS

FRENCH	*esthétique*
GERMAN	*Ästhetik* (n.), *ästhetisch* (adj.)
GREEK	*aisthêtikos* [αἰσθητικός]
LATIN	*aesthetica*

➤ ART, BEAUTY, EPISTEMOLOGY, ERSCHEINUNG, GOÛT, PERCEPTION, SENSE

Because of its etymology, the term "aesthetics" does not appear to pose any special problem of translation in its transposition from one European language to another. Created by Alexander Gottlieb Baumgarten (1714–1762), the neologism *Ästhetik* seemed, at least in the mind of the German philosopher, not to suffer from any ambiguity, and European philosophers, aware of its Greek origins and its insertion into Latin philosophical vocabulary, spontaneously adopted it widely. However, from the beginning of the nineteenth century, it stirred fascination and mistrust in equal measure. The problems, variable from one language to another and from one country to another, concern both the delimitation of the field of knowledge bearing on art and the beautiful, as well as the specialization of knowledge, methods, and objects relative to the study of the sensible. The epistemological coherence that seems to guarantee the nearly identical circulation of a term that is perfectly identifiable from one language to the next—whether English or Romanian, modern Greek, Spanish, Italian, and so forth—thenceforth appears to be an illusion.

I. Baumgarten and the Epistemology of a Science of the Sensible

Starting from the Platonic and Aristotelian distinction—later taken over by the Church Fathers—between *aisthêta* (sensible things or facts of perception) and *noêta* (intelligible things or fact of intelligibility), A. G. Baumgarten has no doubt, as early as 1735, in his *Meditationes philosophicae de nonnulis ad poema pertinentibus*, of the existence of a science of the perceptible world. "*Noêta . . .* are the objects of Logic, *aisthêta* are the objects of *aisthêtikê*, or Aesthetics" (§116). At least, this is how the philosopher, fifteen years before the publication (in Latin) of his *Aesthetica* (between 1750 and 1758), clarifies the object of a discipline that does not exist yet and that he attempts to define later, with a few variations. These variations aim to determine progressively the epistemological framework of aesthetics. In the first edition of his *Metaphysics* (1739), Baumgarten reconstructs, along the lines of the scholastic tradition, a kind of

trivium on the basis of the modalities of aesthetics, between rhetoric and poetics, which, in another work, he describes as follows: "The science of the mode of sensory knowledge and exposition is aesthetics; to the extent it aims at the slightest perfection of sensory thought and discourse, it is rhetoric; to the extent it aims at their greatest perfection, it is universal poetics" (*Aesthetica*, 533).

■ See Box 1.

However, as though the project of a universal poetics seemed too restricted, Baumgarten abandons this definition in the subsequent editions of his *Aesthetica*, ending up with, in the same paragraph, a formulation that is supposed to attest to the complete autonomy of aesthetics (7th ed., 1779): "The science of the sensible mode of knowledge and exposition is aesthetics (logic of the lower faculty of knowledge, philosophy of the graces and the muses, lower gnoseology, the art of the beauty of thought, art of the analogon of reason)."

This is more or less the definition with which the *Aesthetica* of 1750 begins: "Aesthetics (or theory of liberal arts, lower gnoseology, art of the beauty of thought, art of the analogon of reason) is the science of sensible knowledge."

II. The Term "Aesthetics" in Latin, Greek, German, and Other Languages

This characterization of aesthetics, which Baumgarten thinks of as global and able to subsume under a single concept not only beauty and artistic taste but also perceptual experience, does a poor job of masking a plurality of definitions whose coherence is, certainly, far from being clear. In fact, Baumgarten reveals the cognitive dimension of aesthetics by playing on the amphibolous character of the word, at the cost of redundancies that come close to pleonasm—"theory," "science of knowledge," "gnoseology." He Latinizes the Greek adjective *aisthêtikos* as *aesthetica*, but he is also thinking of *sentio*, to perceive by the sense and (or) to perceive by the intellect, which is a way of reminding us, following Aristotle, that there are no *aisthêta* without *noêta* and that they cannot be dissociated, as Kant reminds us when he refers to the Greek adage: *aisthêta kai noêta* (the sensible and the intelligible, what can be sensed and what can be understood). But even this notion Baumgarten formulates, in his own way, in Latin: aesthetics is *ars analogi rationis* (art analogous to reason).

Thus, an equivocation affects the term "aesthetics," one which is all the more formidable since it is not evident, which reveals itself to be a source of difficulty and confusion even among those who use it and thus ratify its usage. While translators in European languages overcome their distress at a term with uncertain roots by trusting either Indo-European (*aiein*, to perceive) or Greek (*aisthanomai*, to feel), of which the Latin *sentio* is an acceptable equivalent according to Baumgarten, things are different for philosophers and thinkers who venture out to explore the field of aesthetics, which, as it is badly circumscribed, turns out to be unlimited.

Kant is certainly one of the first to have attracted attention to the specific, typically Germanic usage of the term aesthetics. In the chapter of the *Critique of Pure Reason* (trans. P. Guyer and A. Wood, 1998) devoted to the "Transcendental

1

Ästhetik

It is as a direct transcription of the German *Ästhetik* that the word *esthétique* enters a French dictionary for the first time, at the end of the eighteenth century. The *Supplément à l'Encyclopédie*, which was published in 1776, provides as a "new term" a note "Esthétique," which is simply a quasi-literal translation of the article "Ästhetik" in J. G. Sulzer's dictionary, *Allgemeine Theorie der schönen Künste* (General theory of fine arts) (1771). The word, documented in French as early as 1753, but not to be found in the RT: *Dictionnaire de l'Académie Française* in either the 1740 or 1762 editions, is thus elevated to lexicographical dignity. The translator of the note, who remains anonymous, comes from the milieu of the Berlin Academy, which played a central role in the exchanges between Germany and French encyclopedists. Sulzer may thus be considered a major agent in the linguistic exchanges in the domain of fine arts, and especially in the introduction of the Baumgartian theory into France. His name, somewhat eclipsed by Johann Joachim Winckelmann's coming into fashion, is nevertheless regularly cited by French theorists of art, such as Quatremère de Quincy. Besides this simple lexical importation, it is the whole project of the *Allgemeine Theorie* that is thus presented and transposed in the *Supplément*, since Sulzer had made this note one of the matrices of his dictionary.

The word's presence in French dictionaries was nonetheless a short one. By 1792 it had disappeared from the section of *Encyclopedie méthodique* devoted to fine arts. It does not make itself at home in French until the mid-nineteenth century, notably with the publication in 1843 of T. Jouffroy's *Cours d'esthétique*. The comparison between the German note "Ästhetik" and its French translation in the *Supplément* also betrays some characteristic displacements of emphasis and interest. Though he remains relatively faithful to the original text, the translator nevertheless tends to attenuate Sulzer's criticisms of J.-B. Du Bos, and, on the other hand, to temper the praise of Baumgarten. Where the German presents Baumgarten as "daring," in a heroic gesture, to lay the first stones of this new science of aesthetics, the French, more skeptically, describes him as "hazardant [*sic*]". In general, the initial balance of the German note between speculative analysis of the essence of art and concrete examination of its different techniques seems to be turned upside-down in the French version, where the practical part is made much more precise, more dynamic, and more programmatic than in the German version. Aesthetics, in the French version, thus remains, up until the *Supplément*, more directly related to an empiricist and practical approach. It presents itself as an examination of the technical modalities of *the arts*, rather than as a speculative analysis of the foundations of *art*. Thus, from the first crossing of the border, a Franco-German divide emerges with regard to the word "esthétique," which the passage of time quickly accentuates.

Aesthetic," he indicates the peculiar meaning of the word, which, he points out, only the Germans use to refer to the philosophy of the beautiful. Implicitly, he indicates here the difficulty of a transposition of the word into a foreign language. Kant, hoping to make this particular meaning of aesthetic more precise ("science of all the a priori principles of perception"), notes the following (156):

> The Germans are the only ones who now employ the word "aesthetics" [*Ästhetik*] to designate that which others call the critique of taste [*Kritik des Geschmacks*]. The ground for this is a failed hope, held by the excellent analyst Baumgarten, of bringing the critical estimation of the beautiful under principles of reason, and elevating its rules to a science. But this effort is futile. For the putative rules or criteria are merely empirical as far as their sources are concerned, and can therefore never serve as *a priori* rules according to which our judgment of taste must be directed; rather the latter constitutes the genuine touchstone of the correctness of the former. For this reason it is advisable again to desist from the use of this term and to save it for that doctrine which is true science (whereby one would come closer to the language and the sense of the ancients, among

whom the division of cognition into *aisthêta kai noêta* was very well known).

Hegel evinces a similar suspicion regarding the German *Ästhetik* and doubts it can be adequately translated into English or French: "To us Germans the term is familiar; it is not known to other peoples" (*Vorlesungen über Ästhetik* [1935]; trans. Knox, *Aesthetics: Lectures on Fine Art*). He clarifies that the French say *théorie des arts* or *belles-lettres*, while the English, he says, referencing Henry Home's (1690–1782) work *Elements of Criticism*, classify aesthetics under "criticism."

In his *Aesthetics*, Hegel finds the term "aesthetic" improper (*unpassend*) and superficial (*oberflächlig*). He mentions the neologism "callistics," constructed from the Greek *to kallos* (beauty), which some had offered as an alternative, but finds it inadequate (*ungenügend*), since it refers to the beautiful in general and not the beautiful as artistic creation. Restricted to a term that has already "passed over into common speech" (*in die gemeine Sprache übergegangen*), he takes care to clarify that he does not mean to deal with the science of sense or sensation, nor with feelings such as pleasantness or fear, but with the philosophy of art, and notably with the philosophy of fine art (*Philosophie der schönen Kunst*).

Hegel puts himself assuredly and deliberately at the opposite extreme from the Kantian double meaning of "aesthetic," meaning both a study of a priori forms of perception and a critique of taste, the study of the feelings of pleasure and pain related to the faculty of judgment, whose domain of application is, according to Kant, art. Nevertheless, we know the paramount importance he gives to nature to the detriment of art in general and fine arts in particular. Similarly, the Hegelian notion of "aesthetics," a term imposed by use and not fully accepted, distances itself from the sense given to it by the Kantian and Rousseauist Friedrich Schiller, in the *Letters on the Aesthetic Education of Man*, where it is primarily a question of the "aesthetic disposition of the soul" (*ästhetische Stimmung des Gemüts*) in its aspiration to the unity of beauty, morality, and liberty.

Finally, one would search in vain for a commonality of meaning, intention, or project between Hegel's philosophy of art and the aesthetics of Jean Paul, the author of *Vorschule zur Ästhetik* (1804, 1813) (translated into English as *Horn of Oberon: Jean Paul Richter's School for Aesthetics*), where aesthetics is defined by the author himself as a "theory of foretaste" (*Vor-Geschmackslehre*), despite the fact that the term *Geschmackslehre* is deliberately formed as an equivalent of "aesthetics."

There is thus little chance, as Hegel points out, that the simple utterance of the word "aesthetic," used as a noun or adjective, would mean the same thing in English, French, and German. Jean Paul, not without perspicacity and humor, brings up such distortions when he sharply criticizes the pseudoscientific constructions of his contemporaries and compatriots ("the modern transcendental aestheticians") and offers an ambiguous homage to "English and French aestheticians" (he cites Home, Geattie, Fontenelle, and Voltaire), for whom, he adds, "the artist at least gains something." "Each nation has its own aesthetic," Jean Paul seems to lament, and he denounces the division of student-aestheticians of Leipzig (prettily named the "sons of the Muses") according to whether they were French, Polish, Meissenish, or Saxon, on the model of the Parisian Collège des Quatre Nations (*Horn of Oberon*).

III. Aesthetics and *Kunstwissenschaft*

The term "aesthetics" seems from the nineteenth century on to be as necessary on epistemological and scientific levels as it seems superfluous on the linguistic one. Faced with this term, European translators, carried away by the urgency of transposition, can easily follow in Hegel's footsteps and make use of the obvious etymological transposition of *aisthêtikos* into their own languages. However, on pain of missing important theoretical and philosophical issues, the translator must make sure of the field covered by the generic "*aesthetics*." He has, more or less, the choice between "philosophy of art," "philosophy of the beautiful," "theory of taste," "theory of art," "theory of fine arts," "theory" or "science" or "critique of the beautiful," "theory or science of art," not to mention some of their close equivalents from other languages, such as *théorie des beaux-arts*, *Wissenschaft vom Schönen*, *Kunstlehre, Kunstkritik*, or *Kunstwissenschaft*, the last of which is not always fully distinguished from *Kunstgeschichte*.

The same concern with differentiating the domains of knowledge falling under aesthetics prompts twentieth-century philosophers to specify the nature and orientation of their work. "Aesthetics" thus loses its relational and interdisciplinary character, straddling different human sciences, and comes to mean rather a sort of generalist and referential metatheory or metadiscourse. Thus, Theodor Lipps takes care to clarify, as a subtitle, that his *Ästhetik* (1923) should be understood as a psychology of the beautiful and of art (*Psychologie des Schönen und der Kunst*). To be sure, he adopts from the very beginning the classic definition, or at least the most commonly agreed-upon one, of aesthetics as the science of the beautiful:

Aesthetics is the science of the beautiful and thus implicitly also that of the ugly. An object is qualified as beautiful if it is suited to arouse or to attempt to arouse in me a particular feeling, notably that which we have the habit of calling the "feeling of beauty."

Immediately afterward, however, he claims peremptorily that, on one hand, aesthetics may be considered as applied psychology, and on the other, that the historical science of art (*historische Kunstwissenschaft*) ventures into aesthetics only on pain of betraying its most essential scientific calling.

Lipps is coming up against the difficult question of the status of aesthetics, considered sometimes as a general philosophical and theoretical discipline, sometimes as a discipline that is itself a part of another more general one, along with art criticism, art history, sociology, psychology, ethnology, and other disciplines concerning the arts as well as the experience that goes along with them. To mitigate this kind of difficulty, Max Dessoir (1906) attempts in the very title of his book to establish a double name, unlikely to be acceptable in another language: *Ästhetik und allgemeine Kunstwissenschaft* (Aesthetics and the general knowledge of art).

IV. Semantic Indeterminacy

This operation that aims to join two distinct approaches—for example, the Hegelian type of philosophy of art and the more scientific and descriptive theories of a Riegl or a Wölfflin—within one discipline, may be congenial to German-speaking philosophers and aestheticians. The English and especially the French, however, are less convinced as to the pertinence of this doubling up within a rather cumbersome expression, especially since the translation of *allgemeine Kunstwissenschaft* by "general science of art" or *science générale de l'art* does not indicate in English or in French any particular method or definite object.

In *The Essentials of Aesthetics* (1921), George Lansing Raymond dwells, as it happens, on the strangeness of importing the German word *Ästhetik* into English. By analogy with "mathematics," "physics," "mechanics," and "ethics," he justifies the plural use of "aesthetics," rather than the singular "aesthetic"—("this term . . . seems to be out of analogy with the English usage")—by the fact that the word refers to a plurality of disciplines in which similar methods produce "greatly varying results." According to the author, the singular ending "ic" would wrongly relate "aesthetic" with "logic" or "music," specific departments centered on a

unique object, in which scientific method produces similar results. From that point on, an expansive definition of "aesthetics" understood in the sense of a "science of beauty exemplified in art" allows the author to devote his reflection to themes and domains that come mostly from what Germans call *Kunstwissenschaft* and *Kunstgeschichte*, and the French *sciences de l'art*, rather than theoretical and philosophical aesthetics.

A pure invention of an eighteenth-century philosopher, the term *aisthêtike*—linguistically irreproachable, as it happens—will no doubt retain some semantic indeterminacy for a long time, despite its apparent translatability. However, though it does not explain by itself how the shift from the Greek verb *aisthanomai* to the philosophy of the beautiful or the science of art came about, it is a continual reminder of the attempt to understand how "humble" sensations, objects of a *gnoseologia inferior*, form in man the ideas that he then reincarnates in what he calls "works of art."

AFFORDANCE

FRENCH   *disponibilité* [of a resource], *exploitabilité* [of a situation]
GERMAN   *affordanz*

➤ *DISPOSITION* and *ACT*, ANIMAL, BEHAVIOR, CONSCIOUSNESS, LEIB, Box 1, PERCEPTION, REPRÉSENTATION, VORHANDEN

The word "affordance" is a neologism coined by James J. Gibson to account for the way in which every organism perceives its environment.

Ecological psychology (Gibson, *Ecological Approach*) and the theory of knowledge derived from it (Noë, "Experience"), contest the representationalist conception. According to the latter, the perceiving subject must form mental representations because he has access only to fragmentary and changing sense data. The ecological theory maintains on the contrary that what humans and animals perceive is *affordances*, that is, possibilities of acting, that exist objectively in the world independent of the fact that they are perceived. The perception of *affordances* uses the information provided by perceptual systems because of their privileged resonance with a determinate environment. Action plays a major role in perception insofar as movement makes it possible to extract perceptual constants from the perceptual optical flux to which it gives rise.

The word "affordance" poses a serious problem for the translator. English "to afford" (to do something) has the twofold sense of having access to sufficient resources and being in a position to act without risk. These two meanings are exploited in Gibson's definition: "The *affordances* of the environment are what it provides to animals, what it gives them or furnishes them, for better or for worse" (Gibson, "Theory of Affordances"). Thus "affordances" could be rendered in French by *ressources* insofar as the English term covers both the targets of action and the obstacles or dangers connected with a given situation. The predominant usage is currently to retain the neologism transposed into French.

AGENCY

FRENCH   *action, agent, agence, agir*

➤ *ACT,* and ACTOR, ENGLISH, FORCE, INTENTION, *LIBERTY,* PATHOS, PRAXIS, SOUL, SPEECH ACT, SUBJECT

The word "agency" appeared in English in the seventeenth century. When it was introduced into philosophy in the eighteenth century, it was initially used in a classically Aristotelian way, opposing action and passion, agent and patient. "Agency" can designate action (in the physical sense) or what modifies action (in contrast to being the object of action), or what modifies the agent (in contrast to the patient). Thanks to the operation of various expressions in English, "agency" came to sum up the difficulties of defining action and, in the contemporary period, of what makes it possible to act, no longer as a category opposed to passion, but as a "disposition" to action, a disposition that upsets the active/passive opposition. In agency, the agents themselves are no longer only the actors/authors of action; instead, they are also caught up in a system of relations that shifts the place and authority of action and modifies (or even completely muddies, notably in its use in economic theory) the definition of action. In its contemporary uses, "agency" is thus the point where the dualisms action/passion and agent/patient are erased and also where the subject/agent is defined in a new way.

The French translation of "agency" as *agir* (which has now become standard and is made possible by the specificity of the infinitive in French but which introduces a unilaterally active character), or even as *puissance d'agir* (which strengthens still further the classical tonality by implicitly correlating agency/*puissance* with action/*acte*), remains

blind to such a development in usage and continues to be linked with a classical view of action and the agent. In many cases, "agent" would be more easily translated by *sujet* (and, in turn, "agency" translates *sujet* better than "subject" does). However, we should note that the French word *agence* is an adequate translation of "agency" when it designates, in a derived usage, an entity or institution endowed with a power of acting. This institutional usage (e.g., Agence nationale pour l'emploi, Central Intelligence Agency) is revealing, in both languages, of a complexity in the mode of action: agency (or the agent) being that which acts, but on behalf of another.

"Agency," which is today widely used in Anglo-Saxon analytical philosophy, especially in America, is probably untranslatable in the primary, strict sense of the term; that is, it is impossible to make it correspond to one and the same term in French translations of the texts in which it figures. This problem is connected to syntactical properties of English that have been systematically exploited in constituting a "semantics of action." Thus, examining this problem, and the more or less satisfactory solutions that translators and commentators have provided, may direct our attention toward a feature peculiar to the way in which a nominalist tradition that goes back at least as far as Hume, and that is illustrated today in the works of the post-Wittgensteinians, deals with the field of subjectivity. As often happens, the existence of alternative "paths" in modern philosophy proves to be inseparable from the interaction between concept and language.

I. Examples of the Polysemy of "Agency"

We can introduce the problem by examining Michael Sandel's book *Liberalism and the Limits of Justice,* which was translated into French by Jean-Fabien Spitz. Sandel devotes a major portion of his work to discussing what he calls two moral "theories," such as those developed in particular by John Rawls: "certain theories of community and agency at the foundation of justice," which Spitz translates (or glosses?) as "certaines théories de la communauté et de la qualité d'agent au fondement même de la théorie de la justice" (*Le libéralisme*). A little further on, Sandel continues his discussion by saying that "[w]e need therefore to assess Rawls' theory of the good, and in particular his accounts of community and agency, not only for their plausibility . . . ," and this time Spitz simplifies, rendering "agency" as *agent*: "Il nous faut donc évaluer la théorie rawlsienne du bien, et en particulier son analyse des notions de communauté et d'agent, non seulement pour apprécier leur plausibilité . . . ." The subhead "Agency and the Role of Reflection" is rendered as "La qualité d'agent et le rôle de la réflexion," the term "agency" once again being simplified to "agent," which makes it possible to achieve the stylistic compression of a hendiadys ("For Rawls, the account of agency and ends falls under the conception of good" [Pour Rawls, l'analyse de l'agent et de ses fins est du ressort de la conception du bien]).

But further on, Spitz has to resort once again to a gloss that makes explicit the position he has taken with regard to the term "agency": "[T]he bounds of the self must be antecedently given . . . in order to assure the agency of the subject, its capacity to choose its ends" is rendered as "[L]es limites du moi doivent être données au préalable . . . pour garantir que le sujet soit bien un agent et qu'il ait la capacité de choisir ses fins." However, immediately afterward, Spitz is forced to completely change his paradigm: "[W]hile the bounds of

the self may seem an undue restriction on agency . . . they are in fact a prerequisite of agency" is translated as "[L]es limites du moi peuvent sans doute nous apparaître comme des restrictions indues de notre pouvoir d'action . . . mais ces limites sont en fait la condition même de l'action." The same fluctuations can be seen throughout the argument.

In this transfer of the contemporary concept of agency into French, we must pay particular attention to the choices made by Paul Ricœur, who has discussed this question on several occasions in a dialogue with analytical philosophers' "semantics." Ricœur began by retaining the word "agency" in its original language:

> Richard Taylor, dans son œuvre récente, *Action and Purpose* (Englewood Cliffs: Prentice Hall, 1966) a développé toutes les implications de cette crise de l'idée de causalité lorsqu'elle est rapportée à l'agent et à son *agency*. L'*agency* de l'agent implique un certain nombre de traits diamétralement opposés à ceux que la notion moderne de cause a conquis.

> (Richard Taylor, in his recent work, *Action and Purpose*, (Englewood Cliffs: Prentice Hall, 1966) has developed all the implications of this crisis of the idea of causality when it is related to the agent and his agency. The *agency* of the agent implies a certain number of characteristics that are diametrically opposed to those that the modern notion of cause has taken on.

> (*La sémantique de l'action*)

This allows Ricœur to move immediately to the apparently substitutable expression "la causalité de l'agent," whose specific characteristics he discusses. On the other hand, in his later works, and especially in *Soi-même comme un autre* (which includes a long discussion on Davidson under the subhead "Troisième étude: une sémantique de l'action sans agent"), he explicitly proposes to translate "agency" by *puissance d'agir*. But he notes: "On pourrait attendre, sous ce titre, une analyse du pouvoir-faire de l'agent. Il n'en est rien; il est seulement question du critère distinctif des actions proprement dites (*deeds and doings*) par rapport aux événements qui ne sont que de simples occurrences (*happenings*), lorsque semble faire défaut le caractère intentionnel [Given the title . . . one might expect an analysis of the agent's power to act. There is nothing of the sort; instead it is solely a matter of the distinguishing criterion of acts in general ("deeds and doing") in relation to events which are but mere happenings, when the intentional character appears to be lacking]."

Ricœur's translations or non-translations are thus always at the same time claims made regarding the essence of the question of the relationships between the "semantics of action" and the "philosophy of 'subjectivity,'" which the uses of "agency" appear to unveil.

An interesting counterexample is provided by reading a more recent essay by Vincent Descombes on "action" ("L'action"). Not only is Descombes familiar with analytical philosophers and discusses their common presuppositions (the pass uniformly given to the psychology of "will" to the advantage of sentences expressing the relationship of the subject to his action) and divergences (the structural point of view versus the causal point of view), but he clearly writes

with English expressions in mind. That is why it is tempting to reconstitute behind one or another of his varied formulations the presence of a term like "agency" (which he never mentions) or the possibility of retranslating them by this term. But this is not always the case, and "agency" is here remarkably translated and absorbed into an overall view of the history of thinking about action.

II. "Agency" as a Principle of Action

"Agency" nonetheless has its own history. In *The Invention of Autonomy*, J. B. Schneewind observes that the first occurrence of the term "agency" in its philosophical sense is found in Samuel Clarke's *Lectures*. What Clarke calls the "Power of Agency or Free Choice" is the ability to act in accord with one's knowledge of eternal ideas. Schneewind adds:

> The *Oxford English Dictionary* shows only one earlier use, in 1658, which is not clearly a philosophical one. It then gives a citation from Jonathan Edwards dated 1762, although Berkeley, Hume, and Price had all previously used the term. In 1731 Edmund Law, referring to Clarke, described the word as "generally including the power of beginning Thought as well as Motion." (King, *Essay*, p. 156n).

In classical English thought, "agency" designates a general and undefined property of acting closely connected with causality and efficacy: agency is thus the active force, the effective cause of action (cf. Ger. *Wirkung*, which differs from *Handlung*, action). In Hobbes, for instance, the conception of agency is classically Aristotelian, as is shown by the perfect agent/patient symmetry that structures his whole reflection on action:

> As when one body by putting forwards another body generates motion in it, it is called the AGENT; and the body in which motion is so generated, is called the PATIENT; so fire that warms the hand is the agent, and the hand, which is warmed, is the patient.

> (*Elements of Philosophy*, pt. 2, in *Complete English Works*, chap. 9)

Thus agency is what characterizes action and the person who performs it and is related to the real and effective cause of action. For example, God may be the source of the agency of an agent, even if the latter seems to be the one performing it.

> [T]he agency of external objects is only from God; therefore all actions, even of free and voluntary agents, are necessary.

> (Hobbes, *Questions concerning Liberty, Necessity, and Chance*, in *Complete English Works*)

Here we find an interesting distinction between the author (as the subject of the will and of responsibility) and agency, the effective cause of action.

It is clear that these classical uses of "agency" are indebted to an action/passion dualism and to a causal interpretation of action (that identifies action with physical efficacy). Hume, who denies the possibility of knowing any causal connection in action, thus clearly asserts the synonymy of agency and force or efficacy, and, even in his skepticism, identifies agency with causality:

I begin with observing that the terms of efficacy, agency, power, force, energy, necessity, connection, and productive quality, are all nearly synonymous; and therefore it is an absurdity to employ any of them in defining the rest. . . . Upon the whole, we may conclude that it is impossible, in any one instance, to show the principle in which the force and agency of a cause is placed.

> (*Treatise of Human Nature*, pt. 1, §3)

In Hume, causal agency is subject to skepticism for the same reason as causal connection: the common error made by philosophers, according to Hume, is to believe that the causal connection is in things and not in the mind (on "mind," see SOUL) and to seek its first nature. Hume and British empiricism thus make possible the first situation of action within anthropology—by showing that it is a matter of mental, and not physical or metaphysical, connections. Such an anthropologization of action marks the term "agency." Nonetheless, Hume closely connects agency and causality, and this has continued to characterize theories of action down to the contemporary period.

> But philosophers, who abstract from the effects of custom . . . , instead of concluding that we have no idea of power or agency, separate from the mind and belonging to causes; I say, instead of drawing this conclusion, they frequently search for the qualities in which this agency consists.

> (*Treatise of Human Nature*, pt. 1, §4.)

III. "Agency" as a Decentering of Action

Contemporary thinking about agency questions the possibility of conceiving action in general terms of cause and effect or action and reaction. It is inseparable from an anthropologization, as is shown by the frequency of the expression "human agency" in contemporary philosophy in English (especially the philosophy of action and moral philosophy): agency is supposed to be what characterizes, among the events of the world, what belongs to the order of human action. Davidson posed the problem very clearly in his already classic essays on action and particularly in his article "Agency" (which was translated by P. Engel as "L'Agir," where Engel translates "agency" sometimes by *agir* and sometimes by *action*):

> What events in the life of a person reveal agency; what are his deeds and his doings in contrast to mere happenings in his history: what is the mark that distinguishes his actions?

Agency is a *quality* of events that makes them into actions, but it is not necessarily their material cause (even if Davidson ends up defining action in causal terms and, fundamentally, identifying it with the event). The difficulty of framing a general definition of agency is precisely the difficulty of classifying specific events under the category of action (ibid.):

> Philosophers often seem to think that there must be some simple grammatical litmus of agency, but none has been discovered. I drugged the sentry, I contracted malaria, I danced, I swooned, Jones was kicked by me,

Smith was outlived by me: this is a series of examples designed to show that a person named as subject in sentences in the active or as object in sentences in the passive, may or may not be the agent of the event recorded.

One way of defining action and agency would thus be to introduce the concept of *intention* (see INTENTION), as is done by a whole series of English-language philosophers concerned with action (Anscombe, Geach, Kenny), and to define agency, in structural terms, by intentionality. In Davidson, the question of agency is eliminated in favor of a reflection on the causality of actions and on the articulation of the mental and the physical. The debate between these two main schools of reflection on action bears, as Descombes observes ("L'action"), on the ontological reality of action: is action defined by a corporeal movement describable as an intentional act produced by a mental or physical state of the agent (the causal conception), or by the change intentionally caused in the patient by the agent within a certain narrative structure (the causative or structural conception)? But beyond this very interesting debate, or short of it, the question remains: is there a definition or a criterion of agency?

This question is not only that of the nature of action, but also that of its *subject*: the variety of actions and modes of agency may be the most striking element of the English language (see ENGLISH), inseparable from a specific conception of subjectivity.

This point has been particularly well treated by Austin in his seminal article "A Plea for Excuses," which is an essential source of contemporary reflection on action and acting (it is frequently cited by Davidson in "Agency," for example). Austin challenges precisely the point mentioned earlier by Hume: the idea of a characteristic or general definition of action. The subject of Austin's article, and of the problematics of excuses, is first of all the profound differences between modes of action. The constant recourse to agency among English-language philosophers does not seek, contrary to the French terms used as equivalents (*agir, puissance, agent*), to erase these differences but rather to mark their irreducibility.

Austin emphasizes both the differences between actions ("Is to sneeze to do an action?") and what "doing something" really means. For Austin, we do not know what an action is, and philosophers who reflect on the question in general terms allow themselves to fall prey to the "myth of the verb," according to which there would be some "thing," "doing an action," which makes manifest the essential characteristics of what is classified under the substitute "do an action."

Why excuses, then? Austin wants to invert the classical philosophical approach that begins by positing the action and then examines justifications and causes. In reality, it is excuses—what we say when it appears that we have acted wrongly (clumsily, inadequately, etc.)—that enable us to begin classifying what we bring together under the general expression, the "dummy" action. Excuses can help us define agency: what is common to an action that one has succeeded in doing and a failed action? Between an action done intentionally, deliberately, expressly, etc., and the same action done (as excuses say) unintentionally, not expressly, etc.? The existence of excuses is for Austin essential to the nature

of human action—they do not come, as it were, after the fact, but are implicated in it. The variety of excuses shows the impossibility of defining agency generally, in a way other than in the detail and diversity of our modes of responsibility and explanation.

Excuses show us, in a sense, what an action is. An action is precisely something that one can excuse, something one does not do exactly. Here we should refer to Austin's underestimated article "Three Ways of Spilling Ink" and to the conclusion of his article "Pretending":

. . . . [i]n the long-term project of classifying and clarifying all the possible ways of *not exactly doing things*, which has to be carried through if we are ever to understand properly what doing things is . . .

The existence of excuses shows, beyond the multiplicity and "humanness" of agency, its passivity, since an excuse always seeks to say in a certain way: "I'm not the agent." As Stanley Cavell says apropos of Austin:

Excuses are as essentially implicated in Austin's view of human actions as slips and overdetermination are in Freud's. What does it betoken about human actions that the reticulated constellation of predicates of excuse is made for them—that they can be done unintentionally, unwillingly, involuntarily, . . . and so on? It betokens, we might say, the all but unending vulnerability of human action, its openness to the independence of the world and the preoccupation of the mind.

(*A Pitch of Philosophy*)

We see that the thematics of the excuse complicates rather than simplifies that of agency. Austin notes, for example, that we do not use just any excuse with just any action. One can excuse oneself for lighting a cigarette "out of habit," but a murderer cannot excuse himself by saying that he acted "out of habit." Finally, Austin says ("A Plea for Excuses") there is a limit to the acts for which any given excuse will be accepted: "standards of the unacceptable" are a question intimately related to the nature of agency.

Just as there is no universal excuse, so there is no *type* of the action, and agency is in no way a general qualification of action but rather the mark of its indefinability and its decentering.

The interest of Austin's thought on this point is that in any case it excludes—as does Wittgenstein in his writings on philosophy and psychology—the facile solution that consists in defining action, and a fortiori (human) agency by the presence of a metaphysical or subjective will, or of a "backstage artiste." The problematics of "A Plea for Excuses" consists not only in saying that I am not the master of my actions, but even that I am not their author or subject. Thus agency forms an interesting couple with "performance," another untranslatable term. The duality of success and failure that Austin establishes regarding the very special actions, neither active nor passive, constituted by speech acts, may define action and agency better than the Aristotelian categories that are invoked to explain and translate the word "agency."

Agency upsets the active/passive pair as well as the cause/effect pair. The passive, whose role is much more important

in English than in French, thus occupies a crucial place in the work of defining action through the concept of agency. In English, a passive utterance is not always the inversion of the active and does not describe an "undergoing," as is shown by Davidson's remark cited earlier: in the English passive, we often see the pure and simple disappearance of the agent, the passive becoming the privileged form of the exposition of an action. Such an erasure of the agent generalizes the phenomenon of *recessive diathesis* (the loss of the actor) of which Descombes, following Wittgenstein and Anscombe, now makes heavy use in his reflection on action ("L'action").

IV. Specific Uses

A. "Agency" in law and economics

The vocabulary of agency in the domain of law and economics allows us to describe modes of action that are in a sense "by proxy," that is, carried out by someone in place of someone else. This is not the "action without a subject" that Ricœur reproaches Davidson for instituting (through the identification of action and event), but, more radically, it is an action whose subject is not where we think it is, in the agent.

Thus we can describe the relation *principal/agent* in the market as conceived in the theory of economic agency. One of the ways most commonly used today to conceive economic organization is the relation between a principal and an agent (cf., e.g., Kenneth Arrow, "Agency and the Market"). The simplest organization is in fact the one that involves two parties, for example, an employer and a worker, a landowner and a farmer, a lawyer and his client. The principal (or constituent) delegates to the agent an action that may be more or less observable. It is this possibility of non-observability that is at the center of the theory of agency.

> The common element is the presence of two individuals. One (the agent) is to choose an action among a number of alternative possibilities. The action affects the welfare of the other, the principal, as well as that of the agent's self.
>
> (Arrow, "Agency and the Market")

Thus we have the example of an action that has an effect on at least two persons, the agent and the principal, but in which the agent is the author only in an uncertain way. Agency is inseparable from this aspect of uncertainty: "The outcome is affected but not completely determined by the agent's action" (ibid.).

The principal has the additional function of prescribing rules and thus controlling the agent's action. The interest of this model is that agency is not only the action of the agent but also a function of this mini-organization. In general, the action of the agent is only imperfectly visible. In fact, the result observed by the principal is the joint product of chance and an action that is known only to the agent (Laffont, *Economics of Uncertainty*).

The ambiguity of the word "agent" is evident: "agent" has both a passive and an active sense (cf. French usages in *agent du gouvernement*, *agent secret*, *notre agent à Hong Kong*). There may be several agents for one principal. Arrow gives two examples in which the relation between principal and agent upsets the established relations between active and passive: the doctor/patient relationship, in which the patient is the principal and the doctor the agent (because of the doctor's superior knowledge), and the case of torts, for example in the event of an accident:

> One individual takes an action which results in damage to another, for example, one automobile hitting another. Although it may seem an odd use of language, one has to consider the damager as the agent and the one damaged as the principal.
>
> ("Agency and the Market")

If the usage is odd, that is because in the normal case of agency, the agent is controlled by the principal and depends on him.

B. "Agency" in Peirce

We can see the two senses of "agency," which are interesting in their very difference, in the work of C. S. Peirce: the first classically connected with the idea of cause (Peirce writes: "any cause or agency"). The second, more unusual, sense designates the particular authorities within a plurality of faculties, a usage characterized by the possibility of using the plural "agencies":

> I wish philosophy to be a strict science, passionless and severely fair. I know very well that science is not the whole of life, but I believe in the division of labor among intellectual agencies.
>
> (*Collected Papers*, 5:536–7)

C. The political sense

In addition to the importance of the term in pragmatism, "agency" has acquired, in American English, a concrete political sense, becoming the function of the agent, and then an establishment or institution that has the power to act on behalf of someone ("an establishment for the purpose of doing business for another," RT: *Oxford English Dictionary*). An unexpected sense appears in the eighteenth and nineteenth centuries in the context of the conquest of the American West and the establishment of local authorities, designating their jurisdiction over the Indians: "agency" designates the political power, the office of this power, and by extension, the Indian territory subject to its jurisdiction.

This usage, which shifts agency from the source of power and action to its field of application, clearly shows the tendency in the political uses of "agency" to make concrete and to embody power in the object on which it is exercised, a tendency we also see in the sole French use of *agence*.

Here we find the erasure of the border between active and passive in the definition of agency and of power, which certainly has consequences for the definition of the political subject/agent. Here again we see the ambivalence of the term *agent*, which is central in English (in contrast to *acteur*, which is often preferred in French and is more clearly active).

In any case, we see that it is impossible to set up a correspondence, even a very general one, between the English set "action"/"agency"/"agent" and the French set *action/agir/acteur* (or the German set *Handlung/Wirkung/Kraft*), a fact all

the more surprising because in contemporary philosophy as it is written in these languages, these sets have defined the nature and the domain of subjective and collective action.

1

"Agency"/"instance"

In the 1960s and 1970s, the French philosophers Jacques Lacan and Louis Althusser both used the category "instance" in a manner that became typical of the structuralist moment. Its use was then widely expanded by their common disciples and involved a complex superimposition of notions of agency, demand, insistence, efficiency, decision, and hierarchy that could not be preserved in English translation. This syncretic formation made it possible to combine in various manners a triple legacy of Marx, Freud, and Saussure, drawing on the historical polysemy of the word *instance* in French. The lack of a match between French and English as far as this polysemy is concerned (especially where idiomatic nuances weigh in) brings out fundamental tensions nested in the structuralist paradigm and helps explain, at least to some extent, the paradigm's logical fragility.

Chronologically, the first use of *instance* appears in Lacan's essay "L'instance de la lettre dans l'inconscient ou la raison depuis Freud," published in 1957 (but, as was the case for most of Lacan's scattered œuvre, influential only after its inclusion in the *Écrits* in 1966 and its 1977 English translation). The expression "L'instance de la lettre" in the essay's title is counterposed in the body of the essay to the expression "l'instance du signifiant." Attention is thus called to the model borrowed from Saussure's binary signifier/signified (S/s), with emphasis placed on the paradoxical character of the signifier as something both material and formal. In

English translation (at least the 1977 one published by Alan Sheridan with the title beginning "The Agency of the Letter"; Bruce Fink's 2002 translation opts for "The Instance of the Letter," obviously hewing more closely to the original French), the double character of *signifiant* is complicated by the double character of *instance*. With *instance* here rendered as "agency," the translation privileges one connotation of the French word at the expense of the other. So, for example, in one sense the letter's agency refers to its "efficacy" in producing the place where a subject thinks unconsciously (not the same as the place where it "exists" consciously). This meaning knocks out the sense of agency as an "insisting" of the signifying chain, or more precisely, the coercion of repetition of thoughts or symptoms. What becomes manifest in the latter is the "indestructibility" of unconscious desire of which the subject is the instrument, not the master.

In 1962 Louis Althusser published an essay on Marxist dialectics, "Contradiction and Overdetermination," later incorporated into the volume *For Marx*. For the first time, he there explained his theory of the "overdetermination" of historical causality, a term explicitly borrowed from Freud's analysis of the unconscious genesis of dreams and other symptoms but transferred to the field of history and politics (and applied specifically to the analysis of revolutions). Although *instance* (translated as "instance" by Brewster) plays an important role in Freud's metapsychology, it

was not used by Althusser with reference to psychoanalysis but rather to a phrase used by Engels when commenting on Marx's "materialist conception of history." Historical events and social configurations, he maintained, are determined by economic factors, albeit only "in the last instance" (*in letzter Instanz*). In Althusser's criticism, this yielded the idea that a social formation is composed of several variously articulated "instances" (what Marx called the economic "infrastructure," or "base," as distinct from the ideological and political "superstructure" (*Überbau*). For Althusser, neither economic base nor ideological superstructure was reducible to the other, even if one retained causal primacy. In subsequent expositions of his theory of "structural causality" (particularly in the collective book *Reading Capital*), the "last instance" was defined not as the one that always overrides the other, but as the one that, secretly, distributes the "efficacy" (*efficace* or *indice d'efficace*) of the "dominant cause." Althusser always preferred "instance" to other partial equivalents (such as "level," "region," or even "practice") because none of these alternatives was as effective in combining a "topography" (*topique*) with a "causality." Only "instance" made it possible to erase the Hegelian dialectical category of "moment" (*das Moment*) as used by Engels.

With Lacan there is a recasting of psychoanalytic problems (ultimately deriving from Freud) by extending them through Saussurian linguistic concepts. Thus we arrive at the idea of the discursive structure of the

unconscious. With Althusser there is a radical transformation (some would say denaturalization) of Marxian and Marxist dialectical categories, with the key notion of "contradiction" set up in analogy to Freudian models of interpretation. The multivalent connotations of *Instanz* in Freud (translated as *instance* in French, and "agency" in English by the *Standard Edition*), and the polysemy of "instance" in both French and English, are fully activated in both Lacanian and Althusserian discourses.

"Instance" is a quite remarkable semantic unit. Derived from the Latin *instantia*, and therefore ultimately from the verb *instare* (literally "to stay in" or "to stay before"), and echoing the "frequentative" form *insistere* (to apply, to insist), it emerged almost simultaneously in French and English in the fourteenth century with the evolution of the two languages, displaying and hierarchizing four types of usage recorded by dictionaries: (1) "urgency, pressure, urging influence" (including the ideas to act "at the instance of" someone, and of "repeated solicitation"); (2) "instant time" (either in the present or at an indeterminate time); (3) an illustration, supporting argument or, on the contrary, an objection (in rhetoric or logic)—where the French uses *par exemple*, the English normally uses "for instance"; (4) "a process in a court of justice" (or this court itself), understood either institutionally or metaphorically (RT: *Oxford English Dictionary*; RT: Bloch and Wartburg, *Dictionnaire étymologique de la langue française*). The first three uses are less old-fashioned in French than in English. On the other hand, as is typically the case, English has a verb form—"to insist," "insisting"—for what in French exists only as a noun (which is now obsolete or technical). In German, *Instanz* (which is today a purely juridical term, except for its post-Freudian and post-Althusserian uses) also existed originally, but it was rapidly challenged by the quasi-homonymous and synonymous German term *Instand* (from *stehen in*), whence derives in particular the adverb *inständig* (insistently). Perhaps we can submit that the "invariant" running through the various uses is the idea of a repeated demand or contest before a tribunal (itself "instantiated"), whose very insistence produces more or less irreversible effects.

In Freud's writings, *Instanz* became a "systemic" concept only very late, when the results of the speculations on the "second topography" were presented in a pedagogic manner (*Abriss der Psychoanalyse*). This occurred in two steps, each of which calls for different associations and evokes a specific "scheme" of thought, but which never remain entirely separate. Initially (as early as the *Traumdeutung* [*The Interpretation of Dreams*], 1900), Freud occasionally used the word *Instanz* to characterize the function of

censorship, which in dreams and other psychic processes selects and represses some desires, pushing their expression into the unconscious. Freud even used the Kafkaesque metaphor of a "warden" standing at the gate separating the licit from the illicit. When the same function (now including "observation" and even "persecution" of the self) was retrieved in manias and obsessions and came to be associated with the *Über-Ich*, or superego, in 1923, it became the typical name for the instance that "splits" the *Ich*, or ego, in order to "judge" (and even "punish") it from the inside. This is in contrast to punishment from the outside, which is typically carried out by various social authorities, especially the father, or more generally the parents (also called *Elterninstanz*, or "parental instance"). Generally, in the usage of this judiciary metaphor, the name "instance" was applied only to the superego and not to the other "regions" (*Bezirke*) or "systems" of the psyche.

In a second step (essentially the *Neue Folge Vorlesungen zur Einführung in die Psychoanalyse* and the contemporary clinical studies on angst), another guiding metaphor, or scheme, comes into play. A conflict emerges in which the ego/subject is caught between the incompatible exigencies of several "masters." The exigencies of pleasure (libido), originating from an infinite "reservoir" called the *Es* (the "it," but translated as "id" by Strachey), battle the exigencies of the superego, which are linked to the "uneasy" process of moralization and civilization. There is some inconsistency in Freud's presentation because sometimes the ego is the "miserable" common target of opposing masters, and sometimes it is "instantiated" as representative of a third kind of exigency: a potential source of anxiety for the subject, namely that of the "external world," or "reality." In Freud's presentation of this structure of the psychic apparatus as a symmetrical interplay of conflictual forces (reminiscent of Plato), the translation of *Instanz* as "agency," as chosen by James Strachey in the *Standard Edition*, makes more sense, provided the term is "depersonalized." "Instance" in the sense of "urgency" would also be relevant, this time on the side of the id, whose "repeated entreaties" force the ego and the superego to erect interdictions and defenses.

We now return to Althusser and Lacan. It is as if they had exploited opposite aspects of the Freudian metaphoric discourse, combining it with different notions of structure and conflict but opening up the possibility of a conversation that was then realized by their disciples. In Althusser's case, it could seem that "instance" is only a nominal reference, used to bridge the gap between Marxian and Freudian notions of "conflict" or "conflicting forces." The essential idea here was to import the latter's model of complexity ("overdetermination") into the

former's concept of the political. However, the continuous reference to Engels's phrase "determination in last instance," where the judiciary connotations are explicit, could not but evoke in the mind of such an assiduous reader of classical political theory the central question always asked by Hobbes in *Leviathan*, "Who shall be Judge?" This is the defining question of sovereignty, which as a consequence can be said to permanently haunt the discourse of "structural causality" itself. Perhaps it forms the unspeakable side of the "materialist" postulate according to which the productive forces (i.e., mainly the workers themselves) remain the driving motor of history, even if in an aporetic manner ("the lonely hour of the last instance never comes"; *For Marx*). An anonymous multiple sovereign—perhaps powerless—inhabits the Althusserian play of causes. In Lacan's case, the driving motive is more explicitly referred to the idiomatic (and paradoxical) fusion of the judiciary process and the schemes of causal automatism ("L'instance, ai-je dit, de la lettre, et si j'emploie instance, c'est non sans raison [car ce mot] résonne aussi bien au niveau de la juridiction qu'à celui de l'insistance" [The instance, I have said, of the letter; and if I use the word instance it is not without reason, for it resonates just as well at the level of juridical utterance as it does at the level of insistence]; *Je parle aux murs*), but a key indication is also given by the subtitle of the celebrated 1957 essay: "La raison depuis Freud" ("Reason since Freud"). One is reminded that in the Kantian tradition, which towers over our conceptions of the subject, "reason" is presented as a "tribunal" that exercises a "critical" function or a function of judgment. The ultimate tribunal is not that of reason, however; it is that of the unconscious. This said, the unconscious itself is not some purely "irrational" agency. It results from the "other logic" of the signifier (or the "letter") to which the subject is subjected or within which it must find a "place." Agency therefore is only half of a good translation: though it marks the Freudian legacy of subjection by "autonomizing" the power of the signifier, it loses the semantic dimension of "structural causality." In the systematization of Lacan's doctrine proposed by the "Althusserian" Jacques-Alain Miller (author of the detailed index of *Écrits*), this structural element essentially amounted to a flirtation with Marxian notions of "materiality" and "domination." This flirtation was eventually overcome, in Miller's scheme, by Lacan's concept of "the real" as an insistence of the void—the "thing" causing anxiety—that can never become symbolized. Interestingly, although perhaps not surprisingly, the vexed translation of *instance* into

AIÔN [αἰών], CHRONOS [χρόνος] (GREEK)

FRENCH   *fluide vital, durée de vie, vie, âge, durée, génération, éternité/temps*
GERMAN   *Ewigkeit/Zeit*
LATIN   *aevum, aeternitas, perpetuitas, aeviternitas, sempiternitas/tempus*

➤ *ETERNITY, TIME,* and DASEIN, ERLEBEN, EVIGHED, GOD, HISTORIA UNIVERSALIS, HISTORY, LEIB, MOMENT, PRESENT, *WORLD*

If *chronos* [χρόνος], symbolized by Kronos [Κρόνος], the Greek god who devours his children, has all the characteristics of "time," *aiôn* [αἰών], it is, on the other hand, a term without modern equivalent. In the Homeric poems it designates the vital fluid, hence a man's lifespan and destiny, the intensity of a part of time. But when, in the *Timaeus*, Plato relates the *aiôn* to the life of the gods and no longer to the human lifespan, the sense of "eternity" comes in. Aristotle also uses this term for his Unmoved Mover, and Plotinus makes it Being's mode of existence. *Chronos* becomes the "mobile image" of the *aiôn* and, in Neoplatonic interpretations, its "son."

The Greek opposition between *aiôn* and *chronos* thus does not coincide with any of the oppositions with which we are familiar, neither that between subjective experience of time and objective time, nor that between eternity and time. It refers instead to two models of time. There is first the model of the physical *kosmos* [κόσμος], which can be dealt with through mathematics and to which *chronos* belongs, cosmic time, connected with the cyclical movement of the heavenly bodies and the sphere of the fixed stars, which Aristotle defined as a succession of instants ("now," *nun* [νῦν]) and "the number of movement in respect of before and after" (*Physics,* 4). Then there is the model of life and time as experienced, linear, with a beginning and an end.

Aiôn, transliterated in Latin as *aevum*, was adopted and adapted by Christian theology. For Aquinas, for instance, "strictly speaking *aevum* and *aeternitas* differ no more than *anthrôpos* and *homo*." But in the thirteenth century, *aevum* was detached from *aeternitas* to designate an intermediary between time and eternity, a guarantee of "the order and connection of things" suitable for characterizing "eviternal" realities, such as angels, that have a beginning but not an end (*aeternitatis ex parte post*).

Aiôn in the Greek philosophical lexicon, and *aevum* in Scholastic terminology, are among the terms most characteristic of the subtlety of the vocabulary of temporality, in the plurality—difficult for us to understand today—of its registers.

I. *Aiôn*: From Vital Fluid to Eternal Life

A. "Stuff of life" and the duration of an existence

In Homer, the *aiôn* is first of all a vital fluid, "the sweet *aiôn* that flows away" (*Iliad,* 22.58; *Odyssey,* 5.160–61): tears, sweat, and later on, cerebral-spinal fluid, sperm, everything that makes life and strength, that melts when one weeps and disappears with the breath of the soul when one dies ("psuchê te kai aiôn [ψυχή τε καὶ αἰών]," *Iliad,* 16.453)—the "stuff of life," R. B. Onians calls it (*Origins of European Thought*). The temporal meaning of *aiôn*, "lifespan," "existence," is attested in Pindar (*Pythian Odes,* 8.97) and the tragic playwrights, particularly in the combination *moira-aiôn* [μοῖρα-αἰών], indicating the "share of life" assigned to each person, the "lifespan imparted by fate" (Euripides, *Iphigeneia in Aulis,* 1507–8; see KÊR). That is probably the meaning with which Heraclitus is playing when he defines *aiôn* as "a child that gives birth to a child, who plays draughts" (RT: B.52 DK: "aiôn pais esti paizôn, pesseuôn [αἰὼν παῖς ἐστι παίζων, πεσσεύων]"): Bollack and Wismann (*Héraclite ou la séparation*, 182–85) argue that the iteration of the substantive *pais* [παῖς] (child) and the verb *paizô* [παίζω] (whose common meaning is "play like a child") suggests the interpretation of *aiôn* as referring to the time of a "generation," the time it takes for a child to become a father and play his own role. In this sense, *aiôn* is a limitation or delimitation of *chronos* [χρόνος], "time" in general: it is "the *chronos* of an individual life" (Festugière, "Le sens philosophique," 271); thus *aiôn* is, to use Euripides's expression, "the son of *chronos*" ("Aiôn te Chronou pais [Αἰὼν τε Χρόνου παῖς]," *Heracleidae* 900).

B. The divine *aiôn*: In time or outside time?

1. Time (*chronos*): A moving image of eternity (*aiôn*)?

When the lifespan designated by *aiôn* is no longer that of a mortal but that of a god, the limits recede: that is how,

according to Festugière ("Le sens philosophique"), the transition to the meaning "eternity" takes place. That holds for the Homeric gods, who are "always living" (that is how Paul Mazon translates the expression "theoi aien eontes [θεοὶ αἰὲν ἐόντες]," *Iliad,* 1.290), and also for Empedocles's *Sphairos* [Σφαῖρος], whose "ineffable life" (*aspetos aiôn* [ἄσπετος αἰών], RT: B16 DK = 118 Bollack) extends into the past and the future ("It once was, was already, and will be").

But with Plato's *Timaeus,* a new conceptual distinction appears between this type of unlimited temporality, which extends through time, and an "eternity" that is outside time and may even generate time. "Eternity" is the customary translation of *aiôn* on the divine model, from which the demiurge took his inspiration in creating the world. The god is an "eternal living being" ("zôion aidion on [ζῷον ἀΐδιον ὄν]," *Timaeus,* 37d2), concerning which we must say— exactly as we must say about Parmenides's Being (8.5)—that it "is," but not that it "was" or that it "will be" (*Timaeus,* 37e6–8). Time, *chronos,* is the name of a supplementary invention of the demiurge to make the world he has just created still more similar to the eternal god: it is, according to the famous expression, "a moving image of eternity" ("eikô . . . kinêton tina aiônos [εἰκὼ . . . κινητόν τινα αἰῶνος]," 37d5–6); but see Brague ("Pour en finir"), for whom this moving image is "heaven" and not time. Instead of remaining in unity, like the god, time moves in a circle according to number ("kat' arithmon kukloumenou [κατ' ἀριθμὸν κυκλουμένου]," 38a7–8) and includes divisions or parts that participate in becoming (days, nights, months, seasons) and to which "was" and "will be" apply.

Thus on the one hand Plato maintains the connection between life and *aiôn*: *aiônios* [αἰώνιος], an adjective he probably created alongside the traditional *aidios* [ἀΐδιος], also applies to the living being that is the god-model (*aiônios,* 37d4; cf. *diaiônias* [διαιωνίας], 38b8), as well as to time as an image (*aiônion*) connected with the living beings that are the world and the heavens—but we understand that it is not so simple to translate it by "eternal," and that applied to time it means very literally "what has all the characteristics of the *aiôn.*" On the other hand, and at the same time, we move from an *aiôn* that is the son of *chronos,* a lifespan included within (limited) time or coextensive with time, to an *aiôn* that is properly called an "eternity," outside time, for which it constitutes the model—Proclus was even to say that the *aiôn* is the "father of *chronos*" (cf. *In Platonis Rem publicam commentarii,* ed. Kroll, 2:17.10; *Elements of Theology,* prop. 52).

In a rigorously anti-Platonic gesture, Marcus Aurelius reversed, term for term, the relationship between *aiôn* and *chronos.* The infinite time at time's two extremities, abstract, unlimited, and corresponding to the void in its incorporeality close to nonbeing, takes the name of *aiôn* ("apeiron aiônos [ἄπειρον αἰῶνος]," 4.3.7), whereas the limited time of the present, which is always determined by the act that sets its extent (*diastêma* [διάστημα]), is associated with a "materialist" approach to *chronos*—both at the level of duration and insofar as the cosmic period thus torn out of the irreality of the *aiôn* is concerned (cf. Arius Didymus, *Epitome,* 26; RT: *SVF,* 2:509; with Goldschmidt's commentary, *Le système stoïcien et l'idée de temps,* 39–41; see also Deleuze, *Logic of Sense,* 78 and 190–94; and SIGNIFIER/SIGNIFIED, Box 1).

2. Time (*chronos*): The number of movement according to the anterior and the posterior?

Aristotle uses etymology to confirm the extension of the meaning of *aiôn* as "lifespan" from mortals to god (*De caelo,* 1.9.279a22–28): "This word 'duration' [*aiôn*] possessed a divine significance for the ancients." In fact, it is the word itself that encourages the passage from the lifespan of each individual to that of the heavens as a whole—or, more precisely, from "the limit that includes the time of each life" to "the limit that includes all time and infinity" ("to ton panta chronon kai tên apeirian periechon telos [τὸ τὸν πάντα χρόνον καὶ τὴν ἀπειρίαν περιέχον τέλος]"; on *to telos* [τὸ τέλος], "the end," "the limit," see PRINCIPLE, I.A). The life of the heavens is properly named *aiôn* "because it is *aiei,* always [*apo tou aei einai tên epônumian eilêphôs* (ἀπὸ τοῦ ἀεὶ εἶναι τὴν ἐπωνυμίαν εἰληφώς)] being immortal and divine [*athanatos kai theios* (ἀθάνατος καὶ θεῖος)]." In the *Metaphysics,* the same holds for the Unmoved Mover as well: since the act or transformation of intelligence into an act (*hê nou energeia* [ἡ νοῦ ἐνέργεια]) is life, and since the Unmoved Mover is this transformation into act, "we say therefore that God is a living being, eternal, most good, so that life and duration continuous and eternal belong to God, for this *is* God" (*Metaphysics,* 12.7.1072b28–30).

Aristotle also confirms the break between *aiôn* and *chronos,* with *aiôn* for the world of the heavens, and *chronos* for the plurality of the sublunary world: "Things that are always are not, as such, in time [*ouk estin en chronôi* (οὐκ ἔστιν ἐν χρόνῳ)]" (*Physics,* 4.12.221b4–5). In fact, time-*chronos* belongs to the order of passivity and not of activity: it causes aging, consumes, leads to oblivion. Although indissolubly connected with generation and becoming, "time is by its nature the cause rather of decay, since it is the number of change, and change removes what is" ("arithmos gar kinêseôs, hê de kinêsis existêsi to huparchon [ἀριθμὸς γὰρ κινήσεως, ἡ δὲ κίνησις ἐξίστησι τὸ ὑπάρχον]," *Physics,* 221b1–3). This sentence, which is both arithmetic and existential, deserves closer examination. On the one hand, it refers to the mathematical definition of time: in Aristotle's *Physics,* time is definitively able to be expressed in mathematics because it is definitely spatialized, connected with movement, which is itself connected with place: "For time is just this—number of motion in respect of 'before' and 'after'" (219b1–2). On the other hand, it refers to existence (*existêsi* [ἐξίστησι], from *ex-istêmi* [ἐξίστημι], "move, put outside oneself"; see DASEIN and ESSENCE) of the subject (*to huparchon* [τὸ ὑπάρχον], from *hup-archein* [ὑπ-άρχειν], "rule below, begin, present oneself, be available, be"; see SUBJECT), to the manner in which time acts on beings that are in time and, in particular, on us, humans who know how to count ("Whether if soul did not exist time would exist or not, is a question that may fairly be asked," 223a21–22). *Aiôn* and *chronos* can henceforth no longer be treated in the same way.

C. From Neoplatonism to the Christian appropriation: *Adiotês* and the persistent polysemy of *aiôn*

Plotinus's interpretation of "always" (*aei* [ἀεί]) as rigorously nontemporal (*ou chronikon* [οὐ χρονικόν]: cf. *Enneads,* 1.5.7; 3.7.2), which is justifiably based on Plato, provides the point of departure for a tradition that seeks to maintain the distinction between the adjectives *aiônios* and *aidios* to mark

the difference between "eternal" and "perpetual" (*Enneads,* 3.7.3). The Neoplatonic tradition thus introduces on the side of time-*chronos* and at a distance from *aiôn*-eternity, even though it derives from the latter, a perpetuity in becoming for which the term *aidotês* [ἀιδιότης] was used only later on. Thus Damascius gives the name "complete time [*ho sumpas chronos* (ὁ σύμπας χρόνος)]" to "time that always flows." "Since this intermediary is related both to time and to eternity," Simplicius remarks, "some philosophers have called it *chronos* and others *aiôn*" (Simplicius, *Corollary on Place,* ed. Diels, 776.10–12 and 779). And Proclus distinguishes between an eternal sense and a temporal sense of *aidiotês* (*Elements of Theology,* prop. 55), modeled on the double interpretation of *aei: to chronikon* [τὸ χρονικόν] and *to aiônion* [τὸ αἰώνιον] (*On the Timaeus,* 1.239.2–3 and 3.3.9). Including the "life of eternity" qua "infinite life" without past or future, the life of the whole being present simultaneously, uniting in the atemporal (*achronos* [ἄχρονος]) life of the *nous* [νοῦς]) the characteristics of the perfect living being of the *Timaeus* with those of the total being in the *Sophist* (*pantelôs on* [παντελῶς ὄν], 248e8), Plotinus establishes time in the soul as a "moving image of eternity" (*Enneads,* 3.7.11). An image without resemblance with regard to a divine presence that illuminates in its immanent life the reciprocal relation between "being" and "always" (on the identity of *to on* [τὸ ὄν], cf. ibid., 3.7.6), between the *aiôn* and the Intelligible, which posits the Intellect as a god (ibid., 5.8.3) whose beatitude is eternal because it is the very nature of eternity (*ho ontôs aiôn* [ὁ ὄντως αἰών], ibid., 5.1.4). That is why it is justifiable to call eternity "god who manifests himself and makes himself appear in his nature" (ibid., 3.7.5), in accord with an echo of the "Chaldaic" name of the god *Aiôn* as an *autophanês* [αὐτοφανής] that loses here all cosmological meaning.

"It was precisely this atemporal, 'vertical' notion, connected with the notions of life, presence, and divinity, that was later adopted"—and adapted—"by Christian theology through Augustine, Boethius, Bonaventure . . ." (Leibovich, "L'*AIÔN,*" 99). But from a lexicographical point of view, the polysemy of the term *aiôn* remains present in all Greek patristic writing through the Septuagint ("generation": Ws 14:6; "long period": Ps 143 [142]; "Eternity": Eccl 12:5) and the New Testament ("period" in general: Eph 2:7; "present age" in the sense of this world: Mt 13:39—often with strong pejorative connotation—and 1 Tm 6:17; "eternity," especially in the extensive sense of "forever": Jn 12:34 and Gal 1:5). After having referred to this polysemy, John of Damascus nonetheless enumerated six meanings of the word *aiôn*: (1) each individual's lifespan; (2) a period of a thousand years; (3) the total duration of time and the world; (4) future life after the Resurrection; (5) each of the seven eras that constitute the history of the world, to which an eighth should be added, beginning after the Last Judgment; (6) according to a definition adopted by Gregory of Nazianzus (*Orationes,* 38.8, in RT: *PG,* vol. 36, col. 320), the *aiôn* is neither time nor part of time, but what "extends itself" (*diastêma*) with eternal realities, being for the latter what time is for temporal realities (John of Damascus, *Expositio fidei,* 15 [2.1], ed. Kotter, 43–44; the Latin translation renders *aiôn* not by *aevum* but rather by *saeculum* [*translatio Burgundii,* fifteenth century, ed. Buytaert, 66–68]). In the tenth chapter of *Divine Names,*

Pseudo-Dionysius notes with regret that the Scriptures "do not always reserve the epithet *aiônios* for what escapes all engenderment, for what exists in a truly eternal way, and not even for indestructible, immortal, immutable, and identical beings." Even "the beings called eternal [*aiônia* (αἰώνια)] are not . . . coeternal [*sunaidia* (συναΐδια)] with God, who is prior to all eternity [*pro aiônôn* (πρὸ αἰώνων)]; in following the Scriptures with all rigor, we must . . . consider as intermediary between being and becoming everything that participates in both *aiôn* and *chronos*" (Pseudo-Dionysius the Areopagite, *De divinis nominibus,* 10.937C–940A). Knowing that *aiôn* was to be translated by *aevum* (*translatio Saraceni; Dionysiaca,* 1:492–93), it will be granted that Pseudo-Dionysius's attempted lexical clarification was far from successful.

II. A Multiplicity of Eternities: *Aevum, Aeternitas, Sempiternitas, Perpetuitas*

At first sight, nothing seems simpler than to connect, as did medieval writers themselves, the Latin form *aevum* with the transliteration of the Greek *aiôn*, and thus to differentiate "eternity" from movement-time (*chronos*). According to Aquinas, "strictly speaking, *aevum* and *aeternitas* differ no more than *anthrôpos* and *homo*" (*Liber de causis,* prop. 2, lect. 2). The translation problem arises from the fact that the Scholastic lexicon made a rigorous distinction between *aevum* and *aeternitas*—though it did so belatedly. In the course of the thirteenth century, *aevum* detached itself from *aeternitas,* coming to designate an intermediary between time and eternity and characterizing certain realities called "eviternal" that have a beginning but not an end (*aeternitatis ex parte post*).

But precisely because of the principle of correspondence between the measures of duration and the essence of beings, this purely extensive differentiation is contested. For eternity is not simply defined *ex negativo* as time without limit (from the point of view of its "continuity," *perpetuitas*) or as an eternity of duration (which would be "always," *sempiternitas*): it is first of all, positively, a permanence and presence itself that is atemporal and intensive (*tota simul*), as incommensurable as God himself. From here comes the essential instability of this intermediary figure, which has to include a temporal aspect in order to distinguish itself from atemporal eternity—without, however, being confused with time.

A. *Aeternitas/aevum*: Eternity of God, eternity of angels (Augustine)

Aevum does not designate the eminently simple eternity that is inseparable from the essence of God, but rather a "qualified," "participated" eternity (*aeternitas participata*), which measures the duration of living creatures whose being is not variable and successive (like celestial bodies and separate substances: angels or rational souls), without, however, attaining *immutability* in the full and absolute sense: either it reintroduces a certain type of variability at the level of the operations of which it is the locus, or it reveals itself as potentially incomplete. Consequently, *aevum* signifies an "angelic" eternity that can be said to be eternal only insofar as it participates in divine eternity without being coeternal with God.

In his *De diversis quaestionibus* (qu. 72: "De temporibus aeternis"), Saint Augustine (354–430) distinguishes two forms of eternity: the first belongs only to God through his absolute immutability; the second coincides with the totality of time. It is from this latter point of view that angels can be said to be "eternal," since they have existed for all time, without nonetheless being coeternal with God because his immutability is beyond all time. In comparison with created time, which is susceptible to change (*tempus mutabile*), this derived eternity called *aevum* is thus presented as a "stable" form (*illud stabile*).

In his *City of God* (12.16), Augustine wonders how God can "precede time," or better yet, "precede all times": "It is not in time that God precedes times; in that case, how could he have preceded all times? He precedes them from the height of his always-present eternity. He dominates all times to come, because they are to come and because, when they have come, they will be past. Our years pass and follow each other, and their number will be complete at the very moment when they will cease to be. God's years are like a single day that is always present. It is eternity" (cf. Augustine, *Œuvres*, 745 n. 87). The *aevum* is thus an *aeternitatis ex parte post*, *aeternitatis creata,* or *aeternitatis diminuta*, as it was reformulated in the thirteenth century by Bonaventure and James of Viterbo.

B. *Aeternitas/sempiternitas*: The eternity of God
and that of the universe (Boethius)

The second cardinal distinction that runs throughout the Latin Middle Ages is the one introduced by Boethius (470–524) between eternity proper (*aeternitas*) and sempiternity (*sempiternitas*): eternity as the "complete possession, simultaneous and perfect, of a life without limit" ("interminabilis vitae tota simul et perfecta possessio," in *Consolation of Philosophy*, 5.6.4), as opposed to *sempiternitas*, the eternity of the universe, subject to time, even if it knows neither beginning nor end.

■ See Box 1.

The chief distinctions between a temporal "now" and an eternal "now," a temporal "always" (*sempiternitas*) and an eternal "always" (*aeternitas*), were already established in the *De Trinitate*, where Boethius inquires into the *praedicatio in divinis*, the question of what the conversion that affects categories in the application to God must be:

> The expression "God is ever" denotes a single Present, summing up His continual presence in all the past, in all the present—however that term be used—and in all the future. Philosophers say that "ever" may be applied to the life of the heavens and other immortal bodies. But as applied to God it has a different meaning. He is ever [*semper*], because "ever" is with Him a term of present time, and there is this great difference between "now" [*nunc*], which is our present, and the divine present. Our present connotes changing time and sempiternity [nostrum "nunc" quasi currens tempus facit et sempiternitatem]; God's present, unmoved, and immovable, connotes eternity ["nunc" permanens neque movens sese atque consistens aeternitatem facit]. Add *semper* to eternity and you get the constant, incessant, and thereby perpetual course of our present time, that is to say, sempiternity [iugem indefessumque ac per hoc perpetuum cursum quod est sempiternitas].

> (*De Trinitate,* 4.28–32)

Thus Boethius establishes in a practically definitive way the distinction between an intensive conception of eternity grasped in the plenitude of its atemporal presence ("plenitudinem totam pariter . . . totam pariter praesentiam"), in the immutable presence of a single instant, and an extensive conception of perpetuity referring to the infinity of a "worldly" time/times that cannot be coeternal with God in any way. The interminable (*interminabilis*) character of eternity, which medieval writers interpreted etymologically as *extra terminos* or *sine termino*, is only the negative (and still worldly) form of the simplicity and perfection that are the positive conditions of its immobility and simultaneity (unitotality). But the quoted definition of eternity implies still more than its atemporal or untemporal being: the eternity of God is a form of life, a life of thought, thought that includes

---

1

Boethius's definition: "What is eternity?"

Eternity, then, is the complete, simultaneous, and perfect possession of everlasting life [*interminabilis vitae tota simul et perfecta perfectio*]; this will be clear from a comparison with creatures that exist in time. Whatever lives in time exists in the present and progresses from the past to the future [id praesens a praeteritis in futura procedit], and there is nothing set in time that can embrace simultaneously the whole extent of its life [totum vitae suae spatium pariter amplecti]: it is in the position of not yet possessing tomorrow when it has already lost yesterday. In this life of today

you do not live more fully than in that fleeting and transitory moment. Whatever, therefore, suffers the condition of being in time, even though it never had any beginning, never has any ending and its life extends into the infinity of time, as Aristotle thought was the case of the world, it is still not such that it may properly be considered eternal. Its life may be infinitely long but it does not embrace and comprehend its whole extent simultaneously [interminabilis vitae plenitudinem totam partier comprehendit atque complectitur]. It still lacks the future, while already

having lost the past. So that which embraces and possesses simultaneously the future and has lost nothing of the past, that is what may properly be said to be eternal, of necessity it will always be present to itself, controlling itself, and have present the infinity of fleeting time [necesse est et sui compos praesens sibi semper adsistere et infinitatem mobilis temporis habere praesentem].

(Boethius, *The Consolation of Philosophy*, trans. Victor Watts [Cambridge: Cambridge University Press, 2000])

everything that can be included all at once, as opposed to time, the condition of life for weaker minds, which can think things only one after the other. God thus lives in an eternal present, which is the model of the ordinary present (cf. Marenbon, *Boethius*, 134–38).

C. The difficult place of the *aevum* between eternity and time

Under the influence of Neoplatonism and especially of the *Liber de causis*, the term *aevum*, which until the thirteenth century had been commonly used in the sense of *aeternitas* or *aetas perpetua*, came to designate the duration intermediate between time and eternity, "post aeternitatem et supra tempus," as Aquinas put it in his commentary on the *Liber de causis*:

> Omne esse superius aut est superius aeternitate et ante ipsam, aut est cum aeternitate, aut est post aeternitatem et supra tempus.

> Every superior being is either above eternity and before it, or with it, or after it and above time.

(*Liber de causis,* 2.19)

These three kinds of superior being correspond to the First Cause, the Intelligence, and the Soul, respectively. This classification is adopted, in a modified form, by medieval writers. For example, commenting on the formula "Deus est temporis et aevi causa" (God is the cause of time and the *aevum*), Albert the Great (1200–1280) explains: "Time is the image of the *aevum*, and the *aevum* is the image of eternity" (tempus est imago aevi et aevum est imago aeternitatis). The notion of *aevum*, thus detached from *aeternitas* and having been given an autonomous position intermediary between time and eternity, is perfectly characterized by Nicholas of Strasburg (ca. 1320): "Medio modo se habentibus oportet dare mensuram mediam inter aeternitatem simplicem et tempus. Haec autem non potest esse alia quam aevum" (It is important to give to entities whose status is intermediary a measure intermediary between simple eternity and time. The measure cannot be other than the *aevum*: *On Time*, 215 va.).

This tripartite classification encountered several insurmountable difficulties, however, and did not succeed in establishing itself. For one thing, the fact that the realities measured by the *aevum* are heterogeneous (angels, rational souls, the heavens, and even sometimes first matter) seems to suggest that a single measure would be impossible. But since unity is the mark of perfection, is it conceivable that time would be one, whereas the *aevum* would be multiple? Is the argument that the *aevum* must be considered one in virtue of its cause and its participation in eternity sufficient to avoid any subjective deviation toward an angelic time that might soon come to be seen as a "quid ad placitum" (cf. Suarez-Nani, *Tempo*, 33–35)?

Along with the question of the unity of the *aevum*, the problem of its simplicity and indivisibility was widely debated in the Scholastic literature around the turn of the fourteenth century. We can easily see why: if the *aevum* is absolutely simple and indivisible, its nature no longer differs from that of eternity; if, on the contrary, the *aevum* has extension and is composed of parts, it is a successive

quantity in the same way as time. Just as in the case of the problem of unity, the necessity of coping with this dilemma runs throughout the Franciscan and Dominican schools and shapes the temporality of eviternal being.

D. The Scotist break: The extension of *aevum* to permanent existence

In the Scotist school, the notion of *aevum* underwent a fundamental transformation determined by the problems involved in the Aristotelian analysis of time associated with movement (and primarily the problem of the movement of the heavens), in order to account for the *being* of substances. If the *aevum* is a measure of permanent being that is potentially corruptible, isn't it *aevum* that has to account for all forms of permanence, substantial as well as accidental, insofar as they depend in an invariable and uniform way on a single cause—namely, God (Duns Scotus, *Sentences* [*Ordinatio*], 2, dist. 2, p. 1, q. 4)? For movement is what is measured by time—not what precedes and receives it. Using this argument, John Duns Scotus (1266–1308) makes the *aevum* the measure of permanent existence as such, no longer recognizing, from this point of view, any difference between a stone and an angel:

> dico quod exsistentia angeli mensuratur aevo; et etiam exsistentia lapidis et omnis exsistentia quae uniformiter manet, dum manet, mensuratur aevo.

> Whence I say that the existence of angels is measured by the *aevum*; and also that the existence of stones and of all forms of existence that remain the same, while they remain, is measured by the *aevum.*

(*Sentences* [*Lectura*], dist. 2, p. 1, q. 3)

Thus freed from any essential reference to separate substances or to celestial bodies, the *aevum* can be defined functionally as the measure of the uniformity of permanent things in general, in their dependence on the "first cause," which is alone capable of preserving them in being (*Sentences,* [*Ordinatio*] 2, dist. 3, p. 1, q. 4). This new model of the *aevum* (which coincides with the weakening of the Aristotelian cosmological paradigm to the point of authorizing the idea of a potential time of which the movement of the heavens, in its recognized uniformity, is only the actual representative) challenges the principle of ontological heterogeneity and hierarchy between celestial realities and the sublunary world. It spread far beyond the Scotist school.

E. Ockham's Razor: *Aevum nihil est,* "The *aevum* isn't anything"

Within the nominalist tradition, William of Ockham (1285/90–1347/49) emphasized the impossibility of conceiving the possibility that an angel might be annihilated after its creation, or that the life of one angel might be longer than that of another, without referring to a "coexisting" succession. Angelic duration, like any duration, must be measured only by the ordinary time of succession, the only one appropriate to it: "Time is the measure of the duration of angels, as it is the measure of movement" (tempus est mensura durationis angelorum, sicut est mensura motus, William of Ockham, *Sentences* [*Reportatio*], 3, q. 8 and q. 11; *Tractatus de successivis*, ed. Boehner, 96).

Thus *aevum* passes definitively from its unstable intermediary position, not to eternity (even as a "second" eternity), but to common, heterogeneous time, it being posited that "time properly so called" (tempus proprissime dictum), or "common time" (tempus commune), "no longer refers to the movement of the Unmoved Mover as its cause [*ratio causalitatis*] qua cause of all other movements, but in virtue of the character of uniformity that belongs to it 'accidentally' [*accidit*]" (William of Ockham, *Quaestiones super libros physicorum*, q. 45; cf. Duhem, *Le système du monde*, 7:379–92). So there exist only two ways of measuring duration: the clock-time conceived for created realities, and eternity for the divine essence alone—even though divine duration, qua infinite duration, cannot be "represented" without coexisting with the duration we conceive.

Only René Descartes was able to take advantage of this last argument from the *motus cogitationis*, the movement of thought, in which the primacy of the thinking self is established in its persistence; but more broadly, it is the whole of the new physics that invests a conception of time that puts an end to the necessity of the *aevum* in its principle of convertibility between (difference in) being and (difference in) duration, after having invested and broadened all the anti-Aristotelian virtualities.

III. The Paradoxes of Time and Eternity

A. "Time," "duration," and "eternity" in the seventeenth century

Freed from the Aristotelian cosmological paradigm as the idea of an arbitrary plurality of purely subjective times (*ad placitum . . .*), in the seventeenth century time is thus defined on the basis of an objective, functional representation and a universal form. The Cartesian criticism of "Scholastic opinion" (*l'opinion de l'École*) has its place in this movement of conceptual unification; if duration is always only "the way in which we *conceive* a thing insofar as it perseveres in being" (putemus durationem rei cuiusque esse tantum modum, sub quo concepimus rem istam, quatenus esse perseverat, *Principles*, 1.55 [in *Œuvres*, ed. Adam and Tannery, 8-1.26.12–15]), and if time is never more than the "way of conceiving" (modus cogitandi) of duration when we want to measure it (*Principles*, 1.57), then the same duration must be attributed to things that are moved and those that are not moved, because "the before and after of all durations, whatever they might be, appear to me through the before and after of the successive duration that I discover in my thought, with which other things are coexistent" (prius enim et posterius durationis cuiuscunque mihi innotescit per prius et posterius durationis successivae, quam in cogitatione mea, cui res aliae coexistunt, deprehendo, Letter to Arnaud, 29 July 1648 [in *Œuvres*, ed. Adam and Tannery, 5.223.17–19]). As for eternity itself, it is *tota simul* "insofar as nothing could ever be added to the nature of God or taken away from it," but "it is not all at once and once and for all insofar as it coexists, for since we can distinguish in it parts since the creation of the world, why could we not also distinguish parts in it before, since it is the same duration?" (sed non est simul et semel, quatenus simul existit, nam cum possimus in ea distinguere partes iam post mundi creationem, quidni illud etiam possemus facere ante eam, cum eadem duratio sit, *Conversation with Burman* [in *Œuvres*, ed. Adam and Tannery, 5.149].

The Cartesian critique allows us to understand why the concept of *aevum* disappears from philosophical speculations in the seventeenth century and does not appear, despite commentators' efforts to implant it there, where it has been thought to reemerge because of the "temporalization of eternity": in Spinoza. In fact, Spinoza's *Ethics* presents the clearest refusal to explain eternity "by continuance or time, though continuance may be conceived without a beginning or end" (*Ethics* 1, expl. of def. 8: "per durationem, aut tempus explicari non potest, tametsi duratio principio, et fine carere concipiatur"). Eternity, which must be understood as "existence itself, insofar as it is conceived necessarily to follow from the definition of that which is eternal" (per aeternitatem intelligo ipsam existentiam quatenus ex sola rei aeternae definitione necessario sequi concipitur, *Ethics*, 1, def. 8), is conceived by Spinoza on the model of eternal truths, whose exemplary form is provided by mathematical truths (insofar as they are valid *ab aeterno et in aeterno*), whereas duration is identified with "the indefinite continuance of existing" (indefinita existendi continuatio, *Ethics*, 2, def. 5), "because it can never be determined on the basis of the nature itself of the existing thing" (*Ethics*, 2, expl. of def. 5). But the fact that duration can be divided into parts when it is measured by this "way of thinking" that is time, in accord with a movement of abstraction establishing "at will" (*ad libitum*) the universal reference-point of all durations (Spinoza, letter 12, ed. Gebhardt, 4:61 and 55) and making it possible in turn to insert them into the system of the laws of nature, does not in any way imply that one of them, an "affection" of things (*duratio*), can be reduced to the other, an imaginary being (*tempus*). For if the force through which a thing perseveres in existence (*conatus*) is nothing other than the power of God expressing itself in a finite, determinate form, the duration of a thing can be understood *sub specie aeternitatis* by conceiving it insofar as it endures "through the essence of God" (Spinoza, *Ethics*, 5, prop. 30, proof). It is by virtue of this immanence of divine power that duration is said to "flow [*fluit*] from eternal things," as Spinoza puts it in letter 12 (ed. Gebhardt, 4:56).

■ See Box 2.

B. *Ewigkeit* and the ecstasy of time: Schelling

Not until the post-Kantian period, when speculative philosophies of history appeared, and especially Schelling's attempt to establish a "geneaology of time," were the notions of *aiôn* and *aevum* re-represented, in an entirely different theoretical domain. "Eternity" (*Ewigkeit*), "in all eternity" (*von Ewigkeit*), were themselves rearticulated with the different figures of time: the "now," but also the instant or decisive lightning-flash (*Jetzt, Augenblick, Blitz*), "lifetime" (*Lebenzeit*), the time or age of the world (*Weltalter*). It was Schelling who pushed furthest the project of rising to a "superior history," in which a genuinely "historical" God is temporalized distinguishing the "times" or "ages" within it, in accord with a time that is "inner" (*innere Zeit*) and "organic." The revival in a new context of the Augustinian question of the "beginning" ("What does it mean to begin? How can one make a beginning?") leads Schelling to locate in God himself ("God in becoming and God to

2

"Eternity of death" versus "living eternity": The Bergsonian experience of *durée*

It is by starting from Spinoza, namely from the irreducibility of duration (*durée*) to mathematical time, and from a certain "eternalization" of that duration, that we can best understand the notion of duration in Bergson's thought. Beyond the ontological partitions of the *aevum*, the Bergsonian experience of duration rediscovers the vitality of the *aiôn*. Bergson opposes "conceptual eternity, which is an eternity of death" (immutable, immobile eternity) to an "eternity of life," "a living and therefore still moving eternity in which our own particular duration would be included as the vibrations are in light; an eternity which would be the concentration of all duration, as materiality is its dispersion"

(Bergson, "Introduction to Metaphysics" [1903]) . He conceives psychological duration only as an opening onto an ontological duration whose reality condition is that the All is never "given," as differentiated, but is an *élan vital*, a movement of differentiation and duration. *The Two Sources of Morality and Religion* (1932), which continues the argument of *Creative Evolution* (1907), seeks to show that Duration is not called Life without a movement appearing that tends to free "man from the level proper to him to make of him a creator, adequate to the whole movement of creation" (Deleuze, *Le Bergsonisme*, 117). Thus Bergson clearly claims to give us the first and last reasons why "the

measure of time never bears on duration qua duration" (*La pensée*, 3).

come") the principle of temporalization, that is, the "decisive separation" (*Scheidung*) that engenders the present, which splits off and frees itself from the past by opening up a future: "The future is what is peculiarly temporal in time" (*Aphorismen*, §214). Thus eternity can once again be seen as the "daughter of time": "Eternity is not by itself, it is only through time; time therefore precedes eternity in accord with actuality" (*Urfassungen*, ed. Schröder, 73; *The Ages of the World*, trans. Wirth). Whatever the considerable differences in conceptualization, we can still discern in the term *Ewigkeit*, which etymology derives directly from *aiôn* and *aevum* (which Kluge links with *Lebenzeit*), the mark of the Homeric sense of *aiôn* as "life," the force and duration of life.

ALLIANCE

This is the traditional French translation of Hebrew *bĕrit* [בְּרִית] which designates the covenant between the people and its god; see BERĪT. Cf. DUTY and EUROPE.

Concerning the terminological networks that make it possible to conceive the relation between humans and the god(s), the entries have been chosen in each language in relation to the values that determine the singularities of each case, in particular: Greek, KÊR, THEMIS, then OIKONOMIA, see *DESTINY, IMAGE*; Latin, PIETAS, RELIGIO, see *OBLIGATION*; Russian BOGOČELOVEČESTVO, SOBORNOST', German, BERUF, SOLLEN, see *VOCATION*.

➤ *COMMUNITY, CONSENSUS,* GOD, *HUMANITY,* PEOPLE, *VALUE*

ANALOGY

| GREEK | *analogia* [ἀναλογία] |
| LATIN | *proportio, analogia* |

➤ COMPARISON, CONNOTATION, GOD, HOMONYM, *IMAGE,* LOGOS, PARONYM, PREDICATION, SENSE, SIGN, *TO BE*

The term "analogy" poses no translation problem in English, Italian, or German because its primary meaning is that of the Greek *analogia* [ἀναλογία], which was initially rendered in Latin by *proportio*. It refers to a mathematical relationship between quantities or, more precisely, an equation of two relationships by quotient. The obvious meaning of "relationship of two parts to each other and to the whole" is thus found in Littré's French dictionary as well as in Cicero (in his Latin translation of Plato's *Timaeus*) and Varro (*De lingua latina*, 8.32). However, this mathematical meaning of "relationship between relationships" was very soon superseded by that of "resemblance between relationships," so that, as Michel Foucault pointed out, "an old concept, already familiar to Greek science and medieval thought," was resituated in the more general register of "similitudes" and ends up occupying in the seventeenth century a separate site between the field of *convenientia* ("making possible the marvelous confrontation of resemblances across space") and that of ethical and even aesthetic *aemulatio* (speaking of "adjacencies, bonds and joints") and extending from a single given point "to an endless number of relationships" (*Order of Things*, 21). These multiple relationships justify the presence of the word "analogy"—always too easily translated—in a vocabulary of untranslatable words because of the multiplicity of fields that it silently coordinates through a series of power plays continued indefinitely by their very familiarity.

Practically speaking, a translator of Plato's *Timaeus* (31c, 32a–b) will have no difficulty in rendering the term *analogia* Plato uses to designate the "bond" or "mean" that makes it possible to order "in a beautiful composition" two "numbers, masses, or forces of any kind" through a third or "mean" ("which is to the last term what the first term is to it"). Nor will a translator of Aristotle's *Poetics* have any difficulty in rendering the same term used to indicate the type of relationship in which "there are four terms so related that the second (B) is to the first (A), as the fourth (D) is to the third (C)" (*Poetics*, 1457b16–26). But the same can be said about a translator of A. G. Baumgarten's *Aesthetica* when he encounters the expression *analogia rationis*, which allows this disciple of Christian Wolff to bring the domain of sensitivity and judgments of taste into the field of knowledge, or about a translator of the theologian Karl Barth or Paul Tillich, when he encounters the expressions "*analogia fidei seu revelationis*" (taken from Paul's Epistle to the Romans 12:6, where Paul says that the gift of prophecy must be practiced "in proportion to our faith") and "*analogia imaginis*" (analogy of the image). The only translation problem raised by the Greco-Latin term *analogia* proceeds not from the absence of an equivalent in European philosophical languages, but from the consequences and stakes involved in applying it to the "problem of being" outside its original sphere, under the Scholastic title of *analogia entis* (analogy of being or analogy of the existent), and thus, by that very fact, from its "Greco-Latin" character. It is a translation *that has already been made*, and in a very precise field it raises questions for the philosopher and the historian of philosophy; it is a translation

that is, in a sense, *too successful*, and functions as a kind of screen between ancient philosophy, especially the Aristotelian tradition, and the various heirs of medieval Scholasticism. As a result, it is for readers of a work in which it does not appear as such—Aristotle's *Metaphysics*—that *analogia* poses a problem whose multiple ambiguities can be dissipated only by a genealogy of an expression that is deliberately "saturated," a genealogy that at the same time produces the "network" that has enabled it to make history. Here lexicography and theoretical innovation are inseparable, so that (and this makes *analogia* a singular, if not really isolated, case) the history of one can be truly written only through a philosophical archeology of the other. Given the importance of the "Thomist" phase in this "twofold" history, that is where we must begin.

I. Forming the Theory of Analogy

The theory known as the "analogy of being" (*analogia entis*) is a central element of Scholastic metaphysics, and is generally presented as an "Aristotelian" or "Aristotelian-Thomist" theory. This appellation should be abandoned. There are several Thomist formulations of the notion of analogy, some of them philosophical, in the commentaries on Aristotle, others theological, in the personal works (*Quaestiones disputatae de veritate*, *Summa contra gentiles*, *Summa theologica*). The first of these are intended to resolve the Aristotelian problem of the "multiplicity of the meanings of being," while the second return to the non-Aristotelian problem, raised by Boethius and Pseudo-Dionysius, of the *praedicatio in divinis* as it is set forth in Boethius's *De Trinitate*, 4, or, to put it another way, to the question of the "divine names." In any case, the medieval notion of the "analogy of being" cannot claim to borrow directly from a positive theory that is aleady constituted as such in Aristotle; instead, it appears at the end of a long hermeneutic process that begins, it seems, as early as Alexander of Aphrodisias, and to which the Aristotelian interpretive tradition contributed throughout late antiquity, from Plotinus to Simplicius. Interpreted on the basis of the Aristotelian corpus, the formation of the medieval theory of analogy presents itself as the gradual fusion of at least six texts that differ in inspiration, scope, and meaning: the distinction between synonyms, homonyms, and paronyms in the first chapter of the *Categories*; the distinction between two types of homonymy (derived from things to their definitions) in the *Topics*, 1.15.107b6–12; the distinction among the different modes of error involving homonymy proposed in *Sophistical Refutations*, 17; the problematic distinction of three kinds of intentional homonyms introduced in the *Nicomachean Ethics*, 1.4.1096b26–31—a unity of origin or provenance, a unity of end or tendency, and a unity of analogy, in which "analogy" has its authentic Aristotelian sense of a mathematical proportion with four terms (a/b = c/d) (see HOMONYM); the theory of the unification of the multiplicity of the meanings of being set forth in book 4 of the *Metaphysics* on the basis of the meaning of the terms "healthy" and "medical," itself complemented by the theory of the accident as an inflection of substance suggested by certain passages in book 7 of the *Metaphysics* (1.1028a15–25). The medieval theory of the analogy of being proceeded mainly from the encounter between the *Categories*, 1.1, the *Nicomachean Ethics*, 1.6, and the *Metaphysics*, 4.1. Before this

synthesis, the notion of a reduced homonymy was preferred, being used without any metaphysical preoccupation as a semantic concept connected with the interpretation of two standard logical problems of homonymy according to Aristotle: the elucidation of the distinction between homonyms and synonyms in the *Categories*, 1.1 and the analysis of the semantic mechanisms of *fallacia aequivocationis* in *Sophistical Refutations*, 17. Characteristic of this problem are the analysis of *aequivocatio ex adiunctis* by the *Anonymus cantabrigiensis*, based on three interpretations of the homonymy of *sanum* clearly taken from *Topics*, 1.15.106b34–38 and that of the *Anonymi compendiosus tractatus de fallaciis*, interpreting in terms of "consignification" the semantic variation presiding over the paralogism of "equivocalness *ex adiunctis*," on the basis of the two senses of *sanum* mentioned in *Topics*, 1.15.106a5–9. At this stage of development, the question of homonymy had not yet produced a theory of the analogy of being: it remained within the limits of the fragments of Porphyry's works transmitted by Boethius's commentaries on Aristotle's logic and the Aristotelian sources of the *Logica vetus* and the *Logica nova*. The metaphysical problem of the plurality of the meanings of being was not confronted as such. Neither did the notion of analogy continue to play an assignable role in the Greco-Roman metaphysics of Boethius's time (*aetas boetiana*), in which until the end of the twelfth century the dominant problem was that of the transfer of categories, the *transsumptio rationum*, which marked all theological uses of the ten Aristotelian categories. In this universe of discourse, the Aristotelian question of the plurality of the meanings of being was occulted by that of the applicability of ontological categories in the domain of theology. Abundantly illustrated in the first medieval commentaries on Boethius's *De Trinitate*, notably in Gilbert de Poitiers and the Porretains, the problem then dominant resided in a single question extrapolated from chapter 4 of Boethius's work: given that "categories change meaning when they are applied to God," is there a pure equivocalness, a metaphoric usage or a "transsumption" of categorial language when it is transposed from the natural domain to the divine domain? (see TO TRANSLATE, Box 1).

II. *Denominativa, Convenientia, Analogia*

The Scholastic problem of analogy appears at the beginning of the thirteenth century, when the word and the notion of *analoga* begin, if not directly to replace, at least to overlap with Aristotle's *denominativa* (or paronyms). This overlapping has a long earlier history: Simplicius (whose *Commentary on the Categories* was translated by William of Moerbeke in 1268) tells us that the Hellenophone interpreters of Aristotle very early on "combined in a single mode homonymy *ab uno* and homonymy *ad finem*," and that other writers "posited them as intermediaries between homonyms and synonyms" (*In praedicamenta Aristotelis*). There is no lack of Latin witnesses to the substitution of the sequence homonyms-synonyms-analogues for the triad homonyms-synonyms-paronyms: the shift had been made as early as 1245, with the first university *Lecturae* of Aristotle's *Libri naturales*. Albert the Great's commentaries on the *Logica vetus* enable us to identify the professors' source here: the Arab philosophers who

intercalated between *univoca* and *aequivoca* "what they call *convenientia*" in order to master conceptually the problem with the homonymy of *being*. Starting with Albert and the sources he mentions, al-Ghazali and Avicenna, we can call the theory of "the analogy of being" any theory that has the following elements: the interpretation of homonymy *ad unum* in terms of proportion; the application of this relation, which is oriented and not convertible like paronymy, to the relationship between substance and accident understood as a relationship between *prius* and *posterius*, primary (anterior) and secondary (derived, posterior); and the distinction between "three modes of analogy," that is, three types of "relationships" governing the attribution of so-called analogical terms—*proportio ad unum subiectum*, which is equivalent to the term "being," *proportio ad unum efficiens actum*, which is equivalent to the term "medical," and finally *porportio*, which is equivalent to the term "healthy," and is more or less clearly connected with final causality. Avicenna's *Metaphysics* was known to Latins before Aristotle's *Metaphysics*, and was thus for the Latin Middle Ages, according to Albert himself, the main source for the problem of the plurality of the meanings of being. It was Avicenna's work that determined the reading of Aristotle's works and established the view that the unity of the concept of being sought by Aristotle is a "convention in accord with ambiguity" (*convenance selon l'ambiguïté*) legible in terms of the "relation of the anterior to the posterior," that is, in the more or less Platonizing framework of a theory of participation by degrees. Although the conception of analogy "in accord with the anterior and the posterior" in the Avicenna tradition dominated most logical and metaphysical commentaries on Aristotle up to 1250–60 (Nicolas of Paris, *Summae metenses*; Roger Bacon, *Quaestiones alterae supra libros primae philosophiae Aristotelis*, IV, q. 3–4), later theories became increasingly complex.

III. Philosophical Analogy/Theological Analogy

The distinction between philosophical and theological analogies explodes the initially unitary formulation. Since, given the absence of an assignable relationship or proportion, it was not possible to approach the problem of *praedication in divinis* in the framework of a theory of analogy "in accord with the anterior and the posterior" between God as creator and as infinite, on the one hand, and created, finite being on the other, Thomas Aquinas introduced, to compensate for this shortcoming, a distinction between analogy of proportion and analogy of proportionality, which has been well described by recent interpreters. Since Boethius's *De institutione arithmetica* (2.40), "proportion" has meant a relationship between two terms, and "proportionality" has meant a relationship between two relationships, whereas by "analogy of proportion" Thomas accounts for what we now call the "focal meaning" of being (or rather of the word "being"): the diverse categorical meanings can be coordinated horizontally like those of the word "healthy." The "analogy of proportionality" seeks to connect two relationships: a cognitive, conceptual relationship (*secundum intentionem*) and an ontological relationship (*secundum esse*). In the sixteenth century, Meister Eckhart virtually exhausts

the concept by reducing theological analogy to a simple analogy of extrinsic attribution based on an "analogy" in the strict sense of the term (a proportion with four elements): just as health exists only in an animal, there is no being except in God. The creature is a sign of God, as urine is the sign of health. However, the relationship between the sign and the thing signified being reflected in a relationship between cause and effect, the exact content of the theory of analogy is a theory of "analogical causality": God is the creator and giver of being, hence the creature is; but the latter's being, which is not rooted in itself, can be reduced to that of God and is no more than a sign of the latter. With the appearance of the "univocal concept of being" in Duns Scotus, the theory of analogy gradually evolves in the direction of a theory of the "analogical concept of being," which the Thomists, and then the "Second Scholasticism," tried to oppose to the Scotist theory. This development, which led beyond the Middle Ages, produced more or less syncretic formations of the ideas of analogy used by the Neo-Thomists and Neo-Scholastics: thus the model for Jacques Maritain's notion of analogy is John of St. Thomas more than Thomas Aquinas.

The discursive complex of *analogia entis* does not exhaust the whole of the field of *analogia*. Modern debates about the purely allegorical status of analogy (E. Cassirer) or, on the contrary, the "effect of metaphorical meaning" that surreptitiously plagues medieval theological analogy (P. Ricoeur) are nonetheless situated in the network defined by the encounter between the Aristotelian problem of "the multiplicity of the meanings of being" and the purely theological problem of "the divine names" inherited from late antique and medieval thought. *Analogia* is the heart of a system from which radiate and become relatively autonomous diverse fields that are necessarily connected by the founding act of *inventio analogiae*: metaphor, symbol, and category.

ANIMAL

GERMAN	*Animal, Bestie, Tier, animalisches Wesen*
GREEK	*to zôion* [τὸ ζῷον], *to thêrion* [τὸ θηρίον]
LATIN	*animal*

➤ AFFORDANCE, LEIB, *LIFE/LEBEN,* LOGOS, NATURE, PHANTASIA, SOUL, SUBJECT

Today, we tend to take the triad "human" / "animal" / "plant" for granted: usage in Romance languages generally reserves "animal" for animals that lack reason but are mobile. However, if we take into account its etymological echo of the root *anima*, in the sense of the vital breath, "animal" also has an extended meaning that allows it to designate any living being. The Greek language offers us a still broader semantic configuration: the word *zôion* [ζῷον] (from *zôô* [ζώω], "to live," *zôê* [ζωή], "life"), which is usually rendered as "animal," includes in many texts not only humans but also the stars and the gods, and sometimes plants. Moreover, the usual translation of the term "animal" in German, *das Tier*, refers to still another constellation of meanings. Close to the Greek *thêr* [θήρ] (with its derivative *thêrion* [θηρίον], which means "wild beast," "predator of game"), the etymology of *Tier* reveals a proximity not with the soul, or even with life, but with brutality, savagery, bestial violence, and even death. This kind of inflection, which tends to turn toward a semantic opposition, thus leads French translators to render *das Tier* as *bête* (beast) rather than *animal*. Too narrow or too broad, the French word *animal* involves a projection onto other taxonomies.

I. The Absence of the Animal among the Greeks: The *Zôion*

History of Animals, *Parts of Animals*, *Generation of Animals*, and so on—Aristotle's biological treatises seem to support the view that the concept "animal" functioned in the same way for the Greeks as it does for us. But the Greek term we translate, through Latin, as "animal" has a much broader meaning:

to zôion, a neuter noun formed on *zôô* [ζώω], "to live": "For everything that partakes of life may be truly called a living being" (Plato, *Timaeus*, 77b), even plants, but first of all the world itself (30b), the gods that are stars in the sky and those of Olympus (39e–f), and, of course, humans no less than our "animals."

However, in this hierarchy of the diversity of species, Aristotle often distinguishes *zôia* [ζῷα] proper (noun) from *zôntes* [ζῶντες] (present participle of the verb) and *zôoi* [ζωόι] (nominalized adjective), namely, simple "living beings" situated at a lower rung on the ladder, those whose souls have the faculty of feeding themselves and reproducing (plants), but not of feeling, moving (our "animals"), thinking, or speaking (humans): "For nature passes from lifeless objects [*tôn apsuchôn* (τῶν ἀψύχων)] to *zôia* [ζῷα] in . . . unbroken sequence, interposing between them beings that live [*tôn zôntôn* (τῶν ζώντων)] yet are not *zôia*" (*Parts of Animals*, 681a12–13; see also *On the Soul*, 2.413b1–4). The difficulty in translating *zôion* is here at its greatest. Wolff's suggestion that it be translated in French as *animé* (animate being: Wolff, "L'animal et le dieu," 163) avoids the confusion with our restricted sense of "animal," but it encounters a new problem: in Aristotle there are *animés* (literally, *empsucha* [ἔμψυχα], in contrast to *apsucha*, "inanimate beings" such as stones; cf. *On the Soul*, 2.413a22) that are not *zôia*, "animals" (precisely, plants, *ta phuta* [τα φυτά]), or concerning which it is difficult to decide, so intermediary is their nature (sponges, for instance: *Parts of Animals*, 681a10–17). In any case, a translation as *animé* or "animal" erases the great chain that leads from simple "animate beings" to *zôia*, singular beings well defined by their increasingly differentiated activities.

■ See Box 1.

1

Bare life (It. *la nuda vita*; Ger. *das bloße Leben*)

"Bare life" is a central term in Giorgio Agamben's political philosophy designating a life stripped of all activities, attributes, qualities, and qualifications.

Early in his book *Homo sacer*, Agamben announces that "the protagonist of this book is bare life" (11; trans. Heller-Roazen, 8). That book's reader might well wonder, however, what this "bare life" is and in what sense it is bared. Is it a good thing, on the order of a purification; a bad thing, such as a deprivation; or neither? The answers Agamben gives to these questions are to be found in the subtle genealogy he offers of conceptions—philosophical and other—of "life" from ancient Greece to the present day.

"Bare life" presents a translation difficulty that should be noted—namely, the English translation given in *Homo sacer* for Agamben's expression *la nuda vita*. The history of this translation is more complicated than it might first appear. In a brief discussion of the idea of the sacred at the end of *Language and Death,* Agamben wrote that "even the sacralization of life derives from sacrifice: from this point of view it simply abandons the naked natural life [*la nuda vita*] to its own violence and its own unspeakableness" (133; trans. Pinkus, 106). This suggestive use of the term *la nuda vita*—literally, "naked life"—does not, however, prepare us for the role it will play in Agamben's later thought. In an essay from 1993, "Bartleby o Della contingenza," Agamben again invokes *la nuda vita*, and in a widely read translation of that essay three years later, the term is again rendered as "naked life." Daniel Heller-Roazen's translation of *Homo sacer* chooses a different translation for *la nuda vita*: "bare life." *Bare* and

naked are indeed often synonymous, and this divergence might seem, at first sight, a negligible one reflecting a mere stylistic preference. It is, however, more than this, as *la nuda vita* is not a term of Agamben's own invention. It, too, is a translation—a quotation without quotation marks from the work of Walter Benjamin.

In "Destiny and Character," Benjamin introduces the term *das bloße Leben*, "bare life," and employs it again in "The Critique of Violence" (see *Gesammelte Schriften*, 2:175 and 2:199–200). That Agamben conceived *la nuda vita* as a translation of Benjamin's *das bloße Leben* is not made clear to his reader in *Language and Death*, in the 1993 "Bartleby o Della contingenza," or in any of the other essays leading up to *Homo sacer*. Nor, for that matter, is it made clear in the opening sections of *Homo sacer*.

At the end of part 1, however, Agamben turns to Benjamin's analyses of law and life and there underlines the relation of the one formulation to the other: "nuda vita [*bloße Leben*]." *Nuda vita*—naked or bare life—is thus, for Agamben, another way of saying *bloße Leben*—bare life— and knowing this allows us to understand better not only Heller-Roazen's translation but also *Homo sacer*'s protagonist. Benjamin's expression *das bloße Leben* designates a life shorn of all qualification and conceived of as independent of its traditional attributes. Although Benjamin does not offer further directions for how it is to be understood, it is clear that "bare life" is not an initial state so much as what becomes visible through a stripping away of predicates and attributes. It is best understood in relation to Agamben's discussion of the two Greek terms for life, *bios* [βίος] and *zôê* [ζωή]. As Agamben observes, for the Greeks the term *zôê* designated "life" in the sense of "the simple fact of living common to all living beings (animals, men, or gods)," and for this reason it tellingly admitted of no plural form (*Homo sacer*, 3; trans. Heller-Roazen, 1). *Zôê*

was then life in its most general sense, a sense every bit as general as "being." The second term, *bios*, referred to the forms our lives take—to "the form or way of living proper to an individual or a group" (*Homo sacer*, 3; trans. Heller-Roazen, 1). In addition to the undifferentiated fact of a thing being alive—*zôê*—there is a specific way of living—*bios*. This distinction corresponded to a fundamental division in the Greeks' political landscape. For them, "simple, natural life" (*zôê*) was not the affair of the city (*polis*), but instead of the home (*oikos*), whereas *bios* was the life that concerned the *polis*. In the very words the Greeks used to express the divisions of their culture, there was a distinction between the life that was the concern of the (city-)state and the private life that lay beyond its province. In Agamben's hands, bare life is linked both to an ideal conception—one where individual lives are not weighed, measured, judged, or valued against their fulfillment of certain criteria (being red, Communist, Italian, etc.)—and to a potentially dangerous one, as in instances where individuals and groups are stripped of all rights associated with such belonging and reduced to a mere

nude or bare life, subjected to unqualified suffering.

We will have no more success in adequately projecting our concept of "animal" on the Greek *thêr* [θήρ] or its derivative *thêrion* [θηρίον]. Even if it happens that the *thêrion* is said to be "peaceful" (*hêmeron*: Plato, *Republic,* 588c) as well as "ferocious" (*agrion*), the word usually designates a "predator," a "wild beast" that is hostile to humans (lions or boars that hunt and are hunted, and are more terrestrial than fish or birds), in contrast to domestic or tame animals. Although a human is by nature a *zôion*—more precisely, according to Aristotle's related definitions, a *zôion logon echon* [ζῷον λόγον ἔχον], a *rational animal* or living being endowed with language, and a *politikon zôion* [πολιτικὸν ζῷον], a political animal living in a city-state (*Politics,* 1.1253a1–10) —in denaturing himself he becomes a *thêrion*. Thus just as someone who has no need to live in a community is a *theos*, "god," so someone who is incapable of doing so is a *thêrion*, "beast," "monster," and no longer a human (ibid., 27–29). Similarly, *thêriotês* [θηριότης], "bestiality," is something quite different from vice: it is the monstrous degradation of a species, seen, for example, among barbarians (*Nicomachean Ethics,* 7.1; cf. Bodéüs, "Les considérations"). This tripartite classification, which situates man between the animal (*thêrion*) and the god and is constitutive of ethics and politics, structures the continuist ontology of the living, *zôos* and *zôion*, which is determinant in biology and cosmology. But none of the Greek terms correspond to the same portion of the world as our word "animal."

■ See Box 2.

II. The Invention of the Animal in the Christian Era: "Animal," *Animus*, *Anima*

In the era when Christianity was emerging, following the lineage of a sacrificial Judaism, animals were both endowed with the status of creatures on an equal footing with humans and devalued because of their alleged lack of a soul. In the context of a discontinuist ontology based on the metaphysical tripartite division matter/life/spirituality, the animal was situated among the living beings deprived of soul or spirit. Saint Augustine was the first to systematize this philosophical position: although refusing them any spiritual principle, he granted them the vital principle (the *anima*, the Greek *psuchê* [ψυχή]), that is, mobility. However, he reserved the *animus* (the soul that knows) and the *pneuma* [πνεῦμα] for humans alone.

The sequence animal / life / living being is constituted, and in the seventeenth century the Cartesians found it easy, on this basis, to define animals in relation to the mind and rationality, whether they were "for" (Gassendi, La Fontaine, Leibniz) or "against" (Descartes himself, La Mettrie, et al.). The debate between mechanism and vitalism (Do animals have souls?) thus has its source in Augustinianism, which connects "animal" and *anima*, and disconnects "animal" and *animus*, thus ratifying for a long time a sharp break between the living and the spiritual.

III. Conceiving the Beast in Relation to the Animal

The humanist position that arises in the Christian era creates this break between the living animal and humans, who have

2

Homo sacer

Homo sacer (sacred man) is a Latin term borrowed from archaic Roman law by Giorgio Agamben to discuss a range of political and philosophical issues. In its original sense, *homo sacer* designated an individual who was banished in response to a grave trespass. From the moment of his ritual pronouncement as *homo sacer*, this person could be killed with impunity, but could not be employed in sacrificial rituals that required the taking of a life. The term is first discussed in Agamben's *Homo sacer: Il potere sovrano e la nuda vita* (1995), where it is presented as a paradigm for understanding contemporary political and biopolitical situations ranging from Nazi concentration camps to everyday life in Western democracies.

The first thing to note about this figure of a "sacred man" in Roman law is that he was not sacred in any reverential sense—in fact, he was far closer to the opposite. Removed from the continuum of social activity and civil legislation, the only law that still applied to him was the one that irrevocably cast him out of the communal sphere. In *Homo sacer* and its sequels, Agamben stresses the enigmatic, paradoxical, and "paradigmatic" status of this figure from archaic Roman law. As Freud, Benveniste, and others have demonstrated, the term "sacred" has displayed in its history a remarkable degree of semantic ambiguity. Emblematically, Agamben's titular figure amply partakes of this ambiguity. To explore the *homo sacer*'s paradoxical status, Agamben turns to Greek conceptions of

"life," beginning with the two Greek words for life, *bios* and *zôê*. The former concerns a life seen in function of its various activities and attributes, the latter refers to the life shared by all the living. It is in light of this distinction that Agamben develops a paradox inherent in the definition of the *homo sacer*. From the perspective of the community that has banished him, the *homo sacer* is stripped of the customary forms or qualifications of a specific life (what the Greeks called *bios*). What remains is an individual utterly without status, seen by the community that cast him out as reduced to bare life (what the Greeks called *zôê*).

Agamben's interest in this figure is not primarily historiographical, and though such banishment was doubtless a terrible fate for an individual, it is not the psychological suffering or sociological implications of this practice that Agamben is endeavoring to understand. For him, this figure from the most remote past of Western legal history bears a message—an ominous one—for today's societies. The explicit goal of the *Homo sacer* project is to explore what Agamben calls "the essential function" of this figure "in modern politics." In the wake of Foucault's studies of "biopolitics" and Arendt's work on related matters, Agamben sees an increasing tendency on the part of societies, both totalitarian and democratic, to discipline and control their subjects through minute observation, definition, and documentation. This subtle control of the activities and attributes

of an individual life (*bios*) is coupled with an extremely disturbing set of cases where individuals are stripped not only of legal rights, but of all attributes except that of their mere physical existence (*zôê*). This process, writ large in the Nazi concentration camps, is one that Agamben sees writ small elsewhere and is the reason why he appeals to his readers' vigilance in the face of contemporary political trends. "If today," Agamben writes in *Homo sacer*, "there is no longer any one clear figure of the sacred man, it is perhaps because we are all virtually [*virtualmente*] *homines sacri*" (*Homo sacer*, 127; trans. Heller-Roazen, 115). This is a "virtually" that commentators such as Slavoj Žižek have tended to ignore; but what bears noting is that for Agamben, the present historical situation shows signs of this exceptional figure returning on a global scale. In sum, Agamben's *homo sacer* is a figure from the remote past that brings into focus a disturbing element in our political present—and points toward a possible future that Agamben sees as our principal duty to avert.

Agamben, Giorgio. *Homo sacer: Il potere sovrano e la nuda vita*. Turin, It.: Einaudi, 1995. Translation by Daniel Heller-Roazen: *Homo Sacer: Sovereign Power and Bare Life*. Stanford, CA: Stanford University Press, 1998.

spirit/mind, and gives birth to the idea that the animal corresponds to a unitary genus that coincides with the category of the living. The presence in German not only of the word *Bestie*, but of two additional terms, *Tier* and *Animal*, that can both be translated into English as "animal" thus poses once again the question, already raised by Greek usage, whether "animal" really refers to a unified category, that is, "a homogeneous genus."

"Animal" is in fact the most common translation of *Tier*, whether we are dealing with a *Haustier* (domestic animal, pet), a *Pelztier* (fur-bearing animal), a *Zugtier* (draft animal), or a *Reittier* (saddle animal). We also speak of the "animal kingdom" (*Tierreich*), the "small animal" (*Tierchen*), and even of "animality" (*Tiernatur, tierisches Wesen*). But the latent Latin root is also used to translate the noun "animality" (*Animalität*) and the corresponding adjective (*animalisch*). In French, there are only two words, *animal* and *bête*. So why is *Tier* usually rendered as *animal* and not as *bête*? Does this reflect, through the Latin lexical connection, a humanist prejudice?

Tier indicates a semantic polarity that is connected etymologically with the Greek *thêrion* (wild beast) and, further back, with the Sanskrit *dheu* (Dastur), which is said to combine in

a single term the original interrelationship of life and death. In some contemporary phenomenological studies, the term *Tier* has been uncritically rendered by *animal* and not by *bête*, even if in the same texts we also find *Animal* and *animalisches Wesen* (Husserl). This kind of translation problem obviously involves the relationship between humans and animals—namely, the problem of the humanization of the animal (if *Tier* is rendered as *animal*, in which the soul is indicated)—as much as it does that of the animalization, or rather the bestialization, of humans (when *Tier* is translated as *bête*, which indicates brutal or savage nature).

ANSCHAULICHKEIT (GERMAN)

ENGLISH   clarity, openness to view, visualizability
FRENCH   *caractère intuitif*

➤ *INTUITION* and ANALOGY, EPISTEMOLOGY, ERSCHEINUNG, PERCEPTION, REPRÉSENTATION, SACHVERHALT, SIGN

Since the 1930s the German term *Anschaulichkeit* has presented a typical case of untranslatability, to the point that its importance for philosophical reflection on science has only recently been rediscovered. Deriving from the Kantian tradition, the term's meaning has been radically modified by quantum theory.

Although it is not listed in the Kantian lexicon proper (where we find *Anschauung* and *Anschauungsformen*), the term does belong to the tradition inspired by Kant that marks all the work done by German mathematicians, physicists, and physiologists of the second half of the nineteenth century. *Anschaulichkeit* designates what is translated inaccurately in French as the *caractère intuitif* or in English by the "visualizability" or "clarity" of a physical theory, but in fact it refers to the possibility of giving phenomena and objects a "spatio-temporal representation," that is, an image in ordinary space and time. With the appearance of quantum theory, this possibility, and this demand, had to be abandoned, whence a drastic change in the use of the term *Anschaulichkeit*, a change that took place in two stages. First, Niels Bohr abandoned the maintenance, in the atomic physics, of "spatio-temporal representations through which up to this point we have tried to describe natural phenomena" ("Über die Wirkung von Atomen bei Stossen"), introducing instead of *Anschaulichkeit* the notion of "symbolic analogy" (*symbolische Analogie*), the only possible approach to objects that cannot be described in spatio-temporal terms. In a second stage the term *Anschaulichkeit* is taken up again but redefined in a way that emphasizes, on the one hand, the role of experimental procedures in the definition of a theory's fundamental concepts (W. Heisenberg, "Über den anschaulichen Inhalt"), and on the other hand—elaborating the Helmholtzian idea

of *Anschaubarkeit* (translated in English by "intuitability"), which, applied to mathematics, appears in Helmholtz's 1878 lecture entitled "Die Tatsachen in der Wahrnehmung" ("Facts of Perception")—the necessary abstraction that the physicist has to carry out with regard to his usual mental images: "The new system of concepts also gives the intuitive content [*der anschauliche Inhalt*] of the new theory. We must thus ask of an intuitive theory in this sense only that it be in itself free of contradiction and that it allow us to predict without ambiguity the results of all imaginable experiments in its domain" (Born, Heisenberg, and Jordan, "Zur Quantenmechanik").

In the late 1920s these changes in the meaning of the term *Anschaulichkeit* had the effect of breaking out of the original Kantian context. The difficulty of translating the term into other languages can thus be easily explained: to understand it, one has to follow the twofold process of the formation and implosion of a vocabulary specifically associated with the history of German philosophy.

ANXIETY

DANISH   *Angest*
FRENCH   *angoisse*
GERMAN   *Angst*
LATIN   *angustia(e)*
SPANISH   *angustia*

➤ CARE, DASEIN, *IL Y A, MALAISE, NEGATION, NOTHING,* SORGE, *TO BE*

The term "anxiety" is etymologically related to that of "narrowness," or "tightening," as are the corresponding Romance and Germanic words, and this can still be sensed in the works of Friedrich Schelling and Jakob Böhme. However, it is above all its elective relationship with nothingness (as non-being) and the possibility of the pure state that Heidegger, following Kierkegaard, will emphasize. That *Angst*, unlike *Furcht* (fear), is "without object" is no less crucial for psychoanalysis.

In a note in section 40 of *Being and Time*, Heidegger refers to Kierkegaard's 1844 book, *The Concept of Anxiety*, declaring that no one had gone as far as Kierkegaard in the analysis of this phenomenon as it appears in the theological context of a "psychological" exposition of the problem of hereditary sin.

In his book (chap. 2, §1), Kierkegaard himself refers to Schelling's non-anthropomorphic use of *Angst*, seeing in it "the sufferings of the divinity longing for creation." Following Böhme, Schelling understands *Angst* in its relationship with *Enge* ("narrowness," "restriction," from the Gr. *agchô*, "tighten," "constrain," "suffocate," and Lat. *angustia*, usually used in the plural, *angustiae*; cf. the Fr. *angoisse/angine*—"that which oppresses, chokes") as a centrifugal movement peculiar to a being that feels stifled or restricted (*beengt*) within himself:

> The anxiety of life itself pushes man outside the center in which he was created. . . . [T]o be able to live there . . . man is almost necessarily tempted to leave the center to escape toward the periphery.
>
> (Schelling, *Sämtliche Werke*, vol. 7)

It is less from this concept of anxiety in Schelling's 1809 *Untersuchungen* that Kierkegaard seeks to distance himself than from that in *Die Weltalter* (*Sämtliche Werke*, vol. 8), where "the sufferings of the divinity longing for creation" characterize a *divine* anxiety whose anthropomorphism Kierkegaard stresses. As for the relationship *Angst/Enge*, it still remains present in German, even if it is muted. It is no accident that Heidegger frequently uses the verb *beengen* in analyzing the phenomenon of anxiety: "What oppresses [lit., 'constrains' or 'makes narrow'] . . . is the world itself" (*Was beengt ist . . . die Welt selbst*; *Sein und Zeit*, §40). In Kierkegaard, the relationship *anxiety/constraint* is less determinant than the relationship of anxiety to nothingness and to possibility. Anxiety (*Angest*) is entirely distinct from fear (*aldeles forskjelligt fra Frygt*)—and this distinction *Angest/Frygt* is found in Heidegger as the distinction *Angst/Furcht* (cf. "Was ist Metaphysik?")—for if fear has

to do with something determinate or very precise (*bestemt*), we are anxious "for nothing" (*for Intet*). This leads Kierkegaard to define "anxiety" this way: "Anxiety is the reality [Dan. *Virkelighed* = Ger. *Wirklichkeit*] of freedom as the possibility offered to possibility" (*Angest er Frihedens Virkelighed som Mulighed for Muligheden*; *Begrebet Angest*, chap. 1, §5).

In innocent Adam, in whom the prohibition on eating the fruit of "the tree of the knowledge of good and evil" (Gn 2:17) awakens the possibility of freedom, the "nothingness of anxiety" (*Angestens Intet*) is transformed into "den oenstende Mulighed af at *kunne*" (the dreadful possibility of *power*), not, to be sure, the power to choose good or evil, but simply *to be able*—"*Mulighed er at kunne*" (possibility consists in *being able*; *Begrebet Angest*, chap. 1, §6).

The specific contribution of Heidegger is to have combined Schelling's and Kierkegaard's definitions of anxiety in his concept of *Angst*, understood as constraint and relationship to Nothing. Into the "bright night" of Nothing, which Heidegger recognizes in his 1929 inaugural lecture "What Is Metaphysics?" as an initiatory gateway into metaphysics, pierces Nothing, as non-being.

Angst and anxiety in psychoanalysis

➤ DRIVE, ES, HEIMAT, Box 2, SUBJECT, VERNEINUNG, WUNSCH

I. The two Freudian theories of anxiety

Sigmund Freud worked out two theories regarding anxiety. The first goes back to the beginning of his work and presents anxiety as a "transformation of the libido" (*Angst als Umwandlung von Libido*). This transformation of the libido into anxiety takes place when "the accumulated psychic tension attains

the threshold that allows it to elicit a psychic affect, but . . . for some reason, the psychic connection that is offered to it remains insufficient; the psychic affect cannot be produced, because certain psychic conditions are partially lacking, whence the transformation into anxiety of the tension which has not been psychically 'bound'" (Manuscript E, "Wie die Angst entsteht," in *Briefe an Wilhelm Fliess*).

Freud's second theory of anxiety is presented in *Hemmung, Symptom und Angst* (1925). Anxiety is conceived first of all as "something felt" (*etwas Empfundenes*), an "affective state" (*Affektszustand*) that appears "as a reaction to a state of danger" (*als Reaktion auf einen Zustand der Gefahr*). It is understood as a "signal" proceeding from the Ego, since only the Ego can judge

situations of danger (*Gesammelte Werke*, vol. 14; see ES). Anxiety is a reaction—a signal—confronted with the "danger of losing the object" (*Reaktion auf die Gefahr des Objektverlust*; ibid.). Freud presents several forms of the loss of an object that are merely attenuated versions of the "helplessness" (*Hilflosigkeit*) of trauma and constitute the core of the situation of danger (ibid.). We also note an essential modification of the Freudian development relating to repression: "[I]t is anxiety that produces repression, not, as we thought, the reverse" ("Angst und Triebleben" [1932], in *Gesammelte Werke*, vol. 15).

Freud distinguishes two kinds of anxiety: "anxiety about the real" (*Realangst*) and "neurotic anxiety" (*neurotische Angst*). "Real danger [*Realgefahr*] is a danger we know, and real anxiety [*Realangst*] is anxiety regarding such a known danger. Neurotic danger [*die neurotische Angst*] is anxiety regarding a danger we do not know," and neurotic danger is "a pulsional danger" (*eine Triebgefahr; Hemmung, Symptom und Angst*, in *Gesammelte Werke*, vol. 14; see also *Die Angst*, in *Gesammelte Werke*, vol. 11).

So far as the notion of danger is concerned, Freud distinguishes between "real danger" (*Realgefahr*), a threat posed by an external object, and neurotic danger, which proceeds from "pulsional demand" (*Triebanspruch*; ibid.).

II. Translation problems

Freud's texts on anxiety pose a few translation problems because of the twofold meaning of *Angst* in German, which can mean "anxiety," but also "to be afraid of," followed in this case by the preposition *vor* (*Angst haben vor etwas*). Freud himself tried to define the difference between these two meanings:

> "Fright," "fear," and "anxiety" are improperly used as synonymous expressions; they are in fact capable of clear distinction in their relation to danger. "Anxiety" describes a particular state of expecting the danger or preparing for it, even though it may be an unknown one. "Fear" requires a definite object of which to be afraid. "Fright," however, is the name we give to the state a person gets into when he has run into danger without being prepared for it; it emphasizes the factor of surprise.
>
> (*Beyond the Pleasure Principle*).

In *Hemmung, Symptom und Angst*, Freud emphasizes that anxiety is "characterized by indetermination [*Unbestimmtheit*] and the absence of an object [*Objektlösigkeit*]; a correct use of the language even changes its name when it has found an object, and replaces it by *fear* [*Furcht*]."

The difficulty persists, despite this remark; neither Freud nor the German language commonly makes this distinction, as is shown by the Duden dictionary (RT: *Duden: Deutsches Universalwörterbuch*) and the RT: *Historisches Wôrterbuch der Philosophie*. In the latter dictionary's article "Angst," we read: "A broad distinction between *Angst* as being without object, a free, dispersed feeling, and *Furcht* as something that is attached to an object, is made neither in the literature as a whole nor in common usage." In addition, the article "Obsessions et Phobies," which Freud wrote in French, offers an opportunity to see that the meaning of the word in question is not univocal: Freud uses both the words *angoisse* and *anxiété* to render the German *Angst* and also uses the expression *névrose anxieuse* to render *Angstneurose* (*Gesammelte Werke*, vol. 1). Faced with this problem, French translators use either a version of the original German or an interpretation of the contexts in which Freud used the word *Angst*. Thus the French version of *Hemmung, Symptom und Angst* translates *Angst* and *Angst haben vor etwas* by *angoisse* and *avoir angoisse devant quelque chose*, respectively. On the other hand, the translators of the *Conférences d'introduction à la psychanalyse* and the *Nouvelles conférences d'introduction à la psychanalyse*, for example, translate the term in a different way. The English version makes the same choice, translating *Angst* by "anxiety" or, depending on the context, by "fear," "afraid," "alarm," etc. In *The Standard Edition* (Strachey, vol. 20, translator's note), however, there is some question as to whether the English "anxiety" still retains a semantic connection with the German *Angst*. The Spanish translation renders *Angst* by *angustia* but occasionally resorts to other terms, such as *miedo* (Lopez-Ballesteros y de Torres, *Obras completas*, vol. 2).

III. Jacques Lacan: Anxiety "is not without an object"

Lacan devoted a whole seminar to the subject of anxiety (*L'Angoisse*), but important remarks on this subject are already found in his earlier seminar on identification: "It is not impossible that you encounter the desire of the other as such, of the real Other. . . . It is here that anxiety arises. . . . Anxiety is the sensation of the Other's desire" (*L'Identification*, 4 April). For Lacan as much as for Freud, anxiety is a signal, but a signal of the presence of the Other's desire as "real" and no longer "symbolic." The Other's desire as "symbolic" presupposes the phallus, which is, Lacan says, the "name" of the Other's desire, that is, it is included in the signifier (see SIGNIFIER/SIGNIFIED). At the same time, the phallus is a lack, a "structuring void" around which is established every possibility of signification (cf. "La signification du phallus," *Écrits*, and *L'angoisse*, 12 December). Anxiety makes its appearance at the moment when the phallus, which governs the relations between the subject and the enigma of the Other's desire, is lacking. Lacan declares: "[T]here is a fear of losing the phallus, because only the phallus can give desire its own field" (Lacan, *L'Identification*, 4 April). Thus anxiety corresponds to "the lack of the lack," which implies a direct encounter with the desire of the "real Other" (cf. *L'Angoisse*, 28 November and 5 December). These reflections led Lacan to undertake a "rectification" of the concept of anxiety with respect to the Freudian position and a certain philosophical tradition: anxiety, he says, "is not without an object" (ibid., 9 January 1963) and for that reason it is the only affect that "does not deceive" (ibid., 19 December 1962). The discussion of anxiety thus paves the way for the elaboration of the concept of the *objet petit a*, the "object causing desire," which he was to announce in the following year's seminar (*Les quatre concepts*).

| APPEARANCE

The word "appearance" is ambiguous from the outset, since it sometimes points toward the phenomenon, the objectivity of what appears on its own, and sometimes toward illusion and deception.

I. Appearance-Apparition

"Appearance" and "apparition" are modeled on Late Latin *apparentia* and *apparitio* (themselves connected with *appareo*, which means "appear," but also "be in the service of," just as *pareo* means "come forth" and "obey"), synonyms in Church Latin, which uses *apparitio* to render the Greek *epiphaneia* [ἐπιφάνεια] (manifestation, epiphany). "Appearance-apparition" refers to what appears in full light, the manifestation or *phainomenon* [φαινόμενον] in the original sense of the Greek verb *phainô* [φαίνω] (to appear), from the same root as the Greek *phôs* [φῶς] (light): see PHANTASIA, I, LIGHT, Box 1, and *PHÉNOMÈNE.*

II. Appearance-Illusion

"Appearance" also refers to false appearance or illusion (as in "don't trust appearances"). This illusion may be connected with individual subjectivity and may concern an error made by the senses, imagination, or judgment (see DOXA, PERCEPTION, PHANTASIA, REPRÉSENTATION). It can also be conceived as having to do with a transcendental subjectivity, and it may be connected with the opposition between the phenomenon and the thing-in-itself (see ERSCHEINUNG; REALITY, with the difference *Realität/Wirklichkeit*; see also GEGENSTAND).

III. The Ambiguities of Greek and German

The interweaving of both positive and negative meanings is particularly marked in Greek and German. Consider the breadth of the term *doxa* [δόξα], which refers to the appearance of what appears, to right opinion (*dokei moi* [δοκεῖ μοι], "it seems to me"), and to general opinion, with its rhetorical meaning (see *endoxon* [ἔνδοξον], "acceptable," under DOXA, II.C; cf. COMMONPLACE and EIDÔLON, Box 1), and finally to the glory of God and its radiance; but in opposition to *alêtheia* [ἀλήθεια] (see TRUTH), it continues to designate at the same time mortals' error and illusion.

Similarly, note the proximity in German of *Schein* and *Scheinen*, of simple appearance and deceptive appearance (*Anschein*), and of the appearing of what shows itself in its full radiance, which "has just appeared" (*zum Vorschein kommt*): *die Sonne scheint* (the sun shines) or *der Mondschein* (moonlight) (see ERSCHEINUNG).

To illustrate this connection, we may cite Gorgias and Hegel:

[ἔλεγε δὲ τὸ μὲν εἶναι ἀφανὲς μὴ τυχὸν τοῦ δοκεῖν, τὸ δὲ δοκεῖν ἀσθενὲς μὴ τυχὸν τοῦ εἶναι]

([H]e said that being was invisible if it did not encounter appearance, and the appearance was without power if it did not encounter being.)

(Gorgias, 82.B.26 DK)

Das Wesen muß erscheinen.

([T]he essence must appear [appearance is not inessential, it is part of the essence itself].)

So erscheint das *Wesen*.

(That is how essence appears,)

(Hegel, *Wissenschaft der Logik*, Bk. II, §2).

IV. Aesthetic Meanings

See *IMAGE* and, in part, EIDÔLON and MIMÊSIS.

➤ AESTHETICS, ESSENCE, *IMAGINATION*, OBJECT, RES, SUBJECT, TABLEAU, *TO BE*

| APPROPRIATION

1. "Appropriation," borrowed from Late Latin *appropriatio*, was used especially in medicine (in the sense of assimilation) and in chemistry (in the sense of catalysis), before being adopted by philosophy as one of the possible translations of the German word *Ereignis* (from the adjective *eigen*, own, characteristic) as it is used by Heidegger; see EREIGNIS; cf. *DESTINY* and *EVENT.*
2. Moreover, it is also the literal translation of a key term in Stoic ethics, *oikeiôsis* [οἰκείωσις], which designates our (extendable) relationship to that with which nature has made us familiar and which is peculiar to us (*oikeios* [οἰκεῖος], domestic); see OIKEIÔSIS; cf. OIKONOMIA, ECONOMY, and *COMMUNITY*, POLIS, POLITICS.
3. More generally, on ways of expressing what is one's "own" and property, see PROPERTY.
4. Finally, on the propriety of terms and discourses in grammar or rhetoric, see COMMONPLACE, COMPARISON, HOMONYM, MIMÊSIS, Box 6, TROPE; cf. *STYLE.*

➤ RES, *TO BE, WISDOM*

ARGUTEZZA (ITALIAN)

FRENCH   *subtilité ingénieuse*
SPANISH   *agudeza*

➤ *WITTICISM*, AND BAROQUE, COMPARISON, CONCETTO, GENIUS, GOÛT, *IMAGE, IMAGINATION,* INGENIUM, MIMÊSIS

In seventeenth-century Italian theory of art, *argutezza* refers to the activity of the imagination and understanding that tends to show the greatest metaphorical ingenuity. From the outset, the word presents significant translation problems because it designates in a language that is itself metaphorical and ingenious, the necessary conditions for the most "subtle" and "witty" modes of signification, and it is practiced in a very broad domain that ranges from sign systems that are discourses to symbolic figures (allegories, emblems, devices, tableaux).

The problem of *argutezza* is inseparable from the so-called baroque aesthetics that developed in Italy. As it appears in Emanuele Tesauro's *Il cannocchiale aristotelico* (The Aristotelian telescope, 1654), *argutezza* refers to the idea of "ingenious

subtlety"; that is, the act par excellence of metaphorical thought, and it implies extremely complex goals that are irreducible to simple "acuity" or "witticism"—although "ingenious subtlety" is accurate enough to render *agudeza* as used by Baltasar Gracián (*Agudeza y arte*), the Spanish remaining closer to the Latin *acutus*.

■ See Box 1.

Like most seventeenth-century theories, Tesauro's draws not only on rhetoric and poetics, but also on Aristotle's whole philosophy, of which it is an application and extension to multiple systems of representation. The network consisting of *argutezza*, *concetto*, and *ingegno* is central in the theory of baroque art: it governs, more or less directly, every conception of metaphor, of the figurability of ideas and inventions, both poetic and graphic. Contrary to the Spanish term *agudeza*, which belongs solely to literary or political discourse, an *argutezza*, in Tesauro's sense, can appear in allegories, verbal enigmas, and devices, in a text and in an architectural work, in an inscription, and in the composition of a picture or the expression of a sculpture.

What is *argutezza* according to Tesauro? "[U]n divin parto dell'ingegno" (a divine part of the mind); the "ultimo sforzo dell'intelletto" (the ultimate effort of the intellect); the "spirito vitale delle morte pagine" (the living spirit of the dead page). Through the power of this divine Pythia, the discourse of ingenious men (*ingegnosi*) differs as much from that of the crowd as the discourse of the angels differs from that of men; these ingenious men have the miraculous power to make mute things to speak, incurable people to revive, and the dead to rise again; this enchantress of souls gives a voice to tombs, to marbles, to statues; and ingenious men who speak ingeniously give them spirit (*spirito*) and movement (*movimento*) (*Il cannocchiale aristotelico*, chap. 1).

In this sense, *argutezza* goes deeper than *concetto*, since it is a faculty of the mind that is between understanding and imagination. One of the essential reasons that the word has no equivalent in other European languages—including Latin, into which the main texts of the period were translated—is that it emphasizes all the metaphorical possibilities of thought by extending it to all the figures peculiar to the visual field, that is, to the plastic arts and to ballet. Thus *argutia* and *argutezza* are in fact the necessary conditions for the production of any symbolic composition and thus transcend the frameworks of traditional *mimêsis*.

Seventeenth-century French theoreticians, such as Le Moyne or Ménestrier, never translate the Italian word: they render or express it by means of periphrasis, as in the forms *représentation ingénieuse*, *invention spirituelle*, *image savante*. The untranslatability of the word is thus patent; but *argutezza*, like *concetto*, had to be "rendered," that is, transposed by circumlocution, as the project of a philosophy of symbolic images was elaborated in France during the last decades of the seventeenth century. Based in the first place on the primacy of the image and the metaphorical nature of thought, this "philosophy" often shows clearly sophistical tendencies in its conception of language and its rehabilitation of myth, of which we still find echoes in Vico.

The failure of translation was compensated for by many theoretical achievements illustrating what is implied by the very concept of *argutezza*. The empty place left by the untranslatability of the word had the effect of renewing, in European texts, the problem of the image, of invention, and of metaphor and imitation, leading to the elaboration of theories far more rigorous than the preceding ones. Thus, starting in the seventeenth century, a whole semantic sequence was contaminated by this new triumph of *concettism*, ranging from the notions of the image, representation, and the sign as such to that of the figure (the Latin *figura* here recovering its full meaning). This tradition persisted in Europe, especially in Germany, down to Herder, despite the hostile rationalist criticism to which it was subjected by the Enlightenment.

This figurability, which was inherent in *concetto* as well as in *argutezza*, that is, in the creativity of the imagination and the understanding, is one reason that both German and English are put to the test by the act of translation. In German, contemporary philologists and historians encounter a difficulty that sometimes increases their "anti-figurative" prejudices. After having proposed *geistreiche Einfälle* (witty ideas) and *witzige Spielereien* (witty play) as translations of *argutezza*, E. Curtius (RT: *La littérature européenne et le Moyen-Âge latin*) adopts the French word *pointe*, which can only produce further ambiguity. To render *argutezza* as *pointe*—instead of the German *Geistreicheleien* (subtleties), for example—in order to preserve the idea of *acutus* and *argutus* is to return to

---

Agudeza and *acutezza/argutezza*

To designate acuity of mind and its ingenious inventions—witticisms, quips, sallies—Spanish has only one word: *agudeza*. Italian has two, which are often difficult to distinguish: *acutezza* and *argutezza*, the former deriving from *acutus*, "sharp," "keen"; the latter from *arguere*, "bring to light," "demonstrate." These two words are almost synonymous for Tesauro and the Italian theoreticians. *Argutezza* also includes discursive metaphors, the *concetti* that can be found in sermons or inscriptions, as well as figurative representations such as emblems, ballets, and allegories. *Acutezza* is a term that is itself metaphorical, designating the metaphorical activity of the mind as a subtle, ingenious, clever faculty of expression. Although we often find *argutezza* used in the same sense, *acutezza* strongly emphasizes the pointed, penetrating, and trenchant quality of this subtlety that is peculiar to the spirit of the *concetto*. We also find in Tesauro the term *acuto*, which in his work refers to the idea of a strong, precise expression, contrary to the Latin *acutus*, which designated a simple style without rhetorical figures. As for *argutia*, which Tesauro sometimes writes *arguzia*, it is often used in the sense of subtlety.

the French translation of the seventeenth century, which is extremely reductive since it denies the fecundity of concettism by reducing it to a pure play of the wit, that is, to a certain conception of the mind that is implicitly classical and rationalist, and thus French. As for the untranslatability of *argutezza*, the deep metaphoricity of the language is, after all, only one difficulty among others. This metaphoricity is a site of confrontation and privileged comparison that arose from the eighteenth century's rationalist desire to eliminate concettism.

Must we finally resign ourselves to including *argutezza* among the untranslatables that are a dominant phenomenon of baroque culture? In reality, we have to resituate the concept not only in the semantic networks of European theories of art but also in comparison to other *topoi*: those of the theology of the image (still active in the seventeenth century) and those of theories of language down to Vico, Hamann, and Jean Paul. This presupposes that we find connections among networks that may at first appear historically and theoretically heterogeneous.

ART

FRENCH	*art*
GERMAN	*Kunst*
GREEK	*technê* [τέχνη]
ITALIAN	*arte*
LATIN	*ars*

➤ AESTHETICS, BEAUTY, BILDUNG, GENIUS, GOÛT, INGENIUM, MIMÊSIS, NATURE, PHANTASIA, TABLEAU

The word "art" has a general sense, that of a way of being or doing ("the art of pleasing"). It becomes more precise when it is associated with the idea of a specialization of know-how implying rules that are peculiar to it ("the art of cooking"); and it is still further specified when it designates a set of human practices, those of artists, "men who have devoted themselves to expression in art" (Baudelaire, *Salon de 1859*). The movement into this lexical funnel was also a historical process, a long sociocultural maturation marked by the influence of the notions of *technê* [τέχνη], *ars*, *art*, and *Kunst*, the transitory influence of the terms "fine arts," *beaux arts*, *schöne Künsten*, and so on, and the return, at the beginning of the nineteenth century, of the term "art" in the singular, the meaning of which had changed in the interim.

I. The Space of *Technê*

A. Know-how

Reflecting on the history of the word "art," Robin Collingwood notes that the "aesthetic sense of the word" is "very recent in origin"; *ars* in Latin and *technê* in Greek, terms that we regularly translate by "art," signify "a craft or specialized form of skill, like carpentry or smithying or surgery" (*Principles of Art*, 5). No distinction is made between the artist and the artisan, or more precisely, the man of art.

■ See Box 1.

The ancient Greeks thus had no term to isolate what we now call "art." *Technê*, like *ars*, covers a much wider field, ranging from know-how in a craft to deception, trickery, and more generally, a way of doing something, a means (RT: *Dictionnaire étymologique de la langue grecque*, s.v.). Nonetheless, the thematics of imitation allows us to approach the "modern" sense of "art"—or at least to project it more or less well in a certain number of contexts. We can delimit the meaning of *technê* by its situation between simple experience or empirical practice (*empeiria* [ἐμπειρία]) on the one hand, and science (*epistêmê* [ἐπιστήμη]) on the other. Plato and Aristotle superimpose a conceptual action on the state of the lexicon. Plato initiates and generalizes the use of adjectives in the feminine (-*ikos*, -*ikê*, -*ikon* indicate relationship) to designate multiple *technai*: in the *Gorgias*, we thus find, alongside weaving or music (*hê huphantikê* [ἡ ὑφαντική], *hê mousikê* [ἡ μουσική], 449d), drawing, arithmetic, reasoning, and geometry (*hê graphikê*, *arithmêtikê*, *logistikê*, *geômetrikê* [ἡ γραφική, ἀριθμητική, λογιστική, γεωμετρική], 450d), and a large number of obvious neologisms: eristic, antilogic, dialectic, sophistic, politics, and rhetoric (*hê eristikê* [ἡ ἐριστική], *hê antilogikê* [ἡ ἀντιλογική], *hê dialektikê* [ἡ διαλεκτική], *hê sophistikê* [ἡ σοφιστική], *hê politikê* [ἡ πολιτική], *hê rhêtorikê* [ἡ ῥητορική]), the last being the one that gives its subtitle to the dialogue, *Peri tês rhêtorikês* [Περὶ τῆς ῥητορικῆς]). It is in this paradoxical dialogue, which deals with the *technê rhetorikê*, the art of speaking, that Plato defines *technê* the most precisely, the better to deny rhetoric the status of *technê*: unlike a simple "routine and a knack" (*empeiria kai tribê* [ἐμπειρία καὶ τριβή], the former meaning literally "rubbing," 463b), art examines the nature and cause (*tên phusin, tên aitian* [τὴν φύσιν, τὴν αἰτίαν]) of that with which it deals, and accounts for them (*logon echei* [λόγον ἔχει], 465a, 501a). Ultimately, rhetoric and cookery are put in the same category, that of the image (*eidôlon* [εἴδωλον]) and flattery (*kolakeia* [κολακεία]), which

Art of the Ancients, art of the Moderns: The rules of art

➤ LOGOS, PRAXIS, *VIRTUE*

Modern descriptions of art constantly mix two great conceptual legacies. The legacy of the Ancients is interested in the process of making any object or work; the aesthetics of the Moderns is interested in the sensations that the object produces for the beholder. The two perspectives do not precisely coincide. The "art" of the Ancients includes every kind of making, and thus what we would call "technique" or "technology." The Moderns' aesthetics include every kind of admirable beauty, and thus the beauty of natural phenomena (the sublimity of volcanoes). When studying the art-technique of the Ancients, we have to abandon as false oppositions antinomies that are legitimate from the point of view of Moderns. Art did not have the beautiful as its exclusive domain, and technique was not limited to the useful. Art was not the realm of mysterious things and "artistic" vagueness, as opposed to technique as the realm of serious things, rigorous procedures, and guaranteed results. Clarifying the vocabulary was as important as relativizing, as a dictatorship or caricature, any scientific view of rationality modeled on industry and, later on, techno-science.

The ancient theory of art does not seem to have aroused great debates or challenges, in any case not before the end of the eighteenth century—that is, before the dawn of the industrial revolutions. For the Ancients, and so long as people thought with Latin, art and technique were one and the same thing: Latin *ars* (from the root **er-*, which provides in particular Gr. *arthron* [ἄρθρον], "articulation," and Lat. *armus*, "upper arm," but which also appears in Lat. *ritus*, "rite," and Gr. *arithmos* [ἀριθμός], "number") equals Greek *technê* [τέχνη] (from the root **teks-*, "construct," "make"). Since art and technique are defined by the production of an object, the question is what guarantees the success of the finished product, and the classic answer is the worker's skill, which is the necessary result of long training: "By the work, one knows the worker."

The fundamental concepts of this theory are those of Aristotle, whose presentation is synthesized in a short chapter of the *Nicomachean Ethics* (6.4.1140a1–24). Technical art is concerned with the production of objects or "works of art," Greek *poiêsis* [ποίησις],

Latin *fabricatio* or *fictio*. Thus in Greek, the artist-craftsman is called a "poet," in classical Latin a *faber* or *fictor*, and in Late Latin *factor* or *operator* (cf. the French expression *facteur d'orgues*). Fabrication is the sole specific character of art. Very generally, art is an "excellence" or "virtue" (*arêtê* [ἀρητή]): "a disposition accompanied by a true (or right) rule." The disposition is rendered as *hexis* [εξις] in Greek, *habitus* in Latin. (See "with a rule": *meta logou* [μετὰ λόγου], Gr. *logos* [λόγος], Lat. *ratio*; "true" or "right": Gr. *alêthês* [ἀληθής] or *orthos* [ὀρθός], Lat. *vera* or *recta*.) Finally, technical art moves in the domain of the contingent, of what might be other than what it is. This character is not peculiar to it. The contingent is also the domain of "prudence" (*phronêsis* [φρόνησις]), which is, so to speak, the production of actions, Greek *praxis* [πρᾶξις]. Technical art and prudence are thus opposed to the intellectual virtues, such as science or *epistêmê* [ἐπιστήμη], which seek to know the necessary (for example, geometry or astronomy). As Thomas Aquinas sums it up, technical art is *recta ratio factibilium*, and prudence is *recta ratio agibilium* (*Summa theologica*, 2a–2ae, q. 47, art. 5). To understand what kind of rationality is referred to here, we have to explain the idea of true *logos* or "right reason," *recta ratio*. The word *recta* refers to the idea of a rule, from *regula*, "regulation," that is, etymologically from *regere*, "to rule" (less "to correct" than "to direct"). The rule of art—as of prudence—is not so much a norm as a fixed reference point in a world of movement. This can be seen in the application of the rules as well as in their discovery.

On the one hand, the rule makes it possible to escape from the contingent. The rule of art must be applied if one wants to obtain a specific result. As defined by the Scholastics, it is a "via certa et determinata." From this point of view, there is no uncertainty in the arts and techniques, neither in the rule nor in the product obtained by applying the rule. This holds for the fabrication in accord with the rules of a knife, a ship, or a house. In these domains, uncertainty and the unpredictable can be reduced almost to zero. The adjective *certus* signifies that the rule has been objectified, expressed, visualized by the intelligence, so to speak, and that we are no longer groping our way by means of an instinctive

practice. The *logos alêthês* [λόγος ἀληθής] of the technician-artist is an increasingly clear and distinct awareness of his means. The clearer the rule, the less difficult it is to transmit it and have it applied by others.

On the other hand, the rules of art have to be discovered. As Aristotle insists at the beginning of the *Metaphysics*, it is by observing particulars that one can arrive at general or even universal rules by induction (A.1). Besides the physician, the canonical example of the technician is the ship's pilot. The sea is more powerful than he is, and it is far from being perfectly predictable. Aristotle lived in a maritime world, where nature made people conscious of how much they were neither its masters nor its possessors. However, far from leading to fatalism, this only made the role of the pilot more important. It is not the sea or the world that is rational, but he. If the rule is a stable reference point in a moving world, it is on the side of the subject, the regulating intelligence. It is the formal element in the operation. The moving world is on the side of the object, of that to which the rule is applied: it is the material element. Aristotle attributes contingency to the object alone, not to the subject—to the result, not to the rule. Modern technical triumphs have caused to be considered "true" only those rules that have been validated by the predictability of the results. But in Aristotle and Aquinas, the absence of guaranteed results does not signify an absence of rules, of rationality. To speak of medicine as an art is now considered a way of emphasizing the irreducible contingency of medicine, which cannot achieve the status of a "true" science. For the Ancients, it was instead a way of emphasizing medicine's ability to find rules, something stable. We look for stability in the material, they sought it in the intelligible. For the production of things in which technique triumphs, the two points of view merge. For techniques that remain, like medicine, an art, the divergence is only a matter of emphasis. But for the fine arts, the divergence is at its maximum. They push to the limit a conception of rationality that seems to us paradoxical, and that dares to assert that the absence of guaranteed results goes hand in hand with the presence of infallible rules.

Francis Goyet

impersonate the corresponding *technê* (464c–d). Thus *technê* is characterized by the presence of the semantic trait "knowledge," to the point that one might often hesitate about which noun to add: *hê politikê* [ἡ πολιτική] (*technê*: *Gorgias*, 464b or *Protagoras*, 319a, *Statesman*, 267d; *epistêmê*: *Statesman*, 303e).

It remained for Aristotle—for whom, contrary to Plato, rhetoric is in fact a *technê*, and even a power of "theorizing" (*theôrêsai* [θεωρῆσαι], *Rhetoric*, 1.2.1355b32) and of reflecting on causes and means by distinguishing the true from the apparent (1.1.1355b10–16)—to make the distinction by the criterion of the field of application: art, like action (see PRAXIS for the difference between *praxis* and *poiêsis* [πρᾶξις/ποίησις]), deals with the contingent, whereas science deals with the necessary (see Box 1). Once the orbit of the meanings of *technê* in its original consistency has been sketched, how should we conceive its relationship with what we moderns call "art"? We need to resort to another defining trait: *mimêsis* [μίμησις].

B. Valorizations and devalorizations

Technê and *phusis* [φύσις], art and nature, are conceived in a relationship of imitation or reciprocal representation that is constantly reversed, both regarding the term imitated (Which is primary, nature or art?) and regarding the value of imitation itself, depending on the system in question (see MIMÊSIS).

Something approaching a modern meaning of "art" can found at the end of Plato's *Sophist*. "Mimesis" is defined as the production of images (*poiêsis tis* [ποίησίς τίς], *eidôlôn mentoi* [εἰδώλων μέντοι], 265b) and not of the things themselves. It can be divine or human. In fact, the divine produces not only things in nature (humans, fire), but also the image that accompanies each thing ("to parakolouthoun eidôlon hekastôi [τὸ παρακολουθοῦν εἴδωλον ἑκάστῳ]," 266c, *phantasmata* [φαντάσματα]—dreams, shadows, reflections; see EIDÔLON, PHANTASIA); and even humans produce not only works (the house produced by the mason's art), but also images ("In building it produces an actual house, and in painting [*graphikêi*] a house of a different sort, as it were a man-made dream for waking eyes," 266c); and these images can be identical copies, reproductions (*to eikastikon* [τὸ εἰκαστικόν], or *hê eikastikê* [ἡ εἰκαστική], the art of making *eikones* [εἰκόνες], 235d, 266d), or relative copies, which include point of view or perspective, trompe l'oeil (*to phantastikon* [τὸ φανταστικόν] or *hê phantastikê* [ἡ φανταστική], the art of making *phantasmata*, 236b–c, 266d). Something like visual art is thus isolated in order to serve as a model for the distinctions to be introduced in the art of speaking, but it is not explored as such. Its main characteristic is ontological: in the *Republic* (book 10), the art of illusory appearance, painting (*graphê* [γραφή]), considered as situated at a distance of three degrees from the truth, proves to be ontologically inferior to carpentry, which takes its models directly from ideas (597a). For each "art," the question is whether a principle other than imitation can save it from the regress that it implies: thus music has a privileged place, given its relation to mathematics—though there is a bad kind of music, which, acting on our senses, softens the mind, and a good kind of music, which is regulated by the principles of mathematical *epistêmê* (3.401d; *Protagoras*, 326a–b).

"Art imitates nature [*hê technê mimeitai tên phusin* (ἡ τέχνη μιμεῖται τὴν φύσιν)]." That means that nature is primary, present first, composed of a plurality of beings that have in themselves the principle of their movement (*technê*

consists of bringing into existence things "whose origin is in the maker and not in the thing made," *Nicomachean Ethics*, 6.4.1140a13–14). But that always also implies that art provides the concepts necessary for thinking about nature. Aristotle elaborates his physical theory of the four causes with reference to making and doing things (*Physics*, 2.2 and 3): for each natural being, we will seek, on the model precisely of a statue, what is its matter (*to ex hou* [τὸ ἐξ οὗ]: bronze, the cause of the statue), its form (*to eidos kai to paradeigma* [τὸ εἶδος καὶ τὸ παράδειγμα]: Athena, who serves as a model for the statue), its efficient cause (the sculptor Polykleitos), and its purpose (to adorn a temple, to bring the city into existence). From this comes the famous complement: "Generally art partly completes what nature cannot bring to a finish [*epitelei ha hê phusis adunatei apergasasthai* (ἐπιτελεῖ ἃ ἡ φύσις ἀδυνατεῖ ἀπεργάσασθαι)], and partly imitates her" (*Physics* 2.8.199a15–16). Art displays both its dependency on the model by imitating it, and a certain superiority in realizing what the model, even though it is prior, was not able to produce.

We understand why in his *Poetics* Aristotle regards positively the pleasure that we derive from what we would call the arts, those that represent (imitate in images, *mimountai . . . apeikazontes* [μιμοῦνταί . . . ἀπεικάζοντες], 1.1447a19) with colors and figures, or that use rhythm, melody, or language, in prose or in verse—music, painting, or poetry. Pleasure (*to chairein* [τὸ χαίρειν], see PLEASURE) is of two kinds. First there is an intellectual pleasure: on looking at an image, we learn to know something, to recognize it for what it is ("The reason of the delight in seeing the picture is that one is at the same time learning—gathering the meaning of things" ["theôrountas manthanein kai sullogizesthai ti hekaston (θεωροῦντας μανθάνειν καὶ συλλογίζεσθαι τί ἕκαστον)"], *Poetics*, 4.1448b15–17). But there is also what we would call an aesthetic pleasure: "It will be due to the execution or coloring or some such other cause" (4.6).

The field of *technê* can thus include all values from divine demiurgy (*artifex mundi*, the Romans called it) to human power or faculty, which is rational and useful, but obviously susceptible to Promethean excess and trickery. If we try to isolate in it the premises of what we now call art, value judgments are ontologically, as well as politically and socially, amplified:

> The Greeks . . . could say in one and the same breath: "He who has not seen the Zeus of Phidias at Olympia has lived in vain" *and* "People like Phidias, namely sculptors, are unfit for citizenship."
>
> (Arendt, *Between Past and Future*, 216–17)

II. *Ars, Kunst*: The Practical and the Intellectual

The Latin notion of *ars*, and the notion of art (and its European equivalents) up to the seventeenth century, is qualified by the adjunction of antonymic adjectives (liberal/mechanical, noble/servile). *Ars* is largely a matter of "making," but it also covers more intellectual attitudes. Similarly, the German notion of *Kunst* wavers between ability (*können*) and knowing (*kennen*).

Rome never admitted the visual arts into the cycle of the liberal arts, the *artes liberales*, or, in other words, into the body of theoretical knowledge which a freeman was expected to master. The liberal arts remained the corner-stone of Christian education and this implied the exclusion of the visual arts from the higher sphere throughout the Middle Ages.

(Wittkower and Wittkower, *Born under Saturn*, 7–8)

These remarks direct our analysis of the meaning of the terms *ars*, *arte*, *art*, and *Kunst* in two directions: on the one hand, the status of the artist and that of his activity, and on the other, the criterion for his social legitimation. The vocabulary the authors of Latin antiquity used to classify diverse human practices is significant in this regard. They distinguished the *artes liberales* (Pliny, Seneca), *honestae* (Cicero), and *ingenuae* (Quintilian) from the *artes illiberales* or *sordidae* (Cicero). The *artes liberales* are intellectual activities such as grammar and rhetoric, the *studia liberalia* Seneca talks about in his letter 88, which have no goal other than the cultivation of the mind, and are alone worthy of a free man. (In his *Etymologies*, Isidore of Seville derived the word *liberatis* from *liber*.) The *artes illiberales* are manual activities, the *artes mechanicae* are reserved for slaves or are remunerated by wages; they include painting and sculpture, but not music, which is considered a mathematical discipline. In the Middle Ages, the number of the liberal arts was set at seven: grammar, rhetoric, dialectic, arithmetic, geometry, music, and astronomy. The first four constituted the so-called *quadrivium*, the last three the *trivium*. Starting in the Renaissance, painters and sculptors no longer wanted to be confused with artisans. The battle they fought ensured that their activity would no longer be regarded as a mercenary craft, but would gain the dignity that was the privilege of the liberal arts. Far from challenging the distinction between mechanical arts and liberal arts, the battle testifies to the permanence of that division, which persisted at least until the eighteenth century. A definition like that given by Jacques Bénigne Bossuet shows the continuing influence of Greek and Latin notions: "The liberal and mechanical arts are distinguished by the fact that the former work with the mind rather than with the hand; and the others, whose success depends on routine rather than on science, work more with the hand than with the mind" (*Connaissance de Dieu*, 1.15).

In the Latin vocabulary, *ars*, in addition to having the very general meaning of a way of being or behaving, was applied in three domains: that involving the object of a "making," of a manual trade; that which requires know-how; and that which has to do with the application of rules: carpentry, rhetoric, and grammar are thus subsumed under a single category. It is therefore the most specific rules, notably of painting, that make it possible to distinguish the arts in the modern sense. The beginning of *De inventione* (1.1–4), where Cicero takes up, with an intention different from Plato's, the parallel between discourse and painting, offers a significant example of this. Commenting on the commission the inhabitants of Croton gave to Zeuxis for a portrait of Helen, Cicero mentions the "very large number of pictures [*tabulas*]" painted by the artist, and speaks of "embellishing the temple of Juno with unmatched pictures [*picturis*]" and masterpieces

(*magna opera*), but he does not use the word *ars*. On the other hand, the word appears in the second part of the analogy, when the process of induction that rises from several real women to the ideal model of the woman is applied to rhetoric, called *ars dicendi*.

As Erwin Panofsky showed in *Idea* (1924), the development of the modern notion of art and artists passed by way of a conjunction of the inductive model of *De inventione* and the deductive model of *Brutus*, in which, this time, Cicero seeks the model for the *ars dicendi* in the example of Phidias sculpting the image of Zeus on the basis of the idea that he forms of him in his mind. Here, *ars* qualifies the activity of the artist turned toward his internal eye (see SPECIES):

contemplabatur aliquem, e quo similitudinem duceret, sed ipsius in mente insidebat species pulchritudinis eximia quaedam, quam intuens in eaque defixus, ad illius similitudinem artem et manum dirigebat.

It was in his own mind that resided a separate vision of beauty that he contemplated and on which he fixed his gaze, guiding his art and his hand by resemblance with this vision.

(Cicero, *Brutus,* 2.7–8)

A crucial aspect of the development of the notion of art thus resides in the appearance in the Renaissance of "a new type of artist . . . essentially different from the artisan of old, in that he was conscious of his intellectual and creative powers" (Wittkower and Wittkower, *Born under Saturn*, 31). The signs of art, which appear in large numbers at that time, no longer have the sporadic character seen in antiquity; they are given concrete form, notably by the inclusion of artists in humanistic culture. The centrifugal force of the process of becoming autonomous is inseparable from the centripetal force that subjects the artist to an intellectual and political dependency. Thus Albrecht Dürer owed his career to the Elector of Saxony, Frederick III, called the Wise, who, through the mediation of the poet and humanist Conrad Celtis, brought him into the Round Table of the learned men of Nuremberg.

The reference to Dürer is particular instructive here. The shift in the meaning of *Kunst* on the basis of its original double meaning allows us to understand how the artisan was transformed into the artist. As Panofsky notes:

Like *ars* in Latin and "art" in English, the German word *Kunst* had originally two different meanings, the second of which is now all but extinct. On the one hand, it denoted "ability" [*können*], that is, man's ability purposely to produce things or effects. . . . On the other hand, it denoted "knowledge" [*kennen*], that is, theoretical knowledge or insight as opposed to practice. . . . In the second, or narrower, sense—which still survives in the expression *Die freien Künste* or "The Liberal Arts"—astronomy could be called *Künst der Sterne* ("art of the stars"); . . . and when Dürer wished to express the idea that a good painter needed both theoretical insight and practical skill he could do it . . . by saying that he had to combine *Kunst* and *Brauch*.

(Panofsky, *The Life and Art of Albrecht Dürer*)

This distinction between *Kunst* and *Brauch* (custom, practical sense) allows us to connect *Kunst* with human activities that more or less imply theoretical foundations. But in other texts, Dürer turns the meaning of *Kunst* in another direction, like a scale that he tips to suit his interest. Thus when he speaks of the rules of art in his *Underweysung der Messung mit dem Zirckel und Richtscheyt* (Four Books on Measurement), it is in the most instrumental sense, as the standard measure of magnitudes.

III. The Arts, the Beaux Arts, and Art in the Modern Sense

In a context in which the opposition, which is Latin in origin, between the liberal arts and the mechanical arts continues to be dominant, the notion of the "fine arts" was used to carry out a transformation of and around the notion of art until the latter was identified with art as such.

Extrinsic legitimation, especially intellectual legitimation through science or philosophy, is a stage in the artist's slow conquest of autonomy. But although this process continued in the seventeenth century, it did so in conjunction with a gradual separation from certain arts whose goals were cognitive. The intellectual criterion made it possible to elevate art, in the hierarchy that governed legitimation, to the dignity of a liberal art: "To judge beauty is to judge order, proportion, and rightness, things that only the mind can perceive," wrote Bossuet in *Connaissance de Dieu et de soi-même* (1670); but this criterion of beauty also made it possible to put into a distinct class some of the arts that benefited from this ennobling. It is important always to keep in mind this twofold movement through which the accession to liberal status was accompanied by a concentration on the specificity of art. More or less concomitantly, the notions of fine arts, beaux arts, *schöne Künste*, and *belle arti*, which had appeared when art began to be institutionalized in the seventeenth century (in the French Académie des Beaux-Arts, for instance), show the convergence of the European vocabulary toward a common concept.

We must also note, however, an inverse process that appeared later on, in RT: *Encyclopédie ou Dictionnaire raisonné des sciences, des arts et des métiers*: the recognition that even the mechanical arts involve mental activity. The latter reflected or led to a rehabilitation of manual trades in the framework of the encyclopedic treatment of human practices sanctioned by the *Encyclopédie* article "Art." In this article, Diderot denounces the incoherence of a definition that assimilates liberal art to a purely mental activity, ignoring the fact that it is an art, that is, an activity that involves making or doing. Precisely to the extent that art assumes the execution of an object, it is distinguished from the pure mental activity expressed in science. Inversely, Diderot rejects the traditional, equally erroneous conception of mechanical art that denies this form of activity any connection with intelligence. In art, execution is based on rules: one can adopt either a practical attitude that consists in operating in accord with the rules without reflecting on them, or a theoretical, "inoperative" attitude that consists in reflecting on the rules. "Every art has its speculation and its practice," Diderot writes (RT: *Encyclopédie ou Dictionnaire*, s.v.), thus restoring to the word "art" a sense rather close to that of the Latin *ars*.

With Immanuel Kant, the philosophical determination of the specificity of art turns in a quite different direction. Taste, he writes in the *Critique of Judgment*, "is merely a judging and not a productive faculty, and what is appropriate to it is therefore not a work of beautiful art [*der schönen Künsten*]. It can only be a product belonging to useful and mechanical art [*nützlichen und mechanischen Kunst*] or even to science [*Wissenschaft*], produced according to definite rules that can be learned and must be exactly followed" (§48). Although a poem, a piece of music, a picture gallery, and so on, belong to the class of the beaux arts, a table service or a sermon is excluded from it. However, this criterion of classification is not sufficient: there is in addition or opposition a notion involving *what art does in the work*, which depends on an entirely different principle. Works allegedly assigned to the beaux arts, Kant says in §49, cannot lack "spirit" (*Geist*), the principle that "animates the soul" ("das belebende Prinzip im Gemüte"): "A poem may be very neat and elegant, but without spirit." The same holds for a narrative, a "festal discourse," or a conversation. In other words, a work of art may lack art, whereas a production that is not a work of art may correspond to the principle of art.

In addition to this chiasmus, there is also the chiasmus of taste and genius: there can be *genius without taste* as well as *taste without genius*. The aesthetic definition of art is thus superimposed upon its artistic determination. The spirit that makes art "is that which purposively sets the mental powers into motion, i.e., into a play that is self-maintaining and even strengthens the powers to that end." It is the free play of the faculties, of the understanding and the imagination, that defines pure aesthetic judgment. The principle that animates art, Kant adds, is "that representation of the imagination that occasions much thinking though without it being possible for any determinate thought, i.e., concept, to be adequate to it, which, consequently, no language fully attains or can make intelligible" (Kant, *Critique of the Power of Judgment*, trans. Guyer and Matthews). The concept dedicates the work to an external or internal goal and manifests the mechanical rules of the art. A work of fine art, instead of being reducible to the concept of a rule, must appear as nature, as the product of genius, that is, "the natural talent [*ingenium*] that gives the rule to art [die angeborene Gemütsanlage (ingenium), durch welche die Natur der Kunst die Regel gibt]" (§46).

- See Box 2.

At the beginning of the nineteenth century, the meanings associated with the beaux arts gradually passed into the words "art" (French and English), *Kunst*, *arte*, and so on. G.W.F. Hegel put his philosophical signature on this transfer with his famous *Lectures on Aesthetics* (1820–29), which were poorly named, since in fact they concern, as he himself said, not aesthetics, but a philosophy of art (*Philosophie der Kunst*). The discipline that he founded confirms the Kantian rejection of the reduction of art to know-how, but deviates from the theory of taste and separates art from nature. This modern sense of the word "art" and its equivalents in various European languages was then added to an old sense (which persisted, obviously), but also soon rose up to oppose it. Artistic interest could no longer be reduced to a vocational

activity, but rather required an individual's total commitment. This figure of the artist inherited from the Renaissance proliferated with Romanticism and the doctrine of art for art's sake:

> *Art*, for these gentlemen, is everything—poetry, painting, etc.; they are in love with *art*, and scorn anyone who does not work for *art*, spend their lives talking about *art*, speaking *art*.

(*Revue de Paris*, January 1833)

Plastic, the plastic arts, *bildende Künste*

➤ PLASTICITY, and BILD, *FICTION,* HISTORY, TRUTH

Plasticity has long characterized the arts of modeling. The Greek *plassein* [πλάσσειν], "shape, fashion, form," is built on a root that means "spread a thin layer, coat" (whence "plaster"; cf. RT: *Dictionnaire étymologique de la langue grecque*, s.v.). It provides the specific vocabulary for working with clay and modeling, and serves in particular to describe the activity of Prometheus, "of whom it is said that he fashioned us, along with other living beings" (Philemon, 89.1), and also that of Hephaistos shaping Pandora, the very paradigm of deception and trickery, a beautiful virgin molded out of earth dampened with water and unleashed among men to open the jar containing all evils (Hesiod, *Works and Days,* 70ff.). From this comes its use relating to literary creation, to fiction assumed to be capable of deceiving—the plasticity of words: in his *Encomium of Helen* (82.B11 DK, §11), Gorgias mentions all those who "have persuaded and persuade . . . by fashioning a false discourse [*pseudê logon plasantes* (ψευδῆ λόγον πλάσαντες)]." Thus in the vocabulary of the historians, *plasma* [πλάσμα] comes to designate fiction, that is, "things that have not happened, but that are narrated like those that have," the false

recounted as true, in contrast to *muthos* [μῦθος] and *historia* [ἱστορία], myth (the false recounted as false) and history (the true recounted as true); cf. Sextus Empiricus, *Against the Mathematicians,* 263–64. And in the Latin rhetorical terminology, *plasma* becomes *argumentum*, whereas *plassein* is rendered by *fingere* (Quintilian, *Institutio oratoria,* 1.8.18–21). On all of this, see Cassin, *L'effet sophistique*, 470–512.

But until the eighteenth century, the material-formal sense was dominant as the criterion for distinguishing a kind of art, as is shown by the article in the *Encyclopédie* (RT: *Encyclopédie ou Dictionnaire*), alongside which appears, without apparent connection, another article with the curious title "*PLASTIQUE (Métaphysique) nature plastique*, a principle that some philosophers claim serves to form organized bodies, & which is different from the life of animals." However, at the very beginning of the century, Lord Shaftesbury had already established the link. For him, the expression "plastic nature," a concept that emerged from the theosophy of the Cambridge Platonists of the second half of the seventeenth century, designated both the unconscious vegetative state of

the growth of beings (a tree or a fetus) and a human power that was free, internal, and conscious, and reflected the principle of nature while transcending determinism. In his *Advice to an Author* (1710; RT: *Characteristicks of Men*, 1:207), Shaftesbury compares the poet and his ability to shape a unitary, organic work to Prometheus, "that sovereign artist, or Universal Plastic Nature." In his *Plastics or the Original Progress and Power of Designatory Art*, an unfinished work that was published in part, and on which he worked in 1712–13, the idea is applied to the plastic arts explicitly designated as such: the painter, who works *materia plastica*, "begins by working first *within*. Here the imagery! Here the plastic work! First he makes forms, fashions, corrects, amplifies, contracts, unites, modifies, assimilates, adapts, conforms, polishes, refines, etc., forms his *ideas*: then his hand: his strokes" (in Shaftesbury, *Second Characters*, 142).

Thus it happens that the term "plastic arts" makes a fleeting and remarkable appearance. Shaftesbury's intuition was developed much later in France, notably by Lamennais (*Esquisse d'une philosophie* [1840]) and Taine

(*continued*)

(*continued*)

(*Philosophie de l'art* [1864–69]). The expression became part of the French critical and philosophical vocabulary far more than of the English vocabulary, where the notion of plastic art is generally rare (except, at the beginning of the twentieth century, in the context of the discovery of modern French art and African art).

In the Germanic domain, on the other hand, the idea, if not the word, began to establish itself at the end of the eighteenth century: not around "plastic," but rather around *Bild*. The plastic arts are the *bildenden Künste*, about which Thomas Munro observes that "its abstract connotation is broad and vague, coming from a noun [*Bild*] meaning 'image' and a verb [*bilden*] meaning 'to form.' Hence it suggests the forming of visual representations" (*Arts and Their Interrelations* [1949], 401); the term, given its application to architecture (a nonrepresentational art) and to painting (a non-three-dimensional art), to the exclusion of mobile arts, is supposed to cover the "arts of static visual form" (ibid.). In the *Critique of Judgment* (1790), Kant distinguishes the *bildenden Künste*, "those by which expression is found for ideas in *sensible intuition*" (§51), which include the plastic (*die Plastik,* sculpture and architecture) and painting, from *redenden Künste*, the verbal arts, which include eloquence and poetry, and from the *Kunst des schönen Spiels der Empfindung*, that is, the art of the beautiful play of sensations, music and the art of colors (*Farbenkunst*). The occurrence of *Plastik* in this classification signals that the original Greek term is being specialized, considerably enriching the German aesthetic vocabulary. "The Greek genius is the plastic artist [*plastischer Künstler*] who makes stone into a work

of art [*zum Kunstwerk bildet*]," writes Hegel in his *Lectures on the Philosophy of History* (1837).

The richness of the German vocabulary introduces numerous paths for aesthetic thought to follow (Herder, Schelling, Hegel, Nietzsche, Fiedler) that are more or less closed to other languages. The example of Herder is particularly interesting: in *Plastik, Einige Wahrnehmungen über Form und Gestalt aus Pygmalions bildendem Traum*, a text published in 1778, his thought is organized around three poles: the generic notion of *bildenden Künste* and the specific notions of *Skulptur* (versus *Malerei*) and *Plastik* (versus *Piktur*). In addition to a new *paragone* of the arts, what is at work here is a promotion of the plastic and of its (tactile) values as a criterion of beauty ("What is beauty?—Ask the blind man!" we read in the epigraph to *Plastik*). For asserting the superiority of the hand over the eye, by the yardstick of the blind man (Rousseau, Diderot, et al.), the vocabulary formed around *Bild* is welcome: "A blind sculptor [*Bildner*], even who was born blind, would be a wretched painter, but in sculpture [*bilden*] he is not at any disadvantage and would probably even surpass a sighted peer," or again: "Sculpture [*Bildnerei*] is truth, whereas painting is a dream" (Herder, *Sculpture*, trans. Gaiger, 64, 45). *Plastik* thus goes beyond the classificatory meaning of *Skulptur*: as posterity was to show (notably Fiedler, Riegl, Einstein), it is the more general modern notion of plasticity (a criterion for assessing painting itself) that is beginning to be explored here.

ASPECT

Aspect, between *Parole, Langues,* and *Langage*

➤ *TIME,* and ESTI, JETZTZEIT, LANGUAGE, MOMENT, PRESENT, SPEECH ACT, *TO BE*

The term "aspect" designates a semantic category of languages, like number, mood, or voice. Traditionally, it is described as referring to the "mode of development" of the process to which the verb refers; more broadly, it concerns the form that this process can take, whether or not the latter is part of some development. This notion is in itself a philosophical object. It appears as such in the history of philosophy, particularly in Greek philosophy, at a time when the concepts that were to serve as the foundation for the linguistic tradition were being worked out. Although the term "aspect," which was introduced later on by analysts of language, is not part of the philosophical vocabulary, a number of other words that are more or less closely associated with it (ranging from the Greek *telos* [τέλος] to the English "performative") were at first philosophical terms. The whole history of thought about aspect, which has been marked by translation issues, as we will see, shows that the words in question are untranslatable.

However, if "aspect" is connected with the untranslatable, it is in a different way. On the material level, the category corresponds to a network of formal differences that is rather heterogeneous but in which we can nonetheless isolate a kind of "hard core" constituted by forms involved in conjugation (at least in languages in which verbs are conjugated, as in Indo-European languages). Between two marks of conjugation taken from two different languages, there will never be a strict equivalence, precisely insofar as each of them is situated in a different system of conjugation that necessarily determines the value it can have. Moreover, these values run through the whole language:

it is not a question of an isolated form but of a whole system that structures the construction of the reference of verbs in that language. As such, they constitute one of the dimensions in which the so-called genius of a language is determined.

However, aspectual events are also outside language. They are aspects insofar as they represent values that can be measured first of all in sentences and discourses, that is, where what Saussure called *parole* is involved, depending as much on the individual thought that the "speaker" elaborates as on the language that conditions this elaboration. On the other hand, they are aspects insofar as they concern a question that involves language generally: the question of the reference of verbs, which is not peculiar to any single language.

Caught both between *langue* and *parole* and between *langues* and *langage*, aspect thus touches in the most acute way on the question of the untranslatable.

Everything about aspect is complicated, heterogeneous, and tumultuous: the types of values concerned, the types of forms involved, and the types of concepts elaborated to account for them. This has in part to do with the very notion of aspect, which is to a large extent problematic, and in part with the history of its conceptualization, which is itself singularly tumultuous.

I. Little Parade of Values

When we speak of aspect, it may initially be a question of the different phases to which reference can be made within a given process: thus we distinguish a phase before this process, when it is merely imminent, its advent proper, its development, its completion, and also the situation that results from it. Languages generally have specific expressions to refer to each of these phases (in French, there are various verbal expressions such as *commencer à, finir de,* etc.). But similar values can be obtained without the mediation of a specific lexical expression. Here are a few examples in French:

— Il sortait quand le téléphone a sonné (He was going to go out).
— À ce moment-là, il neigea (It began to snow).
— Quand elle est entrée, il dormait (He was sleeping).
— Voilà! Il a réparé la voiture (He finished repairing the car; he did all the work, so it should run).
— Désolé, il est sorti (Sorry, he has gone out).

In addition, alongside these "partial" registrations, in which the process is presented at some phase of its development, there is also the possibility of so-called overall registration, in which the process is presented as having happened, without that happening involving a development: that is how, for instance, the following two utterances in French are opposed to each other, the first presenting the overall process, while the latter describes it as it is happening:

— Il répara sa voiture (He repaired his car).
— Il réparait sa voiture (He was repairing his car).

And there is also the matter of the more or less iterative character of the process designated: here we distinguish among isolated processes, intrinsically repetitive processes, reiterated processes, and habitual, recurrent processes.

Finally, alongside the question of phases, differences in "point of view" relative to the way in which the process is envisaged also come into play: certain utterances can stage a kind of reference point from which the process is described, and that may be distinct from the moment of utterance. This point of view can be simultaneous with the unfolding of the process, but it can also be external to it, whether prospective or retrospective. The fact that the point of view can be distinct from the point of registration is demonstrated by the following contrast, in which the same process, registered comprehensively in both cases, is envisaged either retrospectively (from the moment of utterance) or from a point of view presented as simultaneous with its completion:

— Il est entré (He has entered).
— Il entra (He entered).

This variety of phenomena can be explained in part by the empirical diversity of the values that can in fact be marked in languages by procedures that are said to be of an aspectual order. It can also be explained by the complex way in which the concept of aspect itself developed in the history of thought and the history of linguistics.

II. Exchanges among Languages

The concept of aspect developed in an exchange between languages in which it was constantly imported and then re-imported from one language into another, from Greek to Latin, from Romance languages to Germanic languages, from Slavic languages to classical languages, and just as much in the opposite direction, from classical languages to Slavic languages. What is revelatory of this mutual exchange is the history of the word "aspect" itself, which appeared quite late, since it was invented only in the nineteenth century. The word was created in the encounter between East and West, though we do not know whether it was a matter of describing a specific trait of Slavic languages (which were characterized more by aspect than classical languages, or at least more than Romance languages), or of neutralizing what might have been their specificity (by imposing on them a concept of aspect based on classical languages).

■ See Box 1.

For general linguistics, the result is a term used against type: when one thinks about it, the word "aspect" is one of the vaguest for designating what one wants to designate (the mode of development cited by tradition). Naturally, this made the term available for all kinds of reinterpretations: without meaning, it functions as a simple label, ready to cover anything that one might balk at treating under other categories.

This explains why the category of aspect was also able to function as a kind of catchall for the category from which it issued, at least in the Western tradition, namely, the neighboring category of tense.

III. Tense and Aspect

The boundaries between tense and aspect have been debated ever since grammarians began to reflect on aspect.

■ See Box 2.

1

Species, the appearance of words, the appearance of actions, and point of view: The invention of the word "aspect" to designate aspect

The word "aspect" designating a non-chronological verbal category is generally considered a translation of the Russian term *vid* [вид] by C.-P. Reiff (*Grammaire russe*), who introduced the work of N. I. Greč (1787–1867) into France. This attribution obscures earlier attestations of the term outside the Slavic domain: M. de Neuville (1818, cited by Auroux, "Le temps verbal dans la grammaire générale") distinguishes, in addition to the person, number, and tense of a verb, "the aspect, degree, and acceptance"; here, "aspect" designates the duration of the "modification" expressed by the verb, collected in a point or developed to its full extent. The attribution to Reiff also obscures the fact that the translation in question is highly problematic, insofar as the word *vid* itself can be interpreted as "species, division" (in a classification) or as "aspect" (external: what can be seen; cf. the verb *videt'* [видеть], "see")—and insofar as this word already had a grammatical use in traditions before Greč, traditions that used essentially the first meaning (the second is attested chiefly in certain seventeenth-century Czech grammarians). Finally, this attribution obscures the fact that Reiff himself hesitated between these two values in his translation, initially opting for *branche*, which is related to a division. He probably substituted "aspect" for it in the 1828 edition. But the last editions written during his lifetime adopt the term *branche*, and it was the editions reworked by L. Léger (1843–1923) that definitively established the term "aspect," particularly the 1877 edition, which was long considered authoritative, and which served as a basic textbook at the École des langues orientales in Paris.

To be convinced that this translation proceeds from a deviation, if not a betrayal, we need only read Greč's own text, which is given here in a "re-translation" made by J. Fontaine, in which the author has chosen not to translate *vid*:

in grammatical tenses, that is, in the forms of the language through which times are expressed [in nature], can be expressed a few accessory circumstances through which the meaning and scope of the action are defined more precisely. . . .
Forms serving to express these circumstances of the action are called *vidy* [виды].

The very way in which the notion of *vid* is used in Russian grammatical discourse (and no longer in the discourse of French Slavic studies) goes in the same direction: "perfective verb" is *glagol soveršennogo vida* [глагол совершенного вида], literally, "verb *vid* completed," just as "masculine substantive" is *suščestvitel'noe mužskogo roda* [существительное мужского рода], literally, "substantive of the masculine gender." *A contrario*, "substantive in the plural" is *suščestvitel'noe VO množestvennom čisle* [существительное ВО множественном числе], literally, "substantive with/in plural number." In the exercises in textbooks written in Russian we hardly find the equivalent of the French "mettre ce verbe au perfectif" (put this verb in the perfective), and Russian students taking courses in Russian language in France generally do not understand this instruction. In fact, for speakers of Russian, the *glagoly (ne)soveršennogo vida* [глаголы (не)совершенного вида] are nothing more than "verbs of an (in)complete kind," a subset of verbs constituting distinct words and not forms of one and the same word (and if they refused to "conjugate in the present" a "verb of the complete kind," that is because schoolbook grammar associates these forms with the expression of a direction, the "future"). In other words, this translation has only maintained a persistent misunderstanding between the two grammatical traditions.

We see the paradox: the word "aspect," which is supposed to register the specificity of Russian grammar relative to the organization of verbal forms, and which is supposed to draw a lesson from Russian to challenge categories that issued from the classical tradition, is in fact a betrayal of the way in which Russian grammars conceive Russian grammar.

However, another difficulty slips into this operation of translation/betrayal that makes it entirely paradoxical. When the word "aspect" comes to be used to name the division Greč talks about, and also, in a parallel manner (already in Neuville, and to a large extent in the aspectual literature that followed), all the semantic differences, in whatever language, relating to what Greč describes as "the meaning and scope of the action," to what Neuville defines as concerning "the duration of the modification," to what came to be called "the mode of development," and to what has been constantly analyzed since the first descriptions in terms of achievement, perfection, and *telos* [τέλος], it introduces ipso facto a new dimension into the apprehension of the differences in question: the dimension of "seeing," strongly presented in *vid* (formally connected with the verb *videt'*, "see"), and also in *aspect* (derived from *aspicere*, "look at"). Thenceforth, aspect was understood as being a matter of point of view: the notion has been contaminated by the words that name it.

That contamination was doubtless fertile for the general understanding of aspectual events in Russian and other languages, making it possible, for example, to introduce a distinction between the form of a process and the way in which the latter is perceived, or between the way in which it is manifested and the way one chooses to see it: a given aspect and a constructed aspect, which may or may not coincide. We can understand, for example, how the opposition between lexical aspect (which is given) and grammatical aspect (which can be used for enunciatively reconstructing the process) was able to develop within such a problematics. However, it is likely that the conceptual imbroglio was much less fertile for the conception that French Slavic studies developed regarding the way aspectual events play out in Russian. The opposition between several categories of verbs governed by regular properties, discovered by Slavic students of Slavic languages, was made into a matter of marking (since the plural is a matter of marking), whereas it is a matter of categories of verbs. This marking was made the exclusive expression of everything relating to the aspectual event, as if in Russian aspect had a simple, univocal expression, whereas in other languages it is mingled with tense and is constructed over a whole sentence, a whole text. This reduced aspect in Russian to a categorization of verbs, and thus to the opposition that the same non-Slavic students of Slavic called, apparently under the influence of the Neogrammarians, by a Latin name: perfective/imperfective.

This may explain the recent introduction of a new term to designate in Russian all the events relating to the category of aspect. By a precise reversal, this term is a kind of borrowing from the word that translated *vid*: *aspektual'nost'* [аспектуальность] (aspectuality), introduced by A. Bondarko ("Contribution to the problematic of semantic-functional categories") and covering phenomena manifesting themselves in various ways in utterances and texts.

The emergence of temporal and aspectual categories in the Greek grammatical tradition: How the Greek grammarian understood aspect without knowing how, or wanting, to isolate it from tense

Adopting a classification and a vocabulary that he owes to Plato, Aristotle (*Poetics*, 20.1457a10–18; *De interpretatione*, 2–3,16a 19f., 16b 6f.) opposes the "verb" *rhêma* [ῥῆμα] to the "noun" *onoma* [ὄνομα] by a distinctive trait, the ability to "signify time as well" (*rhêma . . . esti to prosêmainon chronon* [ῥῆμα . . . ἐστι τὸ προσημαῖνον χρόνον]) (*De interpretatione*, 2–3.16b6). As an example, he opposes *badizei* [βαδίζει], "he walks," which "also signifies present time (*ton paronta chronon* [τὸν παρόντα χρόνον])," to *bebadiken* [βεβάδικεν], "he walked," which also signifies "the past" (*ton pareluthota* [τὸν παρεληλυθότα]) (*Poetics*, 1457a17). Of these initial definitions, grammarians adopted only the idea that the inflectional paradigms of the Greek verb are "times," *chronoi* [χρόνοι], which they named using nominalized adjectives in the masculine (the implied term *chronos* is masculine), several of which designated, in common usage, divisions of time: for instance, *enestôs* [ἐνεστώς], "present," and *mellôn* [μέλλων], "future." If no paradigm is called "past," that is because for referring to the past Greek had several paradigms, each of which was to receive its own label, but none of which could claim for itself alone the name of "past." Here we touch upon a crucial point: what difference could there have been between the different "times" of the past? It seems that the Stoics raised this problem, and more generally recognized that the different "times" of the verb had *complex meanings*, in which chronology with respect to the present was not the only factor. A scholia on Dionysius Thrax's *Tekhnê* tells us that for the four "times" that the grammarians (and following them, we ourselves) called respectively present (*enestôs* [ἐνεστώς]), imperfect (*paratatikos* [παρατατικός]), perfect (*parakeimenos* [παρακείμενος]; literally, "adjacent"), and pluperfect (*hupersuntelikos* [ὑπερσυντελικός]),

the Stoics used the following "double" designations: present extensive (*enestôs paratatikos* [ἐνεστὼς παρατατικός]), past extensive (*parôichêmenos paratatikos* [παρῳχημένος παρατατικός]), present perfective (*enestôs suntelikos* [ἐνεστὼς συντελικός]), and past perfective (*parôichêmenos suntelikos* [παρῳχημένος συντελικός]). Whatever one thinks of the Stoic theory of time that is in the background of these designations (and the question remains very controversial), it is hard not to admit that the second term of each double designation resembles an *aspectual* designation. In other words, whereas Aristotle saw *badizei* and *bebadiken* as illustrating an opposition between the present and the past, the Stoics saw in it an opposition between presents, between extension and achievement—something like "he is now walking" vs. "he has now finished his walk."

Among the Alexandrian grammarians, as we have seen, "times" were given simple designations which, in two cases out of four, can result from a simplification of the Stoic designations: *present extensive→present*, *past extensive→extensive*; whereas in the other two cases, a different term is used: *adjacent* (the Stoic *present perfective*) and *pluperfect* (the Stoic *past perfective*). Thus any suggestion (of the indicative) concerned might involve a complex temporal-aspectual idea disappeared from the terminology. Does that mean that the grammarians had lost all sensitivity to aspectuality? Not really, but it does seem that they resisted giving it an autonomous status that was dissociated from temporality. This resistance is manifested in a particularly clear way in two passages in Apollonius (*Syntax*, 3, §100 and 102). Examining the difference introduced in utterances in the optative of wish (§100) and the imperative (§102) by the variation of the verbal theme—the "present" theme vs. the "aorist"

theme—Apollonius notes that the present theme implies the idea of extension (*paratasis* [πάρατασις]), and the aorist theme the idea of achievement (*sunteleia* [συντέλεια]), for example, *graphe* [γράφε] (present), "continues to write," vs. *grapson* [γράψον], "finishes writing"; but, commenting on the wish formula he attributes to Agamemnon (*eitheporthêsaimi* (aor.) *tên Ilion* [εἴθεπορθήσαιμι (aor.) τὴν Ἴλιον]) ([I wish] I could complete the siege of Troy), he glosses it by saying that the wish here is literally aimed at "the *past* and the finished in time (*to parôichêmenon kai sunteles tou chronou* [τὸ παρῳχημένον καὶ συντελὲς τοῦ χρόνου])," as if the aspectual notion of the perfective could not, in his view, be isolated from the temporal notion of the past.

This example shows how the Greek grammarian both "understands" perfectly the expression of aspectuality in his language, and nonetheless presents a "deficient description" of it because he is unable to isolate aspectuality and temporality conceptually. We can also understand why the grammarians abandoned the double designations that reflected the Stoic point of view in which the expression of tense and the expression of aspect were combined, in favor of a more poorly motivated simple designation, the four "times" of the indicative mentioned above. As for the values that they associated with these "times" in their descriptions of them, even the explanations of the scholiast who cites Stoic terminology lead us to think that they could all be formulated in *temporal* terms, the four "times" envisaged being simply arranged on a chronological scale going from the oldest (the *pluperfect*, distant past) to the most present (the *present*, the time of action still full of the future), via the

(*continued*)

adjacent (the recent past, bordering on the present), and the *imperfect* (action mainly past, but still including a small portion of future).

However, these boundaries are quite porous, some facts being attributed indiscriminately to one category or the other, and the notions themselves sometimes being defined in equivalent ways. Thus in characterizing aspect, grammarians often speak of a temporality internal to the process.

As for temporal categories, it is as if they were haunted by the aspectual question.

It is generally acknowledged that the linguistic category of tense is organized into three periods around an origin, the present, and that this origin determines the past, the present, and the future tenses.

Such a conception of linguistic tense is debatable.

First of all, there are linguistic forms whose interpretation appears to be unaware of both the problematics of origin and the structure of the periods thus asymmetrically constituted (the past is established, while the future is virtual). This is the case, for example, with generic utterances. It is also one of the things involved in the category the Stoics isolated and described as the *aorist*: a form whose value is supposed to be to refer to a moment taken in an indeterminate relation (*a-oristos* [ἀ-όριστος]) to the moment of utterance. In other words, the aorist offers the possibility of not distinguishing periods of time. In addition, it has been shown that the temporal structuring involved in utterances using the aorist was of a quite different order from that described by the past/present/future scheme: there is no longer an origin separating two periods of time nor the double orientation that that division supposes between retrospection toward a completed past and anticipation of a virtual future. Here the ordering of facts is strictly linear, corresponding to what is described as the sequence of events—unless it is in addition recursive, as in certain cases where the aorist can take on a gnomic value. It turns out in addition that each of the three time periods can give rise to different conceptualizations (see PRESENT) that depend on aspectual oppositions: between a past that has disappeared and a past that has been preserved, between the future and what is to come, between a present that is not limited temporally and a present concomitant with the act of speaking (or thinking, or perceiving), in which it is a matter of what takes place in the simultaneity of that act. Such distinctions occur in languages: consider, on the one hand, the melancholy that can be attached to the French imperfect, and on the other hand the values of achievement that the French *passé composé* can have; or all the marks associated with the expression of the future (e.g., the simple future of the type "je partirai" [I shall leave] and the periphrastic future called "proximate" of the type "je vais partir" [I am going to leave]); or the distinction made in English between the present progressive and the simple present, in particular, with the performative values that the latter can have. The question of the moment—instant, interval, but also point of advent (see MOMENT)—is also shaped by the forms of language, by the different presents on the one hand, and by the aorists on the other—when they ignore duration ("il pleuvra" [it is going to rain]), when they accept duration ("il plut pendant trois jours" [it rained for three days]), and when they say what occurred ("il neigea" [it snowed]).

We can understand, then, why the categories of aspect and tense have been connected throughout the history of linguistics. This may result from a confusion on the part of the describers, who are incapable of truly conceptualizing an autonomous aspectual category. But this confusion is also inevitable because tense is haunted by questions of aspect.

IV. Grammatical Aspect and Lexical Aspect

Although it is inseparable from the temporal question, aspect is distinct from tense in its strongly lexical dimension: in particular, there is the question of how the process is instantiated and the form it can be given. This depends first of all on the type of verbal lexeme involved, and the semantic modalities of the configuration of its reference, whence the necessity of considering alongside so-called grammatical aspect an aspect that is properly lexical.

In the inventory of aspectual facts we have tried to draw up, we did not distinguish a priori between lexical aspect and grammatical aspect. The boundary between them is not absolutely clear, whether from one language to another or within a single language, when similar aspectual configurations might sometimes be attached to oppositions between lexical units constructed with the help of conjugation or through the arrangement of different lexical units within an utterance. Nonetheless, distinctions like those that oppose finalized processes and nonfinalized processes, or those that concern the more or less limited, or more or less intrinsically iterative, character of the process seem at first to correspond to types of processes that are defined lexically. These different dichotomies can refer to types of verbs, distinguishing on the lexical level through the more or less finalized, more or less factual or punctual character of the processes to which they refer. Thus there is a lexical dimension to the aspectual problematics.

Depending on the theory, three, four, or two major categories of process can be enumerated on the lexical level. The classification is based on distinctions that are for the most part borrowed from Aristotle, and in particular from a text that was always to serve as a reference point for theories of

lexical aspect: the passage on the two sorts of activity in the *Metaphysics* (Y.6).

■ See Box 3.

On this basis, an opposition between telic and atelic processes was constructed by the Neogrammarians of the nineteenth century to elaborate the distinction between perfective and imperfective processes, probably in relation to the Slavic opposition then being theorized. The specificity of the Slavic system is that the aspectual system is organized precisely on the basis of a lexical opposition, insofar as it mobilizes classes of verbs, and among these verbs, relationships of derivation.

At the same time, independently of Slavic and any derivational relationship, a typology of processes was worked out that constantly oscillated between ontology and semantics (classes of processes, classes of verbs), and whose touchstone was Vendler's classification, in which the initial dichotomy of the telic and the atelic is simultaneously reanalyzed, completed (there are also verbs that do not refer to a process; there are also properties), and made more complex (there are two distinct types of finalized processes). Vendler proposes four classes, which he calls "states," "activities," "accomplishments," and "achievements."

These four classes continued to be regularly reconstructed and re-evaluated. They seem fated to always follow in the footsteps of another, better established lexical categorization bordering on semantics and syntax: the opposition between transitive and intransitive verbs, with perhaps also middle verbs coming in to complicate matters, and behind them the whole question of diathesis. There is a relation between finalization and transitivity, between the object and the finality relative to that object. There is a relation between the state and the middle verbs, diathesis appearing to be one of the privileged procedures that will cause a verb to move from one category to the other. The fate of this categorization seems thus to intersect with syntax in various ways, to be constantly struggling with the relation between the lexical and the syntactical.

Once again, the dissociation in question, that between the lexical and the grammatical, has turned out to be impossible.

On the one hand, the so-called lexical aspect cannot be conceived as a fixed given. There are verbs that are predetermined in some way for a reference of this or that type (*réparer* is cited for finalized processes, *bricoler* for nonfinalized processes, *savoir* for properties, and *perdre* for events), but in general these oppositions are constructed in the sentence, in a given inflectional form, in a given syntactical environment.

3

Aristotle and *telos*

➤ ESTI, FORCE, PRAXIS, PRINCIPLE

In the *Metaphysics* (Y.6.1048b18–35), Aristotle discusses the definition of an action (*praxis* [πρᾶξις]). He distinguishes two kinds of activities: *kinêseis* [κινήσεις] and *energeiai* [ἐνέργειαι]:

[Only] that movement in which the end is present is an action. E.g., at the same time we are seeing and have seen (*horai hama <kai heôrake>* [ὁρᾷ ἅμα <καὶ ἑώρακε>]), are understanding and have understood (*phronei <kai pephronêke>* [φρονεῖ <καὶ πεφρόνηκε>]), are thinking and have thought (*noei kai nenoêken* [νοεῖ καὶ νενόηκεν]) (when it is not true that at the same time we are learning and have learnt [*ou manthanei kai memathêken* [οὐ μανθάνει καὶ μεμάθηκεν]], or are being cured and have been cured [*oud' hugiazetai kai hugiastai* [οὐδ᾽ ὑγιάζεται καὶ ὑγίασται]). At the same time we are living well and have lived well (*eu zêi kai eu ezêken hama* [εὖ ζῇ καὶ εὖ ἔζηκεν ἅμα]), and are happy and have been happy (*eudaimonei kai eudaimonêken* [εὐδαιμονεῖ καὶ εὐδαιμόνηκεν]). . . . Of these processes, then, we must call the one set

movements (*kinêseis* [κινήσεις]), and the other actualities (*energeiai* [ἐνέργειαι]).

We see that the distinctive properties of these two categories of verbs are provided by relations of inference and semantic compatibility between the form of the present and the form of the perfect. In the case of *energeiai*, there is a relation of inference between the present and the perfect, in the sense that when someone says "I see" we can infer "I have seen." There is also a relation of semantic compatibility since one can very well say "I have seen" and continue to see. Thus the two forms—the present and the perfect—are verifiable at the same time (*hama* [ἅμα], simultaneously).

On the other hand, in the case of *kinêseis*, the present and the perfect are not verifiable at the same time. In fact, when someone says "I am building a house," we cannot infer "I have built a house," at least in the sense in which the house is finished. In addition, once the house is finished, one is no longer constructing it, which means that there is a semantic incompatibility between the present and the perfect.

The term *telos* [τέλος], which means both "complete action," that is, "end," and "limit"

(in competition with *peras* [πέρας]), plays a crucial role in this opposition. In the category of *energeiai*, we have actions proper, that is, activities that are complete (*teleiai* [τέλειαι]) because they have an immanent finality (*enuparchei to telos* [ἐνυπάρχει τὸ τέλος]). In the category of *kinêseis*, we have imperfect activities (*ateleis* [ἀτελείς]) that do not carry their own end within themselves but are transitive and aim at realizing something. Thus activities having an external goal that is at the same time a limit (*peras*) do not carry their own goal (*telos*) within themselves; they are directed toward a goal but this goal is not attained during the activity, but is realized at the end of the activity.

Waterlow, Sarah. *Nature, Change, and Agency in Aristotle's* Physics. Oxford: Clarendon Press, 1982.

Thus *manger du poulet* (eat chicken) is not finalized, *manger de la viande* (eat meat) can refer to a property (opposing non-vegetarians to vegetarians), *manger sa viande* (eat one's meat) will be finalized, and *il mangea sa viande* (he ate his meat) is probably factual.

On the other hand, the dichotomies in question shape not only syntax but also, to an equal extent and in a way at least as closely connected, the value of marks considered grammatical that appear in the conjugation of verbs: thus finalization is one of the values that can be associated with aorists or perfects, and nonfinalization is in a certain way involved in the characterization of imperfects.

Distinctions are no doubt required: imperfects are in general wholly compatible with finalized processes ("Il réparait sa voiture quand on lui a téléphoné" [He was repairing his car when he received a phone call]); then they simply mark the fact that the finality in question was not achieved (at least that is one of the values they can have). If we speak of non-finalization for imperfects, then we must understand it not as an absence of finality, but as the nonrealization of this finality.

V. The Imbroglio of Terminologies

The fact that the question of the imperfectivity of the imperfect can be raised is in itself astonishing. The word *imparfait* (imperfect) "translates" (or rather comes from) the Latin word *imperfectum*, from which "imperfective" also derives (and which it also translates). Moreover, at the same time that the word *imperfectum* was invented (see Box 4), we see a hesitation that is precisely the one that causes a problem here, between *imperfectum* and *infectum* (a nonachieved finality, an absence of finality).

The important point is that the whole history of aspectual terminology is constituted by such exchanges. The invention of the words *perfectum* and *imperfectum* itself proceeds from an enterprise of translation, in which it is a question of taking as a model, or rephrasing, the Greek grammarians' opposition between *suntelikos* [συντελικός] and non-*suntelikos*. However, the difference between the two terminologies is noticeable. A supine past participle, *-fectum,* has replaced *telikos*, and hence *telos*, thereby reintroducing, if not tense (was tense really involved in that past participle?), at least the achievement of an act, and consequently merges with the question of the "accomplished." In this operation, the Stoics' opposition between *suntelikos* (which would thus designate the choice of perfects or imperfects) and *paratatikos* [παρατατικός] (the extensive, in which the question of the *telos* is not involved) was made symmetrical, introducing into aspectual terminology a binariness from which we have never recovered. And this symmetricalization, which sought to describe the organization of a conjugation, was then modeled on the distinction introduced by Aristotle (between *teleios* [τέλειος] and *atelês* [ἀτελής]), which was not grammatical but lexical.

This resulted in a new confusion that is not without foundation because it was already implicit in the *montage* constructed by the Greek philosophers, with on the one hand the *telos* used by Aristotle to differentiate types of process, and on the other the same *telos* used by the Stoics to structure conjugation.

And history repeated itself, in the same terms, regarding Slavic languages, with on the one hand the words "perfective" and "imperfective," modeled on the Latin opposition and imported to describe an opposition in which lexicon and grammar are truly interwoven (since it is a question of categories of verbs, which determine the whole organization of conjugation), and on the other hand the Russian words that are used to characterize the same categories of verbs, and that "signify" the accomplished and the unaccomplished.

In the terminological imbroglio, we can once again see the effects of a confusion connected with the inability to acknowledge the autonomy of lexical aspect, or, in the particular case of Slavic languages, the difficulty of isolating the aspectual dimension in the general system of the language. Nevertheless, the same questions, that of the *telos* and that of accomplishment, are at the foundation of the two aspectual dimensions. They are even so prominent that, alongside the heterogeneous inventory from which we began, we also find, and almost simultaneously in the aspectual tradition, a leveling of all differences in favor of two categories that are supposed to be the categories par excellence of grammatical aspect: the perfective on the one hand, and the imperfective on the other. However, there is also the continuing competition of the "perfect," another translation of the same "word," *perfectum*, designating a category that is not exactly the same as that of the perfective, and which is, for its part, always a grammatical category, never a lexical category: one speaks of "perfect" to designate compound tenses in Germanic languages, for example, of the type "I have received " (as opposed to "I received"), which corresponds to the idea that the *telos* is not only achieved, but transcended in the constitution of a fixed state, given as the result of the completion of the process.

Two, or three, grammatical categories that are the same and not the same as the two, three, or four lexical categories. It is in the name of these categories, and literally behind their name, that the aspectual descriptions succeeded in being applicable to all languages, conflating all the "imperfects" of all languages (and also the English progressive and the Russian imperfective), all the "aorists" in all languages, and aligning perfects, perfectives, the English perfect, the German *Perfekt*, the Latin *perfectum* and the Greek "perfect." The facts are different, but the words, and the recurrence of a problematics that seems invariable, are too strong. Although it is a matter of conjugations, the lexicon and the relation to ontological questions are too influential.

VI. The Aspectual Calculation

Lexical aspect and grammatical aspect reduplicate each other. And, in the same movement, the linguistic differences between aspectual categories reduplicate the ontological differences between categories of processes, the former claiming to draw their legitimacy from the latter. And, still in the same movement, metalinguistic differences reduplicate, and then forget, linguistic differences when the term "imperfect" is used in a universal way, to designate a general category of languages, and, at the same time, as a simple morphological label designating forms in a given language.

Such confusions between the world and languages, between words and sentences, between *langues* and metalanguage,

between metalanguage and *langage*, are ultimately quite commonplace. But here the situation is too tangled not to see in it a symptom of what is preying on the aspectual question in this case. If all aspects are related to each other, that is because aspect cannot be reduced to distinctions between categories (categories of words, categories of formal procedures, ontological categories). Aspect is constructed in a complex interaction between lexicon and grammar. There are not as many aspectual categories as aspectual operations. And these operations play a role several times, in the lexicon, in syntax, in conjugation—and may even play several roles within conjugation, producing, for example, perfects alongside perfectives, and then also aorists, and finally simple preterites (the return of tense), in which the conversion to the perfective has operated in a different way each time.

Thus these are operations that belong to a calculation. In the transition from the lexicon to conjugations, another displacement is involved. The lexicon is composed of singularities that can sometimes collect, more or less broadly, in categories. Conjugations involve system and regularities: they form paradigms, obey rules, and are constructed on the basis of the differences between them. It is in inflectional systems, and perhaps only in them, if we exclude phonology, that the Saussurean notion of value can find its whole scope and become a veritable formal, calculable object. We have rules, procedures for generating. To move from lexicon to conjugations is thus to move from a logic of categories to a logic of calculation.

That is probably the discovery that was involved in the slight shift that took place when Latin grammarians adopted the discoveries made by Greek grammar (see Box 4): choices (of a category, of a theme) are replaced by combinations (of values, of affixes) in accord with regular relationships of generation (paradigmatics) and coexistence (syntagmatics); thus a calculation is beginning to emerge. For this to happen, themes probably had to have lost their operativity in Latin, and affixation, which makes the aspectual value "calculable," had to have begun to occupy the terrain more clearly. If aspect proceeds from a calculation, then we can understand why it can play a role again and give rise to all distinctions. We can see that with the same oppositions, the same invariant parameters, each language can put into play values that are always singular. Languages do not reproduce, with more or less success, two, or three, or four great, invariant categories; they combine in diverse ways two, three, or four great invariant parameters.

■ See Box 4.

VII. Aspect and Enunciative Structuration

To the preceding, a final effect of connection will now be added, in which aspect is plunged into a new dimension, that of the types of discourse that configure the utterance. There is a relation between aspect and type of discourse. The connection is more recent. It was made by Benveniste, who discovered the *discours/histoire* dichotomy while reflecting on aspectual oppositions (the description of the *passé simple* and the *passé composé* in French). Weinrich makes it central to the aspectual question: the distinction between the *imparfait* and the *passé simple* or *passé composé*, a distinction that does not

exist in German, is said to be primarily a matter of discursive construction (with the *imparfait* forming the background of a narration, and the past tenses forming the foreground of what develops and occurs). More recently, this area has been dominated by theories that situate aspect in a "theory of discursive representations" (cf. Kamp's discourse representation theory), and try to reduce it to a matter of discursive organization: thus the models currently most discussed make the *imparfait* an anaphoric mark that repeats an element of the context instead of constructing an independent referent.

Once again the relations are inextricably confused: the types of discourse clearly have particular aspectual properties (we have already seen this in connection with aoristic utterances that structure both aspect and tense differently), and yet all or almost all aspectual forms can appear anywhere, in all or almost all types of discursive contexts. Thus we have "foregrounded" *imparfaits*, which have been recorded and are sometimes called "narrative" *imparfaits*—for example, in an utterance like "Trois jours après, il mourait" (Three days later, he was dying), where it is a question of narrating a prominent event, and where the distinction between *imparfait* and *passé simple* becomes more difficult to evaluate. We also find *passé composés* in narratives, where they compete with the *passé simple*: that is why many analysts of the language consider the *passé simple* an archaic form that is being abandoned in favor of the *passé composé*.

The difficulty is clear: it is hard to attach a given formal procedure to a given enunciative structuration, not only because enunciative structures are supposed to be compatible with several aspectual values, but first of all because the formal procedures themselves are all, more or less broadly, polysemous, their value depending precisely on the context and thus on the enunciative structure in which they are situated.

Here again, this is commonplace: polysemy is everywhere in languages. But in this case it affects aspect: it consists precisely in running through aspectual oppositions, the very ones that are also supposed to be associated with some aspectual marker. The case of narrative uses of the *imparfait* seems to indicate that the *imparfait* can have different aspectual values, of which some are more or less apparently perfective. The narrative *passé composés* (for instance, "Il s'est levé et il est sorti" [He got up and went out]) describe the process in its advent and thus do not have the same aspectual properties as those that appear in utterances describing the state resulting from the process (e.g., "Désolé, en ce moment il est sorti" [Sorry, he left just now]). Not to mention the presents, which are highly polysemous in many languages and which, depending on the language, therefore occupy a more or less extensive aspectual terrain. We are obliged to note that aspect is at least partially independent of formal procedures, that it also plays a role elsewhere, in particular, in the enunciative configuration.

VIII. The Theories

Several models of aspect are in circulation in the linguistic literature. We can divide them roughly into four groups corresponding to four conceptions of aspect.

The first group privileges tense. The peculiar feature of verbs is said to be their temporal dimension. Their reference would therefore be fundamentally a matter of situating in

4

Tenses as a system of family relationships in Latin linguistic texts

Very few texts on interpretations of tense in the Latin domain remain extant. These texts are very probably all of Greek origin, but we cannot gauge with precision the inevitable role of adaptation and reorganization resulting from the specificities of the Latin language and the critical freedom of the Latin describers.

The major characteristic of these texts is that tenses are analyzed in relation to each other, in accord with an overall model of the family relations type: relations among tenses are presented in terms of family relations, engenderment, and marriage.

Consider first Varro. In *De lingua latina* (ca. 45 BCE) he was the first to exploit the two axes, aspectual and temporal, which appear in the Greek texts. His presentation of the verbal system is based on an aspectual binary opposition, *infectum/perfectum* (cf. 10.48), built on the semantic opposition between the unachieved (*infectum*) and the achieved (*perfectum*). Moreover, this presentation is based on the properly temporal tripartite classification *praeteritum/praesens/futurum* (in that order, that is, along an axis oriented from the past toward the future), in which each term is a participle of the tense it is supposed to represent (*praeteritum*: past participle of *praeterire*, "pass before, flow away"; *praesens*: present participle of *praeesse*, "to be at the head of," whence "to be there personally, to attend"; *futurum*: future participle of *esse*, "to be"). Varro suggests (but does not say explicitly) that the same tripartite temporal classification can be found in the *infectum* and the *perfectum*, which would give us a series with six terms: the *infectum* would have a present, a preterite, and a future, corresponding in our nomenclature to the present, imperfect, and future; and the *perfectum* would have once again a present (see XII.B for the problems raised by such an analysis from the interpretive point of view), a preterite, and a future, corresponding to our perfect, pluperfect, and future anterior.

The forms that appear along these two axes entertain relationships of engenderment. The point of origin is the present: *lego* (I read) engenders both the two other temporal forms of the *infectum* and the form of the *perfectum*, *legi* (I have read), which necessarily governs in turn the two other forms of the *perfectum*. This relationship of engenderment substitutes one order for another. In a first phase, the temporal axis is presented as a realistic progression (from the past to the future), and the aspectual opposition is constructed according to bipolar opposition in which the unachieved seems to be the marked pole in relation to the achieved. On the other hand, engenderment makes the present the source of the past and the future, and it makes the unachieved the source of the achieved, the unmarked pole. This substitution in the form of an inversion is clearly of morphological origin: in the Latin verbal system the form called "present" is unmarked morphologically, which makes the others appear to proceed from it by the simple adjunction of temporal morphemes, just as the form of the *infectum* is generally (and in any case in living formations at the historical period) unmarked with respect to the form of the *perfectum* (on the way this *perfectum* is formed, see XII.B). The form that we would call the present, which is the least marked morphologically, is thus presented as engendering all the others, in accord with a principle (explicit in Varro) of the development of linguistic forms by branching out from a root form.

At the end of antiquity, Priscian (sixth century), in book 8 of his *Institutiones grammaticae*, preserves the principle of this engenderment: his whole presentation of verb tenses is based on the model of *cognatio* (family relationship), but with notable differences. Like the whole Latin academic tradition preceding him, Priscian retains (*Grammatici latini*, 2.414.9–418.21) only one temporal series, with five tenses: three fundamental tenses, the present, past, and future, and a division of the past into three tenses, *imperfectum, perfectum,* and *plusquam perfectum* (imperfect, perfect, and pluperfect). This does not mean that Priscian is unaware of or rejects the opposition between the unachieved and the achieved, but under the influence of Greek classifications, he uses it to connect tenses with one another, not to account for the fundamental morphological opposition of the Latin verb. The mode of engenderment Priscian describes thus proceeds in accord with principle of continuity: the present includes partly the past and partly the future; the past contained by the present corresponds, if it remains unachieved, to the imperfect, but becomes a perfect if it is achieved, and a pluperfect if this achievement is distant. This effect of continuity allows Priscian to preserve the image of engenderment on the basis of the present, and to indicate a realist legitimation: as soon as the present includes a past element and a future element, it contains, as it were, the embryo of the past and the future.

In addition to this family relationship that we could call paradigmatic, Latin texts attest to the existence of a syntagmatic type of family relationship, the *cunjunctio temporum*, or "marriage of times." This is a study of the organization of tenses with respect to one another when there are two verbal forms in an utterance. It was in the work of Diomedes, a fourth-century grammarian/compiler (who was undoubtedly drawing on an earlier author), that this study appeared in the most developed form (*Grammatici latini*, 1.388.11–395.10). This text, and the parallel passages we find in Charisius, another grammarian/compiler of the same period, cannot be creations *ex nihilo*. But it remains that the grammatical tradition abandoned this kind of effort. In fact, properly grammatical analysis was recentered on the isolated minimal utterance that constitutes for grammarians the privileged analytical framework. Then the only original studies on temporal relationships, which Diomedes echoes, were these isolated and largely fragmentary "fossil" texts.

time and occupying time, aspect having as its object the internal temporality of processes (the time that they endure), whereas (linguistic) tense has as its object their "external" temporality, that is, the period in which they are situated. The consequence is that all aspectual facts are related to the construction of intervals (the interval during which the process is instantiated). These intervals can be of variable dimensions, reduced to a point, limited, or unlimited; they can partially overlap or be included in each other. Above all, they are capable of being structured by an opposition borrowed from the topology relating to the nature of their boundaries: these are either "open" or "closed," the latter

having the topological particularity of including a first or a last internal point, which then represents either the point of arrival or the point of finality. This provides a possible representation of the notion of perfectivity.

The second group privileges the oppositions discussed in relation to the lexicon. The matter is based on a rereading of the Aristotelian opposition between *energeia* and *kinesis* in terms of qualitative homogeneity or heterogeneity: there are homogenous processes in which the qualitative properties of what is instantiated are stable throughout the instantiation of the process (*dormir* [sleep] or *voir* [see] are supposed to be qualitatively stable, and, in the area of inflectional values, a generic present or an aorist is supposed each to be in its own way given as stabilized); there are processes based on a qualitative heterogeneity, precisely because they are finalized, and they thus imply a qualitative change, whether this concerns simply the result sought or is continually manifested during the whole time of the instantiation of the process (*réparer* [repairing] or *construire* [constructing] indicate a qualitative evolution aiming at a new state that is differentiated precisely on the qualitative level; a secant *imparfait* is supposed to indicate an ongoing qualitative development; a *parfait* is supposed to indicate a qualitative rupture resulting from the instantiation of the process).

The third group has already been mentioned: here aspect is fundamentally a matter of the type of discourse and the enunciative configuration.

Finally, the fourth group organizes the category around the question of the reference point from which the process is regarded. This involves the double problematic of the registration and the point of view that is emphasized.

A matter of intervals, of quality, of discursive arrangement, or of relations between points of reference: it is enough to make one think that one has no idea what aspect is. To be sure, the models are not mutually exclusive. Often enough several of these ingredients are used in the descriptions. Ultimately, we might even say that the tendency is generally to use all of these resources, aspect then being simultaneously a matter of intervals, of quality, of discourse, and of points of reference. That restores some content to it, though the content is rather heterogeneous, but one would thereby have obtained this thesis regarding aspect: aspect is something that mixes diverse ingredients.

There remains a problem that still makes these theories of aspect unsatisfactory, even if one considers combining them. In the combination of an interval, qualitatively differentiated zones, a discursive arrangement, and diverse reference points, we cover all sorts of characteristics of verbal reference, but on the other hand, we have said nothing about the entities that have these characteristics, nothing about what thus comes to occupy the interval in question, to receive these qualities, to be ordered in these ways, nothing about this event that a point of view has registered. We have an interval of time, but in this interval something is supposed to take place that is precisely not merely time passing. There is a process that is instantiated, and it is its instantiation that has this or that quality that can be registered or diversely situated in this or that sequence.

Consequently, we see what the four models arrive at: emptying the aspectual problematics of what nonetheless constitutes it, namely, the process, in its accomplishment. A paradoxical effect, when we have said everything except what we were supposed to say.

On the empirical level, this leads to theories of aspect abandoning, in just as paradoxical a way, a question that is nonetheless situated at the heart of the problem of aspect, namely, the opposition between process and property. None of the four models truly succeeds in rendering the distinction. Processes and properties can both cover more or less limited intervals, even if there are probably more temporally limited properties than unlimited processes. Properties are by definition qualitatively homogeneous, but processes may be. Properties may even begin, situating themselves in a gradual sequence. Although a point of view is necessary to posit a property, the use of that point of view may involve any kind of process, including procedures, particularly when the latter are the object of a description.

The grammatical tradition encounters this question as soon as, seeking to characterize the category of verbs, it repeats that verbs designate actions, and then has to add that they also sometimes designate states and properties. This shows that the difficulty is central: what these aspectual models and traditional conceptions of the verb lack is a theory of what the referent of a verb can be. Thus they lack precisely what Aristotle set about to elaborate, a theory of what he called "movement," of what in this movement exceeds both time and being: we lack a *physics*, in which what happens is distinguished from what is true.

Thus to deal with the question of aspect we need something that linguists are not, a priori, competent to provide, and which is not their subject: philosophy. Aspect is an subject that is irremediably philosophical.

What happens has to be distinguished from what is true. Because languages distinguish the two, and because this distinction is one of the central dimensions of aspect, we must recognize that processes have a qualitative dimension that makes it possible to distinguish them qualitatively from one another, probably a temporal extension, but also a qualitative extension: verbs refer to something that takes place, or does not take place, that is in time, but is not only time. This thing also has qualitative properties. But that is because it does not have only qualitative properties, but is also accomplishment, because the question of aspect exists and develops.

IX. The Infinite Reversals of the Question of Aspect

This connection between the quantitative and qualitative dimensions in processes' mode of instantiation enables us to consider various things. It also allows us to account for the reversals to which the determination of an aspectual value can lead, reversals with which descriptions constantly collide.

Maria Tzevelekou describes one of these reversals (see Box 5) that is crucial and seems to have determined the whole history of conceptions of lexical aspect. According to her, around the notion of *telos*, between Aristotle's founding distinctions and their reinterpretation in the light of aspectual facts, a veritable misunderstanding emerged that led to a literal inversion of Aristotle's theses.

■ See Box 5.

5

The reasons for a reversal: Aristotle's heirs unwittingly betray him

In the contemporary literature we find the opposition "telic/non-telic." It is obvious that these terms are constructed on the analogy with Aristotle's terms *teleios* [τέλειος] and *atelês* [ἀτελής]. However, their content is reversed. The telic corresponds to Aristotle's a-telic (*a-teles, a* = privative morpheme), whereas the non-telic corresponds to the *teleios*. Thus the term "non-telic" designates predicates that do not include a limit of accomplishment, whereas for Aristotle *atêles*

characterizes the predicates that are fully realized only at the end of the interval of time during which these processes are instantiated: it therefore includes a limit of accomplishment that corresponds to the point of perfection, which is, as it were, delayed.

This inversion of the content of the terms used can be explained. It reflects a shift in interest: it seems that the authors who carried out this borrowing and this deviation, which

determines our contemporary use of the terms "telic" and "non-telic," were more interested in the way in which the interval corresponding to the process is constituted than in the degree of perfection of the (perfect or imperfect) actualization of a process during its instantiation. As a result, their central question is no longer the mode of realization (actualization) of process, but rather the existence (or non-existence) of a natural end that delimits the temporal interval.

Key to this reversal is the notion of *telos*, which is translated into French by the word *fin*, which is itself ambiguous (meaning both "purpose" and "end"), but which is not sufficiently ambiguous to render what is involved in *telos*. The Greek *telos* can be attained at the beginning of the instantiation of a process: that is the case for *energeiai*, which are perfect as soon as they are instantiated. *Telos* designates the alternation between quantitative and qualitative instantiation. Thus it implies that the two dimensions can be dissociated, while at the same time designating the point where they coincide. To use the word *telos* thus involves referring to both this dissociation and this coincidence. Depending on the process, but also on the points of view adopted, sometimes dissociation, sometimes coincidence will be emphasized. And a process that is a-telic because not finalized will also be telic from another point of view because it has attained immediately its point of perfection (or "achievement," to use Vendler's term).

These reversals explain the constant misunderstandings surrounding the question of aspect. They also explain the subtle aspectual differentiations that may develop in languages when the telic oscillation, operating at different levels, configures each of these levels differently. They also explain the extensive polysemy of most of the aspectual marks, which can be both telic in some of their uses and a-telic in others.

When we consider the way in which the oppositions between perfection and imperfection are constituted through languages, we have to acknowledge that they are infinitely variable. A single process can be considered perfective in one language and imperfective in another. The French verbs *prendre* (take) and *donner* (give) are thus described as fundamentally perfective insofar as they both refer to finalized processes; but one of the corresponding simplexes in Russian, *dat'* [дать] (give), belongs to the category of the perfective, while the other, *brat'* [брать] (take), is considered imperfective, probably because a gift is a gift from the moment it is instantiated, whereas taking implies some delay between the activity it develops and the expected result. Such facts, which multiply when we examine aspectual oppositions in detail, even within a single language, prevent us from considering

perfection as a predetermined, stable ontological category: perfection is constructed through diverse articulations of the qualitative and the quantitative, these articulations being not just any articulations, always calculable and explainable, but always and incessantly renegotiable.

The question of the *telos* and perfection is not the only one that gives rise to such reversals. Everything in the dissociation between quantity and quality is perpetually unstable and renegotiable. The fluctuating values of the perfect, the way they reduplicate without reduplicating the perfective, and the shift to which they seem to lead in the evolution of a language (from a value of accomplishment to a value of preterition), are probably another manifestation of these reversals.

Everything about aspect leads to confusions. Only a step-by-step calculation of each aspectual value can restitute what will be the foundation of the distinctions involved.

X. Aspect, Location, and Determination

The distinction between quantity and quality is central to the aspectual question because every instantiation of processes is caught up in the dialectic to which this distinction leads. But that does not mean that aspect can be reduced to the calculation of this distinction. An instantiation is constructed: it also has to be diversely located and determined. Thus there must be two other types of questions, two other calculative elements, in the constitution of aspectual values.

First of all, there are the various relations that points of quantitative and/or qualitative instantiation can entertain with the original reference point of the utterance. The category of the aorist testifies to relations of rupture. And the effects of translation often produced by imperfects testify to a complex relation between differentiation and identification that can certainly not be reduced to a matter of anteriority.

Second, there is the question that aspectual models hardly touch upon, that of the different forms of iteration or genericity that can be associated with an utterance (with the reference to a verb in an utterance). This implies a model of instantiation, whether quantitative or qualitative, which takes into account the fact that instantiation can be singular, plural, or generic. The same problem arises with regard to

the reference of nouns (or rather of nouns taken in a nominal group that is itself part of a sentence, which is in turn part of some discursive configuration). That is, the question of iteration shows that aspect is also a matter of determination, the determination in question operating not on nouns, but on verbs.

Aspect is a problem of instantiation. Instantiation turns out to operate in two registers, that of quantities and that of qualities. It proceeds like any instantiation of operations of determination. Through its qualitative dimension it makes use of differentiated points of view that can compete with the speaker's point of view or simply displace it. And because the operations of determination, quantitative and qualitative, are involved several times (verb, conjugation, syntactical construction, context, discourse), the aspectual calculation produces values that may vary infinitely from one language to another or from one utterance to another.

XI. The Question of a Typology of Aspect

If it is true that aspectual calculation runs through all forms of the expression of time, we have to give up the idea that there are languages that are more "aspectual" than others, that is, more attached to the expression of aspect than others that are supposed to be more attached to the expression of time.

There may be less "temporal" languages in the sense that relations between time described and moment of utterance are less determined. That is often said to be true of ancient Greek. It is not clear that this is pertinent. The ancient Greek aorist has a particularly broad range of values, with major variations regarding the moment of utterance. But that is also true of the French present, and even of the French imperfect, where we find not only hypothetical values (not anchored in time), but also present values ("Qu'est-ce qu'elle voulait, la petite dame?" [What did the little lady want?]), and even references to the future ("C'est dommage, il y avait dimanche prochain un joli marathon à courir" [That's too bad, there was a nice marathon to be run next Sunday]). As for the French *passé simple*, it covers a narrower field of values, but it would be difficult to maintain that it refers systematically to the past: the rupture it implies with respect to the sphere of the utterance causes it to be often included in narratives of a fictional kind, for which it makes no real sense to speak of a past (*La belle au bois dormant* [Sleeping Beauty] tells us about something that has nothing to do with the past other than its mythical dimension). What is taken as a temporal affair is simply the fact that these narratives refer to events that are given as both completed (in a register that is that of fiction) and discontinuous with the present.

There is another way of conceiving a typological difference between Greek and French. The system of Greek (ancient and modern) and system of Russian both combine two formal procedures that are largely independent. In Greek, each form of conjugation is characterized in part by the choice of a particular theme, and in part by the choice of an affix. All affixes can, a priori, be combined with any of the three available themes: then we have both imperatives and past tenses or participles in each of the three series. In Russian, there is no theme, but two classes of verbal lexemes. The lexemes of these two classes are compatible with almost all the inflections of the system. In fact, the situation is still more complex: there are a few constraints that are crucial for distinguishing the two classes. It remains that we find also imperatives, infinitives, and past tenses of the two classes. We do not find the same autonomy in French, German, or English, where, even when it is possible to dissociate two types of formal procedures, they are not clearly autonomous. Thus in French, between the base of the present, that of the *passé simple*, and that of the "past participle" there are differences of a thematic order: series like *voit/vit/vu* and even *chante/chanta/chanté* are probably analyzed more on the model of the theme than on that of affixation, to the extent that the vowel that varies cannot be considered as being external to the base (the *oi* in *voir*, and also the *e* in *chante*, are part of the lexical base of the verb). But the inflections that can be associated with each of these bases are for the most part strictly specific to them. In French there is no imperative constructed on a base of the *passé simple* or the "past participle"; and only the "past participle" gives rise to the procedure of auxiliarization that leads to all the system's forms that are called *composées*.

Even from the point of view of the economy of the systems of conjugation, such a contrast is extremely important. It has been proposed to see in this a difference in the treatment of the relation between tense and aspect: Greek and Russian are supposed to dissociate aspectual marking and temporal marking, whereas other languages have marks associating aspectual value with temporal value. If we grant that the opposition between tense and aspect must be reconsidered, such an interpretation can no longer be maintained as such. Nonetheless, the aspectual operations involved in the two types of procedures are not of the same order. It is the question of the articulation between the quantitative and the qualitative instantiations of the process that plagues, in different forms, both the perfective/imperfective opposition in Russian and the series present/preterite-aorist/perfect in non-Slavic languages. On the other hand, affixes and auxiliaries mark operations related to the determination and location of occurrences of constructed processes—determinations and locations whose effects (in terms of iterativity, on the one hand, and variations in point of view, on the other) correspond to the values that traditional analysts identify as either temporal or modal.

Thus we have an (aspectual) calculation related to the quantitative and qualitative dimensions of the occurrence of a constructed process, and on the other hand, a calculation (simultaneously aspectual, temporal, and modal) related to the determination and location of this occurrence. The particularity of Russian and Greek thus seems to be that they dissociate these two types of calculation. That amounts to giving a real autonomy to the strictly aspectual question of the connection between quantity and quality, whereas in other languages the two calculations interfere.

There is another, equally or more important typological difference that intersects with this one, and which this time involves a contrast between Russian and Greek. It concerns the mechanisms at work in the choice of the base subjected to inflexion and auxiliarization.

In Slavic languages, this is a derivational mechanism: to move from one aspectual class to another, another verbal

lexeme is constructed using various affixes, and the lexeme so constructed then has a new semantic value, independently of the fact that it is associated with an invariant aspectual value. The system of themes is based on entirely different principles: it is not a question of constructing another verbal lexeme, but simply of varying the aspectual value of a given lexeme. The morphemes of derivation are singular units of the language; the themes have no singularity and are part of a mechanism of regular variation.

The mechanism itself is regular but not generalized. It is in French, where, apart from a few rare defective verbs, all verbs have a present, a *passé simple*, and a past participle. It is not in Greek, where the absence of a morphology of the perfect is a nonmarginal phenomenon: thus there can be verbs whose lexical particularities are opposed to the construction of such a theme. Themes in French, on the other hand, because they are not restricted, are independent of the semantic content of the lexeme: the regularity of the system has taken priority over the singularity of the lexicon.

These differences will necessarily have effects on the mode of calculation with which aspect proceeds in each of these three types of language. In Russian, this calculation appears as a construction associated with regular semantic effects, whereas in Greek it is part of a selection conditioned by semantic singularities, and in French the selection has become as regular as for any kind of inflection. Whereas the Russian aspect is constructed, and the Greek aspect is chosen, we might say that, under the influence of a rule that is blind because unlimited, the French aspect is obtained: it proceeds from a sort of regular deformation operating within the lexeme's semantic field.

That is, aspect is not conceived, and not perceived, in the same way in the three languages. In particular, one of the consequences of the Greek system's defectiveness is that in Greek aspectual categories can be invented (the missing perfect is invented, a new category is invented), and then be shaped by the genius of a thought. In Russian, aspect has to do solely with the semantic genius of the language, the values that that language invents, and that it reinvents anew for each lexeme: for thought, the Russian aspect is a kind of generator of concepts (see Rémi Camus's text below on the noun *poznanie* [познание], which is said to invent a perfective knowledge). In French, the genius has taken on the regularity of a calculatory mechanics, in which nothing is invented, but in which regular effects are produced beyond the lexemes: the French aspect is thus a generator of new points of view on concepts, new insofar as language alone has brought them about. Three different geniuses of aspect: thus we understand better why it has been so hard to export the notion of aspect from one language to another.

XII. When Aspect Serves to Conceive Aspect

There is an aspectual genius in languages, but there is also the genius peculiar to each form, which can make it untranslatable because it is irremediably singular. There are in fact different ways in which a linguistic event can be untranslatable. This holds in particular for aspectual events. To conclude, we consider three examples, each chosen for its exemplarity, each involving a different form of untranslatability.

First, the case of a word constructed aspectually that can only be specific to a language and its aspectual procedures: it is here that the genius of the language is involved, and what that language alone is able to say.

A. First example. Aspects of "knowledge" in contemporary Russian: A perfective knowledge and an imperfective knowledge

In the expression "theory of knowledge," "knowledge" is translated with the help of the de-verbal *poznanie*, corresponding to the verb *poznat'* [познать], "to be familiar with," constituted on the base of *znat'* [знать], "to know, be familiar with" and the prefix *po*-[по], conferring a perfective status on the verb. The simplex *znanie* [знание], from the imperfective *znat',* would be interpreted here as "to know"—supposing that such a theory is conceived.

Nonetheless, there is no bi-univocal relationship between the oppositions *poznanie/znanie* on the one hand and *connaissance/savoir* on the other (cf. also Ger. *Kennen/ Wissen*, which is something else again). Here we seem to find an opposition between an "imperfective" knowledge and a "perfective" knowledge. The originality of this situation is manifest in the articles of the *Dictionnaire encyclopédique de philosophie* (Moscow, 1983), where *poznanie* is described as an activity (*dejatel'nost'* [деятельность]) associated with a movement from the state (*sostojanie* [состояние]) of ignorance (*ne-znanie* [не-знание]) to that of knowledge. Thus one speaks of *protsess poznanija* [процесс познания], "procedure of knowledge," or again of *čuvstvennoe poznanie* [чувственное познание], "sense knowledge" (knowledge gained through the senses), but of *sostojanie znanija* [состояние знания], "state of knowledge."

Speaking of an aspectual opposition in characterizing nouns, even if they are derivatives—as here—of verbs and opposable in an analogous way to the latter, poses problems. In any case, tradition balks at doing so: it tacitly reserves the perfective/imperfective opposition for forms that have the faculty of governing an object complement. In fact, aspect seems to produce very little among Russian de-verbals (unlike Czech or Slovak, for instance). However, at least in the present case, there is no doubt that the pair *znanie/poznanie* reflects certain characteristics of the verbal opposition *znat'/ poznat'*.

1. The values of *poznat'* (perfective), or when knowledge becomes an experience

Two main values of *poznat'* emerge (as lexicographic practice confirms) associated with differentiated restrictions on usage:

a. *poznat' istinu* [познать истину], "know the truth": acquire certain, true knowledge
This usage has three characteristics:

— *Poznat'* is indissociable from an (intellectual, physical) investment, from an implication of the subject who accedes to knowledge by himself. Uses in which the complement is located in a teleonomy (the object of knowledge is "to be known") belong to this class.

— The measure of actual knowledge is not provided by the object as a concept, but is circumscribed by the investment (in time and space) of the subject; whence the possibility of an adjustment, a more or less exact agreement, between, on the one hand, the direct object as an object of knowledge and, on the other hand, the subject's investment: "Vy načitalis' grošovyx brošjur evropejskogo kommunizma i dumaete, čto vy poznali istinu! [Вы начитались грошовых брошюр европейского коммунизма и думаете, что вы познали истину!]" (You stuffed yourself on ten-penny European communist pamphlets and you imagine that you know the truth!).

— Attestable complements are terms given as inaccessible to a subject's knowledge: *nevedomoe i zapretnoe* [неведомое и запретное], "what is unknown and forbidden," *tajny bessmertija* [тайны бессмертия], "the secrets of immortality," *smysl žizni [*смысл жизни*]*, "the meaning of life," *real'nost'* [реальность], "reality," *dobro i zlo* [добро и зло], "Good and Evil," *sebja* [себя], "oneself," whence *poznaj samogo sebja* [познай самого себя], "know thyself," and so on.

b. *poznat' plen* [познать плен], "know captivity": to feel and experience captivity

Compared with (a), this use is distinguished less by the "concrete" character of the relation it establishes between the subject and the object of knowledge (the subject having been in captivity) than by the absence of teleonomy: the relation is strictly contingent.

Thus we find in the position of a complement feelings and internal states (*nenavist'* [ненависть], "hatred," *blaženstvo* [блаженство], "beatitude," *gore* [горе], "sorrow," *bol'* [боль], "pain," *veru Xristovu* [веру Христову], "faith in Christ," etc.); states and processes that affect the subject of knowledge against his will and that will thus tend to be interpreted as harmful (*smert'* [смерть]), "death," *nevolju* [неволю], "absence of freedom," etc.); and properties predicated of a term (or a process), generally to a greater degree than one might have expected a priori, and whose astonishing intensity is then emphasized (*bednost' žizni* [бедность жизни], "the poverty of life," *čelovečeskoe moguščestvo* [человеческое могущество], "the greatness of man," *prelesti osedloj žizni* [прелести оседлой жизни], "the charms of sedentary life," etc.).

In these two classes of uses, it is a matter of an immediate, experienced knowledge, and thus of a knowledge that is fundamentally intransmissible because it is inseparable from the singular conditions of its acquisition by a subject.

The simple verb *znat'* is certainly not incompatible with the experiential value (glossed as "feel" by the *Dictionnaire de l'Académie*) of (b): *On s detskix let znal gore* [он с детских лет знал горе] (he has [had] felt unhappy since he was a small child). Similarly, a complement of the type *ženščina* [женщина], "woman," is possible in the plural, or with a negative: *ni odnoj ženščiny* [ни одной женщины], "not any woman at all."

But the particularity of *poznat'* is that it can refer to a precise event, a particular experience. Thus *po-* performs a kind of "takeover": knowledge, a nontemporal notion par excellence, is transmuted into an event endowed with a spatio-temporal extension. Knowing becomes an experience. This has in return an effect on the interpretation of the complement of *poznat'*, of whose meaning it retains—in the context of the establishment of a relation to the subject—only what can be envisaged as an interaction in space and time, the woman becoming a sexual partner, the poverty of the world and truth becoming singular experiences. Thus we see that with *poznat'* knowledge is necessarily partial since it is limited to what can be experienced by the subject: the object of knowledge always exceeds what the subject "knows" about it. That is why we find complements after *znat'* that are impossible after *poznat'*: *č'ju-to familiju* [чью-то фамилию], "someone's family name," *nomer rejsa na Moskvu* [номер рейса на Москву], "the number of the flight to Moscow," *pričinu* [причину], "the cause [of]," *svoju ošibku* [свою ошибку], "his error," *parol'* [пароль], "the password." These terms refer to objects of knowledge that are incompatible with partial knowledge.

2. The noun *poznanie* midway between knowledge and knowledge connected with a singular experience

The noun *poznanie* is interpreted in different ways depending on whether it is used in the singular or the plural. In the singular, it is generally given a dynamic, processive value, close to what we have seen at work in *poznat'*: knowledge is often figured as something mobile, or as a mechanism (endowed with a motor), or as a process, even as a path, for example, in the formula *Ternist put' poznanija* [Тернист путь познания], "the path to knowledge is full of thorns."

This processive value denotes the instability of the relation established between the subject and knowledge: the subject does not attain the stable state that constitutes the possession of knowledge. This instability is connected in turn with the actual circumstances of the acquisition of knowledge by the subject(s), with the chance factors encountered, with the difficulties that have to be overcome, with the strategies adopted, and so on. The *teorija poznanija* [теория познания], "theory of knowledge," inquires into the actual conditions under which knowledge is acquired. *Poznanie* also designates knowledge as a human faculty (even if we seldom speak of a "faculty of knowledge"): a faculty manifests itself only if circumstances allow it to do so. Moreover, alongside the negative term *neznanie*, "ignorance," there is no more a **nezpoznanie* than there is a "nonknowledge" or a "nonbirthday": failing to achieve the process of knowledge amounts to remaining in a state of ignorance.

In the plural, on the other hand, we find a resultative interpretation. But then *poznanija* [познания] indicates knowledge acquired through what is once again presented as an individual experience, whence the idea of fragmentary or even superficial knowledge, illustrated by this sentence from Turgeniev: "On byl vsegda vysokogo mnenija o poznanijax Dar'ji Mixajlovny v rossijskom jazyke [он был всегда высокого мнения о познаниях Дарьи Михайловны в российском языке]" (he always had the highest opinion of Daria Mikhaïlovna's knowledge of Russian [superficial, amateur knowledge]).

Inversely, in "Biblioteka soderžala obširnyj svod èzoteričeskix znanij [библиотека содержала обширный свод эзотерических знаний]" (The library held a rich collection of knowledge [*znanij*]), it is impossible to substitute *poznanija* for *znanija* because the knowledge in question is envisaged independently of the conditions of acquiring it (the library having as its function precisely to make knowledge available to everyone).

3. Knowing life, living knowledge: The Byzantine heritage

We have seen that the opposition between imperfective knowledge (*znanie*) and perfective knowledge (*poznanie*) involves in a crucial way a relationship between knowledge and empirical experience, perfective knowledge (*poznanie*) being a lived or experienced knowledge.

We can inquire into the existing relation between the linguistic pertinence of this lived knowledge and the very special nature of theories of knowledge—of the act of knowing?—in Russia. It seems that we might be able to oppose the Latin tradition, which accords priority to the domain of abstraction and work on concepts, to the "Byzantine" tradition, which emphasizes hypostases: what is in each person is at once a compound of essence (*ousia* [οὐσία]) and energy (*energeia* [ἐνέργεια]), an experience and a movement of life. We have to acknowledge a clear pre-eminence of the Byzantine spiritual heritage in Russian tradition, even if that pre-eminence also has historical and cultural causes.

B. Second example: The Latin perfect and Saint Augustine's attempt to express time and creation

The second example is the Latin *perfectum*, which illustrates a quite different kind of "genius of the language" since it is described as raising no translation problem, and as finding in each of its uses and each of its values possible equivalents, if not in every language, at least in French. Its genius resides only in the sum of these uses and values, in the field covered, which is peculiar to the Latin *perfectum* alone, and which might allow, better than any form in another language, the conception of an achievement outside time. Here, the genius of the language is not of the order of what can be said, but of the objects that a language proposes for thought, and thus of what can be conceived in that language.

The Latin perfect is not untranslatable in French; its translation is rarely found unsatisfactory. On the other hand, to translate the various occurrences of the Latin perfect, we have to resort to the whole arsenal of French past tenses—*passé simple*, *passé composé*, *passé antérieur*, *plus-que-parfait*, *imparfait*—and sometimes even the present.

In other words, this "tense" is likely to assume very diverse values depending on the contexts in which it is used. This richness of use corresponds to its morphological richness, and in fact the paradigm of the Latin perfect is based on the syncretism of inherited forms that constituted different, independent paradigms in Indo-European (e.g., the reduplicative perfects vs. sigmatic aorists that we find, respectively, in forms of the Latin perfect such as *tegigi*, "I touched," and *scripsi*, "I wrote," and also in alternating vocalizations of the root, the suffix -*u*, etc.).

In this context, the traditional name of the Latin perfect is very ambiguous: it is a translation, both set and amputated of one of its fundamental elements, of the Latin term *praeteritum perfectum*. The explicit indication that we are dealing with a past tense has thus disappeared, and this is not, as we will see, a matter of indifference. The term "perfect" remains, which has the drawback not only of being a not very legible calque of the word *perfectum*, but also of leading to confusion with other terms that belong to the same terminological field but cover very diverse linguistic realities: the Greek perfect, the perfective in Slavic languages, the English perfect—which are all prisms that have prevented a precise perception of the values peculiar to the Latin perfect.

1. The specificity of the enunciative location

Contrary to the two other Latin preterites, and contrary to the French *passé simple*, the Latin perfect is also frequently encountered in the kinds of text where reference is organized around the subject and the moment of utterance; these texts belong to what Benveniste calls "discourse," as contrasted with more neutral texts not connected (*embrayées*) with the situation of utterance, which he puts in the category of "history," where "events seem to narrate themselves."

The Latin perfect itself does not determine the construction of the enunciative reference point that structures the representation of the process. In this respect, it differs from the French *passé composé*, which, by virtue of its etymology, systematically takes the *nunc* of utterance as its basis; with the Latin perfect, this basis is contextual. It also differs from the French *passé composé* insofar as unlike the latter, it is not aoristic; an aoristic configuration necessarily implies a break between the process described and the enunciative source, which is far from being the general case for the perfect, even though it can also adapt to this situation in the context of historical narration. On the contrary, in a "discourse"-type context, its factual value is combined with a strong assertive modality that is incompatible with the aoristic break.

2. The specificity of the aspectual registration of the process

In a general way, the Latin perfect provides an overall view of the process: translating the inscription of this process in time (its realization or, what amounts to the same thing, its achievement), it also accompanies its achievement until the end, thus leaving the field open for taking into account the situation subsequent to the process in question.

This situation can moreover be simply singularized by the fact that the process is no longer instantiated: there is a considerable compatibility between the perfect and negative value. Here is one example among others, taken from the famous chapter on time in Augustine's *Confessions*: "Quam longotempore illud non *vidi*!" (what a long time since I *saw* that!; *Confessions*, 11.28). There was a last process ("seeing") beyond which the contrary ("not seeing") takes over, and what the circumstantial exclamative measures is this *non-p* that has succeeded *p*.

Another, commonplace type is what is usually called the "resultative": the adjacent situation corresponds to the state resulting from the process described. Variations in the degree to which the perfect is lexically fixed can then appear, ranging from entirely set expressions—*memini*, "I remember" (the verb is defective and has no present form: literally, the form means "I have put into memory")—to free creations, which are rather rare, for example: "Exarsit animus meus nosse istuc inplicatissimum aenigma" (My soul is on fire to

know this most intricate enigma) (*Confessions*, 28), via expressions that are being lexicalized—"*mihi visum est*" (it seemed to me [morally and/or pragmatically] right, hence I decide, or it seemed to me [intellectually] right, hence, I conclude).

A third realization of this point of view is the one that makes it possible to express what is over and done with, both achieved and "gone," hence past: in the text below, this value is not only used but staged by the description of what is "gone" in this case: "Et ipsa una hora fugitivis particulis agitur: quidquid eius avolavit, praeteritum est, quidquid restat, futurum" (Yea, that one hour passeth away in flying particles. Whatsoever of it hath flown away, is past; whatsoever remaineth, is to come; *Confessions*, 15.20).

The final case is the one in which a different process simply comes to occupy the subsequent situation: this is the case of narrative sequences, where the perfective is usually translated by a *passé simple*, at least if the enunciative fixation is not too marked.

We can consequently understand why the Latin perfect would be a particularly flexible and well-adapted tool for expressing the complexity of our perception of time past. Evoking both the image of the achieved and that of what has disappeared, of what is still present or of what has been definitively lost, it stays very close to the lexical meaning of the verbs that in Augustine try to describe the flight of time and memory traces:

> Quamquam praeterita cum vera narrantur, ex memoria proferuntur non res ipsae, quae praeterierunt, sed verba concepta ex imaginibus earum, quae in animo velut vestigia per sensus praetereundo fixerunt.
>
> (Although when past facts are related, they are drawn out of the memory, not the things themselves that are past, but words which, conceived by the images of the things, they, in passing, have through the senses left as traces in the mind.)

(*Confessions*, 23)

With *praeterire*, which recurs three times in this one sentence and also designates simultaneously, as it does in French, the past, what is no longer and what has been, and then with *fixere* (literally, fix, attach), both the paradox of time and the very diversity of the values of the perfect are described.

In addition, we have seen that the perfect showed the situation of the process in time in such a way that one attains and then passes beyond the final boundary of this process, in order, possibly, to be established in the resulting state. Thus it combines the ability to accompany action in a narrative context with the ability to stabilize an achievement: an ideal form for trying to resolve, linguistically at least, the apparent self-contradiction of the divine act of creation as Augustine sees it, and which is moreover the source of his inquiry into time: "Si enim ullus motus in Deo novus extitit et voluntas nova . . . quomodo jam vera aeternitas, ubi oritur voluntas quae non erat?" (For did any new motion arise in God, and a new will to make a creature . . . how then would that be a true eternity, where there ariseth a will, which was not?) (ibid., 12).

We find this resolution realized in the following passage in the text: "Hodiernus tuus aeternitas: ideo coaeternum genuisti, cui dixisti 'Ego hodie genui te.' Omnia tempora tu fecisti et ante omnia tempora es" (Thy To-day is Eternity; therefore didst Thou beget The Coeternal, to whom Thou saidst, This day have I begotten Thee. Thou hast made all things; and before all times Thou art) (ibid., 16).

This passage perfectly illustrates the strong assertive value that the perfect can have: for Augustine, it is a matter of attesting the eternity of God, of making it a credo; for God, it is a matter of promulgating the creation of coeternal Being, that is, the advent of the Son. The creative word—though it is a simple word, it suffices to create—is in the perfect.

It also shows how one and the same form is able to render the founding act of creation as being both past and yet detached from all temporality, true forever, independently of any experience or any passage of time, and thus escaping human deictic locations that would make it a past that has gone and that has not always been.

C. Third example: The function of the perfect in the definitions of *energeia* and *kinêsis*

The third example is Greek, drawn from Aristotle, and illustrates a third kind of untranslatable: a perfect that is supposed to be untranslatable precisely because it does not belong to Greek, since Aristotle is supposed to have invented it.

As we have seen in Box 3 on Aristotle and the *telos*, Aristotle bases his definitions of the key concepts *energeia* and *kinêsis* on an analysis of the compatibilities between forms of the present and forms of the perfect: only *energeiai* have as their characteristic that the indicative present "goes hand in hand" with the indicative perfect. To support his analysis, Aristotle uses a certain number of perfects, in particular, for each of the *energeiai* that he has in mind: *heôrake* [ἑώρακε], *pephronêke* [πεφρόνηκε], *nenoêke* [νενόηκε], *ezêken* [ἔζηκεν], *eudaimonêken* [εὐδαιμόνηκεν], which are respectively the perfects of the forms *horai* [ὁρᾷ] (see), *phronei* (conceive), *noei* (think), *zêi* (live well), *eudaimonei* (enjoy happiness). What is the function of the perfects here with regard to the forms of the present that precede them in the text? How should these perfects be translated?

To explain, and at the same time translate, Aristotle's argument, Gilbert Ryle writes: "Aristotle points out, quite correctly . . . that I can say 'I have seen it' as soon as I can say 'I see it.'" The expression "I can say," which is of course not present in the Greek text, makes it seem that one could in fact use either of these tenses in the Greek language of Aristotle's time, as Aristotle himself does in the text in question. The truth is quite different: Aristotle's use of the perfect in the analysis of what he describes as *energeiai* has nothing to do with contemporary usage of the perfect of these verbs.

First of all, the perfects Aristotle uses in the *Metaphysics* to illustrate *energeiai* are all, with the exception of *heôrake*, extremely rare in Greek; it is even likely that he coined *eudaimonêke* and *ezêke* for the occasion (the normal perfect with *zeî* [ζῇ] being *bebiôke* [βεβίωκε]). *Heôrake*, the only perfect that is regularly found in the texts, never expresses simply the completion of the action of seeing, as it does in Aristotle: its particularity is instead that it continually refers to both the present and the past. For example, in *oude touton heôraka* [οὐδὲ τοῦτον ἑώρακα], taken from Plato's *Ion*, 533b4, which is translated in English by "I never saw one," and

means very precisely "one that I have not been able to see on any occasion (past or present)."

This shows that we must not introduce the notion of "saying" into the interpretation of our text (nor, moreover, that of "one can"): it is not what one can say that interests Aristotle here.

Why does Aristotle nonetheless use the perfect *heôrake* to elucidate the ontological status of *horai*? Because the value of the perfect of the other class of verbs, the kinetic verbs, gave him a very convenient tool for this purpose. The perfect of these verbs faithfully reflects common usage: thus *ôikodomêke* [ᾠκοδόμηκε] (to have built) expresses the state at which the action of *oikodomei* [οἰκοδομεῖ] (to build) has (gradually) arrived. Just as Aristotle could use this value to show that "one builds" does not simultaneously (*ouch hama* [οὐχ ἅμα]) express achievement, he could also use it to show that "one sees" does in fact simultaneously express (*hama* [ἅμα]) achievement.

In other words: the perfect is employed to show that the complete nature of *horai* is opposed to the incomplete nature of *oikodomei*. Using modern terms, we might say that what Aristotle is doing here is showing that there is a "relation of implication" between *horai* and *heôrake*, and a relation of "nonimplication" between *oikodomei* and *oikodomêke*. His approach is thus very similar to that of recent commentators who have proposed basing the opposition between telic and non-telic processes on tests of implication between propositions (see, e.g., Dowty's "entailment tests").

As for translation, if the analysis presented above is valid, it would be better to translate *horai hama <kai heôrake>* by "he sees" implying "he has seen" than by "at the same time one sees and one has seen."

Beyond what distinguishes them, these three examples have in common that the question raised by the aspectual form singled out is precisely an aspectual question: in *poznanie* the question of what can be a property (knowledge) is raised when it is connected with a concrete experience that instantiates it; the *perfectum* Saint Augustine employs is used to challenge the temporal anchorage of an achievement; Aristotle's perfect seeks to express the perfection of an *energeia*.

That is, what is untranslatable in aspect is the way in which it conceives itself.

We should never translate an aspectual form: what it thinks is literally in its form, in what this form literally constructs. Thus we must always translate an aspectual form: translate it literally, in the detours of its form, in order to hear what this form says. Although there can be room for some between-two-languages in the case of nouns, here there is no in-between: one cannot pair a Greek perfect with a French *passé composé*, there is only Greek and French, the languages one by one—or, outside languages, the invariant question of aspect.

ATTUALITÀ, ATTUOSITÀ (ITALIAN)

ENGLISH	actuality
FRENCH	*réalité, effectivité, actualité, réalité effective*
GERMAN	*Tat*, *Handlung*, *Wirklichkeit*, *Aktuosität*
GREEK	*energeia* [ἐνέργεια], *ergon* [ἔργον]
LATIN	*actuositas, actus*

➤ *ACT*, and AGENCY, AUFHEBEN, ESSENCE, ESTI, FORCE, ITALIAN, PRAXIS, REALITY, RES, STATO, TATSACHE, *TO BE*, TO TI ÊN EINAI

A set of speculations centered on the notion of the act provided a name for a major philosophical school of the twentieth century: Giovanni Gentile's "actualism." This Italian neo-idealism marks a division that reappears within the body of Hegelianism, following from the first revision of the original doctrines proposed by the Young Hegelians in Germany. It is linked to the decision taken by Bertrando

Spaventa to translate the German *Wirklichkeit,* on the model of *Aktuosität,* as *atttualità.*

The history of ideas that developed was immediately mirrored in a genuine political history: the philosophical apparatus originally worked out by Neapolitan Hegelianism had national reunification as its goal (the Hegelian logico-philosophical program was reconceived as the speculative and political structure of the Risorgimento) before it was transformed again into a speculative apparatus serving the philosophical and political elaboration of a fascist state, for which Gentile himself created the term *Stato totalitario.*

I. Italian Neo-idealism as a Reform of the Hegelian Dialectic and as Translation: The Mediation of Bertrando Spaventa (1817–83)

In a letter dated 5 December 1864, and addressed to the Berlin Hegelian journal *Der Gedanke,* Theodor Straeter, who had just come back from Naples, noted that "if modern philosophy can still really hope to have a future, it will come neither in Germany nor in France, nor in England, but in Italy, and in particular on its marvelous west coast (at Naples) where, at a certain period, the Greek philosophers formulated their immortal thoughts." In the work of Spaventa, the founder of the Neapolitan neo-Hegelian school, we find an idealism that has been both modernized and renewed.

A. The reform of the primary categories of Hegelian logic

1. The pair *pensare/pensato* (*Denken/Gedanken*): Being as an act of thought

In his *Le prime Categorie della logica di Hegel* (1864), where we find no less than fifty-four occurrences of the term *atto,* Spaventa interprets the inaugural categories of Hegel's logic: Being, Non-Being, Becoming. For Spaventa, Being is nothing other than a thought that is unaware of itself. Within the *act* of thinking (*pensare*) is established, through an abstractive process, the object itself of thought, the thinkable (*il pensabile*).

> *I can,* in thought [*pensiero*], abstract from myself as thought, as simple act, as a function of thinking, and simply *focus* on what is thought [*il pensato*]. Then what is thought is nothing less than Being, the Thinkable, the first Thinkable.
>
> (*Le prime Categorie della logica di Hegel*, 379)

In the *Frammento inedito* (Unpublished fragment [1880–81], published by G. Gentile in his own *Riforma della dialettica hegeliana* [1913]), after having pointed to the four cardinal points of his great "reform," Spaventa radicalized his initial reflections: "Being is essentially the *act* of thought." Being cannot move by itself, for it cannot move outside identity, whence the necessity of a "logical thought":

> The reflection that discovers the deepest determinations in being and non-being is *logical thought* (*das logische Denken*) through which these determinations are engendered not in a contingent but in a necessary manner*. . . .* The *Gedanke* is thought, we may even say—with or without pleonasm—the content of thought (*Gedankeninhalt*), or, as the translator puts it, *the*

speculative content. . . . Distinct from the *Gedanke, Denken* is in general the *act* of thinking, the *vis cogitans,* so to speak. This *vis* engenders all the determinations, all the *states,* all the logical elements: it is the soul of the logical process. We can rightly describe all its products as *thoughts,* in the sense in which they are engendered by it, that is, by thinking as such. . . . [Henceforth,] the true *entity* of these products will be *Denken,* not only because they are its *products,* but also because they themselves produce nothing without the *Denken* that is immanent in them.

> (*Frammento inedito*, 442, 445–47)

But Spaventa adds to this a new solution responding to the interpretive limits of the *Le prime Categorie della logica di Hegel*:

> [I]n a first phase, thought conceived as *the being* itself of being does not yet appear clearly, because it appears practically as a purely subjective function: given that *pure vision* is impossible, etc., I would ask the following question: how can we think the existent? I then retreat into thought, into the *elements* of thought, which do not constitute *concrete* thought (the latter being above all and in the first instance a thought of the existent). And I add: thinking = *distinguishing* (and uniting); being is what can be distinguished [*il distinguibile*], what is purely distinguishable [*il puro distinguibile*]. *Non-being* is the pure act of distinguishing: the existent (*Dasein,* what has become) is the *Distinct,* the pure distinct. And *becoming*? Becoming is the distinguishable (being) qua *dis-tinction* (non-being, simply, which is in this respect both identical and non-identical with being).

> (*Frammento inedito*)

2. Return to Trendelenburg and the Young Hegelians' first reform

a. Spaventa's criticism of the first categories of Hegel's *Wissenschaft der Logik* (*Science of Logic*) draws upon the objections of the Berlin Aristotelian Adolf Trendelenburg (1802–72):

> What is difficult is not acknowledging the identity of Being and Nothingness, when both of them are the Indeterminate, but rather perceiving and defining their *difference,* a *difference* without which *Becoming* itself is impossible. Most of the old Hegelians have very poorly grasped the difficulty of this position.
>
> Trendelenburg was truly the first to draw the attention of both friends and enemies of Hegel to this point, and particularly that of his enemies. . . . Trendelenburg was quite right.
>
> (B. Spaventa, *Prime Categorie*, 400).

In chapter 3 of his *Logische Untersuchungen* (1840), and under the rubric of *Die dialektische Methode,* Trendelenburg attacked the Hegelian dialectic in its inaugural triad, Being–Non-Being–Becoming (*Sein-Nichtsein-Werden*). His first question concerns the possibility of a pure thought independent of any image or intuition. That is impossible, and *movement* constitutes in fact the *Vorausgetztes* and the

actual vehicle of dialectical thought. "Das reine Sein, sich selbst gleich, ist Ruhe; das Nichts—das sich selbst gleich—ist ebenfalls Ruhe" (Pure Being, self-identical, is rest; Nothingness, self-identical, is also rest). Their sought-for unity could never produce anything more than a "static union." How then can movement be introduced into these stagnant waters?

> Aus dem reinen Sein, einer zugestandenen Abstraktion, und aus dem Nichts, ebenfalls einer zugestandenen Abstraktion, kann nicht urplötzlich das Werden entstehen, diese concrete, Leben und Tod beherrschende, Anschauung.
>
> (From pure Being, from an admitted abstraction, and from Nothingness, also an admitted abstraction, Becoming, this concrete, life-and-death-dominating intuition, cannot suddenly emerge.)
>
> (Trendelenburg, *Logische Untersuchungen*, chap. 3)

In reality, the much-vaunted "immanent connection" (*immanenter Zusammenhang*) of the system lets us glimpse different fissures, as well as a general discontinuity. The dialectical process, which was supposed to demonstrate the agreement of concept and thing, "stellt im Gegenteil die Entstehung der Sache auf dem Kopf" (on the contrary stands the origin of the matter on its head) (*Logische Untersuchungen*, 37f., 108f.). Then Trendelenburg goes through, in the categories of negation and identity, the logical means that the dialectic uses to produce, from empty Being, the absolute Idea, through the series of intermediate figures. Thus it is pointless to conceal the intuition that is already there, just as it is absurd to keep silent about the difference between "logical contradiction" and a "real opposition" that can never be attained by a purely logical route.

> [T]he responses presented by the bravest commentators of Hegel with a view to forestalling this kind of objection have absolutely not convinced me—perhaps that is an error on my part, but I cannot do otherwise than set forth very clearly my thought on this point. I shall nonetheless make a very limited exception for [Karl] Werner and Kuno Fischer.
>
> (B. Spaventa, *Prime Categorie*, 369)

b. Here Spaventa refers to the enterprise of the Young Hegelians, first of all Karl Werner and Kuno Fischer, in response to Trendelenburg's criticisms.

Karl Werner, the first "reformer," replied to the objections in his *Logik. Als Kommentar und Ergänzung zu Hegels W. der L.* (1841). Concentrating his attention, like almost all his successors, on the first triad of categories in Hegel's *Wissenschaft der Logik* as an example of the inability of Hegel's philosophy to produce movement, he grants Trendelenburg that Hegel demonstrated only the identity of Being and Nothingness, asserting that their difference was only an "opinion" (*einen nur gemeinten* [*Unterschied*]). Werner does not accept the Hegelian thesis regarding the "ineffability" of the distinction between Being and Nothingness. The central point is that one should not in any way attack the question in terms of "content," but instead keep to the level

of "form"; that is the axis of the passage from the *Phenomenology of Spirit* to the *Logic*, and the key to understanding the intrinsically negative character of Being, and, consequently, its distinction from Non-Being, from the Nothingness that is its explanation, and thus a "more" than Being which then is distinguished from it. If the Being/Nothingness distinction were only a matter of content, there would be no reason to begin with Being rather than with Nothingness—and inversely. But that is not the case, for as Werner goes on to say,

> *Nothingness is more profound* than Being, it is the very depth of Being . . . as regards *form*. Form means knowledge, because knowledge means *shape* (*gestalten*). Being begins, and Nothingness follows; it is the *impulse* for the process (*Fortgang*) in the beginning (*Anfang*); now, Nothingness is not process as such, in this form of *Nothingness*, but process as such means becoming, for only becoming *is* the beginning. Actual beginning means proceeding, means beginning and process as a single, identical process (*Gang*), as a *return to oneself*—which means, as a passing (*Übergehen*). Nothingness is the immediate precedent of Being. This knowledge is the ulterior determination. That is why we have two forms, that of the original form and that of form; form means distinction. Being and Nothingness are equally distinct, as regards *form*; for each identity, each content *is* only qua distinction, qua form, for they are at once development and manifestation.
>
> (*Logik, Als Kommentar*, 45–46)

Thus we can demonstrate the difference between Being and Nothingness by taking into account the fact that Nothingness is "interiorization-memory" (*Erinnerung*) (see MEMORY) of Being, its negation, and as "negating," that is, "thinking," already a Becoming:

> When I say Nothingness, I know more about it than when I say Being—for the latter is something more, it is what reveals itself, tearing away its own veil; for it is *naked* Being, the spirit of Being, Being in Being.
>
> In Nothingness, Being itself breaks the silence in itself. Nothingness is the reflection (*Besinnung*) [which Spaventa translates by *accorgimento*, that is, "penetration," "intelligence-consciousness-perspicacity"] of Being, the opening up in it of its meaning; its look in itself, the point where its originary character emerges. In Nothingness the sacrosanct duplicity of meaning of the emptiness of Being is unveiled. That it is nothing other than Being itself, Being through itself, *full* solely of itself—which says its emptiness, which says Nothingness. Nothingness is thus the knowledge of Being with regard to its plenitude, to its accomplishment on the basis of itself, *with regard to its free action*, to its self-creation;—and in the actuality (*in der Energie*) [= in *energeia* [ἐνέργεια] of this knowledge that moves in itself, Being no longer says Being, but *Becoming*].
>
> (Ibid., 41)

Through this identification of Nothingness with thought, movement, contradiction and necessity are reintroduced into the interior of the Hegelian dialectic. Distinction thus rediscovers its "effability" in what Hegel calls the "*speculative* system of the proposition."

Kuno Fischer, the most imposing of the German "reformers," also lays emphasis on the first categories by observing that already the first one, Being, qua result of an abstraction carried out by thought, assumes "thought in act," that is, the "act of thinking" (*Denkakt*):

> That is why logic begins for itself with the willed act of thought (*mit dem Willensakt des Denkens*), and for others, who want to construct (and teach) it, with the postulate of the accomplishment of this *Act*. The postulate says: "*think.*"

> (*System der Logik und Metaphysik oder Wissenschaftslehre*)

But Being, qua abstract and at rest, denies thought, that is, it denies itself, contradicts itself, and so does Nothingness, which is not pure absence of Being but its negation, that is, its contradiction. Thus they pass into one another, giving rise to Becoming, where the contradiction is dissolved.

> Thinking and Being are identical. Thinking and being are non-identical. The identity is explained in the concept of being, the non-identity in the concept of non-being.

> (*Logik und Metaphysik oder Wissenschaftslehre*, 194–98)

That is the contradiction internal to Being—to the concept of Being, which permits Fischer to explain Becoming without leaving pure thought. Here everything depends on the act of "abstraction."

> In the act of abstraction [*Akt der Abstraktion*], thought withdraws from all external content and every given into its pure activity, thus creating, on the basis of this material, the universal system of pure concepts that produce themselves as necessary actions of thought in the dialectical order. . . . Pure thought contains the preceding stages of the natural and spiritual world as moments that are prominent in itself, and it is thus, by its very nature, full of the essence of things. It is therefore incomprehensible that someone [Trendelenburg!] should reproach Hegel for thinking that acts of pure thought [*die Akte des reinen Denkens*] (the categories) are creations *ex nihilo*.

> (Ibid., §28f.)

While Werner was concerned about introducing movement into the inaugural triad by identifying the second category (Nothingness) with thought, Fischer makes the latter retrocede into the first (Being). The 1865 edition radicalizes still further this gnoseological and subjectivist dimension of Hegelian logic by definitively shifting attention from the initial Being/Nothingness relationship to the "unprecedable" (*indevançable*) Being/Thought relationship:

> [Thought is] *necessary* Thought, or Thought in which nothing is represented other than what is Thought itself: its necessary function.

> (*System der Logik*, 205–6)

B. *Wirklichkeit—Aktuosität* versus *attualità*: Translation's decision

In section 3 of the *Wissenschaft der Logik* (1812 ed.), entitled "Die Wirklichkeit," Hegel introduces, in the third paragraph of "Relation of Substantiality," the notion of *Aktuosität*:

> Diese Bewegung der Accidentalität ist die Aktuosität der Substanz als ruhiges Hervorgehen ihrer selbst. Sie ist nicht thätig gegen Etwas, sondern nur gegen sich als einfaches widerstandloses Element.

> (This movement of accidentality is the actuosity [*Aktuosität*] of substance as a tranquil coming forth of itself. It is not active against something but only against itself as a simple unresisting element.)

> ("Die objektive Logik," Part I of *Wissenschaft der Logik*; trans. A. V. Miller, *Hegel's Science of Logic*)

Further on, in the context of the "Relation of Causality," Hegel continues:

> Die Substanz geht . . . in ihrem Bestimmen nicht von der Accidentalität aus, als ob diese voraus ein Anderes wäre, und nun erst als Bestimmtheit gesetzt würde, sondern beides ist Eine Aktuosität. . . . So ist die die absolute Aktuosität Ursache.

> (Substance proceeds . . . in its determination not from accidentality, as if the latter were formerly something different, and were only now posited as something determined, but rather both are an *Aktuosität*. . . . Thus absolute *Aktuosität* is cause.)

Finally, in the *Zusatz* at paragraph 34 of his *Encyclopedia of the Philosophical Sciences*, Hegel explains the following:

> Der Geist ist Tätigkeit, in dem Sinne, in welchem schon die Scholastiker von Gott sagten, er sei absolute Aktuosität.

> (Spirit is activity, in the sense in which the Scholastics already said of God that he is absolute *Aktuosität*.)

In short, Hegelian *Aktuosität* (the state of what is "in actuality," that is, that which has force and density) is nothing other than the manifestation of substance's own *Wirklichkeit*, or what constitutes, in the strong sense, the essential "actuality" of a thing—its reality as necessary reality of the self in relation to itself, that is, free. It is a question, in this context, of explaining, against a certain reifying understanding of Kantian thought, that nothing preexists the movement of manifestation conceived as *die sich selbst gleich absolute Wirklichkeit* (absolute self-identical reality) (*Wissenschaft der Logik*, 269).

While the term *Aktuosität* appears once in Johann Gottlieb Fichte's work, it nonetheless is not one of his own categories. It is in response to Friedrich Heinrich Jacobi, and in the context of the accusation of "nihilism"" (where the term

Aktuosität is created for the first time by Jacobi himself!) that this single occurrence is located:

> Was er [Jacobi] von der Freiheit sagt: Wer sie läugne, komme auf eine unbestimmte Aktuosität und Agilität an sich.
>
> (What he [Jacobi] says about freedom: anyone who denied it would arrive at an indeterminate *Aktuosität* and agility in itself.)

> (J. G. Fichte, *Nachgelassene Werke*, 3:390)

It is, moreover, probable that Hegel himself took this term from Jacobi, and more particularly from the following passage in the *Beilagen zu den Briefen über die Lehre des Spinoza*:

> Aus dem Satze: das Werden könne eben so wenig geworden oder enstanden sein, als das Sein oder die Substanz, zog Spinoza die richtige Folge, daß eine ewige unendliche Actuosität der Materie eigen, und ein unmittelbarer Modus der Substanz sein müsse.
>
> (From the proposition: Becoming can no more have become or emerged than Being or substance can, Spinoza drew the right conclusion, that matter must have an eternal, infinite *Actuosität*, and that there must be an immediate mode of substance.)

> (F. Jacobi, *Werke*, 4:2, 137–40)

In reality, through Jacobi, it is the whole speculative apparatus of German idealism that was thus condemned: the question of substance, of the Absolute's self-presentation, and their fatal inscription in Spinozism. Although Spinoza does not use the concept of *actuositas*, the obvious allusion to Jacobi is accompanied by a certain allusion to Spinoza affirming that divine power (*potentia*) is none other than his *essentia actuosa* (God's essence in action) (Spinoza, *Ethics* 2, prop. 3, schol.).

The critics seem never to have inquired into the origin of an act and a translation decision rife with an unprecedented conceptual and doctrinal force, nor into the source of the speculative and "transductive" passage from *Wirklichkeit* to *Attualità*. It is as if philosophers were satisfied with a kind of obviousness of the system delivered in its general economy, in the aftermath of its "monumentalization": Italian neo-idealism, and the "actualism" of Gentile. Although the inscription of this lexical-doctrinal history can be read in the text itself, in Spaventa's pure and simple substitution of the neo-Hegelian *attualità* for every occurrence of the Hegelian *Wirklichkeit* (reality), it seems possible to reinscribe this choice in the Hegelian original as such. Let us note that it is the "intermediary link" of Spaventa's writings that dominated the whole future of this twist, which is simultaneously translational, practical, and speculative, of interiorization-memory (*Erinnerung*) within the "little Hegelian" system peculiar to Italy. It is in fact in the intermediary work of 1867, and in the central chapter of Spaventa's *Doctrine of Essence*, that the decision to translate the Hegelian *Wirklichkeit* by *attualità* was made. The choice of this topic is not accidental: as the "background" of Being, Essence is this internal alterity that defines it as Being. It is a structuring alterity, the very dynamism of its engenderment, the process of its

"actualization," that is, of the movement without origin or end that precedes (logically) all facticity, and which, freeing it from its representative fixity, brings out its potentialities by connecting it with itself as its other.

The present author's hypothesis is thus that seeking to strengthen a radicalization of the "active" and "actualizing" part of the category of *Wirklichkeit*, on the basis of a dynamic return of the resources of the neo-Fichteans, Young Hegelians, and the nascent Philosophie der Tat (through the connected notions of *Tat*, *Handlung*, *Tathandlung*, *wirken*, *Tätigkeit*, *Akt*. . . . See TATSACHE), the concept of *Aktuosität*, itself radicalized, certainly offered the model for the whole construction leading to the replacement of the master category of *Wirklichkeit* by that of *Attualità*. Its radicalization has in particular to do with its privileged attribution to the Absolute as such, namely God (cf. the previously cited Hegelian *Zusatz*). Let us note in passing that the English translation of Hegel's *Wissenschaft der Logik*, as well as the associated critical literature (McTaggart, Mure, Harris), proposing a parallel solution, were also to establish the term "actuality" as a translation of *Wirklichkeit*. In France, while Eugène Fleischmann hesitates between *réalité agissante* and *actualité* (*La Science universelle ou la Logique de Hegel* [glossary]), André Droz opts for *Wirklichkeit-Actualité* on the basis of a historical and categorial argument (the Hegelian relation to the tradition of Aristotelian onto-theology, around [l'ἐνέργεια], [l'ἔργον], and to Spinozism) (*La Logique de Hegel et les Problèmes traditionels de l'ontologie*, 123, 125–75).

Thus the act of translating set the translated text in movement; it is the translating, that is, the copy, that stimulates and activates the translated, that is, the "original," by thus providing it a "more-than-life," a "sur-vival," a *fort-leben* that is always to come as Life of the Spirit raising/removing itself above Nature (cf. C. Alunni, "La langue en partage," 63). This was, moreover, to become the categorial and speculative paradigm for the whole political/logical system of" the "(Italic) circulation of European ideas."

II. The Actualism of Giovanni Gentile (1817–83)

Actualism is a doctrine from which Martin Heidegger found it necessary to distinguish himself imperatively and explicitly in 1941: "Actualism is the reverse side of Historicism as a philosophy of the pure Act."

A. The act of auto-synthesis

Following Spaventa, Gentile takes into account the same necessity of reforming Hegelianism in a radically "immanentist" sense by founding a concept of Spirit (*Geist*) conceived through and through as an "auto-concept," as well as a synthesis that is through and through an "auto-synthesis."

To speak of dialectic is to speak of autonomy; that is why the dialectical conception of the real no longer accepts the positing of a *Logos* (of the "Idea") alienated outside itself—or Nature—but wants a *Logos* that, on the basis of itself, makes itself an object inside itself: it is spirit as act that *ex se oritur* (originates in itself). That is what Spaventa approached by positing, in the margins of Hegel's text, "Thinking" at the generating center of Being, this Thinking that he described as a "great prevaricator." Gentile mentions that in Spaventa's

magisterial work of 1861, *La filosofia italiana nelle sue relazioni con la filosofia europea*, the author noted the necessity of "mentalizing (*mentalizzare*) [Hegel's] logic." But it was in his *Frammento inedito* (449) that Spaventa came closest to a "pre-actualist" textuality:

> Generally, subjective thought is reflection: *Nachdenken* (rethinking); it presupposes *Denken* (thinking), and in this sense is posterior to it. Hence logic, whatever it is, is posterior to the *logos*: Hegel's *Nachdenken* is posterior to *Denken*, whose secret he intended to reveal. . . . For some Hegelians (Gabler, "La droite hégélienne"), thinking (*Denken*) is and remains absolutely and eternally thought and thinking in itself, that is, absolute subject: we could also say *Vordenken*, *Vorsubjekt* (proto-thought, proto-subject); thought or the human subject, reflection, are *Nachdenken*; the absolute subject thinks: as for us, we think again.

Thus for Gentile it is clear that

> Spaventa succeeded in glimpsing the principle of idealism as we now understand it, by sapping the opposition between logic (*Denken*) and reflection (*Nachdenken*), by wholly resolving the dialectical process, on the basis of Being itself, in the pure act of thinking: whence the genuine liquidation of the transcendent, and the *actuation* (*l'inveramento*) [which translates as *Verwirklichung*—trans.]

of Hegelianism as "transcendental dialectic," and, consequently as absolute immanentism.

(*La riforma della dialettica hegeliana*, 37)

It is on this Spaventian basis (and drawing more on the system inaugurated by Kuno Fischer than on Werner's first reform) that Gentile affirms his great principle that was to "reform" the whole of transcendental logic: the true category, the true idea, is act, act in act, this *actus purus* in which the "transcendental ego" consists as a eternal positing of self in the other, of self as an other, the dialectical union of opposites, of subject-object. It thus imposes a sort of transcendental concept of the dialectic—which he describes in Spaventa as "dialectic as *Wissenschaftslehre*" (*La riforma,* 30)—by positing, at the very heart of becoming, the Being-subject of "thinking thought" (*pensiero pensante*), "that *pure act* of thought (*del pensare*), which is eternal." This thought or "universal ego" is beyond time. "Nothing, finally, transcends thought [which is] absolute immanence," and the totality of experience restitutes its process, a veritable productive synthesis of self, or *autoctisi.*

■ See Box 1.

A single task remains: to resolve the object in itself, in the "becoming-act" of thinking, by moving from an analytical categoriality (at the hypostatized level of the *res*) to auto-synthetic categoriality (level of *autoctisi*), of the transcendental dialectic of Being as an auto-concept.

1

"Auto-": "Auto-subject," "auto-concept," "auto-synthesis," *autoctisi*. . .

➤ I/ME/MYSELF, SELBST

For Gentile, Hegel, whom he regarded as having forgotten the very nature of a dialectical logic, did not achieve a full awareness of the fact that the generating center of the circular movement of the Absolute (thesis-antithesis-synthesis) can only be thought itself as a subject that is an "auto-subject" (*autosogetto*), a synthesis that is an *act* of "auto-synthesis" (*autosintesi*). "Auto-concept" (*autoconcetto*) and "auto-synthesis" thus provide the titles for chapters 6 and 8 of the *Sistema di logica come teoria del conoscere* (1:74f. and 153f.). Here the prefix "auto-" is used to express the German *Selbst*, the reflected/reflecting Ego in itself in its objectivization, the "auto-subject":

> "Concept" is the thought (*pensamento*) of the truth objectively considered as independent of the act that thinks it (*dell'atto del pensarla*). . . . Auto-concept (*autoconcetto*) is the thought (*pensa-mento*) of the truth that is constituted in the very act of thinking (*pensiero*) that thinks. A thinking intrinsic to the truth which thus thinks itself.

(Ibid., 2:153)

The Self is the Self on one condition: qua *ex se oritur*, qua identical with and different from itself. Its being is neither simple identity nor simple difference, nor simple unity of identity and difference; but this unity qua creative of itself: *autoctisi*: a synthesis that posits its terms in their synthetic relationship.

(Ibid., 2:81)

Autoctisi: Here, Gentile transposes the Greek [αὐτοκτίσις] to designate thought's self-foundation, self-creation:

> There is neither any pure thesis nor any pure antithesis: non-being and non-non-being: but the synthesis, that unique act that we ourselves are, Thinking (*il Pensiero*). Being (thesis) in its abstraction (*astrattezza*) is nothingness; nothingness of thinking (*pensiero*) (which is true being). But this thinking, which is eternal, is never preceded by its own nothingness. It is rather this nothingness that is posited by it; and it is, qua nothingness of thinking (*nulla del pensiero*), thinking of nothingness

(*pensiero del nulla*) that is integral thinking. The thesis does not make the synthesis possible; on the contrary, it is the synthesis that makes the thesis possible by creating it with its antithesis, that is, by creating itself. That is why the pure act is *autoctisi*.

(*La riforma della dialettica hegeliana*, 195)

The generic correlative of this autonomic character is the concept of "self-consciousness" (Ger. *Selbstbewusstsein*): the object of the Ego is the Ego itself. Every cognitive process is an act of self-consciousness.

> Self-consciousness is neither an abstract identity, nor immobility, but precisely a concrete act. If it were something identical, inert, it would need something else to move. But that would destroy its freedom. Its movement is not something posterior to its being: it coincides with being. Self-consciousness is movement or process as such.

(*La riforma della dialettica hegeliana*, 194)

B. Praxis in translation

1. Complex exchangers

Gentile always considered Spaventa to be an idealist who considered and valued experience, and whose philosophy consequently had no pure theoretical moment. The gain in the objectivity of knowledge, the very one that can constantly dissolve the ever-recurring opposition between the titular subject of this knowledge and the object that is supposed to make this same knowledge "objective," is, for Spaventa, a "*practical* process."

> But all that is impossible in the order of pure theory, without practical activity. . . . This concept, lucidly set forth by Spaventa, is, in my opinion, the key to the new, post-Kantian gnoseology; and it is a great merit in our philosopher to have revealed it in Hegel's *Phenomenology*, and to have brought it to light. It was moreover one of the most profound ideas of one of Hegel's German epigones who was very famous but certainly unknown to Spaventa in this regard: Karl Marx. . . . Man can prove truth in *praxis*, that is, in reality and power, the positivity of his own thought.

(G. Gentile, "Bertrando Spaventa," 111–12)

Gentile thus emphasizes the point where Spaventa's concept, which he shared, of a concrete knowledge conceived as action, intersects with Marxist *praxis*. Gentile's "act" will always have to be grasped as practical activity, *praxis*, that is, as transformative, creative, and revolutionary (fascist) activity (see PRAXIS).

This is the site of the greatest density of the translative exchangers implemented by actualism, the site of their speculative crystallization and their historical-political precipitate. What are its fundamental equations? "Actualism" defined as the "philosophy of the *pure act*" raises, as soon as it is posited, a question concerning the historical-political translation and "traditionalization" of philosophy in general; we must also add the question of what is described, north of the Alps, as cultural or historical hegemony. From the first sequence—the body of texts collected in Gentile's *La riforma della dialettica hegeliana* (particularly "The Act of Thinking as Pure Act," 1911)—to those that were to inaugurate performatively the new era (a new *Zeitalter* in politics, Heidegger said, confronted with a work entitled *Aktualismus, Schellings Abhandlung über das Wesen der menschlichen Freiheit*) in the form: "Everything is in the state, and nothing human or spiritual exists, and less still, has any value, outside the state. In this sense fascism is *totalitarian*." Gentile appeals to the state-pedagogue and his foundational role. (Here we may speak of a certain consequence of Hegel's *Encyclopedia of the Philosophical Sciences*, which is doubly pegged to a "philosophy of action" [*Philosophie der Tat*] and a "role of the scientist." It is noteworthy that both dimensions are largely indebted to a Hegel who has himself been rewritten by the early Fichte.) The translational exchanger connected with the *Philosophie der Tat* refers first of all to Moses Hess and his *European Triarchy* (1841), conceived (against Hegel) as a "holy action of the Spirit" and divided into *subjektive GEISTEStat*, *absolutes GEISTESphilosophie*, and *absolute GEISTEStat*, where the true theoretical commutator of the sequence appears, here

too, as the sovereign "Spirit" of which history is the product. In his *Philosophy of Action* (1842–43), Hess defines the "ego" as "the performance of an act" (see G. Bensussan, *Moses Hess. La philosophie, le socialisme (1836-1845)*, 174). The "I think" is thus designated as the action that includes three moments, which taken together constitute the ego; and the latter . . . is not a being . . . but the *performance of an act*." Thus here we have the sequence of the concepts *Akt*, *Tat*, and *Tätigkeit*, which question the Hegelian opposition between the sphere of interiority (*Tätigkeit, Tun*) and the sphere of real exteriority (*Tat*). "Action" represents the integrated unity of thinking (*Denken*) and doing (*Handeln*). Let us add, still apropos of Hess, this other point of contact that is the goal of an essential alterity of the future, of an irreversible novelty that constitutes the background of this prospective view *in actu* as a "praxological" reduplication of the contradiction speculative action/philosophy. Here the Fichtean operator of the *Tat-Handlung* is still one of those most present.

We must also add to the circle of the exchanger the signatures of A. von Cieszkowski, Bruno Bauer, and Arnold Ruge. Let us note the latter's programmatic imperative:

> In place of the system of abstract and theoretically absolute development, the system of concrete development now offers itself, a system that conceives spirit everywhere in its history, and posits the requirement of its future at the end of every history. Hegel's speculative contemplation has to be awakened by Fichte's active force.

(A. Ruge, *Hallische Jahrbücher*, 1209f.)

Disagreeing with subsistent reality, the representatives of the Hegelian Left thus refer their present to the future, a fundamental leitmotif adopted by Gentile.

2. The return of German translation in Italy

These attempts to reform the Hegelian dialectic are presented as an effort to translate the results of German philosophy into a language adhering to the actual requirements of the civil and speculative life of the Italian nation. At the same time, this practice of translation was accompanied by its actualist theory. Whereas Antonio Rosmini (1797–1855) called Hegel a "speculative smuggler," Spaventa developed, through his theory of the "circulation of European ideas," a general and speculative theory of "translation"/"tradition" by relating different philosophical traditions as contraband, import-export, and then as traditionalization (unless it should be called nationalization). He considered the constellation of German idealism a simple resumption (a pursuit, underground and elsewhere) of a national and philosophical textuality in exile, constituted "originarily" by the purest renascent and modern Italian philosophical tradition.

It is precisely this textuality, first translated into German by Hegel, that Spaventa sought to "repatriate" into an "original" Italic space. Here the (German) "original" is already a translation of the translating language (Italian).

Through the work of these series of conceptual and doctrinal exchangers we see the constitution of a genuinely European philosophical fabric marked by a triangulation of which the mediator, up to that point absent from Franco-German *Begriffsgeschichte*, is none other than what we would

describe as the third party excluded from the Franco-German Annals: Italy.

This system, which is extremely innovative for every contemporary theory of the act of translation, is accompanied by an absolutely pioneering text by Gentile: "Il torto e il diritto delle traduzioni" ("Wrongs and Rights of Translation") in *Frammenti di estetica e letteratura*. In 1920, four years before Walter Benjamin published his famous essay "Die Aufgabe des Übersetzers" ("The Task of the Translator"), the founder of actualism had already given a performative dimension to both to what Roman Jakobson was to call "intralinguistic translation" and to Benjamin's notions of an *Ur-Sprache* (originary language) or *Überleben/Fortleben* (survival, afterlife), while at the same time defending (against Benedetto Croce) the idea of a genuine "poetics" of translation.

The necessary condition for such a conception no doubt has to do with the whole complex, self-reflexive history of this translating/traducing of the concept of *Wirklichkeit* into the performative *attualità*. It is through the actualization of this deviation that these views of translation and the theory of translation were able to see the light.

AUFHEBEN, AUFHEBUNG (GERMAN)

FRENCH *supprimer, suppression; abolir, abolition; sursumer, sursomption; assumer, assomption; dépasser, surpasser, abroger, sur-primer, mettre en grange; enlever, enlèvement; relever, relève*

➤ DIALECTIC, and GERMAN, MOMENT, NEGATION, PLASTICITY, RUSSIAN, VERNEINUNG

Since 1939, when the first volume of Hegel's *Phenomenology of Mind* translated into French by Jean Hyppolite was published, *aufheben* and *Aufhebung* have been revered as fetishes of the untranslatable. The "double meaning" (to adopt Hegel's term) of a verb, *aufheben*, that means both "maintain, preserve" and "halt, end," has not only been recognized by Hegel's interpreters and specialists in German philosophy but has become simply part of today's philosophical culture. *Aufhebung* refers to a turn of thought that consists in "transcending" a point of view without refuting it, in carrying out a "synthesis" while retaining the best part of the "thesis" and "antithesis" and at the same time "opening" onto broader perspectives. Perhaps aided by academic habits and the practice of the dissertation, and certainly favored by the penetration of Hegelianism in France after 1945, the debate regarding these two words is probably the most long lasting, the most documented, and the best known of all those that concern problems of philosophical translation.

To draw up a complete list of the French translations of *aufheben* and *Aufhebung* would be a project in itself, which several scholars have already undertaken; here we will limit ourselves, in a first phase, to bringing it up to date.

The most recent inventory (Pierre-Jean Labarrière, 1986, following Gilbert Kirscher, 1978) included, for *aufheben*, and in the order of their entrance on stage: *supprimer* (Jean Hyppolite, 1939) and its neologistic variant, *sur-primer* (Jean Wahl, 1966), *abroger* (Albert Baraquin, 1975), *enlever* (André Doz, 1976), *mettre en grange* (Jean-Louis Vieillard-Baron, 1977), *conservé et dépassé* for the past participle *aufgehoben* (Henri Denis, 1984, preceded by Xavier Tilliette, who in 1973 proposed *dépasser* or *surpasser* for the infinitive), *assumer* (Emmanuel Martineau, 1984). The candidates that have remained the most famous are *relever* (Jacques Derrida, 1972, adopted by Jean-Luc Nancy, 1973) and *sursumer* (following Yvon Gauthier, 1967, Pierre-Jean Labarrière and Gwendoline Jarczyk, first for the *Wissenschaft der Logik* that they translated beginning in 1972). In 1991 Jean-Pierre Lefebvre proposed *abolir* and *abolition* for the noun *Aufhebung* in the *Phenomenology of Mind*, while G. Jarczyk and P.-J. Labarrière used *sursumer* and *sursomption* in their translation of the *Phenomenology* in 1993.

These proposals have not all been useful in translations of works or even particular texts by Hegel: it is the Hegelian *Aufhebung* in general, outside any context, that people seek to translate. This provides an initial illustration of the fetish status that *aufheben* and *Aufhebung* very rapidly took on: people debate *one* word (or two words), and everyone feels competent to propose something, without necessarily dealing with a particular textual content. That is what we have to understand first in the numerous declarations that make *Aufhebung* the main difficulty or the key to what is called "Hegelianism" (see, for example, J. Wahl, "Le rôle de A. Koyré").

I. *Aufhebung* and Its Text: The Remark on *Aufheben* in Hegel's *Wissenschaft der Logik* (1812–31)

This decontextualization of *aufheben* has itself to be explained. We can show that it has its origin in Hegel himself. The word is discussed in the *Wissenschaft der Logik* in a note on terminology that has, as was probably inevitable, attracted all the exegesis of the Hegelian *Aufhebung*. We must therefore reread this text without, however, committing ourselves with regard to the translation of the word at issue:

Anmerkung. Aufheben und das Aufgehobene (das Ideelle) ist einer der wichtigsten Begriffe der Philosophie, eine Grundbestimmung, die schlechthin allenthalben wiederkehrt, deren Sinn bestimmt aufzufassen und besonderes vom Nichts zu unterscheiden ist.—Was sich aufhebt wird dadurch nicht zu Nichts. Nichts ist das Unmittelbare; ein Aufgehobenes dagegen ist ein Vermitteltes, es ist das Nichtseyende, aber als Resultat, das von einem Seyn ausgegangen *ist; es hat daher* die Bestimmtheit, aus der es herkommt, noch an sich Aufheben hat in der Sprache den gedoppelten Sinn, daß es so viel als aufbewahren, erhalten bedeutet, und zugleich so viel als aufhören lassen, ein Ende machen. Das Aufbewahren selbst schließt schon das Negative in sich, daß etwas seiner Unmittelbarkeit und damit einem den äuß erlichen Einwirkungen

offenen Daseyn entnommen wird, um es zu erhalten.—So ist das Aufgehobene ein zugleich Aufbewahrtes, das nur seine Unmittelbarkeit verloren hat, aber darum nicht vernichtet ist.—Die angegebenen zwei Bestimmungen des Aufhebens können lexikalisch als zwei Bedeutungen dieses Wortes aufgeführt werden. Auffallend müßte es aber dabei seyn, daß es eine Sprache dazu gekommen ist, ein und dasselbe Wort für zwei entgegensetzte Bestimmungen zu gebrauchen. Für das spekulative Denken ist es erfreulich, in der Sprache Wörter zu finden, welche eine spekulative Bedeutung an ihnen selbst haben; die deutsche Sprache hat mehrere dergleichen. Der Doppelsinn des lateinischen: *tollere* (der durch den ciceronianischen Witz *tollendum esse Octavium*, berühmt geworden), geht nicht so weit, die affirmative Bedeutung geht nur bis zum Emporheben.

(Hegel, *Wissenschaft der Logik*, in *Sämtliche Werke*, 1965, 4:119–20)

(Remarque. *Aufheben* et le *Aufgehobene* [participe passé substantivé] (l'idéel) est l'un des concepts les plus importants de la philosophie, une détermination fondamentale qui revient purement et simplement partout, et dont il convient de saisir le sens de façon déterminée, en particulier en le distinguant du néant [*Nichts*].—Ce qui se *aufhebt* ne devient pas par là néant. Le néant est l'immédiat; en revanche, un *Aufgehobenes* est quelque chose de médiatisé, c'est le non-étant, mais comme résultat sorti d'un être; il a donc encore en lui la déterminité [*Bestimmtheit*] dont il provient. *Aufheben* a dans la langue un double sens qui fait qu'il signifie à la fois quelque chose comme conserver [*aufbewahren*], garder [*erhalten*], et quelque chose comme faire s'arrêter [*aufhören lassen*], mettre fin [*ein Ende machen*]. Le fait de garder inclut déjà en soi le négatif, au sens où quelque chose se trouve soustrait à son immédiateté et ainsi à un être-là [*Dasein*] ouvert aux influences extérieures afin de garder son être-là.—Ainsi le *Aufgehobene* est-il en même temps quelque chose de conservé, à ceci près qu'il a perdu son immédiateté, sans pour autant l'avoir anéantie [*vernichtet*].—Les deux déterminations de l'*Aufheben* données plus haut peuvent d'un point de vue lexical être présentées comme deux significations de ce mot. Pourtant, il faut s'étonner qu'une langue en soit venue à employer un seul et même mot pour deux déterminations opposées. Pour la pensée spéculative, il est réjouissant de trouver dans la langue des mots qui ont en eux-mêmes une signification spéculative; la langue allemande à plusieurs de cette sorte. Le double sens du latin *tollere* (rendu célèbre par le jeu de mots de Cicéron : *tollendum esse Octavium*) ne va pas aussi loin, la détermination affirmative ne va que jusqu'à l'élévation.)

(Hegel, *Science de la logique* [emphasis in original])

(Remark: The expression "To Sublate." *To sublate* [*aufheben*], and the *sublated* [*aufgehobene*] (that which exists ideally as a moment), constitute one of the most important notions in philosophy. It is a fundamental determination which repeatedly occurs throughout

the whole of philosophy, the meaning of which is to be clearly grasped and especially distinguished from *nothing* [*Nichts*]. What is sublated is not thereby reduced to nothing. Nothing is *immediate*; what is sublated [*aufgehobene*], on the other hand, is the result of *mediation*; it is a non-being but as a *result* which had its origin in a being. It still has, therefore, *in itself* the *determinateness* [*Bestimmtheit*] *from which it originates*. "*To sublate*" has a twofold meaning in the language: on the one hand it means to preserve [*aufbewahren*], to maintain [*erhalten*], and equally it also means to cause to cease [*aufhören lassen*], to put an end to [*ein Ende machen*]. Even "to preserve" includes a negative element, namely, that something is removed from its immediacy and so from an existence [*Dasein*] which is open to external influences, in order to preserve it. Thus what is sublated [*aufgehobene*] is at the same time preserved; it has only lost its immediacy but is not on that account annihilated [*vernichtet*]. The two definitions of "to sublate" [*aufheben*] which we have given can be quoted as two dictionary *meanings* of this word. But it is certainly remarkable to find that a language has come to use one and the same word for two opposite meanings. It is a delight to speculative thought to find in the language words which have in themselves a speculative meaning; the German language has a number of such. The double meaning of the Latin *tollere* (which has become famous through the Ciceronian pun: *tollendum est Octavium*) does not go so far; its affirmative determination signifies only a lifting-up.)

(Hegel, *Science of Logic*, 1:106–7, trans. A.V. Miller)

By reattaching it to its context, that of the beginning of *The Doctrine of Being*, where being and nothingness, far from being fixed points of reflection, merely pass into one another, and where the becoming that succeeds them in the unfolding of objective logic is not the "unity" of being and nothingness, but rather the very movement of their passage, J.-L. Nancy presents the text in its characteristic *chiaroscuro* (Nancy, *La remarque spéculative*, 107). The difficulty can be summed up this way: the effect of displaying the word, elicited by its particular treatment in a terminological note, is countered on the other side by the absence of any definition or even explanation of *aufheben*, whereas according to Hegel it is a "concept," and moreover, "one of the most important in philosophy." Nonetheless, this concept did not wait for the remark that is devoted to it in the text to act and constitute the operator of the dialectic of being and nothingness, but in a way that is itself difficult to assign. Hegel resorts from the outset to various names for action as substitutes for *aufheben*—*übergehen* (pass into), *auflösen* (dissolve), *verschwinden* (disappear)—each of which raises particular difficulties and does not allow us to determine exactly what *aufheben* is, its nature, and the object on which it operates (ibid., 42–58). Inversely, the explanations given in the Remark are not deducible from what precedes it. For Hegel *aufheben* does not mean "annihilate" (*vernichten*); the operation of *Aufhebung* produces something, a "result" that, in virtue of the very fact that it is a result, is something "mediated" (*ein vermitteltes*). From this, however, one cannot conclude that mediation defines

Aufhebung. Rather the reverse (ibid., 62), just as the recourse to the terms of the dialectic of being and nothingness in the Remark (in particular, the distinction that it makes between what is *aufgehoben* and nothingness, *Nichts*) should not lead us to believe that the concept of *Aufhebung* draws all its resources from this dialectic: if that were the case, it could not "recur everywhere" in philosophy. Thus not only is the meaning of *aufheben* made difficult by the coexistence of two meanings "from the lexical point of view" (in natural language) but the "speculative" sense of the word eludes our grasp even in the texts that are supposed to explain it (ibid., 78) and that reveal themselves instead, as Nancy shows, to be incapable of "following the straight line of a discourse" (ibid., 97).

Thus we can better understand the way the debate has proceeded, its obsession with the word, or rather the name *Aufhebung*, whereas it is the verb that Hegel uses most often (in the table of contents of the *Wissenschaft der Logik*, this Remark is listed under the title "The expression [*Ausdruck*] *aufheben*"). As for the difficulty itself that is dealt with in this discussion, it is simple. The best formulation has been provided by J. Wahl, at a time (1966) when the translators' controversies had not yet obscured the stakes: "It is very difficult to say at once 'abolish and preserve'" (*supprimer et conserver*) (J. Wahl, "Le rôle de A. Koyré," 22).

II. *Aufhebung* between Positivity and Negativity

The first question in the debate can be quite rapidly decided with the help of the Remark on *aufheben* in the *Wissenschaft der Logik*: the latter, by virtue of its very generality and its "disconnection" from any precise context (J.-L. Nancy, *La remarque spéculative*, 66) provides at least a good criterion for evaluating translation proposals. This criterion resides in the affirmation of a *positivity* of the process of *aufheben*, which excludes all translations marked by a negative or destructive meaning. The Remark expressly distinguishes *aufheben* from *vernichten* ("annihilate") and from *Nichts* ("nothingness"): we have seen that what is *aufgehoben* is not abolished but remains or rather becomes something that the text calls "mediated" (*ein vermitteltes*). In the lexical network of the Remark, this definition of *Aufhebung* as a process of mediation draws on another distinction between nothingness (*das Nichts*) and the nonexisting (*das Nichtseiende*): there is no nothingness, there is the nonexistence *of* something, in other words, a determinate nonexistent, and not a void of determination, since nothingness in fact cannot be thought. Mediation and determination are thus the two characteristics of the process of *Aufhebung* and found its positivity.

We can grant that here we are dealing with an exegetical achievement. P.-J. Labarrière has particularly emphasized this: "Such a positivity of the negative in the movement itself of its accomplishment—in the becoming that it engenders—is the most direct meaning of *Aufhebung*" ("Sursumer/sursomption," 107). That is why "all translations that privilege the aspect of negativity—*supprimer, abolir, abroger*—will be deficient from a speculative point of view" (ibid., 109). Labarrière then proposes *sursumer* ("sursume"), following Y. Gauthier, who created this neologism by contrast with the Kantian "subsume": in Kant, "subsuming" is defined as the

action of "distinguishing whether something does or does not stand under a given rule (*casus datae legis*)" (*Critique of Pure Reason*, "Analytic of Principles," Introduction, B 171), whereas Hegelian *sursumption* would designate, inversely, "the process of totalizing the part" (Y. Gauthier, "Logique hégélienne," 152n5). It is striking that Emmanuel Martineau's violent polemic against the Labarrière-Jarczyk solution was also waged in the name of the positivity of *aufheben*: to "sursume," which is supposed to persist in "referring to *supprimer* and *surmonter*," or again "the idea of an *eviction* of a less elevated term by a more elevated term" (E. Martineau, "Avertissement," 17), we are asked to prefer *assumer* ("assume"), with the edifying and Marial *assomption* ("assumption") for *Aufhebung*.

It is surely here that the debate about *Aufhebung* in French goes astray, where it unveils the most clearly its strangeness: without realizing it, we have come to debate the nuances of a neologism that should have only those that its inventor gave it. But there is no doubt a reason why, once we have granted the common premise according to which *aufheben* has to be rendered by a verb that brings out its positivity, the competition persisted among proposed translations. *Sursumer* and *relever*, the two main candidates in recent Hegelian literature in French, seem to be of equal value, as do *dépasser* and *assumer*, at least insofar as they do not suggest suppression or annihilation (despite what P.-J. Labarrière says ["Sursumer/sursomption," 116], we do not see what *relever* can add in the way of a negative meaning). On the one hand, however, we have a neologism; on the other, dictionary terms are used, taking greater or lesser liberties with what is supposed to be their definition (notably in the case of *relever*). We must now examine this new dividing line.

III. The Idiomaticity of *Aufheben*:
Between Natural Language and Peasant Folklore

The point of departure is twofold: French has no word that means "both 'abolish' and 'preserve'" (J. Wahl), and *aufheben* is a word that is, if not exactly everyday, at least perfectly ordinary in the German vocabulary. But we must also ask: what does it mean to say that this German word means "both 'abolish' and 'preserve'"? The comparison Hegel makes with the Latin *tollere* on the basis of a pun (*Witz*, see INGENIUM) made by Cicero (*Ad familiares*, XI, 20) allows us to illustrate this. *Tollere* means either "raise" (to the highest office) or "eliminate, abolish): the *Witz* proceeds from the fact that Cicero succeeds in making this "second meaning," which is threatening, heard in a passage that is apparently favorable to Octavian ("We must praise this young man, adorn him with all the virtues, *tollere* him"). On the other hand, *aufheben* means both "preserve" and "put an end to," both at the same time and "both at once." The first concern of French translators has been to understand how such a thing is possible. They thus set out to find communicative situations in which *aufheben* has both its meanings simultaneously, without leaving what P.-J. Labarrière calls its "'natural' site" ("Sursumer-sursomption," 105). Hence on the basis of the supposedly idiomatic expression "Konfituren für den Winter aufheben," the now famous example of jam jars and their contents, the fruit is *aufgehoben*, that is, modified "by a form of negation" that "makes it apt to subsist under other conditions than those which were originally its own" (ibid., 106), that is, the negative preservation of immediacy Hegel talks about in the Remark. A still more pronounced interest in the realities of life outside is to be seen in the *mettre en grange* ("store up") suggested by J.-L. Vieillard-Baron for *aufheben*, in the name of "Hegel's Swabian and peasant background" ("Compte rendu," 217). We could give other examples of the same kind (the Grimm brothers mention the ancient expression *Teller aufheben* ("change plates"): one plate disappears, another is set in its place), while at the same time wondering about the necessity of the operation: in German, *speichern* can mean "save a file to disk," that is, "store," and that usage is just as free of peasant motives as when we say in French that a company has *engrangé bénéfices* (stored up profits). We might also wonder about the widespread fascination with Swabia and its supposed influence on Hegel's intellectual development (and on Heidegger's as well, but Hegel, for his part, rather quickly left his native area). It is true that the region borders on France, and that this allows us to feel more at home. Generally speaking, this tendency to exaggerate rusticity betrays the embarrassment of all translation when confronted by catachreses—that is, metaphors made inaudible because they have been "naturalized" (the legs of a table)—in foreign languages. We can always say "both at once" (but there too . . .) so that the German reader no longer hears the barn and the jam in *aufheben* and that he nonetheless hears them a little bit: who can decide here? Moreover, the problem grows still more complicated when we inquire into the meaning of this naturalization regarding a term concerning which Hegel emphasizes that it provides philosophy—or at least his philosophy—with one of its most important concepts. Hegel's statements concerning the relation between *aufheben* and natural language are in fact ambiguous: astonishment that "a language has come to use one and the same word for two opposed determinations" is not thematized by Hegel (though the expression "auffallend müßte es sein" does not deserve the abundant commentary that J.-L. Nancy devotes to it in *La remarque spéculative*, 72–73: the conditional *müßte*, far from being a marker of ambivalence, is called for by the adjective *auffallend*, which usually requires a modal), except to say that speculative thought finds in it a source of joy ("für das spekulative Denken ist es erfreulich"). The new preface Hegel added, a few days before his death, to the 1831 edition of the *Wissenschaft der Logik* appears to speak of a "joy" (*Freude*) that thought feels in noting the existence of a "speculative spirit of the language [*ein spekulativer Geist der Sprache*]" in words that have the "property . . . of having meanings that are not only different [*verschiedene*] but also opposed [*entgegengesezte*]," as is the case with *aufheben*, which is, moreover, not mentioned here (*Wissenschaft der Logik*, 22). The status of the "speculative spirit of the language" is, however, not clear in either of the two texts (cf. J.-L. Nancy, *La remarque spéculative*, 81, on the undecidable question "of the anteriority—or the interiority—of a similar spirit with respect to the linguistic system"), and it is as though this spirit were scarcely able to attach itself except to words, dispersed here and there by a "stroke of luck" and "good fortune" (ibid., 73) that elicit the thinker's "joy." As for the question as to whether this "joy" is felt in some languages more than in others, it is more difficult than one might at first believe. The 1831 preface does say that the coexistence of opposed

meanings in several of its words constitutes a "privilege" of the German language "in comparison with other modern languages," and Hegel seems to authorize only reluctantly the borrowing of "a few words" from foreign languages. However, a few pages further on, the Remark on *aufheben* no longer bears any trace of this praise of the German language. Above all, it defends the maintenance, in the "technical language of philosophy," of "Latin expressions," which Hegel regards as more apt to "recall the reflected" (*das reflektierte*, a Latinism precisely for *das vermittelte* given at the outset), than the "immediacy" of the "native language." That is why, later in the Remark, *Aufhebung* itself, or more exactly its product, what is *aufgehoben*, can be described "in an appropriate manner" with the help of the "Latin" word *Moment* (see MOMENT).

All these hesitations on Hegel's part regarding the privilege of German, the use of everyday language, and the necessity of a philosophical terminology—in a word, regarding what a "speculative meaning" might be (J.-L. Nancy, *La remarque spéculative*, 76)—explain the difficulty of translating *aufheben-Aufhebung* as much and perhaps more than the simple observation of the absence of a word that can mean "both 'abolish' and 'preserve'" in French. We will, in fact, always hesitate between a "technical" translation such as P.-J. Labarrière's *sursumer*, which presents *aufheben* in its character as a "conventional logical operator" (*Présentation de La Doctrine de l'essence* [*Science de la logique*, I, 2], 1976, p. 29), and a translation more anchored in the idiom, such as *relever* or *dépasser*. And with these last two candidates we will still have to choose between the one that is in accord with etymology (*heben* in *aufheben* means "lift," whence *relever*) and something more usual: *dépasser*, for example, a point of view, has become established in the language of argumentation without—and that is what constitutes its interest here—becoming a technical term; but on the other hand, *se relever* for *sich aufheben* is perhaps better than *se dépasser*, with its ethical-ascetic connotation. In other words, it is the definition itself of what we deem "idiomatic" that is at issue in each case here. And it is precisely this that the Hegelian use of *aufheben* puts in question in German itself, that is, in a language that he shakes up by bringing an ordinary term into the realm of philosophical terminology. That is very precisely what he does with *Aufhebung*. There is the *Aufhebung* that shares with other words the privilege of revealing the fertile contradiction of "opposite meanings" in the natural language, and there is the one that Hegel brings into the technical language of philosophy and that is thus associated with the "Latin" *Moment*. The difficulty derives from this duality that French is obliged to transpose onto the lexical level, or rather—to be more Hegelian—from the movement within the word that in French produces two words, the neologism (*sursumer*) and the "ordinary" word, which is always overdetermined (*relever*); for in fact it is the same *aufheben*, but that is what one can show only by referring it immediately to the German. Thus the translators' debate can probably not come to a conclusion, if coming to a conclusion means finding *the* word that "corresponds" to *Aufhebung*, and it can do it all the less insofar as it concentrates, beforehand, on *one* word, *aufheben* or *Aufhebung*. However, by showing that it is the economy of Hegelian discourse that, by the simple fact that *aufheben* deserves a particular comment, is the first to carry out this

transformation of the word into a fetish, we have at the same time shown that the understanding of *Aufhebung* depends on that of a Hegelian philosophy of signification whose difficulties have been well known in France for the past thirty years. The translation of *Aufhebung* is thereby sent back to the explication of Hegel's text: depending on the importance accorded to this type of exercise, this will be regarded as a consolation or a makeshift.

| AUTHORITY

"Authority" derives from the Latin *auctoritas*, from *augere* (to grow, increase): the *auctor* is a person who "increases confidence" and is the guarantor, the model, the source, the advisor, the founder, before he becomes the "author" in the modern sense of a writer; see ACTOR, and cf. LAW, PIETAS, *RELIGION*; cf. DOXA. Classically, authority (*auctoritas*) is distinguished from power (*potestas*): it is the modality of human command that has its source in a legitimate order and that, by right, dispenses with both constraint and persuasion. Here we find a significant example of the difficulties that modern and contemporary thought encounters in giving a content to this distinction with the analysis of the notion of *Herrschaft*, which translators of Max Weber sometimes render by "authority" and sometimes by "domination": see HERRSCHAFT; cf. *DOMINATION*.

➤ *DROIT*, *POWER*, PRINCIPLE, *WISDOM*

| AUTRUI

Autrui is the complement of *autre*, from Latin *alter*, which first meant, as the suffix of the comparative shows, "the other of two," "one, the other, the second," like the Greek *heteros* [ἕτερος], whereas *alius*, corresponding to the Greek *allos* [ἄλλος], designates "the other of several," and provides the expression of reciprocity (Lat. *alius, alium*; Gr. *allêlôn* [ἀλλήλων]). On the one hand, the you opposed to an I, an "alter ego" whose distance is to be gauged and whose difference is to be understood; on the other hand, a he or it of some kind, an "other" among others, representing a contingent variation of personal identity. The competition between these two ways of expressing alterity, moreover deriving from a single root differently modulated, exists in numerous European languages (cf. Eng. "other"/"else"), even if the difference in usage is not always easy to trace, both being usually finally rendered in French dictionaries by *autrui*.

1. On the Greek difference *allos/heteros*, and the entirely different "heterogeneous" represented by "barbarian," see TO TRANSLATE, Box 1.
2. On the connection between *alius* and *alienus*, "who belongs to an other [in the juridical sense, *alienare* designates the transfer of the property right], foreign, improper, hostile, disadvantageous," and the more modern sense, even if it is still connected with the juridical acceptation, of *aliéné* as irresponsible and foreign to itself, cf. MADNESS. As the RT: *DHLF* notes, *aliénation* began a new career with Sartre and his translation of *Entfremdung*—from *fremd*, "foreign"—in Hegel and Marx: cf. PRAXIS, SECULARIZATION, and *APPROPRIATION*, PROPERTY.
3. But the choice has been made to take up the whole of the network through the difference in German between *Nebenmensch*, which designates the neutral alterity of other individuals or "neighbors" as opposed to a postulated identical universal, and *Mitmensch*, which expresses a singularity irreducible to the tension between particular and universal and constitutes a modality structuring the relationship of an ego to the world: see MITMENSCH and NEIGHBOR; cf. *IDENTITY,* I/ME/MYSELF, MENSCHHEIT, *PERSON*.
4. In Russian, *drugoj* [другой], the "other," in the sense of "second," *heteros*, is terminologically connected with *drug* [друг], "friend, comrade," in a network of relationships in which friendship and familiar proximity reign (*philia* [φιλία]; see LOVE); see DRUGOJ, and cf. SOBORNOST'.

BAROQUE

FRENCH	*baroque*
GERMAN	*Barock* (n.), *barock* (adj.)
ITALIAN	*barocco*
PORTUGUESE	*barroco*

➤ AESTHETICS, ARGUTEZZA, CLASSIC, CONCETTO, GOÛT, MANIERA, NEUZEIT, PORTUGUESE, ROMANTIC

The ease of translating the word "baroque" in European languages, whose corresponding words all come from a common Portuguese root, masks its multiple meanings resulting from successive displacements, contractions, and extensions that do not coincide over the five centuries of its trans-European history.

Derived from a Portuguese jeweler's term, *barocco*, which refers to irregular pearls, the term "baroque" initially had, in the seventeenth century, a pejorative connotation. In late nineteenth-century German art history, "baroque" became a neutral adjective referring to the art of the Late Roman Empire and the post-Renaissance, and was subsequently used, coupled with the word "classic," in various attempts to construct a *Kunstwissenschaft*, a general and trans-historical aesthetics.

But the term's limits fluctuated over time, depending on the country and the domains concerned, leading to a great diversity of contents that intersect with, include, or exclude competing or neighboring notions: mannerism, classicism, rococo. During the last two decades of the twentieth century, "baroque" tended to become, like "Romanesque" or "Gothic," a simple chronological adjective designating the seventeenth century, dislodging the term "classic" in French culture.

A floating signifier, a portmanteau word , "baroque" is thus—depending on the context, the domain, the period, or even the speaker—an antonym or a synonym of "classic," just as it can contain or succeed "mannerism" or "rococo." In many texts, the word could be deleted without any loss of meaning, or be replaced by more precise and less ambiguous terms.

However, the connotations associated with the original figurative sense, which is still alive, the realistic illusion, the nominalist temptation, and the always vigorous post-Hegelian resurgences, can lead to a return of repressed meanings. The step-by-step deconstruction of this linguistic palimpsest is probably the only effective antidote against this babelizing confusion.

I. From the Literal to the Figurative Meaning

In the course of five centuries, the word "baroque" traveled all over Europe. From the literal sense, which is attested in sixteenth-century Portuguese and later passed into French (RT: *Dictionnaire universel*, 1690: "jeweler's term, used only for pearls that are not perfectly round"), derives a figurative sense, "irregular, bizarre, uneven," registered in the 1740 edition of the RT: *Dictionnaire de l'Académie Française*, the only meaning listed in the 1873 RT: *Dictionnaire de la langue française* by Littré and is still used today. In the context of the French aesthetics, both normative and idealist, of "good taste," the word was used in the eighteenth century in the field of the fine arts to designate, with a pejorative connotation, heterodox, bizarre, or libertine forms: "[B]aroque is everything that does not follow norms and proportions, but only the artist's caprice. In Tintoretto's paintings, there is always something strange and unexpected, there is always something baroque" (RT: *Dictionnaire portatif de peinture, sculpture et gravure*, 1757); "baroque music: music whose harmony is confused, full of modulations and dissonances" (Rousseau, in *L'Encyclopédie*, supplement, 1776). In the RT: *Encyclopédie méthodique, Architecture*, vol. 1 (1788), Quatremer de Quincy uses the term with the same normative meaning:

> *Baroque*, adjective. In architecture, the baroque is a nuance of the bizarre. It is, so to speak, a refinement, or, dare we say, an abuse of the bizarre. . . . Borromini provided the greatest models of bizarreness, Guarini can be considered the master of the baroque.

The word passed into Italian and German, where it was used in the same way, a sign of France's cultural domination in Enlightenment Europe.

This first use of the word "baroque" in artistic aesthetics did not refer specifically, and still less generally, to the art of the seventeenth century; it could be used to describe Gothic ornaments and the painting of Tintoretto or El Greco as well as the architecture of Borromini or Guarini, but never the art of Rubens or Bernini. However, the use of the adjective "baroque" with reference to Guarini's fanciful architecture paved the way for anchoring the word "baroque" in the Italian art of the *Seicento*, just as the monarchical propaganda that claimed that the century of Louis XIV equaled those of Pericles and Augustus anticipated the anchorage of the word "classic" in seventeenth-century French culture.

II. From the Figurative to the Historical Meaning(s)

When the discipline of the history of art was founded in Germany at the end of the nineteenth century, after Romanticism's break with the consensus based on "good taste," the word *barock* was adopted to describe the late phases of ancient Roman art (von Sybel 1888) and the art of the Italian Renaissance (Burckhardt 1855, 1878; Gurlitt 1887). "It has become customary to use the term 'baroque' to describe the style into which the Renaissance resolved itself, or, as it is more commonly expressed, into which the Renaissance degenerated" (H. Wölfflin, *Renaissance und Barok*, trans. K. Simon, *Renaissance and Baroque*). Distinguishing a series of formal criteria that form a system (painterly or "picturesque" style, grand style, effects of mass, movement), Heinrich Wölfflin makes the word lose its pejorative connotation.

For Wölfflin, the baroque, a phenomenon peculiar to the Italian fine arts, covers two centuries, from the Renaissance to neoclassicism: it arose around 1520, arrived at full maturity in 1580, entered into a new phase around 1630, and came to an end about 1750, with the triumph of so-called neoclassical aesthetics (Ger. *Klassizismus*). But during the following century its historical and geographical field of application tends to be both restricted by the emergence or resistance of concurrent notions and extended to other countries and other arts.

The example set by German art historians was soon followed by their foreign colleagues, who also used the word "baroque" to designate Italian art. But some of them extended its field of application to other geographical areas and other arts (Schubert 1908; Novák 1915), and some broadened its formal or cultural bases to the flourishing ornamental art (Weisbach 1924), post-Tridentine art (Weisbach 1921), or the art of absolute rule (Friedrich 1952).

But in France the word collided with the idiomatic usage of the terms *classique* and *classicisme* to designate the art of the seventeenth century, a usage with nationalist connotations, whether these were old, in opposition to Italian taste, or, more recently, in opposition to German scholarship. In Spain, though more discreetly, it collided with other terms, such as *siglo de oro* for a somewhat different period (1550–60), or *churriguerismo*, after the name of the Churriguera family of architects active between 1650 and 1740. Later on, "baroque" interfered with "rococo," used in France and Germany to designate not only decorative art but also, by extension, the architecture, painting, and sculpture of the first half of the eighteenth century: according to some scholars (from Wölfflin to Pevsner), rococo is only a late phase of the baroque; for others (from Kimball to Minguet), it is a specific, entirely different formal system. For the earlier period, the emergence of the notions of mannerism and anti-mannerism in painting (Dvorak 1920; Friedlander 1925), and then in architecture (Wittkower 1934), tended to limit baroque to the second phase that Wölfflin originally distinguished (Revel 1963; Zerner 1972). But some scholars, such as Emil Kaufmann, found in the architecture of the Renaissance, from Brunelleschi to Alberti, the bases of the baroque system of composition by gradation and hierarchy, whose extension then turns out to coincide with that of the "classical language of architecture" defined by John Summerson (*The Classical Language of Architecture*, 1963) or with classicism in the broad sense described by Louis Hautecoeur (*Histoire de l'architecture classique en France*, 1943–67).

The word soon entered the field of music, where it designates a form of music that appeared around 1600 and was characterized by the use of *basso continuo* (Clercx 1948). It was also adopted by literary historians, who applied it to the period from 1560–80 to 1640, and defined it according to thematic or stylistic criteria such as the figures of Circe and the peacock or to the intensive use of metaphor (Mourgues 1953; Rousset 1953). All these shifts and overlappings blurred the initial definition proposed by Wölfflin, but they were masked by other new developments in the area of aesthetics.

III. The Aesthetic Category of the Baroque: Realism or Nominalism

After having defined in 1888 the characteristics of the post-Renaissance baroque style, and in 1899 those of the classical art of the high Italian Renaissance, in 1915 Wölfflin attempted, in his *Principles of Art History*, to define a *Kunstwissenschaft* by generalizing the observations made. He distinguished five pairs of fundamental principles of composition: linear/painterly, plane/recession, closed/open form, multiplicity/unity, clearness/unclearness.

The more abstract nature of these concepts, which is illustrated by examples borrowed not only from Italian art but also from the art of Northern Europe, paved the way for a transhistorical broadening that was already anticipated by the initial double historical anchorage that could easily be completed: the classical art of the fifth century BCE / Hellenistic art; Augustan classicism / flamboyant Gothic; Aemilian classicism / the baroque of Rubens; and the transhistorical generalization of the classic / baroque pair that sacrificed the contents.

This thesis and others like it, connected with philosophical-mystical reveries about cyclical history or binary polarity, were able to delude people. They were supported by a return of the represented initial meaning, and by a reduction of Wölfflin's subtle visual analyses to simplistic binary oppositions that intersected with other oppositions belonging to aesthetics (Apollinian/Dionysian) or to ancient stylistics (Atticism/Asianism), or that were based on elementary distinctions (plain/ornamented, simple/complex). The semantic inflation of the word "baroque" was the source of endless confusion that explains its success. Once the word had been launched, it was thought that the baroque was an essence *ante rem*, and people asked whether this or that work was baroque, forgetting that the baroque had no existence outside the corpus that served to define it. When mannerism is evicted from the field of the baroque or, inversely, when it is made to include the French "grand style" or the German rococo, its meaning changes almost completely. The elaborations on the notion of baroque are as about as pertinent for the history of art and culture as are those that can be made on the signs of the Zodiac for human psychology. Like fauvism (Lebensztejn 1999), the baroque is an ill-founded notion conceived sometimes as a synchrony whose limits are very fluctuating, and sometimes as a diachronic stylistic system whose definition changes with the corpus concerned.

French culture, which had specific reasons for developing the notion of a classical seventeenth century, was the last to resist the European triumph of the baroque, basing itself on certain specific features that were opposed to the baroque in the original, figurative sense of the term. The overcoming of this cultural blockage, of which Michel Butor's novel *La modification* (1957) offers a premonitory novelistic expression, closely followed the signature of the Treaty of Rome and the establishment of the Common Market. Victor Tapié's book *Baroque et classicisme* (1957) no doubt played a major role in the substitution of the word "baroque" for the word "classic" in France. Our generation saw Versailles, which had earlier been considered the masterpiece of French classicism, become the great theater of the baroque, and the Maisons-Lafitte château, a classic example of French architecture, perceived as a baroque orchestration of volumes. As the Italian term *gotico* replaced in the seventeenth century the term "modern" that had been used in the sixteenth century to describe the architecture of French cathedrals, the "Baroque Age" replaced the term

"Classic Age" as French aligned itself with other European languages, and we now commonly speak of the "century of the Baroque" as we speak of the "century of the Enlightenment" in referring to the eighteenth century.

BEAUTY

FRENCH	*beauté*
GERMAN	*Schönheit*
GREEK	*kallos* [κάλλος], *kalon* [καλόν]
ITALIAN	*bellezza*
LATIN	*pulchritudo*

➤ AESTHETICS, ART, CLASSIC, DISEGNO, GOÛT, *IMAGE*, LEGGIADRIA, LOVE, MIMÊSIS, PLEASURE, SUBLIME, UTILITY

The words *beauté, beauty, bellezza, kallos* [κάλλος], *pulchritudo*, and *Schönheit* present a twofold difficulty. The first difficulty is conceptual and is inherent in the metaphysics of the beautiful from Plato to Ficino, and in the whole history of aesthetics since the eighteenth century. The concept of the beautiful must satisfy the requirements of universality, necessity, and rationality specific to philosophical reflection, and also adequately designate productions that belong to the artistic domain and are multiple, singular, and without common denominator. The second difficulty has to do with the semantic peculiarities of European languages. For more than a millennium, Greek thinking about the beautiful was understood almost exclusively in Latin. Just as the meaning of the word *mimêsis* [μίμησις] has been reconceived in the term *imitatio*, *kalon* [καλόν] has been reinterpreted through *pulchrum* and has been constantly reinterpreted in the context of new theoretical fields. Whereas *pulchritudo* as understood by Albert the Great and Aquinas assumed a specific comprehension of Aristotle, the same word, as it was understood in the Renaissance, clearly asserted a return to Plato, and especially to the *Symposium*.

The transition to the vernacular language led to new transformations. The mingling of the themes and the frequently Neoplatonic inspiration does not allow us to avoid the play of multiple meanings, contradictions that are intentional and developed in accord with the mode of thought characteristic of the Renaissance. *Bellezza* does not truly render the meaning of *pulchritudo* (any more than it corresponds completely to the meaning of *Schönheit*, which is the philosophical and aesthetic reference point for most contemporary Italian theorists). Moreover, *Schönheit* is itself a very polysemous term. Thus Kant's, Hegel's, and Nietzsche's uses of this term are not only dissimilar but incommensurable.

As for the contemporary desire to reduce the beautiful to an axiological concept, and hence to a question of the logic of value judgments (often in order to disqualify both the beautiful and value), it has ended up making the meaning of the word far more complex and often more obscure, without succeeding in producing positive theoretical results.

I. Metaphysics and Rhetoric: *To Kallos, Pulchritudo*

Theorized by Plato and Neoplatonism, the idea of the beautiful was spread throughout Europe by the Latin language, and this means that *to kalon* [τὸ καλόν] (nominalized adjective, "the beautiful") and *to kallos* [τὸ κάλλος] (geminated noun, "beauty"—Chrysippos created the feminine *kalotês* [καλότης]; see RT: Chantraine, *Dictionnaire étymologique de la langue grecque*, s.v.) were understood through Cicero's writings, just as the work of Plotinus and Proclus were interpreted and disseminated by Marsilio Ficino's commentaries. The theory of art was constructed during the Renaissance within the Latin language and then developed in Italian and French. In the theoreticians of Italian art, *bellezza* refers to a Platonism explicitly inspired by Cicero, that is, to a *kalon* entirely reworked on the basis of *pulchrum*.

A. The metaphysical foundations of the beautiful

Greek thought about the beautiful is subject to three essential orientations: (1) Ethical and metaphysical, through the identification of the beautiful, the true, and the good. The latter was amply developed during the Middle Ages (*Pulchrum perfectum est*). (2) Aesthetic, by privileging the visual domain from the outset. This conception was radicalized and fully developed in Renaissance thought, profoundly influencing the meaning of *pulchritudo* and *bellezza* through the primacy of the eye and vision. (3) Artistic. It was especially the latter meaning that was retained by European culture down to the nineteenth century. But the identification of art with the beautiful, which was extremely ambiguous from the start, has always been a source of problems and logical contradictions that led to its being radically challenged by modern aesthetic thought.

The definition of the word that Socrates attributes to the Sophists no doubt reflects common usage in the fifth century: "*to kalon esti to di' akoês te kai di' opseôs hêdu* [τὸ καλόν ἐστι τὸ δι' ἀκοῆς τε καὶ δι' ὄψεως ἡδύ]" (The beautiful is the pleasure procured by hearing and vision; *Hippias Major*, 298a). But *to kalon* is already a generic term, because the Greek language has more technical terms—such as *summetria* [συμμετρία] (commensurability, proportion) to designate all forms of visible beauty, or *harmonia* [ἁρμονία] (adjustment, harmony) to characterize audible beauty—not to mention a large number of descriptive compounds formed with *eu-* [εὐ] (an adverb that expresses abundance, success, or facility, and that is often rendered by "well"; thus *eueidês* [εὐειδής] designates the beautiful as "beautiful to see," as in the grace of a woman or a warrior, and *euprepês* [εὐπρεπής], "what is appropriate," designates the beautiful as decent, suitable, distinguished, glorious). When Plato uses *kalos*, he is drawing on the multiple meanings of the word, so that the sense of "honest," "just," or "pure" can merge with the properly aesthetic sense of the term.

■ See Box 1.

The polysemy of *kalos* is at the heart of *Hippias Major*, in which several definitions of the beautiful are examined, and all turn out to be unsatisfactory. The distinction between beautiful things and the beautiful is also taken up in the *Symposium*, but in a quite different way. The ascending dialectic

---

1

Beautiful and good: *Kalos kagathos*

➤ VIRTÙ

In Homer, the adjective *kalos* [καλός] already designates both what we call physical beauty (Polyphemus tells Ulysses, who has blinded him: "I was expecting a tall, handsome mortal [*megan kai kalon* (μέγαν καὶ καλὸν)]"; *Odyssey*, 9.513) and what we call moral beauty (the swineherd Eumaeus speaking to the suitor who refuses to give Ulysses something to eat because he is dressed in beggar's garb: "What you say is not handsome for a noble [*ou men kala kai esthlos eôn agoreueis* (οὐ μὲν καλὰ καὶ ἐσθλὸς ἐὼν ἀγορεύεις)]"; ibid., 18.381). It is opposed to *aischros* [αἰσχρός], which, like French *vilain*, designates both the ugly, the graceless, the deformed, and the vile, shameful, and dishonorable.

This synergy between the beauty of the body and the beauty of the soul, the inside and the outside, is manifest in the phrase *kalos kagathos* [καλὸς κἀγαθός], which designates a kind of excellence (Xenophon, *Cyropedia*, 4.3.23) that ranges from birth to actions (ibid., 1.5.9) and determines and sums up all the others (RT: LSJ, quoting Herodotus,

1.30, explains that the term "denotes a perfect gentleman." The portmanteau-words formed in the same way, such as *kalokagatheô* [καλοκἀγαθέω] and *kalokagathia* [καλοκἀγαθία] are part of this same conjunction, which could be called "social," of nature, ethics, and politics; thus in Aristotle nobility or magnanimity (*megalopsuchia* [μεγαλοψυχία]) "is impossible without *kalokagathia* [perfect virtue]" (*Nichomachean Ethics*, 4.7.1124a; cf. 10.10.1179b 10). Moreover, Aristotle notes, "we may ask about the natural ruler, and the natural subject, whether they have the same or different virtues. For if a noble nature [*kalokagathia*] is equally required in both, why should one of them always rule, and the other always be ruled?" (*Politics* 1.13.1259b 34–36). In turn, *agathos* [ἀγαθός], in opposition to *kakos* [κακός] (bad, mean, cowardly), designates both physical valor, the warrior's bravery, and nobility of birth and behavior: in each case, the outside testifies to the inside, and the inside manifests itself outside.

We can understand why Socrates serves as a counter-model here, since he is an *agalma* [ἄγαλμα], one of the hollow statues given to the gods, an ugly bearded Silenus on the outside and bearing treasures on the inside (Plato, *Symposium*, 216d–e). And we can also see why Nietzsche interprets Platonism, which makes the body the tomb of the soul, as quintessentially anti-Greek: unlike Plato, the Greeks believed in "the whole Olympus of appearance. Those Greeks were superficial— *out of profundity*" (preface to *The Gay Science*).

of love rises from the beauty of bodies to that of souls, discourses, actions, and laws, then to the beauty of sciences, and finally attains the beautiful in itself (*auto to kalon* [αὐτὸ τὸ καλὸν]; 211d), the reality that "is the same on every hand [*têi men kalon, têi d'aischron* (τῇ μὲν καλόν, τῇ δ᾽ αἰσχρόν)], the same then as now, here as there, this way as that way, the same to every worshiper as it is to every other," and that is not "something that exists in something else, such as a living creature, or the earth, or the heavens, or anything that is" (211a–b). In addition to this distinction between relative beauties and absolute beauty, Plato repeatedly makes another between the diverse forms of visible beauties, between living bodies, between paintings and geometrical figures, as in the *Philebus*:

> The beauty of figures [*schêmatôn te gar kallos* (σχημάτων τε γὰρ κάλλος)] which I am now trying to indicate is not what most people would understand as such, not the beauty of a living creature or a picture [*ê zôiôn ê tinôn zôgraphêmatôn* (ἢ ζῴων ἤ τινων ζωγραφημάτων)]; what I mean, what the argument points to, is something straight, or round [*euthu ti . . . kai peripheres* (εὐθύ τι . . . καὶ περιφερὲς)], and the surfaces and solids which a lathe, or a carpenter's rule and square, produces from the straight and round.

> (*Philebus*, 51c)

Without lingering over the Pythagorean heritage of these geometrical ideas, we must at least recall that the sense of the beauty of forms is inseparable here from their purity, which arises from abstraction from forms perceivable through the senses. The Sophists' sensualist and relativist position, which emphasizes the subjectivity of perception connected with the infinite variety of colors and sensible forms, is opposed to Pythagorean philosophy and its aesthetic of numbers. Although Plato's thought tends toward the latter conception, that does not mean that sensible qualities, colors, precious metals are absolutely without value: it is simply that they participate in a profoundly degraded world that is absorbed in the sensible. In the cosmological myth with which the *Phaedo* ends, the colors of the "real earth," that of the ethereal heights, are described, as "more brilliant and more pure" (*lamproterôn kai katharôterôn* [λαμπροτέρων καὶ καθαρωτέρων]), to the point that this brilliance lends their variegated colors a unity of aspect, of "idea" (*eidos* [εἶδος]):

> There the whole earth is made up of such colors and others far brighter and purer still. One section is a marvelously beautiful [*thaumastên to kallos* (θαυμαστὴν τὸ κάλλος)] purple, and another is golden. All that is white of it is whiter than chalk or snow, and the rest is similarly made up of the other colors, still more and lovelier [*pleionôn kai kallionôn* (πλειόνων καὶ καλλιόνων)] than those which we have seen. Even these very hollows in the earth . . . assume a kind of color as they gleam [*chrômatos ti eidos . . . stilbonta* (χρώματός τι εἶδος . . . στίλβοντα)] amid the different hues around them, so that there appears to be one continuous surface of varied colors.

> (*Phaedo*, 110c)

In the myth in the *Phaedrus*, it is in the space of the beyond, that of heaven, that we could contemplate the truth in all its brilliance: "It is there that true being dwells, without color or shape, that cannot be touched" (*hê gar achrômatos te kai aschêmatistos kai anaphês ousia antôs ousa* [ἡ γὰρ ἀχρώματός τε καὶ ἀσχημάτιστος καὶ ἀναφὴς]; 247c), and where "Beauty was ours to see in all its brightness" (*kallos de tot' ên idein lampron* [κάλλος δὲ τότ᾽ ἦν ἰδεῖν λαμπρόν]; 250b), "most manifest to sense and most lovely of them all" (*stilbon enargestata* [στίλβον ἐναργέστατα]; 250d). Clearly, it is by analogy with the intelligible world that the purest figures acquire meaning.

Renaissance philosophers like Ficino and Bruno and the theoreticians of art all thought they were being faithful to the Platonic conception of the beautiful by exemplifying it in symbolic and allegorical representations. In the Renaissance, the theory of art was based on the paradox that consists in sometimes eclipsing, sometimes underestimating the intellectual primacy of the beautiful to the benefit of an analogical procedure constituted by sensible images, from the perfect proportions of geometrical figures to pure colors. The cult of Plato in the fifteenth and sixteenth centuries gave rise to an interpretation of *to kallos* that was all the more important because it continued to spread until the nineteenth century: the *eidos* was gradually transformed into an ideal, and while the purity of geometrical figures has a major paradigmatic value, it does so in the function of the "golden number" and in relation to the Pythagorean heritage. When Marsilio Ficino writes, "Amor enim fruende pulchritudinis desiderium est. Pulchritudo autem splendor quidam est, humanum ad se rapiens" (For love is in fact a desire to enjoy beauty. But beauty is the splendor that attracts the human soul to itself), or again, "Praeterea rationalis anima proxime pendet ex mente divina et pulchritudinis ideam sibi illice impressam servat intus" (In addition, the rational soul is closely dependent on the divine mind and preserves in itself the idea of the beauty that the latter has imprinted upon it; *Plotini Enneadis* 1.66, in *Opera omnia*), his definition of beauty is incontestably Platonic in inspiration. But here *pulchritudo* is not equivalent to *to kallos*. In Ficino, as in many philosophers of the Renaissance, the meaning of *pulchritudo* is all the more difficult to determine because beneath its apparent unity it is deeply conditioned by a syncretism that juxtaposes Plato, Plotinus, Jamblichus, Hermes Trismegistus, and Dionysius the Areopagite. Although the conception according to which love is the necessary mediator for gaining access to the beautiful remains in conformity with Platonic thought, the idea that terrestrial beauties reflect heavenly splendor owes much more to Plotinus than to Plato.

■ See Box 2.

When a Platonist like the artist and theoretician Lorenzo Ghiberti writes in his *Commentarii* (c. 1450): "La proportionalità solamente fa pulchritudine" (Proportionality alone makes beauty), proportion is surely one of the essential attributes of the beautiful, even its essence, but it is not determined by reference to Plato's theory of solid bodies: in reality, it is borrowed from Vitruvius's *De architectura* (first century BCE). Heir to Greek theories of architecture, Vitruvius's aesthetic thought is centered on the concepts of *diathesis*

2

The beautiful as participation in light and interiority: Plotinus

➤ LIGHT

Without breaking with the ancient heritage, Plotinus's philosophy developed a reflection on the beautiful, on *mimêsis* [μίμησις], and art that made it possible for the first time to harmonize the requirements of a metaphysics of the beautiful with those of a philosophy of art.

For Plotinus, in contrast to Plato, the world of ideas is not separate from the visible world; radiant with the purest light, it participates in earthly realities through the mediation of the cosmic order. The divine light spreads over the world and truly gives form to chaotic, formless matter. The consequences are important: Plotinus does not deny that a stone or a tree can be beautiful, but they are beautiful only to the extent that they participate in light. In the material, corporeal order, nothing can be absolutely beautiful if the divine light does not exercise its action in giving form to everything. The other aspect that opposes Plotinus's thought to Plato's on the subject of the beautiful concerns the relations between the idea of the beautiful and the existence of art. For Plotinus, art is a mode of knowledge, and even of metaphysical knowledge insofar as it helps us come closer to the One. The main principle that defines the reality of a work of art is no longer *mimêsis*, doomed as it is to be a skilled and empty reproduction of earthly realities, but rather participation (*methexis* [μέθεξις]), now conceived as the cause of artistic activity. Artists are creative, not because they reproduce the forms of reality, even in accord with perfect proportions and harmony, but because they refer to an internal form within their minds. We must add that this internal

form is not the expression of a creative subjectivity but the reflection of an ideal model of beauty (*archetupon* [ἀρχέτυπον]). In other words, this Neoplatonic metaphysics opened up perspectives that were crucial for thinking about art and the beautiful in the Middle Ages. It was to dominate reflection on art during the Renaissance and continue to be productive until the advent of German idealism and European romanticism.

Plotinus's critique of the idea of proportion was just as innovative and original. If proportion and symmetry are in fact beautiful, they are not beautiful as such, but to the extent to which they have their origin in an internal, ideal, and spiritual form. Then the classical theory of the beautiful, proceeding from harmony and proportion—that is, the conception that the whole of antiquity had developed as an immutable axiom—suddenly found itself transformed from top to bottom. This meant in particular that any realism, any objectivism of the beautiful was rejected in favor of a more spiritual conception: "Again, since the one face, constant in symmetry, appears sometimes fair and sometimes not, can we doubt that beauty is something more than symmetry, that symmetry itself owes its beauty to a remoter principle?" (*Enneads* 1.6.1). Though determinant for the existence of the beautiful, proportion and harmony are not measurable quantities but qualities that can be completely perceptible only through the purifying activity of the inner eye and after a specific kind of ascetic practice. That is why in Plotinus the word *kallos* does not designate a property belonging specifically to a determinate form but indicates a participation in

the intelligible, even if it is apprehended in the contemplation of an imperfect being occupying a modest place in the hierarchy of terrestrial things. Having as its goal the world of ideas and the intelligible, the experience of the beautiful implies the conversion of the whole being with a view to a wholly internal perfection: "Withdraw into yourself and look. And if you do not find yourself beautiful yet, act as does the creator of a statue that is to be made beautiful: he cuts away here, he smoothes there, he makes this line lighter, this other purer, until a lovely face has grown upon his work" (*Enneads*, 1.6.9). From that point on, the experience of the beautiful merges with a metaphysical experience, so that the word "beautiful" applied to an object is meaningful only with a considerable extension that implies for the philosopher another way of life and what Pierre Hadot called a spiritual exercise.

[διάθεσις] (the charm that arises from the composition of the parts), *euruthmia* [εὐρυθμία], and *summetria* (the agreement between the parts and the work as a whole). Despite their more or less overt Platonism, these determinations of the beautiful are relatively foreign to the speculations in the *Philebus* or the *Timaeus*. But from the Middle Ages and the Renaissance on, they were so closely related to the concept of the beautiful, to its *idea* [ἰδέα], that down to the nineteenth century most theoreticians adopted them as such, though in each case they had to analyze and justify them and ground them in the body of a doctrine. Thus Hegel still defines them as categories constitutive of the beauty of abstract form. As transmitted by Vitruvius, *pulchritudo* claims to restitute all the meanings of *kallos*, and it is in relation to the Latin word that later authors were able to Platonize regarding the ideas of proportion, symmetry, and harmony as specific conditions of the beautiful.

B. The exclusive reign of *pulchritudo*

In reality, from antiquity to the eighteenth century, and even into the nineteenth century, the Platonic idea of the beautiful was often given as a supreme aesthetic argument only to make it say something else, indeed the contrary of what it actually said. One of the most famous authors of this philosophical inversion to the benefit of a conception of art was Cicero, the true father of the theory of art. In *De finibus*, Cicero writes: "Et quoniam haec deducuntur de corpore, quid est cur non recte pulchritudo etiam ipsa propter se expedanta ducatur?" (And since all that belongs to the corporal domain, why shouldn't we consider that beauty deserves to be sought for itself?; 5.47). What does *pulchritudo* mean here? The word implies the twofold meaning of an achieved and perfect corporal beauty—which it expresses more strongly than the term *forma*—and a sort of moral excellence close to the Greek *kalos kagathos*. But the specifically aesthetic sense

appears clearly in a passage in *De natura deorum* where Cicero sets forth the Stoic cosmology: what occupies the soul of the world more than anything else, he writes, "is first of all that the world be made as well as possible to last, and then that it lack nothing, and especially that it have within it an eminent beauty [*eximia pulchritudo*] and all ornaments [*omnis ornatus*]" (2.22) (that is the meaning of *kosmos* [κόσμος]; see *WORLD*). Despite their semantic position in Latin, *pulchrum* and *pulchritudo*, unlike *forma, venustus, elegans*, and, naturally, *bellus*, were not taken over into the vocabularies of Romance languages. Nonetheless, it was *pulchrum* that, in classical Latin, was deemed most apt to render the universality and abstract rigor of the idea of the beautiful. In a famous passage in *De oratore*, Cicero defines the beautiful as an ideal:

> [T]here is no human production of any kind, so compleatly beautiful [*tampulchrum*], than which there is not a something still more beautiful, from which the other is copied like a portrait from real life, and which can be discerned neither by our eyes nor ears, nor any of our bodily senses, but is visible only to thought and imagination [*cogitatione tantum et mente complectimur*]. Though the statues, therefore, of Phidias, and the other images above-mentioned, are all so wonderfully charming, that nothing can be found which is more excellent of the kind; we may still, however, suppose a something which is more exquisite, and more compleat [*cogitare tamen possumus pulchriora*]. For it must not be thought that the ingenious artist, when he was sketching out the form of a Jupiter, or a Minerva, borrowed the likeness from any particular object;—but a certain admirable semblance of beauty [*species pulchritudinis eximiae*] was present to his mind [*mente*], which he viewed and dwelt upon, and by which his skill and his hand were guided.

(*Orator*, 2.7)

Despite its obvious contradiction of Plato's thought, the adulteration of *kallos* by *pulchrum* is crucial, because it was to acquire authority and become a reference point for seventeenth-century theoreticians of art and even for the founder of aesthetics, Baumgarten. By identifying the Platonic idea of the beautiful, the *to kallos*, with the ideal of the beautiful, that is, with a sort of interior model, Cicero gave *pulchrum* a new meaning. From then on, the separation of the beautiful from the mimetic arts that Platonic metaphysics maintained was in large measure surmounted. It no longer subsisted except in Scholastic thought and in Ficino and Nifo.

The meaning of *pulchrum* in Aquinas is determined first of all by his effort to resolve the problems raised by the antagonistic conceptions within Scholastic thought, namely, the realism of Platonic theories and the persistent subjectivism in aesthetic reflection, and especially the various orders in accord with which the word is used: the ontological or metaphysical order, the logical order, the anthropological order, and finally the specifically aesthetic order. Insofar as it assumes a proportional relation between matter and form, *pulchrum* has an ontological status that is inseparable from the structure of reality. Moreover, this conception explicitly excludes any idealist or subjectivist orientation, but this does not mean that aesthetic subjectivity, in the sense of sensual delight in the perception of the object, is rejected:

> Unde pulchrum in debita proportione consistit: quia sensu delectatur in rebus debite proportionatis, sicut in sibi similibus; nam et sensus ratio quaedam est, et omnis virtus cognoscitiva.

> (Hence beauty consists in due proportion; for the senses delight in things duly proportioned, as in what is after their own kind—because even sense is a sort of reason, just as is every cognitive faculty.)

(Thomas Aquinas, *Summa theologica*)

The peculiar feature of *pulchrum* is that it implies an act of knowing, that is, an effort of judgment to understand the objective aesthetic properties inherent in the structure of reality and the world. *Pulchrum* means intellectual comprehension, including through the senses. Furthermore, qua transcendental, the beautiful possesses what Aquinas calls three properties: *integritas sive perfectio, proportio sive consonantia*, and *claritas*. These properties constitute the most durable meaning of the classical ideal in the arts and determined for a long time the most general categories of aesthetics. But whatever the ulterior meanings of *pulchrum* and *pulchritudo* as "transcendental" might be in Scholastic writers, or as "idea" in the theoreticians of the Renaissance, the words designating beauty in Romance languages remain profoundly marked by the contribution of ancient metaphysics and rhetoric.

II. *Bellezza* in Renaissance Theories of Art

It was by implicitly opposing this metaphysics that Alberti and Leonardo sought to construct the idea of beauty on the basis of a system of rules that had a completely autonomous theoretical value. Among the Renaissance theoreticians, *bellezza* is certainly not a translation of *pulchritudo*. But the considerable effort they made to transfer to the theory of art the theories of light and the Neoplatonic contemplation of the intelligible gave *bellezza* a more intellectual cast that deliberately exalted the primacy of vision, so that *bellezza* surely had a more visual meaning than *beau* or especially *Schönheit* were to have. In reality, contrary to *pulchritudo*, which was almost always used to express a metaphysical idea, even in the field of rhetoric, *bellezza* had to satisfy several contradictory requirements: it had to conform to the *idea* as a superior authority; it had to be realized in the work as an ideal system of proportions and measures, while at the same time exploiting the totality of the forms offered by empirical reality; and, finally, by basing itself on artistic rules set a priori and the actual practice of art, it showed that the work was a second creation of nature, a *natura naturans*, analogous to divine beauty. The word thus crystallized a set of tensions and aspirations that are often incompatible, at the risk of sometimes becoming almost unintelligible. Ficino's cherished idea that beauty is by essence distant from corporeal matter could not be accepted by Alberti and Leonardo, because measure, proportion, and harmony must imperatively be objectified in a perfect work.

▪ See Box 3.

3

Bellezza and *vaghezza*

A comparison of the two versions in which Alberti published his own treatise, one in Latin, the other in Italian, allows us to grasp the transformations introduced by the transition to the vernacular. In *De pictura* (bk. 3), Alberti writes regarding the painter Demetrius:

> At ex partibus omnibus non modo similitudinem rerum, verum etiam in primis ipsam pulchritudinem diligat. Nam est pulchritudo in pictura res non minus grata quam expetita. (Let him seek in all parts not only the resemblance of things, but first of all beauty itself. For in painting beauty is no less pleasant than sought.)

The same injunction is expressed in *Della pittura*:

> Edi tutte le parti li piacerà non solo renderne similitudine, ma piu edgiugniervi

bellezza; pero che nella pittura la vaghezza non meno è grata che richiesta. (It will please him not only to render all the elements with resemblance, but to add beauty to them; for in painting grace is pleasant as well as required.)

Whereas the Latin uses the same term (*pulchritudinem, pulchritudo*), the Italian resorts to two different words, *bellezza* and then *vaghezza*, the latter of which Spencer, in his English edition of the Italian treatise, translates as "loveliness" (*On Painting*).

Vaghezza is derived from the Latin *vagus*, which means "vague, indeterminate." But it also takes on a positive sense, that of an indefinite charm that is closer to the idea of grace than to that of beauty. It is distinguished from *bellezza*, whose meaning here almost coincides with that of the

Latin *concinnitas*, which is used in particular to designate the symmetry and harmony of a discourse (some philologists derive *concinnitas* from the adjective *concinnus*, which means "well-proportioned," while others derive it from the verb *concinnare*, which means "organize, arrange, prepare"). Correggio's figures, and of course the *Mona Lisa*, are the pictorial paradigms of *vaghezza*, whereas the plastic perfection of Raphael's madonnas corresponds very closely to the idea of *bellezza*.

BIBLIOGRAPHY

Alberti, Leon Battista. *De pictura*. 1435. *Della pittura*. 1436. Edited by C. Grayson. Rome: Laterza, 1975.

The *idea della bellezza* remains a metaphysical authority that is recognized as immanent to the artist's consciousness, but becomes intelligible only in the sovereignty of the *regola*. The proper application of the systems of relations and measures that constitute proportion thus becomes an a priori condition, necessary and sufficient, for the accomplishment of the work. As Francesco Scannelli puts it:

> The beauty [*bellezza*] we desire so much is only a reflection of the supreme light, a sort of divine emanation, and it seems to me to be constituted by a harmonious equilibrium of the parts [*buona simmetria di parti*] combined with sweetness [*suavità*] of colors that represent on Earth the relics and promises of heavenly, immortal life.
>
> (*Microcosmo della pittura*)

Scannelli's definition sums up all the goals of the classical ideal, but it was already anachronistic in the seventeenth century. The teleology of the "simmetria di parti," which had reigned from the Pythagoreans to the Renaissance, the conception of the beautiful as a reflection of heavenly life that was still vigorously defended by Bellori and Poussin, was henceforth threatened. Ficino, Bruno, and the theoreticians of mannerism had already adopted the critique of proportion and, ultimately, of rules that is found in Plotinus. The appearance of taste as a new criterion, of genius, of the diversity of rules, ultimately destabilized the balance of the classical theory of the beautiful, as is shown by the first lines of Crousaz's *Traité du beau*, published in 1715: "There are no doubt few terms that people use more often than 'beautiful,' and yet nothing is less determinate than its meaning, nothing is more vague than its idea."

III. The Process of Subjectivizing the Beautiful: From the Artistic to the Aesthetic

A. *Beau* and *beauté*: Attempts to synthesize the heterogeneous

Before the eighteenth century, the French word *beau* was seldom nominalized, and its semantic diversity, which was very evident in the use of the adjective, was often foreign to any aesthetic preoccupation. In any case, in expressions such as *le beau monde* (high society) and *le bel esprit* (wit), the word expresses a certain idea of perfection and sometimes a nuance of irony. Moreover, compared with Italian, it is much more distant from any metaphysical or theological reference.

It is particularly striking that *beau* has virtually no philosophical content and often tends to be no more than a predicate or even a neutral reference. The word appears in Mersenne in its most abstract usage: "To be sure, it is difficult to find or to imagine anything in the world that is more beautiful than light, since it seems that the beauty of all things depends on it" (*Questions inouyes*). The Neoplatonic connotation of the word is very meager here and depends on a relatively conventional usage. In a letter to Mersenne, Descartes writes:

> Regarding your question whether the reason for the beautiful can be established, it is the same as if you were to ask in advance why one sound is more pleasant than another, if not because the word "beautiful" seems to be more particularly related to the sense of sight. But in general neither the beautiful nor the pleasant signify anything more than a relationship between our judgment and the object; and because human judgments are

so different, we cannot say that either the beautiful or the pleasant have a determinate measure.

(18 March 1630, in *Œuvres*)

In other words, judgments regarding the beautiful are no more than the expression of a person, a subjective preference, and thus cannot be the object of any philosophical discussion. Spinoza is just as explicit when he writes that beauty (*pulchritudo*) "is not so much a quality of the object beheld as an effect [*effectus*] in him who beholds it," narrowly determined by our condition and temperament (letter to Hugo Boxel, 1674). From Descartes to Voltaire, philosophical rationalism tends to make judgments regarding the beautiful, and to make the beautiful itself a product of subjectivity; and this subjectivity necessarily gives rise to an infinite relativism that destroys not only any possible objectivity of the beautiful, but also reduces it to the status of an illusion. In the seventeenth century, even before the birth of aesthetics as a philosophical discipline, the latter's most essential concept was thus already largely invalidated in the name of philosophical rationality.

The first consequence of this is that the intelligibility of the beautiful can no longer be determined by philosophical reflection, and that it will, as it were, move into the field of the theory of art and the nascent art criticism. The word *beau* survives in its essential attributes and its metonymic determinations, namely, perfection, form, and systems of proportion. If the beautiful can no longer be conceived as transcendental in the Scholastic sense, as an idea to which the artist's thought conforms, then it has to be defined in the immanence of the experience of art. Whether it is a matter of the creator or the spectator, each party is obliged to reflect on the criteria of the beautiful as they are given by proportion, harmony, and perfection, that is, in a perceptive experience that necessarily disqualifies a priori reasoning and deductive procedures. Only the exemplarity of the perfection of a picture, a poem, or a work of architecture allows us to verify positively the well-foundedness of the rules, so that the idea of a rule without possible reference, determined a priori as in the Italian theoreticians, is henceforth excluded. But this immanence implied by the attention given to rules and to the ideality of the great models in the relationship to works of art does not imply any kind of realism with regard to artistic properties. The idea that an artistic and aesthetic quality might subsist as a real property inherent in the object, independently of the application of the rule and the exercise of judgment, now appears highly problematic. Even Nicole, who was nonetheless determined to restore the beautiful in as rational a manner as possible, rejects any kind of objectivism and sees no solution other than in a logic of judgment. Humans, he writes, must "form an idea of the beautiful that can serve them as a rule in making judgments" (*Traité de la beauté des ouvrages de l'esprit*). Nicole's precept is based on a theoretical demand that has become exorbitant, namely, the identification of the beautiful and the true, and the primacy of the understanding in the exercise of judgment, so that the theoretical solution he proposes is in real danger of becoming a new source of problems. A demand for the universality of systems of artistic rules was gradually substituted for the universality of the idea of the beautiful. Basing themselves on the rejection of a

purely speculative and thus metaphysical procedure, theoreticians sought nothing less than to reconcile the singularity of the rule of art—modifiable in each of its applications—with the right to aesthetic universality.

■ See Box 4.

If the beautiful could be thus reactivated despite the philosophical crisis of which it was the object, it was by virtue of the intervention of an institutional discourse, that of the Académie de Peinture et de Sculpture, founded in 1648, one of whose functions was to produce artistic and aesthetic categories. Nevertheless, a solution in accord with the requirements of rationalism awaited its theoretician. It was for Boileau to realize this program corresponding to the horizon of expectations elicited by the classical doctrine. He gave the word *beau* a new meaning that was to be decisive for the subsequent development of eighteenth-century aesthetic thought: "Nothing is beautiful except the True, the True alone is pleasing" (*Épître IX*). The truth that must be at the heart of art's beauty is not at all the expression of good sense or of a vague common sense, but rather what the artist's genius should aim at insofar as its goal is to reach the point where reason and beauty, truth and nature, are one. The genius of art is thus to achieve a synthesis of these heterogeneous givens. The overproduction of metaphors, patent in Spain and Italy, was incapable of producing this synthesis because it transgressed the order of nature, and thus of the true, to the advantage of the imagination alone. But although Boileau conceived the beautiful as a diversity of authorities (nature, truth, a rational order) in the unity of the concept, he did not yet see the countless relations that constantly threaten the word's univocal meaning. At the beginning of the eighteenth century, Crousaz formulated the central difficulty that was to confront aesthetics:

When we ask what the *Beau* is, we are not talking about an object that exists outside us, separate from any other, as we do when we ask what a Horse is, or what a Tree is. A Tree is a Tree, a Horse is a Horse, it is what it is absolutely, in itself, and without any necessity of comparing it with any of the other parts that the Universe contains. This is not the case with *Beauté*; this term is not absolute, but expresses the relationship of objects that we call beautiful with our ideas, or with our feelings, our intellectual abilities, our heart or, finally, with other objects that are different from us. So that to determine the idea of Beauty, we have to determine and examine in detail the relations to which we attach this name.

(*Traité du beau*)

In asserting that the concept of the beautiful is intelligible only through the analysis of a plurality of relations and determinations, Crousaz initiated a process that in the long run threatened to empty the notion of any productive content. In reality, reflections on the word *beau* clearly indicate a process of subjectivization based on psychological considerations. What does *beau* mean? For Abbé Trublet, "We say that anything that pleases us is beautiful, when the feeling of pleasure, although it is received by some bodily organ, is in the mind itself and not in that organ" (*Essais sur divers sujets*). For Voltaire, the subjectivity of the feeling of pleasure

4

Beauty and grace

The specificity of the theory of art, as it developed in the second half of the seventeenth century in France, resides in the will to overcome this tension between an ideality based on rules and an artistic perfection shown by works and empirical practices. Whence the temptation to deviate from purely rational principles and to derive the beautiful from proportion and symmetry as inherent, objective properties of the works, as for example Félibien does when he distinguishes between beauty and grace:

> Beauty arises from the proportion and symmetry that is found between the corporeal and material parts. And grace arises from the uniformity of internal movements caused by the affections and feelings of the soul. Thus when there is only a symmetry of the corporeal parts with one another, the resulting beauty is a beauty without grace. But when in addition to this beautiful proportion we see a relationship and a harmony of all the internal movements, which not only unite with the other parts of the body but animate them and make them act with a certain accord and a very exact and uniform cadence, then it engenders the grace that we admire in the most accomplished persons, and without it the most beautiful proportion of the members has not achieved its ultimate perfection.

> (*Entretien* no. 1)

As manifested in a beautiful body or in a work of art, proportion and symmetry are constitutive of beauty, but of an abstract, normative, and inanimate beauty. Grace, on the other hand, is inseparable from what seventeenth-century art theorists call "expression," namely, the body's actions that make the movements of the soul visible. Far from being one quality among others, expression is that through which beauty acts on the spectator, touches and moves him or her. That is why it is an essential part of the painter's and sculptor's art. In this sense, we can define grace as the soul of beauty, the beauty of beauty. It consists, Félibien says, in a *je ne sais quoi* "that one cannot well express," and that is "like a secret knot that links these two parts of the body and the mind."

Thus grace has become the necessary condition of aesthetic pleasure. And, unlike beauty, grace cannot be confined within rules: "What pleases," the Chevalier de Méré writes, "consists in almost imperceptible things, such as a wink, a smile, and certain something [*je ne sais quoi*] that very easily escapes us and is not easily found when we look for it" (*Des agréments*).

The debate about art and artistic categories, about the power of rules, thus really begins only with grace, which becomes a condition of the work of art's perfection that requires the implementation of a technique of composing figures and forms, producing harmony and the *je ne sais quoi* without which the language of art remains a dead letter.

BIBLIOGRAPHY

Félibien, André. *Des agréments*. In *Œuvres*. Paris: Les Belles Lettres, 1930.

———. *Entretiens sur les vies et les ouvrages des plus excellents peintres anciens et modernes: Livres I et II*. Edited by René Démoris. Paris: Les Belles Lettres, 1987. First published in 1668–88.

is transformed into a radical relativism: "Ask a toad what beauty, great beauty, the *to kalon* is? He'll answer that it's his female toad, with her big round eyes starting out of her little head. . . . Ask philosophers, finally, and they'll respond with gobbledygook; they have to have something in conformity with the archetype of the beautiful in its essence, with the *to kalon*" (RT: *Dictionnaire philosophique*).

By trying to save the concept by resorting to the imitation of "beautiful nature," Batteux merely eludes the problem by systematically extending *mimêsis* to all the fine arts. For Diderot as for many other theoreticians, only reference to British writers, to the idea of the beautiful as an "inner feeling," could make it possible to preserve an idea that was hard pressed by the hegemony of taste and a certain hostility to metaphysics. But this aesthetic feeling naturally implies a correlate that has to be determined in a system of relations and proportions. Diderot's most precise definition of the beautiful requires him to avoid both La Mettrie's relativism and the classical tradition's objectivism. Aesthetic judgment has to overcome any kind of substantialism of qualities or objects while at the same time maintaining a principle of objectivity. The solution to this problem is entirely dependent on the idea of relationship, which is founded in both judgment and things. The sense of the beautiful has its origin in the perception of relationships:

> The beautiful [*Le beau*] that results from the perception of a single relationship is usually less than that which results from the perception of several relationships. . . . Nonetheless, the number of relationships must not be infinitely great; and beauty does not follow this progression: we acknowledge in beautiful things only relationships that a good mind can clearly and easily perceive in them.

> ("Beau" [1751] in *Œuvres esthétiques*)

Thus the establishment of aesthetics as an exclusively philosophical discipline that gave meaning to the category of "the beautiful" necessarily led to an upheaval in the traditional problematics.

B. "Beauty" and "beautiful": From moral excellence to aesthetic pleasure

"Beauty" and "beautiful" are not reducible to the concept of beauty as it is constructed by the history of philosophy. The association linking beauty with excellence, which issued from the Platonic tradition and which refers to the Greek *to kalon*, is not central to reflection on this network. The use of the word "beauty" is very diverse. It brings in aesthetic and nonaesthetic properties, qualifies the object and its form, and recognizes a specific pleasure felt by the subject. In relation to the object, "beauty" is associated with "simplicity" or "grace"; in relation to the subject, it refers to "design" (intention) or "expression."

At first, the recourse to "beauty" or "beautiful" was inseparable from an analysis of the relation between the beautiful and the good. The idea of moral beauty arose in England around 1700, and combined a sense of beauty with moral

discernment. According to Shaftesbury's *Characteristicks of Men, Manners, Opinions, Times* (1711), people approach the absolute character of beauty by devoting themselves to self-knowledge (RT: Cooper, *Characteristicks*). Thus the soliloquy as interior dialogue expresses a proper sense of the beautiful and the good that reveals the depth of the soul, the order of the heart. Winckelmann, Schiller, Hölderlin, and Wieland continued to develop this archetypal form of moral beauty with the notion of the "beautiful soul" (*schöne Seele*). The originality of the English-language tradition lies in other occurrences of the term "beauty." In *A Treatise of Human Nature* (1739–40), Hume introduces two conceptions of beauty, one anthropological or passional—"beauty is a form"—and the other social or practical—"beauty of interest." Beauty is a form that produces pleasure. Closely connected with the ego, it becomes a source of pride and belongs to the domain of the passions. But it is also based on the convenience that provides pleasure: for instance, the functionality of a house, the luxury of a building, or the fertility of a field all belong to the register of beauty. The value of the beauty of objects resides in their use. The contemplation of the beautiful assumes a social interaction between an owner and a spectator, such that the spectator has an interest, through sympathy or through the easy communication of feelings, in an advantage that directly concerns the owner of the object. These two meanings of "beauty" are not based on a specifically artistic view of the term. In his *Theory of Moral Sentiments* (1759), Adam Smith emphasizes the importance of the beauty of self-interest by stressing the arrangement of objects that provides convenience and manifestly produces the feeling of utility in the spectator; such objects effectively satisfy the love of distinction that so promptly furnishes a satisfaction by sympathy with an owner who seems to be fortunately provided.

In addition to Hume's and Smith's anthropological and social approaches, we must also mention more properly intra-aesthetic reflections regarding the determination of the subject or the object of the beautiful. Thus in *Essays on the Nature and Principles of Taste* (1790), Alison does not associate beauty with the qualities of objects. Objects are merely signs that produce an emotion. From the point of view of a history of the progress of the arts, the quality of the "design" (intention) is first of all productive of the feeling of beauty. Uniformity and regularity thus adequately express the existence of the "design" by making it possible to isolate in the object a resemblance of the parts that makes a regular form discernible. But the more the arts are imbued with talent, the more the feeling of beauty they can elicit has to do with the expression of passion and not with intention. The great criterion of excellence in beautiful forms is the character or expression that corresponds to the appearance or perception of a quality that affects us on the basis of the variety of forms. The superiority of "beauty of expression" over "beauty of design" is accompanied by something that can be a peculiarly artistic or even stylistic character of beauty: the contemplation of the free expressiveness of forms. Alison's analyses of the arts can be explained by the painter Hogarth's *The Analysis of Beauty* (1753), a work about what makes a painting beautiful. Beauty is understood on the basis of the rules regarding lines in painting. According to Hogarth, the spirit of painting has always been the victim of prejudices in favor of straight lines, of the geometricalization of space in the representation of the beauty of human forms. He proposes to make the serpentine or curved line central to painting as the line of beauty. Beauty is thus no longer associated with simplicity but rather with "grace," the latter term emphasizing the infinite variety and complexity of forms, the attraction of the *je ne sais quoi*. Reflection on beauty leads to the necessity of defending the autonomy of artistic expression, the expressive development of painting. In addition, "beauty" is used to examine the cognitive and affective process that generates the idea of beauty in the perceiving mind. From this point of view, the conception of beauty and its perception in Hutcheson's *An Inquiry into the Original of Our Ideas of Beauty and Virtue* (1725) proves essential. According to Hutcheson, humans have a faculty of perceiving ideas of beauty and harmony or an internal sense of beauty through which pleasure strikes us at exactly the same time as the idea of beauty. This "internal sense" is a passive faculty of receiving ideas of beauty from all objects in which there is unity in variety. "Regular" and "harmonious" are synonymous with "beautiful." The assessment of beauty requires the functioning of an inner sense, but it also presupposes a rule of the beautiful, the foundation of the beauty of works of art residing in the unity of proportion among the parts and between each part and the whole. Hutcheson's work made possible the emergence of categories specific to the judgment of the beautiful. A value peculiar to beauty could then be recognized. Beauty was increasingly connected with aesthetic value; then it became entirely possible to give beauty a large role in contemporary aesthetic thought (Mothersill, *Beauty Restored*; Zemach, *Real Beauty*).

IV. *Schönheit* and Its Philosophical Goals

It was in Baumgarten's Latin that Kant first found a definition of the beautiful that he rejected in a way decisive for the whole history of aesthetics. The passage from *pulchritudo*, as it was used by Baumgarten, to *Schönheit*, in the sense given it by Kant, constitutes a fundamental break with all earlier conceptions of the beautiful, both those of the metaphysics of the beautiful and those of theories of art.

Baumgarten's project, set forth in his *Metaphysica* and his *Aesthetica*, was to construct a theory in which the beautiful became a genuine object of knowledge, expressing itself in accord with concepts and forms of sensibility specific to it: "Aesthetices finis est perfectio cognitionis sensitivae, qua talis, haec autem est pulchritudo" (The goal of aesthetics is the perfection of sense knowledge as such, that is, beauty; *Aesthetica*, 1.1 §14). This definition is very likely to be unintelligible if it is opposed at the outset to the central theses of Kant's *Critique of the Power of Judgment*. Baumgarten's originality was to seek to provide the beautiful with a metaphysical foundation without at the same time breaking with the rhetorical and humanistic heritage. Defining beauty as the perfection of sense knowledge implies the possibility that the latter can be determined as truth of a certain type, namely, aesthetic truth. Aesthetic truth differs from logical truth but is not opposed to it; it participates in a *cognitio inferior*, that of the senses and perceptions. This explicitly cognitive position excludes any link with an empirical conception and,

of course, with any transcendental theory of aesthetic experience. Contrary to what is still often said, Baumgarten's *pulchritudo* in no way constitutes a kind of stage necessarily leading to the solutions in Kant's *Critique of Judgment*; it is the expression of an original thought that maintains the tension between the categories of ancient rhetoric, those of Leibnizian metaphysics and semiology, and philosophical demands.

In Kant, the chief condition for the use of *Schönheit* is the rejection on principle of the word *pulchritudo* and all its philosophical implications. In the third *Critique*, every determination of the beautiful is in a way foreign to aesthetics as Baumgarten and Meier understood it. In Kant, *Schönheit* never refers to an idea of the beautiful or to an intellectualist conception, but rather to the problem of taste or to a critique of taste. One remark in the *Nachlass* clearly illustrates all the difficulties that the analytic of the beautiful had to resolve:

> The sensible form of a cognition pleases [*gefällt*] as a play of sensations, or as a form of intuition, or as a way of conceiving the good. In the first case, it is a matter of attraction [*Reiz*]; in the second, of sensible beauty [*das sinnliche Schöne*)] in the third, of the beautiful in itself [*selbständigen Schönheit*].

(*Nachlass*)

In the analytic of the beautiful, the sole true attribute of the beautiful—that is, what is exclusively predicable of it—is the feeling of aesthetic pleasure itself, and not some possible property of the object. This feeling of pleasure is primary and rigorously irreducible to any rule or aesthetic idea. In order to transcend the aesthetic solipsism to which this conception of the experience of the beautiful threatens to lead, Kant posits a subjective universality inherent in the very form of judgments of taste. But this postulate is still the requirement of a right: the latter has to be expressed in a universal communicability that justifies aesthetic experience but is not its goal. In precritical writings as well as in Kant's *Critique of Judgment*, the specific meaning of *Schönheit* is inseparable from that of *Geschmack* as *judicium* or, more precisely, as reflective judgment, and thus as an affirmation of aesthetic subjectivity (see GOÛT).

The post-Kantians' relationship to Kant is marked by an explicit desire to break with him. In his *System of Transcendental Philosophy* (1800), Schelling shows that philosophical thought has to include art as a specific form of intellectual intuition, that is, as a mediation between freedom and nature. Kant had certainly seen the connections between freedom and nature in the beautiful, but not in the ontogenesis of art itself. This recognition of the functions and the metaphysical necessity of art is central to Hegel's conception of beauty. Hegel seeks to show the internal necessity of the link between the historicity of art, and thus of the beautiful, and the systematic structure of his philosophical thought:

> Thus demonstrating the idea of the beautiful [*die Idee des Schönen*], which we take as our starting point, that is, deriving this idea as a necessary implication of the presuppositions that, for science, precede it and within which it arises, is not our goal here, but is rather a matter for an encyclopedic development of philosophy as a whole and of its particular disciplines. For us, the concept of the beautiful and of art is a presupposition given by the system of philosophy [*Für uns ist der Begriff des Schönen und der Kunst eine durch das System des Philosophie gegebene Voraussetzung*].

(*Vorlesungen über die Aesthetik*)

This passage clearly develops what was already announced in "The Oldest System-Program of German Idealism" (a manuscript Franz Rosenzweig found in 1917 among papers that had belonged to Hegel, and whose attribution remains uncertain): the reconciliation of art and philosophy, the identification of the beautiful and art, of thought and appearance, and especially of art and truth. However, problems inherent in Hegel's aesthetic thought remain: How can the idea of artistic beauty, that is, the sole true beauty, be both rooted in metaphysics and the source from which the creative genius of every artist draws nourishment? And how can this metaphysical idea coincide with modes of appearance and manifestation that are as diverse as those of the work of art? In reality, a complete understanding of the concept of the beautiful would assume an infinite analytical regression of the presuppositions operative in the encyclopedic knowledge of philosophy and an endless analysis of all the forms of expression through which the idea of the beautiful is actualized and manifests itself in the history of art.

In many respects, Nietzsche's aesthetic concepts—appearance, illusion, value as the conditions for preserving life—are derived from, or are rather a kind of distant echo, of Kant's thought.

> Nothing is more conditional—or, let us say, narrower—than our feeling for beauty. Whosoever would think of it apart from man's joy in man would immediately lose any foothold. "Beautiful in itself" is a mere phrase, not even a concept. In the beautiful, man posits himself as the measure of perfection; in special cases he worships himself in it. A species cannot do otherwise but thus affirm itself alone. Its *lowest* instinct, that of self-preservation and self-expansion, still radiates in such sublimities. Man believes the world itself to be overloaded with beauty—and he forgets himself as the cause of this. He alone has presented the world with beauty—alas! only with a very human, all-too-human beauty. . . . [T]he judgment "beautiful" is the *vanity of his species* [*das Urteil "schön" ist seine Gattungs-Eitelkeit*].

(*The Twilight of the Idols*)

Contrary to the last idealist aestheticians, such as Vischer or Lotze, and even to Schopenhauer, Nietzsche clearly distinguishes between art and the beautiful. Modern on this point, he makes the beautiful the effect of a belief, an illusion that is necessary insofar as it stimulates every aesthetic feeling. But this critique of idealism becomes inseparable from a rejection of any intellectualist conception of the idea of the beautiful, and this necessarily leads to the latter losing all content. The question of what the word *Schönheit* might still mean today is dealt with using arguments that belong to logic, sociology, and more rarely aesthetics proper, allowing us to discern a will to eliminate the concept, or else a desire

to preserve and sometimes restore a notion that others consider anachronistic or even reactionary. Today, any aesthetics that seeks to give a precise content to the concept of the beautiful is necessarily confronted by a choice: either resort to a metaphysical construction, at the risk of ending up in a position that is difficult to defend, or fulfill the conditions of a logical-semantic procedure that is nonetheless exposed to multiple self-contradictions.

Thus Reinold Schmücker declares: "That art imitates nature, that beauty can be experienced and makes divine perfection perceptible, are no longer plausible claims in the era of waste-management plants and atheism" (*Was ist Kunst?*). Franz von Kutschera replies to these excessive statements with propositions that express the contemporary quandary more subtly: "Beauty is merely one aesthetic concept among others, but because of its vast field of application, it has often been considered the dominant concept of all aesthetic qualities, and aesthetic theory has been defined as the theory of the beautiful. This conception is typical of the old aesthetics" (*Aesthetik*). Given the extreme difficulty of defining exactly what an aesthetic quality is and rigorously theorizing a notion that persists in ordinary discourse as well as in philosophical discourse, we can say that the meaning of the words *beau*, *Schönheit*, "beauty," etc. remains largely indeterminate. But that does not mean that they are empty of content, outdated, or unsuitable for conceptual treatment.

BEGRIFF (GERMAN)

ENGLISH	concept
FRENCH	*concept*
GREEK	*katalêpsis* [κατάληψις]
LATIN	*comprehensio*

➤ *CONCEPT* [CONCEPTUS, CONCETTO], and AUFHEBEN, GEISTESWISSENSCHAFTEN, INTELLECT, INTELLECTUS, PERCEPTION, PLASTICITY, PREDICATION, *REASON,* SOUL, UNDERSTANDING

In its common usage, the German verb *begreifen* designates an understanding of an intellectual order. It is this sense of the "intellectual grasp of a thing or an idea" (in *begreifen* there are echoes of the verb *greifen*: "to seize, catch, capture") that is found in *Begriff*: "Ich habe keinen Begriff davon" means that one has no access to the thing or idea in question. The inflections to which *Begriff* is subjected in philosophy are related to transformations in theories of knowledge. At first, *Begriff* had the strict sense of a function of understanding (Kant), but then it was given independent reality as a figure of knowledge that acquires consciousness in its journey toward absolute knowledge (Hegel). Finally, on the basis of a definition of *Begriff* that claims to be strictly logical, these different meanings were redefined as still too psychological, to the degree that they still contain something of the ordinary sense of the term (Frege). The current discussion of the possibility of reintellectualizing concepts continues to stumble over the difference in languages between a German *Begriff* that has retained part of its naturalness and an English "concept" that is totally unrelated to ordinary usage.

I. *Begreifen, Verstehen, Konzipieren* (Kant): Varieties of Understanding

It was with Immanuel Kant that *Begriff* acquired a specific philosophical meaning far removed from the general meaning forged by Christian Wolff (cf. Wolff, *Vernünfftige Gedanken*, 1.4: "any representation of a thing in our ideas [*jede Vorstellung einer Sache in unseren Vorstellungen*]"). In his *Logic*, which revised and transformed the vocabulary of German academic philosophy, Kant set this very general meaning of representation against a precise meaning that is part of a classification of the kinds of knowledge in which *begreifen* is distinguished from *verstehen* and *konzipieren.* Here is his definition of the "fifth degree" of knowledge:

> To understand [*verstehen, intelligere*] something, to cognize something through the understanding by means of concepts [*durch den Verstand vermöge der Begriffe*], or to conceive [*konzipieren*]. This is very different from comprehending something [*begreifen*]. One can conceive much, although one cannot comprehend it, e.g., a *perpetuum mobile* whose impossibility is shown by mechanics.
>
> (*Lectures on Logic*, trans. Young, 570)

On the other hand, the seventh degree, "to grasp [*begreifen, comprehendere*] something," means "to know through reason [*durch die Vernunft*] or *a priori*, to the extent that this is suitable for our purposes [*in dem Grade . . . als zu unserer Absicht hinreichend ist*]" (*Logik*, Introduction, §8, in RT: Ak., 9:65; Kant, *Lectures on Logic*, trans. Young, 570).

The classification proposed in the *Logic* is remarkable in that it dissociates the verb *begreifen* from the noun *Begriff.*

Whereas the latter enters easily into the definition of *verstehen* as the fifth degree of knowledge ("cognize something through the understanding by means of concepts"), Kant reserves *begreifen* for the supreme degree of knowledge. It is as if *Begriff* were already neutralized by its technical usage, whereas the meaning of *begreifen* could still be debated. The reason for this is doubtless that the verb *begreifen* still connotes something of the act of grasping, and that Kant can see in it the most complete form of capturing or appropriating the object in question. The phenomenon is further accentuated by the presence in *begreifen* of the prefix *be-*, which signifies transitivity and implies, in this precise case, direct, full contact with the object.

The Kantian classifications may vary, but they never alter this fundamental definition of *begreifen.* Elsewhere, Kant corrects the terminology earlier proposed by the Wolffian Georg Friedrich Meier by refusing to translate *begreifen* with *concipere* (conceive): *begreifen* has to be reserved for *comprehendere*, that is, for a mode of knowledge that makes use of an intuition "per apprehensionem" (*Wiener Logik,* in RT: Ak., 24:845). The detour through Latin is revealing: the idea of *apprehensio*—that is, grasping or capturing—naturally leads Kant to *begreifen*, which contains this idea in its etymology (*greifen*). To be sure, *konzipieren*, which is derived from the Latin *capere*, also includes the idea of capture, but the etymology is blurred, and the determination of *begreifen* passes precisely through a new translation or a new Latin equivalent, *comprehendere*, in which the meaning of prehension, of taking in hand, is more clearly heard.

■ See Box 1.

This is the distinction inherited by the term *Begriff.* In the *Critique of Pure Reason*, the *Begriff* becomes a function of the understanding (as opposed to the object of an intuition)—itself defined as a power of concepts. The *Begriff* is what gathers together, unites, and synthesizes the empirical manifold:

> The knowledge yielded by understanding, or at least by the human understanding, must therefore be by means of concepts, and so is not intuitive, but discursive. Whereas all intuitions, as sensible, rest on affections, concepts rest on functions. By "function" I mean the unity of the act of bringing various representations under one common representation. Concepts are based on the spontaneity of thought, sensible intuitions on the receptivity of impressions.
>
> (*Kritik der reinen Vernunft*, in RT: Ak., 3:85–86, trans. Kemp-Smith, 105)

II. *Der Begriff*: Concepts and the Concept (Hegel)

The relative ease with which the use of the term *Begriff* in the *Critique of Pure Reason* can be translated (unlike its use in passages dealing with definitions, such as the one in the *Logic*) no doubt proceeds from the fact that Kant conceives *Begriffe* in their plurality: there are as many concepts as there are possible functions. On the other hand, the term becomes more difficult to understand when it is used exclusively in the singular—as it is in Hegel, whose philosophy is a philosophy of the Concept, the *Begriff*, without further determination. The passage from the plural to the singular also marks

1

Grasping: *Katalêpsis* and *comprehensio*

➤ CONCEPTUS, PATHOS, PERCEPTION, PHANTASIA, REPRÉSENTATION

The Stoics distinguish among true representations those that are apprehensive (in the active sense of "capable of actively grasping objects or situations") and those that are not. For them, an apprehensive representation, *phantasia katalêptikê* [φαντασία καταληπτική], is the most exact and precise, and the one that represents in the mind the peculiar characteristics of the thing represented:

> An apprehensive one is the one that is from a real thing and is stamped and impressed in accordance with just *that* real thing, and is of such a kind as could not come about from a thing that was not real. For since they trust this appearance to be capable of perfectly grasping the underlying things, and to be skillfully stamped with all the peculiarities attaching to them, they say that it has each of these as an attribute.
>
> (Sextus Empiricus, *Adversus mathematicos,* 8.248–49, trans. Bett, 50)

It is a representation so "plain and striking" that it "all but grabs us by the hair, and draws us into assent" (ibid., 8.257, trans. Bett, 52).

The assent that we irresistibly give to such a representation leads to grasping or comprehension, *katalêpsis* [κατάληψις]:

> Zeno professed to illustrate this by a piece of action; for when he stretched out his fingers, and showed the palm of his hand, "Perception," said he, "is a thing like this." Then, when he had a little closed his fingers, "Assent is like this." Afterwards, when he had completely closed his hand, and held forth his fist, that, he said, was comprehension. From which simile he also gave that state a name which it had not before, and called it *katalêpsis*. But when he brought his left hand against his right, and with it took a firm and tight hold of his fist, knowledge, he said, was of that character; and that was what none but a wise man possessed.
>
> (Cicero, *Academic Questions,* 1.47, trans. Yonge)

The clenched fist illustrates comprehension; the other hand gripping it tightly illustrates science, which stabilizes and preserves this comprehension.

The act of prehension and grasping expressed by the verb *comprehendere* (and the noun *comprehensio*) is discernible in all uses of the term that include sensorial apprehension (e.g., Cicero, *De legibus,* 1.30) and all of the levels of taking possession intellectually: thus discourse is imprinted on the mind of the orator because he has first "grasped" the ideas that he will develop by means of images that remind him of them (Cicero, *De oratore,* 2.359). The words themselves "enclose" the thought that they have "grasped" (*De oratore,* 1.70), just as the oratorical period "includes" and "circumscribes" the thought (*Brutus*, 34). All of these possible translations of *comprehendere* allow us to glimpse the richness of the term that Cicero chose to render the Stoic *katalêpsis*: other terms were acceptable, which the Stoic in the dialogue *De finibus* (3.17) gives as equivalents of *katalêpsis*: *cognitio* and *perceptio*. But by choosing *comprehendere*, Cicero emphasizes the gesture Zeno used to describe the different levels of knowledge (and to illustrate as well the relation between rhetoric and dialectic [*De finibus,* 2.17; *De oratore,* 113]). The importance Cicero accords to this gesture, attested by him alone, gives its full weight to Zeno's bending of the substantive *katalêpsis*, which before him had never been used to designate anything but a concrete grasping or capture. The hand gesture makes it possible to understand the unity of movement from representation (*phantasis-visum*)—the open hand—to comprehension—the closed fist—and then to science—the fist gripped by the other hand (*Academic Questions,* 2.145; see above). The hand is still active, but it exercises its activity on itself: the close interweaving of activity in the course of a process that is also a passive reception is stressed by Cicero's translations of *phantasia katalêptikê*. The adjective *katalêptikê* [καταληπτική], generally interpreted as having an active sense, also has a passive sense: Cicero uses not *katalêptikon* [καταληπτικόν] but *katalêpton* [καταληπτόν], which means "grasp" or "what

can be grasped" (*Academic Questions,* 1.41); he translates this term by *comprehendibile*, so that we understand more clearly, thanks to this translation, that representation is what permits grasping, because it can itself be grasped; the grasp becomes possession only when the representation has received assent and approval ("visum . . . acceptum . . . et approbatum"):

> [Zeno] did not give credit to everything which is perceived, but only to those which contain some especial character of those things which are seen; but he pronounced what was seen, when it was discerned on account of its own power, *comprehensible* . . . after it had been received and approved, then he called it *comprehension*, resembling those things which are taken up [*prehenduntur*] in the hand.
>
> (Cicero, *Academic Questions,* 1.41, trans. Yonge)

Thus strengthened by the explanation given to the Stoic "gesture" of *katalêpsis*, the classical meanings of the Latin *comprehendere* determined its subsequent philosophical uses. In the Middle Ages, the novelty of the Latin *conceptus* had to do with the fact that to the image of capture, still present in the word through the verb *con-capere*, was added another, that of giving birth (as in "conception"). From this resulted an entirely different representation of the system of the faculties and of the activity of knowledge (see CONCEPTUS).

the passage from a philosophy of knowledge that associates concept and understanding with a philosophy that claims to be a Science, and to that end unites the Concept with Spirit.

In French translations, the capital *C* is probably the most economical way of indicating the emphatic use Hegel makes of the term "Concept"; it would otherwise be difficult to render in French, which is accustomed to the plural (*les concepts*) or the indefinite (*un concept*). Hegel is in fact the philosopher who opposes *the* Concept to concepts in the plural (cf. *Aesthetik* 1, in *Werke*, 13:127: "In recent

times, no concept has been as infirm as the Concept it-self"). *The* Concept is thus considered to be a figure of knowledge: it is the absolutely simple and pure element in which truth has its existence (*Phänomenologie des Geistes*, in *Werke,* vol. 3), and only its deployment, also called "the work of the concept" (*Arbeit des Begriffs*), provides access to "scientific understanding" (*wissenschaftliche Einsicht*). The *Phenomenology of Mind* makes the *Begriff* almost a dramatic figure by characterizing it as the "movement of knowledge," a movement that is a "self-movement" (*Selbstbewegung*). This movement of the Concept, which can also be called a movement of self-reflection, but is already in the unity of being and reflection (cf. *Wissenschaft der Logik*, in *Werke,* vol. 6), terminates in the unity of knowledge and its object (*Phänomenologie*), which is at the same time division, partition, separation between the different things that are "what they are through the activity of the Concept that dwells in them and reveals itself in them" (die Dinge sind das was sie sind durch die Tätigkeit des innewohnenden und in ihnen sich offenbarenden Begriffs: *Enzyklopädie der philosophischen Wissenschaften* 1, *Die Wissenschaft der Logik*, §163, add. 2, in *Werke*, 8:313). At the end of "Doctrine of the Concept" in *Science of Logic*, the *Begriff* is subsumed by the Idea (see AUFHEBEN), which is also in the singular: the Idea is "the adequate Concept, the objectively true or the true as such" (der adäquate Begriff, das objektive Wahre oder das Wahre als solches, *Die Wissenschaft der Logik,* in *Werke*, vol. 6). Nonetheless, it remains the "principle of philosophy," and in this sense we find it again in the *Philosophy of Mind* in the *Encyclopedia* (cf. *Philosophie des Geistes*, in *Werke*, vol. 10).

This speculative use of the term *Begriff* remains doubly faithful to the common use of the word, however. In the singular, *der Begriff* perhaps suggests above all the act of seizing or grasping, of taking everything to "inhabit" it and be "revealed" in it, as we have seen in Hegel. In addition, when Hegel speaks of the "Begriff des Begriffs" (in *Werke,* vol. 6), he adds to this play on the etymology a completely ordinary use of the word that makes it a synonym of *Bestimmung*, "definition." Despite the inherently speculative aspect of this reduplication of terms, "Begriff des Begriffs" does not mean so much "concept of the concept" as "definition of the concept," that is, its abridged idea, or, as Hegel puts it, its *Abbreviatur*, "abbreviation" (in *Werke*, vol. 5). The extended use of the term, between common language and technical vocabulary, makes it possible to take the same term in two different senses in the same expression.

Thus in Kant and Hegel, the specificity of *Begriff* and *begreifen* resides in each case in grammatical peculiarities: the different uses that make the nominal form (*Begriff*) and the verbal form (*begreifen*) possible in Kant, and the singular and the plural of *Begriff* possible in Hegel. From one author to the other, the play on etymology shifts from the verb (Kant plays mainly on *begreifen*) to the noun (Hegel's play on the majesty of the singular). In both cases, however, the theory of knowledge and the speculative doctrine of science are deployed in a close relationship with ordinary language, or at least with the phantasmal version provided by the etymology. It is this relationship that is lost as soon as the term is translated into French.

III. *Begriff* and the Linguistic Turn

A. *Begriffsschrift* (*Frege*)

Begriff also lends itself to a more strictly *logical* definition, that is, one in which the preceding meanings are contested as connected with a use that is still "psychological." Gottlob Frege's *Begriffsschrift* undertakes a transformation of this kind, and the French translation of his title (*Idéographie*) is for that reason problematic. As Frege points out in his preface:

My goal was to seek first of all to reduce the concept of succession [*den Begriff der Anordnung*] to a series of logical consequences, and then to advance toward the concept of number. To prevent something intuitive [*etwas anschauliches*] from being inadvertently introduced, the absence of gaps in the sequence of deductions had to be assured. . . . That is why I abandoned any attempt to express anything that has no meaning for the deduction. In §3, I have designated as conceptual content [*als begrifflichen Inhalt*] what alone is important to me. This explanation must consequently always be kept in mind if one wants to understand correctly the essence of my formula language [*Formelsprache*]. From this also follows the name *Begriffsschrift.*

The difficulty involved in using "concept" in translating the *Begriffsschrift* comes from the fact that in it, Frege proposes a definition of the concept (and thus of the conceptual content) that is inseparable from his view of logic and his principled antipsychologism. In the preface to *Die Grundlagen der Arithmetik* (The foundations of arithmetic), he defines the three principles guiding his approach: always clearly separate the psychological from the logical, the subjective from the objective; never ask what a word means by itself, but always in context; and never lose sight of the distinction between concept and object (der Unterschied zwischen Begriff und Gegenstand ist im Auge zu behalten: *Die Grundlagen der Arithmetik*, x). The *Begriff* is not a psychological but a logical notion. The distinction between concept and object proceeds entirely from the new logic, according to which simple utterances are analyzed for their function and argument. For example, in the sentence "The Earth is a planet," we can replace "Earth" by other proper nouns, and obtain in this way the sentences "Venus is a planet," "Mars is a planet," and so on. What remains invariant in these sentences is a function, which takes this or that object as its argument. A concept is a function at a place, what can be said of an object. We see that the notion of the concept, thus defined, is in no way psychological, and is independent of any idea of "grasping." Moreover, as Frege explains in "Funktion und Begriff" (Function and concept), the concept thus defined is no longer closed or complete, but in need of an argument; it is "unsaturated" (*ungesättigt*: in *Funktion, Begriff, Bedeutung*, 29).

In his article "Begriff und Gegenstand" (Concept and object), Frege replies to a few objections that had been addressed to him by Benno Kerry regarding his use of the concept of concept:

The term "concept" [*Begriff*] has several uses; it is sometimes taken in the psychological sense, and sometimes in the logical sense, and perhaps also in a confused

acceptation that mixes the two. But this freedom has its natural limit; as soon as a certain use of the term is put in play, it is desirable that it should be maintained. For my part, I have chosen to adhere strictly to the purely logical use of the term.

("Begriff und Gegenstand," in *Funktion, Begriff, Bedeutung*, 66)

B. The analytical uses of "concept"

Such a purely logical approach poses a problem, which Frege lucidly outlines in "Begriff und Gegenstand": How can we talk about a concept (for example, when we say that it is clear, simple, general, and so on) without making it an object and thus violating the principles of Frege's approach? The question, which was to obsess many twentieth-century philosophers of language, is that of predication. If an object is anything about which one can say something (and thus, anything one can make "fall under a" concept), we can speak of "a" concept, and that is what we do, very commonly in fact. Frege's redefinitions have thus not eliminated, even in the analytical field, all work on the notion of the concept, and they have even elicited a new line of reflection on individuation and the distinction of concepts. The logicization and depsychologization of the concept of concept accomplished by Frege have certainly led, in a first phase, to a decay of the concept in favor of predication and objects (to which first Rudolf Carnap's work and then W.V.O. Quine's testifies, each in its own way). The term "concept" has been maintained, but in a rather vague sense, notably in the common expression "conceptual scheme" used by Quine (*From a Logical Point of View*, 44ff.) and his successors in the sense of the whole of our conception of the world, or the whole of our knowledge ("the conceptual scheme of science"): the expression acquires a special flavor from the fact that according to Quine, this conceptual scheme is inseparable from a language and an ontology that are themselves untranslatable into another language in an unequivocal way (see SENSE). The idea of a conceptual scheme is thus associated with the whole debate about incommensurability and relativism that has roiled analytical philosophy and epistemology since the 1960s. This is shown not only by Richard Rorty's work, but also by Donald Davidson's famous text, "On the Very Idea of a Conceptual Scheme," in which Davidson vehemently criticizes the idea of a conceptual scheme and a "point of view" on the world as a source of "conceptual relativism" and associates it—following in that respect Quine himself—with the idea of linguistic difference and untranslatability. A conceptual scheme is language conceived as a source of the conception and categorization of the world. We see what difficulties the philosophy of language encounters in seeking to eliminate or resolve the question of conceptualization, difficulties that have led to a massive return, since the end of the twentieth century, to concepts: it was in fact the return of analytical philosophy to the philosophy of mind, against the antipsychological precepts of Frege and Ludwig Wittgenstein, that allowed a resurgence of the term, this time generally in the plural and rementalized: that is the case in English philosopher Christopher Peacocke's *A Study of Concepts*, which has been much discussed since the 1990s. Many recent discussions of concepts bear on the *possession* of concepts, in the sense of "mental representations." There is, for example, current debate about "nonconceptual content," that is, an intrinsic content of experience that is supposed to be a representation independent of concepts.

Peacocke introduces his thought in *A Study of Concepts* this way:

We need to be clear about the subject matter of a theory of concepts. The term "concept" has by now come to be something of a term of art. The word does not have in English a unique sense that is theoretically important.

Peacocke then quotes Woody Allen, who has a character in his film *Annie Hall* say, "Right now it's only a notion, but I think I can get money to make it into a concept . . . and later turn it into an idea." Peacocke implies here, in an interesting way, that the word "concept" in English no longer really has an ordinary use, and that it certainly does not refer, as he says later on, to the Fregean use. Hence he proposes a purely stipulative definition of concepts based on distinguishing them through their propositional content. We can imagine that it is the logicism of the Fregean conceptual notation and definitions that makes constantly possible, in the wake of analytical philosophy, new, more or less arbitrary definitions of the concept; nonetheless, by the roles that he assigns in his definitions to "functions" and their operativity, Frege maintains a naturalness in the use of *Begriff* that is probably lost in later English translations and the most contemporary uses of "concept."

BEHAVIOR, BEHAVIORISM

FRENCH   *conduite, comportement, béhaviorisme,*
          béhaviourisme, comportementalisme
GERMAN   *Verhalten, Behaviorismus*
ITALIAN   *comportamento, comportamentismo*

➤ *COMPORTMENT,* and *ACT,* AGENCY, ENGLISH, EPISTEMOLOGY,
GEISTESWISSENSCHAFTEN, INTENTION, LEIB, MANIERA, PRAXIS,
SENSE, SOUL, SPEECH ACT, UNCONSCIOUS, *WORLD*

The untranslatable character of the English term "behavior" appears (1) in the hesitation between two translations of the term in French, *conduite* and *comportement*, with the transition (in 1908, with Henri Piéron's reintroduction of the term in psychology) from the former to the latter, manifesting a desire to objectify and make scientific the "observable" notion of behavior; (2) in the contemporary choice of the French term *béhaviorisme* instead of *comportmentalisme* (rarer) to translate "behaviorism." The same can be said of German, which uses "Behaviorism" (*ein verkappter Behaviourist,* "a behaviorist in disguise," [L. Wittgenstein, *Philosophische Untersuchungen,* §307]).

The French term *behaviorisme,* simply copied from the English, designates a given philosophical conception (dating historically from the beginning of the twentieth century in America and in John B. Watson's theories, elaborated at the same time as those of Ivan Pavlov in Russia), according to which only the observation of so-called external behavior can be proved to provide a basis for the description of mental states. The term, introduced in a positive way, has now become pejorative, or at least negative: in French, *behaviourisme,* simplifying and scientist, tends to be opposed to a possible true theory of behavior (cf. M. Merleau-Ponty, *La Structure du comportement*).

We see that the difficulty also concerns the term *comportement.* This term, which since the fifteenth century has designated a way of acting, does not seem to correspond to the problematizations of behavior that have appeared successively in English-language philosophy, notably in the social and even moral dimensions of the English term, to which its classical translation by *conduite* testifies. It was only the behaviorist redefinition of *comportement* at the beginning of the twentieth century that forcibly united the problematic pair *comportement/*behavior. French reluctance to really translate "behaviorism" may in turn signal this gap with respect to conceptions and descriptions of *comportement* and "behavior."

I. "Empiricism," "Naturalism," "Behaviorism"

The term "behavior" appears in the fifteenth century in English and has had from the outset the moral dimension of "conduct," as is shown by the intransitive use of "to behave" (act in accordance with social norms). Thus in Hobbes we read the following:

> By manners, I mean not here, decency of behaviour; as how one man should salute another, or how a man should wash his mouth, or pick his teeth before company, and such other points of the small morals.
>
> (Hobbes, *Leviathan,* Part I, chap. 11)

This normative and social dimension of "behavior" (associated with decency, manners, and morals) is transformed in the empiricists, notably in Hume, where it is complicated by a descriptive dimension. Hume defines human behavior as an observable physical manifestation, an empirical, experienceable phenomenon. It is this behavioral datum that was to found moral science and "naturalize" it by giving it a certitude comparable to that of the natural sciences.

> We must therefore glean up our experiments in this science from a cautious observation of human life, and take them as they appear in the common course of the world, by men's behaviour in company, in affairs, and in their pleasures.
>
> (Hume, *Treatise,* I, Introduction, xxiii.)

Here, "behavior" is immediately translated by *conduite,* which can raise questions since "conduct" is also very frequent in Hume, as well as the pair "behavior and conduct" ("Their whole conduct and behaviour," *Treatise,* Part II, chap. 3). However, the coupling (analogous to that of "belief and assent," see BELIEF) indicates the proximity of behavior and social custom or usage—both objects of observation and experimentation. Behavior thus proves to be the starting point for a naturalization of the social that is not a reduction to physical data but may produce knowledge that is of a quite different kind, and just as certain.

II. "Conduct"/"Behavior": Pragmatism and Behaviorism

In the term "behavior" it becomes difficult to differentiate behavior as such from a problematics of good conduct, a set of social habits, or a product of character, virtues, and so forth. The problematics of "behavior" is very rich among nineteenth-century American pragmatists, and first of all in the work of William James. In his *Talks to Teachers* (1899), he defines the child as a "behaving organism" (rendered by the French translator as "L'enfant comme organisme tourné vers le pratique"). James tries to produce a nonmoral, functionalist, and cognitive concept, thus distinguishing it from conduct (emblematized by Emerson and his "Conduct of Life"). Hume's pair, behavior/conduct, is split apart. "Behavior" is drawn toward a genuine scientific knowledge, and the latter is drawn toward a more socialized set of morals.

But it is obviously the founding texts of behaviorism as a theory of psychology that produced the most explicit redefinition of "behavior," and especially in John B. Watson's famous article "Psychology as the Behaviorist Views It" (1913). This is a naturalistic credo that sought to make psychology a science of which the object and foundation is human (and, indissolubly, animal) behavior.

> Psychology as the behaviorist views it is a purely objective experimental branch of natural science. . . . The behaviorist, in his efforts to get a unitary scheme of animal response, recognizes no dividing line between man and brute. The behavior of man, with all of its refinement and complexity, forms only a part of the behaviorist's total scheme of investigation.

Watson, who was influenced by John Dewey's "functional psychology" tried, unlike the pragmatists, to separate the concept of behavior from that of consciousness (see CONSCIOUSNESS) and to associate it with the concepts of reflex arc, stimulus, habit, and disposition, all terms that

were gradually to invade scientific psychology and lead it to reject data derived from introspection, common sense, or so-called popular psychology. In this context, linguistic behavior turns out to be an important dimension of behavior (*Verbal Behavior* is the title of an influential work by B. F. Skinner) that refers to language from the point of view of its observable productions (see SPEECH ACT).

> The Behaviorist asks: Why don't we make what we can observe the real field of psychology? Let us limit ourselves to things that can be observed, and formulate laws concerning only the observed things. Now, what can we observe? Well, we can observe behavior—what the organism does or says. And let me make this fundamental point at once: that saying is doing—that is, behaving. Speaking overtly or silently is just as objective a type of behavior as baseball.
>
> (Watson, "Behaviorism,
> the Modern Note in Psychology")

Behaviorism proves to be inseparable from a certain conception of behavior as observable and bodily or organic, denying the dimension of conduct and preserving in habit only the idea of conditioning. The stimulus-response schema thus becomes central to the definition of behavior. It is this apparently caricatural and restrictive conception of behavior that leads people to see in "behaviorism" a theory of behavior observed in the laboratory, whose most famous illustration is found in the experiments on conditioned reflexes conducted by Pavlov and his associates between 1900 and 1917.

However, among some pragmatists, notably Dewey and George Herbert Mead, there is a critique of behaviorism understood in this way, and an attempt to reframe the term "behavior" in a way that remains faithful to Hume's definition: experimentation and observation of behavior involve the environment as much as they do the organism. And the environment includes other human beings and complex social mediations.

> Only by analysis and selective abstraction can we differentiate the actual occurrence into two factors, one called organism and the other, environment. This fact militates strongly against any form of behaviorism that defines behavior in terms of the nervous system or body alone.
>
> (Dewey, "Conduct and Experience")

It is also in Dewey's work that we find an interesting clarification of the necessary "seriality" of behavior, and see the appearance of the English terms "comportment/deportment" and the reappearance of "conduct":

> Although the word "behavior" implies comportment, as well as deportment, the word "conduct" brings out the aspect of seriality better than does "behavior," for it clearly involves the facts both of direction (or a vector property) and of conveying or conducing.
>
> (Ibid.)

In Mead as well there is a shift from the notion of "behavior" to that of "conduct":

> The behaviorism which we shall make use of is more adequate than that of which Watson makes use. Behaviorism in this wider sense is simply an approach to the study of the experience of the individual from the point of view of his conduct, particularly, but not exclusively, the conduct as it is observable by others.
>
> (Mead, *Mind, Self and Society*)

Linguistic behavior is thus no longer a special case, but *the* domain in which the social character of behavior appears, through the necessity of the individual's inclusion in the group of co-locutors:

> We want to approach language not from the standpoint of inner meanings to be expressed, but in its larger context of cooperation in the group. Meaning appears within that process. Our behaviorism is a social behaviorism. . . . Social psychology studies the activity or behavior of the individual as it lies within the social process; the behavior of an individual can be understood only in terms of the behavior of the whole social group of which he is a member.
>
> (Ibid.)

Social behaviorism thus seems to rehabilitate the concept of conduct. In French, the term *conduite* was long preferred in describing behavior as a component of social relationships:

> Thus we see that the most useful observations on human intellectual and moral nature, collected, not by philosophers inclined to theories and systems, but by men truly endowed with the spirit of observation and disposed to grasp the practical side of things—moralists, historians, statesmen, legislators, schoolteachers—, have not in general resulted from solitary contemplation and inward-looking study of events in consciousness, but instead from an attentive study of the conduct (*conduite*) of men placed in various situations, subjected to passions and influences of all kinds from which the observer takes great care to free himself as much as possible.
>
> (A. Cournot, *Essai sur les fondements
> de nos connaissances*, 2:548–49)

Thus *comportement* comes to be associated with a specific (nonsocial) conception of psychology. The introduction of the term *comportement* in a technical sense is exactly contemporaneous with the development of behaviorist psychology without being entirely dependent upon it. Empirical psychology, even before Pavlov's work was known and at a time when American behaviorism was still being elaborated theoretically, was represented in France by Binet's successor, Henri Piéron, who introduced the term *comportement* explicitly as a translation, defining the peculiar object of scientific psychology as

> the activity of beings and their sensory-motor relationships with their environment, what the Americans call "behavior," Germans *das Verhalten*, Italians *il comportamento*, and what we can correctly call *le comportement des organismes*.
>
> (Piéron, "Leçon inaugurale à l'École pratique
> des hautes études," 1908)

Piéron, thus anticipating certain cognitivist conceptions, also corrects Watson's behaviorism by contesting the stimulus-response pair and emphasizing physiological mechanisms. Nonetheless, the term *comportement* was henceforth associated with an empirical approach, and refers precisely to behaviorism, just as the adjective *comportemental*, introduced in French a little later (1949), translates "behavioral."

III. Behaviorism and the Philosophy of Mind: Criticisms of Behaviorism and Behaviorism as Criticism

The resistance to behaviorism on the part of the French, discernible in the refusal to really translate the term, may be a sign of a refusal to extend the objectivist method— that of a pure "external description"—to psychology and to what Vincent Descombes calls "mental phenomena" (*les phénomènes du mental*). Over the past quarter century, behaviorism seems to have become a red flag. The term is clearly pejorative and now coexists in French with the less theoretical *comportementalisme.* Today the latter refers to rather specific ultra-empirical methods involving rigid conditioning (in connection with dog-trainers, internal relationships, managers in business, shock treatment, and the *thérapies comportementalistes* of *cognitivo-comportementalisme*). As for the term *comportement*, its uses extend beyond human behavior: physicists speak of the *comportement des molécules*, and linguists of the *comportement* of this or that verb.

Today the negative connotation of behaviorism is no less current in English: behaviorism is the primary target of the philosophy of mind (see SOUL, Box 6), which since the end of the twentieth century has developed largely by using it as a foil. The problem is that this mentalist backlash also involves a repression of behaviorism's critical dimension, which was initially a challenge to a certain discourse on the mental and to the "myth of interiority." Thus, when Ludwig Wittgenstein alludes to behaviorism and notes the behaviorist flavor of his remarks, he does so in part to draw attention to a "truth" of behaviorism, repeated obsessively in the *Philosophical Investigations*: to gain access to another person's interiority we have nothing to go on other than what that person does and says (his exterior). Behaviorism is thus right insofar as it takes into account the limitation of our discourse on the mental. But it is wrong insofar as it seeks to take behavior as the criterion and foundation for knowledge of human nature, outside of any relationship to others or to society. But contemporary mentalist criticisms of behaviorism sometimes seem to see in it only its narrow scientism and naturalism, repressing the philosophical radicalness of its empiricist position.

Two criticisms of behaviorism that are exact contraries coexist today, and can serve to outline the field of the philosophy of mind. The first, which continues Dewey's and Wittgenstein's line of argument, refers to behavior as institutional and social (cf. Descombes): any acquisition of habits or dispositions is social, and the concept of behavior cannot be reduced to individual behavior. The second criticism is at the basis of neo-mentalism: the mental is irreducible to empirical behavior, the mind is certainly somewhere "inside," even if this inside is physical (or neurophysiological).

At first, behaviorism cohabited with the analytical philosophy that issued from the Austrian emigration, whose logical empiricism could be connected with behaviorism's radical empiricism, at the cost of a few misunderstandings. For example, Clark Hull proposed, in his *System of Behavior* (1952), a reconstruction of the theoretical foundations of behaviorism carried out in collaboration with Otto Neurath. The failure of this attempt at systematization prefigured the crisis of behaviorism, which was displaced by the advent of cognitive psychology, the turning point coming with Noam Chomsky's scathing 1959 review of Skinner's *Verbal Behavior.* We can lament the fact that the justified criticisms of certain aspects of the behaviorist program led to a rejection of the behaviorist critique of mentalism, which was precisely what interested Wittgenstein. In his fascinating article "Whatever Happened to Psychology as the Science of Behavior?" Skinner rightly interpreted the decline of behaviorism as a return of mentalism. Discussing, shortly before his death, the history of behaviorism and the way in which psychology as a science of behavior was eclipsed by the cognitive sciences, Skinner notes, "Everyone could relax. Mind was back."

The philosophical rejection of behaviorism has sometimes led to an uncritical acceptance of a psychology that is just as scientistic, and mentalistic in addition. Willard Van Orman Quine, a central figure in analytical philosophy and the last behaviorist, promoted a minimal behaviorism borrowed from P. Ziff: "Behaviorism is not a metaphysical theory: it is a denial of a metaphysical theory. Consequently it asserts nothing" (*Word and Object*, 265). Behaviorism raises a problem particularly interesting for the philosophy of language: what is at our disposal, in matters of language, other than verbal behavior—ours and that of others? That is, *what we say*? In an unpublished lecture, "The Behavioral Limits of Meaning," Quine noted, "In psychology, we can choose to be behaviorists or not, but in linguistics we don't have that choice." Behaviorism is the recognition of the immanent character of all linguistic research, and of the obligatory character of our starting point: ordinary language, "the social art" par excellence. In Quine or Wittgenstein, behaviorism turns out to be a reflection on the nature of the linguistic given. Thus this minimal behaviorism has to take into account the social character of behavior, which is ultimately coherent with Hume's conception of "behaviour" ("we must therefore glean up our experiments in this science from a cautious observation of human life, and take them as they appear in the common course of the world, by men's behaviour in company, in affairs, and in their pleasures" [*Treatise*, xxiii]). It should also be noted that despite American attempts, it is difficult to rid even the term "behavior" of any moral dimension, as is shown by the still-current use of the verb "to behave" in the sense of "conduct oneself well." The subtle grammatical complications surrounding this usage surface in a famous exchange in G. Cukor's film *Philadelphia Story* (1940). A character pontificates, "A woman has to behave, naturally," and another (played by Cary Grant) retorts, "A woman has to behave naturally." Here the meaning of "behavior" depends on a comma.

BELIEF

FRENCH   *croyance*
GERMAN   *Glaube*

➤ *CROYANCE, FAITH,* and CLAIM, DOXA, GLAUBE, MATTER OF FACT, PERCEPTION, PROPOSITION, SOUL, TRUTH

"Belief" has undergone an evolution characteristic of certain terms in English that pass from a mental and moral meaning (as affect or feeling) to a cognitive and propositional meaning (belief gradually detached from faith and assent). This process of objectivization was accompanied by major changes in the grammar of belief. The problem raised by the translation of "belief" has to do with the term's lack of definition, which allows it to move from the emotional to the logical and from the epistemic (degree of conviction, subjective) to the cognitive (conditions of validity, objective).

I. "Belief"/"Faith"

"Belief" is related etymologically to German *Glaube* (via *galauben*, thirteenth to fourteenth century, then *ileve-leve*, the prefix *be-* being added by analogy with the verb *bileve*; cf. *Middle English Dictionary*). The first meaning of "belief," which was identical with that of "faith" (cf. *fides*, *pistis*), belonged to the same semantic field as "reliance" and "confidence"; it referred to a mental or affective condition that was connected with *confiding*, passively relying on someone or something. Thus we read this in Hobbes: "Faith is a gift of God, which man can neither give nor take away"), or in Cardinal Newman: "To have faith in God is to surrender oneself to God." In addition to this theological dimension that closely associated the word first of all with faith, "belief" has a psychological or emotional meaning; it refers more to an affect than to a relation with a proposition. In its first meaning, "belief," like *Glaube*, designated a sense of adhesion that did not need to be justified rationally (see GLAUBE). In the seventeenth century, "belief" and "faith" began gradually to diverge. "Faith" supplanted "belief" in the area of religion, the latter designating a process that differentiated itself from faith, on the one hand by a lesser intensity, and on the other hand by a more intellectual dimension, or even a judgment. This intellectualization of belief (which becomes a state or act of mind) that started in the seventeenth and eighteenth centuries developed without abandoning—and this is the interest of the way the semantic field of "belief" was constituted in English, and also a factor contributing to its untranslatability—the first meaning's dimension of affect or passivity. The French term *croyance*, which is still used to translate "belief" even in its most sophisticated recent uses, raises a problem because it accounts for neither the sensible nor the objective dimension of "belief."

II. Belief and Feeling: Hume

Does "belief" refer to a feeling or to a proposition? Is it subjective or objective? The interplay of these elements determines the term's different senses. Thus it would be problematic to use contemporary distinctions to divide "belief" into psychological and propositional elements and to make belief a "mental state" belonging to the category of the propositional attitudes that Russell defines as associating a (mental or emotional) attitude with a "content" (a proposition or statement). For Hume, "belief" designates both a feeling and a judgment, indissolubly linked, and his use of the term has become a constant point of reference for contemporary theories of belief.

■ See Box 1.

The "belief"/"assent" pair defines a set of problems that deviates from the traditional hierarchies of *savoir/croyance* and *Wissen/Glaube.* Thus it would be a mistake to think of "belief" and "assent" as representing degrees of knowledge, even if probabilistic interpretations of belief tend in this direction. Hume's notion of an intensity of belief that is variable though not measurable may be the origin of the term's semantic deviations, along with his formulation of the problem of knowing "matters of fact," which misleadingly associates the definition of "belief" with the problems of skepticism and of confirming empirical knowledge.

1

Hume: "Belief"/"assent"

To define belief, Hume starts out from the difference between idea and impression, the former being derived and copied from the latter, of which it is only a less intense version: belief is "a lively idea related to or associated with a present impression" (*A Treatise of Human Nature*, 96), or else a "feeling or sentiment" (623) identified with the immediacy of the impression: "To believe is to feel an immediate impression of the senses." This immediacy gives belief an assurance that the idea lacks, particularly in the domain of "matters of fact" (see MATTER OF FACT):

> There is a great difference betwixt the simple conception of the existence of an object, and the belief of it, and as this difference lies not in the parts or composition of the idea, which we conceive, it follows, that it must lie in the manner, in which we conceive it.
>
> (Hume, *A Treatise of Human Nature*)

Belief is a feeling of the existence of its object. Such an "assertion" of existence neither coincides with nor assumes the idea in order to yield a belief: belief is nothing other than a "way" of feeling or conceiving our ideas that gives them more or less force or influence—whence the difficulty of translating *belief* in French as *croyance*, which is closer to the English word "opinion" (cf. "opinion or belief," *Treatise*) and can hardly be seen in French as

an affect: "Belief does nothing but vary the manner in which we conceive any object."

To understand this point, we have to note the essential connection that Hume establishes between belief and assent, that is, the mind's "strong propensity" (265) to affirm what it conceives. "Assent" is naturally connected with French *sentir* (it derives, oddly, from French *assentir*, during the thirteenth to fourteenth centuries), and belongs to the order of feeling (that is, the order of the mind). "Assent"—cf. the associated term "consent," as well as "approval" and "agreement"— designates an individual and collective feeling of acceptance. This assent is not a *fürwahrhalten* (an acceptance of a truth claim) and differs from the logical assent given to a proposition. The "belief"/"assent" pair is wholly defined by the immediacy and vivacity of impression, which can then constitute judgment and establish reasoning from cause to effect.

> Thus it appears that the belief or assent, which always attends the memory and senses, is nothing but the vivacity of those perceptions they present. . . . 'Tis merely the force and liveliness of the perception, which constitutes the first act of the judgment, and lays the foundation of that reasoning, which we build upon it, when we trace the relation of cause and effect.
>
> (Hume, *A Treatise of Human Nature*)

The "belief"/"assent" pair thus defines the semantic field of a sensitive mind difficult to relate to the French use of *croyance* or the German use of *Glaube*. It is all the more remarkable that Hume, in defining "belief"/ "assent," problematizes judgment and inquires into the difference between believing and disbelieving a given proposition regarding matters of fact: "Wherein consists the difference betwixt incredulity and belief?" How can we determine the difference between assenting to a proposition about matters of fact and rejecting it, since this difference is not in the idea itself?

The answer still has to do with the more forceful "manner" of conceiving the idea that is characteristic of belief. The "belief"/"assent" pair defines a feeling of natural and unavoidable belief (183) determined not by reason but by "custom," a mental feeling that we cannot avoid any more than we can wholly elicit it, for it is not active, but passive, and acts on us by causing our actions.

> Nature, by an absolute and uncontroulable necessity has determin'd us to judge as well as to breathe and feel . . . Belief is more properly an act of the sensitive, than of the cogitative part of our natures.
>
> (Hume, *A Treatise of Human Nature*)

III. Belief, Causes, and Consequences

The epistemological problem of the foundation of empirical knowledge, which is at the origin of most contemporary discussions of belief, determines two trends in the redefinition of belief: with regard to its causes, and with regard to its effects.

A. Belief and justification

After Hume, the first trend no longer concerns the empirical causes of belief (habit), but rather its justification, and hence its reasons (cf. the distinction, which has become omnipresent in the philosophical vocabulary, between "cause" and "reason"). The skeptical problem of the cause of our factual beliefs is retranslated into an epistemological problem of the objective conditions of the confirmation of empirical beliefs—in contemporary terms, the problem of induction—and this reintegrates belief into the *croyance/savoir* hierarchy. This is shown not only by the literature on the so-called "problem of induction" and of confirmation by experience, but also by the emergence of new expressions such as "justified belief" and "warranted belief."

■ See Box 2.

Most epistemological theories of belief seek instead to include it within knowledge, to objectify it as Frege did in proposing an objective conception of thoughts (*Gedanken*) as belonging to the mind, not to minds. Beliefs, exactly like Frege's *Gedanken*, are seen as independent of the believer in the framework of a general theory of judgment. Thus Willard Van Orman Quine in his *Pursuit of Truth*:

> A perception is an event in just one percipient; . . . a belief, on the other hand, can have many believers.

Here, belief is propositional: a shareable statement to which one may adhere or not. Such a shift, which may be acrobatic and in any case involves a sharp break with Hume's conception of belief, is illustrated by Russell's procedures. At first, Russell viewed belief as a dual relation between a subject and a proposition conceived as "an objective entity which exists whether or not it is believed." Thus the object of belief is identified with belief itself.

■ See Box 3.

The development that we have sketched here, from a "felt" belief (Hume) to a logical or "propositional" belief

2

Popper and the attempt to separate knowledge and belief

Karl Popper proposes to abandon Hume's concept of belief, which he regards as too "subjectivist," and to separate it from the objective concepts of knowledge and truth. The danger involved in taking belief into account is that knowledge and truth might be seen as "particular cases" of belief, those in which it is justified.

If we start from our subjective experience of believing, and thus look upon knowledge as a special kind of belief, then we may indeed have to look upon truth as

some even more special kind of belief : as one that is well founded and justified.

(Popper, *Conjectures and Refutations*)

For Popper, both verificationist theories (those that emphasize the empirical justification of beliefs, even in terms of probability) and psychologizing theories (those that are concerned with the causes and origins of our beliefs), because they cling to belief and its justification, have to abandon the objectivity of truth.

They all say, more or less, that truth is what we are justified in believing or in accepting.

(Ibid.)

Popper therefore sets out to separate the domain of objective and even conjectural knowledge (which Popper, like Frege, calls "World 3") from that of belief. Popper's point of view is symptomatic, even if it runs counter to the redefinitions of belief (let us recall that he was not a native speaker of English).

3

Wittgenstein and Ramsey: Belief's effects

We can compare the influence of the Frege-Russell conception of belief on F. P. Ramsey and Wittgenstein. Ramsey in his *Foundations* proposes the following definition:

I prefer to deal with those beliefs which are expressed in words, consciously asserted or denied ; for these beliefs are the most proper subject for logical criticism. The mental factors of such a belief I take to be words, . . . connected together and accompanied by a feeling or feelings of belief or disbelief.

A footnote on the same page indicates Ramsey's distance from Hume, but also the complexity of his relationship to empiricism:

I speak throughout as if the differences between belief, disbelief, and mere consideration lay in the presence or absence of "feelings" but any other word may be substituted for "feeling," e.g. "specific quality," "act of assertion" and "act of denial."

Here Ramsey is attacking a logical problem considered in an astonishing way by Wittgenstein, notably in the *Tractatus* (5.54f.). Wittgenstein criticizes Russell's theory of belief as relating a subject A and a proposition *p* in a compound proposition "A believes that *p*." For Wittgenstein, such a conception suggests the possibility (which must be excluded) of thinking or judging nonsense: in the case in which *p* is meaningless, we would then have a meaningless element in a compound proposition that is itself meaningful, which is impossible; therefore the proposition is defective. See *Tractatus* (5.5422): "The correct explanation of the form of the proposition (*Satz*) "A makes the judgment p" (*A urteilt p*) must

show that it is impossible for a judgment to be a piece of nonsense."

Here is the radical solution Wittgenstein proposes in the *Tractatus*:

5542. Es ist aber klar, dass "A glaubt dass p," "A denkt p," "A sagt p" von der Form "'p' sagt p" sind.

(It is clear, however, that "A believes that p," "A has the thought p," and "A says p" are of the form "'p' says p.")

Propositions that bear on a belief do not coordinate a fact and an object (*Gegenstand*) that is the subject A (which would lead to nonsense [*Unsinn*]), but instead coordinate *two facts* ("p"—the thought that p—and the fact p). This redefinition of belief (*Glaube*) has sometimes been interpreted in an anti-subjectivist sense. Matters are perhaps more complicated: in 5.5421, Wittgenstein explains that his definition shows that "the soul—the subject, etc. as it is conceived in the superficial psychology of the present day" are *ein Unding*, a non-thing. A composite soul would no longer be a soul. In reality, Wittgenstein is challenging the psychological idea of a unified subject—"A"—who is supposed to be the subject of assent: if there were a subject of the thought p, the subject would have himself to be composed, like p (would have to be a *zusammengetzte Seele* [a composite soul]), and decomposable into elements of thought. The principle of Wittgenstein's extensionalism thus leads him to a complete depsychologization of belief and the "mind."

It is on the basis of this radical, nonpsychological conception of thought and belief that Ramsey posits once again, in his article "Facts and Propositions" in *Foundations*, the

untranslatable Humean question of the difference between believing and disbelieving a proposition (see Box 1). After proposing his famous solution to the problem of truth (see TRUTH), Ramsey inquires into the equivalence—logically indispensable if we are still following Wittgenstein—of believing not-p and disbelieving p, "but to determine what we mean by this 'equivalent' is, to my mind, the central difficulty of the subject" (*Foundations*, as reprinted in Ramsey, *Philosophical Papers*, 43). Ramsey continues: "It seems to me that the equivalence between believing 'not-p' and disbelieving 'p' is to be defined in terms of causation."

Ramsey proposes to define belief in terms not of attitude but of causal properties (causes and especially effects of beliefs [*Foundations*]), while at the same time admitting, with a modesty that distinguishes him from his successors, that he scarcely sees how to determine them and that his definition remains imprecise. In "Truth and Probability" (reprinted in *Philosophical Papers*), Ramsey produces a theory of the degrees of belief and probability that played a founding role. Ramsey is not interested in the psychological degree or intensity of belief, but in "a measurement of belief *qua* basis of action" (67), and hence in probability. The connection between belief and probability, or between belief and the "problem of induction," is thus constituted entirely differently from the way it appears in Hume, and separately from any examination or measure of feeling, since Ramsey wants to give a resolutely extensional definition of belief that will lead him to a whole reworking of the classical concept of probability.

(Wittgenstein) would be relatively easy to describe if it were not complicated by the maintenance, and even the strengthening, of an emotional or psychological dimension of assent, since most contemporary thinkers on belief do not want to go as far as Wittgenstein and Ramsey in eliminating "attitude" and mind from belief. This is a rather curious point: the propositional (or enunciative) conception of belief has been able to coexist, and has even been associated in contemporary reflection on the status of beliefs and their relationships (notably in Davidson), with a repsychologization of assent, which brings back into the mental act or state of assent the "mind" or feeling that had been excluded by the logical program (which was perhaps hopeless) of what one might have called "proposition-belief."

B. Belief and propensity: Functionalism

A second trend deals with beliefs as causes of our actions, interpreting beliefs, often in naturalistic terms, as dispositions or propensities to action that are based on habit (see Peirce, who inspired Ramsey). In such a dispositionalist theory, belief is generally conceived as a representation that is, in a sense, rather indeterminate. This view is often defined by referring to Ramsey's fine expression asserting that belief is a "navigational chart" that tells us how to orient ourselves in our environment. Ramsey is obviously very prudent as to the causal determination that our beliefs might exercise on our actions and statements. Quine, a philosopher who was, however, clearly dispositionalist, wrote, "Manifestations of belief vary extravagantly with the belief and the circumstances of the believer" (*The Pursuit of Truth*).

Considering belief as a representation that has past causes, notably sensorial and semantic, and future effects, notably on action and other representations, contemporary cognitivists have taken up and transformed Ramsey's attempts. This "representationalist" point of view is found in the cognitive sciences, particularly in functionalism, which defines belief causally as a state brought about by sensorial inputs associated with dispositions to action, and thus stimulating behavioral outputs. Beliefs are supposed to correspond to concrete cerebral states that are not wholly determined (except in extreme functionalist programs) but can be associated with a set of behaviors that may be semantic. This is not the place to enter into the debates surrounding the question of (mental or semantic) holism. It is clear that since the recent development of the sciences of the brain/mind and their invasion of semantic and philosophical questions, we are now seeing a reformatting of the notion of belief, conceived alternatively, and even simultaneously, as a state that is mental, neurophysiological, physical, and so forth. It remains to discover whether the term "belief" can carry this whole new conceptual load, and whether such uses do not involve, as J. L. Austin would say, an excessive abuse of the ordinary use of the word "belief" by overdetermining its natural ambiguity. Because they insist on the passive character of belief and posit it as a source of action and representations, these redefinitions seem once again to revive Hume's naturalism. But they are problematic. The acknowledged failure of functionalism is only one example of the theoretical difficulties encountered by causal theories of belief. However, that is only a symptom of a fundamental problem that concerns precisely the use

of "belief." The recent evolution of the term leads us to ask whether it is so easy to understand it naturally in a physico-mental sense, for example, as an intermediate state that is neither physical not mental but located at the intersection of the two, and capable of causing our actions and discourses. With "belief," we have a case in which the noncritical transfer into French of contemporary English usage raises a problem (whence the difficulty in translating Ramsey), because the French term *croyance* is still more difficult to interpret as designating a causal state detachable from its object ("propositional" or other) than is "belief."

More generally, the flexibility of the use of "belief" in English makes it easier to use in connection with the vocabulary of action than the corresponding terms in other languages. For example, "to act on a belief" is a common expression in English, but it is difficult to translate into French, and so is the substantive "believer," which is obviously not equivalent to the French *croyant.* French philosophers' recent adoption of the term "belief," conceived simultaneously as a statement, a disposition, a physical or mental state, a cause of action, and so on, was philosophically possible and fertile only because of the multiplicity and naturalness of the uses of "belief" in English. The limits of this creativity are seen when we try to find equally pertinent uses in French or German. We can compare this with the difficulty of translating the expression "philosophy of mind" and even of constituting its field, and draw a parallel between the translation of "mind" by *esprit* and the translation of "belief" by *croyance*: in both cases, the French term suffers from strong associations with a thematics (at once spiritualist and psychologizing) that overdetermines translations and forces us to resort to a whole series of specific definitions, or even to invent an artificial language.

IV. The Grammars of Belief: "Belief"/"Certainty"/*Gewissheit*

Philosophical thought has attempted to divide the Humean conception, to separate assent from belief. In addition to the difficulties raised by causal theories, this has led to a neglect of a fundamental logical problem of belief: that of the nature of *assent.* Is it an adherence of the mind (the first meaning of "assent," synonymous with "faith"), a disposition to assert the truth of what the mind conceives, or a "holding-for-true" (*fürwahrhalten*, usually rendered in translations of Kant and Frege as "assent," or in French, as *assentiment*)? Is assent inseparable from judgment and its function, or is it added to judgment, like Russell's assertion-sign? The grammar of assent is also that of belief, of certainty, and of knowledge (the distinction between *savoir* and *connaissance* does not exist in English; see EPISTEMOLOGY, Box 3). It is this set of language games that has to be examined in order to see that it is really possible to abstract *belief* from the other terms—not only *assent*, but also *certainty* and *knowledge*—with which it is systematically connected.

- See Box 4.

So is certainty a subjective or an objective state? This question, outlined in Newman, allows us to challenge mentalist and dispositionalist interpretations of certainty, and even of belief, which has a closer grammatical relationship with truth.

- See Box 5.

4
Newman and the typology of "assents"

J. H. Newman, in his extraordinary work *An Essay in Aid of a Grammar of Assent* (1870), classifies kinds of assent, distinguishing "notional assent" (theological, inferential in nature) and "real assent" ("or belief" [63], which is stronger, involving unconditional acceptance, and is therefore religious in nature). He then differentiates "simple assent" (106; a more or less conscious mental assertion) from complex assent, which is voluntary and the result of thought, hence a judgment: "such assents as must be made consciously and deliberately, and which I shall call complex and reflex assents" (24).

This typology of assents inevitably leads to an examination of the case in which reflective assent involves the assertion of a proposition as true.

> Let the proposition to which the assent is given be as absolutely true as the reflex act pronounces it to be, that is, objectively true as well as subjectively—then the assent may be called a perception, the conviction a certitude, the proposition or truth a certainty, or thing known, or a matter of knowledge, and to assent to it is to know.

Here we must note the difference between "certitude" and "certainty," the former designating a subjective state, the latter an objective condition dependent on knowledge. It is indeed a grammar of assent that Newman elaborates in his examination of the "language game" of belief and certitude, placing certitude, that is, reflective and thus indefectible assent, above "simple assent." Religion demands a certitude: "This is why religion demands more than an assent to its truth; it requires a certitude." Certitude is a mental act, subjective but reflective and founded, of adhesion to a truth (for Newman, a divine truth). The concept thus blends faith and truth in a remarkable way. All certitude is not true; however, when it is false, the error is not in the assent but in the reasoning that leads to it. There is no test for determining whether a certitude is "true," whether it is a *savoir*, except the criteria of proof, of intellectual satisfaction and irreversibility.

5
Wittgenstein and certitude: *Über Gewissheit* / "On certainty"

We must start over from Wittgenstein, using his critique of Russell's concept of assertion and his reworking of Moore's paradox. I can believe something that is not true, or not believe something that is true. But I cannot say (or rather, it is meaningless to say), "It's raining, but I don't believe it" (a). One therefore cannot separate, in the proposition "I believe *p*," the proposition *p* and a (mental or logical) act of assertion. This has several consequences. To say "I believe *p*" is not a description of a psychological state or a disposition; otherwise (a) would not be paradoxical. "I believe *p*" is an expression (*Äusserung, Ausdruck* [see CLAIM]; these terms could also be translated by "avowal") like "I hurt." Believing (*croire, glauben*) is therefore neither a state (mental, physical, or any other kind) nor a disposition (we cannot determine all its consequences and expressions). Wittgenstein thus challenges the idea that assent is an assertion added, in some way, to a proposition when I assert its truth. If (a) is paradoxical, that is because the statement *p* somehow produces its own affirmation, and this was already implicit in Ramsey's "redundant" conception of truth, which preceded the definition of "belief" (cf. TRUTH). This observation ends up causing the implosion of the whole tradition summed up in the belief/assent pair, which is extended to interpretations of belief like that of William James (see *Principles of Psychology*, II, and *The Will to Believe*) and that of Russell. According to Wittgenstein, belief is not a feeling or an act of approval with regard to a proposition (no matter how powerful it might be: in James it creates truth), just as an assertion need not be an affirmative supplement, perhaps symbolized by a sign, to a proposition.

> Daß er das und das glaubt, ergibt sich für uns aus der Beobachtung seiner Person, aber die Aussage "Ich glaube" macht er nicht auf Grund der Selbstbeobachtung. Und *darum* kann "Ich glaube p" äquivalent sein der Behauptung von "p."

> (That he believes such-and-such, *we* gather from observation of his person, but *he* does not make the statement "I believe . . ." on grounds of observation of himself. And *that* is why "I believe p" may be equivalent to the assertion of "p.")

> (Wittgenstein, *Remarks on the Philosophy of Psychology*, I.§504)

More generally, "believe" (*croire-glauben*) is systematically connected with the parent notions of certainty and knowledge, and thus constitute a language game in ordinary language that has to be taken into account. The point is made more precise in Wittgenstein's last text, *Über Gewissheit* [*On Certainty*]. The French *croire*—like "certitude," "certainty," *Gewissheit*—is connected with *savoir*, not because it is a (more subjective or more intense) form of *savoir*, but because of its grammar. There are important grammatical differences between *savoir* and the other verbs. Saying *je sais "p"* does not guarantee that *p* is true, and thus that I really know *p*; I have to prove, in one way or another, that I know it; *je sais "p"* can thus be false or misleading, like *je promets*.

> "Ich weiss," sagt man, wenn mann bereit ist, zwingende Gründe zu geben. "Ich weiss" bezieht sich auf eine Möglichkeit des Darthuns der Wahrheit.

> (One says "I know" when one is ready to give compelling grounds. "I know" relates to a possibility of demonstrating the truth.)

> (Wittgenstein, *On Certainty* = *Über Gewissheit* [bilingual edition], trans. D. Paul and G.E.M. Anscombe, §243)

On the other hand, "I believe *p*" and "I am certain that *p*" always have a subjective truth, and do not require external justification to be accepted. There is an asymmetry between *glauben* and *wissen* that corresponds in part to the difference between "expression" and "description," which is often found in Wittgenstein.

> Es wäre richtig zu sagen: "Ich glaube . . ." hat subjektive Wahrheit; aber "Ich weiss . . ." nicht. "Ich glaube" ist ein Äusserung, nicht aber "ich weiss."

> (It would be correct to say "I believe" has subjective truth, but not "I know.")

<table>
<tr><td>

(continued)

"I believe" is an "expression," but "I know" is not.)

(Ibid., §179-80)

But through its relationship with *wissen* (unlike the French *certitude*, which is closer to *certain* than to *savoir*, and which corresponds to German *Sicherheit* instead), *Gewissheit* has a special status. It is not a mental state, but neither is it a state of things. In *Über Gewissheit*, the term *wissen* (*savoir*) paradoxically acquires a status that is both subjective and objective: I am the one who knows.

Wann aber ist etwas objektiv gewiss? Wenn ein Irrtum nicht möglich ist . . .

</td><td>

Muss der Irrtum nicht *logisch* ausgeschlossen sein?

(But when is something objectively certain? When a mistake is not possible. . . . Mustn't mistake be *logically* excluded?)

(Ibid., §194)

Wittgenstein seems to distinguish *Sichersein* (a grammatically subjective state, but one that is connected with knowledge, §357) from *Gewissheit*. Propositions that are certain (*gewiß*) have a particular form of objectivity; they are the ones we do not doubt, not because they have been proved (one cannot prove them, any more than any empirical proposition), but because they are the "hinges" (*Angeln*) on which our questions and judgments pivot. Propositions that are

</td><td>

certain, even when they are empirical, are part of our logic.

D.h., *die Fragen*, die wir stellen, und unsere *Zweifel* beruhen darauf, dass gewisse Sätze vom Zweifel ausgenommen sind, gleichsam die Angeln, in welchen jene sich bewegen. . . . D.h., es gehört zur Logik unserer wissenschaftlichen Untersuchungen, dass Gewisses in der Tat nicht angezweifelt wird.

(That is to say, the *questions* we raise and our *doubts* depend on the fact that some propositions are exempt from doubt, are as it were like hinges on which those turn. . . . That is to say, it belongs to the logic of our scientific investigations that certain things are in deed not doubted.)

(Ibid., §341–42)

</td></tr>
</table>

For Wittgenstein, the feeling of certainty attached to "hinge propositions" is not so much a mental state (*Seelenzustand*; in *Über Gewissheit* [*On Certainty*], §356) as a feeling of peace or contentment that is not the unreflective acceptance (*Vorschnellheit*) that philosophers attribute to common sense, but rather a form of life: "*Mein Leben* besteht darin, dass ich mich mit manchem zufrieden gebe" (*My life* consists in my being content to accept many things; trans. D. Paul and G.E.M. Anscombe, *Über Gewissheit = On Certainty* [bilingual edition], §344).

Wittgenstein himself acknowledges having the greatest difficulty in "expressing and thinking" the kind of "lived" certainty (*Sicherheit*) he refers to, which is neither objective nor subjective, and remarks, "Das ist sehr schlecht ausgedrückt, und wohl auch schlecht gedacht" (That is very badly expressed and probably badly thought as well; ibid. §358–59). Finally, Wittgenstein recognizes that the type of certainty he wants to describe is "something animal" (*etwas animalisches*, ibid. §359). This is less a nauralistic notation than a reference to the passive dimension of belief, which is in fact an essential element of *Gewissheit*. To explain it, Wittgenstein has to move into English, using the untranslatable expression "satisfied that": "We are satisfied that the earth is round" (ibid., §299).

Certain propositions' very special status between *Wissen* and belief is complicated by various translation difficulties. In French, *certitude* is closer to *croyance* than to *savoir*, whereas German *Gewissheit* allows Wittgenstein connections with *Wissen.* In English "certain" allows, like "belief," very flexible constructions. For example, we have the curious construction "a person is certain to do something," which means not that the person is (subjectively) certain that he will do something, but that the fact that he is going to do it is certain (cf. "the town is certain to be taken"). Such constructions are possible only in a language game in which "certain" has a vague status located between the subjective and the objective that cannot, any more than "belief," be divided into two

functions (assertive and propositional, psychological and logical). It was Wittgenstein who most clearly challenged the neo-Humean dogma of the propositional attitude by showing, through the examination of "I believe" at the intersection of two languages, the genuine subtlety of the grammars of assent.

Ijtihād [اجتهاد]

The word comes from the verbal radical *jhd* meaning "to apply oneself to," "to strive." The corresponding substantive *jihād*, meaning primarily "effort" and "striving," has also come to be used for "holy war." *Ijtihād* is another derived substantive and is to be translated also as "effort" or "initiative," but it means, above all, "effort of interpretation," especially in jurisprudential matters. Thus the noun *mujtahid* (the person who performs *ijtihād*) designates a scholar who interprets the law in order to apply it or adapt it to new cases and circumstances.

Beyond its technical meaning, the concept of *ijtihād*, especially for reformist modern thinkers, has come to signify the intellectual effort of the Muslim world to reconstruct the religious thought and the law in Islam in order to cope with the challenges of the changed times. In that sense *ijtihād* is the dialectical other of *taqlīd*, which is the blind adherence to and repetition of tradition (or what is constructed as such) simply because it is tradition.

BERĪT [בְּרִית] (HEBREW)

ENGLISH	covenant
FRENCH	*alliance*
GERMAN	*Bund*
GREEK	*diathêkê* [διαθήκη]
ITALIAN	*patto*
LATIN	*testamentum, foedus, pactum*

➤ *ALLIANCE,* and BERUF, BOGOČELOVEČESTVO, EUROPE, GOD, LAW, PEOPLE, SOBORNOST'

The word used in the Bible to designate the covenant, *berīt*, is certainly related to the Akkadian *birītu*, "bond." Thus the underlying idea is probably the same as that underlying German *Bund*, from *binden*, "to bind." On the other hand, the literal meaning of the usual expression for "conclude," *karat berīt* [כָּרַת בְּרִית], is "cut" (cf. Gr. *horkia temnein* [ὅρκια τέμνειν]), whence a semantic paradox: one binds by dividing. The expression no doubt comes from the sacrifice consecrating the covenant, as the Greek equivalent *spondê* [σπονδή] came from the libation that completed it, or the English expression "to strike a bargain" came from the gesture of shaking hands. People passed between the two halves of an animal, calling down on themselves the same fate in the event that they committed treachery (Gn 15:9, 17; Jer 34:18).

A covenant is an oath connected with a curse (Gn 26:28; Dt 29:11). The idea first arises from a contract between humans, such as a soldier's obligation to serve his leader (2 Kgs 11:4). At first, this contract is unequal: a superior imposes duties (Jgs 2:20; Ps 111:9). Later it becomes an agreement among equals (Gn 14:13), brothers (Am 1:9), friends (1 Sm 23:18), or spouses (Mal 2:14). The idea of a covenant may include, as it does in contemporary French, international treaties. Such treaties, beginning with the most ancient, between Egyptians and Hittites (1280 BCE), appeal to the gods as guarantors. In this way, every people that enters into a contract recognizes the power of the other's gods and thus makes a kind of covenant with them as well (Ex 23:32). The novelty of Israel is the idea of a covenant between a people and its own god, a god who chose his people (Ex 19:5f.). The divine was a guarantor; now he becomes a partner. In the Septuagint, the word is not translated by the usual Greek word, *spondê*, but by *diathêkê* [διαθήκη], which designates the last dispositions made by a dying person, and thus a testament. In turn, it was rendered in Latin by *testamentum*—which has remained in the "Old/New Testament." On the other hand, the Vulgate prefers *foedus* or *pactum*—Italian *patto*. English "covenant" comes from French *convenir*, whose semantic field is different. The biblical covenant is historical; there is, however, nothing like it in Islam, which is why the term "covenant" is not used to describe the pact (*mīṯāq* [ميثاق]) through which humans, miraculously drawn from Adam's loins, recognize Allah's dominion (Qur'ān 7:172). This pact is situated in preeternity. Allah commits himself in no way, but man is bound by the pact even before he can ratify it in his temporal life.

BERUF (GERMAN)

ENGLISH	profession, vocation, calling
FRENCH	*métier, vocation*
GREEK	*ergon* [ἔργον], *ponos* [πόνος], *klêsis* [κλῆσις]
HEBREW	*tapĕqîd* [תַּפְקִיד]
LATIN	*officium, professio, vocatio*

➤ *VOCATION,* and CLAIM, GLAUBE, GOD, LIBERAL, OIKONOMIA, SECULARIZATION, SOLLEN, STAND, STRADANIE, WORK

Beruf became untranslatable relatively recently: it is associated with Max Weber and his 1904–5 study on *The Protestant Ethic and the Spirit of Capitalism*. The problem concerns first the twofold meaning of the word, which oscillates between the secular (trade, profession) and the religious (vocation): whereas German hesitates, French is forced to choose. But *Beruf* has another, remarkable particularity: its untranslatable aspect does not have to do with the genius peculiar to a language, but to the decision made by a translator, Luther, and to a historical development, that of modern capitalism, whose whole novelty is, according to Weber, concentrated in it.

I. The Semantic Development of *Beruf*

By devoting a section of *The Protestant Ethic and the Spirit of Capitalism* to "The Notion of *Beruf* in Luther," Weber gave the philosophical and sociological vocabulary a new term, and at the same time discovered an untranslatable: the French at times also use the word *Beruf*, all the more willingly because for Weber it has the value of an emblem for the whole process of the emergence of modern capitalism. In itself, *Beruf* can be defined as a certain conception of work as "an absolute end in itself, a calling." For Weber, the spirit of capitalism is concentrated in *Beruf*, as is shown by his definition (or at least his "provisional *image*") of a "mentality that seeks, in a systematic, rational way, a legitimate profit through a vocation (*Beruf*)." This quest for profit was accompanied, in the modern period, by a "social ethic" bearing "a specific idea of *vocation* as *duty* (*Berufspflicht*)" that would confer a moral value on labor and on the vocation in which it is performed. In the French translations of the preceding quotations, the word *Beruf* is rendered by *vocation* and *métier*; the first translator, Jacques Chavy, used in the same passages the terms *vocation*, *profession*, and *métier, profession*. Here we see the difficulty of the term. In French not every *métier* is a *vocation*, whereas *Beruf* denotes two things at once: a regular, remunerated occupation, and a calling (the word *Beruf* comes from *rufen*, "to call"), the election that leads to this occupation and gives life its ultimate meaning. French translators of Weber can choose among three solutions. The first accepts the necessity of choosing, as Éric de Dampierre, who helped revise the first French translation, explains in a note:

> The translation of *Beruf*, "métier et vocation," a key word for Weber in many regards (cf. *Le savant et le politique*), required that the semantic tension between its two poles be retained. We have rendered it by *métier* (or *profession*) in a religious context, and by *vocation* in an occupational context, in order to emphasize this tension that provides the foundation for the work's thesis. Nonetheless, it would be incorrect to assume that these two complementary meanings are present everywhere, in particular in a Biblical context, where doing so would amount to reintroducing an anachronism: in such cases, we have made do with *besogne*, an old Scriptural word that seemed to us the best suited to render the notion in its undifferentiated state.

The principle of translation is thus a constant inversion: to render the foreignness of *Beruf*, the word *métier*, normally used in secular, occupational contexts, is used in religious ones, and the word *vocation*, which is normally used in religious contexts, is used in occupational ones. This solution is necessarily a makeshift one: the inversion is not carried out systematically, and cannot be, since it has to assume what is in question, namely, the division into the temporal and the spiritual, the occupational and the confessional. The peculiarity of German *Beruf* is that it attenuates this division, and expresses simultaneously what French has to distinguish or even oppose. It is thus dangerous to start from this distinction between the sacred and the profane to translate a term that challenges that distinction.

A second solution consists in coining a portmanteau word that indicates the difficulty: that is what Jean-Pierre Grossein does by using *profession-vocation* in the most recent French translation of *The Protestant Ethic*—after having justified this solution in his selection of Weber's writings on the *Sociologie des religions*, arguing that "awkwardness" must be preferred to "insipidness" in cases where *Beruf* clearly denotes the "interweaving" of the two registers ("Glossaire raisonné"). Translator Isabelle Kalinowski emphasizes that this neologism "is more an explanation than a translation." The choice to really translate, that is, to situate the word in the normal usages of the target language, led her to a third solution, using throughout the word *métier*, which has "the advantage of applying better to the very broad meaning that Weber gives to *Beruf*"—unless, of course, the translator is obliged to leave *Beruf* in German. However, with *métier* one of the two nuances of *Beruf* disappears: the French word has no particular religious resonance. Kalinowski accepts this risk, and even sees in it a confirmation of the starting point of Weber's analysis, namely, "the absence in Luther's time of a term having the connotation of the word 'vocation' *in Romance languages*—and, we might add, in other languages as well" (italics in original). The most faithful French translation of Weber would thus be one that failed, precisely because it is a translation into a Romance language, to render the plurality of the meanings of *Beruf*.

The polemic raging among translators thus opposes two philosophies of translation that are probably irreconcilable. As for the word itself, it would be false to say that *Beruf* spontaneously unites contraries, the sacred and the profane, and that it is in its nature to express something different from what other languages express. Weber very clearly refuses to take into account "any ethnical peculiarity of the languages concerned" or to see in the word "the product of a Germanic spirit" (cf. his refusal to invoke a "national character"). Weber's starting point is in fact linguistic, but his reasons are located outside language:

> And if we trace the history of the word through the civilized languages, it appears that neither the predominantly Catholic peoples nor those of classical antiquity have possessed any expression of similar connotation for what we know as a calling (in the sense of a life-task, a definite field in which to work), while one has existed for all predominantly Protestant peoples.

Beruf does not divide languages qua languages, but it reveals another division separating Protestant peoples from others, and from Catholic peoples in particular. In this sense, *Beruf* is a very special kind of untranslatable: "the idea is new, a product of the Reformation"—in short, it is a confessional untranslatable.

How can *Beruf* lack an equivalent if it is not by virtue of a particular character of the language itself? The first thing to note is that *Beruf* was not initially an untranslatable term, but became one: thus we must assume a historical change. Second, this change takes the typical form of a decision, that of an author, Martin Luther, who according to Weber chose to understand the word in a new sense. Third, this authorial decision is more precisely a translator's decision: for Weber, it was in translating the Bible that Luther created

the modern concept of *Beruf* by modifying the earlier use of the word.

Weber's reasoning is set forth in particular in two long notes, veritable textual and linguistic surveys reviewing Hebrew, Greek, Latin, German, English, and Romance languages. The old use of *Beruf* is defined as religious, equivalent to *Berufung* or *Vokation*: it corresponds to French *vocation*, and particularly to ecclesiastical vocation. For Weber, the current sense of the word is thus a "profane" sense, "purely secular": in a remarkable way, Luther is supposed to have secularized the term. According to Weber, the pivotal text that marks the term's transition to its modern use is found in Luther's translation of a passage in Sirach (Ecclesiasticus), 11:20–21, which recommends:

20 Stand by your task, and attend to it, and grow old in your work.
21 Do not wonder at the works of a sinner, but trust in the Lord and keep at your toil; for it is easy in the sight of the Lord to enrich a poor man quickly and suddenly.

The stakes involved in translation seem to multiply infinitely when we consider that the text of Sirach translated by Luther was composed in Hebrew, but transmitted in Greek (the book is, moreover, not part of the Jewish canon). The original Hebrew text was partially rediscovered only in 1896 and finally completed in Qumran, then in 1964: in Weber there are echoes of the first reconstitution (French trans. K.). The Greek translates the first occurrence of the Hebrew *tapĕqîd* [תַפְקִיד]—rendered here as "task," designating an established occupation—by *diathêkê* [διαθήκη]; "work" (v. 20a) renders *ergon* [ἔργον], and "toil" (v. 21a) *ponos* [πόνος]. It is the last two words that Luther (who knew only the Greek text) translated by *Beruf*: *en tôi ergôi sou palaiôthêti* [ἐν τῷ ἔργῳ σοῦ παλαιώθητι] becomes *beharre in deinem Beruf*, and *emmene toi ponôi sou* [ἔμμενε τῷ πόνῳ σοῦ] becomes *bleibe in deinem Beruf* (on the other hand, in v. 20a, *diathêkê* is oddly rendered by *Gottes Wort*, the Word of God; cf. *Die deutsche Bibel*). Earlier German translations had never resorted to *Beruf*, limiting themselves to a literal translation of *ergon* by *Werk*, "work" (the Vulgate translates this word by *opus*). Luther was also the first to conflate the work and the effort that produces it, *ergon* and *ponos*, in a single term: the verse thus begins to turn around this *Beruf* that the translation repeats twice and elevates to the dignity of a biblical concept.

In itself, however, Luther's new translation of Sirach does not make *Beruf* an untranslatable. We must add that he uses the term to translate another word, which is also Greek, but this time it is not a Hebrew word translated into Greek because it is drawn from the Epistles of Paul. The word in question is *klêsis* [κλῆσις], which a French Bible such as the *Jerusalem Bible* translates by *appel* (call) (1 Cor 1:26; Eph 1:18; 4:1–4) or by *vocation* (Heb 3:1), while the Vulgate makes systematic use of *vocatio*. Thus Luther assimilates into *Beruf* not only *ergon* and *ponos* but also *klêsis*: according to Weber, this is the source of the word's twofold meaning of "occupation" and "vocation." Luther's translation decision appears still more remarkable if we follow not the order of the books of the Bible but the chronology of his translation. Luther began by translating the New Testament in 1522; his complete version of the Bible dates from 1534. When he translated Sirach, he had thus already used *Beruf* in its traditional sense (earlier

German Bibles also used a composite of *rufen*, *ruffunge*). The choice of *Beruf* to render *ponos/ergon* appears as a deviation of meaning that we are justified in assuming to be deliberate when we consider how much was invested theologically and doctrinally in this whole translation.

Nevertheless, the question remains whether the conflation of occupation and divine vocation has a basis in the text of the Bible. Weber (French trans. K.) locates a passage in 1 Corinthians (7:20) that seems to move in this direction. This passage exhorts every Christian to "stay in that calling in which he was called" (*en têi klêsei hêi eklêthê* [ἐν τῇ κλήσει ᾗ ἐκλήθη]). In the characteristic reduplication of *klêsis/eklêthê*, we seem to find the two senses of *Beruf*, or at least *klêsis* seems likely to have a non-religious meaning. However, Weber notes that here the word is not strictly synonymous with *ergon* in Sirach (French trans. K.), and interprets it as a social status (*Stand*) rather than as a *Beruf* (in the sense, he explains, of a "delimited domain of activity").

There are, nonetheless, certain problems with Weber's thesis. The first is intrinsic: for a speaker of modern German, Luther's *Beruf* is almost as untranslatable as for a speaker of any other language. The two senses of the word seem to have diverged again after Luther: to avoid any ambiguity, the German editions of the Bible that revise Luther's translation now render the Pauline *klêsis* by *Berufung* (vocation). Weber himself hesitated regarding the sense of *Beruf* in modern German. On several occasions he refers to the "current meaning" of the word (French trans. K), taking it for granted that the latter is "profane" (French trans. K.). Thus *Beruf* would signify no more than an occupation in a "neutral" sense (French trans. K.). However, it is striking that a few lines further on, in describing the development of the Latin *opificium*, Weber explains that the word was "morally neutral" and contrasts it with a text by Seneca (*De beneficiis*, 4.18), where it "becomes . . . the equivalent of *Beruf*" (French trans. K.).

Weber's hesitations show that the word's nuances are still difficult to handle—even for a native speaker, if he lingers over it a moment and asks what it really means. They also show that *Beruf*'s semantic development continues—at least if Weber has correctly accounted for it.

Here we encounter a second difficulty: we can ask whether the use of the term owes as much to Luther as Weber assumes. We should note first that Sirach, where Luther is supposed to have invented the modern meaning of *Beruf*, was not included in the canon of the Protestant Bible. Thus it is unlikely that this meaning would have had much influence had it not been spread by Luther's original works as well. On this point, assessments may vary: there is indeed a doctrine of the *Beruf* in Luther's political works, but one may wonder, reducing it to its real proportions, whether the importance accorded to it is not a retrospective illusion produced by reading Weber.

II. The Doctrine of *Beruf*: A Retrospective Illusion?

Luther's 1523 treatise on political authority, *Von weltlicher Oberkeit*, formulates the idea that "everyone must attend to his *Beruf* and his work" *(Denn eyn iglicher muss seins beruffens und wercks warten)*. But it does not go much further. Luther's other political works elaborate instead a doctrine of conditions (*Stände*). The latter's content corresponds to what Weber

says about *Beruf* and about Luther's sacralization of temporal activity, notably through his refusal to confer a superior value on monastic ways of life: for Luther, God is just as present in the kitchen as in the convent—if not more (see, e.g., *Predigten des Jahres 1534*). Nonetheless, the word *Beruf* is not given special treatment: in particular, it never appears alone, but always in association with *Stände* (see the commentary on Psalm 118, *Das schöne Confitemini*, and the treatise *Vom ehelichen Leben*, which shows that among the *Stände* we must count not only occupations but also marriage). The idea that there is a Lutheran doctrine of the *Beruf* (Gustaf Wingren) is thus more selected from the texts than actually developed in them: it is not that the resulting interpretation is false, but it would take a long investigation into the history of ideas to determine how exegetes finally came to regard the notion of *Beruf* as a central category in Luther's thought. In this investigation, we would have first to determine how Weber himself was persuaded of the importance of the word and idea of *Beruf* for Luther.

The suspicion that Luther has been read retrospectively on the basis of Weber is illustrated by a passage in the chapter on Luther and Calvin in the *History of Political Philosophy* edited by Leo Strauss and Joseph Cropsey. This passage is entitled "Politics as Vocation," but seems in fact to deal with the doctrine of social status. A note added by the French translator recalls, however, the author's main concern at the same time that it returns to the problem of translation:

> The English word "vocation," like the French *vocation*, is a poor translation of the German *Beruf*, and signifies an occupation insofar as one is called to it, the activity that one performs (the text speaks here of the "vocation" of the father or husband). The author is implicitly referring to Max Weber's text on "*Politik als Beruf.*"

Many things are in fact left implicit here (except perhaps the title itself, "Politics as Vocation," a literal translation of Weber's book *Politik als Beruf*). American political science is perhaps alone in giving Luther's politics the place it deserves, and its representatives who emigrated from Europe, from Hannah Arendt to Leo Strauss, played some role in that, but because of the constant debate that they carried on with Weber, they probably knew Luther only through the categories of *The Protestant Ethic and the Spirit of Capitalism*. This retrograde movement came in addition to the one carried out by Weber himself, who found his own questions anticipated in Luther—questions of science and politics as *Beruf*, which, as Catherine Colliot-Théllène points out in her translation of *Wissenschaft als Beruf* and *Politik als Beruf*, deal with the "mission" of the scientist and the politician and refer to something quite different from the Protestant sublimation of everyday occupations. However, that does not mean that we are dealing here with a false problem, as is shown by the difficulties Weber encountered in handling the word. The problem of *Beruf* could probably appear only in the question that Weber asks: to what degree, and in what respects, are we still Protestants? Regarding Luther, the *Protestant Ethic* offers a contrasting analysis. So far as *translation* is concerned, Luther's posterity is strongly emphasized: the English Puritans used "calling," modeled on the *rufen* (call) of *Beruf* to denote a simple occupation—but the word had difficulty establishing itself as a translation of *klêsis* in English Bibles (French trans. K.).

On the other hand, so far as *doctrine* is concerned, Weber recognizes Luther's "economic traditionalism" (French trans. K.), and locates—as did Troeltsch later—modernity in the Puritan sects, the first to establish the "secular asceticism" he considered characteristic of the Protestant ethic and the spirit of capitalism (see French trans. K., where this asceticism is contrasted with Luther's "acceptance" of "the fate that God has irremediably determined for everyone").

No doubt we must also take into account the contribution made by Luther's disciples, who may have provided the theoretical mediation that the new use of *Beruf* in translation needed. In any case, Weber remains prudent in examining the Augsburg Confession (see Kalinowski's note in her French translation; she does not see the modern sense of *Beruf* clearly emerging in this text). Here we are close to the core of the problem, which has to do with the partition between the temporal and the spiritual. Luther's decision to bring *Beruf* into his translation of Sirach is open to completely contradictory interpretations depending on the position taken with regard to the problem of secularization: did Luther secularize the word by using it to translate *ergon* and *ponos*, or did he instead give "everyday temporal work" a "religious meaning" (French trans. K.) far removed from the "disenchantment of the world"? Weber's hesitations concerning the modern meaning of *Beruf* (neutral or ethical?) show that the difficulty has not been resolved—if it ever can be: on the contrary, everything suggests that the secularization thesis is connected with the hermeneutic postulate. We might just as well maintain that the translation of *ponos/ergon* by *Beruf* could hardly be more religious. In the history of German translations of the Bible, *Beruf* here replaces *Werk*. This terminological substitution has a theological motivation that Weber, surprisingly, does not mention: even in an Old Testament text, Luther took care to avoid *Werk*, which referred immediately to the execrated doctrine of salvation by works. The *sola fides* doctrine of justification (justification by faith alone), whose connection with the concept of *Beruf* (see French trans. K.) Weber mentions only further on, thus played a role in the translation in a way disproportionate to the relatively small doctrinal importance of the verse. *Beruf* is a theologically overdetermined translation, and it is probably this overdetermination that explains the other translational twist (also ignored by Weber) that led Luther to render by a single term the two distinct Greek words *ergon* and *ponos*: taken out of its traditional use, *Beruf* had the advantage of drawing attention away from both works and the effort (*ponos*) that performs them, that is, from both the adverse theology and the psychology on which it was based.

Moreover, Weber was the first to emphasize that the "import" of his analysis of Luther's *Beruf* was at best "problematic." He thus abandoned the attempt to establish a direct connection between Luther's attitude toward temporal activity and the emergence of capitalism (French trans. K.). Similarly, it is impossible to explain an untranslatable term like *Beruf* as a decision made at a certain point by a translator when this decision seems not to have had a special impact, at least before Weber. It would be more accurate to say that Weber is the sole inventor of *Beruf*, or that the latter is a Weberian and not a Lutheran untranslatable. To be sure, explaining a term by reference to an individual decision, even if it is a translatorial

decision, does not necessarily make it less enigmatic: that is the case when *Beruf* is explained solely by Luther's initiative. But the solution ceases to be inaccessible when the study of translatorial decisions is connected with that of their reception: *Beruf* probably came from a question peculiar to Weber, who transformed a translatorial fact into a genuine concept, and in doing so brought out the real difficulty. Untranslatables do not always arise where we expect them—in this case, they arise at the intersection of the philosophical, the religious, the political, and the social.

| BIEN-ÊTRE

This term is generally used to translate the English term "welfare," but differs from "well-being" as the objective form differs from the subjective. See CARE, RIGHT/JUST/GOOD, UTILITY (cf. *UTILE*). On the welfare state, its German translation as *Wohlfahrtsstaat*, and the connotations of its French translation as *état providence*, see GLÜCK, IV; cf. *HAPPINESS.*

➤ CIVIL SOCIETY, *GOOD/EVIL*, PLEASURE, POLITICS, *STATE, VALUE*

BILD (GERMAN)

FRENCH	*image, tableau, figure, visage*
GREEK	*eidôlon* [εἴδωλον]
HEBREW	*ṣèlèm* [צֶלֶם], *dĕmût* [דְּמוּת]
LATIN	*imago, species*

➤ *IMAGE* [EIDÔLON], and ANALOGY, BILDUNG, DICHTUNG, DOXA, *IMAGINATION,* MIMÊSIS, OIKONOMIA, REPRÉSENTATION, SPECIES, TABLEAU

The vocabulary derived from *Bild* (image) is particularly rich in German: not because there is, as in Greek, a differentiated plurality of terms to designate an image from different points of view, but because there is an especially complex set of words that are modeled on *Bild* and systematically related to it: *Urbild* (paradigm/archetype) and *Abbild* (copy), *Gleichbild* ("copy," as well, but emphasizing resemblance more than fabrication), *Nachbild* ("ectype," "copy," emphasizing its secondary, imitated status), *Bildung* (education, culture), *Einbildungskraft* (imagination), and so on. The development of this system is representative of a large part of the history of German philosophy.

The starting point for thought about the image (*Bild*) was provided by the biblical verse that says God created man "in his own image" (Gn 1:27). Meister Eckhart's speculation that the image and its model are identical was based on this biblical text and left its mark on later philosophies. In each case, *Bild* had to be entirely rethought, indeed retranslated, depending on whether it was associated with its model (whence the *Urbild/Abbild* opposition) or with the faculty that produces the image (*Einbildungskraft*), and on the way in which the force and function of this faculty was conceived, as reproductive or truly productive. In the course of interpretations of Kant from Fichte to Heidegger, the way in which *Bild* was conceived came to concentrate the major opposition between the understanding and sensibility, and thus the conception of the subject, between spontaneity and receptivity.

I. The Avatars of the Biblical Verse

The beginning of Genesis raises the question of the fundamental determination of the human being created in the image and likeness of the creator in the context of the biblical prohibition on images (cf. Heidegger, *Sein und Zeit*, §10). Thus in Luther's translation, *Bild* (*Gottes*) corresponds to the Hebrew *ṣèlèm* [צֶלֶם], the Greek *eidôlon* [εἴδωλον], and the Latin *imago*.

■ See Box 1.

The New Testament says that Christ is *eichôn tou theou tou aoratou* [εἰχὼν τοῦ θεοῦ του ἀοράτου] ("the image of the invisible God," Col 1:15), and the Vulgate says that he is *imago Dei invisibilis*. Luther renders this as "das Ebenbilde des unsichtbaren Gottes." Luther's translation is more precise than that of the Vulgate; *Bild* leaves open the possibility of a dissemblance (the *dissimilitudo* mentioned by Saint Augustine [*Confessions*, book 7, chap. 10] and later by Saint Bernard [*De diversis*, sermon 42.2]), whereas *Ebenbild* is so to speak on the same footing with its original, a "perfect image" that is not susceptible to degenerating from "the vivacity of the original" (Bossuet). This translation variant shows in an exemplary way the problem raised by the relationship between the image and its model, *Bild* and *Urbild*; in German, the issue was framed by Meister Eckhart, two centuries before Luther.

1

The image in Hebrew (*ṣèlèm* [צֶלֶם], *dĕmût* [דְּמוּת])

The passage in Genesis where it is said that man is made in the image of God is a monologue in which God, addressing himself in the plural, says, "Let us make man in our image, as our likeness" (1:26). The verse presents several difficulties:

a. to whom is this plural addressed? The church fathers saw in it a foreshadowing of the Trinity; the Jews and modern exegetes see in it the chorus of angels;
b. why these two different words, each preceded by a preposition with a different nuance? An almost identical binary formulation, in which the prepositions are inverted, expresses the resemblance between the father and the child (Gn 5:3);
c. what does this resemblance consist of? Is it a physical property, like standing upright? Is it reason? Is it freedom? A poetic formula justifies the inviolability

of the person: "whoso sheddeth man's blood, by man shall his blood be shed: for in the image of God made he man" (Gn 9:6);
d. the verse is followed immediately by the reminder of sexual difference: "So God created man in his image (*bĕṣalĕmēnû* [בְּצַלְמֵנוּ]); in the image of God created him; male and female created he them" (Gn 1:27). What relation is there between the two affirmations?

As for the words for "image," the first comes from a root meaning "to carve" and in the first place designates a sculpted figure, above all for use in a cult—what the prophets call an "idol" once the cult has come to concentrate only on the Temple of Jerusalem. The root of the second means "to be similar," and the word itself designates in the first place a copy, a reproduction.

Furthermore, the first preposition, of which the chief sense is "in," supposes a stable possession; the second, which in the first place means "like," suggests the status of the image is itself metaphorical.

Christian theology distinguishes between the image, which partakes of the nature of man and thus cannot be lost, and the resemblance. Sin disturbed the second, and the economy of salvation must permit its recuperation. The idea is present with the Greek and Latin fathers (Irenaeus, *Against Heresies*, 5.16.2; Saint Augustine, *Of the Trinity*, 14.4.6) before it passes into the Middle Ages (e.g., Saint Bernard, *On the Song of Songs*, 82.7–8). Maimonides explicates the two terms with the principal aim of removing all temptation to make God into a corporeal being (*Guide for the Perplexed*, 1.1).

Rémi Brague

II. *Abbild, Urbild*: Meister Eckhart or the Life of the Image

The term *Bild* underwent a rich theological and mystical development from Meister Eckhart to Angelus Silesius. The originality of Eckhart's doctrine of the *bilde* (Lat. *imago*) has notably to do, on the one hand, with its conception of "being-an-image" (*das Bildsein*) as a relationship of perfect assimilation (*imago est similis*) between the image (*Abbild*) and that of which it is an image (*Urbild*), so that being-an-image is boldly declared to be the whole of the image, which lacks nothing of that of which it is the image: the image is less relative to a model (*Urbild*) than it is the living relationship to this model, which is in turn nothing other than the relationship to the image that constitutes it as a model. On the other hand, Eckhart's doctrine is characterized by his dynamic conception of the image: "*Imago proprie est emanatio simplex, formalis, transfusiva totius essentiae purae nudae*" (Strictly speaking, the image is a simple, typical emanation transfused with the whole essence pure and unadorned), a kind of internal gushing forth and boiling. Eckhart's image is never at rest, but constantly seething, because it is life.

Wackernagel has noted the "prodigious enrichment undergone by the motif of the image through its conversion from Latin into Eckhart's native language," and also the semantic gap between *bilden* and *entbilden* (a term that remained extremely rare: Suso, Tauler, Angelus Silesius): "Between a *bilde* taken sometimes as an image and sometimes as an anti-image, the prefix *ent-* can indicate both difference and its contrary, that is, assimilation" ("Imagine denudari").

With Kant, the term *Bild* embarks upon a philosophical career that is no less rich, if only because of the profusion of terms that it elicited.

III. *Bild, Einbildung*: Kant from the Imaged to the Imaging

Kant clearly understands *Bild* on the basis of the verb *einbilden*, which seems to have been introduced into the German language by mysticism (cf. Grimm, Duden, Kluge), so that it has the meaning of "leaving an imprint on the mind," on the model of terms such as *Einblick* (vision), *Eindruck* (impression), *Einfall* (incidence, idea that occurs to one), and *Einleuchten* (illumination). In this case, the prefix *ein-* indicates a movement of internalization toward the "living source" constituted, according to Meister Eckhart, by "the image of God in the depths of the soul" (*daz gotes bilde in der sêle grunde*), whereas Kant understands it in the sense of a unification. *Einbildung* has in fact been "one of the fundamental terms of Germanic thought since Paracelus and Böhme, and even since the great mystics of the Rhineland" (Marquet, *Liberté et existence*).

In the "Transcendental Deduction" in the first edition of the *Critique of Pure Reason* (A, 120), Kant writes: "*Die Einbildungskraft soll . . . das Mannigfaltige der Anschauung in ein Bild bringen.*" Kemp-Smith renders this as "imagination has to bring the manifold of intuition into the form of an image," but it might better be translated as "the imagination has to form a *picture* of the manifold of intuition." Jean Beaufret has even interpreted this sentence to mean that imagination "organizes into a *single picture* the manifold provided by intuition," having emphasized that "the literal meaning of *Bild* is 'picture' much more than 'image' " ("Kant et la notion de Darstellung"). The "single picture" (*Bild*) in question is none other than the manifold as it presents itself, not as a jumble of sense impressions, but with the more attractive appearance of a universe—as a *kosmos* [κόσμος] rather than a *chaos* [χάος]. Kant thus conceives *Einbildungskraft*, a German translation of the Latin *vis imaginationis*, on the basis of *Bild*, a picture that is single because unified; but he also conceives it, inversely, as a unifying and synthesizing power of "uni-formation." To qualify the synthesis of the manifold of sense intuition, which is possible and necessary a priori, Kant resorts to the expression "figurative (*figürlich*) synthesis," giving the Latin equivalent, *synthesis speciosa*, in which

species echoes one of the Latin equivalents of *Bild*. Because it is "figurative," the *synthesis speciosa* is thus ipso facto *bild-lich* (Heidegger), which means that it refers to the figuring or rather the configuring power of *Einbildungskraft*. On this "very beautiful Latin expression that Kant uses, however, only once in the *Critique*," see Longuenesse (*Kant et le pouvoir de juger*), who refers to a passage in Kant's 1770 *Inaugural Dissertation* in which space and time are described as *formae seu species* essential to the constitution of our minds (§4). It is a "very beautiful expression" notably in that the Latin terms *forma* and *species* always associate the idea of beauty (esp. *hermosura*, Ital. *formosità*) with that of form and aspect—so that we see here already an anticipation of the *Critique of Judgment*.

If imagination (Gr. *phantasia*, Ger. *Phantasie*), defined classically in accord with an Aristotelian tradition as reproductive imagination (*De anima*, 3.3), is taken up again by *Schulmetaphysik* (e.g., in Wolff, *Psychologia empirica*, §92, and Baumgarten, *Psychologia empirica*), for his part, Kant distinguishes, notably in §28 of his *Anthropology from a Pragmatic Point of View* (*Anthropologie in pragmatischer Hinsicht*), a reproductive imagination that belongs to the domain of psychology, and a productive imagination that belongs to the domain of transcendental philosophy, an *exhibitio derivativa* and an *exhibitio originaria*. The reproductive imagination is still called in German *zurückrufend* (re-calling), and the productive imagination *dichtend* (poetic or creative). Insofar as *imago* (image) is etymologically related to the verb *imitari* (imitate), "imagination" is a not very satisfactory translation of *Einbildungskraft* when the latter, conceived as productive, is seen as an originary configuring power in the service of the understanding, or even, according to the first edition of the *Critique of Pure Reason*, as constituting its essence. The question of *Bild* comes up again in the chapter on the schematism, where Kant feels the need to distinguish *Bild* from schema (*Schema*; A, 140–B, 179), thus emphasizing *a contrario* their proximity to each other. The schema, one of the four figures (with the example, the symbol, and the construction) of *Darstellung*, *exhibitio*, is defined as "the representation [*Vorstellung*] of a universal process of the imagination [*Einbildungskraft*] in providing an image [*Bild*] for a concept." This acceptation provided a springboard for Fichte.

IV. *Bild, Bildung*: Fichte or the Projection of the Ego in Image

Fichte builds on the thetic character of the synthesis of the transcendental imagination, conceiving *Bild* on the basis of *bilden*, the image on the basis of imaging, positing "the image as such" as a "free product of the ego," of a projecting, imaging ego: the image is not a makeshift reflection of the thing that has reached the ego, but a projection (*Reflex*) of the ego producing itself in an image in the course of its free activity. In other words, the sole original to which the image can appeal is the ego. Fichte thus associates the imaginary activity of the ego-projecting-itself-in-an-image (*Bild*) with its formation (*Bildung*) understood as an autonomous genesis: "In the act of producing an image, the ego is entirely free" (*Grundriss des Eigentümlichen der Wissenschaftslehre*).

Fichte thus understands *Bild* on the basis of *bilden*, the formed on the basis of forming, and not the other way around. The *Bild* is the result of the production at work in the

absolute ego's self-positing; by projecting itself in an image, the ego gives itself a sort of mirror in which its free productivity is reflected. Thus Fichte has deliberately accentuated and radicalized the thetic character of the synthesis peculiar to the productive imagination, extending the transcendental schematism and its *Schweben* (floating in suspension) that shapes in advance the contours of the thing that the intuition is preparing to take in (Kant) or to capture as part of its sphere of influence (Fichte). When I perceive a house, Kant says, "I draw as it were the outline of the house" (*Critique of Pure Reason*, B, 162), the imagination thus understood being a constitutive ingredient of perception: "This floating (*Schweben*) itself designates imagination by its product; it produces the latter, as it were, in this movement and through this movement itself" (*Fichtes Werke*, vol. 1, *Grundlage der gesamten Wissensschaftslehre*). The Fichtean *Bild* is thus less feigned than freely fashioned in accord with the self-deployment of the absolute ego. *Einbildungskraft*, which Fichte still sometimes calls *Einbildungsvermögen* (shaping power) can thus be defined as "das bildende Vermögen des Ich" (*Fichtes Werke*, vol. 9, *Nachgelassenes zur theoretischen Philosophie*), a "formative power of the ego." Moreover, according to Fichte it would be better termed *Bildungskraft*; here Fichte is pursuing the Kantian enterprise of reappropriating for philosophy a term bequeathed to the German language by the mysticism of the Rhineland.

It was left to other great figures of German idealism, notably Hölderlin and Schelling, to exploit the speculative and poetic resources of *Einbildungskraft* understood as productive imagination, even if Fichte's philosophy is—still more than that of Schelling, with which it is often associated in this respect—the philosophical apotheosis of *Bild*. This phenomenon is probably related to Fichte's concern to anchor in ordinary language the results of his apparently very esoteric research. He is no doubt the philosopher in whose work we find the most occurrences of the term *Bild*. But "the image, the correct translation of *Bild*, does not express this inner power that makes *Wissenschaftslehre* (Doctrine of Science) and consequently the self, a being that 'creates itself'" (Philonenko, *L'Œuvre de Fichte*).

V. *Bild, Gleichbild*: Schelling or the Image as Power

Ascribed in turn to Hegel, Schelling, and Hölderlin, the text Franz Rosenzweig titled *The Oldest System-Program of German Idealism* (ca. 1796) seeks to justify the idea of a "sensible religion" made possible, *nolens volens*, by Kant's *Critique of Judgment*, which makes the beautiful the symbol of morality (§59). By maintaining that "the philosopher must have just as much aesthetic power as the poet" (*der Philosoph muss eben so viel ästhetische Kraft besitzen, als der Dichter*), the author of this text, as a reader of Schiller, seems to have grasped the essence of the Kantian analyses by making this "aesthetic power," which is the imagination as *Einbildungskraft*, the poetizing or productive (*dichtend*) source of philosophizing activity, for all that Kant had made the imagination the secret, common root of understanding and sensibility.

Schelling did not fail to emphasize *Einbildungskraft*, "so well-named in German," which he interprets, in §22 of his *Philosophy of Art* (*Philosophie der Kunst*), as "signifying literally

the power of making uniform" *(die Kraft der Ineinsbildung).* This uniformizing or *esemplasie* (Coleridge), a term created on the basis of the Greek *eis en plattein* [εἰς ἕν πλάττειν], characterizes the fusion of the finite and the infinite (cf. Tilliette, *Schelling*), or again, *Hineinbildung* (another of Schelling's neologisms), that is, the mutual interpenetration of the ideal and the *real* (distinguished from *reel* to match the ideal and come closer to the Latin *res*, *realitas*).

A crossroads for Schelling's meditations up to 1815, the term *Bild* also has a Platonic resonance that is linked in particular with the interpretation of the *Timaeus*, in the opposition between *Urbild* (archetype) or *Vorbild* (paradigm) and *Nachbild* (ectype). Two characteristics constitute the *Bild*: not being the object itself, and being "just like" it, as is explained in Lesson XI of the *l'Historisch-kritische Einleitung in die Philosophie der Mythologie* (*Critical-Historical Introduction to the Philosophy of Mythology*): "*Das Bild is nicht der Gegenstand selbst, und doch völlig wie der Gegenstand selbst*" (The image is not the object itself, and yet it is wholly like the object itself). Nonetheless, in mythology Schelling recognized the presence, if not of the "divine Self" in person, the "*image of the true God*" *(das Bild des wahren Gottes),* or at least his *Gleichbild* or "replica," as an anticipation, and almost by proxy, so that it is to the term *Bild* that Schelling resorts here to connect revelation and mythology. Like *Ebenbild* (which we have already encountered in Luther's translation of Paul's Epistle to the Colossians 1:15), *Gleichbild* is almost an oxymoron, or at least the expression of a unity that is conflicted and accepted as such, designating the element of revelation in a mythology that is not yet revelation.

VI. *Bild, Anblick*: Heidegger or the Image Looking at Us

We have examined what Kant's immediate successors said about the question of the transcendental imagination. In a sense, however, nothing was said, at least according to an important note in Heidegger's book on Kant (*Kantbuch*, §27):

> The explicit characterization of the power of imagination as a basic faculty [*Grundvermögen*] must have driven home the meaning of this faculty to Kant's contemporaries. Thus Fichte and Schelling, and in his own way, Jacobi as well, attributed an essential role to the power of imagination. Whether in this way the power of imagination as seen by Kant was recognized, adhered to, and even interpreted in a more original way, cannot be discussed here. The following interpretation of the transcendental power of imagination grows out of another way of questioning and moves, so to speak, in the opposite direction from that of German Idealism.

Such a declaration shows us first of all that the "stone thrown into the pond" of Marburg Neo-Kantianism represented by Heidegger's *Kantbuch* is nonetheless engaging, secretly but no less "athletically" in a debate with all the interpretations of Kant since 1781, and notably the one that the history of ideas has retained under the name of "German idealism" (Hölderlin being quickly excepted), to the point of characterizing Kant's work as "an unconquered fortress behind the new battlefront." Thus it remains to ask in what way "the essence of *Einbildungskraft* as Kant understood it"

could have been so misunderstood and disfigured by his immediate posterity that this question has to be examined all over again from the opposite direction.

We will limit ourselves here to emphasizing that Heidegger's reading of Kant, like his reading of Hölderlin, accentuates the idea of an essential finitude of the human being, who is a "king of finitude" (Hölderlin, hymn "To Freedom"), whereas German idealism emphasized the unconditional nature of the ego of transcendental apperception as *Selbstbewusstsein*, or "self-consciousness." The *Bild* itself thus became the stake in conflicting interpretations that sometimes inscribed it within a spontaneity Kant reserved for the understanding, and sometimes sought to maintain the equal balance of spontaneity and receptivity, of logic and aesthetics. Instead of stressing the thetic character of the Kantian synthesis (Fichte and Schelling), Heidegger underlines the essential part played, in every knowing, by sensibility understood not as passivity but as receptivity.

Referring to Kant's comment cited earlier, Heidegger remarks that

> The term *Bild* is to be taken here truly at the source, as when we say, looking on a landscape, "What a beautiful view!" [*Bild*] (*Anblick*), or again, in the presence of a gloomy group, "What a sad sight!" [*Bild*] (*Anblick*).

> *Kantbuch*, §19

In a way that is strictly the inverse of the formation of Fichte's (or even Schelling's) *Bild*, here the *Bild* presents itself and offers us a presence that is not the result of our imagination or created by the power of the imagination. The narrowness of the *Bild/Anblick* relationship Heidegger establishes will allow a bold reversal (§20):

> One says of a landscape that it is a view (picture), *species* ["*Anblick (Bild),*" species], as if it were looking at us ["*gleich als blicke sie uns an*"].

The *Bild* is in a way "de-subjugated." Here we see that the question of the *Bild*, with its abundant vocabulary, constitutes a major issue in what opposes Kant's immediate posterity, that is, German idealism, to the phenomenological interpretation of the transcendental schematism in an unexpected revival of the impulse provided by Husserl.

BILDUNG, KULTUR, ZIVILISATION (GERMAN)

FRENCH	*culture, position, éducation, formation, libération des préjugés, raffinement des moeurs, civilisation*
GREEK	*paideia* [παίδεια]
LATIN	*cultura*

➤ CULTURE, and AUFHEBEN, BEHAVIOR, BILD, CIVILTÀ, CONCETTO, *IMAGE, IMAGINATION,* LIGHT, MORALS, PERFECTIBILITY, PEOPLE, PLASTICITY, PRAXIS, STRUCTURE

Designating alternatively physical beauty, intellectual cultivation, the divine imprint on the human mind, the integration of the individual into society, and the constantly emphasized parallelism between Greek culture and German culture, the term *Bildung* is certainly one of those words whose translation seems the most aleatory. The difficulty also has to do with the persistence of secondary meanings that are not eliminated by the choice of a primary meaning but are always conveyed in the background. Moreover, there is a tension between the term *Bildung* and the term *Kultur* that develops starting in the Enlightenment and designates the progress of mores thanks to civilization and then gradually comes to refer to the organic coherence of a social group. The terms *Bildung*, *Kultur*, and *Zivilisation* thus define each other in a variable relationship, but *Bildung* remains the word most difficult to transpose. Between the universality of the nation or of knowledge and immediate singularity, in the German context *Bildung* represents the element of particularity, which explains why it is usually anchored in the two privileged domains of language and art. This particularity of *Bildung* can have an identity-related dimension only by postulating its difference. The German notion of *Bildung* includes precisely an element of programmed incommunicability with regard to anyone who tries to approach the term from the outside.

I. The Question of Holism

By "culture" we can mean, depending on the context or period, a certain amount of knowledge in the domains of history, literature, art, music, and language that distinguishes a person who possesses it from one who does not, and serves as a sign of recognition among members of a group. The German definition of *Bildung* implies, on the other hand, an actualization of human perfectibility. In this sense, it is not reducible to any definite content. If Humboldt praises the Greeks and advocates imitating them, it is especially in order to posit as a paradigm a principle of self-determination and self-regulation that he perceives as central to Greek culture. In many respects, the Greek reference is interchangeable. Far from being an accumulation of objective knowledge, the theory of *Bildung*, as Humboldt defines it, is constructed on the basis of the observation of a gap between the multiplication of fields of partial knowledge and the moral progress of humanity. The point is to take over the positive sciences in order to subject them to the Rousseauian imperative of moral progress. Reducing external reality to imaginary representations produced by *Einbildungskraft*, art constitutes a way of extending *Bildung* that contributes to the self-determination that places the subject of *Bildung* at the center of the perceived world. It reduces the indefinite multiplicity of phenomena to a small number of symbolic elements referring to the infinite. This self-fashioning of autonomous individuality is nonetheless fully realizable only through the mediation of language, which, better than art, provides a symbolic relationship to the world and enables the subject to appropriate it. But through language we pass from human individuality to the singularity of the group in which a relationship to the world can be expressed. At the same time that it expresses the individual's aspiration to the universal, *Bildung* marks a difference because the modes of appropriation and expression of the world through language are not identical. We have often been struck by the theological dimensions of a theory that makes of the human being involved in the dynamism of *Bildung* a veritable monad. In this respect, we can only approve of the idea that *Bildung* is the expression of a holistic dimension of German culture, whereas in his *Sociology of Religions* Max Weber speaks of an *Einsheitskultur* (homogeneous culture), and in his book on *Der Historismus und seine Probleme* (*Historicism and its Problems*) Ernst Troeltsch aspires to a *Kultursynthese* (cultural synthesis). To develop a theory of *Bildung* is to postulate a coincidence of the singular with the universal in a dynamics that is history envisaged from a German point of view. The degree of generality attained by a term that can then be associated with the totality of the elements of an intellectual tradition arouses distrust. *Bildung* is less a pernicious ideologeme than an empty place in discourse, a *coincidentia oppositorum* whose postulated existence makes it possible to engage in discourses on the singularity of the subject and the coherence of the group. It is certainly in this function of touchstone or interstitial glue between conceptual sets that the term *Bildung* is most untranslatable.

It would in fact be rather absurd to claim that a word designating the acquisition of theoretical or practical knowledge can be translated only if it does not assume an identifying function. The idea of a co-extensiveness of language and

human understanding, of a necessary mediation of language in the symbolic appropriation of the world, is not absent from the linguistic thought of eighteenth-century France, whether we think of Condorcet or his posterity among the members of the Société des Idéologues frequented by Humboldt during his stay in Paris and his turn toward linguistics. To a certain extent, the term *Bildung* is thus invested with an arbitrary will to untranslatability. To define the term *Bildung* as an index of a holism peculiar to German culture is thus to accept uncritically a form of intellectual self-perception and the marked-out paths that it implies for anyone who wishes to explore it only from the inside. Whether one thinks the notion of *Bildung* can or cannot be translated ultimately depends only on the arbitrary choice of an intellectual position inside or outside the discourse that it structures.

II. From the Image of God to Human Development

A. Lexical stages

Friedrich Kluge's etymological dictionary (RT: *An Etymological Dictionary of the German Language*) explains that the term *Bildung* (*bildunga* in Old High German), which derives from *Bild*, "image," signified at first creation, fabrication, the fact of giving form. The transition to the idea of intellectual training and then to education is supposed to have proceeded from the language of mysticism, in which *înbilden* designates the acquisition of a figurative representation, establishing a de facto relationship between *Bildung* and *Einbildung* (imagination). The mysticism of the late Middle Ages, like Pietism, maintained that God imprinted his image (*sich einbildet*) on humans. In his 1793 dictionary, Johann Christoph Adelung attributes to the term *Bild* three main meanings: that of the form of a thing, that of the representation of a thing, and finally that of a person or thing considered from the point of view of its apparent form (a man can be designated by the term *Mannsbild*). According to Adelung, the verb *bilden* signifies giving form to something, but also reproducing a thing's form (a meaning that subsists residually in the concept of *bildende Künste*, "plastic arts," "arts of reproduction"; see ART, Box 2). The noun *Bildung* is thus supposed to designate both the action of giving a form and the form itself, notably the form of the human face. Theodor Heinsius's dictionary (1818) lists these two meanings and adds that of a cultivated person's state, as well as that of the ability of the mind to recompose, in a whole that did not previously exist, the singular representations transmitted by the imagination (*Einbildungskraft*). In their dictionary (1860), the Grimm brothers observe that the term *Bildung* is characteristic of the German language, and that it is not found, or found only in forms derived from German, in other Germanic languages. The term is supposed to have designated an image, *imago*, and then, more broadly, a form (*Gestalt*). It is still in this sense that Winckelmann himself knew the term when he wrote that over time, scientific advances taught Etruscan and Greek artists to free themselves from primitive fixed and rigid forms. And, speaking of the Laocoon, Lessing explains that it had "a form [*Bildung*] which inspired pity because it possessed beauty and pain at the same time." The Grimm brothers also note the meaning of *cultus animi, humanitatis*, which they attribute notably to Goethe (see MENSCHHEIT). The numerous compounds into which the word *Bildung* enters can help explain

its meaning. Thus *Bildungsanstalt* (educational institution) refers to the most intellectual sense of the term, whereas the concept of *Bildungstrieb* (formative drive; see DRIVE), borrowed from the anthropologist and anatomist Johann Friedrich Blumenbach, designates nature's aptitude for causing forms to emerge.

Whereas the classical dictionaries of the German language reveal a great wealth of meanings for the term *Bildung*, they are much more circumspect about *Kultur* and *Zivilisation*. Adelung defines *Cultur* (culture), whose roots he recognizes in both French and the agricultural vocabulary, as a purification of the mental and physical strengths of a person or a people, so that *Cultur* can signify both a liberation from prejudices (Enlightenment, *Aufklärung*; see LIGHT) and refinement of manners. The term *Zivilisation* is unknown to Adelung, but he defines "civil" as *bürgerlich*, characteristic of the citizen, and notes that *civilisieren*, borrowed from French *civiliser*, signifies "give good manners." Heinsius adopts these definitions and notes the term *civilisation* in the sense of improvement of manners, derived from the Latin *civilitas*, *civilis*. The term *civilisation*, in its oldest stratum, refers to the political organization of the city. From this survey we can conclude that the great lexicographical investigations that are chronologically close to German idealism do not give the terms *Kultur* and *Zivilisation* a historical or ethnological sense, but simply designate a process of the purification of manners from the point of view of the Enlightenment. Thus these two terms appear in the Hegelian lexicon, and even then rarely, with a processual value.

B. *Aufklärung* and culture

In *Über die Frage: Was heisst aufklären?* (1784), Moses Mendelssohn complains that the words *Aufklärung*, *Kultur*, and *Bildung* are newcomers in the German language. They belong only to the language of books and the common man does not understand them. Mendelssohn's complaint allows us to note a semantic equivalence or extreme proximity among three terms that moreover belong largely to scholarly language.

From Kant's point of view, the determining term is not *Bildung* but *Kultur*. Starting out from a rude, uncultivated state, humans arrive, thanks to the development of their dispositions, at culture (*"aus der Rohigkeit zur Kultur"*), at the organization of their lives in accord with their goals and with the deployment of their own strengths. Humans elaborate culture in society (*Idea for a Universal History with a Cosmopolitan Purpose* [*Idee zu einer allgemeinen Geschichte in weltbürgerlicher Absicht*], chap. 4). From this point of view, culture is also a duty to oneself and to others. In fact, the transition to culture does not result from a continuous evolution, but is produced instead by a tension, humans being, according to Kant, both social and opposed to sociability, inclined to confine themselves to individual behaviors. Culture, more a process than a result, arises from the effort to discipline the tendencies to reject sociability. However, dissensions are not in principle contrary to culture, and may even serve as its motive force. Culture does violence to nature, but at the same time it develops nature's virtualities. Humans' goal is indeed to develop their natural strengths, *"der Anbau-cultura—seiner Naturkräfte"* (*Metaphysics of Morals* [*Metaphysik der Sitten*], 1797), and

these natural strengths are not limited to intellectual and spiritual strengths, but also include physical strengths.

The development of culture culminates in a constitution defined in accord with the concepts of human rights, in an overall refinement of the manners and the intellectual qualities, not of the individual, but of civil society. Thus culture's vocation is to find its full realization in politics. In his *Anthropology from a Pragmatic Point of View* (*Anthropologie in pragmatischer Hinsicht*, 1798) Kant uses the terms *kultivieren, zivilisieren,* and *moralisieren* almost as synonyms. Culture includes education and upbringing and finally obtains a certain aptitude. The term *Zivilisierung* is said to emphasize culture, insofar as culture inclines people to enter into the social whole (*Über Pädagogik*). According to the distinctions made in Kant's posthumously published writings, morality represents a third stage in the progress of humanity toward perfection, following culture and civilization. The relative absence of the term *Bildung* in Kant's work is revelatory of an approach that is comprehensive, collective, and political, without any mystical or organicist dimension.

C. *Bildung* and humanity

The notion of *Bildung* becomes central once again in the language of Herder, who stresses movement and becoming in relation to any fixed situation. In his work, *Bildung* acquires a status that allows it to include the reference both to the biological and organic development of forms and to intellectual education and the refinement of manners. The tension between Kant and Herder is projected in the semantic opposition that leads one of them to prefer to speak of *Kultur* and the other to speak of *Bildung*. Furthermore, *Bildung* applies less to the individual than to humanity as a whole. As a result, it tends to coincide purely and simply with history, a history that would not be solely a history of ideas, but also one of behaviors, feelings, and sense impressions, which is already suggested by the title *Auch eine Philosophie der Geschichte zur Bildung der Menschheit* (*Another Philosophy of History for the Cultivation of Humanity*, 1774). *Bildung* is determined first of all by external conditions and tendencies, by appetites based on the imitation of a model.

What were these tendencies? What could they be? The most natural, the strongest, the simplest! For every century, the eternal foundation of the education of men [*Menschenbildung*]: wisdom rather than science, the fear of God rather than wisdom, love among children and spouses instead of elegance and extravagances, order of life, domination over a house in conformity with God's order, the primitive image [*das Urbild*] of every order and every civil organization—in all that the simplest and deepest enjoyment of humanity, how could that have been, not conceived [*erbildet*], but even developed [*angebildet*], perfected [*fortgebildet*], except by that eternal power of the model [*Vorbild*] and of a series of models [*Vorbilde*] around us?

This eternal model that is the source of all *Bildung* has a pronounced theological dimension. While *Bildung* is a kind of education, it cannot be limited to an intellectual education transmitted by books and libraries:

The education [*Bildung*] and improvement [*Fortbildung*] of a nation are nothing other than the work of destiny: the result of countless causes that converge, so to speak the result of the whole element in which they live.

Reasoning and understanding alone cannot in any case be the sole vehicles of this education of humanity that Herder calls for in the context of the Enlightenment. The heart, blood, warmth, life are all elements that are involved in the education of humanity and cannot be reduced to a rational mechanism. In its double meaning of a process of acquisition and a terminal state, culture (*Kultur*) remains in Herder the distinctive trait of a people and even suggests the possibility of outlining hierarchies among peoples. In Herder, the term *Bildung* is applied to humanity and to the nation, but also to language, the vehicle of culture. While he likes to talk about the formation of language (*Bildung einer Sprache*), this is naturally in the trivial sense of the term. In order for a language to take form it must go through a certain number of phases that historians of the language can reconstruct and scan. But here *Bildung* also signifies that the language is enriching itself, that it is accomplishing a process of improvement, ennobling itself:

Our language is in a phase of formation (*Bildung*)—and the expression "formation (*Bildung*) of the language" is almost a motto that is today on almost everyone's lips: writers, art critics, translators, scientists. Each of them wants to form (*bilden*) it in his own way: and one is often opposed to the other. What should we do if everyone is allowed to form (*bilden*) it: shall I then be authorized to ask what "form" (*bilden*) means? What is a language without formation (*ungebildete Sprache*)? And what revolutions have other languages undergone before they appeared formed (*ausgebildet*)?

This questioning is followed by a series of historical considerations on the best ways of enriching the language among which translation, notably the translation of ancient authors who are distant from German in their mode of expression, plays a central role.

III. Formation or Self-Making

A. Self-Making

The essential dimension that the term *Bildung* acquires around 1800 is that of reflexivity. The development that *Bildung* implies is not only the acquisition of competences with a view to improvement, but corresponds to a process of the self-fashioning of the individual who becomes what he was at the outset, who reconciles himself with his essence. This use of the word is found notably in Hegel, who devotes long passages to *Bildung* in the fourth part of the *Phenomenology of Mind* (*Phänomenologie des Geistes*), the one entitled "Spirit":

The means, then, whereby the individual gets objective validity and concrete actuality here is the formative process of Culture [*Bildung*]. The estrangement [*Entfremdung*] on the part of spirit from its natural existence is here the individual's true and original nature, his very substance. . . . This individuality moulds itself [*bildet sich*] by culture to what it inherently is, and only

by doing so is it then something per se and possessed of concrete existence. The extent of its culture [*Bildung*] is the measure of its reality and its power.

We can see how difficult it is to express otherwise than by convention the whole of the semantic field covered by the term *Bildung* in its Hegelian acceptation. Individual self-fashioning is at the same time a transition from substance to a reality that makes it alien to consciousness.

> The process in which individuality cultivates itself is, therefore, ipso facto, the development of individuality qua universal objective being; that is to say, it is the development of the actual world. This world, although it has come into being by means of individuality, is in the eyes of self-consciousness something that is directly and primarily estranged.

In other words, *Bildung* is a process that both produces and alienates individuality. In order to accede to *Bildung*, individuality distances itself from its Self. A splitting takes place, and the language of this splitting is the perfect language of the world of culture. The overthrow and mutual alienation of reality (*Wirklichkeit*) and of thought define "pure culture" (*reine Bildung*). "The spiritual condition of self-estrangement exists in the sphere of culture as a fact." In the play of the formation of individuality in a process of self-fashioning on the one hand, and of alienation, the estrangement from that same individuality, on the other, thought acquires a content and *Bildung* ceases to be a pure virtuality.

The notion of *Bildung* is important in Fichte's political writings, notably in his *Addresses to the German Nation* (1808), where the education that modifies not only the individual's heritage but his nature itself becomes a kind of glue unifying the people. *Bildung* is no longer a specific education but a "general culture" (*allgemeine Bildung*). Schelling shares with Hegel a comprehensive conception of *Bildung* and in his *Vorlesungen über die Methode des akademischen Studiums* (*On University Studies*) (1808) he explains that "to attain absolute form, the spirit must test itself in all domains, that is the universal law of all free education (*Bildung*)." Nonetheless, in Schelling the term has a much weightier meaning in a passage in his treatise on the essence of human freedom (*Philosophische Untersuchungen über das Wesen der menschlichen Freiheit und die damit zusammenhängenden Gegenstände* [1809]) that illuminates the movement from the *Grund* or initial obscurity to division. According to Schelling, this movement can take place only through a "veritable in-formation (*Ein-Bildung*), things in development being informed (*hineingebildet*) in nature or more precisely by an awakening, the understanding highlighting the unity or *Idea* concealed in the separation from the *Grund*." When Hegel was writing the *Phenomenology of Mind*, *Bildung* still conveyed a mystical meaning inherited from the representation of a form breathed into matter. But this process is henceforth situated strictly within the framework of a self-constituting subjectivity.

B. The indefinite

In many of the contexts in which it is used, *Bildung* includes an element of indetermination that makes it unsuitable for designating solely a process of education, whether it is a matter of intellectual or moral education. The highest form in the hierarchy of forms, the one that would best represent *Bildung*, the forming or shaping with theological roots, would be precisely, in an ever-latent reversal, the absence of form. We encounter this sense of the term *Bildung* notably in the work of Friedrich Schlegel, and particularly in his 1799 novel, *Lucinde*. Carried away by a love without object in the chaos of his inner life, the hero, Julius, feeling that he is destined to be an artist, discovers how far behind he still is in *Bildung* ("*dass er noch so weit zurück sei in der Bildung*"). But the decision to educate himself (*bildete sich*) leads him to forget his century and take his models among the heroes of the past or to project himself into the future, in short, to emancipate himself from temporal determinations. *Bildung* is almost as indeterminate as the state it allows us to leave behind. Schlegel even develops a theory of *Bildung* whose highest degree would be passivity, the abandonment of forms, and the acceptance of idleness. Women are supposed to attain spontaneously this state of openness to the indefinite. Men, on the other hand, should seek to achieve it. "That is why in women's love there are no degrees or stages of *Bildung*." The indefinite dimension of *Bildung*, its openness to a vague infinity and its reversal into a victory over the tyranny of forms, is not peculiar to Romanticism. Paul Natorp, in a very nationalist work entitled *Die Seele des Deutschen* (*The German Soul*, 1918), emphasized the fact that Goethe, beyond his philosophical, aesthetic, and literary qualities, acted as a *Lebensbildner* (shaper of life). After him, "the term *Bildung* should never have been understood in a superficial sense, because for him, and for anyone who remained faithful to his spirit, it meant nothing less than the organization of the whole of life into a living masterpiece." *Bildung* is supposed to be the act of giving life and in that way moving beyond forms. Natorp appeals to the model of Goethe's Prometheus: "I am here and give form to men in accord with my image, to a race that resembles me." Understood in this way, *Bildung* becomes a kind of organic duty to express a German idea that cannot be limited to the individual but includes the collectivity.

C. *Bildung* and philology

Despite its numerous extensions, *Bildung* corresponds to a specific kind of education: the study of antiquity and especially Greek philology. There is a very clear reason for this. The Greeks had an all-encompassing cultural system, *paideia* [παίδεια], whose paradigmatic value in turn permitted the construction of national cultural systems in Europe: "The original Greek creation of culture (*Kultur*) as a system of *paideia* and pure forms that served as its organ produced the effect of an illumination on the peoples of the world" (Jaeger, *Humanistische Reden und Vorträge*).

■ See Box 1.

Transposing the Greek paradigm to German reality required a special familiarity with the ancient Greek language and the texts that transmitted it. *Bildung* became primarily a philological activity. Even before Friedrich August Wolf made in clear in his *Prolegomena ad Homerum* (*Prolegomena to Homer,* 1795) that understanding the *Iliad* and the *Odyssey* required an understanding of how they were transmitted

1

Paideia, cultura, Bildung: Nature and culture

➤ *IMAGE*, LOGOS, RELIGIO, *VIRTÙ*, *WORLD*

A fragment of Democritus quoted, via Aristotle, by Stobaeus, sums up the importance of *paideia* and its aura: "*Paideia* is the world [*kosmos* [κόσμος]; Diels-Kranz suggests *Schmuck* (ornament)] of those for whom this goes well (*tois eutuchousin* [τοῖς εὐτυχοῦσιν]), and the refuge of those for whom it goes badly (*atuchousin de kataphugion* [ἀτυχοῦσιν δὲ καταφύγιον])" (68 B 180 DK). The word *paideia*, which designates both "youth" and "education, culture," derives from *pais* [παῖς], "child"; not the child as his mother gives birth to him, *teknon* [τέκνον] (from *tiktô* [τίκτω]), engender, and as he is brought up (*trephô* [τρέφω]), feed, cause to grow), like any animal at all, but the human offspring whose body and mind have to be shaped, whence a common phrase, notably in Plato, *paideia kai trophê* [παίδεια καὶ τροφή] (*Phaedo*, 107d, e.g., translated by L. Robin as "formation morale et régime de vie", and "culture et goûts" by M. Dixsaut). *Paideia* is understood in its proximity to *paidia* [παιδιά], "play": thus Plato's *Laws* call for legislation "on *paideia* and *paidia* relative to the Muses" (2.656c). *Paideia* is opposed to *apaideusia* [ἀπαιδευσία], the ignorance of the badly educated, as is shown, for example, by the myth of the cave, which opens like this: "Next, said I, compare our nature in respect of education and its lack to such an experience as this" (*Republic*, 7.514a 1–2). Or again: "By education, then, I mean goodness in the form in which it is first acquired by a child" (tên paragignomenên prôton paisin aretên [τὴν παραγιγνομένην πρῶτον παισὶν ἀρετήν]) (*Laws*, 2.653b 1–2). From Socratic dialectic to the austerities of the laws, everything in Plato is thus persuasive and pedagogical, oriented toward the standard of virtue that would be taught by the philosopher-king and conveyed through institutions.

Everything in Plato, but also everything in Aristotle, for whom *paideia* is a way of fulfilling the definition of man as an animal endowed with *logos* [λόγος]. No one, neither the child, nor, of course, women, nor even slaves, achieves this without *paideia*: each one is in his own way not only a living being, like an ox, but a living being endowed with enough *logos* to acquire more ("Wherefore they are mistaken who forbid us to converse with slaves and say that we should employ command only, for slaves stand even more in need of admonition than children"; *Politics*, 1260b 5–7; cf. Cassin, *Aristote*). No one has *logos* from the outset, totally and once and for all, because *logos* constitutes for us nature's goal (*Politics*, 7.13.1334b 15): to lead

toward *logos* by *logos* is the very essence of *paideia* (Cassin, *Aristote*). In other words, man's nature is his culture. The breadth of *paideia* ranges from politics—it is the *logos* that makes man a "more political" animal than others (*Politics*, 1.1253a 7–10)—to ontology—it is evidence of *apaideusia* (lack of education) to demand that everything be demonstrated (*Metaphysics*, 4.4.1006a 6; cf. 3.1005b 3–4), and, in the case of the principle of noncontradiction, we are then "no better than a vegetable" (*Metaphysics* 4.4.1006a 14–15).

As Hannah Arendt emphasizes, it is a matter of our mode of relation to the things of the world (*Between Past and Future*). To characterize Greek culture in its relationship to the art that is often confused with it, Arendt cites the statement Thucydides puts into the mouth of Pericles in his funeral oration for the latter: "We love beauty within the limits of political judgment, and we philosophize without the barbarous vice of softness" (*philokalou-men te gar met' euteleias kai philosophou-men aneu malakias* [φιλοκαλοῦμέν τε γὰρ μετ' εὐτελείας καὶ φιλοσοφοῦμεν ἄνευ μαλακίας]) (Thucydides, 2.40; Arendt, *Between Past and Future*; cf. Cassin, *L'Effet sophistique*). In opposition to the over-refinement of the barbarians, the political and practical standard of *paideia* defines the Greeks' relation to beauty and wisdom. In relation to the barbarians, and then to the Romans, we see that the *logos* constituted par excellence by the Greek language can become the depository of *paideia* (see GREEK, Box 1), and that in the Hellenistic schools, culture was presented in the form of *mimêsis rhêtorichê* [μίμησις ῥητορική], "literary culture," meaning the appropriation of great authors and of creative imitation, but of culture and no longer of nature (Cassin, *L'Effet sophistique*).

We also see why it is Greek *paideia* and not Roman *cultura* that functions as a model in German *Bildung*. *Cultura* derives from *colere*, "to inhabit, cultivate, practice, maintain," from the root **kwel-*, like *pelomai* [πέλομαι], "to turn around," which we find again in "circle," and the verb designates both humans' relation to the gods—they cultivate them, make them the object of a cult—and that of the gods to humans—they live with them, protect and cherish them (cf. A. Ernout and A. Meillet). Literally and first of all, *cultura* is *agricultura*, "the culture of the earth": the mind is like a field that cannot produce unless it is suitably cultivated and "philosophy is the culture of the mind" (*cultura autem animi philosophia est*; Cicero, *Tusculan Orations*,

2.13). Arendt notes emphatically: "It was in the midst of a primarily agricultural people that the concept of culture first appeared, and the artistic connotations which might have been connected with this culture concerned the incomparably close relationship of the Latin people to nature, the creation of the famous Italian landscape" (*Between Past and Future*). It is precisely here that we see one of the fundamental differences between the Greeks, who conceived cultivating the earth as a Promethean act, almost a rape, and the Romans, who fashioned nature into a habitable place: "The reason why there is no Greek equivalent of the Roman concept of culture resides in the predominance of the arts of fabrication in Greek civilization. Whereas the Romans tended to see even art as a kind of agriculture, as the culture of nature, the Greeks tended to see even agriculture as an element of fabrication, as one of the ingenious and skilful technical artifices through which humans, who are more frightening than anything else that exists, domesticate and dominate nature."

Bildung is located on the side of *technê* [τεχνή], art, of artifice and fabrication, and not on the side of *natura*. Werner Jaeger never ceased to emphasize its relation to plastic activity, the *plassein* [πλάσσειν] through which the sculptor models his creation: "The term *culture* (*Bildung*) should be reserved for this kind of education (*Art der Erziehung*) alone, the one for which Plato uses the material metaphor of the character that is *fashioned* (*als bildlicher Ausdruck für das erzieherische Tun*). The German word *Tun* indicates very clearly the nature of Greek education in the Platonic sense: it suggests just as much the artist's plastic composition (*das künstlerische Formende, Plastische*) as the guiding model which is always present to the mind of the artist (*dem Bildner innerlich vorschwebende normative Bild*), the *idea* or *typos*" (*Paideia*; see ART and PLASTICITY). And what is thus shaped by the legislator is "the living man": "Other nations have created gods, kings, spirits: only the Greeks have shaped men" (cf. this phrase which we will not try to translate: "Ausbildung, Durchbildung, Vorbildung, Fortbildung, nicht Bildung," Jaeger, *Humanistische Reden und Vorträge*).

Thus it is through humanism and not culture that *Bildung*, which considers humans as works of art, inherits the very action of *paideia*.

during the intellectual history of Greece, Wilhelm von Humboldt had told him that in his opinion there was, alongside the particular forms of intellectual learning, another that federated humans' various modes of expression and gave them their unity.

> This education (*Ausbildung*) is increasingly losing its importance and achieved its highest degree among the Greeks. It can be better promoted, it seems to me, only by studying great and remarkable men from this point of view, or to put it in a word, by studying the Greeks.

> Letter from Humboldt to Wolf, 1 December 1792

In his *Darstellung der Altertumswissenschaft* (1807), Wolf pointed out a radical difference between the ancient peoples of the Orient on the one hand, and the Greeks and Romans on the other:

> One of the most important differences is . . . that the former scarcely rose, or only by a few degrees, above the kind of culture (*Bildung*) that is called politeness (*Policirung*) or civilization (*Civilisation*), in contrast to superior intellectual culture (*Geisteskultur*) properly so called.

The germ of a dichotomy between *Kultur* and *Zivilisation* is already present here. By an obvious paradox, in Wolf's work the term *Kultur* often designates the education of the mind, whereas *Bildung* designates the social condition attained. The conceptual divisions do not exactly coincide with the semantic divisions.

To create a new German culture, to gather together what had been dispersed, to restore a unity comparable to that of the model of *paideia*, Germans had to study Greek. *Bildung* became a kind of substitute for a centralized state at the same time as a humanistic improvement of the individual. This simultaneously educational and political function of *Bildung* was in fact of a very different nature depending on whether the Greek paradigm was invoked to construct a German culture around 1800 or to magnify the German Empire and its subjects' conformism during the Wilhelmine period.

It is chiefly Humboldt who can be considered the theoretician of *Bildung* as a transfer of the Greek paradigm to Germany. Moreover, we find in Humboldt a competing use of the terms *Bildung*, *Ausbildung*, and *Kultur* that challenges the frequently alleged opposition between *Bildung* as intellectual education and *Ausbildung* as practical training. We can show, Humboldt writes in *Über das Studium des Altertums* (*On the Study of Antiquity*), that the attention given to physical and intellectual culture (*Bildung*) was very great in Greece and was guided principally by ideas of beauty, and that "a strong tendency among the Greeks to educate [*auszubilden*] man both in his greatest diversity and in his greatest possible unity is undeniable." The parallel between the fragmentation of Greece and the fragmentation of Germany being obvious in Humboldt's writing, *Bildung* appears as a form of constructive tension between identity and plurality. The *Bildung* of German Hellenist philologists from Wolf to Wilamowitz by way of Philipp August Boeckh, Gottfried Hermann, Otfried Müller, Hermann Usener, and others is also a way the individual participates in the collective.

D. The individual and the collective

The term *Bildungsroman*, generally translated as "novel of education," was introduced into critical terminology by Wilhelm Dilthey, who makes use of it in his *Leben Schleiermachers* (*Life of Schleiermacher*, 1870) to characterize the novels of German classicism. A novel about a young man's coming to awareness of himself and at the same time finding his place in the social world, the *Bildungsroman*, which is often also called the *Entwicklungsroman*, "novel of development," or *Erziehungsroman*, "novel of character development," combines Rousseauist roots (the German reception of *Émile, ou de l'éducation*, 1762) with Pietist roots (Karl-Philipp Moritz's *Anton Reiser*, 1785). This twofold background corresponds to the structural ambiguity of the notion of *Bildung* as both the education of the social individual and an internal education independent of any context. A subset of the *Bildungsroman* genre is the *Künstlerroman* (novel about an artist), in which the hero's discovery of the world of art enables him to succeed in his exploration of both an inner space and a social life.

The main example of the *Bildungsroman* is provided by Goethe's *Wilhelm Meister*, and more particularly by the first volume, *Wilhelm Meisters Lehrjahre* (*Wilhelm Meister's Apprenticeship*, 1795–96). For Goethe and his hero, the notion of *Bildung* implies a shaping of singular existence by the acceptance of outside influences, family relationships, art and especially the theater, Pietistic religious trends, and certain social milieus, especially the nobility. The hero himself explains what he means by *Bildung*: "Let me tell you: ever

since I was a boy, my wish and intention has been to educate myself completely as I am." According to Goethe, German bourgeoisie were able to acquire practical training, to develop some of their abilities with a view to being socially useful, and even to acquire a general intellectual education. However, he considers this education inferior to the one he thinks was previously reserved for the nobility, an education of the person taken as a whole, without any amputation. The influence of a complete, unamputated personality can be obtained through a new form of aristocracy whose acquisition depends notably on artistic education. It is easy to show that the various phases of the acquisition of *Bildung* in *Wilhelm Meister* correspond to the phases through which German culture passed in the eighteenth century, thus making the individual development of Wilhelm's personality an allegory of the education of the German people itself. Another notable characteristic of Goethe's conception of *Bildung* has to do with the role accorded to action. Whereas the complete education of the personality, analogous to the education of the people as a whole, transcends the acquisition of separate abilities, it must, when it is once acquired, reconnect with practical activity. *Wilhelm Meisters Wanderjahre* (*Wilhelm Meister's Journeyman Years*, 1821, 1829), a sequel to the first novel, justifies this return to the practical, as if the notion of *Bildung*, in the simple context of Goethe's work, were already evolving and included within itself the necessity of a theoretical reformulation. "In any case, society now forces us to have a general education; therefore we do not need to worry about it anymore, it is the particular that we have to appropriate." Let us note that in his poem *Hermann und Dorothea* Goethe uses the term *Bildung* in an archaic sense of harmonious physical constitution, at the same time that in *Wilhelm Meister* he is developing the theory of *Bildung* as intellectual education.

IV. Resisting Organicism

A. *Bildungsbürgertum*

The French occupation of Germany during the Revolutionary Wars and especially during the Napoleonic Wars was a sort of incubation period during which the concept of *Bildung* acquired its central place in Germany's philosophical self-image. This French period of German history is characterized by a radical reduction of spatial fragmentation and the emergence of the idea of a German state that would be the heir to the Enlightenment, that is, of a pedagogical state. Whereas in old Germany intellectual education was one of the duties of certain social groups, virtually the prerogative of corporate organizations after 1800, and more precisely after the foundation of the Humboldt University in Berlin (1810), it became the distinctive insignia of servants of the state, of a state that was initially virtual or partial but after 1871 included most of the Germanic world. *Bildung*, a reference point that was clearly less important in Alemannic Switzerland and Austria than in Germany proper, was the condition of membership in the universality of the state, just like property. Real property or military office that was not accompanied by cultural capital, that was not legitimized by *Bildung*, even became suspect. Educating a new kind of citizen or subject, the *Bildungsbürger* (roughly, middle-class intellectual) tended to deprive *Bildung*

of its subjective, individual, reflexive dimension and make it a form of property or symbolic capital. In the second half of the nineteenth century the idea of technical, professionalized, socially pertinent training was established, and led to a previously almost imperceptible opposition between general education, culture, *Bildung* and specialized training, even technical training, *Ausbildung*, *Fachausbildung*. The German state, drawing its legitimacy from its pedagogical functions—a new type of legitimacy that obviously inspired the French Third Republic, traumatized by the defeat at Sedan—sought to make ever-broader groups participate in the integrative system of *Bildung*. Social Democratic movements fit perfectly into this dynamics, which led to the notion of *Volksbildung* (popular education) and the multiplication of *Volksbildungsvereine* (popular education associations).

By becoming institutionalized and transforming itself into social glue, *Bildung* lost its individualistic dimension and espoused social strategies. It no longer provided the unity of a culture. In the second of his *Unzeitgemässe Betrachtungen* (*Untimely Meditations*), Nietzsche deplores the fact that historicism has substituted *Gebildetheit* (erudite culture), the prerogative of the philistine (*Bildungsphilister*, a term that appears around 1860), for *Bildung*. According to Nietzsche, Germans, in the grip of historical studies, were losing their human dimension and becoming "creations of historical culture, wholly structure, image, form without demonstrable content and, unhappily, ill-designed form and, what is more, uniform." In fact, for Nietzsche there is no longer any true *Bildung* but only a historical knowledge of its components. People limit themselves to ideas of *Bildung* (*Bildungsgedanken*) or to the feeling of *Bildung* (*Bildungsgefühl*) in order to avoid making a decision about *Bildung* (*Bildungsentschluss*). Far from recognizing culture in contemporary Germany, Nietzsche was persuaded that the Greeks (whom, like Humboldt, he regarded as the criterion in this area) would call Germans "walking encyclopedias." To designate authentic *Bildung*, the *Bildung* that has disappeared, and in particular that of Greece, Nietzsche liked to use the term *Kultur*, emphasizing a living unity, the "unity of artistic style in all the expressions of the life of a people."

B. Culture and organicism

Starting in the middle of the nineteenth century, the term "culture" ceased to designate a future and expressed instead an entity, a state of national communities. Jakob Burckhardt understood *Kultur* as referring to "the totality of the intellectual developments that take place spontaneously and without aspiring to universality or monopoly" (*Die Cultur der Renaissance in Italien*). Processuality is not completely lacking, but it is a process that takes place within the unity of an organism. In relation to the simply totalizing tendencies of holism, organicism implies a quasi-biological functionality. Culture is thus "the process of millions of persons through whom the naïve action determined by their race is transformed into a conscious aptitude." Cultures are born, flourish, and die, and this organic life of cultures is governed by "superior, inaccessible laws of life." For Burckhardt, culture represents the critical authority of civil society as opposed to the state and religion. It includes the fine arts, to be sure, but also livestock-raising, agriculture, maritime shipping,

commerce, and crafts; all these elements enter into various combinations in the notion of culture. The diversity of the internal programming of culture allows us to distinguish major historical periods and to speak of cultures in the plural. The sense of the term in Burckhardt is very close to that used by ethnologists. While Burckhardt thinks that "the miracle of language" is at the origin of culture as a federating bond, we must remember that language is also what Franz Boas—who was trained in Germany before leaving for the United States—made central to ethnological investigations and methods.

In Oswald Spengler's *Decline of the West* (*Der Untergang des Abendlandes*, 1923), the concept of culture becomes an operative concept for the historian. To understand Western culture, he wrote, "we must first know what culture is, how it is related to visible history, to life, to the mind, to nature, to the spirit, in what forms it manifests itself and to what extent these forms—peoples, languages, and periods, battles and ideas, the arts and works of art, the sciences, the law, great men and great events—are symbols and can be interpreted as such." Culture corresponds to a network of symbolic forms, to their concentration around a people and even a race—a term that in Spengler's terminology is not too far from that of "culture." Peoples are spiritual entities (*Seelische Einheiten*) based on symbols, but Spengler draws a distinction between primitive peoples, such as the sea people during the Mycenaean period, who do not have a strong coherence, and peoples of culture (*Kulturvölker*), who are much more precisely determined. After the moment of culture, peoples sank into the era of fellahs, the condition of Egypt during the Roman period. Moreover, to primitive cultures Spengler opposes great cultures in a hierarchy of values that is also applied to languages. Whereas *Bildung* is considered only in the singular, cultures are plural and hierarchized.

The symbolism that guarantees a culture's organic unity may be religious in nature. Within a cultural community (*Kulturgemeinschaft*) like Judaism, culture's function is to regulate morals (*sittliche Kultur*). In his *Religion der Vernunft* (*Religion of Reason*), Hermann Cohen further notes that culture, the glue that holds a people together, is based on an unwritten religious law regarding "this eternal, this unwritten that precedes, must precede, all writing and so to speak all culture, because it creates the foundation for all culture." In his *Philosophie der symbolischen Formen* (*Philosophy of Symbolic Forms*), Ernst Cassirer speaks of the "cultural myths (*Kulturmythen*) that differ from natural myths in that their function is not to explain the origin of the world and to legitimate a cosmology, but to explain the genesis of 'cultural goods' (*Kulturgüter*)." Through the intermediary of myths, notably salvation myths, "culture becomes conscious of itself."

C. Culture or civilization

Did Freud write on "Civilization and Its Discontents" or on "Culture and Its Discontents" (*Unbehagen in der Kultur*)? The question that divides translators reveals a semantic dichotomy in which French privileged the term *civilisation* before gradually importing the stakes involved in the German dichotomy. It is certain that for Freud, *Kultur* corresponded to a constraint exercised on drives: "This replacement of the power of the individual by the power of a community constitutes the decisive step of civilization [*der entscheidende kulturelle Schritt*]. . . . The liberty of the individual is no gift of civilization [*Kulturgut*]." Cosmopolitan, universalist, marked by the spirit of the Enlightenment, democratic in its essence, *Zivilisation* includes on the other hand a threat of decomposition for the national entities that it transcends or federates. The notion of *Kulturkampf* (culture war), which designated the politics of the Prussian Protestant Bismarck with regard to Catholic groups, well expresses the menace that weighs on culture and obliges us to defend it. This defense does not shrink from using radical means, and in the belligerent language used during the First World War, Thomas Mann himself did not hesitate to champion a defense of the idea of culture, including the brutal forms its affirmation might take. In any case Germany, better rooted in nature, was supposed to be resistant to civilization conceived as primarily intellectual. In its exacerbated form, the opposition between culture and civilization reflects the ancient German mistrust with regard to a universality inherited from the Enlightenment that was supposed to conceal a French desire for hegemony. We can understand why the French political vocabulary at the beginning of the twentieth century appealed to the notion of civilization in reaction to the German instrumentalization of the dichotomy. This semantic opposition, which arose from Franco-German distrust, became a structuring factor in ethnological studies that could be scientific only by studying concrete societies rooted in their particularity, and thus cultures, but without seeking to see to what extent these cultures drew on the universal reservoir of possible human behaviors, and thus on a human civilization. When Freud uses the term *Kultur*, he does not do so to appeal to its radically organicist and nationalist dimension, but rather to challenge the pertinence of the opposition itself.

Norbert Elias seeks to outline the sociogenesis of this opposition. While he does not hesitate to use the term "civilization," he does so on the one hand to account for an investigation that is international or at least extends to the whole of the West—he even discusses a national feeling on the part of the West. On the other hand, civilization, which he connects with the "civilities" of court society, includes forms of concrete life that the history of mentalities has taken as its favorite object of study:

> The French and English concept of civilization can refer to political or economic, religious or technical, moral or social facts. The German concept of *Kultur* refers essentially to intellectual, artistic, and religious facts, and has a tendency to draw a sharp dividing line between facts of this sort, on the one side, and political, economic, and social facts, on the other. The French and English concept of civilization can refer to accomplishments, but it refers equally to the attitudes or "behavior" of people, irrespective of whether or not they have accomplished anything. In the German concept of *Kultur*, by contrast, the reference to "behavior," to the value which a person has by virtue of his mere existence and conduct, without any accomplishment at all, is very minor.

> Elias, *Über den Prozess der Zivilisation*

These definitions show the spiraling overdeterminations to which these terms have been subjected. Taken over by the social sciences long ago, the term "culture" can have in German the sense that Elias gives to the term *Zivilisation*. But the national closure of culture in 1936 made the word unusable in German for a discourse that intends to be international. The term *Zivilisation*, against which Thomas Mann railed during the First World War, was invested with the most positive semantic core of the term "culture," culture becoming in turn the refuge of *Geist*, with which the sociologist was incapable of coping. *Kultur* and *Zivilisation* are in fact semantic variables that can draw, depending on the intellectual context, on an interpretive tradition based on the postulate of a Franco-German opposition.

Kulturgeschichte

In 1909, the historian Karl Lamprecht founded in Leipzig an Institut für Kultur und Universalgeschichte (Institute of Cultural and Universal History). Its goal was to introduce into the field of historical studies, in opposition to the political mode of historiography that was then dominant, the economy, artistic productions, the history of printing, and all the other phenomena of life that might play a role in defining a historical period. While the notion of *Kultur* designates an effort to apprehend concrete life in all its aspects, an effort facilitated by the regionalist orientation of Lamprecht's first works, the epithet "universal" immediately corrects that limitation. Cultural history seeks to be universal, and Lamprecht's institute was characterized by a concern to see to it that the cultural histories of the diverse nations were taught, and in their own language. It was the whole method of historical studies that was overthrown by cultural history's self-definition, unleashing in the last years of the nineteenth century the methodological quarrel (*Methodenstreit*), but also echoing a tradition discernible among the historians in Göttingen at the end of the eighteenth century. Even though the direct connection is controversial, cultural history precedes and in a way anticipates the kind of investigations carried out by Marc Bloch and Lucien Febvre under the name of the history of mentalities.

The theoretical basis for Lamprecht's attempt to write a cultural history was located farther back in German psychology's tendency to broaden its domain of application from experimental psychology to the psychology of peoples. The term *Völkerpsychologie*, which is the logical if not lexical antecedent of *Kulturgeschichte* (cultural history), does not designate the psychological characteristics that an empirical science is supposed to have attributed to

(*continued*)

different peoples. For Wilhelm Wundt, it was a matter of attempting a universal history of the psyche after observing that when experimental psychology ignores the social dimension, it ends up in an impasse. This general history of the psyche brings in social practices, the economy, and art. A particularly important element of collective psychology explored by Heymann Steinthal and Wilhelm Wundt, who thus opened the way to the concept of cultural history, was provided by language. Although Wundt's psychology, like Lamprecht's historiography, rejects Hegelianism, one cannot fail to see a continuity between cultural history and the efforts made by Hegel's disciples and readers to realize the concrete elements of an encyclopedic system that was only sketched out. The history of art played an especially important role in this deconstruction-realization of Hegelianism.

It cannot be denied that in some respects the universalist dimension of *Kulturgeschichte* could serve as a justification for the Wilhelmine Empire's imperialist tendencies, the reference to *Kultur* not being capable, in the context of 1900, of eliminating all ambiguity. It was only through a series of predictable linguistic shifts that the term "cultural history" came more recently to designate the history of intellectual life in these diverse forms, reducing the initial *Kulturgeschichte* to only one of its dimensions.

3

"Humanities" (or "The Unnatural Sciences")

The Anglo-American term "the humanities" overlaps with the French *sciences humaines* and the German *Geisteswissenschaft* but only to a small and questionable degree. Most of the *sciences humaines* would be called social sciences in English, and *Geisteswissenschaft* is usually translated, all too narrowly, as "intellectual history." History itself, understood in its broadest sense, is taken in some (although far from all) American divisions of the territory to be a social science.

"Humanities" is a term much used now in the United Kingdom, the United States, and Latin America, but until recently the applicable word, in the United Kingdom especially, was "arts," as opposed simply to "sciences." This old usage is still visible in the names of faculties in the United States called Arts and Sciences. Confusingly, "the Arts" now refers more and more to the practice of the arts, and "humanities" refers to the informed study of such arts (literature, theater, cinema, painting, sculpture, dance, photography, etc.), along with philosophy and languages, native and foreign.

Nietzsche did not have all of these matters in mind when he wrote of the "unnatural sciences," but his notion of the unnatural in this context evokes almost everything that now seems difficult, bewildering, and necessary about the humanities:

> The great certainty of the natural sciences in comparison with psychology and the critique of the elements of consciousness—with the unnatural sciences, one might almost say—rests precisely on the fact that they take the strange as their object, while it is nearly contradictory and absurd even to want

to take the not strange as one's object [*The Gay Science*].

"Psychology and the critique of the elements of consciousness" have turned specifically into (some) psychology, (some) philosophy, and several zones of literary theory and anthropology—and more broadly into the humanities themselves. Again, Nietzsche says, "What is known is what is hardest to know," which we might translate as "The humanities as forms of organized knowledge seek to make intelligible what seems mysterious because it is familiar." Students of literature, for example, manage to make interesting sense of a whole series of magnificent but not-at-all strange objects, from the predictable rage of Achilles to the inevitable fall of Milton's Adam and Eve, and from Candide's unsurprising adventures to Molly Bloom's repetitive infidelities.

In his book *The Humanities and the Dream of America*, Geoffrey Harpham recognizes that the term "humanities" "did not appear for the first time in the United States," and astutely tracks its European history, and its shifting meaning within the United States. In the 1980s the humanities in America were part of what Professor Harpham calls "the milieu," in the 1990s they bore the blame for every instance of disaffection, relativism, and "weakening of our vision and resolve."

Harpham lists some of the "many . . . notions associated with the humanities," and the list is impressive:

> [they] inculcate, often through attention to works of art, a sense of other minds and cultures; require and reward attention to formal and textual features as well as to literal or manifest meaning; invite individual interpretation and inference; cultivate the faculty of judgment; awaken a sense of values; engage the emotions as well as the intellect; enlarge our imaginative capacities; challenge, deepen, and enrich our understanding of the world; provide fertile ground for the growth of self-knowledge; and under the right circumstances, open the way to tolerance, restraint, humility, and even wisdom.

This is a lot; but there is also a certain modesty lurking everywhere in the list, except perhaps in its last clause. The humanities will not make bad persons good, they may even help them to justify the way they live; and they will not support one political program rather than another. This is why Harpham's last clause, even with its careful "under the right circumstances" and "open the way," goes too far. People have been known to become tolerant and wise while pursuing humanistic studies, and it may seem as if their studies have made them tolerant and wise. But as long as those same studies are pursued by torturers and camp commandants, without any noticeable effects on their careers, it is fitting to claim less rather than more for the disciplines of the humanities. Indeed, properly understood, less *is* more. It would, in an extreme but not perverse sense, be part of humanistic understanding to allow even torturers and camp commandants to make what they will of their education. Whether they should be allowed to have the jobs they have is another question.

Harpham carefully considers useless knowledge, knowledge that is "useless in

the best sense." He also writes of "the use-fulness of useless knowledge." There are two crucial ideas lurking in these phrases. One is that much useful knowledge, especially in physics and medicine, started out as useless knowledge, that is, as disinterested inquiry, inquiry for inquiry's sake. If no one risks pursuing knowledge for no reason, there will finally be no knowledge that matters. This is a powerful claim, and a fine argument against eager pragmatists. The other claim is more elusive but also more humanistic. It is that disinterested inquiry is a value in its own right,

even if it is never cashed in materially. It is one part of being human, and in this sense string theory is as humanistic as Aristotle, more so in a way because less practical. It is easy to see that these two claims go together: the first denies ultimate or inevitable uselessness, the second helps scholars to keep going in the dark, and redeems uselessness if it needs redeeming. The first claim on its own is a little too pragmatic, and could be accused of selling inquiry short, even in the longest run; the second claim may be a little too pure, and certainly, in hard political

times, needs all the reinforcement it can get from the first.

BOGOČELOVEČESTVO [богочеловечество] (RUSSIAN)

FRENCH   *divino-humanité, théanthropie, déihumanité, théandrie*
GREEK   *to theandrikos* [τὸ θεανδριχός]
LATIN   *Deus-Homo*

➤ GOD, HUMANITY, and AIÔN, GOOD/EVIL, HISTORIA UNIVERSALIS, MENSCHHEIT, MOMENT, NAROD, RUSSIAN, SOBORNOST', SVET

Bogočelovečestvo [богочеловечество] (divino-humanity), a Russian term that refers to the Greek patristic concept *to theandrikos* [τὸ θεανδριχός], has a central place in nineteenth- and twentieth-century Russian philosophy. It designates two movements directed toward each other: that of the divine moving toward man and that of humanity rising toward the divine. It presents both Christ in the hypostatic union of his two natures, divine and human, and the humanity of men taken in the sense of the accomplishment of their true divine-human relation. In both cases it involves an ontological encounter.

The term *bogočelovečestvo* is marked by the influence of diverse philosophical traditions, mystical par excellence, and Western as well as Eastern. Two aspects are essential for understanding it. An initial interpretation allows us to see in it a "theanthropy" that takes into account a whole previous patristic heritage and appeals solely to debates about the nature of Christ, the Incarnation, and the meaning of salvation and original sin. A second interpretation is authentically Slavophile and Russocentric and refers to questions concerning the destiny of humanity, the Russian people, Slavic unity, Orthodoxy, and the universal church (*vselenskaja tserkov'* [вселенская церковь]).

I. The History of the Word

In the form *obožitisja* [обожитися] (become God), which refers to *theôsis* [θέωσις] (divinization), the idea of the ontological encounter of the human with the divine is already present in 1076 in the *Izbornik* ("Compilation") (RT: *Materialy dlia slovaria drevnerusskogo iazyka*, 2:532). Greek authors (such as John Climacus, Symeon the New Theologian, Gregory of Sinai, and Gregory Palamas) who stressed the idea of the divinization of man were subsequently translated into

Slavic languages. There is an uninterrupted tradition, both literary and practical, that leads from the Greek Hesychasts (Gregory Palamas, Gregory of Sinai, Nicholas Cabasilas, Nicephorus) to the Russian Hesychasts (Nil Sorksy, fifteenth century) and ultimately to the *startsy* [старцы] (eremitic fathers) of Optina Pustyn', a monastery in Central Russia that Vladimir Solovyov and Dostoyevsky visited during the summer of 1878, the year in which Solovyov wrote his *Lectures on Godmanhood* (*Bessedy o Bogočelovečestve*).

In the *Lectures* we encounter for the first time the term *bogočelovečestvo* [богочеловечество] with a philosophical meaning, in the context of universal history. In turn, Sergei Bulgakov considerably enriched this notion by attributing to it strictly theological—and particularly Christological and Trinitarian—meanings in his work on divine wisdom and theanthropy (1933–36). The notion was developed in the direction of religious existentialism and Russophile universalism by N. Berdyayev in his *Spirit and Reality* (1932), *The Russian Idea* (1946), and *The Divine and the Human* (1949). It was later given various inflections—cosmic and salvational in the work of G. Fedorov, personalist in L. Chestov and S. Frank, and "mathematicizing" in P. Florensky.

Bogočelovečestvo is the strange product of disparate intellectual influences in the form of a synthesis of the Jewish Kabbalah, the anthropology of the Greek church fathers, the mysticism of Jakob Böhme and Meister Eckhart, and finally of Spinoza and the German philosophy of identity, in particular in Schelling's system. The latter's influence on the work of V. Solovyov is remarkable. Thus *vseedinstvo* [всеединство] (uni-totality), a central notion in Russian universalist philosophy, is nothing other than a Russian version of the German *Alleinheit*; similarly, Solovyov's *vseobščee znanie* [всеобщее знание] echoes Schelling's *Anschauung*. For his part Berdyayev wrote two important studies on Jakob Böhme and his influence on Russian thought (Berdyayev, *Mysterium Magnum*, 1:5–28, 29–45). The influences of German philosophy were exercised on this notion in parallel (Stepoun, 1923) with purely Russophile intentions, creating a conception of the world based on the ecclesiastical consciousness of Russian Orthodoxy (A. Khomiakov, I. Kiryevski, I. Samarin, C. Aksakov).

II. Semantics: Theandry or Divino-Humanity

Bogočelovečestvo is translated in English in different ways: by "theanthropy" or "theandry," or again by "divino-humanity" or "Godmanhood." From the linguistic point of view, the term is composed of two parts: God (*bog* [Бог]) and humanity (*čelovečestvo* [человечество]). Both Berdyayev and Solovyov define divinity (*božestvennoe* [Божественное]) by drawing on Eckhart's *Gottheit* and Böhme's *Ungrund* but also on the mystery of the Trinity so dear to the Greek fathers. For Berdyayev, "divinity . . . is deeper than God the Father, the Son, and the Holy Spirit. It is absolute freedom, the result of everything, including God, freedom in which even the difference between good and evil is not defined. This ineffable, transcendent Divinity has come into the world in the form of the Trinity, in three hypostases," to complete its creation with humanity, whose goal is to become divino-human (Berdyayev, *Meaning of the Creative Act*). This difference between divinity and God implicit in *bogočelovečestvo* refers to the process of a theogony that is pursued in the revelation of the divine through the history of humanity.

Berdyayev draws on the "divine void" (*božestvennoe ničto* [божественное ничто]), in Greek *to meon* [τὸ μέον]), which is the basis for all creation and is located within human nature (particularly within the person (*ličnost'* [личность]). Solovyov emphasizes instead the primordial universalism of human consciousness, which, once restored in Christ, will return universality to all partial existences and restore the uni-totality *vseedinstvo* [всеединство] lost by fallen humanity:

> Since the divine principle is the real object of religious consciousness, that is, an object that acts on consciousness and reveals its content in it, religious development is a positive, objective process, a real interaction between God and man, and thus a divino-human process.
>
> (Solovyov, *Lectures on Godmanhood*)

Semyon Frank goes still further in affirming an incomplete creation of the world. He considers knowledge (*znanie* [знание]) the true blossoming of being, the growth of life: thanks to this form of anthropogony, theogony and cosmogony attain their real goal (cf. Berdyayev, *Tipy religioznoj mysli v Rossii* [The variety of Russian religious thought]). The second part of the term *bogočelovečestvo*—that is, *čelovečestvo* (человечество [humanity])—raises fewer problems of translation. While signifying the humanity of Christ, *čelovečestvo* has in Russian religious thought a second, very specific meaning: that of a humanity united in the community of Spirit (*sobornoe čelovečestvo* [соборное человечество]). Vladimir Solovyov writes: "Reunited with its divine principle through the intermediation of Christ, humanity is the church" (Solovyov, *Lectures*); thus it is, according to an idea dear to Gregory of Nyssa and adopted by G. Fedorov, the unity constituted by the living, by the dead, and by those who are yet to be born.

III. The Actualization of the Patristic Heritage

Although it echoes the capital formula of Saint Irenaeus ("The Word of God was made man and the one who is the Son of God was made the son of man, united with the Word of God, so that man might be adopted and become the son of God" (*Adversus haeresis* [Against heresies], III, 19, 1, 939b) and was abundantly taken over by Saint Athanasius, Gregory the Theologian, and Gregory of Nyssa, the notion itself, whose meaning *bogočelovečestvo* rearticulates, goes back to Pseudo-Dionysius the Areopagite. The creation of the word *bogočelovečestvo* is nothing more than a nominalization of the adjective "theandric" [θεανδρικός] used by Pseudo-Dionysius in his fourth letter to express the idea of the humanity of Christ (RT: *PG*, vol. 3, letter 4, col. 1072C). The adjective "theandric" designates a mode of activity peculiar to the God-made-man (*andrôthentos theou* [ἀνδρωθέντος θεοῦ]), which he has carried out in our favor (*kainên tina tên theandrikên hêmin pepoliteumenos* [χαινήν τινα τὴν θεανδρικὴν ἡμῖν πεπολιτευμένος]; ibid.) Pauline anthropology opened the way to the idea of the ontological encounter between the divine and the human in the person of Christ, the second Adam, whose sacrifice paved the way for the renaissance of humanity (Rom 5:12; 1 Cor 15:22, 45; Gn 1:26). The whole later anthropology of the Greek church fathers develops this idea. Orthodox patristics proposed a mystical vision of the world in which the divine work is never finished and goes on in the creation of humanity by humanity itself. In some passages Russian authors literally echo patristic expression. "It is toward the God-man [*bogočelovek* (богочеловек)] that the whole history of humanity tended," Solovyov writes in his *Lectures.*

In the theological register *bogočelovečestvo* is the synthetic notion that expresses in a single concept two symmetrical events in Christian history. The first of these events is the Incarnation of the Word, its *kenôsis* [κένωσις], that is, in Greek *enanthrôpêsis* [ἐνανθρωπήσις] (in Russian, *bogovoploščenie* [боговоплощение] in which *voploščenie* [воплощение] (incarnation) has its origin in *plot'* [плоть] (flesh)). The second event is the divinization of man, *theôsis*, that is, *anakephalaiôsis* [ἀνακεφαλαίωσις] (in Russian, *obožienie čeloveka* [обожение человека]). The term *kenôsis* was formed by the Greek fathers on the basis of the verb *kenoô* [κενόω], that is, "to empty" (with the reflexive pronoun "to empty oneself"). It has its origin in an expression in Paul's Epistle to the Philippians, 2:7. The naming of Jesus as Lord (ibid., 2:9) is preceded by a sequence that describes the humbling of the one who was "in the form of God" (ibid., 2:6). His elevation comes at the end of a descent (in Russian, *sošestvie* [сошествие]) and an annihilation (*heauton ekenôsen* [ἑαυτὸν ἐκένωσεν]) until he reaches the obedience that makes him accept death on the Cross. This theory of *kenôsis* also invaded Russian Orthodoxy. V. Tareev (1866–1934) developed the idea that the creation itself was a kenotic act. But his most original ideas had to do with the temptations over which Christ triumphs by accepting his kenotic state. Bulgakov reinforces this idea of Tareev. For him, there is *kenos* [κενός] in the Incarnation only because there is a *kenôsis* in the Trinity as a whole and a divine *kenôsis* in the Creation. The *kenôsis* in the Trinity consists in the mutual love of the divine persons, which surpasses any individual state. The Creation inserts God into time and includes a certain risk. The *kenôsis* of the Incarnation is located above all in God, in the Word's will to love (Solovyov, *Lectures*), and appeals to the personalization of the Trinity that turns out to be so important for Orthodox theology.

In Greek patristics *kenôsis* and *theôsis* are symmetrical. The notion of *theos anthrôpos* [Θεὸς Ἄνθρωπος] was the cornerstone of Greek soteriology, whose meaning is found literally in the idea of the real union of man and God. The Incarnation represents the two sides of a single mystery:

> We say in fact that God and man serve each other as models, and that God humanizes himself for man in his love of man, to the very extent to which man, strengthened by charity, transposes himself for God in God.
>
> (Maximus the Confessor, *Ambigua*, RT: *PG*, 91:10, 113)

In Christian theosophy the point of contact between these two movements of *kenôsis* and divinization is man, but the way of conceiving the latter's relation to God differs in the Catholic and Orthodox anthropologies.

■ See Box 1.

IV. *Bogočelovečestvo* and the "Russian Idea"

The Russian philosophers of the nineteenth and twentieth centuries often emphasized the elaboration of a new kind of philosophy opposed to the positivism and empiricism prevalent in the West. They considered themselves the inventors of a genuine religious anthropology and of its true language, in which *bogočelovečestvo* is a central term. The originality of this notion consists in the intense attempt to make the subtleties of the dogma of the humanity of Christ work together with the idea of the divinization of man and the historical conception peculiar to Russian Slavophiles of the period, at the center of which was the Russian idea (*russkaja ideja* [русская идея]). The latter's historical source resides in the quasi-nationalistic and statist construct elaborated by the monk Philotheos (end of the fifteenth century), who made Moscow the "third Rome." In the nineteenth century the Russian idea consisted in a critical, messianic vision of European humanity as divided into two opposed worlds: the Catholic West and the Orthodox East. Solovyov, and later Berdyayev, following the Slavophiles, condemned the "decadent West" and asserted the particular role of Russia, which is neither Eastern nor Western, but a great "comprehensive East-West" that, alone on earth, "holds the divine truth and represents God's will" (Solovyov, *Lectures*).

The opposition between East and West has its roots in the history of the Christian church, namely in the schism between a Catholic West (the material part) and an Orthodox East (the spiritual part):

> Thus before the perfect union, there is the division . . . of Christianity into two halves, the East clinging with all its strength to the divine principle and preserving it by maintaining within itself the necessary conservative and ascetic spirit, and the West expending all its energy on developing the human principle, to the detriment of divine truth, which is first deformed and then completely rejected.
>
> (Ibid.)

1

Orthodox and Catholic soteriologies

Beyond the historical and theological subtleties of the period of ecumenical councils, this is where we find the key to the divergences between the anthropologies of the Greek and Latin fathers. Starting out from the idea that original sin introduced death into human existence and caused man to lose the grace of being "in the image of God," Orthodox anthropology remains very attached to the idea of the spiritual improvement of humans in their history and to the accomplishment of the deifying contemplation at the end of time (*apokatastasis* [ἀποκατάστασις]), the restoration of humanity and things at the Last Judgment, adopted by Origen and Gregory of Nyssa. The Word was made flesh, according to the Greeks, in order to restore to man the resemblance to God that he had lost through Adam's sin and to deify him. This resemblance guaranteed man's immortality, which original sin had caused him to lose. That is why the Incarnation of the Word is defined by the Greek fathers as the necessary condition for accomplishing the promise of eternal life. It is through love for man that God sought, by means of the sacrifice of Christ, to save fallen humanity (Athanasius [295–373], *De incarnatione*, 6, 5) (Méhat, 1966, 82–86). Man "would have been lost had the Son of God, the Lord of the Universe and the Savior, not come to put an end to death" (Athanasius, *De incarnatione*, 9, 2). The metaphor that is important for the whole Orthodox terminology and that remains present in Russian philosophy is that of the "divine thirst," the "lack" manifested by God with regard to humanity, to which he shows his love by creating it pure and wanting to save it.

Confronted by this Orthodox soteriology, Anselm of Canterbury (1033–1109) developed a Latin soteriology in terms of "divine *dominium*," of cosmic order and justice corrupted by human sin. It is especially in accord with the register of property or legitimate possession (*possessio, dominium, dominus*) that Anselm sets forth the relations between the creature and his Creator. The latter is the master (*dominus*), and the creatures endowed with intelligence (angels and men) are this master's slaves, the serfs or servants (*servi, conservi*). Man has offended the Creator of justice and order in his will and in his honor (*Dei honori*): original sin consisted in disobeying the *Dominus*. The ideas of *rectitudo*, of *rectus ordo*, which are identified with those of *justitia* or *debitum*, are essential in Saint Anselm's doctrine (Roques). Having fallen, man is not capable of giving God his due. Christ, on the other hand, owes the Father nothing but repays the human debt to him. Finally, humanity is indebted in two ways: for Adam's sin and for the death of Christ.

The Greek (Orthodox) and Latin (Catholic) anthropologies are opposed as being, respectively, that of divinization and that of redemption, of grace and debt, of restoration (re-creation) and reparation (restitution), of divine love and divine honor, of participation in order, of rebirth and buying back, of loss and debt, of economy and speculation, of contemplation and calculation, of sanctification and satisfaction. This difference between the Greek and Latin anthropologies is taken over by Dostoyevsky in the legend of the Grand Inquisitor (*The Brothers Karamazov*).

According to Solovyov, if modern history had been limited to the development of the West, it "would have ended in disintegration and chaos" (ibid.) However, "if history had stopped with Byzantine Christianity, the truth of Christ [divino-humanity, *bogočelovečestvo*] would have remained incomplete for lack of the free and active human principle that is indispensable for its accomplishment" (ibid.) Russia's messianic vocation consists in combining the "divine element of Christianity" preserved in the East and the human principle freed and developed in the West (ibid.) The "catholic character" (*narod* [народ]) of the Russian people, that is, its "conciliarity" (see SOBORNOSTʹ) makes it possible to realize this vocation. Solovyov picks up here the idea of the Slavophile A. Khomiakov, according to which it is within the ideal church as a divino-human, theanthropic unity, that *sobornost'* [соборность] (the communion of the Spirit) is developed.

> However, since man can receive the Divinity only in his absolute wholeness, that is, in union with all things, the man-God is necessarily a collective, universal being: it is pan-humanity, or the universal church [*vselenskaja tserkov'*].
>
> (Ibid.)

Solovyov's universal church is the living analogy of the Absolute. Thus, according to the Russian idea, humanity is *bogočelovečestvo*: a human community in the history of which the divine is manifested and gradually reveals itself. In overcoming its division, this community must pass from the stage of history to that of metahistory. The latter is nothing other than the intrusion of eternity into historical time, a sort of accomplishment of time, the *kairos* [καιρός] that manifests itself solely in encountering the *sobornost'* of reunited humanity.

ÇA

The French demonstrative pronoun *ça*, a contraction of *cela*, is the widely accepted translation of the German *es*, a third-person singular neuter pronoun that Freud uses, in his second topology, to designate the third construct (id) of the psychic apparatus alongside the *Ich* (ego) and the *Über-Ich* (super-ego): see ES, and DRIVE, I/ME/MYSELF, UNCONSCIOUS, WUNSCH; cf. ANXIETY, ENTSTELLUNG, LOVE, PLEASURE, VERNEINUNG.

Es is also used in the German expression *es gibt*, which French renders as *il y a.* See ES GIBT, ESTI, *IL Y A.*

➤ CONSCIOUSNESS, DASEIN, ERLEBEN, *IDENTITY*, SIGNIFIER/SIGNIFIED, *SELF*, SUBJECT

CARE

FRENCH   *souci, soin, sollicitude*
GERMAN   *Sorge, Fürsorge, Besorgen*

➤ *SOUCI* and ANXIETY, *AUTRUI*, DASEIN, GENDER, LAW, LOVE, *MALAISE*, MORALS, SECURITAS, SEX, SORGE, VERGÜENZA

The word "care" has recently been used with increasing frequency in English philosophy, but its translation into other languages raises a problem for two reasons in particular. First, it is used to translate the Heideggerian term *Sorge* (*Sein und Zeit*), and second, it appears in the expression "the ethics of care," which feminists oppose to the impartiality of "masculine justice" (Gilligan, *Different Voice*; Young, *Justice*). In both cases, it is impossible to translate "care" into French.

I. The Translation of *Sorge* by "Care"

We must note first that "care" does not derive from Latin *cura* but rather from Old High German or Gothic *Kara*, which means "care," "lament," "sorrow." The word initially designated a painful mental state such as concern or anxiety, and it was indeed appropriate to use "care" to render the German *Sorge* as it is used by Heidegger. For Heidegger the very Being of *Dasein* is "care" (*Sorge*) (*Sein und Zeit*), so that the latter is in the world in the form of *Besorgen* (concern). Cares, tribulations, and melancholias are distinct states, but they are part of the ontological structure of *Sorge*: "*Dasein* exists as an entity for which, in its Being, that Being is itself an issue" (*Being and Time*, 274).

The word "care" also designates the effort to anticipate a danger or to protect oneself from the uncertainties of the future by acting responsibly. That is the most common meaning of the term in English, and here again we see how well the importance of temporality in "care" corresponds to Heideggerian concerns: "The ontological meaning of care is temporality" (ibid.). But the deficiencies of the English translation of *Sorge* by "care" rapidly make

themselves felt because the element of nothingness is absent in "care": "Death, conscience, and guilt are anchored in the phenomenon of care."

Finally, Heidegger connects *Sorge* with curiosity, which leads him to retranslate Aristotle: "All men by nature desire to see" (*pantes anthropoi tou eidenai oregontai phusei*) (ibid.)—taking *eidenai* in the original sense of "to see" and connecting *oregontai* (lit., "seek") with *Sorge*, "care." And he translates Aristotle in these terms: "The care for seeing is essential to man's Being." Thus he makes an association between "seeing" and "thinking" in Western metaphysics that the English translation as "care" cannot render. There is no possibility of making the connotations specific to the German *Sorge* flow into the English "care," and the current development of the meaning of "care" that is drawing this word in the direction of interpersonal relations and concern about others makes the translation of Heidegger given here in English rather enigmatic.

II. "Care" and "Solicitude"

German distinguishes more clearly than English or French between care for oneself or *Selbstsorge* (which, Heidegger says, is "tautological," *Being and Time*, 366), on the one hand, and on the other *Fürsorge* or "care for the other," which Macquarrie and Robinson translate not by "care" but by "solicitude" and which the French translator renders as *assistance*. Solicitude, which is "an affectionate care for others," has a meaning different from "care" and must be attached to a different register, that of action in matters of help and social aid. "Care" designates the whole set of public arrangements necessary for the welfare of the population in a welfare state. That is a meaning for which there is no French equivalent. For example, the expressions "prenatal care" and "postnatal care" refer particularly to the responsibilities of public health agencies with regard to pregnant women and infants. Caregivers are people who, whether as volunteers or not, take care of the elderly or anyone in need.

Since in many countries the great majority of caregivers are women, feminists have offered a critique of the ethics of justice in the name of the virtues attributed to these disinterested, noncompetitive, nonquantifiable, nonpossessive behaviors that constitute most of women's nonremunerated work: caring for children and the elderly, efforts to keep the family group intact, etc. Thus these militants seek to oppose to the "masculine" ideal of an ethics of impartiality and justice an "ethics of care." Without taking a position regarding the "feminine" character of the values in question, we can say that these feminists' reflections have led to a genuine "deconstruction" of universalist morality and the principle of identity, in accord with a trajectory that merges with the Heideggerian heritage of *Sorge*, though we cannot say that

the common use of the word "care" has played a role in this matter.

| CATEGORY

"Category" is derived, via Vulgar Latin, from the Greek *katêgoria* [κατηγορία], (*kata* [κατά], against, on, and *agoreuô* [ἀγορεύω], speak in public), which designates both the prosecution in a trial and the attribution in a logical proposition—that is, the questions that must be asked with regard to a subject and the answers that can be given. From Aristotle to Kant and beyond, logic has therefore determined a list of "categories" that are as well operations of judgment (cf. *JUSTICE*); see ESTI (esp. Box 1) and HOMONYM. On the lexical networks implied by this ontological systematics, see BEGRIFF, MERKMAL, PREDICATION, PROPOSITION, SUBJECT, and cf. ESSENCE, PROPERTY, *TO BE,* TRUTH, UNIVERSALS.

| CATHARSIS, KATHARSIS [κάθαρσις] (GREEK)

FRENCH   *purgation, purification*

➤ ART, MELANCOLY, MIMÊSIS, MITMENSCH, BOX 1, NATURE, BOX 1, NEIGHBOR, PATHOS, PLEASURE, PROPERTY, SUBLIME

The word *katharsis* initially was connected with rituals of purification before becoming a Hippocratic term in the theory of humors. Aristotle's *Poetics* inflected its meaning by maintaining, in opposition to Plato, that tragedy and theater can care for the soul by giving it pleasure. In the traditional translation as "purgation," it was part of French classical discourse on tragedy (Corneille, 1660) before reappearing in its Greek form in Lessing's works criticizing Corneille's criticism of Aristotle (the Greek word, which was already present in English, then returned in nineteenth-century discussions of Lessing; see RT: *DHLF*, s.v. "Catharsis"). In psychoanalysis and psychotherapy, the "cathartic method" that Freud gradually disengaged from its association with hypnosis is connected with abreaction, the emotional discharge that makes it possible, through language, to eliminate the affect bound up with a traumatic event. The word's oscillation between the meanings "purification" and "purgation" while remaining constant through various languages has continually provided material for polemics and reinterpretations.

I. From Scapegoat to Tragic Pleasure

The adjective *katharos* [καθαρός] associates material cleanliness, that of the body (Homer calls it an "uncovered place";

it is applied to water, to grain; cf. RT: *Dictionnaire étymologique de la langue grecque*), with the moral or religious purity of the soul—thus Empedocles's *Purifications* contains both a project of perpetual peace, constructed around metempsychosis, and alimentary prohibitions. *Katharsis* [κάθαρσις] is an action noun corresponding to the verb *kathairô* [καθαίρω] (clean, purify, purge). Initially it had the religious sense of "purification," and referred particularly to the ritual of expulsion practiced in Athens on the eve of the Thargelia. During these festivals traditionally dedicated to Artemis and Apollo, a loaf of bread, the *thargêlos* [θάργηλος], made from the first grain harvested that year, was offered; but beforehand the city had to be purified by expelling criminals from it (cf. Harpocration's lexicon: "The Athenians, during the Thargelia, drove two men, as purifying exorcisms, out of the city, one for the men, the other for the women," and then scapegoats, according to the ritual of the *pharmakos* [φαρμακός]). Apollo himself is called *katharsios* [καθάρσιος], "purifier," and moreover is forced to purify himself after killing Python in Delphi. According to Socrates in Plato's *Cratylus*, he is fittingly named *apolouôn* [ἀπολούων], "the washer," insofar as the music, medicine, and divination that characterize him are so many *katharseis* [καθάρσεις] and *katharmoi* [καθαρμοί], practices of purification (405a–c).

According to the *kathairontes* [καθαίροντες], the "purgers," "the body will receive no benefit from taking food until the internal obstacles [*ta empodizonta . . . tis ekbalêi* [τὰ ἐμποδίζοντα . . . τις ἐκβάλῃ] have been removed" (Plato, *Sophist*, 230c). The purgative method that works for the body also works for the soul, which cannot assimilate knowledge before it has been purged of its opinions by *elegchos* [ἔλεγχος], "refutation"; the patient "must be purged of his prejudices and made to think that he knows only what he knows, and no more" (230d). But there is a still more radical purification that Plato transposes from the religious domain, Orphic and Pythagorean, to philosophy (cf. Dodds, *The Greeks and the Irrational*, chaps. 3 and 5): "purification consists in separating the soul as much as possible from the body" (*Phaedo*, 67c); if only the pure, purified thought can take possession of the pure, the unmixed (*to eilikrines* [τὸ εἰλικρινές]) that is truth, mustn't the soul leave the body?

Katharsis connects purification with separation and purging, not only in the religious, but also in the political (Plato, in the *Laws* [5.735b–736a], describes painful purges as the only efficacious ones) and the medical domains. In Hippocratic medicine, *katharsis* was connected with the theory of the humors and names the process of physical purgation through which harmful secretions are expelled, naturally or artificially, through the upper or the lower orifices: the term can designate not only purging as such, but also defecation, diarrhea, vomiting, and menstruation (Hippocrates, *Aphorisms*, 5.36; 5.60; cf. *De mulierum affectibus*). This Hippocratic meaning is valid in Aristotle's whole naturalist corpus (in the *Historia animialium*, 7.10.587b, for example, the term designates the rupture of the amniotic sac, various bodily discharges, etc.; cf. RT: *Index aristotelicus*, s.v.). However, as a remedy—Greek *to pharmakon* [τὸ φάρμακον], the same word, in the neuter gender, as the one designating the scapegoat— *katharsis* implies more precisely the idea of a homeopathic medicine: purgation is a way of curing harm by harm, the

same by the same, and it is also why every *pharmakon* is a "poison" as much as a "remedy," the dosage of the harmful thing alone producing a good result (see NATURE, Box 1).

Here we have one of the possible keys to the rhetorical, poetic, and aesthetic meaning of *katharsis*, which Lausberg characterizes as "a homeopathic hygiene for the soul" (RT: *Handbuch der literarischen Rhetorik*, §1222). This kind of cure is connected with the *katharsis* produced by sacred melodies, mentioned in Aristotle's *Politics*. There are enthusiastic, possessed individuals who "fall into a religious frenzy, whom we see as a result of the sacred melodies—when they have used the melodies that excite the soul to mystic frenzy (*tois exorgiazousi . . . melesi* [τοῖς ἐξοργιάζουσι . . . μέλεσι])—restored as though they had found healing and purgation (*iatreias . . . kai katharseôs* [ἰατρείας . . . καὶ καθάρσεως])" (7.1342a 7–11). More generally, for Aristotle (who here goes beyond a Plato, whom he salutes but subverts; cf. *Republic*, 3, starting at 398) *katharsis* is one of the functions of music, along with education and a good way of life, and with leisure and a relaxation of tension: for all those in the grip of passion "are in a manner purged and their souls lightened and delighted (*kouphizesthai meth' hêdonês* [κουφίζεσθαι μεθ ἡδονῆς])." The purgative melodies likewise give humans an innocent pleasure (*charan ablabê* [χαρὰν ἀβλαβῆ]) (*Politics*, 7.1342a 14–16).

This homeopathic meaning is maintained in the *Poetics*: tragedy includes "incidents of pity and fear, wherewith to accomplish its catharsis (*katharsin* [κάθαρσιν]) of such emotions" (6.1449b 27–28). This is a purgation of the same by the same, or rather by the representation of the same. But unlike participants in Corybantic rites that seek to cure the soul of a furious madness, the spectator of tragedy is in full command of his faculties; he has no need to be cured. Whence a second meaning, which is in a way allopathic: the passions are purified by the spectator's seeing them, to the extent to which the poet shows him things that have themselves been purified and transformed by *mimêsis* [μίμησις]: "The Plot in fact should be so framed that, even without seeing the things take place, he who simply hears the account of them shall be filled with horror and pity at the incidents.. . . The tragic pleasure is that of pity and fear, and the poet has to produce it by a work of imitation" (14.1453b 4–13). Purgation, that is, the representation of diagrams by means of a musical or poetic work, substitutes pleasure for pain. Ultimately it is pleasure that purifies the passions, lightens them, relieves them of their excessive, invasive character, and resituates them in a point of equilibrium.

Finally, to radicalize catharsis, we have to follow the skeptical physician Sextus Empiricus in choosing for the soul as for the body a remedy capable of "eliminating itself at the same time that it eliminates the humors" or dogmas: the skeptical modes of expression are thus in their very form, which includes doubt, relativity, relationship, and questioning, self-purging (*Outlines of Pyrrhonism*, 1.206; cf. 2.188; cf. Voelke, "Soigner par le logos").

II. Purgation of the Passions and Purification of Morals in the Classical Theater

This twofold meaning connecting the remedy with pleasure is the basis for the ambiguity and at the same time the richness of later interpretations. The influence exercised by Aristotle's *Poetics* on the French theory of the dramatic poem was accompanied by a reworking of the ancient problematics in relation to new concerns connected with a profoundly different conception of the passions. From a Christian point of view, it is the passions themselves, and not merely their excesses, that are considered bad. It is no longer a matter of purifying the passions but of purifying oneself of passions, that is, of purifying morals. What seventeenth-century authors meant by "purgation of the passions" thus does not have quite the sense that *katharsis* had in Aristotle. The French emphasize the moral and especially the pedagogical aspect attached to the idea of theatrical *katharsis*. "The main goal of poetry is to benefit . . . by purifying morals," Father Rapin wrote (*Réflexions sur la Poétique*, 9). "Poetry is an art that was invented for the instruction of men. . . . The ill are treated, and tragedy is the only remedy from which they are able to benefit, for it is the only amusement in which they can find the pleasant and the useful," Dacier wrote in the preface to his French translation of Aristotle's *Poetics* (1692). Although it appeals to Aristotle's authority on this point, this way of conceiving the purgation of the passions in the theater has little to do with Aristotelian *katharsis*. Corneille makes the same error when he criticizes Aristotle on this point, rejecting the idea that tragedy can purify the spectators' passions: he thinks he is deviating from Aristotle, whereas he is merely opposing the interpretation his contemporaries gave of him. Racine is one of the few writers to remain faithful to Aristotle: "Tragedy," he wrote, "exciting pity and terror, purges and tempers these sorts of passions, that is, by arousing these passions, it deprives them of what is excessive and vicious in them, and returns them to a state that is moderate and in conformity with reason" (*Œuvres complètes*, quoted by J. Tricot in his translation of Aristotle's *Politics*). It is true that unlike Corneille, Racine understood Greek, and translated and annotated whole passages of the *Poetics* and the *Nicomachean Ethics*.

■ See Box 1.

Relying on Corneille's criticism, but at the same time respecting convention and what he thought was Aristotle's thought, Du Bos developed a rather confused reflection on this subject that concludes as follows: "Thus tragedy purges the passions rather as remedies cure, and as defensive weapons protect against offensive ones. It doesn't always happen, but sometimes it does!" (*Réflexions critiques sur la poésie et sur la peinture* [1719], §44, "Que les poèmes dramatiques purgent les passions").

III. The "Carthartic Method" in Psychoanalysis

The "cathartic method" is part of the prehistory of psychoanalysis. It was developed by Josef Breuer and Sigmund Freud on the basis of their research on the etiology of symptoms of hysteria, as they explain in their work *Studien über Hysterie* (*Studies on Hysteria*, 1895). In seeking the causes of the pathological phenomena of hysteria, the two Viennese physicians noticed that their patients' symptoms were causally connected with a traumatic situation that the patient could not consciously remember (cf. "Über den psychischen Mechanismus hysterischer Phänomene" ["On the Psychical Mechanism of Hysterical Phenomena," 1893], in *Studien über Hysterie*). The affect involved in this "psychic trauma [*psychische Trauma*]," "blocked" (*eingeklemmte*) and

not discharged through the normal channels, is transformed into a hysterical conversion. "Catharsis" is produced when under treatment the path leading to consciousness and the normal discharge of the affect [*normale Entladung des Affekts*] is opened up ("*Psychoanalyse*" *und* "*Libidotheorie*" [*Psychoanalysis and Theory of the Libido*] [1922]). The "cathartic procedure," as Breuer called it, consists in using hypnosis to treat the patient through catharsis. The narrative of the "psychic trauma" is in fact usually followed by a discharge of affect (abreaction) that constitutes "catharsis" proper (cf. *Selbstdarstellung* [*Self-representation*], 1924).

After the publication of *Studien über Hysterie*, the two collaborators' positions regarding the etiology of hysteria diverged: "Breuer gave priority to what might be called a physiological theory," whereas Freud confirmed the sexual content at the origin of hysterical phenomena, also pointing out the importance of "the differentiation between unconscious and conscious mental acts" (*Selbstdarstellung*). Later on, Freud abandoned hypnosis and suggestion in favor of free association, thus creating "psychoanalysis." However, the effectiveness of catharsis allowed him to confirm two fundamental results, which were subsequently confirmed, as he says himself:

> First, hysterical systems have meaning and significance because they are substitutes for normal mental acts; and second, the disclosure of this unknown meaning coincides with the suppression of the symptoms, and thus here scientific research and therapeutic effort coincide.
>

From Aristotle to Corneille and back

Corneille's criticism of the idea of theatrical catharsis illustrates the way his contemporaries transformed this problem. The purgation of the passions in the sense in which Corneille thought Aristotle understood it is for him purely "imaginary": tragedy, he wrote, has the particular "utility" that

> by means of pity and fear it purges such passions. These are the terms Aristotle uses in his definition, and they tell us two things: first, that it [catharsis] excites pity and fear, and second, that by means of them, it purges similar passions. He explains the first at some length, but he says not a word about the latter, and of all the

conditions he uses in this definition, this is the only one he does not explain. . . . If the purgation of the passions happens in tragedy, I hold that it must happen in the manner that I say; but I doubt that it ever happens, even in those that meet the conditions set by Aristotle. They are met in *Le Cid* and caused its great success: Rodrigue and Chimène have the probity subject to passions and these passions cause their misfortune because they are as unhappy as they are passionate for one another . . . their misfortune elicits pity, that is certain, and it cost the audience enough tears to make that incontestable. This pity must make us fear that we will fall into a similar

misfortune and purge the excessive love that causes their misfortune and make us feel sorry for them, but I do not know whether pity gives it to us or if it purges it, and I fear that Aristotle's reasoning on this point is just a fine idea that has never actually produced its effect. I leave this up to those who have seen the performances: they can examine it in the secrecy of their hearts and go over what moved them in the theater, in order to see if in this way they arrived at reflective fear, and whether it rectified in them the passion that caused the disgrace that they so lamented.

> *Discours de la tragédie*, 1660

In his *Hamburg Dramaturgy* (1767–68), Lessing reproached Corneille precisely for not having understood the sentence in chapter 6 of the *Poetics* and of having unfairly criticized Aristotle:

> Finally, as for the moral goal that Aristotle assigns to tragedy, and that he thought he had to include in his definition, we know how many debates about it have arisen, particularly recently. I feel sure that I can show that those who have blamed Aristotle on this point have not understood him. They have lent him their own thoughts before finding out what his were. They are battling chimeras with which they are themselves obsessed, and flatter themselves that they victoriously refute the philosopher when they defeat the phantoms of their own brains.

| CERTITUDE

"Certitude," from ecclesiastical medieval Latin *certitudo*, designating in particular "Christian conviction," is heir to two meanings of the adjective *certus*, one "objective" and the other "subjective": "beyond doubt, fixed, positive, real," regarding a thing or knowledge, or "firm in his resolutions, decided, sure, authentic," regarding an individual. Although *certitudo* has no Greek equivalent, the Latin verb *cerno, cernere*, from which *certus* is derived, has the concrete meaning of "pass through a sieve, discern," like the Greek *krinein* [κρίνειν] (select, sieve, judge), which comes from the same root. Thus begins the relationship between certitude, judgment, and truth, which since Descartes has been connected with the problematics of the subject and of self-certainty. The whole terminological system of truth is thus involved, from unveiling and adequation to certitude and obviousness: see TRUTH, and ISTINA, PRAVDA.

I. Certainty, Objectivity, Subjectivity, and Linguistic Systems

1. The objective aspect manifests itself first, *certitudo* translating for example the "determined nature" of objects or known properties (as in Arab commentaries on Aristotle's *Metaphysics* translated into Latin), or the incontestably true nature of principles: see TRUTH, Box 6; cf. RES (and *THING*), PRINCIPLE.

2. With the revolution of the subject inaugurated by Cartesian philosophy, the second aspect comes to the fore: some "reasons," "ideas," or "propositions" are "true and certain," or "true and evident," but the most certain and the most evident of all, and thus in a sense the truest, is the certitude of my own existence, a certainty that the subject attributes to itself: see SUBJECT and I/ME/ MYSELF, SELBST. The thematics of certainty precedes that of consciousness both historically and logically, but it ends up being incorporated and subordinated by it: see CONSCIOUSNESS; cf. ES and UNCONSCIOUS.

3. Certainty thus becomes a quality or disposition of the subject that reproduces, in the field of rational knowledge, the security or assurance that the believer finds in religious faith, and that shields him from the wavering of the soul, see *CROYANCE* [BELIEF, GLAUBE]; cf. DASEIN, *MALAISE*, and esp. *LIFE/LEBEN,* SEHNSUCHT.

4. It will be noted that French retains the possibility of reversing the perspective by exploiting the Latin etymology, as Descartes does in the *Principles of Philosophy* when he transforms the *certitudo probabilis* of the Scholastics (Aquinas) into "moral certainty." On the other hand, English tends to objectify certainty to the maximum in opposition to belief (see BELIEF), whereas German hears in the term *Gewissheit* the root *wissen* (to know, to have learned) and situates it in a series with *Bewusstsein* and *Gewissen* (see CONSCIOUSNESS), clearly marking the constitutive relationship to the subject in opposition to *Glaube* on the one hand, and to *Wahrheit* and *Wahrscheinlichkeit* (lit., "appearance of truth," i.e., "probability") on the other (see TRUTH, II.B).

II. Knots of Problems

1. On the relations between certainty and belief, the modalities of subjective experience, see *CROYANCE*.

2. On the relation between individual certainty and the wise man's constancy, see PHRONÊSIS and PIETAS; cf. MORALS, VIRTÙ, *WISDOM*.

3. On the relations between certainty and truth, the confrontation between subjectivity and objectivity in the development of knowledge, see—in addition to TRUTH— ANSCHAULICHKEIT, *EXPERIENCE,* PERCEPTION, REPRÉSENTATION.

4. On the relations between certainty and probability, the modalities of objective knowledge insofar as it is related to a subject's experience, see—in addition to *PROBABILITY*— CHANCE, DUTY, DOXA, *SENS COMMUN* [COMMON SENSE, SENSUS COMMUNIS], MATTER OF FACT.

➤ SOUL, *TO BE*, UNDERSTANDING

| CHANCE / PROBABILITY

FRENCH   *chance, probabilité, avantage*

➤ *PROBABILITY*, and *DESTINY*, ENGLISH, HISTORY, UTILITY

The English notions of chance and probability, which were long confused with each other, each took on a specific meaning with their entry into the field of mathematical calculation, which made it necessary to distinguish them as early as the second half of the eighteenth century and to distinguish them even more clearly in the nineteenth century. No doubt there were some cases in the eighteenth century where "chance" had exactly the same meaning as "probability." For example, in his *Essay towards Solving a Problem*

in the Doctrine of Chances (1763), Thomas Bayes declares that "[b]y *chance* I mean the same as probability," even though his work brilliantly demonstrated that they are not the same. Chance clearly retains the "subjective" spirit of arbitrary randomness, since we speak of the "chance of being right" (in assigning a degree of probability between two selected degrees); thus it represents, in the tradition of J. Bernoulli's *Ars conjectandi*, a fraction of certainty. On the other hand, probability is clearly "objective" in that it seems to apply more directly to events. In dice, the probability of rolling an ace is one in six; it seems to be a property of the situation. Nonetheless, the preceding proposition can also be interpreted and formulated as follows: the chance of being right when one says that an ace will be rolled is one in six.

I. Probability of Chances and Probability of Causes

Between the 1650s, when Pascal, along with Fermat, invented the "geometry of chance" (*géométrie du hasard*) and tried to enumerate the chances and to calculate odds (*calculer le parti*), and the end of the eighteenth century, "chance" and "probability" had time to change meaning. The last chapter of *La logique de Port-Royal*—of which Pascal was at least the inspiration, if not the author—determines probability by calculating the odds (of winning if a given event occurs). At each step in the complex gaming situation he is analyzing, Pascal calculates the players' odds, that is, the amount each would have to be paid if the game were to stop before chance determined the winner in accord with the rules. Nonetheless, "calculating the odds" is taken as a verb, whereas "probability" is usually taken by Pascal and in the *La logique de Port-Royal* as the equivalent of "chance." In 1739, Hume, in *A Treatise of Human Nature*, grasped the two major axes along which the two notions are divided when they are not considered synonyms. The first opposes the "probability of chances" to the "probability of causes." When in a given situation we can draw up a table of all the possible outcomes and calculate that a given situation will occur rather than another, we speak of the "probability of chances." Thus, in calculating the odds in a game, we tend to speak of the "probability of chances" because the mind can make a concise inventory of all the situation's possible outcomes. The Pascalian term *hasard* is perfectly rendered by the English word "chance" (Maistrov, *Probability Theory*).

We speak of the "probability of causes" in very different circumstances, which Hume clearly distinguishes: if a sequence of similar events A_1B_1, A_2B_2, A_3B_3 . . . A_nB_n has been witnessed by one or more persons and an event of type A occurs, we can use Newton's binomial to calculate the probability that an event B will occur; in this case we will speak of the "probability of causes." Note that on the basis of an event of the type B, we could have calculated in the same way the probability that an event A preceded it. It is clear that, borrowing Hume's image, the probability of causes is assessed not by making a complete count in a system of cases that have to be inventoried in every direction, but more linearly, in the way that one plows a furrow in a single direction. Although the weight of past cases bears on the determination of the probability of a cause or an effect in a present situation, taking into account past situations in the situation of a game (of chance) has nothing at all to do with the probability of chances

and constitutes a genuine epistemological obstacle to its evaluation.

II. Subjective Probability (Chance) and Objective Probability (Probability)

Cutting across this first opposition between the "probability of chances" and the "probability of causes" and contradicting it to some extent, there is another opposition that has been even more influential not only in mathematics, but also in the domains of religion, economics, jurisprudence, and society: the one that distinguishes subjective probability (generally called chance) and objective probability (generally called probability). Price is correct in saying that Bayes (*An Essay*) deviated from common usage on this point. If I roll a mathematician's six-sided die that is well balanced and not loaded and that clearly shows one of its faces when it has finished rolling, the probability of obtaining an ace, or indeed any other face, is one in six. Probability seems here to apply directly to the event, even if that is not the case and if it is a pure fiction connected with the discourse that allows us to make a prediction. But if I am in a situation where I am drawing winning and losing lots from an urn, I calculate the value of the relation between the number of losing lots and the number of winning lots that it contains on the basis of the drawings I have already made, and I attribute a probability to the outcome of the drawing I am about to make with a chance of being right or wrong. Bayes's rule relates the probability that an event will occur to the chance of being mistaken when I calculate it. His rule calculates, as Price puts it, borrowing Bayes's own expression:

> . . . the chance that the probability for the happening of an event perfectly unknown should be between any two named degrees of probability, antecedently to any experiments made about it.

Chance no longer bears directly on the event but, rather, indirectly on my estimate of its probability. In a given initial situation, I can decide as I wish to situate between two degrees the probability that an event will occur; the "chance of being right" changes, of course, as this situation develops, that is, as I collect new information regarding the event in question. The degree of chance is calculated by an understanding that measures the value of a decision in relation to the probability of a given event in a given situation or at various stages of that situation. Curiously, since in this new function it is difficult to use the term "chance" in the plural, an author like Price substitutes the word "odds" for it and speaks of the "odds of chance" or the "odds of probability" (*An Essay*). The point is all the more remarkable because for a long time the English word "odds" was used only in the singular. Although "odds" clearly takes on the meaning of the French word *cote* in a wager that can receive a cardinal number, "odds" initially designated the strangeness of an event, the unexpected characteristic that made it an unusual, even unparalleled, event; but this does not mean that the word has no relation to arithmetic, since we commonly speak of odd numbers. In its singularity, the event is incommensurable, but in a contradictory fashion it thereby acquires the status of a unit constitutive of a number that preserves its character of being imperfect, odd, and difficult to divide.

III. The Importance of the Distinction between Chance and Probability in Religious and Juridical Debates

We can now see why the reversal of a "subjective" interpretation of the arguments of natural religion, which had been previously based on analogies (e.g., God is to the universe as an architect is to a building) turned out to be particularly devastating. The "chance of being right" evaluates various competing hypotheses; it does not limit itself to the examination of a single analogy whose terms are considered without showing any imagination. This technique of argumentation, which does not always adopt Bayes's terminology, is that of Hume's *Dialogues concerning Natural Religion.*

The shift from a perspective that is allegedly *de re* (bearing directly on things) to one that is *de dicto* (by chance) proved to be very efficacious in the juridical domain, especially in criminal law. Jacques Bernoulli, who in his *Ars conjectandi* defined probability as a fraction of certainty, saw very early on the interest of probabilities for economic, juridical, political, and social calculations; but it was the Bayesian perspective, which was to be that of Bentham's utilitarianism down to our own time, and also that of Laplace and Poisson, that gave these calculations their true value. If society, not only as the guardian of the laws, of order, and of security but also of justice, has an interest in such and such a crime or offense being punished, we can calculate our chances of being right in attributing this crime or offense to such and such a person whom we are preparing to punish, and at the same time evaluate, on that basis, whether it is just to proceed with this punishment (see EIDÔLON, Box 1).

IV. Probability, Chance, Expectation

Our difficulty in translating the terms "probability" and "chance" can thus proceed from certain contradictions in the use of "chance": in the first opposition between chances and causes, it has an essentially objective meaning connected with counting up situations, whereas in the second opposition, it has the subjective meaning of a relationship of values; the context will always indicate which type of opposition is concerned.

Nevertheless, the notion of expectation, which is very close to those of probability and chance, adds to the difficulty. Although it is usually appropriate to avoid translating "expectation" by the French word *attente* in contexts where it clearly refers to an evaluation of probability and to prefer the term *espérance*, we have to acknowledge that the latter term lacks clarity. Pascal, whom we have presented as the author par excellence of the "probability of chances," reasons less on probability than on expectation; however, it is a question of calculations that belong precisely to the domain of objective probabilities. Subjective probabilities, on the other hand, were later to be characterized by a fundamental use of expectation on the basis of which probability alone is defined, as we see in Bayes (*An Essay*), who posits the probability of an event as the relation between the expectation attached to this event and the benefit one hopes to realize if it occurs:

> The probability of any event is the ratio between the value at which an expectation depending on the happening of the event ought to be computed, and the value of the thing expected upon its happening.

This is the place to note that the idea of subjective probability arose in a language that allowed this complicated formation by means of gerunds that cannot really be translated into French (see ENGLISH)—even if, a few years later, Continental mathematicians dealt with this idea with the same ease as mathematicians working in English.

CHÔRA [χώρα] (GREEK)

➤ DESCRIPTION, *FORM*, GREEK, *LIEU*, POLIS, *REASON*, TO TRANSLATE, *WORLD*

> Inasmuch as *chôra* has no meaning—at least not in this classical sense—it is intrinsically untranslatable. It is such as to disrupt the very operation of translation.
> —Sallis, *Chorology*

In general, where it is used in Plato's *Dialogues*, the word *chôra* [χώρα] has, according to the context, the commonplace meaning of "land," "place," "space," or "room" (Algra, *Concepts of Space in Greek Thought*). As Casey points out, its primary connotation is "occupied space," as in "a field full of crops or a room replete with things" (Casey, *The Fate of*

Place). This is the signification of the first appearance of the word in the *Timaeus*, where Socrates is characterizing the country outside the city proper (Cornford, *Plato's Cosmology*, *Timaeus*, ¶19). Such a sense of extraterritoriality and extension certainly anticipates the way in which it is used later in the dialogue. But in the following creation story, narrated by Timaeus, Plato endows *chôra* with a special significance, and a corresponding ambiguity, which has been debated ever since, from Aristotle to Derrida.

The *Timaeus* as a whole is concerned with foundation of the just city, and with the corresponding idea of beginning, starting with the creation of the cosmos itself. The dialogue purportedly takes place following a conversation the day before concerning the perfect city—a summary of the conversation by Socrates makes a clear reference to the central aspects of the city outlined in the *Republic*; but Socrates professes to be dissatisfied with the static and abstract nature of the picture drawn so far. He demands a livelier image, one that sets the city in motion so to speak, and Critias suggests that the heroic story of the war between ancient Athens and Atlantis would supply the requisite action. But before a narrative of city foundation, Timaeus, with his astronomical knowledge, proposes to establish the story of cosmic becoming. This then is the context for the elaboration of the concept of *chôra*.

The word *chôra* itself first appears in its newly ambiguous, but philosophical, form in paragraph 52b of the *Timaeus*. But its appearance has been prepared for by Plato some paragraphs before. In brief, the argument up to the introduction of *chôra* goes something like this: Timaeus has, in the first part of the dialogue, given an account of how the universe "came into being" (Cornford, *Plato's Cosmology*, *Timaeus*, ¶27), distinguishing between two states: "that which is always real and has no becoming" and "that which is always becoming but is never real." The former is "apprehensible by the intelligence with the aid of reasoning," the latter is an "object of opinion and irrational sensation, coming to be and ceasing to be, but never fully real" (Cornford, *Plato's Cosmology*, *Timaeus*, ¶28). Thus separating out the unchanging (rational) reality, from the changing (sensible), lived, reality, Timaeus uses this well-known Platonic distinction between the ideal primary reality and the physical secondary reality to sketch out the steps taken by the demiurge (*dêmiourgos* [δημιουργός], "maker," "father," "constructor") as he "keeps his eye on the eternally unchanging and uses it as his pattern for the form and function of his product." This is so that he can ensure a "good" result, for whenever he looks to "something which has come to be and uses a model that has come to be, the result is not good" (Cornford, *Plato's Cosmology*, *Timaeus*, ¶28). Timaeus uses the word *kalos* [καλός], which can mean "good," but also "satisfactory," "desirable," and, of course, "beautiful." In this way, as Francis Cornford notes, "the visible world . . . is a changing image or likeness (*eikon*) of an eternal model" (*Plato's Cosmology*). A postulate that raises as many questions as it answers: if something is in a state of becoming, does it begin at any one point? Or, what might be the "cause" of such becoming, as opposed to the state of being, or the same? Or, finally, is the "real," as copy, really real, or simply a dream or shadow of the real? Plato compounds these difficulties by having Timaeus state that what he is describing is no more than a "likely story," for mortals are in the end

"unable to render an account at all points entirely consistent with itself and exact . . . (or) furnish accounts no less likely than any other" (Cornford, *Plato's Cosmology*, *Timaeus*, ¶29c). And, as Derrida will note, the problem extends not only to reasonable stories, but also to naming. Even the "Heaven," "world," or "cosmos" may take different names: "let us call it," says Timaeus, "by whatsoever name may be most acceptable to it" (Cornford, *Plato's Cosmology*, *Timaeus*, ¶28b).

This, then, is the procedure of the "demiurge," compared by Plato to a craftsman (*dêmiourgos* [δημιουργός]), who as "intelligence" itself, "framed the universe," fashioning "reason within soul, and soul within body," as a living creature. Not a god, or "God," the demiurge operates like a craftsman on materials he did not himself create, with reason guiding his design. Out of the four primary bodies—fire, air, water, and earth—he fashions a universe bound together by proportion and thereby "visible and tangible" (Cornford, *Plato's Cosmology*, *Timaeus*, ¶32b). The aesthetics of this work, "a living being whole and complete, of complete parts . . . single, nothing being left over," "a single whole consisting of all these wholes" (Cornford, *Plato's Cosmology*, *Timaeus*, ¶33a), has had a long history in Neoplatonism and neoclassicism: this "shape rounded and spherical, equidistant every way from center to periphery—a figure the most perfect and uniform of all . . . perfectly smooth" (Cornford, *Plato's Cosmology*, *Timaeus*, ¶33b) has held a privileged position in the theory of ideal forms. Endowed with a centrally positioned world-soul, itself the embodiment of reason and harmony, and incorporating, like some perfect armillary, the motions of the seven planetary rings, this world incorporates time within its circularity, marked by the differential motions of the planets.

Such was the world constructed as Plato recounts "by the craftsmanship of Reason" (Cornford, *Plato's Cosmology*, *Timaeus*, ¶47e); but it failed to take note of a second equally powerful cause, that of Necessity (*anankê* [ἀνάνκη]). Here Plato makes it clear that his "demiurge" is by no means the omnipotent creator of everything out of nothing construed by later religions. Rather his craftsman works with materials already at hand—fire, water, air, and earth "before the generation of the Heaven" (Cornford, *Plato's Cosmology*, *Timaeus*, ¶48b), materials whose prior existence has not been explained by Reason's work, and that demand what Plato terms an "errant cause" as "origin." But this origin is immediately subject to question, for as Plato states, "'first principle or 'principles'—or whatever name men choose to employ" are exceedingly difficult to explain. Indeed, Timaeus affirms that the explanation should not be demanded of him, as it poses too "great a task"; rather he promises to give "the worth of a probable account," one "no less probable than any other, but more so" (Cornford, *Plato's Cosmology*, *Timaeus*, ¶48d).

In beginning again, then, "once more" and in moving toward "the conclusion that probability dictates," in starting over with his account of creation, Plato acknowledges the impossibility of certainty for the first time. If one can be certain about the forms of Reason, those of Necessity demand a more speculative approach. The need for this fresh beginning, principle, or starting-point arises from this intrusion of the irrational, that which can be controlled by Reason, but that Reason did not bring into being.

Here then is the already uncertain context into which *chôra* is introduced.

For in starting again to describe the universe, Plato now joins to his two principal orders of existence—the unchanging intelligible model and the changing and visible copy—a third, a medium of sorts that supports the two. This medium is of a "form difficult and obscure" (Cornford, *Plato's Cosmology*, *Timaeus*, ¶49) but its nature can be stated as that of the "receptacle (*hupodochê* [ὑποδόχη])—as it were, the nurse—of all Becoming." Such a "receptacle" unlike its contents—fire, water, air, and earth that are in a perpetual state of change—is unchanging and permanent. Plato, as Cornford notes, somewhat misleadingly, compares it to the gold out of which one makes all kinds of figures. The receptacle "must be called always the same; for it never departs at all from its own character; since it is always receiving all things, and never in any way whatsoever takes on any character that is like any of the things that enter it" (Cornford, *Plato's Cosmology*, *Timaeus*, ¶50b). It is, Plato explains, a kind of "matrix" for everything, that, although it is changed by the things that enter it, and may appear to have different qualities at different times, is in itself always the same.

In a passage that much later had implications for feminist readings, Plato, always trying to explain that "which is hard to express," seeks another comparison through gender: "the (intelligible) model in whose likeness that which becomes is born," is compared to a father; "that which becomes (the copy)" is like an offspring, and "that in which it becomes" (the receptacle) inevitably takes on the characteristics of a mother (Cornford, *Plato's Cosmology*, *Timaeus*, ¶50 c–d). This apparently simple simile, one that gives the character of generation to the receptacle, is, however, immediately contradicted in what follows: for Plato insists that the receptacle, whatever else it is, is "invisible and characterless, all receiving," a "nature" that, precisely because it is free of all the characters that come from elsewhere, enter into it, and pass out of it, cannot be endowed with a specific gender. Plato compares this lack of character to the liquid base used by the makers of perfumes that is as odorless as possible: "Thus it is, in the first place, for the perfumes that one prepares artistically, in order to give them a good odor. The perfume makers avoid first of all as much as possible all odor in the liquid base which must receive them" (*Timaeus*, 50e). It should be noted here, as Derrida will observe in his essay "La Pharmacie de Platon," that "the *pharmakon* also means perfume. Perfume without essence, as we said above, drug without substance. It transforms order into ornament, the cosmos into cosmetic." Would this mean that, by the same token, Plato is comparing the "receptacle," not yet named *chôra*, to a *pharmakon* [φάρμακον], a drug that, without smell, receives all smells that pass into, through, and out of it, with the implication that such smells are transformed into dangerous perfumes? At this point we are better taking Plato at his word when, even as he struggles for comparisons and mixes his metaphors, he states baldly that this receptacle partakes "in some very puzzling way of the intelligible" and is "very hard to apprehend" (Cornford, *Plato's Cosmology*, *Timaeus*, ¶51b).

What is certain is that Plato has determined the need for three things: the unchanging "Form," "ungenerated and indestructible"; that which "bears the same name and . . . is sensible"; and a third, previously called the receptacle, but

which now gains a name: *chôra* (Cornford, *Plato's Cosmology*, *Timaeus*, ¶52). *Chôra* is now finally "defined" as "everlasting, not admitting destruction," somewhat like the Form, but different in that it can be apprehended. Its apprehension, however, is not by reason or the senses, but by what Plato calls "a sort of bastard reasoning" with a status somewhere between the two; you have to think about it, but nevertheless it is in the visible world, invisibly (Cornford, *Plato's Cosmology*, *Timaeus*, ¶52b). We apprehend *chôra* then as "in a dream" forcing ourselves to acknowledge that "anything that is must needs be in some place and occupy some room, and that which is not somewhere in earth or heaven is nothing" (Cornford, *Plato's Cosmology*, *Timaeus*, ¶52b). This very act of recognizing that all objects demand situation, Plato argues, leads to the "hybrid" or "bastard" reasoning that in turn forces recognition of *chôra*.

The ambiguity of *chôra*'s nature is further complicated by Plato's next analogy, advanced to explain the emergence of chaos, a chaos readying itself for the reasoning work of the demiurge. *Chôra* once again becomes the "nurse of becoming," but a nurse immediately transformed into a winnowing basket that is shaken by its contents and in turn shakes them: "just when things are shaken and winnowed by means of winnowing-baskets and other instruments for cleaning corn, the dense and heavy things go one way, while the rare and light are carried to another place" (Cornford, *Plato's Cosmology*, *Timaeus*, ¶52d). In this way were like and unlike things separated, and made ready for the demiurge.

At this point in his attempt to characterize the invisible *chôra*, Plato has assembled a number of apparently contradictory "images" or what were later to be called "metaphors," drawn from the arts of fabrication (*technê* [τέχνη]) as if to underline the action of the demiurge. Yet the *chôra* anticipates the arrival of this grand artisan—*chôra* is, so to speak, always already there. It is at once all-receiving, a receptacle, and something that harbors, shelters, nurtures, and gives birth. It is infinitely malleable like gold, and it is a matrix for all things. As things shake, it winnows like a basket, separating out the chaff from the grain. What is clear, as Cornford points out, is that the *chôra*, while not a void, is not "matter" in itself, as subsequent interpreters will have it. (Cornford, *Plato's Cosmology*).

When resituated in the context of the city narratives of the *Timaeus* and *Critias*, it becomes clear that Plato's use of the word's ambiguities is consistent with the need to provide a firm and original foundation, one that originally emerged out of the earth and the cosmos, not only for ancient Athens but for a renewed city that could be projected as emerging out of and within a *chôra* that was ever-ready to receive and nurture, and that in all its connotations was connected to a content-filled and cultivated land, with room for the polis.

In subsequent rereadings and reinterpretations, the Platonic *chôra* was subjected to oversimplification (Aristotle) and overinterpretation (Chrysippus, Proclus). In Aristotle, place (*topos* [τόπος]) takes precedence over Plato's semi-mystical creation fables—as Casey remarks, "Chôra yields to Topos, the bountiful to the bounded" (Casey, *The Fate of Space*; and Algra, *Concepts of Space in Greek Thought*). Indeed, Aristotle's reading of the *Timaeus* explicitly (and perhaps deliberately) identifies the receptacle with the *chôra*, and thence the *chôra* with

matter, going on to conflate *chôra* with *topos* (Aristotle, *Physics*, 4.209b; cited in Sallis, *Verge of Philosophy*). For Epicurus, however, *chôra* retains a certain Platonic energy; the root verb is *chôrein*, "to go" or "to roam." As Sextus Empiricus explains, Epicurus distinguished among "void" (*kenon* [κενόν]), "place" (*topos*), and "room" (*chôra*), where "room" affords the space for the constant motion of the atoms, the "*spielraum* of atomic bodies," as Casey calls it. The Stoic Chrysippus goes further, characterizing such a "room" or *chôra* as space for both roaming and also extension, a connotation followed by the Neoplatonist Syrianus (Casey, *The Fate of Space*), and thence by Proclus in his exhaustive commentary on the *Timaeus*.

Since Proclus's commentary, and throughout the myriad subsequent textual analyses that have ranged in their emphasis from Pythagorean geometry, cosmological symbolism, and biological geneticism, to the form of the ideal polis, the search for the lost Atlantis, and the mythologies of ancient Athens, little or nothing indicated *chôra* as a keyword, beyond the indices accompanying the translation of many such terms in Plato. Indeed, John Sallis, in his attempt to describe or found a "chorology" after Plato is hard pressed to find, save by omission and post-Derridean inference, a problematic role for, or even a mention of, the word.

Nevertheless, the word *chôra* gained ground as a keyword in philosophy in the 1970s. Its status as a term to be confronted by and for deconstruction was tagged by Derrida in 1968, adopted within semiotics by Kristeva in 1974, and taken by Irigaray and others as a point of departure for a questioning of gender categories. In 1985 it was presented by Derrida as a problem for (Peter Eisenman's) architecture, thence to become a moment for reflection on architecture's gender in the work of Anne Bergren, on deconstruction and architecture in Jeffrey Kipnis, and on the grounding of architecture itself in Eisenman and Derrida's project for a garden in Bernard Tschumi's La Villette. Taken back into philosophy by Derrida in 1987 and 1993, *chôra* was re-inscribed within Neoplatonic interpretation by John Sallis in 1999.

It was Derrida, who, in a sideways glance at the word in his discussion of "La Pharmacie de Platon" ("Plato's Pharmacy") first opened up a question that has since developed into a critical field of inquiry of its own. The context is significant. The essay is concerned with another word whose meaning is obscured by multiple uses, significations, and (mis) translations, but which nevertheless, when identified as a sign, stands out as a mark of Plato's deep ambiguity toward writing, a *pharmakon* that might be at once a "drug" or "remedy," dangerous or helpful. Speaking of the untranslatability of the word *pharmakon* in the *Phaedo* (but also everywhere that it appears in Plato), Derrida writes of "this regulated polysemy which has allowed, by ineptness, indetermination or over determination, but without contradiction, the translation of the same word by 'remedy,' 'poison,' 'drug,' philter,' etc." Such errancy in definition and translation has indeed undermined "the plastic unity of this concept, its very rule, and the strange logic which links it to its signifier" in such a way that it has "been dispersed, masked, obliterated, struck with a relative unreadability, by the imprudence or empiricism of the translators, certainly, but first and foremost by the redoubtable and irreducible difficulty of translation." But this is the result, Derrida argues, less of the difficulties

of passing from one language to another, or even from one philosophical language to another, and more of a question within the Greek language itself, of that "violent" tradition whereby a non-philosophical language is transferred into a philosophical one. "With this problem of translation," Derrida notes, "we will be dealing with nothing less than the problem of the passage to philosophy." And later he concludes: "La *khôra* est grosse de tout ce qui se dissémine ici" (*chôra* is pregnant with everything that is disseminated here). For Derrida, indeed, *chôra* was "grosse," a word that indicated the difficulty of naming, categorizing, or even writing the "origin," or at least that "origin" posited by Plato, before the entry of the demiurge in order to shape the world.

Derrida was already engaged in writing his essay "Khôra" in homage to Jean-Pierre Vernant. Here he takes on the apparent confusion of "metaphors"—he prefers not to call them metaphors for reasons he will later divulge—used by Plato to describe, characterize, or define *chôra*, or the "receptacle," in order to demonstrate that these turns of phrase are irreducible questions of writing. In a long citation from Albert Rivaud's edition of the *Timaeus*, Derrida demonstrates the confusion surrounding the word and question of "place," or *chôra* (citing Rivaud, *Platon*). Rivaud had noted the proliferation of what he called "metaphors for *chôra*, metaphors for the 'place,' the 'site,' 'this in which' things appear, 'this on which' they manifest themselves, the 'receptacle,' the 'matrix,' the 'mother,' the 'nurse'—it is container and contained at the same time, 'the space that contains the things.'" Rivaud himself translates *chôra* as a "porte-empreinte," literally "carrier of the imprints" (as in *porte-parole*, "carrier of the word"), the "excipient," or, "the entirely de-odorized substance, or the gold with which the jeweller can impress a quantity of different figures." Derrida exposes the ambiguity of Plato's introduction of the "third genre" of being.

Derrida, however, was inevitably dissatisfied with the notion of "metaphor," and "comparison," working rather to identify the aporias in Plato's own discourse. The paradox is clear: what is named "chôra" or "place" cannot itself be situated or "assigned a home"; "it is more situator than situated." Indeed, Derrida resists all attempts to define the word, translate the word, or supply additional metaphors or comparisons for the word. Indeed, the "interminable theory of exegeses" (Derrida, *Khôra*) that surrounds *chôra* "seems to reproduce that which, following the discourse of the *Timaeus*, would happen not with Plato's text, but with *khôra* herself." All translations, he writes, remain "on the level of interpretation" and thereby subject to anachronism. There is, therefore, no question of proposing "le mot juste" for *chôra*; rather than reducing it falsely to a name or essence, it has to be understood as a structure. As Derrida concludes, "one cannot even say of it that it is *neither* this, *nor* that, or that it is *at the same time* this and that." Marking the continuing ambiguity, Derrida and Sallis engaged in a friendly debate as to whether the word should be written without an article (*khôra*) as Derrida insisted, or with an article (the *chôra*) as Sallis preferred. For Derrida the article "presupposes the essence of the thing," which had no such essence in Plato's usage; for Sallis omitting the article "would risk effacing all difference between the word and that of which the word would speak" (Sallis, *Verge of Philosophy*). *Chôra*, indeed, remained elusive

to the end and still, as a recent commentator notes, the question remains "multilayered" and "incoherent" (Sayre, "Multilayered Incoherence of Timaeus' Receptacle").

But perhaps the problem of *chôra* would not have surfaced in so poignant a form if, as he recounts, Derrida had not been introduced by the architect Bernard Tschumi to the architect Peter Eisenman in 1985, and suggested that a concept on which he was writing a paper would perhaps serve to open a discussion that would launch their collaboration in the design of a garden for Parc La Villette. The concept was named "chôra"; in common translation, the special nature of this term, taken from Plato's dialogue the *Timaeus*, was rendered "place" or "space." Apparently an innocent enough suggestion, the debates over the "meaning" of the word extended into seven taped discussions, seemingly replicating the Socratic model of the original, and eventually a book of transcriptions, drawings, and the translation of a version of Derrida's own essay on *chôra* appeared. In this way, a word, long-forgotten in the footnotes of Plato translation and exegesis was launched into a veritable, architectural discourse, not perhaps as a solution to any "space of deconstruction," but rather as an insoluble conundrum set by the philosopher for the architect, to test the capacity of architecture to signify its own origins, its groundings in *chôra*.

CIVIL RIGHTS

FRENCH   *droits civils, droits civiques*

➤ *DROIT*, and CIVIL SOCIETY, CIVILTÀ, LAW, MENSCHHEIT, POLITICS, RULE OF LAW, *STATE*

The expression "civil rights" can be rendered in French by both *droits civils* and *droits civiques*. In the first case, the reference is to the customary classifications of rights that distinguish civil rights (such as property) from political rights or social rights. In the second case, the reference is to the meaning acquired by "civil rights" in the context of the American civil rights movement of the 1950s and 1960s, whose main goal was to put an end to racial segregation and, more generally, to the discrimination of which minorities were the victims.

If we want to understand why English speaks of "civil rights" (including the right to vote) and even of "civic rights" (i.e., citizens' rights), where we might think the "rights of man" or "human rights" ought to be in play, we have to refer to American constitutional history. After the Civil War, the United States adopted three amendments to the Constitution that should have put an end to slavery and its aftereffects. The Thirteenth Amendment abolished slavery; the Fourteenth Amendment states that

> [a]ll persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the state wherein they reside. No state shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any state deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.

The Fifteenth Amendment protects citizens' right to vote against any restriction based on "race, color, or previous condition of servitude." But the juridical and political development of the United States led to these amendments being deprived of much of their substance by racial segregation and various artifices designed to deprive blacks of their right to vote on various pretexts (e.g., literacy tests); moreover, the Civil Rights Act of 1875, which sought to prohibit racial discrimination in public rights, was declared unconstitutional by the Supreme Court in deciding a set of civil rights cases in 1883. To the extent that the fight against discrimination, relying on the new liberal orientation of the 1960s Supreme Court, sought to restore the full scope to the rights of American citizens, and not simply to guarantee the rights of individuals, it was natural that it would present itself as a movement for civic rights. Its goal was not only to guarantee human rights, but also to see to it that black Americans would be recognized as full-fledged citizens.

CIVIL SOCIETY

ENGLISH   civil society, political society
GERMAN   *bürgerliche Gesellschaft*
GREEK   *koinonia politike* [κοινωνία πολιτική]
LATIN   *societas civilis*

➤ BILDUNG, CIVIL RIGHTS, CIVILTÀ, *DROIT*, ECONOMY, HISTORIA UNIVERSALIS, LAW, OIKONOMIA, PEOPLE, POLIS, POLITICS, SECULARIZATION, *STATE*

Far from simply designating a recent notion introduced by Hegel or Marx in the wake of Anglo-Scottish economists, the expression "civil society" (*societas civilis, société civile, bürgerliche Gesellschaft*) belongs to the most classical vocabulary of political philosophy. Originally, it corresponded to the Latin (and then French) translation of Aristotle's *koinonia politike* [κοινωνία πολιτική] (political community). It thus initially designated the form of human existence that prevails when men live under political or civil laws. The same situation persists with modern contractualist theories, in which "civil society" is opposed to the state of nature (Hobbes) and fuses with political society (Locke) or even in authors like Kant, for whom civil society is another name for the state. The distinction between civil society and the state, which seems obvious since Hegel and Marx, should thus be understood as the fruit of a complex and paradoxical history. And the history of these concepts is inseparable from that of their translation.

I. *Koinonia Politike* and *Societas Civilis*

In order to understand the history of the concept of civil society, our first obligation is to avoid confusing the Aristotelian lexicon for political community with that for society, by identifying, for example, man's character as a "political animal" with a simple natural sociability. The political community described in book 1 of the *Politics* is not the simple product of sympathy or of the incapacity of each individual to suffice on its own, since it is distinguished essentially from such other forms of community as the couple, the family, or the village. The domestic community is characterized by an unequal relation of authority in which the head of family commands those who are by nature destined to obey him, whereas in the "political community" (*he polis kai he koinonia he politike* [ἡ πόλις καὶ ἡ κοινωνία ἡ πολιτική]), authority is exercised over free and equal men who, in various ways, participate in public affairs. Understood in such terms, the city is first in nature because *it* is what makes it possible to "live well" and for man to realize fully his nature, but it is encountered only under certain conditions, which are not to be found, for instance, in despotic regimes or empires. Aristotle's thought on political community is thus strictly derived from the political experience of the Greek city-state. And it can be easily understood that the translation of Aristotle's concepts posed some difficulties in the Roman—and subsequently Christian—world. Conventionally, in keeping with a usage to be found in medieval translators of Aristotle, *polis* [πόλις] was translated as *societas civilis* while maintaining as synonyms the city-state, the political community thus become civil society, and the republic (*civitas sive societas civilis sive republica*), but the Latin plainly has different connotations from the Greek. *Societas* designates a juridical link that is not necessarily political and is defined above all by consensus and the pursuit of common ends. Latin authors like Cicero also

evoke the Stoic idea of a society of the human race (*societas generis humani*) that could certainly not consititute a political community in the Aristotelian sense. *Civis, civilis*, and *civitas* thus acquire a universalist dimension, linked to Rome and Roman law's capacity to spread citizenship quite broadly, in a manner unknown in the classical Greece of the city-states (Moatti, *La Raison de Rome*). The properly French notion of contemporary civil society, which evokes the universality of the juridical bond between individuals more than a shared belonging to a particular civic entity, continues to bear the trace of that transformation.

■ See Box 1.

II. City of God and Civil Society

The fate of civil society derives equally from an intellectual and moral revolution favored by Roman experience, the spread of Christianity, and particularly the theory of two cities defended by Saint Augustine in *The City of God.*

For Saint Augustine, civil society is assuredly a natural reality, participating in the goodness of the created world, but the corruption of human nature that followed the Fall prevents attributing full self-sufficiency to him and renders precarious in advance all efforts to attain happiness on earth, which is nonetheless the object of the earthly city. While awaiting the Last Judgment, the two cities coexist in humanity (like the elect and the reprobate), and their relation cannot be resolved by the pure political abstention of the just. On the one hand, the Christian must indeed obey the civil power and accomplish his civic duties, but on the other, he can and must not forget that the natural *societas* is linked to original sin and that it is grounded in self-love pressed to the point of contempt of God, the heavenly city being alone able to establish true communication between men. Even if the visible church does not coincide with the celestial city (since it contains sinners and reprobates), that complex relation between the two orders of nature and grace manifests itself in the church's ambivalent relation to the state: the church must acknowledge the specific consistency of civil society, but it must also act in the earthly city to help men attain their natural and supernatural ends. The medieval posterity of Saint Augustine would explore the possible solutions to this theologico-political dilemma, which went from pontifical theocracy to Luther's doctrine of the two realms by way of theories favorable to the primacy of the emperor or the king (Quillet, *Les Clefs du pouvoir au Moyen Age*). In the evolution of modern thought, one can schematically distinguish five solutions to the problem of the relations between civil society and the city of God. The first is that of the Catholic Church, which is remarkably stable and consists of positing simultaneously the consistency proper to civil society and its essential incompletion, which implies an acceptance of the civil power, but also the affirmation of a minimal (and eminently variable) political competence of the church. This is why, even today, the expression "civil society" is synonymous, for political theologians, with "political order." That position can be distinguished simultaneously from Luther's (which insisted on the essentially repressive role of the political power while affirming the principle of inner liberty) and from the doctrines of the Catholic Counter-Reformation

1

Gemeinschaft and *Gesellschaft*, community and society

Even if the opposition between *Gemeinschaft* and *Gesellschaft*, which was introduced in sociological theory by Ferdinand Tönnies (*Community and Society*), has no true equivalent in the prior history of political philosophy (Pasquino, "Communauté et société"), it can be compared to certain major themes introduced in Germany by political romanticism and the School of Law: where German jurists distinguished two modes for the formation of law ("natural" and spontaneous or, on the contrary, "artificial" and deliberate), Tönnies opposes two types of human collectivity. Community (*Gemeinschaft*), in which familial economy and agriculture predominate, rests on unanimous and spontaneous adherence to substantial values, whereas society (*Gesellschaft*), which is commercial and industrial, is based on an individualization of interests, a quest for compromise, and voluntary association. *Gemeinschaft* evokes themes out of romanticism, and the model of *Gesellschaft*

is furnished by the anthropology of Hobbes. It is not merely types but also stages of cultural development that follow each other according to a logic that runs the gamut from unconscious to deliberate: "the age of society follows that of community. The latter is characterized by social will as concord, custom, and religion; the former by social will as political convention and public opinion" (Tönnies, *Community and Society*). Tönnies, however, is not a simple nostalgic conservative: he is rather in search of a way of moving beyond the opposition between *Gemeinschaft* and *Gesellschaft*, which explains his interest in modern socialism, which, while expressing the conflicts in society, shows the necessity of reconstructing a lost unity.

The distinction between *Gemeinschaft* and *Gesellschaft* can be connected with other couplings of similar concepts in the sociological tradition, such as the organic and critical epochs in Auguste Comte, the

dual—mechanical and organic—forms of solidarity in Durkheim, or, more recently, the holistic and individualistic societies of Louis Dumont. Max Weber offered a reconstruction of the opposition in individualistic terms, through his distinction between *Vergemeinschaftung* and *Vergesellschaftung*, which puts the accent on the type of activity—affective and traditional or, on the contrary, rational—predominating in social relations (Raynaud, *Dictionnaire de philosophie politique*); but most contemporary representatives of methodological individualism tend to reject Tönnies's conceptions, bringing to the fore the conflictual or calculating dimension of communitarian bonds (see RT: *Dictionnaire critique de la sociologie*, s.v. "Communauté").

(Bonald, de Maistre), which led to the negation of any autonomy of civil society, all to the benefit of the church. The millenarian tendencies of the Thomas Münzer sort (violently opposed by Martin Luther) can, for their part, be considered attempts to achieve the city of God on earth, to the detriment of all the institutions of civil society, such as marriage and property. The fascination exercised by Thomas Münzer on Marxist thinkers, from F. Engels to E. Bloch, thus connects them to fanatical currents hostile to civil society (Colas, *Civil Society and Fanaticism*). Finally, the philosophies of history issuing from German idealism are the fruit of an effort to think the continuity between civil society (or the state) and the heavenly city: thus it is that for Hegel the true Christian state is the one that fully ensures the autonomy of the political order—on the condition, to be sure, of its distinctness from civil society.

III. State and Civil Society

If the Roman invention of the *societas* permitted a certain affirmation of the universality of law, it could do so only by insisting on the law's foundational capacity, which, in the case of Rome (whose tradition on this matter was quite different from what prevailed in canon law), was not without a certain artificiality (see, for instance, Thomas, "Fictio legis," on the importance of *fictio* in Roman law). It also had the effect of undoing the bond, affirmed by Aristotle, between the political community and political freedom, following a logic amplified by the Christian transformation of the political order: the universality of humanity is emphatically proclaimed by Christianity, but Christian monarchies (in which power, to be sure, is not exercised over free and equal men) are fully

accomplished forms of civil society. Whatever the case, despite the distance separating the political community of Aristotle from the civil society of the Christians, the two notions share the feature of designating a natural reality which, even if it may entail an internal hierarchy, fully coincides with the human political order; and it was precisely on these two points that the subsequent transformations of the concept of civil society would bear.

Contractualist theories of modern natural law fully maintain the equivalence between civil society and the political condition or the Republic, and that feature would be maintained in the Continental tradition up to and including Kant's *Doctrine of Right*. But the dominant trend in modern political philosophy, embodied by Hobbes, is also clearly artificialist, in that it is opposed to the Aristotelian idea of the naturalness of the political bond, which is not without consequences for the status of civil society. The logic at work here leads, in fact, on the one hand, to making of the preservation of subjective freedom the aim of political association, and thus of affirming the eminent value of what is today called the private sphere, all the while entrusting to political power the protection and even the definition of the rights of the members of the civil association. This is why, on the one hand, thinkers as statist in orientation as Hobbes or Rousseau are also individualists and, on the other, a philosopher like Kant affirms the necessary primacy of public law while considering as rational and irreducible the distinction between private and public law. It thus is possible, on the basis of the distinction between private and public law that guarantees it, to think something like an opposition between civil society and the state, even if, for example, Kant calls natural

society the sphere of private relations in order to reserve the title of civil society (*societas civilis*) for public law and the state (Ferry, "L'émergence du couple État/société").

The genesis of the contemporary concept of a civil society essentially distinct from the state thus passes through the invention of new schemata, native to English-language philosophy, on the basis of an idiosyncratic experience and juridical categories quite different from those of the law and philosophy of the Continent. The most familiar aspect of that invention is the formation of political economy accompanying the expansion of mercantile relations: modern economics leads to seeing in society the fruit of an indefinite quantity of political behaviors, which brings one to "a new conception of society, as opposed to the idea of a political nature of man (Aristotle) as it is to a sociality constructed against nature (contractualist theories)" (Collot-Thélène, "État et société civile"). Now that experience is all the more easy to conceptualize in the framework of English thought in that that thought disposes (with "common law") of juridical categories that allow one to distinguish with relative ease between law and statute law (i.e., such law as is advanced by a legislator) and to recognize the necessity of a power of constraint to force respect of the law without for as much according it a pre-eminent role in the formation of law. "Civil society" thus includes institutions that are already political, such as tribunals, because its "other" is less the state than the government, which is not the sole source of law.

Anglo-Scottish reflection on civil society also presents another extremely important aspect, developed by Ferguson (*An Essay on the History of Civil Society*, 1759), by Millar, and by Hume: civil society has a history, which passes through the affirmation of *civility* and leads to a general progress of *civilization.* That history shows how, in modern Europe, the growth of mercantile exchanges permitted the enrichment of human experience while reducing the importance of constraint and military force in the government of societies. It is inseparable from the great modern debate over the respective merits of (modern) "commerce" and (ancient) civic virtue, in which, moreover, Ferguson and even Smith have more nuanced positions than is usually believed (Gauthier, *L'Invention de la société civile*; Pocock, *Virtue, Commerce and History*). Finally, it encounters the thought of Montesquieu, for whom the apology of the British regime was inseparable from the idea that the ancient civic sense belonged to a past long gone. It was by way of this motif that the "English" problematic of civil society was to have an echo in all of European philosophy, including among authors with an investment in the traditional identification between civil society and the state (see, for example, Kant, *Idea of a Universal History from a Cosmopolitical Point of View,* 1784).

The extraordinary power of the reconstruction effected by Hegel is evident in his *Principles of the Philosophy of Law*, in which one finds both the heritage of antiquity and that of Christianity, the contribution of modern natural law and that of the Anglo-Saxon thinkers or Montesquieu (including the opposition virtue/commerce). We have already seen how Hegel's philosophy can be considered as a legitimization of the process of secularization of modern societies, as a truth of the Christian state; in the same manner, the distinction between civil society and the state allows one to surmount the antinomy of ancient virtue and modern commerce, even while making of civil and political existence the guarantor and truth of the "right to subjective freedom" that lies at the core of the modern world. Civil society in the strict sense, which succeeds the family, allows the individual to surpass the immediate naturalness of familial relations and is comprised of three moments: the system of needs (which corresponds to the world of political economy), the protection of freedom and property by the administration of law, and finally the police and corporation (understood as organs of economic regulation and not only of maintenance of political order), which are necessary to correct the spontaneous effects of mercantile economy. Civil society thus itself calls for a superior unity, which will be given in the state, which alone allows man to lead a universal life. Thus, even as it is the point in which the greatest split between the particular and the individual is effected, civil society is also what permits that higher unity of the individual and the whole that endows modernity with its meaning. Significantly, Hegel, moreover, indicates that civil society is the privileged terrain of the development of culture (*Bildung*), which indicates simultaneously its debt to the English problematic of civilization and its will to distinguish itself from it (*Bildung* is said to be more internal than civilization).

Starting with Hegel, the meaning of the notion of civil society appears to be more or less fixed, a circumstance that in no way prevented it from being the object of profound meditations. This is not the place, for instance, to show the extent of Marx's originality, concerning which we will offer but a few brief terminological remarks. The first concerns the perpetual interplay of two notions that Marx distinguishes quite well, but often takes pleasure in fusing: civil society (*bürgerliche Gesellschaft*) cannot be reduced to bourgeois society, even if it is the emancipation of property that allowed the state to acquire "a specific existence alongside civil society and outside it." That interplay shows Marx's ambivalence regarding the notion of civil society: of the original English concept he scarcely retains anything but the economic aspect ("the conditions of material existence") since he makes juridical relations elements of the superstructure. On another front, Marx—from the *Critique of Hegelian Political Right* to *The Civil War in France* (1871)—was always a determined adversary of the state, for whose final reabsorption in a regenerated civil society he called. Historical materialism thus appears to be a radicalization of English political economy, pressed into the service of a radical critique of the divisions of the human city. It remains for the reader to determine whether we are confronted with a fertile reversal of juridical idealism or a radical negation of the juridical and political conditions of civil society.

| CIVILITY

"Civility" derives from Latin *civilitas*, which means first of all everything that has to do with the city, *civitas*, and the citizen, *civis*; for example, *civilitas* is the term Quintilian chooses (2.15.25) to translate Plato's *hê politikê* [ἡ πολιτική]. But the Latin word also designates a certain kind of relationship, gentle and ennobled, among people (*clementiae civilitatisque*, "his clemency and courtesy," Suetonius says [*Augustus*, 51.1]); see MENSCHHEIT, Box 1; cf. PARDON.

In the eighteenth century, "civility" thus became a synonym of "politeness," with various subtle variations depending on the authors. Here we examine mainly:

1. Italian thought on civility and politeness; see CIVILTÀ, "civility/civilization," and CIVILIZATION, SPREZZATURA.
2. The way in which "civility" continues to spread in "civil society"; see CIVIL SOCIETY.

On the more general relationship to politics and progress, see CIVILIZATION.

➤ BEHAVIOR, *CULTURE*, INGENIUM, *PRUDENCE*, *WITTICISM*

| CIVILIZATION

"Civilization" is a word that emerged in the eighteenth century (Mirabeau the elder, *L'Ami des hommes*, 1758) to designate dynamically what civility designated "statically" (see *CIVILITY*): civilization is a process through which humans become "civil" by overcoming primitive barbarity through gentler customs and the establishment of "civic" ties.

I. "CIVILIZATION," *CIVILISATION, CIVILTÀ, ZIVILISATION*

Here we have chosen to give priority to the following:

1. Italian thought about *civiltà*, a single term to designate what French calls *civilité* and *civilisation* (cf. SPREZZATURA and VIRTÙ).

2. The German distinction between *Kultur* and *Zivilisation*, discussed in the entry on BILDUNG (see *CULTURE*).

II. Civilization and Politics

On the relation between politics and "civil/civic," see CIVIL SOCIETY. More particularly, see the following:

- on the Greek notion of political community and its connection with the humanity of man, see POLIS and LOGOS, II.A;
- on "barbarity," see TO TRANSLATE, Box 1;
- on Latin *civitas*, see LEX;
- on civil society, see LIBERAL, and the difference between "politics" and "policy" in POLITICS.

See also *DROIT, JUSTICE,* and LAW.

On the relationship to progress, see CORSO, HISTORIA UNIVERSALIS, HISTORY, PERFECTIBILITY, *PROGRESS,* SECULARIZATION; cf. *DESTINY*, GLÜCK, MENSCHHEIT.

➤ *CULTURE*

CIVILTÀ (ITALIAN)

ENGLISH	civility, civilization
FRENCH	*civilité, civilisation*
GREEK	*asteiosunê* [ἀστειοσύνη], *paideia* [παιδεία], *politeia* [πολιτεία]
ITALIAN	*cortesia, urbanità, gentilezza, buona creanza*
LATIN	*civilitas, urbanitas*

➤ BILDUNG, *CIVILITY*, and CIVILIZATION, and INGENIUM, POLIS, SPREZZATURA, *STATE*, *WITTICISM*

In French, two different words, *civilité* and *civilisation*, correspond to two distinct notions, whereas in Italian, a single word, *civiltà*, covers a broad semantic field that includes them both. Here we will seek, if not to explain this divergence from a common origin (Lat. *civis* and its derivatives), at least to show how reflection on this terminological proximity and distance sheds light on the way in which Western societies have conceived their historical destiny.

I. The Connection between Politics and Ethics

The Italian word *civiltà* and the French words *civilité* and *civilisation* have common etymological roots: the Latin *civis* (free member of a city, citizen), its abstract derivative *civitas* (citizenship, citizenry, city), the adjective *civilis* (relating to a citizen, civil; concerning the citizenry as a whole, politics; what is suitable for citizens; popular, affable, benevolent, gentle), the noun *civilitas* (quality of being a citizen, sociability, courtesy), and the adverb *civiliter* (as a citizen, as a good citizen; lawful; with moderation, with gentleness). In all of these uses, we must note the twofold connotation: one political, referring to the particular way of organizing life in common represented by the ancient city-state, and the other moral and psychological, referring to the moderation of manners that life in a city is supposed to produce. The second meaning is also expressed by the term *urbanitas*, which alludes to the *urbs*, the city in its concrete reality, understood as a place where individuals are in permanent

contact, thanks to which manners and language lose their "rusticity" (from *rus*, "countryside"), Rome being the City par excellence, the *Urbs.* Moreover, in the semantic field of Greek, we can note the same group of meanings. *Civitas* corresponds to *polis* [πόλις], *civis* to *politês* [πολίτης], *civilis* to *politikos* [πολιτικός] (the latter meaning "what concerns citizens," "what concerns the state," and also "capable of living in society," "sociable"). In addition, *astu* [ἄστυ] designates, like *urbs*, the city as opposed to the countryside, and often, when used without an article, Athens. The adjective *asteios* [ἀστεῖος], "regarding a citizen," qualifies "what is in good taste, cultivated, elegant," and, speaking of language and style, "subtle, witty" (*asteia* are *bons mots*). It is worth pointing out here that the French word *politesse* does not derive, as is often thought, from Greek *polis*, but from Italian *polito* (smooth, clean), which is itself derived from Latin *politus* (made smooth, clean, by polishing). We find the same duality in the Italian, French, and Spanish words derived from the Latin root.

In contemporary Italian, *civiltà* (formerly *civilità*) designates on the one hand "the state of a people that has reached a certain degree of technical and intellectual progress," "all human achievements in the political, social, and cultural domain," "all the manifestations of the economic, social, and moral life of a people at a given point in its history" (RT: *Grande dizionario della lingua italiana*, s.v.). In the first two senses (the third being modern), the word was already used by Torquato Tasso, in his verse play *Aminta* (1573), for example. Giambattista Vico speaks of "laws suitable for domesticating a barbarous people to lead it to *un' umana civiltà*" (*La scienza nuova*, §100), but in general he uses instead the word *umanità*, which in his work does not designate "the human species," but rather both the process through which nations cease to be "barbarian" and become "fully human," and the final result of this process. On the other hand, *civiltà* also designates a behavior characterizing social life, that of "a cultivated, educated person with elevated feelings." In this case, the word is synonymous with *cortesia*, *urbanità*, *gentilezza*, and *buona creanza.*

A comparison with French is instructive. *Civilité* is first attested in the fourteenth century, in Nicole Oresme's translation of Aristotle's *Ethics*, where it is defined as "the manner, ordering, and government of a city or community" (2.1.9). Here the word retains its first Latin meaning, which is political. But as early as the following century, by a shift already found in Latin, as we have seen, the meaning becomes moral and psychological, designating a certain quality of the relations between members of a community. Thus Antoine Furetière, in his *Dictionnaire universel*, defined *civilité* as "a decent, gentle, and polite way of acting or conversing together" (RT: *Dictionnaire universel*, s.v.). A century later, Denis Diderot and Jean Le Rond d'Alembert's *Encyclopédie* noted that "civility and politeness are a certain decorum in manners and words tending to please and to show the respect that we have for each other" (RT: *Encyclopédie ou Dictionnaire*, s.v.). The word continued to have this meaning, though it was used increasingly less frequently. According to the dictionaries (e.g., RT: *Le nouveau petit Robert*, s.v.), *civilité* is an "old-fashioned" word. However, at the present time there seems to be a renewed interest in the term, which better expresses the "citizen" (*citoyen*) aspect (the word *citoyen* now being used, contrary to its classical use, adjectivally with a view to supplanting *civique*) of the felt need to return to a minimal politeness.

II. When "Civilization" Separates from "Civility"

The question is when and how, if not why, the word *civilisation* appeared in the French language (especially since it is so close in form and etymology to *civilité*, though it has a different meaning), whereas in Italian *civiltà* continues to express a semantic content that is now divided between two different words in French.

The history of the French word *civilisation* is well known. If we grant that this noun appears for the first time in a work by the Marquis de Mirabeau, *L'Ami des hommes ou traité de la population* (1757), it is interesting to note that in this author's writing, the neologism still has a meaning very close to that of *civilité*, since Mirabeau writes elsewhere that "*civilisation* is the moderation of manners, urbanity, politeness, and knowledge disseminated in such a way that decorum is observed and takes the place of detailed laws" (*L'Ami des femmes ou traité de civilisation*, draft for a book, cited in Starobinski, *Blessings in Disguise*, 7). It was only a little later that *civilisation* acquired the meaning that it still has in French, the definition of which we can take from François Guizot, who wrote *Histoire de la civilisation en Europe* (1828). For Guizot, civilization was a "fact," "a fact like others, that can be studied, described, narrated," but also a fact that is not like others, because it is "a fact of progress, of development," so that "the idea of progress, of development" seemed to him "the fundamental idea contained in the word *civilisation*" (trans. Hazlitt, 12, 16).

The French linguist Émile Benveniste, in his article "Civilisation," has shown how *civilité*'s ending in *-té* made it a static term that no longer sufficed to express an idea that was becoming established in the second half of the seventeenth century, the idea of a general progress of human society through time, and how *civilisation*, by its ending in *-isation*, corresponded better, by its very form, to the dynamic aspect of this development. This explains the ease with which people at the end of the century of Enlightenment adopted the Marquis de Mirabeau's neologism. However, we must note the significant resistance of the English writer Samuel Johnson, who, in 1773, as his biographer James Boswell tells us, refused to include the word "civilization" in his famous *Dictionary*, because "civility" sufficed (Boswell, *Life of Samuel Johnson*).

Italian, we might say, agrees with Johnson. As we have seen, it has preserved *civiltà* in the sense of "civility" and "civilization." The less frequently used term *incivilimento* expresses the dynamic movement of which *civiltà* is the result. *Civilizzazione*, modeled on the French *civilisation*, was introduced into Italian in the early nineteenth century, and is found in Alessandro Manzoni and Giacomo Leopardi, but it never became really established, for revealing reasons. Around 1860, for example, Filippo Ugolini wrote: "*Civilizzazione*; let us leave this word to the French, and let us be satisfied with our *incivilimento*, from *costume*, or with *vivere civile*, from *civiltà*. We had these words long before the French had either the word *civilisation* or the state that corresponds to it" (Ugolini, *Vocabulario di parole*

e modi errati). This remark, which is obviously polemical, was inspired by Italians' exacerbated nationalism at the time, but it is also connected with an older trend of thought, the equivalent of which is found in Germany. It was France, the country of the Enlightenment and then of the Revolution, that was in question. France is reproached for its political, ideological, and linguistic expansion, and more profoundly, for its dry rationalism, its conception of progress based solely on scientific, technical, and economic values, its loss of the sense of historical values, of tradition, of popular roots. In contrast, Italian *civiltà* refers, if not to ancient Rome, at least to the Renaissance, a period in which Italy was a model for Europe as a whole. It is the bearer of humanistic values and expresses itself in every domain, from politics and morals to aesthetics. Less oriented toward the future than toward a certain past considered as a model, exempt from hubris, it emphasized the improvement of humans as individuals and still more as social beings (whence the very important dimension of "civility," rather than mastery over nature, in the notion of *civiltà*).

CLAIM

FRENCH   *exigence*, *revendication*
GERMAN   *Anspruch*

➤ *EXIGENCY*, and *DROIT*, DUTY, ENGLISH, LAW, *POWER*, *VOICE*

Derived from Old French *clamer* (in Latin, *clamare*, from the same semantic field as *clarus*, "clear, strong"), the verb "to claim" initially meant, in its first historically recorded uses, "to call, cry, proclaim" (call loudly). However, the current uses of the English verb "claim" and the noun "claim" lack equivalents in French. Contemporary French translations of "claim", such as *revendication, réclamation*, and *pretention*, all have a tone that is, if not pejorative, in any case negative, as if the demand expressed in "claim" needed to be supplemented by a justification (as in the French expression *revendication légitime*). But in its initial usages, juridical or political, "claim" posits the demand as founded, in nature if not in right, and it could be adequately translated in French by *titre*: thus we have to explore the complex relationship between "claim" and "right" (*droit*), a notion which, as Alasdair MacIntyre has pointed out, emerged later on and of which "claim" (a demand founded on a need) might have constituted an early form, thus raising the problem of rights itself. This juridical use has persisted in contemporary Anglo-Saxon discussions of the philosophy of law, of which it constitutes one of the specific features.

In the nineteenth and twentieth centuries, "claim" moved from the political and juridical fields to that of the theory of knowledge, and then more generally to the philosophy of language. "Claim" becomes a "claim to know" and then a "thesis." The use of the term raises first the problem, which emerged from English empiricism and was then taken up by Kant, of the legitimacy of knowledge, of my claims to know and say. There is an equivalent in German (*Anspruch*), but none in French. Finally, "claim," as in Stanley Cavell (*The Claim of Reason*), becomes a "statement" to be maintained or claimed ("my claim is").

I. "Claim" as a Juridical and Political Demand

A. "Claim about," "claim to": A demand for something that is owed, the demand for a right

The noun "claim" and the verb associated with it designate a demand for something as owed: "Not to beg and accept as a favor but to exact as a due." Then "claim" is rendered in French by *exigence* or *titre*. But this raises the question of the legitimacy of the demand, whereas "claim" acquires a juridical (and philosophical) meaning only with the emergence, apparently relatively late, of the term "right." Its meaning then becomes more specific: "an assertion of a right to something" (RT: *Oxford English Dictionary*). A whole juridical vocabulary develops around "claim," as is shown by a multitude of expressions such as "lay claim," "make a claim," "enter a claim," and so forth.

The development of the uses of "claim" raises essential problems connected with the nature of rights. "Claim" originally designated a fundamental demand, the satisfaction of a physical need, or the recuperation of a vital good that has been taken away (which is the use we find in Shakespeare: in *King John*, a character *claims* his wife when she has been taken away by another). But this raises the question of the naturalness and the possession of rights.

> One reason why claims about goods necessary for rational agency are so different from claims to the possession of rights is that the latter in fact presuppose, as the former do not, the existence of a socially established set of rules. . . . [T]he existence of particular types of social institution or practice is a necessary condition for the notion of a claim to the possession of a right being an intelligible type of human performance. . . . Lacking any such social form, the making of a claim to a right would

be like presenting a check for payment in a social order that lacked the institution of money.

(A. MacIntyre, *After Virtue*, 67)

Thus is raised the problem of the status of property claims or titles, which has become central in Anglo-Saxon juridical and political thought: a claim is a demand and a title to ownership of an object that one already legitimately owns. It is, moreover, noteworthy that the use of the term underwent a concrete extension precisely at the time when pioneers were conquering new territories. In America and in Australia, a claim designated a parcel of land acquired by occupation (and not granted or inherited), for example, by miners. This "local" American sense of the word "claim" underlies a certain conception of the claim to property rights as fundamental, and perhaps also to rights in general as (re)taking possession of one's own territory (a territory later claimed by Native Americans was called an "Indian claim"). This clarifies a meaning of "claim to a right": I demand what is mine and always has been.

It is obvious that a certain conception of claims is based on these earlier senses of the word, and that the latter, far from having been erased or integrated into "right," remains in competition with it. We see the result of this in the numerous recent discussions of W. N. Holfeld's book *Fundamental Legal Conceptions* (1919), in which a claim becomes the right par excellence, defined as a privilege or immunity, a "perimeter of protection" (cf. J. Y. Goffi, *Le philosophe et ses animaux*). A "right-claim" is more than a simple right, for it is not merely the permission to perform a certain act (tolerance), or even a prohibition on preventing someone from performing it (right), but implies society's obligation to see to it that the claim is respected, to make the act possible. The theoretician of the norm, Von Wright, shows in *Norm and Action* (86f.) that deontic logic cannot function in accord with two contradictory terms A/non-A, for example, prohibited/authorized, but it is necessary to posit a third term, a supplementary degree of authorization, or of the right, which is the claim. A claim, far from being absorbed into the idea of right, is thus a radicalization of the latter, which explains the anti-authority and territorial form taken too often by questions of right(s) when they have the status of a claim.

B. "Claim on": Locke, or the possible illegitimacy of the political "claim"

This radical, possessive dimension is found in another use of "claim," in the sense of a "claim on" someone. The political sense of "claim" exists in neither Hume nor Hobbes, though it is widespread in Locke. In Hume, a right (that of property, for instance, or that of a sovereign over his subjects) is connected with a conventional agreement or contract that does not need to be founded on anything other than custom and habit. Conversely, Locke calls a "claim" the ruler's authority over a subject, and differentiates it from paternal authority. "Governments claim no power over the son because of that they had over the father" (*Second Treatise on Civil Government*, §118).

Here we encounter an idea of a claim that applies to the person the originary concept of a claim, but—and this is the specificity of Locke and his heirs—redefines it. The claim to

power over a subject must always be explained and justified in terms of natural law: it is because of this justification that it is necessarily a claim, and not a natural authority. Thus in Locke a claim can be illegitimate, made without the people's consent and against its interests, and in fact it is usually in this sense that Locke uses the term.

> If anyone shall *claim* a power to lay and levy taxes on the people by its own authority, and without consent of the people, he thereby invades *the fundamental law* of property, and subverts the end of government [emphasis added].

(Ibid., §140)

The one who holds power is not a lawgiver, but a mere representative of the law (executor), and has a right to be obeyed only in this capacity; he cannot claim it for himself:

> Allegiance being nothing but an obedience according to law, which, when he violates, he has no right to obedience, nor can claim it otherwise than as the public person vested with the power of law.

(Ibid., §150)

Locke's theory can thus be interpreted as an attempt to bring claims into the field of rights, and to subordinate the claim to power to natural law. That is what determines, for him, the possibility of the people rejecting authority. A bad ruler who "claims that power without the direction of the law, as a prerogative belonging to him by right of his office" (ibid., §164), thus gives the people a reason to "claim their right and limit that power." A claim therefore requires a right, and is no longer a foundation or origin but a demand that itself has to be grounded.

Thus in Locke we find for the first time the curious verb "disclaim" (ibid., §191): I can disclaim my membership in the community governed by law and withdraw from it (I will then be outside its jurisdiction, losing the rights inherent in that membership). Whence the later appearance of the expression "to issue a disclaimer" (symmetrical with "enter a claim"), which means to reject a responsibility or to renounce a right and thus one's membership. Thus in and with the notion of a claim, a twofold problem is posed: that of the foundation of authority, of entitlement, and that of the recognition of this authority by its subjects: here we move from the political question to the more general question of the community.

II. "Claim" as a Demand for Knowledge

The problem of authority, of the claim to power, moves from the political field to that of knowledge and argumentation, but the political question still underlies the epistemological problem. In *The Claim of Reason*, Cavell explores this semantic transfer and remarkably develops the relationship of the juridical to the cognitive, and then to the linguistic.

The cognitive concept, like its political ancestor, emerges from discussions of empiricism. What is the question of empiricism, and correlatively, of skepticism? It is the question of legitimacy, of the right to know. What allows us to say that we know? Hume examines our claim to know by reasoning on the basis of experience (note that when in the *Enquiry Concerning Human Understanding* he asks "what is the foundation

of all reasoning and conclusions from experience?" he uses, not "claim," but "pretension"). We "claim" to know, but with what right? The question is taken up again by Kant, in whose work we can discern the emergence of an equivalent of "claim": *Anspruch*, which designates the claim of reason to ask questions that are beyond its power but are legitimate and natural. The legal sense of "claim" can thus be found in the Kantian *quid juris*. The problem of reason is the problem of the claim: a demand that is both inevitable and impossible to satisfy, and is thus fated to remain a claim forever.

Cavell develops this tension between the arrogance and the legitimacy of the philosophical pretension indicated by "claim." At the outset, *The Claim of Reason* defines "claims" as "claims to community." Underlying the question of the basis for knowledge is the political and not solely epistemological question of the foundation of our common use of language. For Cavell, my claim to know masks a prior claim: the claim to speak for others, and to accept that others speak in my name.

> The philosophical appeal to "what we say," and the search for our criteria on the basis of which we say what we say, are claims to community. And a claim to community is always a search for the basis on which it can be, or has been, established.

> (Cavell, *The Claim of Reason*)

The juridical and gnoseological problems raised by "claim" are transformed into a question about our common criteria, our agreements in language.

> When I remarked that the philosophical search for our criteria is a search for community, I was in effect answering the second question I uncovered in the face of the claim to speak for "the group"—the question, namely, about how I could have been party to the establishing of criteria if I do not recognize that I have and do not know what they are.

> (Ibid.)

The question is that of my membership in the community of language, and also that of my representativeness: where do I get the right or claim to speak for others? According to Cavell, this question is the very one that ordinary language philosophers like Austin and Wittgenstein ask. The meaning of "claim" is inseparable from the possibility of losing my representativeness or membership, of being reduced to silence.

> For all Wittgenstein's claims about what we say, he is always at the same time aware that others might not agree, that a given person or group (a "tribe") might not share our criteria.

> (Ibid.)

Thus Cavell offers an analysis of Rousseau in terms of claims:

> What he claims to know is his relation to society, and to take as a philosophical datum the fact that men (that he) can speak for society and that society can speak for him.

> (Ibid.)

My society must be my expression. That is what the theoreticians of democracy always hope, and it is the illusion that Cavell denounces in the work of John Rawls, for instance: if others silence my voice, claim to speak for me, in what way have I agreed to this?

> To speak for yourself then means risking the rebuff—on some occasions, perhaps once for all—of those for whom you claimed to be speaking; and it means risking having to rebuff—on some occasions, perhaps once for all—those who claimed to be speaking for you.

> (Ibid.)

The social contract implies the constant possibility of withdrawing from ("disclaiming," Locke said) the community. Linguistic or political agreement among humans, precisely because it is still a claim, is as fragile as it is profound. This essential fragility of political agreement, which is always threatened by skepticism, constitutes the linguistic sense of "claim."

III. "Claim," The Voice of Ordinary Language

Political agreement is of the same nature as linguistic agreement, which Wittgenstein called *Übereinstimmung* (*Philosophical Investigations*, §241), and which is translated in French as either *concorde* or *accord*, the better to indicate the presence of the voice, the *Stimme* (see STIMMUNG). This agreement exists only insofar as it is claimed, invoked, appealed to. Thus, along with "claim" is defined an agreement that is neither psychological nor intersubjective and is founded on nothing other than the validity of a voice (*Stimme*): my individual voice claims to be, and is, a "universal voice."

With the appeal to the voice, we encounter the first sense of "claim" (*clamare*, "to cry out, to call"). The concept of voice turns out always to underlie the technical concept of "claim." A voice claims when it asserts, on the basis of itself alone, a universal assent—a claim that, no matter how exorbitant it might be, Cavell seeks to formulate in a still more shocking way, without basing it, as in Kant, on something transcendental, or on some rational condition.

To show how the concept of "claim" rethought in this way provides a reply to skepticism, we can point to the universality characteristic of aesthetic judgment in Kant. In his earlier book *Must We Mean What We Say?* Cavell shows how close the approaches of ordinary language philosophers like Wittgenstein and Austin are to Kant's: for them, I always appeal to *myself* to say what *we* say, and this can be rendered only by "claim," or *Anspruch*. To understand this, we have to see what the ordinary language philosophers' approach consists in, on the basis of "what we say when":

> I will suggest that aesthetic judgment models the sort of claim entered by these philosophers, and that the familiar lack of conclusiveness in aesthetic argument, rather than showing up an irrationality, shows the kind of rationality it has, and needs.

> (Cavell, *The Claim of Reason*)

It is Kant who offers the deepest thinking about "claim." The idea of a universal agreement based on my individual

voice makes its appearance in the famous §8 of the *Third Critique.* In aesthetic judgment, Kant discovers "a property of our cognitive faculty," "a claim [*Anspruch*] to the universal validity [*Allgemeingültigkeit*] of its judgment," so that "satisfaction in the object is imputed to *everyone*" (trans. Bernard, *Critique of Judgment*, §8, 49). We know how Kant distinguishes the pleasing from the beautiful (which claims universal assent) in terms of private versus public judgment. How can a judgment that has all the characteristics of the private claim to be public? That is the problem raised by the notion of a claim. Judgments of taste require and demand universal assent; "in fact it imputes this to everyone for each of its judgments of taste, without the persons that judge disputing as to the possibility of such a claim [*Anspruch*]" (ibid. §8, 49). In such a claim, "nothing is postulated but a . . . universal voice (*allgemeine Stimme*)" (ibid., §8, 50). This is the "voice" that is heard in *übereinstimmen*, the verb Wittgenstein uses with regard to our agreement ("in language," cf. *Philosophical Investigations*, §241).

The proximity of the Kantian universal voice and the theses of ordinary language philosophy appear with this final sense of "claim," simultaneously *Anspruch* and *Stimme*: a claim that is empirically unfounded and thus threatened by and pointed out by skepticism, to speak in the name of everyone. Kant's "universal voice" is what we hear in Cavell's claims about "what we say" (*Must We Mean What We Say?* 94).

By redefining "claim" in this way, Cavell brings together the diverse semantic traditions. My assertions or theses—claims—are always based on an agreement in language, on a claim to my representativeness, which is itself political and legal in nature—hence on my voice as singular and universal. To recognize the close connection between all these senses of the word "claim" is to recognize that language, expression—in the cognitive as well as in the political domain—is always also a voice that wants to make itself heard.

CLASSIC, CLASSICISM
NEOCLASSIC, NEOCLASSICISM

FRENCH   *classique, classicisme; néoclassique, néoclassicisme*
GERMAN   *klassik, Klassizismus*
ITALIAN   *classicismo; neoclassico, neoclassicismo*
LATIN   *classicus*

➤ AESTHETICS, BAROQUE, GOÛT, MANIERA, MIMÊSIS, NEUZEIT, ROMANTIC

The ease of translating the term "classic" into all European languages, which is due to a common Latin root (*classicus*), masks differences in content depending on the languages and cultures concerned. The adjective *classicus* (first-class) was used by Aulus Gellius to designate the best authors, from Demosthenes to Virgil, the ones humanist educators used in their classes (whence an amusing false etymology, still given in Furetière's dictionary [RT: *Dictionnaire universel*]). The word is used in this sense in all European languages, each of which has its own "classics." It is also used more specifically to designate the artistic works inspired by antiquity (the classical language of architecture, classical sculptures and ornaments) that the romantics opposed.

But two derived and divergent uses—in France, on the one hand, to qualify the art of the century of Louis XIV, considered as the period of a perfection equal to that of the centuries of Pericles and Augustus, and on the other hand in Germany, to designate the formal system of the Italian High Renaissance in opposition to that of the baroque—eventually created a semantic nexus that was complicated still further by a final difference between the German use of *Klassizmus*, the reaction to Rococo that itself came to be opposed to romanticism, and other Europeans' use of "neoclassicism" (*néoclassicisme*, neoclassicismo) to describe the renewal of taste connected with the discovery of Pompeii, Greece, and Egypt.

I. The Adjective "Classic"

In seventeenth-century France, only the adjective *classique* was used: "it is used almost exclusively to describe the authors read in classes, or who enjoy great authority," Furetière notes in his RT: *Dictionnaire universel* (1690). Following Aulus Gellius, he cites, among these good classical authors, Cicero, Caesar, Sallust, Virgil, and Horace, "who lived in the time of the Republic and toward the end of Augustus, when good Latin was still written, before it began to be corrupted in the time of the Antonines," thus suggesting a threefold link between the idea of the classic and the authority of the ancients, the purity of the language, and teaching.

But in his *Discourse on Theophrastus*, which is situated in the context of the Quarrel of the Ancients and the Moderns, La Bruyère observes, "We who are moderns, will be ancients in a few centuries." As early as the eighteenth century, the word is extended to good French authors, "whose perfect models should be imitated as much as possible"; "you have given me great pleasure," Voltaire writes, "in telling me that the Academy is going to do France and Europe the favor of publishing a collection of our classic authors, with notes that will stabilize language and taste" (see 1761 letter from *Selected Letters of Voltaire*, trans. L. C. Syms, 150). We find again here the role of authority—in this case, of the Academy—and the concern for the preservation of a good state of the language and for the imitation of good models. The lectures given at the Royal Academy of Painting and Sculpture, in which the

works in the king's collection (especially those by Poussin, considered the leader of the French School of painting), on the one hand, and on the other the courses given by Jacques François Blondel, who celebrated the works of François Mansart, paved the way for the extension to the fine arts of this notion of "French classics," and particularly the "classics" of the century of Louis XIV.

This development was not limited to France: the preface to the first volume of the *Literary History of France* published by the Benedictines in 1733 emphasizes that "[w]e have seen several foreign nations, far less studious than ours, priding themselves on collecting in a library all the authors they have given to the Republic of Letters."

II. How French Classicism Became Baroque

The French word *classicisme* was created on the basis of the adjective *classique* in the context of the battle with romanticism. In 1873 Émile Littré still considered it a neologism, and defined it as the "system of the exclusive partisans of the writers of antiquity or of the classic authors of the seventeenth century." The word is also used in a related sense in the field of the fine arts: works that "claim to imitate the works of ancient statuary" are called *classique*, and David's "new school" is called the *école classique* because its "compositions are regular and imitate the Greeks."

In Germany, the term *Klassizismus* is still used to designate the international movement at the end of the eighteenth and the beginning of the nineteenth centuries, which in France is called *néoclassicisme*, a more accurate term because the source of classicism, the imitation of the ancients, was renewed at that time by the discovery of Greek architecture and by the rationality of the Enlightenment.

In French culture, on the contrary, the notion of classicism was shifted to the art and literature of the second half of the seventeenth century. In the aftermath of the battle over romanticism, instruction in the universities and schools tried to make French literature of the seventeenth century the expression of the French genius: clearness of expression, sober elegance, nobility, and decorous sentiments. This notion was extended to the fine arts, and it was claimed that the same qualities could be found in the works of Poussin, Le Sueur, and Lebrun. Since this period corresponded to the reign of Louis XIV, it was called the "Classic Age," as the Spanish speak of the "Golden Age."

However, writers on German art history adopted the term *Barock*, which had up to that point been pejorative (see BAROQUE) in referring to the art of the Seicento (H. Wölfflin, *Renaissance und Barok*), and, on the other hand, they constructed a visual analysis on the basis of the contrast between the classical aesthetics of the early Cinquecento and the baroque aesthetics of the Seicento (H. Wölfflin, *Kunstgeschichtliche Grundbegriffe*, 1915). French classicism was thus contemporaneous with Italian baroque.

Certain national specificities (it was forgotten that they were not peculiar to the century) and the existence of lively debates regarding the role of ornament or antique models (it was forgotten that they cut across the two cultures) made it possible for a time to maintain the opposition between (French) classicism and (Italian) baroque. But when the notion of baroque was broadened on cultural (*stile trentino*) or

formal (the "grand style") bases, it was difficult not to see that some aspects of French art in the seventeenth century, from Simon Vouet's decorative lyricism to the grand style of Hardouin-Mansart, belonged to this international model. Describing French classical art as baroque reversed the way it was read, leading to a rediscovery of the theatricality of works that had earlier been admired for their balance and clarity, and of the baroque grandiloquence of Versailles, previously celebrated for its classical moderation—whence the necessity of introducing other notions like that of Atticism (Merot, *Éloge de la clarté*, 1998). Roland Barthes discerned a dark Racine who might have read Sade, and Anthony Blunt found in François Mansart a paranoid anxiety about the perfect form that relates him to Borromini. The internal tensions within the two cultures were rediscovered in their common reference point, which was, however, differentiated from that of antiquity: the tense expression of Pierre Puget's statue of Milo of Croton, conceived in emulation of the ancient Laocoön, is contrasted with the calm gestures of the nymphs in Girardon's sculpture *Les bains d'Apollon*, which is inspired by the Apollo of Belvedere; Bernini takes the same statue as his starting point, giving it life in his "Apollo and Daphne," whereas Poussin, inversely, idealizes the figures or the models that pose for him.

For literature as for the arts, classicism is not a doctrine but a horizon.

COMBINATION AND CONCEPTUALIZATION

A "Particle Metaphysics" in German

➤ GERMAN, and *DESTINY*, ENGLISH, FRENCH, *TO BE*, TO TRANSLATE

While the use of any linguistic system is based on a double operation of selection (paradigmatic) and combination (syntagmatic), the German language is characterized by the great importance of combination, both at the systemic level and as a process of semantic innovation. This "Lego set" functions both in everyday language and within each code or subsystem. We also find it in philosophical language, where the omnipresence of combinations plays a crucial role

in conceptualization. That certainly does not mean that speakers of German spontaneously become "philosophers" or theoreticians merely by virtue of their language, but it remains that in German one can, quite differently from in French, conceptualize on the basis of the language's basic rules and, as it were, "do philosophy with grammar."

But the philosophical use of German grammar is based on a paradox. On the one hand, philosophical language seems to seek to make manifest language's ontological implications, and on the other, it extracts itself from the natural gangue of language by using the flexibility inherent in writing to bring out the difference between the concept and the linguistic given, thus emphasizing the emergence of the concept. Without claiming to offer a historical account or a rigorous study of the properly linguistic aspect of this question, we will first examine briefly the role played by combination at the level of individual words and then bring out, using the extreme example of the language games peculiar to Heidegger, the simultaneously linguistic and philosophical conditions of the translatability and untranslatability of the concept of *Gestell*. Then we will show how, by creating the concept of *Gefährt*, the philosopher Hans-Dieter Bahr rewrites and unwrites the Heideggerian *Gestell* by giving language still another twist.

I. Combinations and Conceptual Resources

A. The double register of combinations

The German language constantly uses a double register of combinations. The first register corresponds to the mechanism that Saussure called, in chapter 6 of his *Course on General Linguistics*, "syntagmatic interdependence," and which is a generalizable phenomenon of the constitution of meaning. The second register is completely specific to German and entails important consequences regarding the nature of philosophical writing.

By "syntagmatic interdependence" Saussure refers to the fact that in any arrangement of signs, the combination of elements functions as a mathematical "product" insofar as combination creates meaning independently of the original meaning of the elements it arranges. He speaks of a "combination of interdependent elements, their value deriving solely from their mutual contributions within a higher unit" (see RT: *Cours de linguistique générale*; English trans. here by Roy Harris) and gives as an example *désireux*, which is not a semantic addition of two elements—*désir* and *eux*, but rather the mathematical "product" of their juxtaposition.

But for word construction German uses a parallel type of construction in which, at the end of the process of combination, each original element retains more or less completely its literal meaning. Whence the impression that German is more "motivated" than French, that is, that the sign is less arbitrary in German because the relation between signifier and signified is more constantly discernible. Thus a railway station or yard is called a *Bahnhof* (*Bahn* = way [cf. *Eisenbahn* (railway)] + *Hof* = court or yard), whereas *Bauernhof* (*Bauer* = farmer + *Hof*), that is, a farm, is verbatim a "peasant's yard," and *Gasthof* (inn) is the combination of *Gast* (guest) and *Hof*, etc. Similarly, a restaurant in a railway station is a *Bahnhofgaststätte*, that is, a railway (*Bahn*) + court (*Hof*) + guest (*Gast*) + place (*Stätte*).

Of course, the rules of combination are governed by numerous constraints, whether within the words or in their arrangement; it remains that the resources of combination in German are particularly rich in comparison with those of other European languages. They are even virtually unlimited, and the result is constant linguistic innovation. Although German has retained a certain number of combinations that eventually join the reservoir of words reflected by a given historical state of the dictionary, creation is incessant. New combinations can be invented at any time, no matter what later happens to them.

We could say that in a certain sense combination is more important than selection, or that it draws selection to it, or that it exercises a pressure on it, with the result that a few elements make it possible to deploy a multiplicity of meanings. For example, it suffices to take verbs as polyvalent as those corresponding to *mettre* and *poser* in French—*setzen*, *legen*, and *stellen*—and to combine them with prepositions such as *an*, *aus*, *ab*, *vor*, etc., or with verbal particles such as *dar*, *ver*, *zu*, *ent*, *um*, etc., in order to deploy, by combining verb and preverb, a considerable number of meanings that in French would require recourse to an equally considerable number of different verbs. If we actuate the combinatorial process that governs the syntagmatic environment of the verbs *legen*, *stellen*, and *sitzen* alone, we obtain the following translations—and here we are limiting ourselves to indicating just a few of their common arrangements—*sich auf etwas einstellen*, "adapt to something" (whereas "to meddle or be involved in something" is expressed by *sich mit etwas abgeben*); *etwas umstellen*, "invert or rearrange something"; *sich umstellen*, "adapt to a new situation"; *seine Uhr umstellen*, "reset one's watch"; *auf ein Pferd setzen*, "bet on a horse"; *Wert auf etwas legen*, "assign value to something"; *zulegen*, "speed up"; *eine Platte auflegen*, "put a record on"; *etwas verstellen*, "mislay something"; *sich verstellen*, "dissimulate"; *sich einsetzen*, "go to bat for something or someone"; *sich durchsetzen*, "assert oneself" or "pay dearly for something"; *etwas jemandem zustellen*, "mail something to someone"; *Vieh umlegen*, "slaughter livestock"; *sich auf etwas hinsetzen*, "sit down on something"; *jemandem etwas hinstellen*, "deposit or put something somewhere for someone," etc.

It has to be emphasized that in German determination by particles and preverbs is very clearly spatial in nature: for example, the preverb *an* is formed on the basis of the preposition *an*, which indicates the idea of contiguity, whereas the particle *um* is formed on the basis of the preposition *um*, which means "around." But *an* also has a temporal, inchoative value, and the preverb *um* can indicate a process of change (*seine Uhr umstellen*, "to reset one's watch"; *sich umstellen*, "to adapt"; *etwas umwerfen*, "overturn something"); the idea of a Freudian *Verschiebung* (displacement) is already in the particle *ver-*, which itself indicates movement or delay, just as *Entstellung* is semantically invoked by the particle *ent-*, itself indicating an idea of deformation, etc. Not only is the concrete and spatial aspect usually more visible than it is in French, whose Latin substrate is not in principle obvious and requires a knowledge of etymology (for example, to discern the Latin preposition *ad* in *apporter*, from *ad* and *portare*, or *inde* in *emporter*, from *inde* and *portare*), but the rise from the empirical to the transcendental is implicit in the play of

combination in German, since it allows the passage from the spatial to the temporal, from the concrete to the conceptual, and from the representable to the idea.

B. The resources made available to philosophical language by ordinary combination

These procedures, which are particularly effective at the level of the linguistic system, offer conceptualization and philosophical language unlimited resources.

It suffices, in fact, to repeat this movement of language by reusing its elements and the rules of their combination to promote the word to the status of a concept. But moreover, this reuse of grammar is never limited to a simple repetition. There is repetition and differentiation.

In his book on Freud's language, Georges-Arthur Goldschmidt states, not without forcing things a bit:

> There is nothing simpler or more immediate than the philosophical vocabulary. Chapter 1 of the *Phenomenology of Mind,* "Die sinnliche Gewißheit" ("Sense-certainty"; it is true that German can hardly differentiate between "sensible," "sensorial," and "sensual"), consists from beginning to end of words familiar to a five-year-old child (with perhaps the exception of *Vermittlung,* "mediation," and *Unmittelbarkeit,* "immediacy").

> (G. A. Goldschmidt, *Quand Freud voit la mer*)

There is something profoundly true in this exaggeration, and it is hardly exaggerated to say that the most common, everyday German is very often potentially the German of ontology. For example, when one wants to say that someone is undergoing withdrawal (from drugs, etc.), one says that *er leidet unter* (he suffers under) *Entzugserscheinung. Erscheinung* also means "apparition," "phenomenon" in the philosophical sense, and *Entzug,* which here means "weaning," also means "withdrawal." Suffering is thus expressed by the same words that serve to refer to the withdrawal of Being.

It would, of course, be a kind of fetishization to conclude that German, like Greek, is from the outset and by nature the language of metaphysics (the shame-faced French version) or, worse yet, that one can philosophize only in German (the triumphalist German version).

All the examples just mentioned show that two effects are in fact conjoined: at the lexical level we see the possibility of an immediate passage from ordinary language to philosophical language—as if the latter "mirrored" the everyday, and vice versa; and at the syntactical level, combinatorial procedures that are particularly effective for language proper offer major resources for conceptualization and philosophical language.

Let us emphasize once again that this does not mean that we move immediately from everyday language to the language of philosophy. There is both repetition and differentiation. There is repetition because it suffices to reduplicate processes of linguistic combination, reusing their elements and rules to extract the concept from a preconceptual discourse. But the repetition is marked as both repetition and difference. To give a famous example, the noun *Aufhebung* does exist in language in its normal and normed state, but it does not have the double meaning that Hegel gives it, whereas the verb *aufheben* can in fact mean "preserve," "raise," or "cancel." The properly dialectical meaning that Hegel gives the noun *Aufhebung* is as distant from the norm in German (because normally *Aufhebung* means simply "abolition," "suspension [of a session]") as it is irremediably untranslatable in French. On the other hand, Hegel himself often uses the verb *aufheben* in the completely customary sense of "cancel." The concept deepens the gap between ordinary language and philosophical language but without there being any need to invent a new terminology (see AUFHEBEN).

It is here that we encounter the problem of the *Fremdwort*, that is, the use of a foreign term, usually of Latin or French origin, in order to express what German can say by means of the procedures we have just isolated. Concepts of foreign origin, precisely because they are outside the ordinary language / philosophical language circuit, are perceived as odd, arbitrary, even incomprehensible. Thus *Willkür*, from *Wille*, "will," and *Kür*, "choice," hence "free will," but the word *Arbitrarität* is "not well-received." It is spontaneously rejected.

C. Untranslatability and the evolution of translations

Taken all together, these phenomena are prodigiously effective for German philosophical writing and constitute one of the main reasons why a large part of its vocabulary cannot be translated word for word. The latitude that German grants combination contrasts very strongly with the situation of French, where the irreducible distance between one word and another requires conceptual creation to take quite a different path: the concept of writing cannot mean the same thing in German and French because the processes of conceptualization do not take place on the same stage.

The result is a strange to-and-fro between German and French, the direction of which can be totally reversed over time. Thus, it is striking to note that in the nineteenth century French translations of German philosophical texts had a strong tendency to Gallicize the text, whereas in the twentieth century, and especially after World War II, the tendency was on the contrary to "Germanize" French philosophical language. Under the pressure of this new *habitus*, we are no longer surprised to read *chosification* (modeled on *Verdinglichung*) or *déterminité* (modeled on *Bestimmtheit*). The effect of contamination is obvious and in no way disconfirms what has just been said. In this case, although the words are French, it is a question of a peculiarly German philosophical idiom that has been acclimated in the philosophical language. Generalized, it would lead to an idiom completely separate from everyday French, whereas for the German philosophical language the same phenomena have their very distant source in the abandonment of Latin as the scholarly language in modern Germany, especially since the eighteenth century.

II. An Extreme and Revealing Example: The Heideggerian *Ge-Stell*

A. The terminological constellation of technology

Let us take, as an extreme illustration, the case of Heidegger. In *Die Technik und die Kehre*, he sets forth his philosophy of technology on the basis of a small group of words whose treatment illustrates perfectly the mechanisms under

discussion: the concept is dissociated from ordinary language in accord with principles of combination and re-marking. The word *Kehre*, which was used from the sixteenth to the nineteenth centuries and meant "turn," "return" (like the plow at the end of the furrow) or, in a Pietist context, "(spiritual) conversion," has disappeared from ordinary language, which uses the forms of *kehr-* only in the form of a combinatory element—for example, *Rückkehr*, "return from," *Abkehr*, "the act of turning away from," *Verkehr*, "commerce, traffic," *Wiederkehr*, "return, comeback," etc.—or of *kehrt-* (for example, *kehrtmachen*, "make a U-turn, turn back"). The linguistic "turn" represented by *die Kehre*, the "twist" that Heidegger gives language, thus consists in fabricating a word, *die Kehre*, by analogy with *die Wende*, "the turning point, the reversal," with the strong connotations of temporality that the word implies, especially in the sense of "historical turning point" or "reversal of the sequence of events."

The twist to which Heidegger subjects the language leads him to a deliberate overdetermination: *die Kehre* is a return(ing), a turning like returning. Heidegger designates thereby the return/anamnesis of Being manifested and concealed by technology, or a new way of conceiving technology in its nontechnological essence.

The two other verbs that provide the linguistic core of conceptualization in this text are *bergen* and *stellen*. *Bergen*, *stellen*, *Ge-Stell*, *Kehre*, to which is added *Bestand* (from the verb *bestehen*, "exist"), form a constellation of words on the basis of which Heidegger conceptualizes technology's relation to Being.

B. The re-marking of *Ge-stell*

In the case of *Ge-stell*, a typical example of the untranslatable, Heidegger, who is well aware that the word he is creating is unusual, excuses himself for the challenge that his creation represents and feels obliged to explain it in order not to be incomprehensible. "Wir wagen es, dieses Wort in einem bisher völlig ungewohnten Sinne zu gebrauchen" ("We dare to use this word in a way completely unusual up to now"; *Die Technik und die Kehre*, 1978, p. 19). After reminding us that the Platonic term *eidos* is far more daring than *Ge-Stell*, he concludes by saying that the use he makes of the latter almost demands too much of language and thus might lead to misunderstandings.

■ See Box 1.

Ge-Stell, an untranslatable term par excellence, has unfortunately been acclimated in French in the form of the term *arraisonnement*. In André Préau's translation of Heidegger's *Essais et Conférences*, we find the following note (p. 26), which seeks to justify the choice of the term:

> We have seen this root figure in a small group of verbs designating either fundamental operations of reason and science (following the trace, presenting, highlighting, representing, explaining) or measures of technology's authority (questioning, requiring, deciding, committing, setting up, ensuring, etc.). *Stellen* is at the center of this group; here it is "to stop someone in the street to demand an explanation, to force him to *rationem reddere*" (Heid.), that is, to ask for his sufficient reason. The idea is taken up again in *Der Satz vom Grund*

(1957). Technology calls nature to account, boards and inspects it [*l'arraisonne*], requires that everything justify itself before the tribunal of reason and in accord with its norms.

In *Questions IV*, the translator's note on p. 155 is hardly more illuminating, and translators, who rightly challenge the translation given in *Essais et Conférences*, clear themselves of responsibility by concluding that the term is untranslatable:

> And they add: "It seemed to us impossible to find in French a word corresponding to *Stellen* and rendering all the derivations Heidegger attaches to the verb *stellen*: *Gestell*, *Nachstellen*, *nachstellen*, *verstellen*, *Bestellen*.

There is, of course, no single verb that translates the German *stellen* in all cases and in such a way that one could find it in all the combinations of the original. But there are other factors that help make *Ge-stell* untranslatable. To lay out the logic of the concept insofar as it arises in and through writing, we can start from the place in the text where Heidegger explains the reasons for his choice. He writes:

> Wir nennen jetzt jenen herausfordernden Anspruch, der den Menschen dahin versammelt, das Sichentbergende als Bestand zu bestellen—das Ge-Stell . . . . Ge-Stell heißt das Versammelnde jenes Stellens, das den Menschen stellt, d.h. herausfordert, das Wirkliche in der Weise des Bestellens als Bestand zu entbergen. Ge-Stell heißt die Weise des Entbergens, die im Wesen der modernen Technik waltet und selber nichts Technisches ist. Zum Technischen gehört dagegen alles, was wir als Gestänge und Geschiebe und Gerüste kennen und was als Betandstück dessen ist, was man Montage nennt.

Here is André Préau's French translation of this passage in *Essais et Conférences*:

> Maintenant cet appel pro-voquant qui rassemble l'homme (autour de la tâche) de commettre comme fonds ce qui se dévoile, nous l'appelons—l'Arraisonnement . . . . Ainsi appelons-nous le rassemblant de cette interpellation qui requiert l'homme, c'est-à-dire le pro-voque à dévoiler le réel comme fonds dans le mode du « commettre ». Ainsi appelons-nous le mode de dévoilement qui régit l'essence de la technique moderne et n'est lui-même rien de technique. Fait en revanche partie de ce qui est technique tout ce que nous connaissons en fait de tiges, de pistons, d'échafaudages, tout ce qui est pièce constitutive de ce que l'on appelle un montage. (28–29)

Here we can make three observations:

1. Heidegger clearly distinguishes between the technicity of technology, represented by the terms for which he gives the generic principle of construction, and thus technology as a material procedure functioning by means of machine-like arrangement, from the nontechnical essence of technology, which is the object of his reflection. This distinction itself corresponds to a double use of language: the normal use, which describes technology as machinery, and the term *Ge-Stell*, which reconstructs language by combining two elements against their nature: *Ge*, which refers to the seme of

1

Gestell

➤ VORHANDEN

In German, the word *Gestell* usually means frame(work), mount, setting. As Heidegger remarks, "In ordinary usage, the word *Gestell* refers to some kind of apparatus, for example, a bookrack. *Gestell* is also the name for a skeleton" (*Question concerning Technology*). The word entered the philosophical vocabulary in Heidegger's work—probably in the 1953 lecture "The Question of Technology," where it characterized the essence of modern technology—or technology as such. Although it is not a neologism, the term must nonetheless be understood as a neologism in view of the fact that it is used by Heidegger in a broad, unexpected, unusual sense to designate the whole or the collection (which is indicated by the prefix *Ge-*) of all the modes of setting (Ger. *stellen*) that causes man's way of wanting to impose modern technology on the whole planet ultimately to enslave him as the servant of what he intended to have at his service.

Starting in the 1950s, Heidegger called *Gestell* what in the 1930s he had called *Machenschaft*—not, of course, in the common sense of "machination," but as "the realm of doing" or even "efficiency."

Regarding the choice of the term *Gestell*, Heidegger told the German news magazine *Der Spiegel*:

> Das Wesen der Technik sehe ich in dem, was ich das "Ge-Stell" nenne. Der Name, beim ersten Hören leicht mißverständlich, recht bedacht, weist, was er meint, in die innerste Geschichte der Metaphysik zurück, die heute noch unser Dasein bestimmt. Das Walten des Ge-Stells besagt: Der Mensch ist gestellt, beansprucht und herausgefordert von einer Macht, die im Wesen der Technik offenbar wird.

> (I see the essence of technology in what I call the *Ge-Stell*. This term, which is easily misunderstood when first heard, when correctly conceived refers what it designates back to the innermost history of metaphysics, which still determines our existence. The reign of the *Ge-stell* means: man is subject to the control, the demands, and the provocation of a power that is manifested in the essence of technology.)

> ("Martin Heidegger im Gespräch," in *Antwort*; M. Heidegger, *Reden und andere Zeugnisse eines Lebensweges*)

As he remarked as early as a lecture given in 1953, Heidegger proposes to interpret *Gestell* in a "completely unusual" (*völlig ungewohnt*) way, on the model of *Gebirg* (mountain range) or *Gemüt*.

Let us attempt here a brief comparison of two French translations of the term *Gestell*. *Arraisonnement*, a public-health term, means "a careful examination of a ship that is suspect for health reasons" (Littré), and *arraisonner un navire* also means, in a maritime and hygienic context, "to find out where a vessel is coming from and where it is going." But, in addition, *arraisonner* means "to seek to persuade by giving arguments." It is this twofold meaning that A. Préau has in mind when he justifies his translation: "Technology calls nature to account, boards and inspects it [*l'arraisonne*], requires that everything justify itself before the tribunal of reason and in accord with its norms" (translator's note in "La question de la technique," tr. Préau, 26). The translation of *Gestell* by *arraisonnement* is certainly a discovery that stimulates thought by situating the essence—or rather the site of modern technology—in the realm of reason and the principle of reason, *rationem reddere*. But it is also open to criticism because the *Gestell* does not express itself using the vocabulary of reason. "A good translation" and at the same time one that is "eminently interpretive," says F. Fédier, and in addition one that "lets us glimpse what the word *Gestell* means as Heidegger uses it," but only on condition that the word *arraisonnement* be understood "to express a rational, systematic treatment in which everything is already grasped in the framework of arrangements to be made in order to provide a *solution* for *problems*" (*Regarder voir*, pp. 206–8). Fédier himself proposes *dispositif* (apparatus) as a translation for *Gestell* or, in a more developed way, *dispositif unitaire de la consommation*, meaning by that "all the prior measures by means of which everything is made available in advance in the framework of a putting in order." Here all explicit reference to reason has disappeared. On the other hand, the root *stell* of the verb *stellen* (set, set up) has a prominent place in the apparatus. Nonetheless, a circumlocution is necessary to render the meaning of the German collective prefix *Ge-* : *unitaire* and the *cum* in *consommation* indicate it doubly.

construction (the act of putting together, assembling) and *stell*, torn away from the usual semantics of the word *Gestell*, which can mean, for instance, "scaffolding, rack, skeleton" (these are Heidegger's own examples). There is a layering, and the product thus obtained becomes useless for ordinary use—whence Heidegger's fears of being misunderstood. The word is uprooted, and the usual rules of combination (*Ge* + *stell*) have produced a surplus of meaning well indicated by Heidegger's way of writing the word with the dash characteristic of re-marking.

2. When Heidegger writes: "What originally unfolds mountains in lines and runs all through them in the fold of their cohesion is this collector we call a 'mountain range'" (Was die Berge ursprünglich zu Bergzügen entfaltet und sie in ihrem gefalteten Beisammen durchzieht, ist das Versammelnde, das wir Gebirg nennen) (*Die Technik und die Kehre*), this sentence is difficult to understand if one does not see in it the play of oppositions between traits (*Bergzügen*, translated here as "lines" [*lignes*]), fold (*entfaltet*, "unfolds," and *gefaltet*, "folded," with all the Leibnizian and Goethean connotations of *Vielfalt* and *Mannigfaltigkeit*, "multiplicity" and "diversity"), and cohesion (*Beisammen*). In this semantic constellation the *Ge-* in *Gebirge* (*der Berg*, "mountain," *das Gebirge*, "mountain range") is equivalent to the seme Totality

(a collecting totality). Just as the range is what "runs through" and collects the diverse, the *Ge-* in *Ge-stell* attracts attention to what, beyond the functionality of machine-like construction, is the whole—an ideal, non-presentable whole that merges with Being and masks it in and through its function and state. That is what all French translators note, following in the footsteps of Heidegger (*Essais et Conférences*, 26n1 and 348n2; *Etre et temps*, 355n1). It is clear that the French term *arraisonnement* in no way reflects these remarks, unlike Fédier's *dispositif unitaire*.

3. The semantic derivation of *Gestell* on the model of *Gebirge* (the idea of collection) and not of *Gestänge* or *Geschiebe* (assembly or collection) thus moves the seme "assembly" toward the seme "collection." But this holds only for the *Ge-* in *Ge-stell*. The second part of the term has to be related to the system of conceptual marks that Heidegger elaborates around *stellen*, and which it is not impossible to describe, despite what the translators of *Questions IV* say. The meaning of *stellen* that André Préau borrows from Heidegger and cites in his note ("to stop someone on the street to demand an explanation, to force him to *rationem reddere*") might provide support for the idea of *arraisonnement*. But in *Der Satz vom Grund*, Heidegger gives a quite different commentary on the relation between *stellen* and *rationem reddere*. As always in his work, the commentary gives rise to new expansions of the conceptual constellation. Everything turns on the meaning of *reddere*. Heidegger emphasizes that *ratio* is *ratio reddenda*, reason is a rendering. After proposing as German translations for *reddere* the words *zurückgeben*, "to render, give back," and *herbeibringen*, "to bring," he adds *zu-stellen*, with the hyphen of the philosophical remark. The postal analogy is explicit: "Wir sprechen von der Zustellung der Post. Die ratio ist ratio reddenda" (We are speaking of delivering the mail. Reason is *ratio reddenda*) (*Der Satz vom Grund*, 47). "Delivering the mail": we are far from the pirate metaphor of boarding and inspecting (*arraisonnement*); instead, we are concerned with the logic of the return to sender. Reason sends the world back to itself and thereby renders account of it. The spatial metaphor (return to sender) can be related systematically to the thematics of Being as "a sending" (*Schickung* or *Geschick*), rendered in French as *envoi*, a word that plays cleverly (let us note in passing that "cleverly" can be translated as *geschickt*, *mit viel Geschick*) on the semantic ambivalence between destiny (see SCHICKSAL) and sending, which in Heidegger is systematically related—but in a rhizomatic way—with history and historicity (see GESCHICHTLICH). Heidegger never ceases to *zu-stellen*. In the lines following the paragraph quoted above, he says explicitly that he includes in the verb *stellen* the connotations of *her-stellen*, "fabricate, produce," and *dar-stellen*, "represent," both referring to *poiêsis*. If then *Ge-Stell* brings together the whole of the construction, it produces and represents. It is the essence of technological construction as presenting totality. But in order to present Being, technology penetrates it. It opens it up, pierces it, transforms

it, redistributes it, and in that way brings it out, reveals it—that is the concept of *Entbergen*.

The constellation of concepts grouped around the verb *bergen*—which is central for Heidegger, since it is explicitly developed elsewhere to explain the concept of truth as *Unverborgenheit*, on the basis of the Greek *alêtheia*—refers in German to an original ambivalence given by language. Like the famous verb *aufheben* at the origin of Hegelian thinking, the verb *bergen* is ambiguous from the outset, because it means both "conceal" (like *verbergen*) and "bring out" (for example, victims buried under ruins). Heidegger recomposes the Greek *alêtheia* by resorting to the concept of *Unverborgenheit*, constructed on the basis of the verb *verbergen* ("conceal," but also "hide from our sight"). Thus *alêtheia* is the essence of what was hidden from our sight (*verborgen*) and appears as if unburied, un-concealed. That is why the "poïetic" part of *Ge-Stell* refers to the ambivalence of technology, which brings out Being but at the same time veils it, since reason receives back only its own image, which it sends to itself.

However, since each displacement, each condensation of the term, encounters not words belonging to the "natural" state of language but ones that have already been displaced, uprooted from their meaning, things are still more complicated. For example, there is *bestellen*, which is caught up in the rhizomatic links surrounding *-stell* and *Ge-stell*, and in no way corresponds to the normal sense.

Normally, to *bestellen* something means to "order something" (as one orders an article from a catalogue), or to "reserve" (for example, a theater seat), or again "ask someone to come somewhere, summon," not to mention other uses, such as *schlecht bestellt sein um jemanden*, "someone is in a bad way." But in Heidegger, and especially in the context of *Die Technik und die Kehre*, the verb *bestellen* means something else. Its use, which is completely unusual and in reality incorrect in all its occurrences, elicits each time, and always indirectly, the idea of having something at one's disposal, of using an apparatus or being dependent on it. As such, *bestellen* is thus opposed to *Bestand*, "inventory," as *Ge-Stell* is opposed to the idea of construction; the opposition is anchored in part in language, through the opposition between *stehen*, "to stand," and *stellen*, "to set up." *Bestellen* is the act of "putting in" (put in an order, put in place, put in cultivation, etc.). Reason catches nature in a trap and by doing so is caught in its own trap.

The technological availability of the world thus catches Being in a trap, tracks it down; entities are thus sought, observed, invented; nature is pursued in an apparatus of representation until the object (*Gegenstand*: that which is [*steht*] before [*gegen*] the eyes) disappears as an object and, becoming inconsistent (*gegenstandlos*), it reappears as a simple inventory, as consistency (*Bestand*): it is the movement from *Gegenstand* to *Bestand* (see OBJECT). In ordinary language *Bestand* corresponds to being appropriated and possessed (patrimony, inventory, substance, list), to whatever constitutes some existing thing in the mode of belonging. To constitute a *Bestand* is to store up such things, in and through technology.

Ge-Stell is thus the part of Being that we have made available (*bestellbar*, in Heidegger's vocabulary) and which manifests it by disguising it as *Bestand*. That is why, as Heidegger

says toward the end of the text, if the fate of being (*das Geschick*), its sending, reigns in the mode of the *Ge-Stell*, then we are "in the greatest danger." But this conclusion differs from the view of the ecology movement because the famous "return/turning point" (*Kehre*), the "conversion" with which Heidegger's reflection ends, is the recognition that the greatest danger is also the greatest good fortune—even the salvation that is evoked by Hölderlin's verses quoted by Heidegger: "Wo aber Gefahr ist, wächst / Das Rettende auch." Salvation consists in turning toward that which—in technology, but beyond its *Ge-Stell* and the narcissistic trap of its apparatus—manifests the sending/destiny of Being.

The *Ge-Stell* is thus not an *arraisonnement*. It might be better to render *Ge-Stell* as "un-hiding" or even "hide and seek."

III. *Gefährt* and *Gestell*:
Hans-Dieter Bahr's reply to Heidegger

Heidegger's language constitutes a limit-state for philosophical writing, and if the contagion of the operation of re-marking is unlimited in his work—the term "rhizome" is clearly not excessive to describe what happens in it—it would be wrong to believe that the contagion is limited to the margins of his work. In philosophy, as in literature, a text never comes along all by itself. From Adorno to Ernst Bloch or Ulrich Sonnemann, to mention only them, there is no lack of examples that would show the permanence of a philosophical writing that contrasts strongly with the pompous waffling of certain contemporary German philosophers, who consider the excess of personal writing style peculiar to Heidegger as inseparable from his political compromises and who have inevitably concluded that precision of thought involves giving up a personal style. The following few lines by Hans Dieter Bahr, one of the young German philosophers who have not given up on a personal writing style, shows that the reply is never long in coming. In the essay from which these lines are taken, which appeared in 1985 under the title *Sätze ins Nichts* (Sentences [cast] into Nothingness, or Leaps into Nothingness) and which is devoted to the subject of the city, Bahr replies, in a very beautiful language whose richness makes most of the terms untranslatable into French, to the Heideggerian *Ge-stell*.

Das Gefährt . . . Aus mehreren Gründen scheint mir das Technische genauer als Gefährt denn als "Gestell" verstehbar zu sein. Beschreibt Heidegger auch durchaus Fahrt und Gefahr der Technik, so doch zu sehr an eine enge Dialektik unbeständiger Bestandssicherung gebunden, als verfügten wir bereits über eine neue Schrift, die jene Technik wiedergebe. Über das Technische der Verfügungen, Sicherungen und steuernden Verschickungen hinaus mit all ihren katastrophalen Entgleisungen, ist Technik zudem Trans-Mission, schwappt über sich als Sendung und Nachricht, als Zutragung und Zuständigkeit hinaus, schreibt sich über unser Können und Verstehen hinaus, in Schriften, die man nicht weniger mühevoll dechiffriren wird als jene der Natur, schwerer vielleicht, zumal wenn sich das genealogische Vertrauen vorschiebt und technische Dinge als irgendwie menschliche Kinder, Ausdruck unserer selbst, unserer Triebe und Willen oder als Geburten artungleicher

Befruchtungen zwischen Natur und Menschen begriffen werden sollen.

(The vehicle . . . For many reasons, it seems to me that technology is more precisely understood as *Gefährt* [vehicle] than as *Gestell*. Heidegger does refer to technology as a journey and a danger, but in doing so remains too closely bound to a narrow dialectic of the erratic [*unbeständiger*] preservation of what has been acquired [*Bestandssicherung*: "preservation of the status quo, of a stock of goods"] as if we already had a new writing style that renders this technology. Beyond the technology of controlling, securing, and regulating sendings, with all its catastrophic derailments, technology is also trans-mission, it exceeds its sendings and reports, its deliveries and its jurisdiction, and writes itself beyond our capacities and our understanding, in writings that humans will decipher with no less difficulty than those of nature, perhaps even more, especially if trust in genealogy shoulders its way in and technological things are seen as a kind of human children, an expression of ourselves, our drives and our wills, or as the progeny of unnatural cross-fertilizations between humans and nature.)

(*Sätze ins Nichts*)

Here *Gefährt* is played against *Gestell*. But it is not enough to note the substitution of one term for the other; we also have to look into the use of language that makes the substitution possible. Hans Dieter Bahr, who refuses to continue thinking technology on the basis of the idea of "collection" (*Versammlung*), prepares his operation of destitution by thematizing—using the example of the description of Greek vases based, from Aristotle to Heidegger by way of Simmel, on the concept of collection—their multiple function as "trans-lators." The word "trans-lation" (*Übertragung*) does not mean "transport" in the sense that the distance between two places is abolished. The translation carried out by the recipient is a vehicular movement, in that it accompanies what it moves, and the history of its sending is one of the dangers that lie in wait for both its content and its goal. The vehicle/recipient is not only the bearer of changing contents, but is itself borne, it is the bearer/borne, and its content is as ambivalent as its being since it can both "bring misfortune by transporting the damage, the poison, or even the ashes of the dead or a simple emptiness, after being robbed on the way." Whereas in the *Interpretation of Dreams* Freud uses the two different concepts, *Übertragung* ("translation," and then "transfer") and *Verschiebung* (displacement) to make a distinction between the transportation of one entity into another, Bahr connects them. This connection, and the semantic renewal that it produces, is based on what claims to be a literal interpretation of the verb *übertragen*: *über-tragen* means movement (*über*) and carrying (*tragen*), and thus *Übertragung* is a kind of "passage-support." For Bahr the trans-lation (*Über-tragung*) carried out by the recipient is a vehicular movement insofar as it accompanies what it moves.

Although the content of the text runs counter to Heidegger's philosophy of technology, whose "narrow

dialectic" it criticizes, the counter-thesis remains insepara-
ble from a subversion of the writing style, which consists in
disengaging the Heideggerian *Gestell* from its semantic inter-
connections and in displacing it, as it were, in situ. This is pre-
cisely the idea of displacement that then proceeds to disturb
the play of Heideggerian style and to destabilize its stakes.

Das Gefährt is the vehicle. The word in ordinary language
would be *Fahrzeug* or in technical language, *Vehikel*, and the
term *Gefährt* is, moreover, old-fashioned. But once it has
been torn out of the register to which usage has limited it,
it "de-dialecticalizes" that which, in the Heideggerian *Gestell*,
referred multiplicity and arbitrariness to the fate of Being.
Language, no less inventive and filled, by its very richness,
with untranslatables, is open to the world as the thematics it
sets forth, namely, a technology that is, like language, a mode
of writing, and to which it would be vain to think that we can
ever get the key in advance.

Heidegger is no doubt the one who has made the most
vertiginous use of the procedures described here, and
few German philosophers currently use the resources of
German style to as much effect as Hans Dieter Bahr. The
question remains open to what point this extreme ten-
dency shown by Heideggerian writing reconnects with
a kind of writing whose tracks lead back to the mystics
of the Rhineland, and also to what extent it is connected
with the affirmation of a specifically German philosophi-
cal tradition whose appearance coincided with the need to
distinguish itself from both the use of Latin and the liter-
ary use of the language. There are many studies on this
question, and research is far from complete. The role of
Christian Wolff in the eighteenth century and his explicit
project of constituting a linguistic artificiality drawing its
resources exclusively from German, notably by elaborat-
ing adequate artifices, *Künstwörter*, were crucial for the
specific development of German philosophical writing.
But we also have to take into account the archeology of the
German philosophical language and the play of exchange
and differentiation between linguistic procedure and con-
ceptual procedure proper that we have described here. No
doubt this work remains largely to be done.

COMMON SENSE (ENGLISH)

FRENCH   *sens commun*
LATIN   *sensus communis*

➤ *SENS COMMUN*, and ENGLISH, MORALS, PHRONÊSIS, POLITICS, PRINCIPLE, SENSE, TRUTH

The clearest philosophical uses of the expression "common sense" date from the early eighteenth century and especially the work of Shaftesbury and Thomas Reid. The tradition of commonsense philosophy that begins with eighteenth-century English and Scottish writers starts from the meaning of "common sense" as a shared way of feeling and assessing (*sensorium commune*) to find its origin in an evocation of sociability, a sense of community (*sensus communis*). But English-language philosophy also defends the possibility of common sense as a true judgment or opinion that serves as the foundation for philosophy. Philosophical discourse is thus based on principles that are obvious truths for common sense and are preliminary to any knowledge. Reflection on common sense assumes that ordinary life has truth-value.

I. The Concept of "Common Sense"

Common sense, according to a minimal definition, is not a philosophical term. It designates a form of popular good sense. When one says, "Just use your common sense!" one is referring to the possibility of a practical wisdom, an ordinary apprehension of things. Thus to help people better understand love, marriage, children, and so on, there exist books with titles like *The Common Sense Book of Love and Marriage* and *The Common Sense Book of Baby and Child Care*. "Common sense" can also refer to the register of shared opinion. In David Hume, recourse to the general opinion of humanity, which prevents philosophy from going astray, functions like a common sense: "The general opinion of mankind has some authority in all cases; but in this of morals 'tis perfectly infallible" (*Treatise of Human Nature*, 552). Though the general opinion of mankind defines a common sense necessary for the establishment of a moral philosophy, the resort to common sense is sometimes more ambiguous; thus Hume mentions the truth of the proverb about the pointlessness of arguments about taste: "And thus common sense, which is so often at variance with philosophy, especially with the sceptical kind, is found, in one instance at least, to agree in pronouncing the same decision" (*Essays*, 235). Even if common sense is part of a relationship to the world different from that of philosophy, it sometimes allows us to save philosophy from the dangers of metaphysical uses by bringing it back to the ordinary uses of discourse. In other words, common sense serves as a point of anchorage in the usual, in the ordinary, in order to invoke the position of opinion with regard to

a philosophical question: "Are there any irreducibly social goods? . . . Common Sense is divided on the issue, and confused" (Taylor, *Philosophical Arguments*, 127). We might say that this recourse to the *sensus communis* has existed since Greek antiquity and does not constitute something specific to common sense. The originality of the tradition of common sense resides in the concern to move from a simple appeal to common sense to a concept of common sense. That is the goal of Shaftesbury's *Essay on the Freedom of Wit and Humor*. The work begins with an account of an entertaining conversation on morals, politics, and religion. Among the different participants, some occasionally take "the liberty to appeal to common sense" (*Characteristics of Men*). Next, common sense is defined:

> But notwithstanding the different Judgments of Mankind in most Subjects, there were some however in which 'twas suppos'd they all agreed, and had the same Thoughts in common.

However, this definition of common sense is not developed further, because the emphasis is put on the impossibility of finding fundamental principles or common ideas of religion, morals, or politics. How could common sense help construct a practical philosophy?

II. The Sense of the Common Good

Shaftesbury, who was a great reader of the Stoics, took an interest in the use of "common sense" as *sensus communis*. In the works of Marcus Aurelius (*Meditations,* 1.16), *sensus communis*, which translates the Greek *hê koinonoêmosunê* [ἡ κοινονοημοσύνη], designates a sense of community, a sociability. Shaftesbury adopts this heritage and then gives priority to *common* (what is common to a community, the common good) over *sense* (the sensorial or cognitive faculty). "Common sense" refers to critical work performed on our representations to make them conform to the common good. Common sense expresses the "sense of publick weal, and of the common interest, the love for community or society, natural affection, humanity, obligingness, or that sort of civility which rises from a just sense of the common rights of mankind, and the natural equality there is among those of the same species" (*Characteristics of Men*). It is both a moral and a social sense of reason, structured by a virtue that consecrates the profound nature of man, honesty: "Men's first thoughts, in this matter, are generally better than their second; their natural notions better than those refined by study, or consultation with casuists. According to common speech, as well as common sense, Honesty is the best policy" (*Characteristics of Men*). Common sense differs from good sense to the extent that the latter, as the natural faculty of distinguishing the true from the false, is a factor of knowledge rather than of practical philosophy. Common sense is the social and political equivalent of moral sense. The latter designates a disposition or ability to form adequate ideas of the moral good. In contrast, common sense designates a disposition to form adequate ideas of the common interest. It presupposes the idea of a public space or public sphere. It is this meaning of "common sense," which is particularly present in English-language philosophy, that Michael Walzer discusses in *Interpretation and Social Criticism*.

The definition of the apprehension of the social world in the mode of social criticism continues this tradition of the sense of the common interest.

III. The Epistemology of "Common Sense"

It remains that common sense is also a fundamental concept for the theory of knowledge. The thought of Thomas Reid presupposes a rational comprehension of sense as judgment in order to establish an epistemological role for common sense:

> In common language sense always implies judgment. . . . Good sense is good judgment. . . . Common sense is that degree of judgment which is common to men with whom we can converse and transact business.

> (*Essays on the Intellectual Powers of Man*, 426)

In this case, common sense is close to good sense. Common sense as good sense is a judgment: it designates the part of reason that includes the primitive and natural judgments common to all humanity. It is, in a way, a common intelligence that spontaneously bears upon a certain number of objects of knowledge. From this point of view, this activity of the mind or exercise of judgment is more or less developed in each of us, depending on whether we are more or less experienced in making such judgments, more or less gifted:

> Common sense is . . . an exercise of the judgment unaided by any Art or system of rules: such an exercise as we must necessarily employ in numberless cases of daily occurrence. . . . He who is eminently skillful in doing this, is said to possess a superior degree of Common Sense.

> (Whately, *Elements of Logic*, preface)

Not having common sense does not amount here to a lack of wisdom in life's ordinary affairs; according to both Whately and Reid, it is, in a way, to lack intelligence, to deprive oneself of an a priori undetermined mode of judgment. Common sense constitutes the practical precondition for any knowledge, the whole of the pre-knowledge that is taken for granted and that it is harmful to put into doubt. It is embodied in principles that simply affirm the existence of our different ways of knowing. That is the case for the principle of the reality of the phenomena of consciousness: it has to be considered self-evident that people think, remember, and so on (*Essays*). The existence of the knowing subject is a factual truth, a principle of common sense or a natural judgment that is common to humanity and can thus be produced by anyone.

IV. Common Knowledge and Ordinary Life

Common sense is thus part of a philosophy and an epistemology through which, according to G. E. Moore, a commonsense view of the world can be achieved. It is not that common sense does not contain some false propositions, but the massive certainties that it contains, taken all together, constitute the truth of the commonsense view of the world. In a way, in conformity with Thomas Reid's philosophy, the mind can have immediate knowledge of the existence of objects, of matter, of other minds, that defines true beliefs for which it is pointless to provide a justification. Common sense is the mental authority through which we know with

certainty that many very ordinary propositions are true. In the register of the definition of a theory of knowledge, the question of common sense suggests a way of approaching a common fund of knowledge, a common knowledge in which anyone with judgment can share. There is a community of judgments that can reconcile us all, despite doctrinal philosophical differences. Common sense suggests the possibility of a philosophical communicability:

> There is this advantage in putting questions from the point of view of Common Sense: that it is, in some degree, in the minds of us all, even of the metaphysicians whose conclusions are most opposed to it.
>
> (Sidgwick, *Philosophy*, 42)

The philosophical meaning of "common sense" presupposes a defense of common sense. Reflection on common sense is in part continued by reflection on ordinary life in contemporary American philosophy—for example, in the work of Stanley Cavell (*In Quest of the Ordinary*), who does not limit himself to saying that the formulations of ordinary life are true in their ordinary sense. He tries to determine what their ordinary sense means—just as the philosophy of common sense seeks the meaning of common sense.

COMMONPLACE

FRENCH	*lieu commun*
GREEK	*topos* [τόπος], *topêgoria* [τοπηγορία], *deinôsis* [δείνωσις]
LATIN	*locus communis, indignatio*

➤ COMPARISON, CONCETTO, *CONSENSUS*, *DESTINY*, DOXA, *IMAGE*, INGENIUM, MIMÊSIS, PATHOS, *PROBABILITY*, SUBLIME, TRUTH

The modern expression "commonplace," in the sense of a cliché or banal saying, has a history going back at least three centuries. If it has a pejorative connotation nowadays, for a long time it had a positive meaning, as an essential element of one's intellectual and artistic development. From the sixteenth to the eighteenth centuries, *lieu commun*, or "commonplace," was a technical term in France and across Europe. Broadly speaking, it had two very distinct meanings, which are both in their own way present in the modern sense of the term. On the one hand, "commonplace" was an element of oratorical training; on the other, it referred to the different headings of a catalogue. These two senses in turn go back to the sense of *topos* [τόπος] in ancient rhetoric, defined by Aristotle as "that which groups together a multiplicity of enthymemes" (*Rhetoric*, 2.26.1403a16–17), those syllogisms of probability that characterize rhetoric.

I. *Topos*: The Commonplace as a Reservoir of Premises

The first of the three meanings goes back to Aristotle's *Rhetoric*. The Greek word was simply *topos* [τόπος], "place" (or *lieu* in French, which was how Médéric Dufour translated it in his edition, *Aristote*, introducing in French a distinction between *lieux propres* or *lieux spécifiques* [particular or specific expressions] and *lieux communs* [commonplace or general expressions] in 1.2.1358a13ff., and in 2.22.1396b28). The *topos*, according to Aristotle, is a *stoicheion*, an element of the enthymemes: "It is that which groups together a multiplicity of enthymemes" (*eis ho polla enthumêmata empiptei* [εἰς ὃ πολλὰ ἐνθυμήματα ἐμπίπτει], 2.26.1403a17). This is why, unlike premises, or "protases," which are specific to only one of the oratorical genres—the deliberative, the judicial, and the epideictic; so, for example, the useful or honest instead of the deliberative—a "place" or generality is always "common" (*houtoi hoi koinoi* [οὗτοι οἱ κοινοί], or *koinêi* [κοινῇ]: "generalities are the commonplaces of law, of physics, of politics"; 1358a13–14), for example, "the generality of the more or less." As Jacques Brunschwig emphasizes, "the topos is a machine that produces premises from a given conclusion, so that one and the same generality has to be able to deal with a multiplicity of different propositions, and one and the same proposition must be able to be to dealt with by a multiplicity of generalities" (preface to his edition of the *Topics*). In the subsequent history of rhetoric, this first meaning of "commonplace" will obviously not be forgotten. In Latin rhetoric, that of both the ancients and the moderns, *locus communis* is contrasted, in a way that is clearer and more pedagogical than in Aristotle, to the "particular" expressions of each of the three genres. "Commonplace" refers, then, to a list that has almost no variants, which goes from the Definition (then the Etymology, the Enumeratio partium, etc.) to "Adjoining expressions" (Adjuncta), by way of expressions of Opposition and of Comparison. As in Aristotle, these expressions are, by hypothesis, "general invented expressions." Every generality is indeed a reservoir, a "place-to-find" arguments (see COMPARISON). Moreover, Aristotle did not invent the term *topos*, which in all probability goes back to the arts of memory. But his distinctive gesture was to have completely reconceived, as he so often did, a term that the usage of the Greek language gave to him in an unelaborated form. So it is logical that all the subsequent topics should refer *topos* as a concept back to the *Rhetoric*, and even more so to the Artistotelian *Topics*.

Rhetorics of the *topos*, rhetorics of the *kairos*

➤ ART, LOGOS, MOMENT

Rhetoric, or *rhêtorikê <technê>* [ῥητορική <τέχνη>], is a term that appeared for the first time in Plato's *Gorgias*. It only appears for its claim to be an art, *technê*, to be discredited, and reduced to the paradoxical status of *alogon pragma* [ἄλογον πρᾶγμα] (a thing deprived of *logos* [λόγος], or if one prefers, a "practice without reason"; 465a). It is thus the eloquence of Gorgias and of the Sophists (their oratorical success and their teaching) that is excluded from philosophical discourse and rationality. A good rhetoric still needs to be invented: the philosophizing rhetoric of *Phaedrus*, that is, the "dialectic," "the art of dividing and gathering together" (266b), whose aim is not to persuade but to elevate the soul (this is what was termed "psychagogy"; 261b).

The subsequent elaboration of rhetoric in Plato, as well as in Aristotle, consisted in devaluing, even prohibiting, a certain type of rhetoric in favor of another type. Deprived of art and of reason, this rhetoric deals with time and speech (a rhetoric of improvisation, *schedioi logoi* [σχέδιοι λόγοι], or "hurried," *ex tempore* speech; a rhetoric of the *kairos* [καιρός], or the "opportune moment," which is able to exploit the paradoxes of speech with these *kataballontes* [καταβαλλόντες]

invented by Protagoras, or catastrophic arguments that are inverted as soon as they are spoken). This rhetoric is valued as authentic and truly technical; it focuses on what is said, and it brings time back to the space being dominated. Described by the philosophers, discourse was an organism that was widespread and finely articulated, and one had to be able to "divide it up" while respecting its overall plan (cf. Plato, *Phaedrus*, 265b). It was made up of a hierarchy of *sun* [σύν], "with," which went from predicative syntax to the syllogisms, and conformed to the norms of *hama* [ἅμα], or "at the same time," as prescribed by the principle of noncontradiction. It thus privileged stability of meaning over the disruptive effects of the signifier, of homonymy, of puns (the entire *organon*, Aristotle's metaphysical and logical apparatus from the *Metaphysics* Γ to the *Sophistical Refutations*); it described "periods" (literally, "complete turns" that could be taken in with a single glance; *Rhetoric*, 3.9.1409b1) and used visual figures of speech ("metaphor," which carries across, and "metonymy," which takes the part for the whole) at the expense of auditory ones (those alliterations that claim to be poetic; 3.1.404a24–29). The importance

accorded to *topos* [τόπος], or "place," was obviously an essential part of this system. It is easy to see how the power of place could fire the imagination of commentators, and they proposed a whole series of rich metaphors relating to space in order to define this term: mold, matrix, seam or vein, circle, sphere, region, well, arsenal, reservoir, seat, store, treasure house, and not forgetting Ross's "pigeon-hole" (Brunschwig, preface to *Topics*).

With *topos*, philosophizing rhetoric spatialized the temporality of speech, and succeeded in turning even invention into a kind of thesaurus.

II. The Latin *Locus Communis*: The Commonplace as a Part of Oratorical Training

This second sense bears the trace of the other great thinker on rhetoric, Cicero, even if this meaning was already present in the *Rhetoric to Herennius*. In the Latin Europe of the sixteenth to eighteenth centuries, it was the predominant meaning, and also paradoxically the one we have lost from sight. On first analysis, it appears not to fit with the Aristotelian *topos*. Even though it is also linked to *doxa* and to the general, its essential difference is that it cannot be defined solely in terms of invention. The *topos* is not a set of propositions (or of sentences, if one prefers), but the means by which propositions are produced. The *locus communis* in Cicero's sense of the term is first of all an often very oratorical embellishment, or quite simply a passage in a speech, or even what is commonly known as a tirade (so in Aristotelian terms, a set of propositions, of arguments, etc.). It is only very distantly and indirectly a "place." Whatever the case may be, it would be best at this point to treat this new concept or object as a simple homonym of its Greek predecessor.

The Ciceronian *locus communis* has three characteristics. The first is the fact that it gathers up received ideas, or *doxa*. The second is that it speaks in general terms, *generaliter*. Finally, this generalization is extensive; it is not limited to a brief statement, or to a proverbial saying. One of the

clearest texts on this is without doubt Cicero's *On Invention*, at the end of book 1, §100–105. In a legal context, the canonical moment for the commonplace expression is the peroration. This is the moment when the prosecution makes its closing speech, and when the accuser speaks no longer against the accused he is facing, but against the crime in general—when our prosecutors inveigh no longer against Mr. so-and-so who has raped or killed, but against rape or murder in general. In ancient treatises, the usual example was parricide, which in Rome was the unforgiveable crime par excellence: in Cicero's *For Milon*, the classic example is the praise of self-defense.

As for the *doxa*, it is immediately apparent how serious the stakes are. Of course *doxa* is a matter of mere opinion, not of truth. But for the rhetorician, the fact that the *doxa* is not true does not mean it has no value. On the contrary, it is heavy with *gravitas*. We thus encounter one of the meanings of the word *doxa* in Greek, the positive meaning of "reputation, fame": the *doxa* is all of the values that are current in a given society, and it is defined most clearly whenever these values are treated with contempt. Parricide aroused particular indignation among the Romans—and *indignatio* is precisely one of the words Cicero uses to refer to the commonplace. This new word has the advantage of being less formal than the expression *locus communis*, which for

rhetoricians used to the very idea of "place" is grammatically incorrect. *In-dignatio* allows us to reformulate what is at work, since within the word we find *dignitas* or "dignity", or even the "decency" of *decet* and *non decet*, which are close etymologically, that is, the notion of "decorum" (see MIMÊSIS, Box 6; and the article "Decorum" in RT: *Historisches Wörterbuch der Rhetorik*). Parricide, racism, even rape, shatter the *decorum* or, in the French of the seventeenth century, the *bienséance* (rules of social propriety), that is, they threaten the entire edifice of social relations.

In this legal context, this shift to the general also takes on a particular significance. By generalizing, a lawyer "elevates" the debate, as we still say, quite justifiably. This elevating movement also elevates emotion, raising it to a higher level, since in raising up we appeal to the great and general principles. General principles move the general public, by arousing great feelings. We are at the height of the effects that rhetorical art is capable of producing, what Cicero named *movere*, and which translates the Greek *pathos* [πάθος]. And once the movement of generalization is a movement that raises up, at its highest point we inevitably find the question of the political. In Cicero himself, we go very quickly from parricide trials to properly political trials, whose theme is that one's homeland is in danger. When Verrès crucifies a Roman citizen in Sicily with his eyes turned toward Italy, he is assassinating the very idea of Roman citizenship. As Quintilian notes, with this example we reach not only the highest point, or *summum*, but in a way what is above the highest point, the *supra summum* ("*non modo ad summum, sed quodam modo supra summum*"; *Institutes of Oratory*, 8.4.4). We are at the highest point of emotion and of the intolerable, that is, the height of the sublime.

The third and final trait of the commonplace relates to another term that is no less important for rhetoric, particularly in Latin: length or extent, *copia*. It is not just a matter of long, flowing speech, of quantitative length, since *copia* is above all qualitative. Formed from *opes* (forces, particularly military forces), *copia* is an army of arguments, a Roman army. Depending on which of the images Cicero happens to like, *copia* is either a river that has burst its banks or a devastating fire. In both cases, it is irresistible. It is not for nothing that the canonical moment of indignation is the peroration. The end of the river-speech sweeps one up and finishes one off; the last remaining dikes of resistance collapse. Indignation against the accused and pity for the victims are the two essential *loci communes*, typical of peroration, for which Cicero's *De inventione* gives a list of particular "places," this time in the canonical sense of argument. One could ultimately compare such oratorical arguments with a great aria from an opera rather than with a tirade. What people expect the most is not the least enjoyable and arouses no less applause. Great emotion unites a public, and even more so a community. It can even, as in the case of Verdi, lead to the birth of a nation. So pathos is not vulgar, but worthy of that beautiful name *common*, which has indeed, since Cicero, been one of the connotations of *locus communis.*

It is clear, then, that the Ciceronian *locus communis* is in no way a synonym for the Aristotelian *topos*. The same word refers to two quite distinct realities. Now that these two senses have been identified, one might wonder what the Greek

equivalent is for *locus communis* or *indignatio* in Aristotle, and the Greek rhetoricians generally. It would indeed be surprising if Aristotle's *Rhetoric* paid no attention to such an important phenomenon.

For the later Greek rhetoricians, and in particular those who came after Cicero, the answer is easy. As a technical term, the strict equivalent of *indignatio* is *deinôsis* [δείνωσις]. A very full history of this term can be found in the article "Deinotes" in RT: *Historisches Wörterbuch der Rhetorik*, in particular, column 468: "*der früheste rhetorische Terminus, der mit* deinos *verwandt ist, ist* deinôsis (= lat. Indignatio)." The emblematic figure for *deinôsis* was Demosthenes; for example, when Quintilian quotes in Greek the word *deinôsis* and associates it with *indignus* and *indignitas* (6.2.24; see also 8.3.88 and 9.2.104); or in Longinus (12.5 in particular: "Demosthenes is sublime in the *deinôseis* [ἐν ταῖς δείνωσεις]"). Denys of Halicarnassus more than anyone, in his *Demosthenes*, attributed *deinotês* [δεινότης] to his hero as one of his major qualities. The *deinos* was, first and foremost, the terrifying appearance of the sacred, the equivalent of the Latin *terribile*—so Phoebus Apollo's bow that sent down a plague was described as *deinos* (*Iliad*, 1.49). From there the meaning shifts to "powerful" and also "skillful," used for any artisan who is a master of his art, and, in particular, for the rhetorician or the Sophist. The artisan who is *deinos*, as a master of his art, is like a god whose techniques are hidden and whose effects are spectacular. How to become *deinos* is the only thing that Gorgias promises to teach (Plato, *Meno*, 95c). The adjective denotes an entire program: power and skill, mastery of the effects on the public, a "huge" success, all of the truly terrifying and sacred promises of rhetoric are condensed into this one word—the art of making oneself a master and possessor of the hearts of men.

So when Demosthenes is *deinos*, he is no longer an orator, but a god who paralyzes and galvanizes his audience, who does what he wants with them, irresistibly. This is no longer a "tirade," but what one might call a thunderous "exit," a cataclysmic lightning bolt hurled down by Jupiter. So *deinôsis* limits the *locus communis* to its most visible dimension, that of the prosecution, and forgets pity (which in Cicero is also a construction, a commonplace). From this limitation we even move on to a further one. Longinus describes *deinôsis* solely in terms of its brevity, so as to contrast it with the particular form of the Ciceronian sublime, which involves extension or *copia*. On the one hand, the thunderous "exit," on the other the devastating river of the Ciceronian commonplace: these are the two modalities of the same sublime. What is more, when Longinus writes in Greek to a Roman he invents the neologism *topêgoria* [τοπηγορία], which would never actually pass into general usage, to designate Cicero's *locus communis.* The term was formed from *topos*, but with a suffix that referred to public speaking, or *agora* (*agoreuein* [ἀγορευείν], "to speak in front of the Assembly"); *On the Sublime*, 12.5: Demosthenes is sublime "in the *deinôseis* and the violent passions," Cicero "in the *topêgoriai* and the perorations."

As for Aristotle, his *Rhetoric* only uses *deinôsis* incidentally, four times according to the Belles Lettres edition, which quite rightly translates the term as a "feeling of revolt, indignation, exaggeration." This incidental usage underlines the fact that Aristotle, for once, has not reformulated the

term as a concept. He takes the usage as it is given to him and does nothing more with it. The usage he records is rather interesting since on the face of it, it is already codified by rhetoric: either pity or *deinôsis* (*ê oikton ê deinôsin* [ἢ οἶκτον ἢ δείνωσιν]) (3.16.1417a13); "the passions (*pathê* [πάθη]) to be aroused when the facts are established are pity, *deinôsis*, anger (*eleos kai deinôsis kai orgê* [ἔλεος καὶ δείνωσις καὶ ὀργὴ])" (3.19.1419b26). We again find the crucial moment of the peroration, once the facts are established (see also its use in 2.24.1301b3), as well as the fundamental vacillation of the prosecution between pity for the client and indignation for his accuser. This vacillation is already in Plato, who also records the usage of his time: "pity and *deinôsis* [ἐλεινολογίας καὶ δεινώσεως] (*Phaedrus*, 272a). The vacillation recalls, in Aristotle's *Poetics* (6.1449b28), the famous passage on *katharsis* (purification, purging), in which "pity and *phobos* [φόβος]" serve as emblems and as a condensed form of other passions [ἐλέου καὶ φόβου] (see also *Poetics*, 13; and in 19.1456b1: "and the others of this kind"; cf. CATHARSIS).

This detour through the *Poetics* is useful in putting our investigation onto the right track. Four incidental usages do not constitute a theory. But there is one place where the *Rhetoric* systematically discusses *indignatio*, but gives a completely different name than *deinôsis*; this is in 2.9, which is the precise counterpart to 2.8, on pity. We are in the moment of fundamental vacillation, between pity and then sacred terror. The clue that Aristotle is at this point rethinking the trivial notion of *deinôsis* is in the change of vocabulary. In 2.9 he names it *nemesis* [νέμεσις], as the goddess or incarnation of Justice. Most of the Latin translations of Aristotle are quite content to render it as *indignatio*, along with its derived terms, as is the French Belles Lettres translation, which talks of "indignation." The immediate opening of the chapter underlines the fact, as if it were necessary, that the use of such a highly charged term relates to the sacred: "if we attribute indignation to the gods" (*nemesan* [νεμεσᾶν]; 1386b14), it is because the gods feel this sentiment when they see that those who do not deserve to be, who are thus unworthy of it, are happy. Such a divine emotion is clearly distinguished from the more human envy, or *phthonos* [φθόνος], that we feel toward the happiness of our equals and rivals, which in our eyes is undeserved. Indeed, like spectators in a tragedy, we will be like gods if in this respect we have "no personal interest" (1386b15–20). That we are clearly dealing here with a work of conceptualization is again emphasized by the comparison with the *Nichomachean Ethics* (7.1108b1), where it is once again stated that *nemesis* is to envy what true courage is to temerity. *Nemesis* is the "happy medium" of indignation, it is a *just* form of indignation.

By reformulating the concept, Aristotle draws out what is truly at stake. His description is clearly informed by that of *deinôsis*, like Demosthenes' "exit" or Cicero's peroration. But the sacred quality of *deinos* could always be suspect, and anyone who places himself in the divine role of prosecutor could be motivated by personal interests. The fundamental question is: who made you the prosecutor? In order to reach the truly sublime, the one who thunders must by this very fact be inhabited by a god, who for both Demosthenes and Cicero is the god of the homeland in danger. Or to put it another way, he has to have Justice with him, he has to be able to

appear as the very incarnation of Justice. Here as elsewhere, Aristotle's *Rhetoric* shows that it is truly an ethics, much like Quintilian's (who makes a number of remarks along the same lines).

In the seventeenth century, the Christian rereading of this chapter is not entirely self-evident. Is one not, in feeling indignant toward those who are unworthy (*indigne* in French), acting as if one were God himself, and doubting his Providence, which mysteriously rewards those on this earth who do not deserve it? A professor of rhetoric such as Christoph Schrader (at the University of Helmstedt) argues for the rights of Christian indignation in the choices that depend on human free will. One should not, for example, in use and in public office "prefer the unworthy to the worthy (*ne indigni dignis praeferantur*)" (commentary ad loc, 332: this opens up the question of merit or worthiness). But other than this, and from a more metaphysical point of view (*De rhetoricorum Aristotelis sententia et vsv commentarius*), he uses Aristotle's chapter as an incitement to asceticism, for example, toward the goods listed in 1387a12, "riches, power," as well as the gifts one is born with, which is in fact everything that comes from *Fortuna* or Providence. At that point we need to hold back our desire for *indignatio*, and leave this feeling to God alone. We are not Nemesis, and this is a way of emphasizing the extent to which the sublime that is described here, from Aristotle to Longinus, is a manifestly pagan sublime.

III. Commonplaces as Categories of an Index

This is again a homonym. In the sixteenth century, "commonplaces" in the plural was used to designate the categories under which a reader would classify the quotations that for him seemed noteworthy. So it was a sort of filing system, or index, or repertoire. This pedagogical tool had two objectives: to train one's memory, and to develop one's judgment.

One term from this period expressed this dual ambition, the verb "to digest," and the noun "digest" is still used to convey this idea in English. Technically speaking, the verb refers to the idea of classifying a quotation under such and such a category: *digerere* means to distribute elements, each one into the box where it belongs. The usual expression designating this sorting out of commonplaces is thus "*per locos communes digesta*" (each thing in its own category). The word "digest" has to do with the body, but also with the mind. The mind will retain better what it has digested better. This is the meaning of the famous image of the bee that Seneca uses in his letter 84 to Lucilius, the terms of which are endlessly cited and reworked by Erasmus throughout his work—Erasmus himself transforms it into a real cliché that is constantly borrowed and adapted during the sixteenth and seventeenth centuries. The bee gathers pollen from flowers: this is the moment when a pupil notes down in his notebooks or on a slate the "flowers" of literature and history (cf. Hamlet noting down in his "common-place book" that his uncle is a "villain," just after he has seen the ghost!). When the bee is back in the hive, the pollen that has been gathered is redistributed into the different alveoli of the hive: this is the moment of "digestion," of distribution, when the pupil copies out onto the large *in-folio* of blank pages that he keeps at home. It is then that the mind can make its own honey and incorporate knowledge from outside.

It is clear that without any judgment or critical perspective this act could turn into one of pure compilation. This was strongly emphasized by the Reformer Melanchthon (1497–1560), who was rector of the celebrated university at Wittenberg after Luther. The pernicious double of *digerere* was *congerere*: to accumulate for the sake of accumulating. The solution was order at every moment of the process (see the booklet *De locis communibus ratio*). Order reigns, both in reading and in writing: to classify well was to think well, was to write well. One of the aims of commonplaces was to educate oneself in the field of knowledge one decided principally to pursue. As far as reading was concerned, for Melanchthon the category-words had to be organized in analytical order, which he preferred to the jumble of alphabetical order. The model was the encyclopedia, as a tree with branches. Whatever his domain, a student would develop his memory and his critical faculties by organizing his collection of commonplaces according to the big and then small categories of his discipline. As for writing, his discourse would also benefit from this same order, since without a well-conceived plan it could turn into a compilation of arguments. One has only to reread Quintilian's comments on *dispositio* to find the same aversion to what is, precisely, difficult to digest: "a copious abundance of ideas, no matter how large, would merely provide a heap or a kind of congestion [*cumulum atque congestum*], if they were not put into order by this same disposition [*in ordinem digestus*]" (7, prologue 1).

As an essential element of the pedagogy of the Jesuits, this method played a very important role in the organization of study across Europe and in all fields of knowledge. For commonplaces in the sense of categories was by no means confined to literature, or even to the humanities more broadly speaking. The method was an often explicit adaptation of the first tool of Aristotle's *Topics* (1.14.105a ff.), that is, the idea of collecting premises, commonly accepted propositions (*endoxai* [ἔνδοξαι]). Aristotle himself earned the sobriquet of "reader" because of this: read everything, index everything. This was how he wrote *The History of Animals* or *Politics*, beginning by drawing up an inventory and classifying—by "digesting"—all the available information. This was also how Bodin wrote his *République* in the sixteenth century: the vast compilation of all the existing constitutions was a prelude to his induction, which for Bodin would then reveal a new concept of sovereignty.

What is the relationship between oratorical training and an index of categories? We might turn again to Melanchthon for the answer. We should first of all emphasize the context, which was not rhetorical but theological. His *Lieux communs de théologie* (Commonplaces of theology), which appeared in 1521, was conceived as a manual, and we can see it as one of the first comprehensive works of Lutheranism. The main doctrinal questions were addressed systematically and provided a coherent body of doctrine that was contrasted with the previous one. Order here was only necessary because of the context of theological controversy. If one's principles were not good, one could not formulate good discourses, and if Melanchthon drew attention to the term "commonplace," it was because the Reformer had read Cicero very well. He understood that for Cicero the movement toward generality was at the heart of his rhetoric. The movement upward from the particular to the general produced the essential ideas, the framework, and the overall articulation, and these ideas organized the arguments of the speech and aroused the moments of most intense emotion.

IV. The Commonplace in the Modern Era

The commonplace in the modern sense is both a *faux ami*, which looks deceptively like the word in its classical sense, and a true heir. It is a *faux ami* in a text as apparently simple as the following, written by Pierre Bayle in 1686:

> C'est ce que je réponds au lieu commun qui a été si rebattu par les ignorants, que le changement de religion entraîne avec lui le changement de gouvernement, et qu'ainsi il faut soigneusement empêcher que l'on n'innove.
>
> (This is what I reply to the commonplace, which has become so worn out from use by ignorant people, that the change of religion brings with it a change of government, and that therefore we have to be careful to prevent any innovation.)
>
> *(Commentaire philosophique sur ces paroles*
> *de Jésus-Christ)*

The proximity of *lieu commun* and *rebattu* gives the impression that we are already dealing with its contemporary meaning. We are already, it is true, in generality, and even political conservatism, the very kind that Flaubert scorns so joyously in his *Dictionary of Received Ideas*. But what the *faux ami* prevents us from seeing is that Bayle is here referring to an entire historical development. Those who are ignorant have for a long time, passionately, discussed the question that concerns, as in Cicero, the homeland in danger. The category-word is something like "Government" or 'Dangerous Innovations," and on this subject arguments and quotations have been collected eagerly since it is known in advance that they can be reused. The author only gives us the substance of these long developments on a question of principle. He is the one who abbreviates it, and who gives us the false impression that the commonplace is reduced to one or two expressions, to what we nowadays understand as "cliché."

And yet the very possibility of such a reduction is not unfaithful. A cliché only needs to be expanded, just as the expansion itself can be abbreviated. This is not the main point, which is rather the excessive visibility that the method *of* commonplaces has given *to* the commonplace. Bayle is not reproaching the commonplace for being overused, but for being worn out through overuse by ignorant people. What we reproach the cliché for, following Flaubert, is to be overused, period, by intelligent as well as by ignorant people. In other words, if the commonplace in the modern sense is truly the distant heir of former meanings of the term, it is that the legacy itself has become too ponderous. Doxa was once near to Wisdom, and we now find it closer to Stupidity.

COMMUNITY

"Common" derives from Latin *communis*, "what belongs to everyone," from *cum*, "with," and *munis*, "what fulfills its task, its duty" (related to *munus*, office, gift); it corresponds to Greek *koinos* [κοινός], "common, public," in which we probably see the same root as in the Latin *cum*, and which contrasts with *idios* [ἴδιος], "peculiar, private." "Community" designates the fact of being in common, what is held in common, and the group or institution that shares what is held in common.

I. Common and Community

1. What is held in common is opposed to what is one's own and to property: see PROPERTY.
2. "Common" can be used in reference to different levels of community. It can refer to humanity as a whole: see LOGOS, *SENS COMMUN*, UNIVERSALS, as well as *AUTRUI, HUMANITY* [MENSCHHEIT]*, IDENTITY*, [I/ME/MYSELF, SAMOST', SELBST]. Or it can refer to a particular human community defined as a people (see PEOPLE and NAROD; cf. HEIMAT), or as a culture (see BILDUNG, CIVILTÀ, *CULTURE,* TO TRANSLATE) considered distinctive because of some privileged trait (see *MALAISE*).

II. Political Community and Society

1. The entry CIVIL SOCIETY explores the main systems used to describe the community, as opposed to society and the state. For Greek, in addition to *koinônia politikê* [κοινωνία πολιτικ] (CIVIL SOCIETY, I), see the entries for POLIS, OIKEIÔSIS, OIKONOMIA. For Latin, in addition to *societas civilis* (CIVIL SOCIETY, I), see PIETAS, RELIGIO, and cf. LEX. On the distinction between *Gemeinschaft* and *Gesellschaft* in German, see CIVIL SOCIETY, Box 1.
2. In *mir* [мир], Russian has a special constellation that refers simultaneously to peace, the world, and the peasant community; see MIR and SOBORNOST' (conciliarity, communion), and cf. NAROD (people); cf. *CONCILIARITY*.
3. The contemporary avatars of the political promotion of the community are considered in the entry LIBERAL, Box 3.

COMPARISON

FRENCH	*comparaison*
GREEK	*sugkrisis* [σύγκρισις], *antithesis* [ἀντίθεσις], *parathesis* [παράθεσις]
ITALIAN	*paragone*
LATIN	*comparatio, contrapositum, adpositum*

➤ ANALOGY, COMMONPLACE, CONCETTO, *IMAGE*, INGENIUM, MIMÊSIS, PROPERTY

Comparison or simile has suffered by the recent success of metaphor. It has served as a foil for its brilliant alter ego. To restore its interest, we have only to recall that the apparently canonical *comparatio-metaphora* pair is deceptive. This pair comes from a passage in Quintilian that has been taken out of context. In Latin, *comparatio* designates

only in a marginal way a similarity introduced by a word such as "like." It refers to a mental operation: making a parallel between *x* and *y* in order to bring out resemblances and differences. The expression *comparaison n'est pas raison* (comparison is not reason) reminds us both that comparison is an instrument for producing intelligibility and that this instrument works well, almost too well: from here comes the need to be prudent in using the extremely fertile method of *comparatisme* (comparative studies).

I. *Comparatio, Sugkrisis*, "Parallel"

Comparison is an image or figure of speech in a specialized and marginal sense. In the whole of Quintilian's *Institutio oratoria* (*The Orator's Education*), this sense appears only once among the twelve occurrences of the words *comparatio* and *comparativus* listed in the index of the Belles Lettres edition. In a massive, generic way, *comparatio* designates a parallel: the comparison of *x* and *y* in order to discern their resemblances and differences, and often to emphasize the superiority of one over the other. In Greek, the equivalent word is *sugkrisis* [σύγκρισις], which is frequently used with this meaning, but in the late period (from Philodemus to Plutarch). As *sugkrisis* suggests, the point is to exercise one's judgment, to judge one thing in relation to another—*sug-krisis* [σύγ-κρίσις] is put together from *sun* (with) and *krisis* (judgment). The result is not a little formula tossed off in passing, a figure of style, but a long, complete development.

Thus *comparatio* is one of the preliminary exercises given in rhetoric classes (Quintilian, *Institutio oratoria,* 2.4.21). It has the length of an academic "assignment," and as such, it was part of the baggage of every cultivated person from antiquity to the ancien régime. In this culture, to make a comparison was also to provide oneself with the means to construct a whole development. Thus comparison is a "figure of thought," or more literally, a "figure of sentences" (Lat. *figura sententiarium*), that is, one that extended over one or more sentences. Similarly, comparison is related to conception and invention: considering something in a nutshell and then developing what one has seen in all its consequences. A visionary like Victor Hugo was well aware of its virtually endless possibilities. For example, in his novel *Notre-Dame de Paris*, the formula "Ceci tuera cela" (This will kill that, 5.2) launches the extensive *comparatio* between *x*, the book, and *y*, the cathedral.

One example of a class assignment with its possible developments is found in Quintilian's *Institutio oratoria* (8.4.14; cf. 8.4.9–14). Discussing one of Cicero's speeches, Quintilian notes that "here Catiline is compared to Gracchus, the constitution of the state to the whole world, a slight change for the worse to fire and sword and desolation, and a private citizen to the consuls, all comparisons affording ample opportunity for further individual expansion, if anyone should desire to do so." This allows us to understand better the most common specialized sense of *sugkrisis*. The Greek word designated a classic exercise in literary criticism: a parallel between two authors or two works, the better to differentiate them. There again, academic culture long retained the memory of this: we recall the classic assignment on Racine and Corneille, people as they are and as they should be. Longinus's *On the Sublime* includes a number of such exercises, whether the parallel/difference between the *Iliad* and the *Odyssey*, between Plato

and Lysias, or between Demosthenes and Cicero. A pairing like Demosthenes and Cicero, developed at greater length, is the basis for Plutarch's *Parallel Lives.* Plutarch concludes the discussion of almost every pair of men with what he calls literally a *sugkrisis*: a comparison of Theseus and Romulus, Lycurgus and Numa, and so on.

II. *Eikôn* and *Metaphora, Similitudo* and *Tralatio*: The Status of "Like"

With respect to this fundamental meaning, a comparison in the modern sense is called a "simile"; the English renders the Latin *similitudo*, which itself rendered the Greek *eikôn*, "icon" or "image." Moreover, the idea that metaphor is an abbreviated simile comes from Quintilian (*Institutio oratoria,* 8.6.8). Quintilian takes from Aristotle the excessively famous example of "Achilles is like a lion," as opposed to "Achilles is a lion" (Aristotle, *Rhetoric,* 3.4.1406b20–24; Quintilian, *Institutio oratoria,* 8.6.9). Aristotle distinguishes between *eikôn* [εἰκών] and *metaphora* [μεταφορά] (*Rhetoric,* 3.4.1406b20–23), and Quintilian between *similitudo* and *tra[ns]latio*, the latter word being itself the Latin equivalent of the Greek *metaphora*, which Quintilian also uses:

Aristotle		Quintilian
eikôn	=	*similitudo*
metaphora	=	*tra[ns]latio*

■ See Box 1.

Note that the concept of *comparatio* is not part of this table—of this register of concepts. Quintilian imports the noun *comparatio* for explanatory purposes, to show what happens in a simile and thus also in a metaphor. In his work, *comparatio* is hardly more than a deverbal noun derived from the verb *comparare*, which he had initially used. A simile is "like" a parallel/difference, the latter being as familiar to readers of Quintilian—or Aristotle—as it is unfamiliar today:

> In totum autem metaphora brevior et similitudo, eoque distat quod illa comparatur rei quam volumus exprimere, haec pro ipsa re dicitur. Comparatio est cum dico fecisse quid hominem "ut leo," tralato cum dico de homine "leo est."

> (On the whole *metaphor* is a shortened form of *simile*, while there is this further difference, that in the latter we compare some object to the thing which we wish to describe, whereas in the former this object is actually substituted for the thing. It is a comparison when I say that a man did something like a lion, it is a metaphor when I say of him, "He is a lion.")

> (Quintilian, *Institutio oratoria,* 8.6.8–9, trans. Russell)

From *comparare* to *comparatio*, the verb and noun are there to make it understood that the essential point is not the presence or absence of the word "like." The point is that a parallel between Achilles and a lion would develop at length everything that belongs to the hero and everything that belongs to the animal to discriminate between them by means of a parallel/difference. This very intellectual process is thus the inverse of metaphor. The simile maintains the distance

1

Reminder: Aristotle's definition of "metaphor"

➤ ANALOGY, INGENIUM, LOGOS

The recent success of metaphor draws its title of nobility from Aristotle. Metaphor, unlike comparison or simile, is a trope, a "figure of words," namely, according to its canonical definition in the *Poetics*, "giving a thing a name that belongs to something else" (*onomatos allotriou epiphora* [ὀνόματος ἀλλοτρίου ἐπιφορά], 1457b7–8, trans. Bywater, 1476). This may be done by moving from the genus to the species, from species to species, or, finally and especially, in accord with a relationship of "analogy": a metaphorical expression then abbreviates and summarizes a proportional relationship (to call the evening "day's old age" is to imply that evening is to day as old age is to life). Whereas for Quintilian, metaphors are "abbreviated similes," for Aristotle "comparisons [*eikones* (εἰκόνες)] are metaphors that need

logos [*logou deomenai* (λόγου δεόμεναι)]," that is, as Dufour and Wartelle translate it, that "need to be developed" (*Rhetoric,* 3.4.1407a14–15), but "just because it is longer, it is less attractive" (3.10.1410b18–19). Both metaphor and simile are mental operations. So far as metaphor is concerned, "when the poet calls old age a 'withered stalk,' he conveys a new idea, a new fact [*epoiêsen mathêsin kai gnôsin* (ἐποίησεν μάθησιν καὶ γνῶσιν)] to us by means of the general notion of 'lost bloom' which is common to both things" (3.10.1410b15–16). And "in philosophy also an acute mind will perceive resemblances [*to homoion theôrein* (τὸ ὅμοιον θεωρεῖν)] even in things far apart" (3.11.1412a12–13). The success of a metaphor, even in the form of a witticism (*asteion* [ἀστεῖον], 3.11.1411b22–24), has to do with

the brilliance of the connection it makes between philosophy and poetry.

One of our problems with the passage from Aristotle to Quintilian is a problem of translation, namely, a difference in the way the Greek is rendered in Latin and in French: Quintilian translates *eikôn*, the other word Aristotle uses for "metaphor," which is generally translated in French by *comparaison*, as *similitudo* and not *comparatio*.

---

between Achilles and the lion (see here the verb *distat*, which is typical of *comparatio*), whereas metaphor fuses these two poles in a flash of intuition. Length in one case and brevity in the other merely indicate the difference between these two mental processes. On the whole, the presence of "like," which has so hypnotized criticism, is just the tip of the iceberg. It emblematizes the essential, since the "like" forestalls complete assimilation. But making it the absolute criterion for distinguishing between simile and metaphor is erroneous and leads to many disappointments: this criterion doesn't work.

So let us set aside comparison in the modern sense. In "comparison" in the sense of parallel/difference, the point is to juxtapose two elements that then correspond—without ever being conflated. Let us take an example. In his chapter on the verbal figures, Quintilian deals with an effect of repetition taken from Cicero. Here the repetition involves the first words of the parts of the period, "you" and "him," in a parallel between you the jurist and him the military leader—a famous parallel because, contrary to all expectations, Cicero gives the advantage to the military man:

Vigilas tu de nocte ut tuis consultoribus respondeas, ille ut eo quo intendit mature cum exercitu perveniat; te gallorum, illum bucinarum cantus exsuscitat; tu actionem instituis, ille aciem instruit; tu caves ne tui consultores, ille ne urbes aut castra capiantur

(You pass wakeful nights that you may be able to reply to your clients; he that he and his army may arrive betimes at their destination. You are roused by cockcrow, he by the bugle's reveillé. You draw up your legal pleas, he sets the battle in array. You are on the watch

that your clients be not taken at a disadvantage, he that cities or camps be not so taken.)

(Cicero, *Pro Murena,* 22, quoted in Quintilian, *Institutio oratoria,* 9.3.32, trans. Cousin)

This is a good example of the possible length: the parallel extends over ten paragraphs, from §19 to §28. Moreover, it is accompanied by another that serves as its conclusion, the parallel between the orator and the jurist, the orator being just as superior to the jurist as the military leader is (§29–30). Quintilian quotes this passage and comments: "In antitheses and comparisons [*in contrapositis vel comparativis*], the first words of alternate phrases are frequently repeated to produce correspondence [*solet respondere primorum verborum alterna repetitio*]" (9.3.32).

Contra-positum: this is not far from the Italian word *contrapunto*, "counterpoint," and the French *contraste*, one of the words by which French rhetorical textbooks of the eighteenth century retranslate *comparatio*.

III. *Contrapositio* and *Antithesis*

Contrapositio is the Latin word that Quintilian uses in the same chapter 3 of book 9 to render the Greek *antitheton* [ἀντίθετον] in referring very specifically to the verbal figure called "antithesis." In all of these words, the prefixes *anti-* [ἀντί] or *contra-* largely determine the meaning. The Greek word for "antithesis" can designate any kind of parallel. It refers literally to the act of setting one thing next to another, -*positum* translating -*theton*, and *contra-* translating *anti-*. In this very general sense, antithesis is a special case of parathesis. When two elements are set opposite each other, they correspond

either by being similar, symmetrical (*para* [παρά], parallelism, parathesis, *adposita*; cf. Quintilian, *Institutio oratoria,* 5.10.86: "Adposita vel comparativa") or by being dissimilar, opposed (*anti-*, contrast, antithesis, *contraposita*). Furthermore, *anti-* does not necessarily signify the exact contrary: the island of Anticythera is simply the one that is across from Cythera; *x* and *y* face each other. We could say the same about the prefix *para-*; *parallêlos* [παράλληλος] is constructed on the basis of *allêloi* [ἀλλήλοι], "one and the other": to juxtapose. One of the words in the entry on *sugkrisis* in Hesychius of Alexandria's Greek dictionary even combines the two prefixes *anti-* and *para-*. This word is *antiparathesis* [ἀνθιπαράθεσις], which is used, for example, by Dionysius of Halicarnassus to designate, very simply, a parallel/difference—in short, a contrast, in this case between the bad Hegesias and the excellent Homer (*On Literary Composition,* 6.18.24). Elsewhere, Quintilian says again that he translates the Greek *antistasis* [ἀντίστασις] by *comparatio*: this clearly emphasizes that the essential element is the prefix (Quintilian, *Institutio oratoria,* 7.4.12).

IV. Comparison and Comparatism: Double Attention and the Aesthetics of Counterpoint

This terminological complex thus allows us to broaden the brief article "*Comparaison*" in Lalande's *Vocabulary* (RT: *Vocabulaire technique et critique de la philosophie*, s.v.). The latter refers, rightly, to Étienne Bonnet de Condillac and his school. The quotation from Condillac's *Logique* (1.7) is interesting:

> As we give our attention to an object, we can give it to two at once. Then, instead of one exclusive sensation, we experience two, and we say that we are comparing them, because we experience them exclusively in order to observe them side by side, without being distracted by other sensations: and this is exactly what the word "compare" means. Comparison is thus only a double attention.

This quotation reminds us in a remarkable way of the following passage in Petrarch, which Condillac probably did not know. Petrarch develops his long and famous parallel, or *comparatio,* between solitude and urban life (*On the Solitary Life,* 1.1.8). He notes:

> I think that I shall describe all this better if I do not devote separate developments to everything that it seems to me could be said about these two ways of life; I shall on the contrary mix them, referring by turns to a given aspect of one of them, so that attention [*animus*] is directed now to one side, now to the other, and that it can gauge, looking from the right and from the left as one does with an alternate movement of the eyes, the difference that separates the most dissimilar objects placed next to each other.

This quotation show how reductive it would be to limit oneself to Condillac alone. The philosopher elaborates in his own idiom, explicating a notion that he finds in "ordinary" language—a notion that was elaborated a long time before and that he inherited from the whole rhetorical culture of his time. Before Condillac there was at least Aristotle. In his *Topics*, comparison is involved in two of the four

instruments, or *organa,* that provide an abundant source of propositions. These are the third and fourth instruments: attention directed toward differences and then resemblances (*Topics,* 1.16.107b–17.108a).

■ See Box 2.

As Aristotle described it, comparison serves first of all to make inductions: to bring out the universal by comparing individual cases (*Topics,* 1.18.108b). By whatever mediation, the idea of *comparatio* is at the origin of all the comparative disciplines that emerged at the beginning of the nineteenth century. Comparative anatomy was inaugurated by Georges Cuvier's *Leçons d'anatomie comparée* (1800–1805), and was soon followed by comparative physiology (1833), comparative embryology, and so on. François Raynouard's *Grammaire comparée des langues de l'Europe latine dans leurs rapports avec la langue des troubadours* (1821) provided the foundation for the discipline of *Romanistik* founded by Friedrich Diez some fifteen years later. Comparative geography was inaugurated by Carl Ritter's *Die Erdkunde im Verhaeltnis zur Natur und zur Geschichte des Menschen oder allgemeine vergleichende Geographie* (1817–59), part of which was translated into French by Eugène Buret and Édouard Desor as *Géographie générale comparée* (1835–36). In his anthology, *Cours de littérature comparée* (1816–24), François Noël limited himself to juxtaposing texts in French, Latin, English, and Italian. In his *Mémoires d'outre-tombe* (1848–50), Chateaubriand went so far as to call his *Essai sur les révolutions*, originally published in 1797, "a comparative work on revolutions [*un ouvrage sur les révolutions comparées*]." The general movement is in fact that of the "double attention" Condillac talked about. More than *comparé* (compared), this should be called *comparant* (comparing), as in German (*vergleichend*), or "comparative," as in English. What counts is not so much the two objects juxtaposed as the intellectual act of bringing them together.

The fact that comparison does not always provide proof in no way deprives the method of interest: because it is inherently plural, comparison elicits thought. To put the point in the old terms, comparison is part of topics, which is a matter of invention and not of criticism, which concerns judgment. First *invenire,* then *iudicare*. First find, produce results, then weigh and reweigh, decide what the results mean. To reject the comparative method because some of its results are unacceptable is to fail to understand its role as an instrument, a tool. This negative judgment generally goes hand-in-hand with an inability to explain one's own topics, one's way of collecting the materials for thought.

Comparison thus understood can be used not only as an intellectual tool but also as an aesthetic means. We have seen this in the quotation from Cicero's *Pro Murena*, in which the alternating repetition of the first words produces a figure, a sort of rhythm, "you . . . him." Here are two further examples.

In musical terms, contrast or contraposition is somewhat like counterpoint. The Greek word *sugkrisis* is attested, in the Septuagint, in the very specialized sense of "musical concert": Ecclesiasticus (Sirach) 32 (35):7. Here we are in a context of harmony: the person presiding over the banquet is asked not to "strike a false note" by inappropriately lecturing people who want to party. Good taste consists, on the contrary, in being like "a carbuncle seal on a ring," like "a

2

The comparison of the arts

The comparison of the arts is a literary genre that began in the Renaissance and continued throughout the classical period. It took several forms. The first and most important was a parallel between the arts of the visible and those of discourse: painting and sculpture on the one hand, poetic arts on the other. On the basis of this comparison, which is in a way generic, more specific forms of comparison emerged—comparisons between painting and sculpture, or between painting and music. The Italian word *paragone*, which means "comparison" in general, was used in all European languages to designate the comparison between painting and sculpture that gave rise to many debates in the sixteenth century. The comparison between painting and music (the analogy between sound and color, reflections on the notion of harmony) was also present in the Renaissance and in the classical age. It was revived in the twentieth century with the birth of abstract art.

The comparison between the arts of the eye and those of the ear is part of a long tradition that, according to Plato, goes back to Simonides, and that was spread during the Renaissance through the reading of Horace. In the *Art of Poetry*, Horace says, "What is heard, not seen, is weaker in the mind than what the eyes record faithfully as it happens" (*Art of Poetry*, trans. Raffel). But it is another remark of Horace that was to play a crucial historical role, the one in which he drew a parallel between painting and poetry: "ut pictura poesis erit," a poem is like a picture (ibid.). Adopted by the theoreticians of the Renaissance, this comparison is at the origin of what has been called the doctrine of *ut pictura poesis*. But this doctrine is based on a misunderstanding, or rather an inversion: whereas Horace compared poetry to painting, relating the arts of language to those of the image, Renaissance authors inverted the direction of the comparison. "A poem is like a picture" became "a picture is like a poem." The phrase *ut pictura poesis*, as it was understood

in the field of discourse on art, always consisted in defining painting, in determining its value, in relation to criteria of the poetic arts. This doctrine was unquestionably fertile for several centuries; it played an essential role in helping painting acquire the dignity of the liberal arts (see ART). Through this comparison, the painter was able to accede to the rank of the poet and the orator. The expressions *pictura loquens* and *muta poesis* are topoi that serve to qualify poetry and painting, the latter being often represented in engravings by a figure wearing a blindfold or holding a finger to its mouth. Painting is a "mute poetry" and poetry is a "speaking picture." Seventeenth-century French writers called them "sisters" (*sœurs*; the English called them the "sister arts") and described them as united in a constant relationship of reciprocal emulation. Thus André Félibien, in his work *Le songe de Philomathe*, stages *ut pictura poesis* by means of a dialogue between two sisters, one blonde, the other brunette, the former expressing herself in verse, the latter in prose (published in 1683, reprinted as an appendix to book 10 of the *Entretiens sur les vies et les ouvrages des plus excellents peintres anciens et modernes*, 1666–88).

Ut pictura poesis did not limit itself to changing the image and status of the painter; it also transformed the definition of the painter by imposing on him the categories of poetics and rhetoric (*inventio*, *dispositio*) and by attributing a narrative goal to him. The doctrine of *ut pictura poesis* also triumphed in history painting, long considered the most noble kind of painting.

But very early on, reservations were expressed with regard to a comparison that subjected painting a little too much to the order of discourse. Thus Leonardo da Vinci preferred to describe poetry as blind painting rather than as speaking painting, to maintain the equality between the two arts: "Painting is a mute poetry and poetry a blind painting; both seek to imitate nature in accord with

their means" (*Traité de la peinture*, trans. Chastel, 90). But Gotthold Lessing, in his *Laocoön* (1766), was the first to provide a systematic critique of the doctrine of *ut pictura poesis*. Disqualifying the very idea of a comparison between the arts, Lessing insists on their differences and the limits that separate them, as is shown explicitly by his book's subtitle: *Laocoön: An Essay on the Limits of Painting and Poetry*. The rejection of the parallel in the name of the argument for specificity was extensively developed in the nineteenth century, following Charles Baudelaire, by all the defenders of "modernity." This argument has played a major role in the contemporary analysis of art. In 1940, Clement Greenberg published in the *Partisan Review* an article, "Towards a New *Laocoön*," that was to become one of the main texts of "modernist" criticism. Appealing specifically to Lessing, Greenberg writes: "The avant-garde arts have in the last fifty years achieved a purity and a radical delimitation of their fields of activity for which there is no previous example in the history of culture. The arts lie safe now, each within its 'legitimate' boundaries, and free trade has been replaced by autarchy" (1:32).

musical concert during a banquet"—that is, the ornament that crowns everything. The Vulgate translates this as "et comparatio musicorum in convivio vini." Although very specialized, this meaning is within the logic of the terms *sugkrisis* and *comparatio*. Whether it be music as harmony or social harmony as music, in both cases the idea is that each element should be in its proper place. It is a matter of decorum, that is to say, of appropriateness (see MIMÊSIS, Box 6). The focus of attention is shifted from the parts to the whole. It is no longer a double attention, but, so to speak, a triple

one. If intellectual contrast serves to examine each of the two elements, to illuminate each by the other, contrapuntal harmony seeks to merge them into a whole that simultaneously transcends and respects them. Then the whole is more than the sum of its parts, and the parts in turn are enhanced by the light that their comparison yields. Taken as a whole, the aesthetic dimension is the pleasure of *com-prehending* in the sense of holding the two contrapuntal lines together.

The other example reminds us that this phenomenon is exceedingly classical. This example is poetry. In this case,

what does it mean to set two things face to face so that they correspond to each other? The effect of contrasted symmetry is emblematic of the Italian sonnet. First, there are the two quatrains. Not only is each symmetrical in itself, *ab* and then *ba*, but also and especially the two quatrains correspond to each other. The repetition of rhymes is not in itself very important. The essential fact is that this repetition is accompanied by a general schema in which everything tends toward symmetry: to *comparatio*. All of the variations of symmetry are then possible, whether the poet draws the symmetry from resemblance or from difference, from the *adpositum* or from the *contrapositum*. Joachim Du Bellay's *L'Olive* reintroduced the sonnet in France in 1550; the same year, Pierre Ronsard's *Odes* broadened the practice. The imitation of the Pindaric model made it possible to make two segments and not merely two quatrains correspond to each other: *strophe* and *antistrophe*. In Greek poetics, the *antistrophe* corresponded to the *strophe* in having the same metrical scheme; the chorus chanted the *strophe* while dancing in one direction, and the *antistrophe* while dancing in the opposite direction. In the Ronsardian ode, though the rhyme scheme is the same in the *strophe* and the *antistrophe*, the rhymes themselves are not the same, unlike those in the quatrains of the Italian sonnet. This underlines the essential fact. The symmetry has to do not with the repetition of rhymes but with the will to symmetry: with the pure fact of counterpoint, of setting two elements beside one another, of comparing.

COMPORTMENT

"Comportment" corresponds to the French *comportement*, which, along with *conduite*, serves as the standard translations of the English "behavior." Adjacent to "behavior," "comportment" particularly emphasizes the objective, observable aspect of ways of acting, as reactions to the world and manifestations of internal dispositions. The article BEHAVIOR studies the differences between behaviorism and the psychology of *comport(e)ment*.

CONCEPT

"Concept" is borrowed from the Latin *conceptus*, based on *concipere* (*cum-capere*, take entirely, contain). The *conceptus* is what one conceives in two senses of the term, the product of an internal gestation (the concept is mind's fetus) and collection in a unit, generality: CONCEPTUS; cf. INTELLECT, INTELLECTUS, SOUL, UNDERSTANDING. On the difference between "nominalism" and "conceptualism," see TERM.

Only the act of intellectual grasp subsists in *Begriff*, which corresponds to *comprehendere* and *comprehensio*, and belongs to the Stoic idiolect *katalepsis* [κατάληψις] (BEGRIFF, Box 1); see BEGRIFF, where the development of terminologies of understanding is analyzed through German and English; cf. AUFHEBEN, MERKMAL, PERCEPTION.

Finally, Italian *concetto* has a very special status. It is an ingenious invention situated between aesthetic design and witticism; see CONCETTO; cf. ARGUTEZZA, DISEGNO, INGENIUM.

CONCEPTUS (LATIN)

ENGLISH   concept
FRENCH   *concept*

➤ BEGRIFF, *CONCEPT*, CONCETTO, and INTELLECT, INTELLECTUS, INTENTION, REPRÉSENTATION, SIGN, SIGNIFIER/SIGNIFIED, SPECIES, TERM, UNDERSTANDING, UNIVERSALS, WORD

The Latin masculine noun *conceptus* (genitive: *conceptus*) came to occupy a distinctive place in Western philosophical terminology only in the second half of the thirteenth century. Meaning literally "fetus," it had been used figuratively since Roman antiquity to designate an intellectual representation developing in the mind (Macrobius, Priscian). But it was with Thomas Aquinas (ca. 1255–74) that the noun *conceptus* became prominent and then spread among epistemologists. This rapid success can be explained by two factors. First is the ambiguity of the term that had previously been dominant, *intellectus*, which designated both the intellectual faculty and the units it represented—and sometimes even the meanings of words. Second and above all is the very semantics of *conceptus*: on the one hand, it denotes, in the literal sense, the product of internal gestation; on the other hand, its etymology (*con-capere*, "take together") alludes to the collection of a plurality of elements in a single perception, that is, nothing less than the notion of generality. The internal production of thought on the one hand, and generality on the other: these are the two key components of *conceptus*. Though the later use of

"concept," or *Begriff,* oscillates between reference to an abstract, entirely depsychologized object (as in Frege) and reference to a mental representation (as in the cognitive sciences), the medieval notion surely belongs far more to the second of these two approaches.

I. *Intellectus/Conceptus*

The Latin used in medieval schools had numerous terms for the mental unit of intellectual representation. *Intellectus* designated the understanding itself, of course, but often also the internal objects of understanding. *Species intelligibilis*—paired with *species sensibilis*—put the accent on the representation of the thing in thought, the term *species* initially signifying something like aspect, appearance, or image (see SPECIES). *Verbum mentis* or *verbum cordis*—literally, the mind's or heart's word—related, in the wake of Augustine, to the comparison of human thought with the divine Word. *Intentio* often refers to the unit of thought insofar as it is directed toward some external object (from which comes the famous theme of intentionality). As for *conceptus*, which at the end of the Middle Ages became the key term in this semantic field, it referred first of all to something produced internally.

Literally, *conceptus* designates the fetus conceived in the womb of the mother, but already Macrobius (fifth century) used it in the derivative sense to say that intentions are born from a mental concept (*conceptus mentis*, in *Saturnales,* 1.18.17). But especially the grammarian Priscian (sixth century) wrote, in a passage that was very influential in the Middle Ages, that the spoken word (*vox*, see WORD) indicates a mental concept (*mentis conceptum*), which he also called *cogitatio* (*Institutiones grammaticae,* 11.7). But this use remained metaphorical and marginal. The term was not part of Augustine's usual vocabulary (though he often uses—especially in *De Trinitate*—the corresponding verb *concipere* to designate the mental act giving rise to a "mental verb" within itself). Boethius, translating and commenting on Aristotle's logic in the early sixth century, resorted to *intellectus* to refer to units of intellection (and to render the Greek *noêma* [νόημα]). *Intellectus* is also frequently used in the same sense during the twelfth and thirteenth centuries—especially by Abelard. Bonaventure and Albert the Great, for example, much prefer to use *conceptus* for what we would now call a "concept."

In the first half of the thirteenth century, in fact, *conceptus* used in the abstract sense seems to appear regularly only in direct or indirect relationship with the passage in Priscian mentioned above, according to which the spoken word signifies a "mental concept." In this case, it is opposed to *affectus*, grammarians and logicians (for example, Peter of Spain, *Syncategoreumata,* 2.2, and 8.6) distinguishing between signifying in the mode of the concept ("per modum conceptus") and signifying in the mode of affect ("per modum affectus") (cf. Rosier, *La parole comme acte*, chaps. 2, 3, and 5). But even in this limited context, when one encounters the form *conceptum*—the most frequent, and the one that appears in Priscian—it is not always easy to decide whether it is the accusative of the noun *conceptus* or the past participle of the verb *concipere*. The difference between these two possibilities is large, because taken as a past participle (nominalized or not), *conceptus*—or *conceptum*—normally refers to the thing conceived and not to a mental unit. Roger Bacon in particular proposes to interpret Priscian's work this way, and consequently sees in it the idea

that the word signifies the thing itself rather than a mental concept (*Compendium studii theologiae*, 61).

It is with Aquinas, between about 1255 and 1274, that the noun *conceptus* becomes really prominent in the philosophical vocabulary. A half-century later, at the time of William of Ockham, it was in widespread use among epistemologists. In fact, in the middle of the thirteenth century, the ambiguity of *intellectus*, which denoted both the intellectual faculty and its units of representation, and sometimes even the meaning of words, became all the more intolerable because the ambient Aristotelianism distinguished not only various types of intellectual representation ("intellectus simplex" and "intellectus compositus," for example), but also various types of intellect, or in any case, various functions of the intellect ("intellectus agens," "intellectus possibilis," "intellectus adeptus," "intellectus speculativus," "intellectus practicus," etc.; see INTELLECTUS); using a single word obviously risked leading to the most complete imbroglio. *Conceptus*, related to the verb *concipere*, which was already current in the philosophical vocabulary, had a twofold semantic peculiarity that was particularly attractive in this context: on the one hand, it denoted, in the literal sense, the product—or sometimes the process—of internal gestation; on the other hand, its etymology (*con-capere*: "take together") itself suggested the unification of a plurality in a common apprehension. But a major epistemological problem faced by Aquinas and his contemporaries was precisely how to join the Augustinian doctrine of *verbum mentis* (literally, "mental speech") that was so important in theology and that emphasized the mind's engenderment of an internal, prelinguistic thought, with the Aristotelian theory of abstraction that was taught in the faculty of arts on the basis of *De anima*, and that was supposed to account for the formation of general ideas in the mind.

II. Mental Speech and Internal Discourse

For Aquinas, the *conceptus*—which he also calls *conceptio*, *ratio*, or *verbum mentis*—is a purely ideal object, an internal product existing in the mind in an "intentional" rather than a real way, and representing some external reality in the order of the intelligible. The metaphorical relationship between this *conceptus* and the fetus, often forgotten in modern translations, has to do precisely with the fact that the intellect has to give birth to the *conceptus* within itself, as Aquinas clearly explains: "And when it is in the act of understanding, our intellect forms something intelligible that is, so to speak, its child [*proles*], and that for this reason we call a mental concept [*mentis conceptus*]" (*De rationibus fidei*, chap. 3).

This recourse to *conceptus* understood in this way was very controversial at the end of the thirteenth and the beginning of the fourteenth centuries. Several authors, especially Franciscans such as Pierre de Jean Olivi and William of Ware, complained that Aquinas had introduced between the act of understanding and the external thing that is its true object a useless and harmful intermediary that could act as a screen (cf. Panaccio, *Le discours intérieur*, chap. 6). Gauthier Burley, for example, is very explicit: "There are in the understanding no such concepts that are formed by the act of understanding and are at the same time representations of things [*similitudines rerum*]" (*Quaestiones in librum Perihermeneias*, 3.8).

But for all that, the word *conceptus* was not abandoned, even by Thomism's adversaries. Ultimately, the main debate was about whether *conceptus*, understood as an intellectual representation, had to be seen as a purely ideal object that was the mental correlate of the act of understanding, as Aquinas maintained, or as this act itself. Medieval thinkers were thus very aware of an ambiguity that was long to affect ideas like "concept," "understanding," and "representation," suggesting sometimes a process or an episode (an "act," the Scholastics said) and sometimes its object or result (occasionally seen as a purely intelligible entity).

After a few hesitations, William of Ockham ended up adopting the theory of the act. From this point of view, the *terminus conceptus*—or just *conceptus*—loses its status of intentional object and is identified with a mental quality of the individual subject, a quality endowed with a real existence in the mind (like that of "a white spot on a wall," Ockham explains), and in this school of thought, the original idea of an ideal product of the understanding fades away.

Starting in the fourteenth century, the remaining element common to most schools' use of the widespread term *conceptus* was the idea of a general intellectual representation that could appear as either subject or predicate in true or false mental propositions and play certain precise roles in reasoning. William of Ockham, Jean Buridan, and their followers made abundant use of *conceptus* to designate the simplest unit of mental discourse ("oratio mentalis"), in which they saw a natural sign that could have various semantic properties (*significatio*, *connotatio*, *suppositio*). Logical and semiotic functions thus become more important in this vocabulary than the mental dynamics. But the psychological dimension was not eliminated—far from it: contrary to the Fregean *Begriff*, the medieval *conceptus* is always mental; it exists, in one form or another, only in individual minds.

The common English translation of *conceptus* by "concept" remains, of course, the best available choice, but the very obviousness of this simple transposition usually conceals the complexity and diversity of characteristics that were simultaneously or successively associated with this term in the Middle Ages, from the relationship to the vocabulary of childbirth to the crucial insertion of the word into the very heart of the logic called "terminist" and seen as a grammar of thought.

CONCETTO (ITALIAN)

ENGLISH	conceit, concept, idea, thought, representation
FRENCH	*concept*, *idée*, *pensée*, *représentation*
GERMAN	*Begriff*
LATIN	*conceptus*

➤ BEGRIFF, *CONCEPT*, CONCEPTUS, and ARGUTEZZA, COMPARISON, DISEGNO, GENIUS, *IDEA*, *IMAGE*, INGENIUM, MIMÊSIS, REPRÉSENTATION, SPECIES, STRUCTURE

The word *concetto* presents no particular difficulties in contemporary Italian philosophical discourse insofar as, like the word *concept* in French, its meaning is presently strongly determined by the massive contribution of German philosophical texts. Since Immanuel Kant, French and Italian have reelaborated their definitions of *concept* and *concetto* with reference to *Begriff*. But this modern equivalence threatens to obscure the fact that in the Italian tradition from Dante to Benedetto Croce, *concetto*, indissolubly philosophical and rhetorical, refers both to the ingenious invention at work in the image and in the idea, and to the operation of the understanding involved in what we call the "concept." Only since the nineteenth century has the word referred almost exclusively to the operations of generalization and abstraction as we understand them today. In fact, neither Giordano Bruno, nor Tommaso Campanella, nor Giambattista Vico saw in the *concetto* an act having to do with the intellect alone and with its logical and cognitive functions.

I. The Semantic Autonomy of *Concetto* with Respect to *Conceptus*

At a time when Latin (that is, the Latin of the Scholastics) constituted almost the whole of the intellectual language,

Dante's use of the word *concetto* already raised most of the problems we encounter in philosophical language proper. This is all the more remarkable because it was only starting in the fourteenth century that the word was gradually affected by the rhetorical tradition, the aesthetic and artistic thought of the Renaissance, Marsilio Ficino's Neoplatonism, and the Aristotelianism of the Jesuits in the seventeenth century. In Dante, *concetto* shows an amazing autonomy with respect to the Latin *conceptus*, as if there were no interpenetration between Scholastic discourse and poetic discourse. Thus in the *Paradiso* (in the *Divine Comedy*), Dante offers us a number of ways to use the term; for example:

1. "Ne' mirabili aspetti vostri risplende non so che vi trasmuta da' primi concetti" (In your admirable appearance something divine shines forth that transmutes your earlier image).
2. "Queste sustanze . . . non bisogna / rememorer per concetto divisa" (These substances . . . need not / be remembered by separate ideas).
3. "O quanto è corto il dire e come fioco al mio concetto!" (O how inadequate is speech and how dim my thought!).

(*Paradiso*, 3.58–59, 29.79–81, 33.121–22, trans. Sisson)

Idea, concept, thought, image, intention (in the sense of an intellectual and artistic project), an act of the creative imagination, the *concetto* thus tends very early on to designate a number of intellectual activities, in an extension that produces an exceptional polysemy.

■ See Box 1.

II. The Productivity of *Concetto*

In the sixteenth century, the word *concetto* tends to bring out the originality of the production of schemas and representations by showing *in actu*, as it were, the activity of the mind, which can be the *ingegno* or the *intelletto*. From this comes the gradual extension of *concetto*, which, while claiming to be the expression of the idea, shows ostensibly the activity of the imagination, the subtlety of the mind in the metaphorical comprehension of the world that is specific to *conceptismo*. The semantic polyvalence of the word, which is used in extremely heterogeneous fields of application, can proliferate in a single text (the Platonic or pictural, symbolic, or metaphysical meaning, as in Giordano Bruno) and end inevitably in ambiguities. But these semantic ambiguities are not derived from etymological contingencies; on the contrary, they are carefully maintained and favored by authors insofar as the goal is precisely to substitute for the idea the more subtle nuances of the *concetto*. That is why it is ultimately not important to know that *concetto* is derived from *concepire* in the sense of "conceive" or "imagine," since only the multiple goals in the service of which the word is used matter.

The diversity of uses, intentions, and meanings is such that German translators of the word *concetto*, particularly when used in reference to the baroque, usually retain the Italian word, except, of course, in the case of poetic texts. In the case of philosophical texts, French translations of *con-cetto* by *concept*, *idée*, or *pensée* are merely arbitrary solutions and are seldom satisfactory. Thus, to translate a sentence from

Campanella, "Il mondo è il libro dove il sénno eterno scrisse i propri concetti" (*La città del sole* [1623], in Seroni, 326), we can propose, "The world is a book in which eternal reason writes its own thoughts" or ". . . its own ideas." But we will never be able to translate *propri concetti* by "its own concepts," because the divine intellect, which is identified with universal reason, does not really express itself through concepts, but through ideas. Moreover, the topos of the Book of the World refers back to the idea that the totality of the objects in the universe constitutes a system of signs expressing God's thought, which cannot be treated as simple concepts.

The difficulties regarding the possible translation of *concetto* as a specific expression of the modalities of thought culminate in the work of Giordano Bruno. In *De gl'heroici furori* (On heroic furor), Bruno's philosophical and sapiential thought is usually analogic: he sets forth his ideas most precisely in the interpretations of allegories, emblems, and devices around which the dialogues are articulated. The text tends to exemplify all the modalities of the idea insofar as it is based on a symbolic image and is fully intelligible in relation to the latter. Bruno usually calls this idea a *concetto*, as in this passage:

On the doubtful road of uncertain reason and affection to which Pythagoras's letter refers, where on the right appears the difficult path, thornier, rougher, and more deserted, on which the hunter unleashes his hounds and mastiffs to track down wild beasts, which are the intelligible species of ideal concepts [*le specie intelligibili de concetti ideali*].

(*De gl'heroici furori* [1585], 1.4)

Because we cannot use the word "idea" to translate *concetti ideali*, the translator has to content himself with rendering the Italian literally. The difficulty is not that truth and beauty can be adequately designated only in the allegorical mode (in this case, the allegory of the myth of Acteon), but that *concetti ideali* can be attained only through a symbolic image. The notion of an ideal concept, which is already vague, is not capable of making it clear how *concetto* has a connotation that is in a way figurative and closely connected with the activity of the imagination.

Another example, also from Bruno, shows the proximity of the *concetto* and the idea:

High and deep, and always alert, o my thoughts [*pensieri*], ready to leave the maternal lap of the suffering soul, you, archers well-armed to hit the target from which the sublime idea [*alto concetto*] is born, along these rough paths Heaven does not allow you to encounter a cruel beast.

(Ibid.)

This passage describes symbolically how the soul, seeking reconciliation with the heart, must call upon archers whose function is to drive away the seductions of the senses, those of sight, so as to allow access to a superior beauty. These archers must in addition repress their own sight, close their eyes, the better to flush out the *alto concetto*, well rendered by "sublime idea" insofar as it is a matter of a quest for the beautiful and the true in a perspective inspired by Neoplatonism in the wake of Marsilio Ficino.

1

The *concetto*, an aesthetic rival of "idea"

Although they seem far from a philosophical procedure, Michelangelo's two verses cited by Erwin Panofsky in Italian in his book *Idea* perfectly exemplify the difficulties that translators still encounter: "Non ha l'ottimo artista alcun concetto ch'un marmo solo in sè non circonscriva col suo soverchio" (The excellent artist has no *concetto* that a marble alone does not include with its superabundance: *Le rime di Michelangelo Buonarroti*). The Italian text is rendered by the French translator of Panofsky's book this way: "L'artiste excellent n'a aucun concept qu'un marbre seul en soi ne circonscrive de sa masse" (Panofsky, *Idea*, trans. Joly). We could point out to the translator that the word *concept* does not reflect Michelangelo's obvious Neoplatonism, and that the word *idée* would have already been more adequate. But above all, we must explain that *concept* cannot really illuminate the problematics at work in *concetto* as it is encountered in Renaissance theoreticians of art, so that the word *concept* means almost the opposite of what Michelangelo intended. The German translator Karl Frey (*Die Dichtungen des Michelangelo Buonarroti* [1897]) shows that he is better informed and more prudent when he renders "Non ha l'ottimo artista alcun concetto" as "Im *Geiste* kann nicht mal

der grösste Meister ein Bild sich machen" (literally, "The greatest master cannot form an image in his mind"). Of course, "ein Bild sich machen" lacks Platonic overtones, suggesting activity that is more properly psychological than aesthetic and metaphysical. In reality, a satisfactory understanding of the ways in which the word is used by Italian theorists would require a more precise knowledge of their own philosophical reference points. Even in Michelangelo, the question of whether he takes *concetto* in a Neoplatonic or an Aristotelian sense is controversial (Panofksy and Götz Pochat are opposed on this point). This divergence in interpretation regarding *concetto* already appears among Michelangelo's contemporaries. Fortunately, we have a text written during the author's lifetime by an academician, Benedetto Varchi, that correctly analyzes Michelangelo's text from a philological point of view. Even if we take into account Varchi's tendency to Platonize the sense of Michelangelo's poem, as a philologist and historian he confirms the correspondence—or even equivalence (which is more debatable)—between *concetto* and *idea*:

As our poet uses it, *concetto* corresponds to what the Greeks called *idea*, the

Romans *exemplar*, and what we call *modello*, that is, the form [*forma*] or representation [*imagine*], called by some "intention," that we have in the imagination [*fantasia*], of everything we intend to do or say; which intention is spiritual . . . and serves as an efficient cause for everything we say or do.

(*La lezzione di Benedetto Varchi sopra il sottoscritto sonetto di Michelangelo Buonarroti*, in Barocchi, *Scritti d'arte*, 2:1330)

Through the tension it maintains between a poorly elucidated Platonism and an Aristotelianism that holds that the artist realizes his *concetto* in matter, Varchi's analysis has the merit of showing the extraordinary plasticity of the word, its fundamental polysemy that proves to be very fertile in the expression of intellectual functions. The definitions Varchi gives are simply possible interpretations of the word as it might have been understood by a Renaissance humanist who was especially concerned to show that the aesthetic thought of the period was in perfect harmony, in Italian, with Neoplatonic ideas.

We see here how *concetto* expresses an allegorical, symbolic, and philosophical procedure that results in an increasingly redoubtable polysemy. Two currents glorify still further the productivity of the *concetto*: on the one hand, the theory of art, whose paradigm, after Alberti's *De pictura*, remained Cicero's *De oratore*, which emphasizes artistic invention; and on the other hand, *conceptismo*, which connects the activity of the mind solely with language as such.

III. *Concetto* in Theories of Art

In Georgio Vasari, the word *concetto* is close to the idea considered as a general representation:

Da questa cognizione nasce un certo concetto e giudizio, che si forma nella mente quella tal cosa che poi espressa con le mani si chiama disegno.

(From this apprehension is formed a concept, a reason engendered in the mind by the object, whose manual expression is called drawing.)

(Vasari, *Le vite* [1568])

In Vasari, *concetto* denotes a particularly active intellectual act, a conception, whose function is to promote the art of drawing as a form of thought. The idea of the beautiful in the sense of "ideal" is the ultimate reference point of the artist's thought, and the *concetto* becomes the mark of the activity of the *intelletto*, which, through its ingenuity and fecundity,

makes it possible to construct a priori the system of rules governing the production of artworks. The clear desire to intellectualize the theory of art rapidly eventuates, at the end of the sixteenth century—that is, with the generation that followed Vasari—in a semantic inflation of the word *concetto* that could only produce further ambiguities. From then on, no art was conceivable without the productive activity of the *intelletto*, of the *ingegno* (in the sense of ingenuity or genius), so that the *concetto* tends to slowly eclipse the idea in metaphysical reflection on art. This ascension of the act of conceiving ends up including metaphysics, theology, and thought about art, as is shown, for example, by Federico Zuccaro's theory of *disegno*:

Ben è vero che per questo nome di disegno interno io non intendo solamente il concetto interno formato nella mente del pittore, ma enco quel concetto che forma qual si voglia intelletto.

(It is quite true that by this name of *disegno interno* I mean not only the internal concept formed in the mind of the painter, but also this concept that any intellect can form.)

(*L'idea de' pittori, scultori e architetti* [1607])

Disegno is almost identified with *concetto* in the sense of an original conception of the intellect, since it is a matter of analyzing the faculties that make artistic creation possible.

Thus *concetto* is deliberately distanced from the idea in the Platonic sense and becomes the intellectual act of a creative freedom exercised on signs, forms, representations. But sometimes the *concetto* is so strongly imbued with divine ideas that it is no longer a product of the *intelletto*, but rather a form of the intellect's participation in God, as Zuccaro says explicitly:

> In questo modo essendo l'intelletto e i sensi soggetti al Disegno e al concetto, possiamo dire, che esso Disegno, come Principe, rettore e governatore di essi se ne serva come cosa sua propria.
>
> (In this way the intellect and the senses being subjected to the *disegno* and to the *concetto*, we can say that this *disegno*, as the Prince, orator, and governor, makes use of them as its own property.)

> (Ibid.)

In this case, we could translate *concetto* as "ideal representation" or even "ideal and ingenious representation." With Zuccaro's generation and the first treatises written by the Jesuit theoreticians of the seventeenth century, the *concetto* acquires the remarkable characteristic of being both very close to the idea as the principle of the production of forms, and very distant from it because it breaks with any reference point, and especially with any possible resemblance, to become only a mental, plastic, figurative, and symbolic expression. From this comes the confusion of translators—for example, those of the seventeenth century—who limited themselves to terms that were frequently too general, such as *conception d'esprit*, *pensée*, or *imagination*, as did Nathanaël Düez in his *Dictionnaire italien-français* (1670). At the opposite pole from the idea, which retained its prestige as a metaphysical authority, the *concetto* gained a field of application extending beyond ingenious inventions (all the symbolic figures: allegories, emblems, devices, graphic enigmas) as far as the language of the angels (*i concetti divini*) and even the coded language of God that transforms the world into a vast system of enigmatic, allegorical, emblematic signs. From that point on, the possible ways of translating *concetto* become steadily more limited and should lead us to resort to the equivalents proposed by French theoreticians of the seventeenth century: *idées ingénieuses*, *représentations savantes*, and even *inventions savantes*.

IV. *Concetto* and *Conceptismo*

From the sixteenth to the seventeenth century, *concettismo* (Italian) or *conceptismo* (Spanish) was an effort to radicalize the rhetorical tradition in the sense of an almost exclusive primacy of metaphorical thought that was developed both in the order of discourse (the art of the witticism) and in that of plastic or symbolic representations. The authors sought to extend all forms of eloquence as far as possible, from discourse to pictorial representation, in order to glorify the resources of the *ingegno*.

The theoreticians of mannerism and the Jesuits tried to reconcile the Ciceronian ideal of eloquence with the philosophical categories of Aristotle and Aquinas. The expression of the idea henceforth demanded a more witty, more *concettoso* discourse, more subtle than really conceptual. The *concettosità* of an ingeniously formulated idea is precision of thought insofar as it succeeds in realizing itself in an analogical and metaphorical mode. *Conceptismo* as it was theorized by Jesuit pedagogy postulates very explicitly that every thought and every language are originally metaphorical, so that the existence of a literal meaning of a proposition or even of an image seems not only prosaic or illusory, improbable or deficient, but also a form of potential symbolism. And that means that every *concetto*, that is, every *concetto ingegnoso*, presupposes a conception of metaphor and figure situated in a kind of general semiotics. To think in a *concettosa* manner is to know how to reconcile the austere rigor of the concept with the inventiveness of metaphor. That is why the word "concept" cannot adequately translate *concetto*. The *concetto della bellezza* cannot be rendered precisely by the "concept of the beautiful," because the English word remains in conformity with the Latin *conceptus*, that is, it is incapable of rendering the productivity of the imagination and the aesthetic inventiveness peculiar to the Italian word. In authors like Matteo Peregrini and Emanuele Tesauro, who were theoreticians of metaphor, symbolic expression, and the witticism, the *concetto* was subjected to the new requirements of *argutezza*, an infinite source of ingenious expression. *Argutezza* became the supreme faculty of inventions and symbolic creations in most of the arts of discourse and plastic arts, so that in his *Cannochiale aristotelico* (1654), Tesauro declared it the "gran madre d'ogni 'ngnoso concetto" (grandmother of every ingenious *concetto*). The word *concetto* refers to what consciousness produces in its metaphorical activity and to any representation that contains wit and subtlety. Here, the problematics of the *concetto* are completely absorbed by the hegemony of the rhetorical and sophistic problematics of the *argutezza*.

CONNOTATION

FRENCH   *connotation*
GERMAN   *Konnotation*
LATIN   *connotatio, consignificatio*

➤ ANALOGY, HOMONYM, PARONYM, PRÉDICABLE, PREDICATION, SENSE, SUBJECT, SUPPOSITION

Commonly used in linguistics since L. Bloomfield (1933), theorized by Hjelmslev, abundantly exploited by Roland Barthes and Umberto Eco, and central to semiotics and the theory of the text, the notion of connotation has a number of remarkable ambiguities that can be described, if not completely mastered, by considering the term's slow maturation, opposed to that of "denotation" (Fr. *dénotation*, Ger. *Denotation*), at the heart of the system of notions that articulate, in modern philosophy, the fields of ontology, semantics, philosophy of logic, and philosophy of language.

The first documented uses of the word *connotation* in French designate the confused meaning of a word or a concept, as opposed to a clear meaning (Port-Royal). This French sense of the word corresponds to the stress put on an element that was initially present in the semantic field of the medieval Latin *connotatio*—the derivative or secondary aspect, also marked in the synonymous term *consignificatio*—as if the confused/distinct pair were superimposed on the more general derived/direct pair. The original meaning of the Latin *connotatio*, which is also found in the English expression "associative meaning" (equivalent to "connotative meaning") poses no particular problem. Linguists and theoreticians of literary texts both oppose the "contextual coloring" (*coloration contextuelle*) or "implications" that a term can have in a given context (i.e., its "connotation") to its so-called referential, conceptual, or cognitive meaning indicated by the term "denotation." However, the idea of connotation involves a philosophical difficulty because of the possible interferences between the system of direct (distinct) and secondary (confused) signification on the one hand, and on the other the Fregean system of *Sinn* and *Bedeutung*, whose discordant translations ("sense" vs. "reference," or "sense" vs. "denotation") are a source of troublesome ambiguities.

I. Connotation/Clear or Primary Meaning and Connotation/Denotation

The sense of "confused meaning" was introduced in the *Grammaire de Port-Royal* (1676):

the reason that a noun cannot subsist by itself is that in addition to its distinct meaning, there is another confused meaning that can be called the connotation of something associated with the distinct meaning. Thus the distinct meaning of "red" is redness. But it signifies it by indistinctly marking the subject with this redness, and that is why it does not subsist alone in discourse, because it must be implicit in the word that signifies this subject. Just as this connotation makes the adjective, when it is separated from words that signify accidents, substantives are made from them, as from *coloré, couleur*; from *rouge, rougeur*; from *dur, dureté*; from *prudent, prudence*, etc. And when on the contrary we add to words that signify substances this connotation or confused meaning of something with which these substances are connected, we make adjectives of them: from *homme, humain*; *genre humain, vertu humaine*, etc. The Greeks and Romans have an infinite number of such words, *ferreus, aureus, bovinus, vitulinus*, etc. But Hebrew, French, and other vulgar languages have fewer of them. French explains it by a *de, d'or, de boeuf*, etc. If these adjectives based on the names of substances are stripped of their connotation, they are made into new substantives, called abstract or separate. Thus *homme* having made *humain*, from *humain* we make *humanité*, etc.

In English, we find the same opposition in John Stuart Mill, where it is colored by an additional trait, the opposition between the comprehension and the extension of a concept or a term, which enables him to define denotation as "the things an expression applies to," connotation being the complementary "information" that any common noun normally "brings to mind" regarding the objects that it "denotes." The problem raised by the use of connotation in philosophy is that its opposite, "denotation," has gradually merged with the German *Bedeutung* taken in its Fregean meaning. As a result, there is a danger of confusing two oppositions that do not necessarily coincide: denotation (*Bedeutung*) and meaning (*Sinn*), on the one hand, and primary meaning (*significatio prima, principalis*) and secondary meaning (*significatio secundaria, ex consequenti, connotatio*) on the other. Even if English tends to use the term "denotation" to explain that two expressions applying to the same thing (i.e., having the same denotation) can differ in meaning, we must avoid identifying, by means of the word "connotation," this meaning with Frege's *Sinn*. A quick examination of the origins of the term "connotation" shows that this tendency or temptation is connected with the polysemy of the Latin *connotatio*, which, from the outset and through the diversity of disciplines in which the notion is used, mingles inextricably the logical, linguistic, and ontological registers.

The Latin term *connotatio* appeared in the twelfth century, and its first use was essentially theological, in the domain of Trinitarian semantics. The verbs used to express the idea of connotation (*notare, connotare, consignificare, innuere*) all refer to the same idea: making something different known with (*cum*) itself—whence the specialization of connotation in the sense of "secondary meaning of a word" and the close connection of the various terms expressing this idea with the idea of consignification (*consignificatio*) or co-intellection (*cointellectio*).

▪ See Box 1.

1

Denotatio/connotatio in medieval logic

In medieval logic, the distinction between "connotation" and "denotation" does not exist in the form of an opposition between *connotatio* and *denotatio*. The verb *denotare* emerged along with terminist logic. It is found in Peter of Spain, for instance. Analyzing the sentence "sedentem possibile est ambulare" (it is possible that the person who is seated walks), Peter notes that the participle "refers to" or "includes a simultaneity" (*importat concomitantiam*). This *concomitantia* can be signified either in relation to the verb *ambulare* (in the sense of "dum sedeo, me ambulare est possibile" [while I am sitting, I can walk]), which is false, or denoted relative to the predicate (in the sense of "dum sedet, potentiam

habet ad ambulandeum postea" [while he is sitting, he has the capacity to walk later], which is true. Peter therefore observes, in a more general way, that

> Quando denotatur concomitantia respectu hujus verbi *ambulare*, tunc ponitur possibilitas supra totum dictum, et sic est falsa; quando autem denotatur concomitantia respectu praedicati, tunc possibilitas ponitur supra subjectum dicti, et sic est vera.
>
> (When simultaneity is denoted in relation to the verb "to walk," then the possibility bears on the whole of the *dictum*, and the proposition is false; when it is denoted in

relation to the predicate, it concerns the subject of the *dictum*, and the proposition is true.)

Tractatus, 7.70

This example suffices to show that *denotare* was not initially opposed to *connotare*, as "denotation" is opposed to "connotation" in modern linguistics. In Peter of Spain's text the verb *denotare/denotari* is a simple synonym of *significare/significari*.

BIBLIOGRAPHY

Peter of Spain. *Tractatus Called Afterwards "Summulae Logicales."* Edited by L. M. De Rijk. Assen, Neth: Van Gorcum, 1972.

In the late Middle Ages, the analysis of *connotatio* focused on a more specific phenomenon: the meaning of "denominative" terms (*denominativa*; see PARONYM), that is, concrete accidental terms (like "white"), and finally ended up in Ockham's distinction between absolute and connotative terms. This shift explains in part the diversity of the problems the Middle Ages encountered with the notion of connotation: the distinction between signification in itself and accidental signification (*significatio per se* and *significatio per aliud*), primary signification and secondary signification (*principaliter significare* and *secundario significare*), direct signification (*in recto*) and indirect signification (*in obliquo*), signification according to the anterior and the posterior (*secundum prius et posterius*) or analogical (see ANALOGY)—all combined with the problems involved in the semantic distinction between signification (*significatio*) and reference (*suppositio*, *appellatio*).

II. *Connotatio* and *Consignificatio*

Secondary meaning, as opposed to primary meaning, was at first designated by the term *consignificatio* and the corresponding verb, *consignificare*. These terms were used for different problems:

1. "Secondary signification" is used for tense, which is "consignified" and not signified by the verb, and also for composition, or the predicative function (*prossêmainein* [προσσημαίνειν] in Aristotle)—the questions of contingent future tenses, of divine prescience, and of the unity of the articles of faith could all benefit from this notion of consignification because it made it possible, for example, to posit a unity of the articles of faith independently of the accidental, temporally determined forms in which they were formulated (Christ will be born / is born / was born).

2. It is also said that the denominative term (or paronym) consignifies the subject (e.g., *album* signifies whiteness primarily, and consignifies the subject of the whiteness).

3. In the Platonizing analyses of the early twelfth century, the paronyms "whiteness" (*albedo*), "whitish" (*albet*),

and "white" (*albus*) are said to signify the same quality, or form, or idea, but in different ways, and hence with different consignifications (cf. Bernard of Chartres: "'whiteness' signifies a pure virgin, 'whitish' the same entering a bed chamber or lying on a bed, 'white' again the same, but deflowered").

4. "Consignification" is used for all parts of speech that are neither subject nor predicate, those that are "consignificant" (*consignificantia*, *consignificativa*) or syncategorematic; then it is said that not everything signifies the universal, but consignifies universally.

We can mention two other less important meanings:

5. *Consignificare* can also be equivalent to "signify the same thing," as when one says that in a proposition the subject and the predicate "consignify."

6. It is also said that the parts of a compound noun "consignify," for example, *equus* (horse) and *ferrus* (savage) in the compound *equiferrus* because they retain something of their meanings, but do not signify strictly speaking because these meanings merge in a single meaning, which is that of the compound.

By extension on the basis of (1), most grammatical accidents will be described, starting in the twelfth century, as consignifications (person, number, etc.) because they are properties that are accidental with regard to the primary grammatical meaning that makes it possible to define the word as belonging to this or that part of speech. The Modists of the thirteenth century maintained that all grammatical properties, both essential (defining the class of words and its species) and accidental, were consignified because they corresponded to different ways of apprehending the thing signified. The modes of signifying (or modes of consignifying) are here opposed to the lexical meaning, whereas earlier *consignificata* were only a part of the latter, the accidents. The term *consignificare* can thus have two distinct meanings, either "signify with" (*significare cum*), as when one says that the verb consignifies the tense (it refers to its signified with

a secondary temporal meaning), or "signify in such a way" (*significare sic*), as when one says that the noun *motus* signifies movement in the mode of substance, the verb *movere* signifies it in the mode of movement, etc. It was only in the first sense that *consignificare* was replaced, notably in the logical tradition, by *connotare*; in the fourteenth century, for instance, writers referred to a verb's temporal connotation (cf. Maierù, *Terminologia logica della tarde scolastica*).

The notion of *consignificatio* is a useful tool for distinguishing between terms that are clearly related on the semantic level without being synonyms. This holds for the first three meanings listed above, and for their extensions: the noun *cursus* (race) and the verb *currit* (he runs) have the same meaning, but they differ because only the second consignifies time; the denominative "white" signifies the same thing as the corresponding abstract noun "whiteness," but by connoting the subject of the quality; the noun "suffering," the verb "to suffer," and the interjection "ow!" all mean the same thing, but signify different real properties that are indicated by membership in different grammatical categories.

III. *Connotatio* in Theology

Theologians are confronted by the problem of distinguishing not between terms that are close in form and differ only partly in meaning, but between terms that are "identical" when they are used to speak of created realities and God. Moreover, they have to explain why different attributes can be predicated of God, signified by different words, whereas God himself is simple and indistinct. The notions of *consignificatio* and *connotatio* proved to be useful tools for coping with these two problems.

Starting in the second half of the twelfth century, theologians believed that it did not suffice to oppose a predication regarding God to the same predication regarding a created reality—as in the example of Boethius's *De Trinitate*: "God is just/man is just," where they said that in the latter case the usage is correct because it is in conformity with the first meaning of the term, whereas in the former case we are dealing with a figurative, transferred, equivocal usage (see TO TRANSLATE). In "God is just" and "God is good," the same divine essence is predicated, but these statements are not identical in meaning because something different is consigned or "compredicated," for example, that God is the cause of justice, on the one hand, and that he is the cause of goodness on the other. Analogously, "God is just," in which "just" consignifies that God is the cause of justice, can be contrasted with "man is just," where the same adjective consignifies that man is the effect of divine justice. Thus it was possible to maintain that every predicate amounts to attributing to God the same divine essence, which is "essentially signified," but that it "signifies secondarily" or consignifies a different effect in the creature. This explains why different attributes are not synonymous when they are attributed to God: even if "just" and "merciful" signify the same thing in God, in the sense that there is no distinction between justice and mercy in God, who is an absolutely simple entity, it is not tautological or redundant to say "God is just and merciful" because the two adjectives have different connotations, since the effects of justice and mercy on human beings are different. From this two rules regarding the functioning of conjunction are drawn: in ordinary

statements (e.g., "Man is just and courageous") conjunction associates the signifieds; in theological statements (e.g., "God is just and merciful") it associates (*copulat*) the "consignifieds" (*consignificata*), namely, the effects that are "compredicated" in this proposition, but not the divine essence, which is identically "predicated" by each of the two adjectives. The problem of co-reference raised by statements such as "Deus est justus et talis est Petrus" (God is just and so is Peter) is resolved in an analogous way: even if divine justice and Peter's justice have nothing in common, they can be compared because the comparison is made solely on the level of consignification. The identity of predicates in God thus becomes compatible with the diversity of names that designate them and the meanings that are conventionally associated with them. This theory of consignification allowed Prévostin to propose the idea that there is a *univocatio et non equivocatio* (see HOMONYM) in the statements "God is just" and "man is just," precisely because the two predications have something in common. Toward the end of the twelfth century, the terms *connotare/connotatio* were used instead of *consignificare/consignificatio*, which nonetheless continued to be used in the logical and grammatical traditions. We note as well the use of *compraedicare* and *coassertare* to distinguish between primary and secondary predication.

However, the ad hoc character of this idea of connotation elicited criticisms. It was appealed to whenever there was a need to distinguish within a single term something identical and something different; it could even be used to demonstrate the doctrinal unity of the "authorities" that are supposed to be strictly speaking contradictory since one had only to say that the controversial pages use the same words with different "connotations." At the turn of the thirteenth century, there were lively debates about how to determine this difference indicated by connotation: should connotation be thought from the point of view of God (the cause) or from that of the creature (the effect) (*connotatio a parte rei/a parte creaturae*)? Should one acknowledge that relational nouns, even when predicated of God (e.g., "*Deus est creator*"), connote something about creatures, but not about God? Indeed, why not attribute all names to God since he is the cause of all the things they signify? These difficulties eventually undermined the theory of connotation, and first Albert the Great, then Aquinas, found new solutions to the same problems. (Cf. Rosier, "Res significata et modus significandi"; Valente, "Justus et misericors")

■ See Box 2.

IV. Connotative Terms

For William of Ockham, the classification of categorematic terms into absolute and connotative terms is central, and is based on the same criteria as before. The connotative name "is one that signifies something in a primary way [*primario*] and signifies something else in a secondary way [*secundario*]." The absolute name is one that does not signify something in a secondary way, and is thus such that it signifies everything it signifies primarily and *in recto*. Thus "animal" signifies an ox, an ass, etc.; it signifies and thus constitutes a reference (*suppositio*) to each of the individuals of whom it may be true to say "this is an animal." It corresponds to "natural kind terms." The category of absolute name includes all the

2

Connotatio in the work of Roger Bacon

In *De signis* and then in the *Compendium studii theologicae*, Roger Bacon developed a sophisticated analysis of connotation. For him, the different modes of connotation are based on analogy: connotation is produced when a term signifies, by imposition, one thing, and one or more things are associated with it through a relation of natural signification, so that several things are "made readable" by the same word. The word thus signifies one thing "conventionally," but because of the different natural relations that exist between that thing and other things, it can "naturally" signify these other things. Because of the conventional relation of the word to the thing signified, and because of the natural consequent relation between the thing signified and the thing connoted, we can say that the word naturally implies the latter.

Roger Bacon distinguishes seven modes of connotation:

1. non-being is understood in being by privation;
2. the names relating to God connote the creature (the Latin word *creator* signifies secondarily the creature, which is the result of the relation of creation);
3. the names of creatures imply the creator, because of their dependence on him (whence the valid inference: "there is a creature, therefore there is a creator");
4. the accident connotes the substance, and vice versa;
5. the universal implies the vague particular ("man exists, therefore a man exists") or the particular in disjunction ("man exists, therefore Socrates or Plato or ... exists");
6. an essential part (e.g., a roof) implies another essential part (e.g., a wall)—this example is taken from Avicenna and al-Ghazālī;
7. the name of a relative implies its correlative (e.g., father-son).

In a statement, the word signifies only its primary signified ("double" does not signify "half") and the statement is verified only for this primary signified. However, the speaker can do as he pleases (*ad placitum*) by reimposing the word, changing its meaning, so that the secondary signified becomes the primary signified and that the word then signifies the latter *ad placitum*. It is interesting to note that Bacon does not use the term *connotare* in *De signis*, although in the *Compendium* he uses it with the same examples, calling attention to the theological origin of this term:

> The name given to a single thing outside the soul may signify several things outside the soul at the same time, and these are what philosophers call *cointellecta* and theologians call *connotata*. In fact, all things that follow by natural and necessary implication from the name of another thing are understood with it (*cointellecta*) and connoted by it, for otherwise we could not say that they follow from it necessarily, for example, "creature therefore creator" and "creator therefore God," since only God creates. And every specific accident connotes its subject, thus "capable of laughter, therefore man."

Among the examples we find words that clearly indicate this theological origin of the notion, such as "creator," which was also to be the case in the work of William of Ockham.

nouns (abstract and concrete) of the category of substance, and the abstract nouns of the category of quality (William of Ockham, *Summa logicae*, I, chap. 10).

Absolute nouns have no nominal definition (*definitio quid nominis*) but only a real definition (*definitio qui rei*); conversely, connotative nouns have no real definition (because they cannot be defined by reference to a particular class of objects) but only a nominal definition that accounts for their hierarchized semantic structure, composed of at least one word in the nominative (*in recto*) and one word in an oblique case (*in obliquo*). They include, first, the concrete categorematic terms of the category of quality, the denominatives (*denominativa/paronyma*). Thus "white" means "something formless informed by whiteness" or "possessing whiteness"; it signifies primarily individual substances that are white, and connotes secondarily their individual whitenesses: what is *in recto* in the definition designates the *significatum* (something), and what is *in obliquo* designates the *connotatum* (whiteness). Relational nouns like "father" are also connotative; in a propositional context, "father" refers to the individuals of whom it is true to say "this is a father," but in addition it connotes something else, namely, the individuals who have a father, and this implies that a relational term cannot receive a complete definition without the intervention of its correlative, and vice versa ("father" = a sensible substance having a child; cf. *Summa logicae*, III–3, chap. 26); the two correlatives do not have the same nominal definition and thus are not synonyms since what intervenes *in recto* in the definition of one is found *in obliquo* in the definition of the other, and vice versa. Also included among the connotatives are categorematic terms belonging to categories other than those of substance and quality, negative expressions (e.g., "immaterial") and philosophical terms such as "true," "good," "intellect," "will," and so on. This notion of connotation also allows Ockham to defend the fundamental idea of an extensionalist conception of reference, according to which all categorematic terms signify and refer to particular substances or qualities. One of the points that has been controversial among Ockham's interpreters is whether there were connotative terms in mental language or whether they could always be eliminated from mental language if a nominal definition that included only absolute terms was substituted for them (Paul Spade). A crucial argument against this claim is based on relational terms (e.g., "father") whose nominal definition necessarily includes their correlative, as we have seen; this shows that it is impossible to totally eliminate connotatives from mental language (Claude Panaccio).

According to Spade, since a connotative term could always be substituted for its nominal definition, which contained only absolute terms (if the first nominal definition contained a connotative term, the latter could in its turn be replaced by its nominal definition until there were no longer any connotative terms), there was no need to postulate connotative terms in mental language. Panaccio has opposed this analysis, on

the one hand by pointing to passages clearly indicating that for Ockham there were connotative terms (notably relational terms) in mental language, and on the other hand by showing that this was an essential part of Ockham's theory. The previously mentioned argument based on relational terms is crucial: since the nominal definition of a relational term necessarily contains another connotative term, namely, its correlative, this implies that relational terms, and thus connotative terms, cannot be totally replaced by absolute terms at the level of mental language, and thus that they exist in mental language (cf. Panaccio, "Guillaume d'Ockham").

We find interesting elements in other medieval logicians. Buridan in particular attributes a referential function both to what is signified (the *suppositio*) and to what is connoted (the *appelatio*): the connotative term (e.g., "white") connotes that to which the corresponding abstract term ("whiteness") refers; it "refers to" what it signifies primarily and "calls" what it connotes (see SUPPOSITION). Elsewhere, Buridan explains:

> There is essential predication between two terms when neither of them adds to the signification of the other a connotation extraneous [*extranea*] to that to which the terms refer. There is non-essential or paronymic predication when one of the terms adds to the signification of the other a foreign connotation, like "white," which refers to a man and calls up (that is, connotes) whiteness insofar as it is added to it. Therefore: the proposition "Man is [an] animal" is essential, whereas "Man is white" or "Man is capable of laughter," is paronymic.

CONSCIOUSNESS, CONSCIENCE, AWARENESS

DUTCH	*innerlijke medewetingh, innerlijckste bewustheyt, meêwustigheyt*
FRENCH	*conscience*
GERMAN	*Bewusstheit, Bewusstsein, Gewissen, Gewissheit*
GREEK	*sunaisthêsis* [συναίσθησις], *suneidêsis* [συνείδησις], *sunesis* [σύνεσις], *suntêrêsis* [συντήρησις]
ITALIAN	*consapevolezza, coscienza*
LATIN	*conscientia*

➤ *ACT, CROYANCE* [BELIEF, GLAUBE], *FAITH*, I/ME/MYSELF, PERCEPTION, SENSE, SOUL, SUBJECT, UNCONSCIOUS

Although it was created by philosophers, the concept of consciousness has become absolutely commonplace, denoting the individual's or the group's relation to itself. Thus it refers to what the philosopher and the "common man" have in common, and as a result, like "criticism" or "wisdom," it can designate philosophy itself. The same was not true of the ancient terms (*suneidêsis* or even *conscientia*), which are usually given as its equivalents. Thus modern European philosophy has endowed itself with a common past, though it cannot establish a complete equivalence between essentially untranslatable paradigms. After distinguishing the effects of retroversion associated with the Greco-Roman heritage proper, we will show how, starting in the sixteenth century, three great episodes in the European invention of consciousness followed one another. The mark they left is visible everywhere: the religious and political institution of "freedom of conscience" that led to the identification of the latter with the "citizen subject"; the construction of a theory of consciousness as a general faculty of knowledge by John Locke and his successors (Étienne Bonnot de Condillac, Christian Wolff, Immanuel Kant); the conflict of metaphysics of personal identity and of self-consciousness (*Selbstbewusstsein*).

The circulation of concepts and the relative unification of terminologies obtained by the early nineteenth century, when philosophical modernity sought new foundations for itself, did not erase major differences among Romance languages, German (*Gewissen* and *Gewissheit*, *Bewusstsein* and *Bewusstheit*), and English ("consciousness" and "awareness"), without which it would be difficult to understand the way in which the heritage of transcendental philosophy and the new field of the "cognitive sciences" or the "philosophy of mind" are developing today. This is what makes it possible to foresee, if not an end of consciousness, at least a change in its referents and in the possibilities of translating it.

In France, the national point of view gives rise to an illusion that the different senses of the French word *conscience* are distributed over two or more corresponding words in other languages or that the French term unifies what other languages divide. But it is not clear that the semantic fields of other languages are divided, or that they are all included in what French calls *conscience*. It may be that taken together they effect a displacement in usage, which is broader than any one of them, but more restrictive than their sum. This illusion goes hand in hand with a question peculiar to French, which is whether the apparent unity of the word *conscience* should be considered a simple homonym or an analogy, the expression of a kernel of signification circulating among particular meanings. Dictionaries do not take a single view on this point, and they are evolving. Obviously, these fluctuations are related to the history, which is itself transnational, of linguistic innovation in the area of "thought about thought." Here we find ourselves confronted by a

privileged case for the study of what Renée Balibar calls "European co-lingualism."

I. The Legacy of Antiquity and Scholasticism

In Romance and Germanic languages, the main terms derive from two main roots: on the one hand, *scire, scientia*, whence *conscius* (and its antonyms *nescius* and *inscius*), *conscientia, conscient* and *conscience*, and so on; on the other hand, *wissen*, whence *gewiss, Gewissen* and *Gewissheit, bewusst* (*unbewusst*) and *Bewusstsein, Bewusstheit*, and so on. It has become customary to say that the meanings of the modern French word *conscience* are connected with different uses of the Latin *conscientia* and the Greek *suneidêsis*.

As far as the Greek word is concerned, this clearly involves retroversion on the basis of correspondences established by Romans seeking to create their own moral terminology. From the poets to the philosophers, the Greek terminology for the relationship to oneself in the order of knowledge and ethics is much more complex. Thus it was only in the Hellenistic period that *suneidêsis* came into common use in the schools of ethics to designate the way in which the individual, "[alone] with himself," evaluates the worthiness of his conduct and the value of his person, in this life or in anticipation of death. The question remains whether St. Paul had such a meaning in mind in important passages in his epistles such as this one:

> They show that what the law requires is written on their hearts, while their conscience also bears witness [*summarturousês autôn tês suneidêseôs* (συμμαρτυρούσης αὐτῶν τῆς συνειδήσεως)] and their conflicting thoughts accuse or perhaps excuse them on that day when, according to my gospel, God judges the secrets of men [*ta krupta tôn anthrôpôn* (τὰ κρυπτὰ τῶν ἀνθρώπων)] by Christ Jesus.
>
> (Romans 2:15)

However that may be, it was on the basis of these formulations and metaphors they share with the Stoic tradition (the "inner voice," the "stage" on which each person makes his acts appear, or the court before which he "bears witness" for or against himself, etc.) that the age-old dialectic between the "natural" and "supernatural" character of the moral consciousness was carried out.

■ See Box 1.

Although it still poses problems, the history of the Latin *conscientia* is better known. Before Cicero made it a key term in *humanitas*, the uses of the word developed in the two directions in which *cum* can be interpreted (cf. C. S. Lewis, "Conscience and Conscious"): on the one hand, the direction that connotes appropriation and achievement (know well, be well informed about); on the other hand, the one that connotes a private or secret "sharing." From that point on, there was the idea of a knowledge reserved for a few people, each of whom "confided in himself." This meaning led to the fundamental representation of an internal testimony given to oneself (whence Quintilian's famous formula: "*conscientia mille testes*" [conscience is as good as a thousand witnesses]), and finally to the idea of a "judgment" that is made within us with regard to our acts and thoughts. This is the source of an authority that can be opposed to that of any

institution: at once the "interior master" and a guarantee of autonomy. This union of contraries, to which the Augustinian tradition was to give an ontological weight, has persisted down to our own time.

■ See Box 2.

The Church Fathers identified *conscientia* with the soul that had to confront its creator, and it was thus not only judge but judged. In Augustine, *conscientia* is subordinated to a more fundamental notion, *memoria*, the true name of the self-presence that has always already confessed God's Word: by questioning the "secrets of his conscience" in his "innermost depths" ("*interior intimio meo*," Augustine says in his *Confessions* [book 3]), man does nothing less than discover transcendent truth in himself ("*superior summo meo*," "higher than all my height"). St. Jerome says that the spark of conscience put within us, *scintilla conscientiae*, continues to burn even in criminals and sinners (*Commentary on Ezekiel*, in RT: *PL*).

As for Scholasticism's speculative developments of the term, they also proceed from Jerome, but through a stunning error: copyists, thinking they had found in his text a word *suntêrêsis* [συντήρησις], interpreted it at first as a derivative of *têrêsis* [τήρησις], *conservatio* (preservation), then as a derivative of *hairesis* [αἴρεσις], *electio* (choice). Thus was forged a fictive Greek word, *synderesis*, that performed the essential task of making double use of consciousness as a passive faculty (a trace of divine creation) and an active faculty (operating under conditions of sin, after the Fall). Scholastic theologians then formulated the "practical syllogism" of the process through which Revelation illuminates our actions and guides them: (1) *syntheresis*, (2) *conscientia*, (3) *conclusio* (cf. Chollet, "Conscience"). This is a fundamental intellectualist scheme of thought that continued to be influential after its theological justification evaporated: without referring to it, it would be difficult to understand the place that consciousness occupies in G.W.F. Hegel as the middle term of the spirit's becoming, between universality and singularity.

With the Reformation, however, *syntheresis* (or *sunderesis*, or *synderesis*) fell into disuse, and the immediacy of *conscientia* as the inner testimony of morality and a sign of grace won out: it became in German (Luther) the *Gewissen*, with its own certainty (*Gewissheit*), in French (Calvin) the *conscience* associated with the systematic practice of the *examen de conscience*. Thus we find ourselves at the starting point of the drama in three episodes that led to making "self-consciousness" the privileged expression of the philosophical idea of "subjectivity" in the West: in it we witness the European invention of consciousness.

■ See Box 3.

II. The European Invention of Consciousness

The first episode in the drama corresponds to the debates aroused by the Reformation concerning "freedom of conscience"; the second leads to an identification of the "self" with the mind's reflective activity, to which Locke gave the name "consciousness"; the third, at the turning point of the eighteenth century, led to a reinterpretation of the principles of knowledge and morality as expressions of *Selbstbewusstsein*.

1

The Greek for "consciousness": Retroversions

➤ OIKEIÔSIS, SENSE

It is said that the Greeks did not know about consciousness. In fact, there is no Greek word corresponding to "consciousness," but there is a great variety of terms and expressions onto which "consciousness" is projected, and that sometimes refer to a relationship to the self, sometimes to a moral judgment, and sometimes to a perception, often producing a crossing or derivation among several of these meanings.

From the Homeric poems to the Socratic dialogues by way of tragic dramaturgy, every Greek hero essentially carries on a conversation with himself, and in doing so he thinks his thoughts, feels his emotions, and debates courses of action. The "organs of consciousness" (RT: *Origins of European Thought*, chap. 2) of the Homeric hero are words that we find very difficult to translate because they refer to a physiology loaded with meaning: *kêr* [κῆρ], or *kradiê/kardia* [κραδίη/καρδία], the "heart" or even the "stomach," as an organ that can be pierced; *êtor* [ἦτορ], the "heart" as the seat of emotions and intelligence. But it is especially the *thumos* [θυμός], which is lodged in the *phrên* [φρήν] or the *phrenes* [φρένες] (the entrails, the diaphragm, the lungs, but the word belongs to the family of *phronein* [φρονεῖν], "to be informed, think"), which is also rendered by "heart," that constitutes the privileged interlocutor in the dialogue of the self with itself. The *thumos* is both an impulse (Chantraine connects it with *thuô* [θύω], "to rush forward with fury"; RT: *Dictionnaire étymologique de la langue grecque*) and the breath of life, a vapor or spirit connected with hot and boiling blood (Boisacq [RT: *Dictionnaire étymologique de la langue grecque*] derives it from the Sanskrit *dhûma-*, whence the Greek *thumiaô* [θυμιάω], "make smoke" [Latin *fumus*], which must be clearly distinguished from *psuchê* [ψυχή], the breath of the "soul" that escapes from the mouth of the dead and goes to reside in Hades, whereas the *thumos* is eaten and dissipates) (RT: *Origins of European Thought*, chap. 3). Thus, when he is about to abandon Patroclus's body, Menelaus "speaks to his magnanimous *thumos*" and "launches [these words] through his *phrên* and his *thumos*" (*Iliad* 17.90, 106). The philosophical outcome of this reflexive conversation is the Platonic definition of thought (*dianoia* [διάνοια]) as "the internal dialogue of the soul with itself, without voice [*entos tês psuchês pros hautên dialogos aneu phônês* (ἐντὸς τῆς ψυχῆς πρὸς αὑτὴν διάλογος ἄνευ φωνῆς)]" (*Sophist* 263e; cf. *Theatetus* 189e), which opens

out, through the Socratic demand for "the agreement of the self with itself [*homologein autos heautôi* (ὁμολογεῖν αὐτὸς ἑαυτῷ)]" (*Protagoras* 339c), onto the moral dimension of self-consciousness. To the individual who never ceases to refute Socrates and to shame him, "his closest relative, who lives in the same place," "centuries to come were to give . . . the name of consciousness" (*Hippias Maior* 304d).

There is no Greek term that brings together all of the values of this dialogue of the self with itself, but we see the concurrence of several words in *sun-* (con-) followed by a verbal action whose meaning varies considerably depending on context, and which is translated by "consciousness." In the domain of perception-apperception, *sunaisthêsis* [συναίσθησις] is, particularly in Plotinus (*Enneads* 3.8.4), translated by "self-consciousness" (RT: LSJ, s.v.): as Bréhier put it, the "intelligence" (*sunêsis* [σύνεσις], another candidate for "consciousness") and "self-knowledge" (*sunaisthêsis*) allow nature to see and produce what is around it. But the term is in competition, even in Plotinus, with the sequence "*to aisthanesthai kai parakolouthein hautôi* [τὸ αἰσθάνεσθαι καὶ παρακολουθεῖν αὑτῷ]" (in Bréhier, *Histoire de la philosophie*: "feeling and self-consciousness"—literally, "the accompanying of oneself") that characterizes wisdom when it refers, no longer to this nature that is to us as a sleeper is to a person who is awake, but rather to the wise man himself, concerning whom the Stoics wondered whether he remained happy when he was sleeping. Furthermore, we should note that in Aristotle in particular, it is *aisthanes-thai* [αἰσθάνεσθαι] (to feel) alone that is most commonly translated as "to be aware of" (Tricot, referring precisely to the apperceptive function of "common sense," translates it this way in the *Nicomachean Ethics* 9.9, where the question is whether the happy man needs friends), whereas *sunaisthanesthai* [συναισθάνεσθαι] means very explicitly "feel with," like "eat with," or "live with," not with oneself, but with other selves that are one's friends (see *Eudemian Ethics* 7.12, 1244b26 and 1245b25).

We move imperceptibly from the epistemic to the ethical with *sunesis* (from *suneimi* [σύν-ειμι], says *Cratylus* 412b, "to go with, accompany," or from *sun-iêmi* [συν-ίημι], "to throw together, bring closer," and in both cases, "understand"), whose meaning ranges from sagacity to the awareness of wrong. Thus *sunesis*, translated as "intelligence," is, with *eusunesia* or "perspicacity,"

the critical virtue of those who know how to use "prudence" (*phronêsis* [φρόνησις]; see PHRONÊSIS), because they learn quickly (Aristotle, *Nicomachean Ethics* 6.11); but Dumont chooses *conscience* in translating in Democritus (B77 DK: "Fame and riches without consciousness are fragile possessions"), and here is how Méridier translates Orestes's reply to Menelaus when the latter asks what illness is killing him: "Ma conscience. Je sens l'horreur de mon forfait" (*hê sunesis* [ἡ σύνεσις]—literally, "the awareness that I know [*sunoida* (σύνοιδα)] I have committed terrible acts," Euripides, *Orestes* 396).

Finally, *suneidêsis* (from *sun-oida*, precisely) is retrospectively the best calque for *consciousness*. Democritus uses it to designate "the awareness of the badness of a life" that arouses fear and encourages the invention of eschatological fictions (B297). The sense of the noun (which is not found in Plato) becomes clearer starting in the Hellenistic period, especially in the Stoic doctrine of *oikeiôsis* [οἰκείωσις]. Thus, regarding the animal's primitive inclination to preserve itself, nature attaching it to itself from the outset, Diogenes Laertius (7.85, trans. Yonge) quotes this comment of Chrysippus, in the first book of his treatise *De finibus*: "The first and dearest object [*oikeion* (οἰκεῖον)] to every animal is its own existence [*tên hautou sustasin* (τὴν αὐτοῦ σύστασιν)], and its consciousness of that existence [*tên tautês suneidêsin* (τὴν ταύτης συνείδησιν)]. For that it is not natural for any animal to be alienated from itself [*allotriôsai* (ἀλλοτριῶσαι)]."

Its scope, from the Stoics to the New Testament, ranges from the appropriate relation to oneself to the awareness of good and evil. None of these terms, of course, shows as well as the Homeric descriptions how much the Greek "subject" speaks to himself at the same time that he thinks and acts.

Conscientia

The language of Latin philosophy, even though it is marked by the spread of Stoicism (see Box 1), was elaborated at the same time that Cicero, Lucretius, and Seneca were helping to write a critical history of philosophy. That is why the uses of *conscientia* in classical Latin present—synchronically—the different historical and literary strata that constituted the experience of and ways of expressing consciousness.

In many of its occurrences, *conscientia* designates the experience of having done something wrong (the latter is often made explicit by a genitive: *conscientia scelerum*) and the remorse that flows from it: these uses have to be related to those we find in juridical contexts, where *conscientia* and *conscius* designate recognized guilt and the sentence handed down.

As a form of remorse, *conscientia* appears in the lists of the passions ("ardentes tum cupiditate, tum metu, tum conscientia," "inflamed by passion, fear, remorse," Cicero, *De legibus* 2.43, trans. Keyes) and is the object of topical descriptions derived from tragedy: "conscius ipse animus se forte remordet" (The soul that knows itself to be guilty torments itself: Lucretius, *De rerum natura* 4.1135).

Thus the noun includes both the tragic moment of the self's knowledge of itself through the suffering of the body (gnawing, burning, suffocating) and the interpretation that Hellenistic philosophies gave of this moment: "Mens sibi conscia factis / praemetuens adhibet stimulos torretque flagellis" (The conscience-stricken mind through boding fears applies to itself goads and frightens itself with whips: Lucretius, *De rerum natura* 3.1018, trans. Munro, 134). Lucretius's analysis is also found in Cicero's *De legibus* (1.40): "Non ardentibus taedis sicut in fabulis sed angore conscientiae fraudisque cruciatus" ([The guilty are not pursued] by flaming torches but by the fear to which their fear gives rise and by the crime that tortures them).

More positively, *conscientia* coincides with the experience of self that is not immediately given but is constructed in (re)collection, recapitulation, memory (which is suggested by the formation of the word, *cum-scire*)—that is, what Cicero refers to in *De re publica* (6.8),

"sapientibus conscientia ipsa factorum egregiorum amplissimum virtutis est praemium" (For the wise, the simple awareness of having performed remarkable acts constitutes the highest reward of their virtue), and in *De senectute* (9), "conscientia bene actae vitae multorumque bene factorum recordatio iucundissima est" (Nothing more pleasant than the consciousness of having led one's life well and the memory of many good acts that one has done).

This movement of self-evaluation is also clearly marked in a second series of occurrences in which the term appears especially in expressions that explain the origin of moral evaluation: *conscientia deorum / conscientia hominum* (Cicero, *De finibus* 1.51: "qui satis sibi contra hominum conscientiam saepti esse et muniti videntur, deorum tamen horrent" [Those who think themselves sufficiently protected and sealed off to escape the judgment of men are nonetheless afraid of the gods' judgment]). Taking others' judgment into account in evaluating responsibility gives *conscientia* a meaning close to that of *pudor* (*aidôs* [αἰδώς]): the internalization of this judgment (which may or may not be emphasized in the syntagma *conscientia animi*) is developed in two divergent directions. Either one appropriates external norms of judgment, in accord with a split point of view that tends to be expressed in metaphors of an internal theater (one judges oneself, one provides a spectacle for oneself), or one opposes one's own criteria of evaluation to those of external authorities: images of barriers and roofs delimit a space of interiority that protects the rectitude of judgment and its inalienable character against *fama* and *opinio*.

The first direction can be seen in the following remarks by Cicero: "nullum theatrum virtuti conscientia maius est" (Virtue has no greater theater than the conscience: *Tusculan Disputations* 2.64, trans. King); and by Seneca: "conscientia aliud agere non patitur ac subinde respondere ad se cogit" (The guilt [that tyrants feel] does not allow them to amuse themselves: it constantly forces them to answer for their acts before its tribunal: *Epistulae* 105.7, trans. Gummere), "bona

conscientia prodire vult et conspici ad se cogit" (Good conscience wants to show itself and subject itself to public view: ibid., 97.12).

The second direction can be seen in these remarks: "dicitur gratus qui bono animo accepit beneficium, bono debet; hic intra conscientiam clusus est" (It is said that a man who gladly receives a favor and gladly returns it is grateful: he is grateful in the innermost chamber of his conscience: Seneca, *De beneficiis* 4.21); "mea mihi conscientia pluris est quam omnium sermo" (In my opinion my conscience is worth more than what everyone else says: Cicero, *Ad Atticum* 12.28.2).

Between these two aspects of internalization, we cannot see the lines of an evolution any more than we can rigorously divide the uses of the genitive or the dative in the phrases *conscientia animi / scelerum / hominum—conscius sibi*. On the contrary, the uses of *conscientia*—and their networks of metaphors—suggest at the same time interiority and exteriority, at the moment when the fundamental question of ethics concerns the validity and the scope of natural norms. Then we grasp, in the unceasing back-and-forth movement, the historical and philosophical moment in which the subject can be constructed.

A. The metonymy of conscience

The first episode is here named the "metonymy of conscience" because its most striking achievement was the possibility of using the French word *conscience* to designate not only a faculty of the mind, even personified or identified with the internal testimony of a double of the subject, but as the other name of a single individual. This personification is manifested in the possibility of qualifying consciousness-subjects with regard to their actions and experiences: a *conscience noble*, *conscience éclairée*, *conscience*

3

Conscientia and *Gewissen* in Luther

➤ BELIEF, GLAUBE

Luther has been called "the inventor of the *Gewissen*" (Hermann, *Luthers Theologie*), and Lutheranism the "religion of *Gewissen*" (Holl, "Was verstand Luther unter Religion?"). For many people, Luther, the first theoretician of *Gewissen* in the German language, is also the first modern theoretician of the conscience. That is what his famous 1521 reply at the Diet of Worms is supposed to proclaim, in a heroic mode, when he states the reasons that prevented him from retracting when confronted by the Church of Rome:

> Unless I am convinced by the testimonies of the Holy Scriptures or evident reason (for I believe neither in the Pope nor councils alone, since it has been established that they have often erred and contradicted themselves), I am bound by the Scriptures adduced by me, and my conscience [*Gewissen*] has been taken captive by the Word of God, and I am neither able nor willing to recant, since it is neither safe nor right to act against conscience. God help me. Amen.

> (*Verhandlungen mit D. Martin Luther auf dem Reichstage zu Worms* [1521], in *Dr Martin Luthers Werke* 7:838.2–9)

This refusal has often been seen as an appeal to freedom of conscience and thus as the birth certificate of modernity. On reading the text, however, one may be astonished by this view: What is this *conscientia* that Luther invokes as an inalienable good but that he says has been "taken captive by the Word of God"?

1. In the wake of the historical debate regarding the birth of modernity, the debate about Luther's notion of conscience has often concerned the latter's autonomy. Without being explicitly rejected, the distinction between *suntheresis* and *conscientia* henceforth becomes secondary. This is Luther's conceptual innovation in relation to Scholastic theories of conscience: for him there is now only *one* conscience, defined as "the origin or site of the strongest affects" (Hirsch, *Lutherstudien*), that a person can experience. Confronted by the Law, by the Promise, the conscience alternately rejoices, hopes, worries, gets frightened, despairs: Luther's conception of conscience involves first of all descriptions of *states*, feelings, affects. These analyses, which we could call "psychological" if we were sure that they were ultimately based on a concept of the psyche, show

that conscience is no longer so much a faculty of the mind tending toward the good as the precise site where the relation between man and God is produced. It is there that man is destroyed or raised before God (cf. *Vorlesung über den Römerbrief* [1515–16], in *Werke*, 56:526.31–32). Thus Luther did not conceive of the conscience as autonomous. If it is defined as "something higher than Heaven and Earth," that is only by virtue of its tendency to be "killed by sin" or, on the contrary, "given life by the Word of Christ," depending on the nature of the relation between man and God (*Vorlesungen über 1. Mose* [1535–45], in *Werke*, 44:546.30–31). At no time is man alone with his conscience. The latter is in no way productive, it is only the reflection or "bearer" (*Träger*: Hirsch, *Lutherstudien*) of a relationship whose establishment does not depend on it. That is why Luther's statements regarding conscience vary so much. He also calls it an "evil beast" (*mala bestia*) that "makes man oppose himself" when it persuades him to put his trust in good works rather than in faith to gain salvation (*Vorlesungen über 1. Mose*, in *Werke*, 44:545.16–17). The conscience may be praised or blamed, depending on whether it is Christ or the Devil who controls it: in both cases, it is not free in the sense that it constitutes an original site of freedom.

2. Beyond these contradictory judgments, according to Luther the conscience is nonetheless unified by a certain number of conceptual decisions and linguistic usages. Luther's other great innovation is in fact to have established conscience in a paradigm that also includes "faith" and "certainty." He breaks with the intellectualism of Scholastic theories by associating conscience with "faith" and the "heart" (cf., e.g., *Invokavitpredigten* [1522], in *Werke*, 10/3:23–24). The principle is this: as faith is, so is conscience, so are the works; or, only faith can give conscience the certainty that the works accomplished are good (cf. *Von den Guten Werken* [1520], in *Werke* 6.205.1–13).
   In at least three ways, the relation between conscience and certainty is central to Luther's theory of conscience. Conscience is defined first of all by a *need* for certainty: it is this need that Luther objects to in what he considers to be Erasmus's skepticism (*De servo arbitrio* [1525], in *Werke*, 18:603.23–24).

Second, conscience is the *site* of certainty, on the condition that it has been previously invested with faith (cf. *Das schöne confitemini* . . . [1530], in *Werke*, 31/1:176–77: "Ein hertz, das . . . fur Gott von allem dinge gewis urteilen und recht reden kan . . . ein froelich, sicher, muetig gewissen" [A heart that . . . can judge with certainty and speak correctly of all things . . . a joyous, sure, courageous conscience], once again associating faith with the heart). Finally, the conscience serves as a *refuge* from the uncertainty of faith, and in that very way, as the ultimate certainty: no one is ever certain (*gewis*) of having faith, but everyone has to rely on the *Gewissen* that tells him that faith alone provides salvation (cf. the important text in *Von der Wiedertaufe an zwei Pfarrherrn* [1528], in *Werke*, 26:155.14–28, in the context of the Anabaptist polemic).

It is in this perspective that we must understand the famous theory of "freedom of conscience," which is, according to Luther, synonymous with "Christian or Evangelical freedom." Luther's *conscientia* is in no way a principle of action; it is "not a faculty for performing works, but a faculty of judging these works" (*De votis monasticis* [1521], in *Werke*, 8:606.30–35). Here, internalization is pushed so far that freedom of conscience can coexist with the servile will (see ELEUTHERIA, Box 2). This is because conscience does not draw its freedom from itself: here, we find once again the motif of its heteronomy. However, the most important thing is that in Luther, freedom of conscience merges with its certitude: a conscience is free only if faith has made it sure (cf. *Vom Abendmahl Christi. Bekenntnis* [1528], in *Werke*, 26:505.34 : "*frey und sicher ym gewissen*").

In Luther's German, the association of conscience with certainty, *gewiss* with *Gewissen*, is immediate: it will be found again, raised to a concept, in Hegel, *Gewissheit* replacing the adverb *gewiss*, to which Luther usually limits himself (cf. Hegel, *Phenomenology of Mind*, 6.C.c). However, we must avoid concluding that it is the proximity of the words that led Luther to associate the ideas, to the point of imbuing certainty with his concept of conscience. It is remarkable that Luther's Latin makes exactly the same connection, this time without an echo effect, between *conscientia* and *certitudo*: from Latin to German, Luther's concept of conscience does not vary (cf., e.g., *De servo arbitrio*, in *Werke*, 18:620.3: "*certitudines conscientiae*"). From such a convergence, we might conclude that Luther's Latin is

"completely imbued with his German" (Bornkamm, *Luther's World of Thought*): in writing *conscientia*, Luther might have been thinking *Gewissen*. Without trying resolve this question of precedence (did Luther think first in German or in Latin?), we can suggest that Luther's theological invention, the establishment of the *Glauben-Gewissen-Gewissheit* paradigm, was taken over by the potentialities of the German language, which were in turn more than exploited, and this time explicitly, by the tradition that the *Wissen-Gewissen-Gewissheit* paradigm followed in philosophy from Kant to Wittgenstein. By reattaching Luther's invention to its antecedents (first of all, the theological debates of the thinkers of the Middle Ages and the Reformation regarding the certainty of salvation), we would gain the means to give a long historical account of conscience that would at the same time be a history of bilingualism (in this case, German/Latin) in European philosophy.

malheureuse, *conscience déchirée*, and so on (following a procedure that under other circumstances can also be applied to the soul, the mind, the heart, and the understanding). Such a potentiality is exercised especially in the languages in which the Calvinist Reformation, humanist irenicism, skepticism, and Neostoicism collided in the sixteenth and seventeenth centuries: a period when absolutism was developing and the first demands for citizen's "rights" were being heard.

Everything begins with John Calvin's definition of *conscience*: identified with the Christian's faith, which resides in his "innermost heart" (*for intérieur*), it expresses in itself the mystery of an absolute submission that is at the same time a liberation because it subjects the individual only to grace. The metonymy is already common in Calvin: "I say that these remedies and reliefs are too narrow and frivolous for troubled consciences that are downcast, afflicted, and frightened by the horror of their sin" (*Institution de la religion chrétienne*, 4.41). Nonetheless, it is the experience of political struggle that puts this metonymic play at the heart of the uses of the word *conscience* by making the *for intérieur* also a "fort" and a "force" (whose concept competed throughout the seventeenth century with those of "mind" and "genius" to designate the principle of individuality). Whereas the Anabaptists invented the "objection of conscience," Calvin defended the "adhesion of conscience." The English Puritans of the seventeenth century subjected all their actions to the absolute command of conscience from which conviction proceeds ("convinced in conscience of the righteousness of the Parliament's cause," quoted in Walzer, *Revolution of the Saints*). The corresponding adjective is "conscientious."

The Wars of Religion also produced the idea of a withdrawal into the *for intérieur* when people were called to account by states and churches. The two representatives of the European irenicist trend that played a decisive role here are Sebastian Castellion and Dirck Coornhert. The former, who translated the Rhineland mystics into Latin and French, was the great theoretician of freedom of conscience, understood as an inalienable individual right. He established its originary character by adopting the classical form of the *elegchos* [ἔλεγχος]:

> I find that the first and efficient cause of . . . the sedition and war that torments you is necessarily [a matter] of consciences. . . . I am sure that the cause that I am now dealing with would be voided by a single word of evident truth, and that no one would dare to contradict it even a little. For all one has to say to those who compel other people's consciences is: "Would you want yours to be compelled?" And suddenly their own consciences, which are worth more than a thousand witnesses, would convince them so fully that they would all be struck dumb.

(*Conseil à la France désolée*, 1562)

As for Coornhert, in 1582 he published *Synodus van der Conscientien vryheyt* (Synod on freedom of conscience). Arguing against both rigorous Calvinism and the Neostoic reason of state, he naturalized in a very Latinized Dutch the "compulsion of consciences" as "*dwang der conscientien*" and became the master of "Christians without a church" all over northwestern Europe. Traces of his "individualism" or "subjectivism" are still found even in some late seventeenth-century German Socinians—in the sect of the *Gewissene* or "conscientious people," for whom conscience was the sole authority in matters of faith (*Glauben*) or certitude (*Gewissheit*) (Kittsteiner, *Die Entstehung des modernen Gewissens*). The connection between the two may be found in the pages of Louis Meyer's *Philosophia sacrae scripturae interpres* (1666), in which Meyer, who was a friend of Spinoza's, appealed to "clear and distinct perception" to reject both literalist interpretations of the Scriptures and the inspired "enthusiasm" of the Quakers. In

the Dutch version of his book, Meyer himself sought equivalents of the Latin *conscientia*: *innerlijke medewetingh, innerlijckste bewustheyt, meêwustigheyt*.

Finally, we should mention the itinerary followed by the skeptics, of whom the most brilliant is Montaigne, who began from a philosophy inspired by Stoicism to create an unprecedented mode of public confession. Jean Starobinski (*Montaigne in Movement*) showed how personal identity is infinitely sought here in the movement of writing, which in Montaigne becomes the real basis of consciousness:

> Let me excuse here what I often say, that I rarely repent and that my conscience is content with itself—not as the conscience of an angel or a horse, but as the conscience of a man. . . . I speak as an ignorant inquirer, referring the decision purely and simply to the common and authorized beliefs. I do not teach, I tell.

> (*Essays of Montaigne*, 3.2, trans. Frame)

In politics, Montaigne was a conservative, an admirer of Justus Lipsius. In his work, *conscience* is related to *inscience* and opposed to "faith" ("an enormous distinction between devoutness and conscience": ibid., 3.12). If we do not keep these facts in mind, we can understand neither the effects of the Cartesian revolution nor Hobbes's attack on the idea of conscience. In his *Leviathan*, Hobbes relates the word "conscious" to its Latin etymology (*con-scire*, "to know together") and identifies "conscience" with "opinion." Such a notion is intermediary between the concept of judgment and what we would now call "ideology." It allows us to understand why the "plea of Conscience" must be absolutely rejected by the state, and dissociated from the *for intérieur*:

> And last of all, men, vehemently in love with their own new opinions . . . gave those their opinions also that reverenced name of Conscience, as if they would have it seem unlawfull, to change or speak against them; and so pretend to know they are true, when they know at most, but that they think so.

> (*Leviathan*, 1.7)

Hobbes's citizen constructs his personality not on the basis of consciousness/conscience, but on "will" and "authority" or on representation.

B. Knowledge and ignorance of the "self"

Historians of philosophy tell us that the major moment when consciousness begins to designate the essence of subjectivity coincides with a return to the metaphysical foundation of the faculty of judgment summed up in the Cartesian *cogito*. The reality is more complex, as is shown by a remarkable series of semantic shifts and lexical inventions. René Descartes was not the "inventor of consciousness." The French word *conscience* never appears in his work, either in the texts he wrote himself or in translations of them that he read and revised. And *conscientia* in Latin comes up only once, in a paragraph in the *Principia philosophiae* (1.9) devoted to the definition of "thought" (*cogitatio*). The equivalent of *conscius esse* that Descartes accepted was simply *connaître*, which was here close to *sentir*. The philosophy of the *Meditations* is not

that of consciousness but of "certitude" and its modalities. Descartes nonetheless played a role in the invention of consciousness in the seventeenth century because of his thesis that "the mind always thinks," on which he founded the idea that the soul or mind is "easier to know than the body." As Geneviève Lewis has shown, the term *conscience* was spread by the first Cartesians, who were in reality mainly "Augustino-Cartesians," though they were no more faithful to Augustine's question (How does God make himself felt in the "innermost part" of my soul?) than to Descartes's (Who am I, I who am certain of my thinking existence?). The first of these followers was Louis de La Forge, author of the *Traité de l'esprit de l'homme* (1667). In this work he described the "admirable function" of thought as "the perception, consciousness or internal knowledge that each of us feels immediately by himself when he perceives what he is doing or what is happening in him." Antoine Arnauld identified the Latin *conscius esse* with the "reflection that may be called virtual and that is found in all our perceptions," and that allows us to define thought as "essentially reflecting on itself" (*Des vraies et des fausses idées*, 1683). In this sense, the Cartesians are the true inventors of what Wolff was to call "rational psychology." This first trend in the (re)definition of consciousness is at the origin of the tradition of French *spiritualisme* (cf. Victor Cousin), the influence of which has never really disappeared.

Far more important is the English development manifested in the invention of the neologism "consciousness." The first to use it was Ralph Cudworth, in *The True Intellectual System of the Universe* (1678): this is a refutation of atomism and materialism, to which the leader of the Cambridge Platonists opposed a monism based on Neoplatonism. For Cudworth, nature can be understood as a hierarchy of beings based on the sole principle of the formation of individuals in which vital force and thought are two successive degrees. It is to mark the passage from one to the other that Cudworth forged the word "consciousness" (itself part of the series Con-sense, Consciousness, Animadversion, Attention, Self-Perception), merging Plotinus's terms *sunaisthêsis* and *sunesis*. Consciousness is thus the highest form of the feeling or perception of the self (which is also a "self-enjoyment") that characterizes all life. Of course, it does not belong essentially to human beings, but eminently characterizes the divine spirit. In opposition to Cartesian dualism, Cudworth maintains that the obscure or dormant forms of consciousness begin below humanity, just as its lucid or purely intellectual forms extend beyond the human mind. That is why he also uses the term "inconscious." His influence was to be considerable, especially on Gottfried Leibniz, to whom he transmitted Plotinus's term "monad."

Locke appears to be far more Cartesian. The drafts of the *Essay on Human Understanding* (1690; 2nd enlarged ed., 1694) show that the word "consciousness" was not part of his vocabulary before Cudworth published his work. In the final version, however, he sums up the essence of the gap between the immediacy of *sensation* and the *reflection* by which the mind perceives its own operations, giving the definition that was to become famous: "Consciousness is the perception of what passes in a Man's own mind" (2.1.19). From this proceed all the developments of Locke's philosophy of mind, from the reformulation of the Cartesian idea that the mind cannot

think without knowing, to the description of "the experience of consciousness": an uneasy movement in the course of which all knowledge is formed. In a supplementary chapter in the second edition (2.27, "Of Identity and Diversity"), loaded with allusions to the controversies of the time regarding the immortality of the soul and the perspective of the Last Judgment, he makes consciousness the criterion of personal identity and responsibility. In this chapter, Locke deepens his conception of the relations between consciousness and the "inner sense," described as essentially an internal memory, in a kind of secularization of Augustinian theses. Consciousness, which is self-identical in the continual flux of its perceptions, can thus function as the operator of a *self-recognition*: it is through consciousness that an individual can consider "himself as the same," that is, as a *Self*.

The French translation of "consciousness" as *conscience* could not, as is now acknowledged, be taken for granted: it collided with the linguistic habit that reserved this term for a moral faculty, and conflicted with the new uses introduced by the Cartesians and by Malebranche. That is why Locke's first translators (J. Le Clerc, P. Coste) preferred at first to render "to be conscious" by *concevoir* or *être convaincu*, and "consciousness" by *sentiment* or *conviction*. It took a semantic revolution to *re-create* the word *conscience* in French with a new meaning. But this revolution put European philosophy on a new path (because in the eighteenth century, the whole "Republic of Letters" read Locke in Coste's French translation), where the conflict between psychologism and transcendental philosophies would eventually arise.

■ See Box 4.

In the end, not until Condillac did *conscience* become a full-fledged metaphysical term. Condillac made no reference to Descartes; he introduced, in addition to the concept of consciousness, that of attention, which is a differential consciousness, an "additional consciousness" accorded to some perceptions and not to others. Following Locke, and so to speak in the margins of his text, Condillac arrived at "the feeling of my being," the recognition of the permanence of a "being that is constantly the same," the identity of the "self of today" with the "self of yesterday." Consciousness then became in French as well a concept designating the perception of an internal unity subsisting through the succession of its own representations, but also capable of splitting into "multiple personalities" (Condillac, *Essai sur l'origine des connaissances humaines*).

C. A conflict in continental philosophy: *Selbstbewusstsein* or *sens intime*

Locke himself uses "self-consciousness" just once:

> For as to this point of being the same self, it matters not whether this present self be made up of the same or other Substances, I being as much concern'd, and as justly accountable for any Action that was done a thousand years since, appropriated to me now by this self-consciousness, as I am for what I did the last moment.

> (*Essay Concerning Human Understanding*, 2.27.16)

This formulation, which closely links (self-)consciousness, memory, and responsibility, is in the logic of equivalence that it constructs between the problematics of self and of consciousness. But it is especially significant retrospectively, insofar as it marks for us the starting point of the conflicts in modern philosophy. Coste was not able or willing to translate, but added in a note: "*Self-consciousness*: an expressive word in English that cannot be rendered in French in all its force. I put it here for the benefit of those who understand English."

The difference between the psychological and the transcendental that is latent here could be made explicit only in another language. *Bewusstsein* (a nominalized infinitive, at first written *Bewusst sein* to translate the Latin [*sibi*] *conscium esse*) was invented by Wolff only in 1719, while he was writing works that wrenched the term *Psychologie* away from its first meaning of the theory of specters or spirits to make it a "science of the inner sense" (*Psychologia empirica*, 1732; *Psychologia rationalis*, 1734). In this neologism, introduced alongside the traditional *Gewissen* as the term corresponding to *conscientia*, we can see, more than a transposition of the Cartesian *conscientia-cogito* (as is usually thought), a response to Locke's distinction between "conscience" and "consciousness." From then on, *Bewusstsein* was used in Germany both by the metaphysicians of the *Aufklärung* (Alexander Gottlieb Baumgarten) and by the theorists of a more empirical anthropology (Johannes Niklaus Tetens).

For Kant, *Bewusstsein*, whether empirical or pure, is always a knowledge of our representations of objects, that is, a connection between the elements that constitute them: intuitions and concepts. The underlying link is basically a speculative interpretation of the conjunction of *sunaisthêsis* and *suneidêsis*, which Kant understands negatively, in the famous formula: "Thoughts without content are void; intuitions without conceptions blind" (*Critique of Pure Reason*, trans. Guyer and Wood). To sense-consciousness must be added an intellectual consciousness to produce the mechanism typical of transcendental consciousness, which is capable of grasping its own form (or of "thinking thought" in its conditions of possibility, in accord with the ancient Aristotelian ideal of a *noêsis noêseôs* [νόησις νοήσεως]).

■ See Box 5.

The difficulties of "self-consciousness" constitute both a point of contact and a source of permanent misunderstandings between the German and French traditions in the philosophy of the subject. The "same" expressions take on values that are in fact profoundly different.

The *Selbst-* that is part of constructions such as *Selbst-achtung*, *Selbst-bewegung*, *Selbst-bestimmung*, and *Selbst-bewusstsein*, is understood sometimes in a subjective sense, sometimes in an objective sense: as spontaneous self-expression or as a capacity for being affected by something that is "oneself." Thus Kant immediately turns around the question from which the concept of transcendental apperception emerged. He asks not only how we can separate the pure form of an "I think" (*Ich denke*) from the empirical consciousness and its contents, but also how our activity of thinking *affects us ourselves*, in the "inner sense." How does the "I think" know itself or perceive itself thinking? This auto-affection is still a *Selbst-bewusstsein*, this time in the sense of a consciousness (of the activity of) the self, that is, of an *experience* (which is sensible in a way, even though

4

Consciousness and *con-science*: The role of Coste's translation

Produced in close collaboration with the author and reprinted several times between 1700 and 1755, the translation of Locke's *An Essay Concerning Human Understanding* by the Protestant Pierre Coste is still the only complete French version available. Two translator's notes concerning new terms necessary to translate "the Self" and "consciousness" indicate the difficulty of finding in French, at the end of the seventeenth century, an equivalent for the neologism created by Cudworth and Locke:

> The English word is "consciousness," which could be expressed in Latin by *conscientia*. . . . In French, we have, in my opinion, only the words *sentiment* and *conviction* that correspond to some extent to this idea. But in several places in this chapter they can express only imperfectly Mr. Locke's thought, which makes *personal identity* depend absolutely on this act of Man *quo sibi est conscius*. . . . After having reflected for some time on ways of remedying this difficulty, I found nothing better than to use the term *conscience* to express this very act. . . . But, it will be said, it is a strange license, to turn a word away from its ordinary meaning and give it one that it has never been given in our language. . . . I see finally that I could have simply used our word *conscience* in the sense that Mr. Locke used it ["consciousness"] in this chapter and elsewhere, since one of our best writers, the famous Father Malebranche, did not scruple to make use of it in this same meaning in several places in *La recherche de la vérité*.

> (*Essai philosophique concernant l'entendement humain*, 2.27.9n)

In her study Conscience *as Consciousness*, Davies shows that here we see not only important evidence for the formation of the modern conception of "consciousness," but also an actual moment of that formation. Why did Coste render the definition in 2.1.19 by "cette conviction n'est autre chose que la perception de ce qui se passe dans l'âme de l'Homme" before suddenly changing in 2.27.9 to render "since consciousness always accompanies thinking, and 'tis that, that makes everyone to be, what he calls self," as "puisque la *conscience* accompagne toujours la pensée, et que c'est là ce qui fait que chacun est ce qu'il nomme *soi-même*"? The only evidence provided by the context is the collocation in the same sentence of the two fundamental theoretical terms that are henceforth correlative: "the self" and "consciousness." Coste thus invents *con-science* at the precise moment when he is forced by the theoretical matter to create not one but *two* neologisms, one lexical, the other semantic.

An enigma arises here, however. If the term *conscience* in the sense of pure self-knowledge already existed, why did Coste allow himself a neologism? In reality, this is one and the same problem. If Locke's translator, obliged to create *con-science*, has to try to differentiate himself from Malebranche at the same time that he appeals to him as a precedent, that is because the meanings of *conscience* as Malebranche uses it and Locke's "consciousness" are in reality in conflict. The notion of *conscience* that Malebranche identifies with the "inner feeling" (*Recherche de la vérité*, 3.7, ed. Lewis) is ultimately anti-Cartesian: it is the imperfect knowledge we have of the soul ("we know of our soul only what we feel happen in us"), thoroughly mixed with the "feeling of what is happening in our body," and liable to all sorts of illusions. Malebranche is well aware that he is thereby destroying the very heart of Cartesianism:

> I have said in several places, and I believe I have sufficiently proved . . . that we have no clear idea of our soul, but only *conscience* or inner feeling; that thus we know it much more imperfectly than we do extension. This seems to me so evident that I did not believe it was necessary to prove it at length. But the authority of M. Descartes, who says positively . . . *that the nature of the mind is better known than anything else*, has so preoccupied some of his disciples that what I have written has served only to make me seem to them a weak person who cannot take a clear position and hold firm to abstract truths.

> (*XIe Éclaircissement*, in *Recherche de la vérité*, 3:98ff.)

Thus Malebranche's *conscience* has to do less with knowledge than with ignorance of oneself, whereas Locke, for his part, is opposed to Descartes not epistemologically but ontologically. His "consciousness" is not ignorance but, on the contrary, the immediate recognition by the mind of its own operations on the inner "stage" of which it is the spectator. What Locke inaugurates is the turning of the Cartesian idea of self-knowledge against the idea of the mind or soul (*mens*) as substance. For all that, the ignorance of the self inherent in consciousness will not disappear: it reemerges, notably in Kant's analysis of the "paralogism of rational psychology" that opens the *critical* phase of transcendental philosophy and bases it on the idea of an originary ambivalence inherent in the subject's relationship to itself.

it refers to any content of consciousness). Kant identifies it with the pure experience of time and is concerned to show that it must never be confused with the concept of transcendental apperception, since it constitutes the *Ich* as a phenomenon. But he also shows that the confusion is constantly induced by the very structure of thought ("Paralogisms of Pure Reason," in *Critique of Pure Reason*, trans. Guyer and Wood). This aporia is the starting point for all of the discussions of German idealism concerning the "experience of consciousness" torn between truth and illusion, infinitude and finitude, interiority and exteriority.

The question raised by Maine de Biran (*Essai sur les fondements de la psychologie* [1811], published in 1859), and after him by a French tradition that extends to Henri Bergson and Maurice Merleau-Ponty, is quite different. For Maine de Biran, self-consciousness (for which he also uses the Latin expressions *conscium sui* and *compos sui*), "an original fact of the inner sense" that founds all philosophy, is an individual feeling (as in Malebranche) and has as its prototype the "immediate apperception" of one's own body. He expresses the irreducibility of the union of mind and body as it is experienced in particular in "effort"; this feeling contains

5

Consciousness, self-consciousness, and "apperception"

In the *Critique of Pure Reason* (1781), Kant makes *Selbstbewusstsein* the supreme principle of knowledge and, at the same time, its own critical judge. Such an act of thought must therefore be considered a "transcendental apperception," that is, a grasping by the understanding itself of the pure form of the unity that it imposes on every representation of an object. This is another translinguistic equivalence that conceals, however, a syntactical and historical difficulty.

This difficulty begins with Leibniz, who, confronted by the Cartesian conception, had taken a position opposite that of Locke: for innate ideas, but against the idea that the mind can know itself through its own thinking. In his correspondence with Arnauld, Leibniz still referred to *conscience* (associated with *expérience intérieure*, *pensée*, and *réminiscence*). But in *Nouveaux essais sur l'entendement humain* (2.27), he retranslates "consciousness" as *consciosité* or *consciencosité*, rejecting Coste's neologism. This attempt, which was not adopted by others, clearly shows the tension between the two aspects of the notion of "consciousness": "self-presence" and "self-knowledge." For Leibniz, however, the only really adequate notion is that of "apperception" (from the verb *apercevoir*, or rather

from *s'apercevoir*); it makes it possible to hierarchize perceptions: a clear perception is not necessarily distinct, that is, it does not necessarily include a knowledge of its own constitution (*Monadologie*, §14). Leibnizian apperception is the mind's perception of the representations that develop (or unfold) in front of it the world of which it is a part, so that it can situate itself in it. The Kantian *transzendentale Apperzeption*, on the other hand, is only the way the consciousness reflects its own invariant form through the diversity of objective contents. But in exchange, it immediately raises itself to universality; it is the condition of all possible experience, individual or collective.

Must we then render *Selbstbewusstsein* in French by *conscience de soi* or, as translators like Pierre-Jean Labarrière and Gwendolen Jarczyk, who have reflected at length on Hegel's use of the term, prefer, by *auto-conscience*? It seems that in Kant's text (and notably in the "Transcendental Deduction" section of the *Critique of Pure Reason*), we can find a significant difference between the notions of the "Bewusstsein [der Identität] seiner [meiner] selbst," and *Selbstbewusstsein*: the homonymy of the psychological and the transcendental is constitutive. In Hegel, on the

contrary—as Derathé emphasizes (96) in his translation of the *Grundlinien der Philosophie des Rechts* (1821)—the "play" between *Selbstbewusstsein* and *Bewusstsein von sich* occupies an important place, but refers rather to the subtle distinction between *conscience de soi* and *conscience du soi* (or *du moi*) ("self-consciousness" and "consciousness of the self"). Note that this can be translated into Italian without apparent problems by *auto-coscienza*—and by *coscienza di se*—with a clearer connotation of "consciousness of the self," which *consapevole* suffices to express in practice. English, obviously, uses "self-consciousness." These variants are connected with a more general problem in expressing reflexivity on the basis of Greek and Latin models (*auto-*, *sui*).

immediately the positing of an antithesis between the self and the external world to which it is opposed. Thinking about self-consciousness is thus thinking about the two terms of this antithesis, their separation and their complementarity insofar as they are part of the same lived experience. The problem Maine de Biran raises is thus at the origin of French existentialism, and in this sense explains why French philosophy has never ceased to "translate" into existential terms the problems of the relation between psychology, phenomenology, and the transcendental dialectic of consciousness. But correlatively, the detour through *Bewusst-sein* (a way of writing it introduced in the twentieth century in analogy with the Heideggerian *Da-sein*) allows us to understand what is at stake in the post-Kantian aporia of "auto-affection" as well as in the post-Biranian questioning of the duality of the "simple fact": a reflection on the being of the "conscious being."

III. Contemporary Theoretical and Semantic Problems

Since the invention of consciousness, two problems have dominated the expression of the subject in the three great European philosophical languages and maintain permanent gaps among them, bordering on untranslatability, whereas the equivalences are in theory fixed. The first problem concerns the gap between the German paradigm of *Wissen* and

the French paradigm of *science.* The second concerns the difficulties inherent in psychological discourse, as shown in the problem of translating the English words "consciousness" and "awareness." They develop in opposite directions, but in both cases they illustrate the latent competition between the dichotomous oppositions of which philosophy is so fond (the moral point of view versus the psychological point of view) and more complex derivations that better reflect the mutual influence of language and concept.

A. "Conscience" and "certitude": *Gewissen, Gewissheit*, and *Bewusstsein* from Kant to Wittgenstein

The paradigm of *wissen* (Gr. *oida* [οἶδα], Lat. *scire*) is of fundamental importance for modern philosophy as a whole. In general, it does not have the same structure as that of the French *savoir* (as is shown by the different uses of *science* and *Wissenschaft*). But the correspondence between *conscience* and *Bewusstsein* raises specific problems. This has to do first with the fact that *Bewusstsein*'s etymology implies a more explicit decomposition than the one found in *conscientia* (*cum + scire*). Present from the start (in Wolff) in the competition between *Bewusst sein* and *Bewusstsein*, this latent decomposition is still at work in philosophical writing. It is reinforced by the parallelism between the active and the passive forms: *bewusst werden* (become conscious) thus corresponds to *bewusst sein*

(to be conscious), which connotes the result or the faculty (consciousness). Whereas rational and later experimental psychology takes the new substantive for an equivalent of the English term "consciousness," Hegel and his followers restored the ontological emphasis on *Sein*. From this comes Karl Marx's formula: "Consciousness [*das Bewusstsein*] can never be anything other than the conscious being [*das bewusste Sein*]" (Marx, *The German Ideology*). Martin Heidegger also played on this, but turned it around, opposing to the *Bewusst-sein* of the critical tradition simply *Da-sein*, "being there," thrown into the world, rather than "being conscious" or being as consciousness. On the contrary, the transcendental tradition from Kant to the Marburg School and Edmund Husserl tried to erase this ontological mark and retain only the idea of faculty or function. In the end, it had to situate this denegation in the terminology itself: it seems that *Bewusstheit*, a substantive of quality that escapes the question of "being" and is basically a German transposition of Leibniz's *consciosité* or *conscienciosité*, was introduced by Paul Gerhard Natorp and at the same time by Wilhelm Wundt (on this point, see Husserl, *Logische Untersuchungen*, vol. 2, "Untersuchungen zur Phänomenologie und Erkenntnislehre," part 2, "Remark on the Translation of Certain Terms"). The *Bewusstheit*/*Bewusstsein* pair separates in the negative: *die Unbewusstheit* corresponds to "unawareness" (which would be rendered in French by *inconscience*), whereas *das Unbewusste* corresponds to "the unconscious" (which would be rendered in French by *l'inconscient*) (Ellenberger, *Histoire de la découverte de l'inconscient*, 728n).

But the most interesting point lies elsewhere. The paradigm of *wissen* is broader than that of *scire*: it includes not only *Gewissen* and *Bewusstsein*, but also *Gewissheit*, taken as an equivalent of the Latin *certitudo*. Thus here we should abandon the idea that all the relevant meanings are included in the field of the French *conscience*. For German philosophy, it is not from outside that certitude intervenes in consciousness: from the outset, it is part of the same kernel of meanings, which philosophers organize in different ways. Keeping in mind the theological background (*gewiss* and *Gewissheit* are essential signifiers in the Lutheran faith, closely linked to the anti-intellectualism of the Reformation; see Box 3), we will discuss four configurations. In Kant, the fundamental problem concerning *Bewusstsein* resides, as we have seen, in the distinction between an empirical phenomenon and a transcendental condition for the possibility of thought ("It must be possible for the 'I think' to accompany all of my representations," *Critique of Pure Reason*, §16, trans. Guyer and Wood), followed by the return to the empirical in the form of the subject's self-perception. *Selbstbewusstsein* thus connotes simultaneously an auto-affection of the subject, an "internal sensibility," and the pure logical form of self-identity (for which Johann Gottlieb Fichte later created the formula *Ich = Ich*). The possibility of this critical distinction rests not only on the abstract opposition of two heterogeneous modes of representation (transcendental apperception and the inner sense), but also on the actual discovery of forms of consciousness that are concerned solely with pure thought: in the area of theory, the experience of the apodictic certainty of judgments; in the area of practice, the experience of the categorical imperative or the moral consciousness. It is remarkable that these two concepts are

defined by Kant using symmetrical formulas that attach both of them to *Bewusstsein* as the "common name" of transcendental subjectivity. *Gewissheit* is defined as "consciousness of the necessity [*Bewusstsein der Notwendigkeit*] of judgments" (*Logic*, Introduction, 9). *Gewissen* is defined as "consciousness [*Bewusstsein*] of a free submission of the will to the law" (*Critique of Pure Reason*), or else as "the consciousness [*Bewusstsein*] of a tribunal within man" (*Metaphysics of Morals*), and so on. The complete organization of the notions is thus as follows: *Bewusstsein*, insofar as it grasps itself as a pure form, is the transcendental unity of *Apperzeption*; insofar as it is the theoretical consciousness of necessity, it is *Gewissheit* (we might say "pure logical feeling"); insofar as it is the practical consciousness of the law, it is *Gewissen*; finally, in one or another of these modalities, the subject affects itself, "from the inside," as a psychological *Selbstbewusstsein*. This semantic organization is ternary, not binary.

The Hegelian organization is entirely different, particularly as it is set forth in the *Phenomenology of Mind*. There, Hegel offers an account of the genesis of *Bewusstsein* from *Gewissheit*, taking the latter's modalities as a guiding thread. From "sense certainty" to "the mind's certainty of itself," *Gewissheit* is *Bewusstsein*'s active *relationship to itself*, which explains why consciousness can experience itself as truth in each of its experiences, and why it must nonetheless repeatedly divest itself of itself in discovering its error. As a concept, *Bewusstsein* can emerge only with a first negation of *Gewissheit*, of perception; but on the other hand, the problem of *Gewissheit* can be taken beyond *Bewusstsein*, or better yet, it can take consciousness beyond itself, into the concept of absolute Spirit or Knowledge. In this context, the question of the *Gewissen* is treated in a localized way, as a particular figure of consciousness (*Bewusstsein*) and of its own *Gewissheit* (certitude). But this figure is privileged: it is the key moment in which *Bewusstsein* knows (*weiss*) itself as a pure subject (the concept of a pure subject is thus fundamentally a moral concept), and conceives itself essentially as *Selbstbewusstsein*, having only itself as its "object." This subjective figure of truth, which is deeply illusory, is entirely imbued with a self-referential *Gewissheit*.

■ See Box 6.

In *Sein und Zeit* (§§54–55), Heidegger centers his analysis of the *Gewissen* on the common expression "the voice of conscience." Contrary to the "metaphor of the tribunal," it is supposed to refer to an originary characteristic of *Dasein*: interpellation, the "call" (*Ruf*, *Anruf*) to responsibility (*Schuld*), to "being oneself" (*Selbstsein*). Such a voice by which "*Dasein* calls to itself" is always already of the order of discourse (*Rede*), even though it is essentially quiet or speaks only by keeping silent, that is, it determines no task or duty (*Pflicht*). This description is thus opposed term-for-term to Kant's definitions. Neither *Gewissheit* nor *Bewusstsein* plays any role in it. They are concepts basically foreign to Heidegger's thought, which reserves them for the description of the metaphysical moment of subjectivity that was opened up historically by Cartesianism and culminates in Hegel. It is hard to imagine that this phenomenology did not play a role in the way Jacques Derrida "deconstructed" the Husserlian conception of consciousness, in a chapter entitled

6

Translations of Hegel's *Phenomenology of Mind*

It is remarkable that none of the three French translations of Hegel's *Phenomenology of Mind* has adopted the same equivalent for *Gewissen*. Each has recognized the difficulty and chosen to draw the system in a different direction. J. Hyppolite (1939) translates *Gewissen* as *conscience morale* or *bonne conscience*, in order to "avoid the possible confusion of *Bewusstsein* and *Gewissen*." J.-P. Lefebvre (1991) is the only translator who has noted "the connotation of certainty that is associated with [*Gewissen*]" and translated it as *conviction morale*, "so as to indicate the intimate dimension of *Gewissen*" (in your soul and conscience) by reserving *persuasion* for *Überzeugung*. Finally, G. Jarczyk and P.-J. Labarrière (1993)—who proposed that *Selbstbewusstsein* be rendered as *auto-conscience* (see Box 5)—render *Gewissen* as *certitude-morale*, which fuses the two concepts, but give the tautology "la certitude inflexible de

la certitude-morale" as a translation of "die unwankende Gewissheit des Gewissens"—reserving *conviction* for *Überzeugung*. For his part, in a note to his translation of *Grundlinien der Philosophie des Rechts* (168), Derathé offers this comment on the difficulty:

> The German language distinguishes between *Gewissen* and *Bewusstsein*. It thus has two words to designate what we call in French *la conscience*. For Hegel, the words *Bewusstsein* and *Selbstbewusstsein* (self-consciousness) are related to *Wissen*, to scientific knowledge or to knowledge in general. On the other hand, Hegel regards *Gewissen* as a form of *Gewissheit*, of certainty, or, more exactly, of self-certainty: "This pure self-certainty, Hegel says, pushed to its extreme limit, is manifested in two forms, one of which passes immediately into the other in the

form of conscience and in the form of evil . . ." (*Encyclopaedia*, §511). To avoid confusion, *Gewissen* is often rendered in French by *conscience morale* and *Bewusstsein* by *conscience*. I prefer to follow the example of Bayle and Rousseau and translate *Gewissen* simply by *conscience* without further qualification. However, let us recall that for Rousseau, conscience is "the infallible judge of good and evil, which makes man like God," whereas for Hegel, it is simply a subjective certainty that can deviate from the truth and take evil for good. That is why Hegel raises the question (*Grundlinien der Philosophie des Rechts*, §137) of true or veridical conscience [*Gewissen*], which is the disposition to want that which is good in itself and for oneself and that, for Hegel, appears only at the level of ethical life or *Sittlichkeit*.

"The Voice That Keeps Silence," writing, for example, that "it is this universality that ensures that, structurally and by right, no consciousness is possible without the voice. The voice is the being which is present to itself in the form of universality, as con-sciousness [*con-science*]" (*La voix et le phénomène*, 89). Thus Derrida plays in French on the etymology and connotations of a German concept, but at the same time he diverts them and to some extent can authorize criticism of them. His "con-sciousness" (which he writes as Coste did when translating Locke) is a *Bewusstsein* haunted by the Heideggerian analytic of *Gewissen*, which makes the certainties of phenomenological experience vacillate in a special *Ungewissheit*. We might quote partly similar remarks from Paul Ricœur's *Soi-même comme un autre* (1990).

Our last witness is Ludwig Wittgenstein. Here again, *Bewusstsein* is no longer central, but for reasons different from Heidegger's. The *Tractatus Logico-Philosophicus* replaced this term with *Gefühl*, moving it entirely into the realm of subjectivism and even of "mysticism" (§6.45). And the posthumous collection *Über Gewissheit* reduces *Bewusstsein* completely to the latter term, understood in its subjective meaning. The whole book is constructed around the question of what *Ich weiss* (I know) means, and thus around the relationship between *wissen* and *Gewissheit* in various language games. Something of the battle Wittgenstein's aphorisms wage against tautology is irremediably lost as soon as we pass into French or English:

> And in fact, isn't the use of the word "know" [*wissen*] as a preeminently philosophical word altogether wrong? . . . "I believe I know" [*Ich glaube es zu wissen*] would not need to express a lesser degree of certainty [*Gewissheit*].
>
> (*Über Gewissheit*, trans. Paul and Anscombe)

Against the heritage of "Cartesianism," we need to return here to a very close examination of Descartes's own language.

B. Consciousness or experience

The translation of the terms "awareness" and "consciousness" has the interest of bringing out a theoretical difficulty of which insular philosophers may themselves not be aware. "Aware" is an old English word meaning "to be awake, on one's guard, recognize." On the other hand, "awareness" does not appear before the nineteenth century (RT: *Oxford English Dictionary*, s.v.). Short of a paraphrase, it can, of course, be translated into French by *conscience* when the term is used by itself. The difficulties begin when it is necessary to render "consciousness" and "awareness" in the same context (expressions such as "conscious awareness" even occur). The situation becomes critical when statements in the form of definitions risk turning into tautologies: "Conscious experience names the class of mental states that involve awareness" (Flanagan, *Consciousness Reconsidered*); "This consciousness, in the 20th century, has come to mean a 'full, active awareness' including feeling as well as thought" (Scott, "The Evidence of Experience"). Then translators hesitate between indicating the English term in parentheses (Dennett, *Consciousness Explained*) and the introduction of expressions that particularize usage and suggest philosophical interpretations (*connaissance immédiate* for "awareness": Penrose, *The Emperor's New Mind*)

Thus we can understand why, in his own French adaptation of his famous lecture "Does Consciousness Really Exist?" (1912), William James used the French word *aperception*, which current French translators no longer dare to use. The essence of the problem seems to be the following: The uses of "awareness" and "consciousness" are obviously not distinct,

and even less codified. On the other hand, they are dominated by recurrent questions regarding the pertinence of the concept of consciousness inherited from classical philosophy: ontological problems (as James Mark Baldwin put it, "It is the point of division between mind and not mind," *Dictionary of Philosophy and Psychology*), or problems bearing on the ability of the neurosciences to "explain consciousness"—that is, to objectivize the subject—or on the connection between consciousness and personal identity. The contexts show that the term "awareness" sometimes constitutes a nontechnical equivalent of "consciousness," which is supposed to provide access to a common experience and serve as a point of reference for the elaboration of a scientific concept, and sometimes the name of an elementary phenomenon to which the enigma of the specificity of psychic phenomena might be reduced. It is a question of simultaneously showing the circular nature of the definitions of consciousness and trying to break it. Then we see that the argumentative structure of the expositions generally consists (with or without a classification of the forms or degrees of consciousness, as in Ryle [*The Concept of Mind*] or Flanagan [*Consciousness Reconsidered*]) in situating the field of the phenomena of consciousness between the two extreme poles of "awareness" and "the self." For the whole of this field, a metonymic term is necessary, one that transcends the difference between "awareness" and "consciousness," while at the same time expressing their intrinsic relationship: this term is generally "experience," which thus represents, as in Locke, Hegel, or James, the most general name of subjectivity.

This remark leads to another. Since awareness forms the first anchoring point for consciousness within experience, its meaning is obviously not unequivocal: it depends on theoretical positions that are mutually contradictory, oscillating between the idea of the necessary presence of a personal subject and that of the latter's absence. However, what remains constant is the argumentative function of refutation or *elegchos* performed by the reference to awareness. In fact, "aware" is synonymous with "not unconscious": consciousness is that which is not unconscious, thus aware, or present to itself. As always in philosophy, double negation tends to connote the originary. The semantic structure (awareness + consciousness = experience) is not at all limited to cognitive contexts. On the contrary, it appears in the same way in the contexts of moral and political philosophy. Thus it shows the dependency of all these domains in relation to a single implicit phenomenology.

But furthermore, it competes with a second, formally similar structure that seems to be more or less reserved for the adversaries of cognitivism (like Searle [*Minds, Brains and Science*]), and that is based on the interpretation of experience in terms of consciousness + intentionality. This seems to pose no problems of translation. But our desire to resolve the problem (which is basically insoluble) raised by the doublet "consciousness"/"awareness" can thereby only be whetted. The symmetry of these two constructions competing with "experience" corresponds to the fact that from an "objectivist" point of view, the problem is the immediate relation of the subject to himself (designated by "awareness"), whereas from a "subjectivist" point of view, the problem is the immediate relation of the subject to objects (designated by

"intentionality"). On closer inspection, we see that here "intentional" and "intentionality" are based on the same "double negation" as "aware" and "awareness": it is a matter of naming the "not-unconscious." This amounts to saying that in all cases, the "definitions" of "consciousness" that want to avoid self-reference rely on the attempt to find a word to express this limit of thought.

IV. The Borders of *Conscience* and Linguistic Clues

Ever since consciousness was invented, the expression of the problems it has synthesized has constantly been racked by the gaps between linguistic paradigms. The plurality of meaning we have described is clearly not a defect, but the source of a continually renewed dynamics of thought that plays with the possibilities of problematization that are concealed by words in other languages that are more or less equivalent to the French word *conscience*. This process can change reference points, but it cannot stop. Its meaning has been temporarily masked by the way in which the philosophy of the first part of the twentieth century (Léon Brunschvicg, Ernst Cassirer) brought the various "manifestations" or "degrees" of *la conscience* into a figure of a great progress, which was ultimately identical to humanity's march toward the realization of its own essence, conceived on the classical European model. The debates aroused by psychoanalysis (attached by Freud to the expression *das Unbewusste*, "the unconscious," which was forged by the Romantics at the beginning of the nineteenth century), or by the "deconstruction of the subject" in the twentieth century after Heidegger and the various structuralisms, did not alter significantly the feeling that it was unequivocal. The same will not be the case, probably, for the two phenomena that are going to mark the coming years: the intensification of confrontations between the ways of conceiving of individuality, personality, the psychic apparatus, knowledge, and so on in Western and non-Western cultures and systems of thought, and the diffusion and development of the paradigm of the cognitive sciences. These two phenomena (which are perhaps connected) will go hand-in-hand with a new revolution in the economy of linguistic exchanges, both in the sense of a multiplication of translations between European and extra-European idioms, and in the sense of the imposition of a new technical-conceptual *koinê*, basic Anglo-American. The question of what place the words and notions "conscience," "consciousness," and "awareness," *Bewusstsein*, *Gewissheit*, and *Gewissen*, will have at the point where philosophy, the sciences, ethics, and even mysticism intersect, in common language and in scientific languages, now seems wide open.

CONSENSUS

"Consensus" is a direct borrowing from the Latin, which means "agreement, unanimous judgment" (from *cum*, with, together, and *sentire*, perceive, feel, think, judge), and translates the Greek *sumpatheia* [συμπάθεια] (*sun-* [σύν], with, like the Latin *cum-*, and *paschein* [πάσχειν], to be affected, undergo, suffer). It was used in particular by the Stoics to designate agreement, conspiracy, and a certain number of things between the two, and it was adopted by physiology to designate the interdependence of bodily organs (cf. IMPLICATION, OIKEIÔSIS, PATHOS). But "consensus" is also, at least in English and French, a good translation of Greek terms such as *homonoia* [ὁμόνοια] (literally, identity of thought, whence unanimity, concord), and even *homologia* [ὁμολογία] (identity of discourse, whence agreement), which opens out onto the city and the constitution of politics; see LOGOS, II.A, LOVE, II.B.2, SPEECH ACT (esp. Box 1); cf. POLIS, POLITICS (cf. IMPLICATION, OIKEIÔSIS, PATHOS).

Consensus clearly points toward "common sense," that to which everyone can adhere: see *SENS COMMUN* [SENSUS COMMUNIS, COMMON SENSE] and SENSE, as well as COMMONPLACE and DOXA.

In contemporary usage, "consensus" designates not only agreement but the human community that is based on it beyond its divisions, whether the unifying element is civil or religious: see *ALLIANCE,* CIVIL SOCIETY, PEOPLE, PEOPLE/RACE/NATION (esp. Box 1), SOBORNOST'; cf. *COMMUNITY, DROIT*, WELTANSCHAUUNG.

➤ PRAXIS, SECULARIZATION, *WHOLE*

CONSERVATIVE

The word "conservative" derives from the Latin *conservare* (to preserve, respect, save), which designates the fact of preserving and faithfully observing: see PIETAS, RELIGIO.

Here we will focus, as in the entry for "liberal," on the difference between modern political uses of the term in French and English. The English term "conservative" originally designated one of the great traditional parties in Great Britain, occupying the place that would in France be that of the "right" (*droite*), and later referring to a more general political and even moral position hostile to the most antitraditional aspects of modern society. In any case, the position of the "conservatives" is always understood in a relative way, as is shown by the two series of oppositions analyzed here: see WHIG/TORY, for the birth of the modern British political system, and LIBERAL, for the contemporary usage that divides the main political currents into conservative, liberal, and radical.

➤ CIVIL SOCIETY, LAW, *LIBERTY*, POLITICS

CONTINUITET / CONTINUERLIGHED / CONTINUERLIGT (DANISH)

ENGLISH   continuity, continual
FRENCH   *continuité, continuellement/continûment*
GERMAN   *Kontinuität, Kontinuierlichkeit/kontinuierlich*

➤ CONTINUITY, and AIÔN, DASEIN, LEIB, *PERSON*, PLUDSELIGHED, PRESENT, *TIME*

To render the idea of continuity, the Kierkegaardian lexicon uses two terms: *Continuitet* and *Continuerlighed*, which are denoted in the following by "continuity (A)" and "continuity (B)." In French and English, there is a subtle difference between *continûment*/"continuously" (without interruption) and *continuellement*/"continually" (possibly repeatable). In some cases, either of the two Danish concepts can be used, and yet one can recognize in the use of the second one (*Continuerlighed*) a concern to emphasize the dialectical particularity of the existential continuity, to oppose it to permanence and to the stability of nature.

Continuity (B) designates the fact that an existing individual is continuous in becoming by virtue of a decision that has the value of an origin. For nature or for ordinary existence, time is only "the dialectic that comes from outside." On the other hand, for the individual who lives his existence on the basis of himself, who is "originally dialectical in himself," time operates in such a way as to bring out "the metamorphosis of the most precisely determined continuity as process, succession, continuous transformation through the years."

Continuity (B) characterizes the cohesion of ethical life in harmony with the requirements of social reality, of life that escapes dissolution, diffusion (*dœmrer*) in the humors, and momentary affective tonalities. This concrete continuity, which "masters the humors [*Stemning*]" (see STIMMUNG), is described in contrast to the abstract continuity of the mystic. The ethical choice of oneself involves becoming-oneself as a task of existence in its continuity in accord with duration. That is the origin of "the concrete person in continuity [A]." Ethical triumph has to do with the "fact of being continuous"—continuity (B); it is the fact of being at once hope and memory. In fact, the unhappy relationship to the past and to the future of man deprived of presence is at the opposite pole from the positivity of movement backward (repentance) and forward (desire), which characterizes the purity of heart of the person who desires the One. "Repentance must have its time," which is nothing other than the return to a past marked by the lack of this desire. It works in favor of the cohesion of life animated by movement forward.

Aside from continuity (A) as the permanence of humanity, that is, "descent as continuity in the history of the species," recourse to this notion appears especially when there are figures or situations whose traits are marked by an absence of continuity. That is the case for the aesthetician, the ironist, who has no continuity (A) other than boredom. Kierkegaard was inspired here by the ironic negativity that Hegel dealt with in his *Aesthetics* apropos of romantic art. (It also anticipates Nietzsche's Zarathustra, who is "tired of poets.") The ironist frees himself from continuity (A) with the real

conditions of a temporal existence; he lives an "eternity without content," a felicity without joy, a superficial depth of the being at the same time starved and sated. He lacks continuity; being prey to successive humors "that instantly succeed one another," he is, as it were, confusedly diffused in them. To that is connected, in *Either/Or*, "the poetic infinity" of boredom or of the void characteristic of "demonic pantheism" (ibid.), or again, of the unhappy eternity of the bookkeeper, sketched in counterpoint to the happy eternity of "a voluptuously beautiful woman in a harem, reclining on a sofa in all her allure" (ibid.; see PLUDSELIGHED).

The interruption of continuity also has a gnoseological meaning. For instance, when faced by becoming in its diverse forms, it is not bodies of knowledge in continuity with each other but, rather, "opposed passions" that are established. That is the case of faith and doubt, which are dependent not on conclusions but on a decision. The loss of "continuity with oneself" marks the "new creature" constituted by the believer, who is, as it were, born a second time. The demonic and this believer are thus two antagonistic figures with respect to continuity. Alongside the properly theological development of the continuity of sin and eternity, the Christian theory of the instant is the occasion for a barely veiled critique of Hegelianism. It denounces the reduction to this "simple continuity [A]" that is carried out by thinking that ignores the instant as a "plenitude of time." It consists in believing that the meaning of the past can be brought out, not on the basis of what it really was (incarnation, redemption), but in a relationship of "simple continuity" with the future, namely, progress and history in conformity with the *Weltgeist*. Similarly, to think we can access the future not on the basis of what it will be (resurrection, judgment) but in continuity with the historical present is to underestimate the import of the instant instituted by Christianity.

The most explicit discussions of continuity and discontinuity with respect to the rhythm of thought are found in the great "theoretical" work of 1846, the *Concluding Unscientific Postscript.* When thought believes it can find a foundation in the "solidity of the continuous," it feels sure of itself, and consequently directly communicable *sub specie aeterni.* Like Socrates, the existent aware of "the deceptive life" in which he interacts with the idea finds himself "isolated," having only an "extremely private relationship with it." The possibility of death, which foils infinity's deceptions, casts doubt on any kind of positive assurance. The consciousness of finite time impedes continuous thought and situates man in the time of becoming. Time imposes its law and prevents this "abstract continuity which is not a continuity" from being prolonged. Thought's passion is opposed to the false continuity of abstract thought, because it is the "momentaneous continuity [B] that both slows the movement and is its impetus." Time, which cannot fail to affect thought, imposes on it a discontinuous rhythm, suspends the immanent continuity of conceptual sequences. It is in the staccato temporality of individual existence and not in the great continuity of world history that the relationship to the Absolute is played out, a relationship that consists of suffering and tribulation. Whereas in the ethical order temptations and tests attack temporal existence at

its weak points, (religious) tribulations are like "Nemesis bearing on the powerful instant of the absolute relationship." Continuity (B) is broken when "the real resistance of the Absolute" is expressed.

| CONTINUITY

"Continuity" (from *tenere* [to hold, last, persist] and *cum* [with, together]) designates an uninterrupted persistence in time and also in space. Kierkegaard's proposal of original terminological distinctions in Danish is discussed in CONTINUITET; we will complete the Kierkegaardian lexicon concerning time in the articles PLUDSELIGHED (suddenness-without-consequence), MOMENT, Box 3, and NEUZEIT, Box 1.

We have also studied the expression of continuity through the "aspect" of verbs, which denotes the mode in which action develops: see ASPECT.

More broadly, see *TIME* [AIÔN, MEMORY, PRESENT].

| CORSO, RICORSO (ITALIAN)

ENGLISH   *course, return, recurrence*
FRENCH   *cours, retour, récurrence*

➤ *RÉVOLUTION*, *TIME*, and AIÔN, AUFHEBEN, CIVILTÀ, *DESTINY*, HISTORIA UNIVERSALIS, HISTORY, MENSCHHEIT, PEOPLE/RACE/NATION, PERFECTIBILITY

Two words in everyday Italian, *corso* and *ricorso*, have acquired philosophical status because of Giambattista Vico's use of them in his *Scienza nuova* (1744). These words are associated with the idea of a cyclical conception of history that Vico is supposed to have defended at a time when the linear conception of an indefinite progress of humanity was being established. For a long time, Vico's work has been generally known only from this point of view, but an attentive study of his texts shows that it is very questionable whether in his *Scienza nuova* Vico merely adopts the ancient theme of the cyclical nature of time. This superficial and even erroneous interpretation of what he calls the *corso* and *ricorso* of nations prevents us from seeing the depth and originality of his thought.

I. Neither Cycle nor Spiral

The Italian word *corso* derives from Latin *cursus* (from *currere*), which designates a race, the act of running, and figuratively the course or itinerary followed by something (*cursus rerum, cursus vitae*). Vico uses it in the expression *corso che fanno le nazioni* (the course followed by nations), which serves as the title of Book Four of the *Scienza nuova*, designating the development of nations through time (Vico speaks only of "nations," which are concrete realities, and not of "humanity," an abstract term designating the human species). The "scientific" study of this necessary, universal evolution and

unfolding is the *Scienza nuova*'s chief goal: "since these institutions have been established by divine providence, the course of the institutions of the nations had to be, must now be, and will have to be such as our Science demonstrates, even if infinite worlds were born from time to time through eternity, which is certainly not the case" (§348). This is what Vico calls "eternal ideal history" (*storia ideal' eterna*). The actual history of nations is thus governed by a law of succession and can be divided into three "ages," that of the gods, that of heroes, and that of men. In the course of this history human beings, starting from a virtually animal state, develop the seeds of "humanity" that exist in them. The last state is that of "reason completely developed" (*ragion tutta spiegata*), with the appearance and flourishing of abstract thought, of philosophy and science. On the political level, it coincides with the emergence of the popular republic or democracy.

Thus we might think that *corso* so defined is a kind of constant progress leading, as Vico puts it, to an *akmê* (culmination). But history, with the examples of Greece and especially Rome, on which Vico concentrated his analyses almost exclusively, shows that it is difficult if not impossible for nations to maintain themselves in this state of complete perfection of their humanity, and that, as is shown by the paradigmatic fate of Rome, the principle of freedom, which is that of democracy, makes the latter degenerate into anarchy and corruption.

This is where Vico's text has to be examined very closely. For this state of disorder in which cities then find themselves, divine providence has three remedies, according to Vico. The first is the appearance of a monarch who, like Augustus, holds the institutions and the laws in his hands, makes order and equity reign, and makes subject peoples content with their fate. The second is that degenerate populations fall into the hands of better populations and are reduced to the status of provinces. The third and most radical occurs when the first two have proven impossible. When the social disintegration provoked by the "barbarity of reflection" (*barbarie della riflessione*) has reached its extreme, nations return to the primitive state of "barbarity of sensation" (*barbarie del senso*) from which they had long before emerged. A new *corso* begins, which Vico calls a *ricorso*, and it will repeat, not in their events, but in their temporal structure, the three stages of the *corso* defined through the study of the history of Greece and Rome. The fifth and last book of the *Scienza nuova*, which is devoted to the *ricorso delle cose umane* (the *ricorso* of human affairs), thus offers a panorama of the history of Western nations taken as a whole and seen as one and the same nation after the fall of the Roman Empire. The West moves from an "age of the gods," then from an "age of heroes"—which coincides with what we call the Middle Ages and what Vico calls "the barbarous times come again" (*tempi barbari ritornati*)—to an "age of men" (*età degli uomini*), which is the modern world.

As we see, the word *ricorso* does not refer, as is often believed, to a backward movement, to a regression, a process of involution that makes nations retrace their steps and brings them back to their point of departure (understood in that way, the *ricorso* would be the inverse of the *corso*). The return to the starting point comes at the end of a *corso*, and makes it possible for another *corso* (*ri-corso*), identical in its general structure, to begin.

Before inquiring into the view of the history of nations that emerges from these analyses, we must note two important points. On the one hand, Vico does not speak of the "*ricorso* of human affairs" in the first edition of the *Scienza nuova* (1725), in which the principles of his "science" are already laid out, which proves that the question is not essential for him, and that it is merely a confirmation of the general validity of these principles. And on the other hand, he never uses, in the final version of his work, the words *corso* and *ricorso* in the plural, which disconfirms the common interpretation that holds that for Vico history offers the spectacle of a series of *corsi* and *ricorsi* indefinitely succeeding each other—unless, to give this succession the appearance of a progress, these cycles are seen as a spiral; but neither this image nor the idea connected with it is found in Vico's work.

Corso can be translated into French by *cours*, but the translation of *ricorso* is more delicate. *Recours* (recourse, appeal) appears in the juridical vocabulary, and if we can acknowledge that Vico's *ricorso* does indeed have the meaning of an "appeal" that nations might make before the tribunal of history, it does not refer, or no longer refers, to the repetition of a course, of a run (the verb *recourir*, in one of its common meanings, preserves this idea, and a course that has not been properly run has to be rerun). Jules Michelet translates *ricorso* by *retour*, but we might also suggest *récurrence* as a rendering.

II. Is the *Ricorso* Inevitable?

While the common interpretation of *ricorso* in Vico as merely a simple (and regrettable, according to some writers) borrowing of the old theme, naturalistic in origin, of the cycle of life and death, here applied to nations, is not defensible, the *Scienza nuova* nonetheless raises questions that are difficult to answer. However, a careful reading allows us to arrive at some reasonable conclusions. For Vico, the *corso* followed by nations is an "idea" realizing itself in time, an idea inferred from an informed observation of the history of various nations, and whose specifically "scientific" value derives from the fact that it can be deduced, in an axiomatic way, from the study of fallen human nature after original sin. This idea allows us to understand the temporal destiny of all nations, and has at the same time an heuristic value: thus Vico "discovers" the true identity of Homer (Book 3 of the *Scienza nuova* is entitled "Discovery of the True Homer"), and between the first and last editions of his work, he "discovers" that the Middle Ages is simply a repetition of the "divine" and "heroic" ages of Greek and Roman antiquity. An idea cannot be pluralized; it is unique, and this implies, as we have seen, that all nations that have existed, or now exist, or will exist, have had, have, and will have a history whose general movement follows the *corso* outlined by Vico. Ultimately, and in a more concrete way, Vico merely affirms that the emergence and development of all human societies are based on religious, moral, juridical, and political values embodied in institutions whose form changes in accord with an immutable temporal order, as the nature of fallen man changes and transforms itself, "humanizes itself," without the effects of the original Fall ever completely disappearing.

Does that mean that at the end of the *corso* followed by each nation there is necessarily a final decadence and dissolution, and that to save humankind providence must always use its ultimate means, which is to bring nations violently back to their principles, which are also their beginnings, in order to allow them to begin all over again? This is not certain. Vico offers few explanations on this point, but in any case we find nowhere in his work the idea of a mechanical or organic necessity that would condemn nations to an ineluctable death, other nations taking their place in order to follow the same process. In the case of Rome, the final dissolution was the result of the failure, due to humans themselves, of the first remedy that providence provided them, namely the establishment of a rational monarchy. Was this failure inevitable? Are "human" times, those of "completely developed" reason, always condemned to corruption and death? The question remains open, and Vico himself gave no categorical response to it. When at the end of the *Scienza nuova* he speaks of the situation of modern Europe, he appears to think that "today a complete humanity [*umanità*, in the sense of "civilization"] seems to be spread abroad through all nations, for a few great monarchs rule over this world of peoples" (§1089). But this declared optimism is counterbalanced by a severe judgment on modern culture, and in particular on the philosophy of his period, whose dominant trends seem to Vico to adopt the positions of those who, in antiquity, participated in the general corruption by preaching a dissolving individualism (Skeptics, Epicureans, Stoics). But he never predicts the final catastrophe, even if he fears it. The world of nations, he repeats, is not prey to the *casus* (accident) or to the *fatum* (fate). The "new science" he claims to have founded permits him, as he says in a passage in the 1725 edition, only to offer a "diagnosis" of the state of the nations, to call them to the order of freedom and justice, with respect for the founding principles of every society, religion, and the family. So far as the rest is concerned, nations hold their destiny in their own hands, under the watchful eye of the providence that wants to "preserve the human race upon this earth" (§1108).

———. *The New Science of Giambattista Vico*. Translation of the third edition (1774) with the addition of "Practice of the New Science." Edited by T. Goddard Bergin and M. H. Fisch. Ithaca, NY: Cornell University Press, 1984.

CROYANCE

The French word *croyance* derives from the Latin *credere*, which means "to confide in," "believe, think," and, in an intransitive sense, "to be confident" or "to believe, have faith." The term is thus capable of combining two heterogeneous notions: a logical and epistemological one of opinion and assent, and another religious or even superstitious one of faith.

I. *Croyance* and *Foi*: *Der Glaube*

The two registers are not, however, differentiated in the same way in all languages. While French can choose to oppose *croyance* and *foi*, as English opposes "belief" and "faith," the German expression *der Glaube* (belief, faith) cannot by

itself indicate the distinction between logical assent and adherence to a religious content. Whence the difficulty encountered by French and English translators in making intelligible both the Kantian adage "I had to limit knowledge [*Wissen*] to make room for belief/faith [*Glauben*]" and the transition to the Hegelian problem of the relations between "faith" and "knowledge" after the Enlightenment: see GLAUBE. See also *FAITH, RELIGION,* SECULARIZATION.

II. *Croyance* and *Assentiment*

1. The English term "belief," which is derived from Germanic *Glaube*, gradually detached itself from "faith" (from Latin *fides* [faith, confidence, sincerity, protection]) to designate, from Hume to Wittgenstein, the whole field of a "grammar of assent" on the basis of the polarity of feeling and judgment. See BELIEF.
2. On the degrees of assent and the relationship to the object or to reality, see DOXA, PERCEPTION, Box 3, REPRÉSENTATION, TRUTH, WILL. See also VERNEINUNG; cf. *CERTITUDE, PROBABILITY, REASON.*
3. On the belief in the external world, the existence of the object, and the "suspension" demanded by skepticism and phenomenology, see EPOCHÊ; cf. BEGRIFF, Box 1, GREEK, OBJECT.

➤ CLAIM, EPISTEMOLOGY, MATTER OF FACT

| CULTURE

The French word *culture*, like its analogues in various European languages, comes from the Latin *cultura*, which designates agriculture and the transformation of nature, implying a relationship to places and to gods (*colere*, the verb from which it derives, also means "inhabit" and "worship"), and, starting with Cicero, the cultivation of the mind and the education of the individual. It denotes a tension between the natural and art or artifice, on the one hand, and between the human universal and particularity or singularity on the other.

I. *Cultura* (Lat.), *Paideia* (Gr.), *Bildung* (Ger.)

The Latin *cultura*, which concerns the harmonious adaptation of nature, proposes a model entirely different from that of the Greek *paideia* [παιδεία], in which we hear the Promethean art of making a little man (*pais* [παῖς]), or rather a little Hellene (see BILDUNG, Box 1, TO TRANSLATE, I, and ART, I). The term, which is exceptionally rich and full of connotations, is connected with *Bild*, "image" (see BILD and *IMAGE*), with *Einbildungskraft*, "imagination" (see *IMAGINATION*), and refers to "formation" (*bilden*) and "plasticity" (see PLASTICITY and ART, Box 2).

II. *Bildung/Kultur/Zivilisation* (Ger.), *Culture/ Civilisation* (Fr.), *Civiltà* (Ital.)

Bildung, which retains the element of particularity in the notion of individual formation, is distinguished from both *Kultur* and *Zivilisation* in an unparalleled triplet. See BILDUNG for the evolution of these three terms from the Enlightenment onward (cf. LIGHT).

See the same entry for the way in which the Franco-German relationship has been determined by the meaning and value of the French word *civilisation* in relation to the German *Kultur*. Finally, Italian *civiltà* refers both to "civilization" and "civility"; see CIVILTÀ.

III. Culture/Cultures

On the tension between universal civilization and particular culture, see MENSCHHEIT, Box 1; TO TRANSLATE, Box 2; cf. EUROPE, LOGOS, NAROD, PEOPLE.

IV. The Great Interactions

1. On the relation between culture and nature, see ART, BILDUNG, *FATHERLAND,* GENIUS, INGENIUM, NATURE.
2. On the relation between culture and history, see HISTORIA UNIVERSALIS, HISTORY, SECULARIZATION.
3. On the relation between culture and art, see ART, KITSCH, MIMÊSIS (and BILDUNG, Box 1, for *mimêsis rhêtorikê* [μίμησις ῥητορική]).

➤ GEISTESWISSENSCHAFTEN, RELIGIO

D

DAIMÔN [δαίμων] (GREEK)

ENGLISH demon
FRENCH *démon*

➤ *DEMON*, and BOGOČELOVEČESTVO, *DESTINY*, DEVIL, DUENDE, GENIUS, GOD, *HAPPINESS*, MORALS

"Demon" was closely associated with "devil" in early Christianity and thus acquired very negative connotations, but the Greek *daimôn* was initially undetermined axiologically. Neither good nor bad in itself, it was characterized just as much by its ontological ambivalence.

I. *Daimôn* and Distribution (*Daiomai*)

In Homer the word may designate a *theos* [θεός], a god, but in a relatively vague way. More exactly, in its use in Homer, *daimôn* seems to refer sometimes to a divine power that manifests itself in a diffuse way, and sometimes to a particular god who is not precisely identified.

To determine this more closely, we will begin with the etymology of *daimôn*. Plato suggested that the *daimôn* was a *daêmôn* [δαήμων], that is, an intelligent, clever being (*Cratylus*, 398b), but it is in fact a term derived from the family of *daiomai* [δαίομαι], "share (out)" or "distribute," and *dais* [δαίς], "part" or "lot." In accord with this etymology, the *daimôn* can be understood as the being that distributes lots, or as the effect of this distribution: then it is—and this is once again a significant indeterminacy—either the power that distributes lots or the lot itself that falls to someone, whence in both cases a strong connection with the idea of fate (*heimarmenê* [εἱμαρμένη]; *potmos* [πότμος]). And although Homer's use of the word scarcely reflects this etymology, we can clearly see its influence in the compound adjectives *eu-daimôn* [εὐ-δαίμων], "happy," literally, "one who has a good *daimôn*," used from Hesiod on, and its antonym *dus-daimôn* [δυσ-δαίμων], which Empedocles created precisely to qualify fate (*potmos*, cf. 31 B 9, 4 DK).

For his part, Hesiod presents daimons as men of the golden age who have become "guardians of mortal men" after their own deaths (*Works and Days*, 122–23). This usage persisted for a long time because taken literally it helped to endow daimons with personal, functional characteristics and situated them as a category of beings intermediary between gods and humans that played a providential role with regard to the latter.

Was this the result of learned reflection on the adjectival use? In any event, Empedocles went still further than Hesiod, and in his poem *Hoi Katharmoi* (The purifications) he created a narrative whose protagonist is a daimon who has been exiled, like others of his kind, from the domain of the gods (31 B 115 DK; in this narrative the daimon, designated as an active, knowing subject, expresses himself

in the first person). The real etymology of *daimôn* plays a major role here: Empedocles's demonogonic narrative shows explicitly that the daimon is the result of a willed separation from the divine world—and that its development, begun by this exile far from the gods and punctuated by the incarnations that necessity imposes on it, involves moving from the misfortune of birth and mortality (a true *dus-daimonia* [δυσ-δαιμονία]) to happiness and apotheosis (31 B 146–47 DK). The result is a mutation: it is no longer a matter of becoming *eudaimôn* but rather *makar* [μάκαρ], the equal of the gods, that is, blissful. By individualizing the daimon in this way, Empedocles inaugurates, although he does not pursue, a profound evolution in the use of the term that makes it signify a kind of personal principle, connected with the individual human without merging with the latter.

II. Plato: Interpreting the Intermediary

It can be said that all the later semantic developments of this term in philosophical thought are determined by the use made of it by Homer, Hesiod, and Empedocles. Plato summed up pretty much all of them, and provided in the *Symposium* the standard philosophical text that was to nourish and guide all later demonological speculations. The daimon, of which Eros is the prototype, is seen as an intermediary (*metaxu* [μεταξύ]) between humans and the gods that allows them to enter into communication (202d). Elsewhere, Plato also refers to daimons that serve as guardians (*Laws*, 713d, for the golden age of the past) or even as upholders of the laws, when he endorses the widespread idea that a personal daimon is attached to each soul and determines its life on earth (*Republic*, 10.617e) and after death (*Phaedo*, 107d–108c). But in the *Timaeus*, it is man's *nous*, his intellect, which is designated as a daimon within him (90a); this metaphorization of the term, this connection between the daimon and humans, reminds us not only of Empedocles, but also of Heraclitus's enigmatic formula, frequently glossed by commentators: "man's character, his daimon" (*ethos anthrôpôi daimôn* [ἦθος ἀνθρώπῳ δαίμων], B 119 DK; see MORALS, Box 1), not to mention Socrates's famous daimon.

■ See Box 1.

Plato's diverse uses of the term show how many interpretive possibilities it provides.

III. Demonologies: From the Principle of Transcendence to the Fallen Angels

The whole later tradition down to the period of the Roman Empire was marked by abundant speculation on the nature of daimons, inspired by the meanings we have just examined, coordinating them or selecting them in order to found a genuine demonology. Thus various medio- and Neoplatonic

1

Socrates's demon

According to the testimony of Plato (more precise than that of Xenophon), Socrates's demon is most often designated by the adjective *to daimonion* [τὸ δαιμόνιον]: this would be, in Socrates's own sayings, "the demonic" that manifests itself to him; but in truth the complete expression is "demonic sign" (*to daimonion semeion* [τὸ δαιμόνιον σημεῖον]; see, particularly, *Republic*, 496c and *Euthydemus*, 272e). These terms suggest that he perceives this internal sign as a direct intervention of which he does not seem to be able to specify the exact nature (except to note that this sign manifests itself to him as a voice; cf. *Apology*, 31d). "Demonic" means no more and no less than that it is a matter of something that is beyond him, related to the divine, to a form of transcendence (for the first time in the *Apology* Socrates evokes "*theion ti kai daimonion*" [θεῖόν τι καὶ δαιμόνιον],

"something divine and demonic"; 31c), although (according to Plato at least) this "demonic" is never taken by Socrates to represent a demonic being. "Demonic sign" means therefore for Socrates a sign sent by the god and for this reason of a demonic nature. What is more, this "demonic" manifests itself only in a negative manner, and it only distracts Socrates from doing such and such a thing, without offering any positive incitement (*Apology*, 31d). Socrates's demonic sign would thus be the minimal form of the personal demon of which we see the emergence beginning with Empedocles (or even Heraclitus), and which Plato will constantly refer to; indeed, this sign, which is beyond Socrates, is at the same time what most intimately belongs to him: it addresses itself to him and to him alone; it is a sign sent by the god, through a personal relation to this individual who is Socrates. Is it the mark of

a chosen man? Socrates does not contest or confirm that others apart from him could be the beneficiaries of such divine signs, but he compares, without claiming they are identical, this demonic communication to a sort of divination, an art that is itself exceptional and of which he does not in any case deny the reality (cf. *Apology*, 33c). For these reasons, we will not take the Socratic demon as a simple figure for internal consciousness or conscience—this rationalist interpretation is too reductive; the phenomenon of the demonic certainly indicates Socrates's adherence to a divine principle, in the absence of a profound belief in the traditional gods. Truth is, for Socrates, the exclusive possession of the god—the demonic helps him to grasp shreds of it, which are valid for him and comfort him in his divine "mission," as it was announced by the Delphic oracle (cf. *Apology*, 21ab).

texts, as well as Stoic, hermetic, or Gnostic texts, bear the marks of thought about demonic beings classified into types: personal or not, simple or double, guardian or avenging, good or bad, and so on. Questions were raised about their nature and capacities for action, about where they were, and also about their ability to transform themselves, for a certain plasticity was attributed to these gods who were less than gods. A classic view in this regard, reflecting the speculations of the Old Academy (*Epinomis*, Speusippus, Xenocrates), is that of Plutarch, who defines daimons as divine beings subject to passions, even though they have no bodies (cf. *De defectu oraculorum*, 416C), a position that allows him to detach the true gods from mythological narratives that were supposed to represent daimons. At the same time, Plutarch acknowledges that daimons manifest themselves in diverse forms; located on the moon, they have a place in the hierarchy of beings between the gods and the souls of humans and animals. But in the end, for Plutarch daimons represent a superior degree of purification for souls. Up to the third century CE, the meaning of *daimôn* remained unstable, so that we see a proliferation of the types of daimons, encouraged by unbridled interpretation of poetic and philosophical texts and religious traditions (but occasionally condemned by the Epicureans).

It is remarkable that a quite different mode of interpretation was proposed by Plotinus in the third century, although it spiritualized the daemonic principle too much to succeed in permanently affecting the use of the term. Plotinus saw in the daimon nothing other than the name of a principle of transcendence for the being to which it is attached (cf. *Enneads*, 3.4 [15]). Plotinus thereby combines the idea of destiny with that of personal identity, while at the same time overcoming the antinomy between them: we are ourselves our daimons

insofar as we are our destiny, and insofar as we are capable of transcendence.

This way of spiritualizing the notion of the *daimôn* was conveyed instead in the notion of genius, that is, through a translation that made the Greek *daimôn* correspond to the Latin *genius* (which evolved much more clearly from the meaning of "daemonic being" to that of a personal principle). To the church fathers writing after the New Testament, the term *daimôn* (taken literally, it was simply transliterated into Latin: *daemon*) was seen as referring to a powerful, evil being. In Christian doctrine, demons are fallen angels who obey the orders of their leader, the Prince of Evil, Satan, the devil (*diabolos* [διάβολος], "slanderer" in classical Greek, taken in a radical sense corresponding to *sāṭān* [שָׂטָן] in Hebrew, of which it is essentially a translation). The anti-pagan polemic led logically to presenting the pagan gods themselves as demons; Plutarch's argument against mythology was thereby amplified and generalized. With Christian doctrine's association of the daimon with the devil Satan, the term underwent a decisive and almost permanent change. Although at first it had referred to a divine manifestation, "daimon" subsequently designated a mediating semi-divine being and a personal principle for humans before it came to be the name of evil beings hostile to God and to humans—through an almost complete semantic reversal.

| DASEIN / EXISTENZ (GERMAN)

ENGLISH   life
FRENCH   *existence, réalité humaine, être-là/existence, temps, durée d'une existence, présence, vie, être*
GERMAN   *Kampf ums Dasein* (struggle for life)
ITALIAN   *essere-ci, esserci, adessere*
LATIN   *existentia*

➤ ESSENCE, *LIFE/LEBEN*, and *ACT*, AIÔN, *DESTINY*, EREIGNIS, ERLEBEN, ES GIBT, I/ME/MYSELF, PRESENT, REALITY, SOUL, SUBJECT, *TO BE*, VORHANDEN

Dasein, in its contemporary (Heideggerian) usage, has become a paradigm of the untranslatable. It is a common word that Heidegger transformed into a neologism (as is also the case for his use of terms such as *Bestand, Machenschaft, Gestell, Ereignis*, etc.) to the point of proposing an alternative pronunciation, accenting, against normal usage, the second syllable, *sein* (being). When Heidegger injected a new meaning into *Dasein* to make it signify, in *Sein und Zeit* (*Being and Time*), the being whose own existence is at stake, the term was already charged with history and diverse meanings: time, the duration of an existence, presence, and also life, being, existence, being-there. All these meanings intersect with one another in the course of a tumultuous history, especially from Kant to Schelling, by way of Goethe, Schiller, and Fichte. Nonetheless, they have a common denominator in the complex relationships between *Dasein* and its pseudo-doublet *Existenz*, which emerged directly from Latin *existentia*.

Dasein's resistance to any translation emerged in the twentieth century as an outcome of the Germanization of the Latin *existentia* into *Dasein*, as if *Dasein* had ultimately never recovered from this blow and continued to point toward an entirely different area of meaning from the one to which the metaphysical term *existentia* tried to assign it. It is this history that we need to look into first.

As a substantive, *Dasein* appeared only rather recently in German: not until the seventeenth century was the verb *dasein* (to be present, *vorhanden*) nominalized, and far from being a technical term, it was formidable only in its disarming simplicity, comparable to that of the French expression *ça y est* (that's it; there you have it). We should distinguish the various acceptations with which the term is loaded: modal (Kant), emphatic (Goethe, Schiller, Jacobi, Hamann, Herder), passive (Fichte), ecstatic (Schelling), and finally ontological or existential (Heidegger).

I. *Dasein, Wirklichkeit, Existenz*: Kant

In his 1763 opuscule, *Der einzig mögliche Beweisgrund zu einer Demonstration des Daseins Gottes* (*The Only Possible Argument in Support of a Demonstration of the Existence of God*), Kant renders the Latin *existentia* by the expression *Dasein Gottes*, a translation that Hegel adopted in his 1829 *Vorlesungen über die Beweise vom Dasein Gottes*. In Kant's *Critique of Pure Reason*, this acceptation of *Dasein* is found again, in the table of the categories, under the second category of modality: as a dynamic category, *Dasein* is opposed to *Nichtsein* (nonbeing), and is intercalated between the possible and the necessary. The second of the postulates of empirical thought in general is called *wirklich*, which is in accord with the material conditions of experience. *Dasein* is thus what is (the existent, nature) as *wirklich*. It is the real insofar as it is differently "positioned" than the possible, but without "containing" anything more than the possible: "Sein ist offenbar kein reales Prädikat" (Being is obviously not a real predicate; *Critique of Pure Reason*). Kant seems not to have distinguished between *Dasein* and *Existenz*. The article "Dasein" (RT: *Kant-Lexikon*) refers to *Existenz, Sein, Wirklichkeit, Natur*, etc.

We know that the *ens realissimum* whose *Dasein* the 1763 opuscule sought to prove was in 1781 assigned the status of a simple ideal of pure reason. The paradox inherent in Kant's use of *Dasein* as a Germanic substitute for *existentia* is that the ecstatic dimension of the notion of existence (in the sense of a movement toward an outside) is subverted, turned inside out. The *Dasein Gottes*, or the "there is–ness" of God ("Es ist ein Gott" [There is a God], Kant writes in boldface letters at the beginning of his 1763 opuscule: *Akademia Ausgabe des Kants Schriften* (*AK*), 2:65—cf. Wolff, *Deutsche Metaphysik*, §946: "Das ein Gott ist" [That there is a God]) will in fact be understood in Kant's mature critical philosophy as inherent to ethical-practical reason, "but not as a being outside man." Kant's unpublished work is very explicit on this point (*AK*, 21:144–45): "Gott muss nicht als Substanz ausser mir vorgestellt werden. . . . Gott ist nicht ein Wesen ausser mir sondern bloss ein Gedanke in mir" (God must not be pictured as a substance outside of me. . . . God is not a being outside of me but simply an idea in me). If existing means "having a being or substance outside my thought"—*ex-sistere*—Kant is the one who asserts both that there is a God and that God, strictly speaking, does not ex-sist, or has no being other than that of a simple ideal of pure reason, a rational fiction necessary for the deployment of practical reason. If Descartes could write, "[B]y *essence* we understand the thing insofar as it is objectively in the intellect, by *existence* [*existentia*], this same thing insofar as it is outside the intellect [*rem eandem prout est extra intellectum*]" (*Correspondance*, vol. 4), we can see how aberrant it is to render *existentia* by *Dasein* when the

latter term is supposed to express an in-existence, an ideal being *in mir* (in me).

■ See Box 1.

Thus the Latin word *existentia* already had a rather turbulent past, without which we cannot really understand it, when Kant took it up and Germanized it as *Dasein*, taking as his guide the Wolffian equation *existentia-actualitas* and identifying *Dasein* with what is *wirklich* (real, actual). In Wolff, the question of the *existentia Dei* was summed up in the demonstration of an independent essence, a being that was "autonomous" or "self-standing," for which the name "God" was appropriate because of the connection between *stare*, *sistere* and *stehen*, and *ständig* (*Deutsche Metaphysik*, §929). Wolff's

1

Note on Latin *existentia* and French *existence*

Before we arrive at the problematic rendering of the Latin *existentia* by the German *Dasein*, we encounter a difficulty in (a) the plasticity of *existentia* and (b) the gap between the Latin *existere* (i.e., *exsistere*) and the French *exister*. Even in Latin, during the classical, patristic, and Scholastic periods, their meanings overlap and sometimes blur in instructive ways.

In classical Latin, the verb *exsisto* (a compound of *ex* and *sisto*, from *stare*, "stand") does not mean "exist," but rather "step up, come forth, arise," and by extension, "appear, emerge." Thus in Cicero we read "timeo ne existam crudelior" (I fear *to show myself* too severe; *Letters to Atticus*, 10.11.3) and "existunt in animis varietates" (there *emerges* a certain diversity among minds; *De officiis*, 1.107), or in Lucretius, "existere vermes / stercore" (living worms *spring out* / of stinking dung; *De rerum natura*, 2.870–71). The young Descartes still echoes this classical sense when he mentions, in his *Cogitationes privatae*: "hoc mundi theatrum . . . , in quo hactenus spectator exstiti" (this theater of the world in which I have up to now *appeared* only as a spectator).

Unknown in classical Latin, the noun *existentia* seems to appear only in the fourth century CE, in Marius Victorinus, who, after his conversion to Christianity, translated Plotinus's *Enneads* into Latin, and in Candidus the Arian, who also uses (*De generatione divina* 1; RT: *PL*, 8.1013) the derivatives *existentitas* (existentness) and *existentialitas* (existentality). According to Marius Victorinus (*Adversus Arium* 1.30.1062 c 18ff.), "the sages and the ancients" definitely distinguished between *existencia* and *substantia*, defining *exsistentiam* (existence) and *existentialitatem* (existentiality): "praeexistentem subsistentiam sine accidentibus . . . " (as the initial foundation, preexisting the thing itself, in its accidents . . .), even though, according to the usual meaning of the terms (*in usu accipientes*), *exsistentia* and *substantia* did not differ, and it was even "permissible to use equivalently existence, substance, or being" (*sive existentiam, sive substantiam, sive quod est esse*). Contrary to all expectations, *existentiality* refers to an existing substance provided with all its accidents.

We can gauge here the violence deliberately and explicitly done to the usual meanings of the terms *exsistencia* and *exsistentialitas* by using them as technical terms in the context of the Trinitarian controversies. This violence is connected with the difficulty of acclimating in Latin, and in Christian dogma, the vocabulary of Greek Platonic and Neoplatonic ontology. From a strictly lexicographic point of view, Candidus the Arian and Marius Victorinus are nonetheless the precursors of the vocabulary of *existentiality* (German, *Existentialität*) in the twentieth century.

In general, "*ex-sistere* signifies . . . less the fact of being itself than its relationship to some origin" (Gilson, *L'être et l'essence*), and that is why the Scholastics basically understood *existere* as meaning *ex alio sistere*, that is, "accede to being by virtue of another origin," thanks to a detachment with respect to a provenance that was ultimately to be interpreted as *causa* (French, *cause*; German, *Ursache*; cf. Gilson, *L'être et l'essence*). In a classic text (*De Trinitate* 4.12), Richard of St. Victor strongly emphasizes that when we say that something exists (*exsistere*),

subintelligitur non solum quod habeat esse, sed etiam aliunde, hoc est ex aliquo habeat esse. . . . Quid est enim existere nisi ex aliquo sistere . . . ?

(this implicitly refers, not only to what has being, but to what derives it [i.e., being] from elsewhere, namely, from some other. . . . What is it, in fact, to exist [*exsistere*], if not to receive one's being from something else [*ex aliquo sistere*] . . . ?)

The question of *existentia* then undergoes a shift toward that of *causa*, and that is the tradition, via Suárez, Leibniz, and Wolff, of which Kant's *Critique of Pure Reason* is the heir: Kant took up the "privileged" dimension attributed to human existence (as a disposition of the "personality") in freedom, as the *ratio essendi* of the moral law, only under the banner of *causality* (Transcendental Dialectic, third antinomy)—whence also the crucial issue constituted by the question of causality in the debate between Kant and Hume.

For Suárez, in fact, *ex-sistere* is *extra causas sistere*, "to stand outside causes," or even "to be apart from causes," as is established in the *Disputationes metaphysicae*, 31.4.6:

. . . existentia nihil aliud est quam illudesse, quo formaliter et immediate entitas aliqua constituitur *extra causas suas* . . .

(. . . existence is nothing other than this being by virtue of which a certain entity is constituted, formally and immediately, *apart from its causes* . . .)

Similarly, for Eustache de Saint-Paul (*Summa philosophiae*, 4.37) what "exists" (*existit*) "is the thing [that] is said to be in actuality or outside its causes" (*res [quae] dicitur esse actu sive extra suas causas*), and this thing "begins to exist only when it advances outside by virtue of its causes" (*[res] incipit existere cum virtute causarum fors prodit*). For something to exist, it has to come out of its hole, and in being driven out, to emancipate itself from its causes, but also thereby confirm their tutelary power. It is under the pressure of actuality that the fate of *existentia* will henceforth be played out, rethought in the light of the two pairs, *causa/effectus* and *potentia/actus*, as is the case in Wolff, where *existentia* is equivalent to *actualitas* (*Philosophia prima sive ontologia*, §174).

We owe to Leibniz the further enrichment of the Latin vocabulary of *existere*, which was already very rich, as we have seen, with the derivatives *existentia*, *existentitas*, and *existentialitas*, by resorting, in his *General Investigations Concerning the Analysis of Concepts and Truths*, and in a Latin worthy of Hermolaus Barbarus (cf. *Theodicy*, art. 87), to the present participle of the factitive of *existere*, *existentificans* (existifying), as well as to the desiderative *existiturire*. We probably cannot understand "*Omne possibile EXISTITURIRE*" as meaning that "everything possible is a future existent" (cf. M. Fichant's French translation), given that the author of *De libertate* elsewhere asserts that he has considered "those things among the possible that are not, will not be, and have not been." The meaning is rather that every possible is "futurable," admissible,

promotable, or susceptible to be promoted to reality, except when it conflicts with other co-possibles. Leibniz does not say that every possible exists by futurition, if not virtually, but rather that the realizable non-real can—and wants to—present itself as something realizable, or "existentiable," namely, "existentifiable." Commenting on this Leibnizian *hapax*, Heidegger (in *Nietzsche*) writes: "Existence itself is of an essence such that it provokes the power of wanting oneself [to be]." We can also compare the way Leibniz uses the word *existere*, in his meditation on the status of the possible, on the formation of the future tense in ancient Greek, as it developed from an earlier desiderative present and includes, unlike Latin, a genuine future infinitive (RT: Meillet, *Aperçu d'une histoire de la langue grecque*).

Thus, by means of an unprecedented radicalization of what remained in a state of incubation during the Middle Ages, Leibniz can be said to have pushed to its ultimate consequences, and at the same time to its last entrenchments, the saturation of the vocabulary of existence by that of efficiency, in conformity with his interpretation of substance as "a Being capable of action" (*Principes de la nature et de la grâce*, art. 1), and faithful to the language of causality and the principle of reason—*ratio seu causa*.

From Candidus the Arian and Marius Victorinus to Suárez and Leibniz, by way in particular of Richard of Saint Victor, Latin philosophy was able to discern a major speculative issue in the lexicon of *ex-sistencia*, to the point that it exhausted the field of its lexical variations. From Suárez's extracausal *existentia* to Leibniz's existentification, or the reinterpretation of existence

on the basis of efficiency, to the Kantian inquiry into the *Kausalität der Ur-sache*, the "causality of the cause" (*Critique of Pure Reason*), the history of the problems that critical philosophy took up was played out, in a secret genealogy, and handed on to German idealism.

Whatever may be said about the various acceptations of the Latin *existentia*, we have finally to note the narrow but sensitive and delicate difference between *existentia* and the French *existence*. The difficulty inherent in translating the Latin word by the French one was emphasized by Scipion Dupleix in his *Métaphysique* (1617):

> [W]e are obliged to note that in our French language we have no term that corresponds energetically to the Latin *existentia*, which means the bare entity, the simple and naked being of things, without considering any order or rank that they hold in relation to the others.

German work nonetheless remained very Latin in its conceptualization, and it was for the generations that followed Wolff and Kant to rediscover, beneath the outer bark of a borrowed conceptuality, a very vital sap.

II. *Dasein*: The Reconquest of the Verb—From Goethe to Jacobi

From Goethe to Jacobi, and even as late as Nietzsche (cf., for example, *The Gay Science*, bk. 4, §341: "die ewige Sanduhr des Daseins"), *Dasein* was to be revived in a form quite different from that of a technical term. That explains its use in Goethe, which is indissociable from wonderment before the very presence of things, the simple fact of their coming into being. Goethe seems to reconnect with a prephilosophical or at least pretechnical sense of *Dasein* as life, being, existence, the pure miracle of things offered to human perception. It is the good fortune, always unique and singular, of being able to say "I was there!" (*ich war dabei*), as in Goethe's famous declaration after the battle of Valmy. *Dasein* comes to mean *dabei sein*, as if the verbal nature of the verb *dasein* had been wrested away from its conceptual fixation in *Dasein*.

As for Jacobi, he adopts this emphatic sense of *Dasein*, especially in a typical, even emblematic expression of his enterprise: *Dasein enthüllen* (disclose the *Dasein*). The term *Dasein* could thus serve as a banner for an antiphilosophical enthusiasm (according to Schelling) in the context of the pantheism controversy. A passage in Jacobi's *Über die Lehre des Spinoza in Briefen an den Herrn Moses Mendelssohn*, copied out by Hölderlin (*Grosse Stuttgarter Ausgabe*) and by Schelling (cf. the preface to *Vom Ich*), calls the disclosure and revelation of *Dasein* "the greatest merit that a thinker can have." The feeling of existing/*Gefühl des Daseins*, what Rousseau called, in the fifth of his *Rêveries d'un promeneur solitaire*, "the feeling of existence divested of any other affection," seems to have been the rallying cry of a new sensibility that defined an era (Tieck, Moritz, Jean-Paul [Richter], Novalis. On this point, cf. X. Tilliette, *L'intuition intellectuelle de Kant à Hegel*).

III. *Daseyn, Daseyen, Da-sein*: Fichte and Hegel

A frequently overlooked passage in Fichte's *Die Anweisung zum seligen Leben* makes a great deal of the term *Daseyn* (using its old spelling):

Inwiefern das göttliche Daseyn unmittelbar sein lebendiges und kräftiges Daseyen ist—Daseyen sage ich, gleichsam einen Akt des Daseins bezeichnend . . .

(Insofar as the divine existent is immediately its living and powerful existentifying—by which I mean an act of the existent, as it were . . .)

Thus Fichte clearly distinguished between *Dasein* and *Daseyen*, defining the latter as "an act of *Dasein*," a pure acting, an "actness." We can also admire both Fichte's sure sense of the German language in his neologizing concern to reawaken, in conformity with the spirit of his philosophy, the verbal and even thetic character of *Dasein*, and the strange escalation represented by the nominalization (or deverbalization) in the sequence *dasein—Daseyn—Daseyen*. The Fichtean *Daseyen* is not "found there" in the sense of the equivalence between *Seyn* and *Vorhandenseyn* present elsewhere in Fichte; it "sets itself there." Nonetheless, Fichte is probably the first philosopher writing in German to have seen a philosophical stake in the word *Dasein*. If *Dasein* was in Kant a classical philosophical term, but definitely not German, and in Goethe a German term, but definitely not a philosophical one, it is only with Fichte that it becomes a term of "classical German philosophy" (on the problematization of these oppositions, cf. Bourgeois, *La philosophie allemande classique*).

Hegel, for his part, understood in *Dasein* the *da* of *Sein*, a figure of immediacy (cf. his *Wissenschaft der Logik*, bk. 1, §1, chap. 2 A.1). Hegel conceives *Dasein* as the *Sein* that is never solely *da*, in a "certainty of perception" that asks only to be allowed to mobilize and defer itself until "absolute knowledge" arrives, at first mesmerized by the immediacy of the *hic et nunc*, then shaken and set in motion by the dialectic that it bore within itself, without knowing it, from the start: the being-there of *Dasein* is where it is only because it has not yet reached the stage where what can be known through it awaits it. Thus the translation of *Dasein* by "being there" is probably more suited to Hegel's language than to Heidegger's. Moreover, Hegel himself did not fail to emphasize, in *Wissenschaft der Logik*: "Dasein, etymologisch genommen, Sein an einem gewissen Orte" (*Dasein*, understood etymologically, [is] being in a specific place). In Hegel, unlike in Heidegger, *Dasein* is thus conceived on the basis of its evident etymology. For the very numerous occurrences of the word *Dasein* in the *Phenomenology of Mind*, see the impressive inventory drawn up by Jarczyk and Labarrière as an appendix to their translation.

IV. *Existenz/Dasein*: Schelling

However, it was Schelling who reawakened in modern philosophy the ecstatic dimension of existence that the Kantian equation of *existentia* with *Dasein* had made somewhat dormant, and as a result, radically dissociated *Dasein* and *Existenz*: "in attributing to God . . . *Existenz*, *Daseyn*, you have to recognize a nature in him."

These lines, from the first version (1811) of *Die Weltalter*, deliberately adopt a vocabulary that is more Jacobi's than Schelling's own, to divorce terms that Kant had married, to radically dissociate *Daseyn* and *Existenz* by understanding *Existenz* (returning from Scholastic Latin to classical Latin and from classical Latin to classical Greek) in opposition to

Grund (obscure background). Nothing exists, strictly speaking, except that which is capable of dissociating itself from its own background, wrenching itself away from it in response to a crisis, as analogically, light extracts itself from mass. *Existenz* is not simply *Daseyn*, because it detaches itself from *Daseyn* and posits outside itself, at its own peril, something that, unless it resolves to exist, must be content simply to be. All being is an *ex-stans*—cf. Schelling: *das existierende* [ἐξίσταμαι]/*existo*/[ἐξιστάμενον] = "ein außer sich gesetztes . . . Seyendes" (an existent set outside itself). While Kant moved from *existentia* to *Dasein*, Schelling awakens, in the torpor of *Dasein*, the mute and disturbing dimension of the Existent, in its constitutive "eccentricity," of that "existence which is precisely nothing other than ecstasy," as he put it in the 1830 introductory course in philosophy (*Einleitung in die Philosophie*, lecture 27). The term *Existenz* is thus privileged in relation to *Dasein*, which for Schelling is strongly marked by Jacobi's vocabulary, but does not for all that go beyond ordinary usage.

How should we understand Schelling's "extra-logical nature of existence [*Existenz*]"? How can we think of that which exceeds all thought without thereby making it a simple content of consciousness? That was to be the question of positivist philosophy. In Schelling, the Existent (*das Existierende*) takes on a pregnant meaning that was to echo, via Kierkegaard, as far as Heidegger.

V. Heidegger's *Dasein*

The development that began with Kant's little work of 1763 reached its high point in Heidegger's *Sein und Zeit* (1927). From Kant to Heidegger, the movement seems to have been reversed: it is no longer *Dasein* that is conceived on the basis of *existentia/Existenz*, but existence, understood quite differently, that is conceived on the basis of *Dasein*. Except that the existential analytic, which in 1927 is a structure for the acceptance of *Dasein*, presents itself as an implicit theology (cf. Heidegger, *Metaphysische Anfangsgründe der Logik Gesamtausgabe*): the expression even of a *Dasein Gottes* (Kant, Hegel) has become impossible, the term *Dasein* being reserved, in Heidegger's thinking, for *menschliches Dasein*, human *Dasein*. The breadth acquired by the term *Dasein* goes hand in hand with its restriction to the being of the human being, delimiting a finite realm.

The history of *Dasein* thus finds, in *Sein und Zeit*, an unexpected new departure. In this work the term reaches its culmination and its limits: it designates the very being of the being that we are, essentially or inessentially, not in the sense of an identity, but in proportion to a being that we have "to be"—*zu sein*, with movement (cf. *Hier zu haben*), which corresponds etymologically to the English "to be," Russian *do* [цо], Danish *at* (*vaere*)—in a transitive and even factitive sense (whence the hermeneutics of factivity that was the prelude to *Sein und Zeit*). In Heidegger, the *da* in *Dasein* almost means *zu* (toward). *Dasein* is never "localized," but localizing; it must be thought of with movement, in the accusative.

Does that mean that the term *Dasein*, in Heidegger's terminology, has no parallel in Western thought? Heidegger himself seems to have provided a way to explore that question: the being of *Dasein* was assuredly not unknown in antiquity,

if only as *praxis* [πρᾶξις] (*Metaphysische Anfangsgründe der Logik*). Consider as well the problem of the connection between *Dasein* and *psuchê* [ψυχή] in *Sein und Zeit*, §4.

In certain respects, the history of the translations of *Dasein* into French reflects that of the (anthropological and existentialist) misunderstandings committed in the course of the reception of Heidegger's thought: from *réalité humaine* (Corbin, Sartre) to *être-là* (Ital., *esserci*), to the point that Heidegger's translators now prefer to translate *Dasein* as . . . *Dasein*.

The untranslatable (*unübersetzbar*) nature of *Dasein* was, moreover, emphasized by Heidegger himself in his letter to Beaufret on November 23, 1945 (published as an appendix to the bilingual French and German edition of the *Lettre sur l'humanisme*):

Da-sein . . . bedeutet für mich nicht so sehr "me voilà!" sondern, wenn ich es in einem vielleicht unmöglichem Französisch sagen darf: être-le-là.

(For me, *Dasein* means not so much "here I am!" as, if I may put it into what may be impossible French: *être-le-là* ["being the there"].)

Similarly, in a 1941 lecture (*Metaphysik des deutschen Idealismus*), he observes that:

Das Wort "Da-sein" ist daher auch in der Bedeutung, nach der es in Sein und Zeit gedacht wird, unübersetzbar. Die gewöhnliche Bedeutung von Dasein = Wirklichkeit = Anwesenheit lässt sich nicht mit présence oder "Realität" übersetzen. (Vgl. z. B. die französische Übersetzung von "Dasein" in "Sein und Zeit" mit "réalité humaine"; sie verbaut alles in jeder Hinsicht.)

(The term *Da-sein* is therefore untranslatable, even in the acceptation in which it is conceived in *Sein und Zeit*. The usual meaning of *Dasein = Wirklichkeit = Anwesenheit* cannot be translated by "presence" or "reality." (Cf. for instance the French translation of *Dasein* in *Sein und Zeit* by "réalité humaine"; this blocks everything in every regard.)

Hence Heidegger himself tells us that *Dasein* is untranslatable, reversing Kant's assumption that *existentia* can be translated by *Dasein*. The vocabulary established in *Sein und Zeit* allows us, however, to situate *Dasein*, to know this being that we are, and that we have to be, as part of an existential, and no longer categorical, logic that requires the existential analytic to bring out these existentials that are irreducible to properties attributed to things. *Vorhandensein*, or "being at hand," no longer characterizes anything but the mode of things' presence, which "are found there," in contrast to *Dasein* struggling with its "difficulty of being" and with the care that is its essence, its *arkhê*-structure (*Urstruktur*, in *Gesamt-ausgabe* [*GA*], vol. 20). In the francophone world, the debates about the translation of *Vorhandenheit* and *Zuhandenheit* have probably been too marked, or even obsessed, by the presence of the word *Hand* in these two compounds—the comparison made by J. Taminiaux, in *Lectures de l'ontologie fondamentale*, between the *Vorhandenes* in *Sein und Zeit* and the *procheira* [πρόχειρα] mentioned in Aristotle's *Metaphysics* (A2 982b 13) is an example of this.

But *Hand* is no more audible than, for example, *main* in contemporary French (cf. E. Martineau's foreword to the French translation of Heidegger's *Interprétation phénoménologique de la "Critique de la raison pure" de Kant* and the translator's notes; J.-F. Courtine's foreword to the French translation of Heidegger's *Les problèmes fondamentaux de la phénoménologie*).

If Heidegger later abandoned the expression *menschliches Dasein* (human *Dasein*), that is because it seems redundant, or does not sufficiently avoid the risk of being anthropologized: "*Dasein* is not the human being . . . " (*Beiträge zur Philosophie*).

The connection between *Dasein* and *Existenz* is established by §9 in *Sein und Zeit*: "*Das 'Wesen' des Daseins liegt in seiner Existenz*" (The "essence" of *Dasein* resides in its existence; italics in the German text). The quotation marks around the word *Wesen* indicate that this no longer refers to the *essentia* traditionally distinguished, in the metaphysical vocabulary, from *existentia*, but rather of a "realm" that Heidegger's translators have sought to render in French by *déploiement* (F. Fédier), *aître* (G. Guest), or in English by "root-unfolding" (P. Emad and K. Maly).

Existenz designates the mode of being peculiar to *Dasein*, in its irreducible specificity, the dimension within which it is imparted and to whose share it has fallen to deploy its being, as distinguished from existence/*existentia* understood metaphysically in opposition to essence, that is, as *Vorhandenheit*. *Existenz*, in its pregnant sense, characterizes *Dasein*'s mode of being, its *Weise* (*Sein und Zeit*, §9), which should be understood as "guise" or "melody" (*GA*, vol. 29/30: "eine Weise im Sinne einer Melodie"; *GA*, vol. 79: "eine eigene Weise, mehr im Sinne von einer Melodie"). The existent is no longer understood as being what is at hand (*Vorhandenes*), but as being in proportion to *Dasein* (*daseinsmäßig*), which the existential analytic envisages purely and simply in its relation to being, to the exclusion of any other kind of consideration (cf. *Sein und Zeit*, §10). That is what underscores the difference between the *existentiel* and the *existential*. The set of the ontological structures of human existence constitutes existentiality as the dimension on the basis of which existence must be understood.

The phrase "Dasein existiert" (*Sein und Zeit*, §12; *GA*, vol. 2) is thus in itself an extraordinary concentrate of the difficulties we have just pointed out. The history of the concept of *Dasein* and its semantic curve show the gradual emergence of a major philosophical issue in the very development of the language. Thus it is hardly surprising that its ins and outs are echoed in a text Heidegger addressed to M. Boss (*Zollikoner Seminare*):

Sofern aber diese [i.e., Existenz] durch das Da-sein ausgezeichnet bleibt, muss auch schon die Benennung "Da-sein" in einem Sinn verstanden werden, der sich von der geläufigen Bedeutung des Wortes "Da-sein" unterscheidet. Die unterschiedliche Schreibweise [i.e., Da-sein] soll dies andeuten. Die gewöhnliche Bedeutung von "Dasein" bedeutet soviel wie Anwesenheit, so zum Beispiel in der Rede von den Beweisen für das Dasein Gottes.

(However, insofar as this [i.e., *Existenz*] remains marked out by *Da-sein*, the term *Da-sein* must be understood in

a sense distinct from the usual meaning of the word *Dasein*. That is what the different way of writing it [i.e., *Dasein*, with a hyphen] is supposed to indicate. The usual meaning of *Dasein* is roughly synonymous with existence, as for example when one speaks of proofs of the existence [i.e., *Dasein*] of God.)

From the *Dasein* (*Gottes*) to the *Da-sein* Heidegger speaks of, from the existence of God designating simply his *Daß* (*that* he exists) to his existential (*existential*) dimension at the heart of which the being of the human being is electively deployed, structured by care / Lat. *cura* / Ger. *Sorge*, a movement, a gap has occurred, which a simple hyphen seeks to mark, typographically.

| DECEPTION

From the Latin *decipere*, which literally means "to take [*capere*] by causing to fall into a trap, to fool, to deceive," "deception" implies illusion, seduction, and fraud. The term relates in philosophical contexts to the power of speech or discourse to create illusion (*apatê* [ἀπάτη] in Greek), and becomes a theme in the discussion of rhetoric and sophistry. See TRUTH, Box 3; see also *RUSE* [MÊTIS]; cf. *FALSE, FICTION,* LOGOS, *LIE,* SPEECH ACT.

"Deception" relates equally to the notion of *desengaño* characteristic of the golden age of Spanish literature, where the term refers to disillusionment as both "being saved from error" and "disenchantment"; see DESENGAÑO; cf. BAROQUE, *MALAISE, RÉCIT,* SECULARIZATION, SPREZZATURA.

➤ *NEGATION*, VERGÜENZA

DEFORMATION

1. "Deformation," as well as "distortion" and "displacement," are standard translations of the German *Entstellung*, which Freud uses to designate one of the mechanisms of repression. See DRIVE, ENTSTELLUNG, VERNEINUNG, WUNSCH; cf. ES, SUBLIME, Box 3, UNCONSCIOUS.

2. On the distortion of reality implicated in the act of putting into speech, see HISTORY, LOGOS, MIMÊSIS; cf. *FICTION, RÉCIT*.

3. On the form of the word itself, see COMBINATION AND CONCEPTUALIZATION; cf. *NEGATION.*

➤ CONSCIOUSNESS, *FORM*

DEMON

In modern English, *demon* (Lat. *daemon*, Gr. *daimôn* [δαίμων]) is, by way of Church Latin, very close to *devil*; see DEVIL (*diabolos* [διάβολος] in the Greek Bible, Semitic and Arabic *Sāṭān* [שָׂטָן]).

In Greek, a *daimôn* may be either good or bad; see DAIMÔN, and its semantic descendants in German (e.g., Hölderlin's "demonic"); see also the Spanish DUENDE, which contains the same ambiguity. Through *daiomai* [δαίομαι], "to share," *daimôn* is related to destiny; see *DESTINY* [KÊR].

The semantic field also implicates singular aesthetic creation; see notably DICHTUNG, GENIUS, INGENIUM, LEGGIADRIA, MADNESS; as well as satisfaction, moral or otherwise: *HAPPINESS*, GLÜCK, MORALS, PLEASURE, *WISDOM*; cf. ACEDIA.

On the relationship between religion and revelation, see DEVIL and GOD. See also BOGOČELOVEČESTVO, PIETAS, RELIGIO.

➤ AIÔN, EUROPE, PEOPLE

DEMOS [δεμός] / ETHNOS [ἔθνος] / LAOS [λαός] (GREEK)

➤ *GOVERNMENT, STATE*, and LAW, POLIS, POLITICS, RULE OF LAW, STATE/GOVERNMENT, STATO

Many debates among historians, sociologists, political theorists, and philosophers in the twentieth century were framed in terms of an opposition between "two concepts of the nation": one (closest to the etymology of Lat. *natio*, from *nascere, natum,* which also generates *natura*) associates it with a traditional bond transferred from one generation to another (whence the idea of a common "substance" of the community, be it cultural or racial); the other (often supposed to have triumphed with the great "bourgeois" revolutions of the late eighteenth century: North American, French, Haitian, Venezuelan), would embody the ideals of the Enlightenment and follow the model of a contractual community of "citizens." This ideal dichotomy is often combined with genealogies of nationalism and imperialism as typical "modern" phenomena, whose roots may lie in a bifurcation in the understanding of the notion of a "people." This is nowadays increasingly defined as the opposition of the people qua *demos*, and the people qua *ethnos*, following ancient Greek models. One can argue, however, that this is a truncated genealogy, leading to a mystifying alternative. Debates about "nations" and

"nationalism" require at least a *third concept*, for which there also exists a Greek name: *laos*. The system of oppositions is a more complex one. And so, accordingly, are the applications to contemporary dilemmas.

Recent uses of the "Greek" pair of words *ethnos* versus *demos* seem to have been initiated by the Austrian-born sociologist Emerich K. Francis in 1965. In his presentation, the opposition has a primarily anthropological meaning, contrasting "prenational societies," whose collective identity and integration are secured by the domination of "genealogy" (in the strict sense of kinship, or in a broader sense of inherited traditions and memberships), with "nations" (or "national societies"), where the dominant principle of integration (what he calls the "demotic bond") is territorial and legal, relating each individual citizen to the state and the public administration. The model for the national society is provided by European states, and the opposition clearly matches other evolutionary patterns invented by the sociological tradition: "status" and "contract," *Gemeinschaft* and *Gesellschaft*, and so forth, albeit with a special insistence on the "deconstruction of kinship" carried on in the process of nation building.

Apart from applications in the anthropological field, the main fortunes of the antithesis followed from its subsequent use within debates bearing on what type of collective identity could be provided by European integration. They followed from a seminal 1986 essay by Rainer M. Lepsius, in which he also discussed the latent conflict of two traditions in the history of Central Europe (*Mitteleuropa*): one of "ethnic nationalism" and one of "civic nationalism." The question was now to decide whether this "unnamable political object"—the new European Union—should involve a return to the idea of a shared inherited identity, or a progress toward a purely "constitutional" construction. After being adopted in that sense by Jürgen Habermas in his discussion of *Verfassungspatriotismus* (patriotism of the constitution) and the "postnational constellation," it became standard in political and philosophical debates.

It is indeed interesting to observe the variety of "cases" to which the *ethnos* versus *demos* antithesis, whether explicitly referred to a "Greek" dilemma or not, has now been applied, retrospectively or prospectively. The following are but a few examples, but they bring interesting connotations:

1. When the demonstrations against the regime of the German Democratic Republic began in 1989, in the form of popular marches around the main city-square in Leipzig, the motto was *Wir sind das Volk!* (meaning "we are the citizens," in whose name this regime falsely claims to govern); but toward the end, when the Federal Republic of (Western) Germany had announced that it would integrate the Eastern *Länder* immediately, the motto became *Wir sind ein Volk!* (meaning "we are a single historical people," or nation, ranging from East to West, and divided artificially by history). One could easily argue that the demonstrators had passed from *demos* to *ethnos*, even if the Federal Republic could be perceived—in spite of the name—as more "democratic" than its socialist counterpart.

2. Sometime later (2000), the same (reunited) FRG modified its legal framework for the "normal" access to citizenship (apart from naturalization), both to ease the relationships with its increasing Turkish minority, and to come closer to the French and U.S. model of *ius soli* (as opposed to *ius sanguinis*), or to promote territorial law as opposed to genealogy—the former being perceived to incarnate a less "exclusivist" conception of the nation. This time it was moving from *ethnos* to *demos*.

3. Another interesting example is provided by the debate about the definition of the State of Israel (which originates in the Zionist project called by its founder Theodor Herzl *der Judenstaat*, "the State of the Jews"): it refers to itself officially as "a Jewish democratic state," but the dominant political parties in Israel understand it as "a Jewish state that is also democratic" (therefore essentially deriving its collective identity from the real or mythical Hebrew origins of the majority, relegating the Arab minority to a condition of "internal outsiders"); whereas others understand it as "a democratic state" in which all citizens ought to be fully equal, even if it was founded by Jews fleeing persecutions and genocide in Europe at the expense of an autochthonous population. The situation is rendered even more complicated by the fact that both the Jewish majority in Israel and the dispersed Palestinian communities refer to a "right of return" based on a combination of descent and affiliation to the territory. In this case, *ethnos* and *demos* seem to be undermining each other.

These examples, however partial and quick, show the semantic weight carried by the *ethnos* versus *demos* antithesis. They make it all the more important to explain why the discursive and historical pattern is, in fact, more complicated. This begins with two philological remarks.

The full meaning and intentions of the opposition can hardly become isolated from a web of juridical, sociological, anthropological, and political contexts. One of them is particularly important because—in Foucauldian terms—it illustrates the relationship with the "biopolitics" of the modern (bourgeois) state. *Ethnos* could not be brought into this opposition independent of the fact that a "discipline" describing the customs and social structures of non-European peoples (colonial or virtually colonized) was called "ethnography" (created by German scholars in 1807). And *demos* could not be used independent of the fact that European modern states claimed to be essentially "democratic," at least in this sense that their legitimacy derived from a collective right of "self-determination" and the "popular will." The latent pattern is that of an "ethnographic object" observed by "democratic subjects." But the European states also developed a discipline called "demography," which includes questions of the type raised by ethnographers (social effects of marriage, for instance), albeit applied to nation-states and not to prenational "tribes" or "cultures" (the name was coined in 1855 in French to name statistics of populations, replacing the old "political arithmetic"). It is interesting to ask if the semantic quadrangle can be completed with a term "ethnocracy": this is actually the case since political theorists (in particular comparing the discriminations in Israel with those of apartheid South Africa—whether rightly or wrongly) have supported the idea that the modern *demos* is haunted by the figure of the *ethnos,* particularly in regimes that grant a legal privilege, or a "leading role," to one of the "nationalities" forming the nation itself. The *ethnos* versus *demos* opposition thus proves capable of generating a complete system of theoretical distinctions.

The reference to a "Greek" model becomes, then, all the more surprising. As it was presented, for example, in Aristotle, a Greek conception of the political distinguishes two great types of "communities" (*koinôniai*) in which human beings can live: some are based on the tribal structures and obey chieftains or kings, and they are called *ethnè*; others, considered more civilized (therefore more perfectly "human"), distinguish the private and the public sphere, they are called *poleis* (which we translate with the Latin name for "city," *civitas*). *Demos* is not directly opposed to *ethnos*: rather, it names the multitude of the citizens, independent of their social status or rank. And insofar as in "cities" all citizens enjoy certain basic rights (such as deliberation in the public assembly), their regime contains, according to Aristotle, a "democratic element."

But there were several other terms in ancient Greek to designate the "popular" element (see PEOPLE). The most important for our purpose is *laos*: central in the Homeric terminology, where it designated the community of the warriors, whose collective power would normally become subjected to the authority of "princes" (*anax*), but could also challenge it (as in famous episodes of the *Iliad*), it had become an archaic notion in classical Greece. Its importance for modern debates about the political function of the nation comes from its having been selected by the translators of the Septuagint who, working in Alexandria between the third and the first century BCE, translated the *Torah* (followed by other parts of the Bible) into *koinè* Greek, to render Hebrew ʿ*am*, the proper name of the "Elect People of God" (or the Hebrew nation). More precisely they used *ethnè* to call the "other nations" (more simply "the nations" [*goy'im*]) and *laos* for the Elect People. In Latin (*Vulgata* or "vulgate") it became the opposition of *populus* (*electus*) and *nationes* or *gentes* ("the Gentiles"). This is a completely different opposition than *ethnos* versus *demos*; but it is from there that many of the emphatic notions of nationhood and its political mission derive in modern times, because it becomes the bearer of the "universalistic" and "messianic" dimension of the nation.

Already in the eschatological perspective of the Old Testament, the universalistic perspective is present because the Hebrew people, which distinguishes itself from all others by the fact that "its God" is unique and is the (only) true God, is also the one that has been "chosen" by God to reveal the truth to humankind and achieve the redemption of the others through its own redemption. In the prophetic books (especially Isaiah, where the messianic perspective becomes explicit), this redemptory function is attributed only to the "remnant" (*She'erit*) who remained obedient to the Law or faithful to God in the Exile, therefore forming a group similar to a "people in the people" (or a "people of the people"). This function in Christian theology is displaced by the church (or

the community of the faithful who acknowledge Jesus as the Messiah and await his return) as the "New Israel," and therefore the (mystical) equivalent of the "Chosen People." It is this theological notion (also used to name the Christian or Roman Empire) that modern nationalism would "secularize." Let us note here an important twist: if according to the general perspective, *laos* is the totality of the Christian people forming the church (*ekklèsia*, taken from the name of the "assembly of the citizens" in the Greek political terminology), it is also more precisely the "simple faithful" as opposed to the *klèros* (or the priests, who are the theological equivalent of magistrates). Therefore it retains at the same time a sense of mission or destination, and a "popular" determination—a very powerful way of merging the categories of universality and community.

On this basis it becomes easier to understand how the (secularized) political theology of the modern states as "universal" political communities—both in the *intensive* sense (realizing equality and liberty, or rather, a universalization of rights, among their citizens) and the *extensive* sense (spreading civilization, or democracy, or republicanism, in the world, and easily associated with an "imperial" destiny)—permanently evokes the legacy of the *laos* rather than either *ethnos* or *demos*. Two "lines of descent" are particularly significant.

One belongs to the English-American tradition. As extensively documented by J.G.A. Pocock (critically discussing Michael Walzer's *Revolution of the Saints*), English Republicanism, especially in its "Puritan" form, during the Civil War developed a specific combination of apocalyptic and civic consciousness, which made it possible to represent "God's Englishmen" as an "Elect Nation" constituting its Commonwealth against the tyranny of idolatrous monarchs. Pocock would also argue that an "apocalyptic Whiggism" formed part of the political heritage that Puritans carried over to the American colonies. And perhaps it is not wrong to accept that this combination was still there when, during the American Revolution and with decidedly more imperialist resonance than the Puritans' uprising in England, the United States went on to conceive of itself as the subject of a "manifest destiny," first in the Americas, then with respect to the world.

Another line belongs to the French-German dialogue over the relationship between "nation," "cosmopolitanism," and "emancipation" in the nineteenth century (with twentieth-century sequels). It begins with the proclamation of the "sovereignty of the nation" (as opposed to the king) in the *Déclaration des droits de l'homme et du citoyen* (a "secular" document undoubtedly, but also located at the core of a new "civil religion," and often printed in images imitating the traditional representation of Moses's Tablets of the Ten Commandments. When Republican France turned imperial and presented itself as *La Grande Nation* (not very different from the idea of a "manifest destiny" in American terms), it led German "Jacobins" like the philosopher Johann Gottlieb Fichte to write about the special mission of *Die Deutsche Nation*, whose inflexible resistance to foreign invasion, based on absolute moral values, would restore the possibility of perpetual peace on the European Continent. But it is especially in the antithetic figure of the Marxian proletariat

as "universal class" that an eschatological notion of the "people of the people" became reinvented—at the same time revolutionary and cosmopolitan ("internationalist," or gathering its people among the excluded multitude from all countries). Whereas the French notion of *laïcité* (deriving from *laikos*, the opposite of *klèrikos*: as if the Christian people had liberated itself from its own hierarchy) until today retains the democratic and assimilationist connotations of the *grande nation* (see SECULARIZATION).

Greece, Rome, and Jerusalem are thus more than ever providing symbols for the invention of political modernity. Centuries have passed, but who can say that this is over?

| DÉNÉGATION

Borrowed from the Latin *denegatio* (denial), the word was taken up in psychoanalysis to translate Freud's term *Verneinung*: see VERNEINUNG. The German, word, however, refers both to negation in the logical sense (as opposed to affirmation, *Bejahung*; or assertion, *Behauptung*: see *FALSE, NEGATION, NOTHING,* PROPOSITION) and to the process Freud describes as a refusal, defensive or not, to admit that one has said something. Negation is thus a form of repression: see DRIVE, ENSTELLUNG, ES, UNCONSCIOUS, WUNSCH; cf. CONSCIOUSNESS, EGO, SUBJECT. The difficulty of translating *Verneinung*, notably into French and English, is thus related to the loss of the term's logical and psychological ambivalence.

➤ BELIEF, *CROYANCE*, REPRÉSENTATION, TRUTH

| DESCRIPTION / DEPICTION

FRENCH   *description, représentation*
GREEK   *ekphrasis* [ἔκφρασις]
LATIN   *descriptio, depiction*

➤ *RÉCIT*, and CONCETTO, DICHTUNG, DISEGNO, ERZÄHLEN, *FICTION*, HISTORY, *IMAGE*, MIMÊSIS, REPRÉSENTATION, SIGN, SPEECH ACT, STRUCTURE

English and French distinguish description and narration in the same way. In English, however, description may also be opposed to depiction, the latter taking on a visual connotation that contrasts with the verbal resonance of "description." This second distinction does not have a French equivalent. While French can distinguish the act of depicting (*dépeindre*) from that of describing (*décrire*) or narrating (*narrer*), of these three verbs *dépeindre* is the only one without a noun form in ordinary usage. Where English has "depiction," French must use *représentation*. Hence the difficulty in translating into French the distinction between depiction and representation, which, like that between depiction and description, plays a very important role in theories of aesthetics in the analytic tradition. This has led to the recent introduction of the term "depiction" into French philosophical language.

I. Different Ways of Making Someone See

The Latin *descriptio* denotes either a drawing or a written or oral description. More rarely, a *descriptio* is a visual sketch, but also a verbal description or a representation in the imagination. There is an image in both cases, but the visualization is not necessarily literal: in both cases, the *de-* prefix indicates that one "de-scribes" or "de-picts" *from* a model or the original.

Until the seventeenth century, the English word "description" could mean a pictorial representation—a portrait. The word is still used by Hogarth ("a description of

such lines as compose the features of a face"), but more in the sense of a drawing or delineation, whereas "depiction" contains the root "pict"—that is, paint, color, pigment. Svetlana Alpers continues to use "description" with visual connotation, opposing the description characteristic of Dutch painting and a new visual culture with the narration characteristic of Italian painting and traditional text-based culture. Most often, however, "description" designates a verbal mode of visualization or metaphorical representation that compares poorly with the visual arts. Addison emphasizes its ambiguous or secondary status as "resembling even less" than painting (which itself resembles its objects less than sculpture), though "description" is still closer to what it represents than music.

Sometimes functioning as simple stylistic variations of "describe" and "description," "depict" and "depiction" may denote both representations that are literally visual as well as metaphorical visualization by writing that "makes one see" (also called "picturing" or, in the manner of Ruskin, "word-painting"). Edgar Allan Poe uses "depict" to denote the art of the portraitist ("for her whom he depicted so surpassingly well," in "The Oval Portrait"), but also for the art of the narrator or psychological portraitist ("This depicting of character constituted my design," in "The Mystery of Marie Rogêt"). We find comparable uses in recent criticism. In Williams, "depiction" refers mainly to visual representation by daguerrotype ("depiction of face in portraiture," passim), but also occasionally to painting by means of literary text ("depiction of portrait in sentimental fiction," "depiction of spectatorship in *The House of the Seven Gables*"). Flaxman clarifies "description" as "visually oriented description," while, by contrast, Krieger defines "ekphrasis" as a verbal description without thereby implying that there are nonverbal ones. He defines description as being essentially verbal in a quasi-tautological manner, and in fact uses "verbal depictions" as a variant with exactly the same meaning. Becker, on the other hand, in his detailed commentary on the shield of Achilles, falls back on a clear and explicit distinction between "description" and "depiction." "Visual depiction" denotes what Achilles's (fictional) shield is supposed to represent, while "verbal description" refers to the way in which the poet describes that representation: "In a description of a depiction of the sun (484), the same phrase is used as in a description of the actual sun (239)." According to Becker, Homeric ekphrasis is often a simultaneous description of the shield and what is depicted on the shield, and this Homeric mode of ekphrasis is distinguished from later modes precisely because it continues to direct our attention to the material nature of the fictional object, to the images in metal as well as the story they relate, rather than simply using the fictional imagistic representation as a pretext to introduce the narrative.

■ See Box 1.

II. Modes of Denotation or of Perception?

That this distinction has acquired the status of a conceptual opposition operative in philosophical discourse is essentially due to the work of Nelson Goodman. Goodman distinguishes between "verbal description" (where the adjective denotes, as

1

"Ekphrasis": From word to word

"Ekphrasis" (from *phrazô* [φϱάζω], "to declare," and *ek* [ἐϰ], "completely") is a putting into words that exhausts its object; the term denotes minute and complete descriptions of works of art.

The first, and no doubt the most famous, known ekphrasis is the one Homer gives at the end of book 18 of the *Iliad*, the subject of which is the shield of Achilles, forged by Hephaistos. It was made at the request of Achilles's mother, Thetis, not to allow her son to evade death, but so that "all should marvel"(466ff.) when he did meet his destiny. The work is cosmo-political, representing not only Earth, Sky, and Sea, bordered by the river Ocean, but also two cities in living detail, one at peace and one at war. The blind poet gives the first synthesis of the world of mortals, thus proving for the first time that poetry is more philosophical than history.

Not only is this first ekphrasis a description of a fictional object, but its historical successor is a second ekphrasis whose model is the first ekphrasis, as though the author were doing a remake. Here the subject is the shield of Hercules, and is attributed to Hesiod. This palimpsest therefore does not follow a phenomenon—a real shield—nor does it follow nature itself or human cities, but only a *logos*. Swathed in culture, the object loses both its natural reference and what is called, following Aristotle, the life of the narrative. As Paul Mazon notes, making the value judgments we expect: "Through it all there is not a gesture which is truly 'seen,' which gives the impression of life. Nor is there a word on the lips of the characters which emits a clear and frank tone: everyone speaks a language of pure convention." Ekphrasis is thus at the furthest remove from metaphor, the craft of which consists in placing things *pro ommatôn* [πϱὸ ὀμμάτων], "before the eyes," following the doctrine of *ut pictura poesis*—in order to produce a new and original understanding. "When the poet calls old age 'a withered stalk,' he conveys a new idea, a new fact, to us by means of the general notion of 'lost bloom' which is common to both things" (Aristotle, *Rhetoric*, 3.10.1410b 14–16; cf. *Poetics*, 21, 22). Ekphrasis is no longer here imitating painting insofar as it attempts to place the object before our eyes—to present the object as a painting would—but to imitate painting insofar as it is a mimetic art—to paint painting itself. Imitating imitation in order to produce an understanding, not of the object, but of the fiction of an object—of objectification: ekphrasis is literature.

Ekphraseis proliferated in the second Sophistic period, including Philostratus's *Images* and Callistratus's *Descriptions*, to the point of constituting a genre in its own right. With the *xenia*, critiques of still lives that a host would give as presents to his guests, and which depicted the dishes they may have eaten at his house, the object itself is now at three removes, and has become a mere pretext for a literary representation of a pictorial representation. The original is no longer available to perception and can no longer be the object of an adequate description; it is at most presupposed or produced following an act of fiction (see SPEECH ACT, Box 1).

The fate of ekphrasis is linked to that of the novel. Not only do novels abound with ekphrases, but more decisively, novels are often structured by an ekphrasis. In the opening lines of *The Adventures of Leucippe and Clitophon*, for example, the narrator, having just escaped from a storm, looks at the votive offerings and stops at a hanging painting that contains the template of the story of the novel itself—in the course of which we witness the offering of the painting by the protagonist. The paradigm case of ekphrasis, however, comes from Longus's pastoral romance *Daphnis and Chloë*. The entire novel is the ekphrasis of an ekphrasis since the story is modeled on a painting, which is itself, we learn, composed not of lines and colors but words:

> When I was hunting in Lesbos, I saw, in a wood sacred to the Nymphs, the most beautiful thing that I have ever seen—a painting that told a love-story. The wood itself was beautiful enough, full of trees and flowers, and watered by a single spring which nourished both the flowers and the trees; but the picture was even more delightful, combining excellent technique with a romantic subject. It had become so famous that crowds of people used to go there even from abroad, partly to pray to the Nymphs, but mainly to see the picture. In it there were women having babies and other women wrapping them in swaddling clothes, babies being exposed, sheep and goats suckling them, shepherds picking them up, young people plighting their troth, pirates making a raid, enemies starting an invasion.
>
> After gazing admiringly at many other scenes, all of a romantic nature, I was seized by a longing to write a verbal equivalent to the painting. So I found someone to explain the picture to me, and composed a work in four volumes as an offering to Love and the Nymphs and Pan, and as a source of pleasure for the human race—something to heal the sick and comfort the afflicted, to refresh the memory of those who have been in love and educate those who have not.

In this story, nature is less beautiful than painting ("painting held more charm"). The painting that the ekphrasis describes is already a story: "a painted image, a love story." This painted story, finally, requires a "response." The Greek expression, "*anti-grapsai tei graphei*," is more precise: it is a matter of writing "against" the original and "starting over"—to replicate it and compete with it, playing the roles of both attorney for the defense and recording clerk. This "rewriting" or "response" is the interpretation of the painting over the course of four books. The *ut poesis pictura* of the *graphê*, that is, the painting, is followed by the *ut pictura poesis* of the *antigraphê* [ἀντιγϱαφή], the pastoral itself. There is thus only an *ut poesis poesis* that moves from word to word.

With ekphrasis, we are at the furthest remove from both nature and the first natural science of philosophy, whose goal is to tell things as they are—and insofar as they are, and by what cause. We are also at the furthest remove from an immediate and ontologically innocent phenomenological description. We find ourselves in the world of art and artifice, ruled by and following the performative, effective power of speech that has been freed from truth and falsehood, as it sets out not to say what it sees, but to make seen what it says.

for Krieger, a constant feature of description), and "pictorial representation," or "depiction" (in *Reconceptions in Philosophy*, Goodman professes a definite preference for "depiction" over "representation," which he uses from then on in "a wider, more flexible sense"). Goodman sees in "description" and "depiction" two modes of denotation—two ways of referring to or representing something—but he vigorously opposes the idea that depiction has anything to do with resemblance. According to him, descriptions or predicates (nouns, descriptive phrases . . .) are composed of linguistic symbols that belong to digital systems (formed of discrete units), whereas pictures, in the case of depiction, belong to dense or analog systems. Goodman uses "description" in a wide sense that seems to cover practically any linguistic formulation. Alongside the description/depiction distinction, we find in Goodman distinctions between names and descriptions, on one hand, and pictures on the other, and again between paragraphs and pictures, or predicates and pictures.

The distinction between depiction and representation, developed in particular by Peacocke, introduces a supplementary distinction, internal to the act of perception, between a first level that derives from a pure perception and a second level that requires the mastery of a symbolic system. This distinction, which is reminiscent of Panofsky's distinction between the pre-iconographic and iconographic stages, plays an important role in the analysis of the perception of artworks. When I look at a painting, I can identify an object (a child, an old man, or a lamb) without knowing what it represents (love, time, or Christ). This first identification would correspond to the perceptual experience of the depiction. But the existence of a precognitive and pre-predicative level of perception, which would define what some call a stage of pure perception, is a thesis that is far from generally accepted today.

DESENGAÑO (SPANISH)

CATALAN	*desengany*
ENGLISH	disillusionment, disenchantment, disappointment
FRENCH	*désillusion*
GERMAN	*Enttäuschung*
ITALIAN	*disinganno*
PORTUGUESE	*desengano*

➤ *DECEPTION*, and BAROQUE, *FALSE*, *LIE*, *MALAISE*, PLEASURE, SPREZZATURA, TRUTH, VERGÜENZA

The noun *desengaño* comes from the verb *desengañar* (composed of the negative prefix *des* and the verb *engañar*), which comes, according to RT: Corominas and Pascual, *Diccionario critico etimológico castellano e hispánico*, from the medieval Latin *ingannare* (mock, scoff at, deride), which itself comes from the classical onomatopoeia *gannire* (yap, bark); similarly for the Catalan *desengany*, the Italian *disinganno*, and the Portuguese *desengano*. "Disillusion" in English and *Enttäuschung* in German represent the two senses between which the different significations of *desengaño* oscillate: on one hand, knowledge, overcoming blindness, being disabused, all of which correspond to the fact that one has escaped error and illusion; on the other, disappointment at the fact that a hope has not been realized.

The word *desengaño* achieved its full splendor in the sixteenth and seventeenth centuries. Beginning in 1492, when the Jews were forced to choose between leaving Spain and converting to Catholicism, the theme of *desengaño* in picaresque and mystical writing was a way for "new Christians" (children of converted Jews) to imagine pathways and openings in a hostile society that had closed all its doors to them. Cervantes wrote *Don Quixote* in this spirit. A bit later, toward the middle of the seventeenth century, when the Society of Jesus had consolidated its victory and Spain had become a bastion of the Counter-Reformation, Baltasar Gracián responded to the continuing experience of *desengaño* by dramatizing it and by praising appearance as the only reality.

Today *desengaño* retains traces of its former richness and still has a variety of meanings.

I. The Principal Meanings: Knowledge by Which We Are Disabused, Deception, Deceit

1. The first of the senses of *desengaño* that are currently in use is that of the grasping of a truth that lifts someone out of a state of being deceived or mistaken. In his RT: *Tesoro de las dos lenguas española y francesa*, César Oudin, the first translator of *Don Quixote* into French, translates *desengañar* as "détromper, désabuser quelqu'un, lui ouvrir les yeux." According to Covarrubias (RT: *Tesoro de la lengua castellana o española*), *desengañar* also means "to express oneself with full clarity such that one does not conceive something by taking it for something else" (*hablar claro, porque no conciban una cosa por otra*). The example he chooses confirms the idea that it is the truth itself that disabuses us ("La misma verdad nos desengaña"). *Desengaño* then takes on a two-part character: first, the revelation of a new truth—a veritable illumination; second, thanks to this acquired knowledge, a slower movement that consists in an "escape" from error ("conocimiento de la verdad con que se sale del engaño [deception] en

que se establa"), as in the Latin phrase *ab errore deductus* (RT: *Diccionario de autoridades*). *Desengaño* is thus a form of knowledge with practical effects: it deals not with an abstract truth, but with lived truth, one that provokes a change.

2. This change constitutes the second meaning of the word, which is defined by the RT: *Diccionario de la lengua española* as an "effect of this [new] knowledge on one's state of mind" (*efecto de ese conocimento en el ánimo*). The *Diccionario* suggests a distinction between a neutral meaning and one that is clearly negative and restricted to the plural of *desengaño*, corresponding to "lessons learned at the cost of bitter experiences." Manuel Seco et al. (RT: *Diccionario del español actual*) provide a synthesis of these two strains by characterizing *desengaño* as a negative impression felt by someone who discovers that a person or thing does not meet their expectations. He offers several examples taken from contemporary literature, notably from the work of Diaz Plaja, *El español*: "[S]exual intercourse includes a punishment, that of the violent death of Calisto and Melibea, or simply the *desengaño* that follows climax [*el desengaño que sigue al goce*]"; from Calvo Sotelo, *Resentido*: "Lo normal es que quienes sufren ese desengaño terrible se hagan resentidos" (It is normal for those who suffer this terrible *desengaño* to become full of resentment); from Miguel Delibes, *Emigrante*: "La chavala se ha llevado un desengaño de órdago, por más que ella diga misa" (The girl suffered a terrible *desengaño*, even if she claims otherwise)—literally, "even if she recites the Mass"; in informal Spanish "to recite the Mass" means to say things that no one believes, however solemn they appear. These quotations recall the context in which the different senses of *desengaño* developed from the classical to the contemporary period. When the word is close to disappointment or disillusionment, it deals primarily with disappointment in love, which may entail punishment, especially if there was pleasure (*goce*) involved. The informal common usage cited in the last passage shows how much *desengaño* remains secretly linked with a religious notion of lacking or loss, even today.

3. The third sense of *desengaño* indicates the word or judgment by which one blames someone for something. This meaning is primarily expressed by the familiar and figurative form taken by the adverb and adjective: *desengañadamente* (*malamente, con desaliño y poco acierto* [in a negligent and improper way]) and *desengañado* (*despreciable y malo* [despicable and bad]). The effect of disappointment is here attributed to the unsteady or poor character of the person who has disappointed; he did what he did without believing in it, that is, poorly: "Cuando se pondera que alguno ha ejecutado mal alguna cosa, se dice bien desengañadamente lo ha hecho." In this sense, *desengañado* translates the Latin *perversus*, "bad" (RT: *Diccionario de autoridades*). The adjective can sometimes pass on to the noun this sense of malignance. The RT: *Diccionario de autoridades* thus attributes to the object of deception a face that has become, in the context of sin, terrible and frightening. *Desengaño*

now indicates the horrible object that gives rise to the feeling: "Vida de San Borja: Vióse en su mismo original la cara del desengaño, tan terrible, que bastaba a introducir susto hasta en los mármoles del templo" (The Life of Saint Borgia: He saw in his own model the face of *desengaño*, so terrible that it alone sufficed to create fear even in the marbles of the temple). In a more satirical vein, but a no less serious one, Francisco Quevedo goes to the point of transforming this *desengaño* into a refusal of all illusion and all seduction; it becomes the truth—that of books, as opposed to the lies of living beings—truth that traversed the inanity of appearances as well as the vanity of pleasure and existence:

Pareciéndome que los muertos pocas veces se burlan, y que gente sin pretensión y desengañada más atienden a enseñar que a entretener.

(As it seemed to me that the dead rarely laugh and that, being unpretentious and disillusioned people, they would rather teach than amuse.)

Visita de los chistes (cited in RT: *Diccionario de construcción y regimen de la lengua castellana*)

II. Picaresque Contempt for the Law and Mystic Wisdom

José Luis Alonso Hernández (RT: *Léxico del marginalismo del siglo de oro*) notes that the adjective *desengañado* takes on the sense of "crook, cheat, swindler" when it is turned into a substantive. *Desengañado*: a picaresque character, crook, or thief, in the sense that he is familiar with all possible forms of deception (*engaño*)—"he will return to drinking and invite others as disabused as he is" (torñó a beber y a convidar a otros tan desengañados como él; M. de Obregón).

■ See Box 1.

Unlike in the religious sense, according to which *desengaño* is related to sin and failure, and hence to a sort of surfeit of law, the familiarity with evil in the picaresque novel is identified with contempt for the law bordering on insouciance, either real or fake (it does not matter which); sometimes it even approaches an uncommon degree of anger, as for Mateo Alemán (*Life of Guzman*). His revolt derives, of course, from being used to hunger and poverty, but especially from a keen sensitivity to the respectable arrogance of the affluent—that is, the "old Christians."

However, in the golden age as well as today, the adjective *desengañado* also indicates the opposite of *pícaro* and appears as a synonym for "wise." It is applied to a man who, retired from the bustle and commerce of the world, lives privately and far away, desiring nothing other than to live in peace away from the tribunals of a society that has no room for nonconformists:

Dichoso el que jamás ni ley ni fuero,
Ni el alto tribunal de las ciudades;
Ni conoció del mundo el trato fiero.

(Happy he who has never known laws or statutes,
Nor the high court of the cities,
Nor the harsh treatment of the world.)

(Luis de León, *En una esperança que salió vaga*)

1

Pícaro

Of uncertain origin, this word means in the first instance "rascal," "rogue," or "beggar"; someone without shame in the sense of modesty (*vergüenza*) or honor (*honra*), the most Christian of values according to the drama of Lope de Vega, the "official" author of the Spanish Golden Age (sixteenth and seventeenth centuries). The *pícaro* is thus first and foremost a mischievous character, malicious (*descarado*) as well, but above all, an outlaw. In the hands of some authors, such as the writer of *Lazarillo de Tormes*, the character is a crafty one, sometimes dishonest, but with a genuine awareness both of himself and the boundaries of the world, in particular those that separate his world from that of his masters and those of his own subjectivity. Despite the apparent paradox of such a genealogy, the *pícaro* may be considered a remote descendant of the mystics. As in Mateo Alemán's work, *pícaros* and mystics share an acute and sometimes tragic awareness of the rules of social power and the "falseness" of all worldly authority, which Teresa of Avila called, with "picaresque" contempt, "authorities of junk" (*autoridades postizas*). But Alemán's *Guzmán de Alfarache* dares to attack God and his creation, which he considers to be an utter failure. The mystic's rejection of the world as it is remains, for the *pícaro*, a rejection of all transcendence.

Luis de Léon, an Augustinian monk with a subtle command of Greek and Hebrew, a professor at the University of Salamanca, and one of the greatest poets of his time, also dared to defy the law (which in his case was an Inquisitorial interdiction against translating the Bible into Castilian), offering a beautiful lyric version of the Song of Songs to a Carmelite nun. And yet his poems retain a clear and sharp aggressivity that is in the same vein as Mateo Alemán's harsh and resounding revolt, despite being in a completely different register. Without actually naming them, the RT: *Diccionario de autoridades* shows that the adjective *desengañado* designates precisely these "new Christians," such as Mateo Alemán, Luis de León, or Teresa of Avila, who endlessly told her charges that true virtue is hidden in works and not in one's birth: "Los desengañados dicen, que la nobleza no se adquiere naciendo, sino obrando" (The *desengañados* say that nobility is not acquired by being born but by acting).

Some words of classical Castilian, like *desengaño*, seem to have been forged through a play of violent and almost exaggerated oppositions in an extreme tension between an internal and external aspect with regard to social and religious laws, and sometimes at the edges of their laws' own fluctuating boundaries. Américo Castro, a historian exiled from Spain after the civil war and a close confidant of Marcel Bataillon, "one of the masters of Cervantism" according to Jean Cassou in his introduction to *Don Quichotte*, offered constant reminders that all of the spiritual and mystic literature of the fifteenth and sixteenth centuries shared a common origin with picaresque novels, with *La Celestina*, and especially with *Don Quixote*. This literature is caught between a Christian optimism colored by Erasmism and a picaresque *desengaño* and was born and developed precisely among the children of the first converted Jews, who became Christians with lives "on the frontier," psychologically speaking. In the picaresque novel, derision, provocation, and constant games with the law, as in *Lazarillo de Tormes*, often hide a distance as well a brutal acceptance bordering on submission. Having become a respectable husband at the end of the novel, Lázaro accepts with philosophic calm that his wife, the servant of the archpriest, should remain the latter's mistress—Lázaro's world is too narrow, unlike that of Cervantes, to allow for a dream of freely chosen love or even nostalgia for an inner world, which *pícaros* scorn as useless anyway. Sometimes the distance between desire and reality becomes so great, as in *Guzmán de Alfarache*, that it is transformed into an immense revolt. For this antihero, *desengaño* becomes both submission and permanent transgression, which comes up empty, although it has a healthy outlet in writing.

In mystical literature, on the other hand, *desengaño* comes with a flight into the backcountry of subjectivity and inner life in order to recreate another world through prayer and writing, a world that is invisible but truer, that of the *El castillo interior*, secret and indestructible, a castle of the soul "all of diamond and clear crystal," as Teresa of Avila put it. She is, indeed, a great *desengañada*, but one whose desire never steered her wrong: "Dejánla [el alma] no solamente desengañada de lo que la falsa imaginación le ofrecía, sino tan ansiosa del bien, que vuela luego a él con deseo que hierve" (It [the soul] remains not only *desengañada* with what the false imagination offered it, but so avid for the good that it flies toward it boiling with desire; L. de León, dedication of *Obras Sta. Teresa*, quoted in RT: *Diccionario de construcción y regimen de la lengua castellana*).

III. *Desengaño* and Desire to Live in *Don Quixote*

Américo Castro was one of the first to point out the link between the eroticism of mystical texts and that of Renaissance pastoral literature, which is so present in Cervantes's novel. In *Don Quixote* (pt. 1, chap. 14), the praise of *desengaño* belongs first to a woman. The shepherdess Marcela, having chosen, "in order to be able to live free, the solitude of the countryside," refuses all blame for the suicide of her lover. She claims to have always opposed the hope that sharpens desire with the *desengaño* that disabuses. On her lips, *desengaño* becomes knowledge of the absolute freedom of the object of desire; in other words, recognition and acceptance of her independence: "Those whom I have made amorous by my appearance, I have disabused with my words" (A los que he enamorado con la vista he desengañado con las palabras). A tragic knowledge for Marcela's suitors, blinded by her beauty and their own desire; an unacceptable knowledge to which Grisóstomo prefers death; a knowledge that the pretty shepherdess nonetheless defends until the end, refusing to confuse the truth of her desire—the cruel absence of reciprocity between men and

women; that is, *desengaño*—with contempt: "Setting someone straight should not be taken for disdain" (Que los desengaños no se han de tomar en cuenta de desdenes).

As with Marcela, the desire for life on the part of the knight errant and his squire is all the greater given the extent of the *desengaño*. Sancho, having been the governor of the imaginary island of Barataria and disappointed to learn that the dream of power was just a lack of freedom, feels a *desengaño* that is not at all bitter. It resembles, rather, a strong reassurance of feeling truly alive; stripped, Sancho feels his existence: "Desnudo nací, desnudo me hallo, ni pierdo ni gano" (I was born naked, and now find myself naked; I neither lose nor win; pt. 2, chap. 57). This book in which "Spain finds itself ceaselessly mirrored" (Cassou, Introduction) is also the work of a descendant of converted Jews, to whom Philip II twice refused the post in the Indies for which Cervantes pleaded. Only those who could prove their "Christian blood" had the right to such posts. Cervantes, like the majority of mystics and picaresque authors, invented points of reference other than the Church and social power to communicate the brutal conflict between dream and reality. Don Quixote dies of it—we do not know whether he dies "of melancholy [*melancolía*], of having been defeated, or of the will of Heaven" (pt. 2, chap. 74)—but Cervantes writes his own *Don Quixote* through to the end, despite the existence of the fake version by Alonso Fernández de Avellaneda. The term *desengaño* appears 357 times in the two parts of the novel. As if *desengaño* had become the bearer of an extraordinary life force, in the dedication of *The Trials of Persiles and Sigismunda*, which was written a few days before his death, Cervantes claims to live only through that desire: "Ayer me dieron la extremaunción y hoy escribo ésta; el tiempo es breve, las ansias crecen, las esperanzas menguan y, con todo esto, llevo la vida sobre el deseo que tengo de vivir" (Yesterday they gave me extreme unction and today I'm writing this. Time is short, my agony waxes while hope wanes, and yet despite all this, my desire to live keeps me alive).

In *Don Quixote*, *desengaño* leads to a new richness, one that lies beyond good and evil, since dogmas and moral categories have disappeared in favor of writing that seeks neither to prove nor to convince but rather prefers to be a pure art of life. Further, the exceptional and fundamental feature of this art is that it is completely lacking in desire for any kind of religious solution. All that remains is fiction, dreams, nostalgia, anxiety, pleasure, and above all, a great need for true, genuine life—"la verdad adelgaza y no quiebra" (truth can be reduced to a thread but does not break; pt. 2, chap. 10).

In the novel, life away from the court and big cities is made up of pleasure in the simplest things—Sancho and Don Quixote, both alone and together, often improvise delicious lunches on the grass by the side of the road, ones that would make the princes of the Earth die of envy. It also contains the most fantastical and unreal elements, like the dream of the cave of Montesinos, which resembles a Platonic myth (pt. 2, chaps. 22 and 23). And then again, life is made up of words as alive as anything: words read in books of chivalry; the words written by the author, Miguel de Cervantes, and by the Arab narrator of the second part, Cide Hamete Benengeli; the words translated by a Christian for the author; and also spoken words, usually reported by a witness of the countless characters who come and go and are transformed over the course of the story—all these words are there to indicate a radical alliance with the elements of life, including the most frightening ones, the most extravagant one, the craziest ones. And so *desengaño*, rather than taking the form of bitterness or escape, becomes a pure complicity with the adventure of living, painful or happy depending on the course of events. It is as though all these words of life and literature existed only for the sake of giving the most beautiful form possible to the experience of *desengaño*, one that is found especially in the gap between desire and reality and from which fiction is born—and for Sancho and Don Quixote, the space in which they can breathe. And it allows desire, if it cannot reach its object, at least to come back to itself after its long travels (pt. 2, chap. 72).

IV. Gracián and the Strategy of *Desengaño*

The cycle of *desengaño* was completed at the end of the baroque era in Spain with a triumphant Catholic form that was practically official: the Jesuit Gracián responded to *desengaño* with a strategy of stagecraft and manipulation, praising appearance as the sole reality. With Gracián, we are practically at the other end of the spectrum from picaresque and mystical *desengaño* and much closer to a kind of disillusionment that comes from perfect courtly duplicity. The bitter lightness of picaresque *desengaño* and the mystical audacity that consists in inventing an internal world to respond to the *desengaño* that comes from the world as it is become in this context the construction of a much weightier kind of staging, where the difference between being and seeming comes only in flashes before disappearing entirely in favor of the idea that being consists in nothing other than seeming—and in obedience to the rules of the court: "Man without illusions, wise Christian. Philosopher courtier: but without appearing so, let alone affecting it." (Varón desengañado, cristiano sabio. Cortesano filósofo: mas no parecerlo; menos afectarlo; *Art of Worldly Wisdom*, §100).

A rebel in his own bizarre way, Gracián spent half of his time in trouble with the Society of Jesus. Ignoring the interdictions, he went so far as to publish his books at his own expense—in particular the last parts of the *Criticón* (1653 and 1657), which he had printed without the slightest authorization and only partially hiding his identity—before later returning to the fold, which he had never completely left. For this "Christian" disciple of Machiavelli, a Hobbesian before his time, a defender of the power that comes with secrecy and dissimulation who was convinced of the need to manipulate in order to survive, and an ambitious connoisseur of the social passions that he dared to expose—for him, *desengaño* became a weapon, a projectile, an explosive destined to trap the naïve and the imprudent. The weapon became invisible, and he practically turned it on himself toward the end of his life by proclaiming his obedience to the law of the double life (which Pascal considered Jesuitical) and by transforming his initial disillusionment into a need for constant calculation, an infinite casuistry, in order to escape the threat of death lurking at all times:

A breast without a secret is an open letter. Where there is a solid foundation secrets can be kept profound: there are spacious cellars where things of moment may be hid. Reticence springs from self-control, and to control

oneself in this is true triumph. You must pay ransom to each you tell. The security of wisdom consists in temperance in the inner man. The risk that reticence runs lies in the cross-questioning of others, in the use of contradiction to worm out secrets, in the darts of irony: to avoid these, the prudent become more reticent than before. What must be done need not be said, and what must be said need not be done.

(Gracián, *Art of Worldly Wisdom*)

Desengaño enjoyed a resurgence with Romanticism, this time characterizing the disappointments and sufferings of love, politics, and history, in the spirit of the times. Originally, however, the underground complexity of *desengaño* developed on the side of the very ones who, "disabused" and "disenchanted" because of their banishment by a hostile society, often in highly marginalized situations—whether in prison like Luis de Léon or Cervantes or, like Gracián, in the heart of one of the most powerful institutions of the Spanish Counter-Reformation, in relation to which he remained independent and dissident—invented other worlds and alternative pathways, which are still present in the language of today, to communicate this experience and transform it through writing.

DÉSINVOLTURE

Désinvolture is one of the possible translations of the Italian *sprezzatura*, introduced by Baldassare Castiglione in *The Book of the Courtier* (1528), where it relates to Italian thinking about civility and politeness.

See SPREZZATURA; see also *CIVILITY, GRACE,* ITALIAN, LEGGIADRIA, *STYLE.*

DESIRE

The etymology of "desire" is highly informative. The word comes from the Latin *desiderare*, composed of the privative *de-* and *sidus*, *sideris* (star). Thought to be an ancient term from divinatory or maritime language, *desiderare* literally means "to stop seeing the star," "to condemn the absence of, to miss," while *considerare* means "to see the star," "to examine with care or respect."

The term appears here first insofar as it is relevant to the vocabulary of psychoanalysis, and more precisely, as one of the received translations of the Freudian *Wunsch*: see WUNSCH and DRIVE (especially DRIVE, Box 2). Cf. ES, UNCONSCIOUS.

More widely, it is part of a variety of networks:

1. The network of absence and satisfaction, of lack and plenty: see PLEASURE as well as GLÜCK (cf. *HAPPINESS*) and *MALAISE*; cf. *ACT*.
2. The network of love, including sexual love, and passion: see LOVE, PATHOS (cf. *PASSION*), TALENT, and cf. GENDER, GESCHLECHT, SEX.
3. The oppositional network of freedom and the will: see *LIBERTY* [ELEUTHERIA], WILL, WILLKÜR.
4. The network of the powers of the soul: see SOUL, GOGO; cf. I/ME/MYSELF, GEMÜT.

➤ GOÛT, INTENTION, MADNESS

DESSEIN

Dessein is, along with *dessin*, one of the received translations of the Italian *disegno*. Eighteenth-century French broke with Italian tradition and, like German and English, separated the semantic fields of *dessein* and *dessin*. See DISEGNO and *DESSIN*; cf. CONCETTO and LEGGIADRIA.

Nevertheless, *disegno* is to be thought of alongside "design," which not only means "drawing" (*dessin*) but also "the ability to grasp patterns"; see STRUCTURE, IV.

On the importance of *dessein* for aesthetics, see also GENIUS, INGENIUM, MANIERA, MIMÊSIS, TABLEAU.

For the relation between *dessein* and finality, see *DESTINY* and especially KÊR, Box 1; for *boulê* [βουλή], the design of Zeus, see OIKONOMIA and TALAṬṬUF; HISTORIA UNIVERSALIS; cf. PRINCIPLE.

On the relation between design, intelligence, and moral action, see AGENCY, INTENTION, MÊTIS, PHRONÊSIS, POSTUPOK, PRAXIS, *WISDOM,* VIRTÙ, WILL.

➤ *IDEA*, SENSE

DESSIN

Dessin is, along with *dessein*—from which it diverges around 1750—one of the received translations of the Italian *disegno*. See DISEGNO and *DESSEIN*. Cf. CONCETTO and LEGGIADRIA.

The term is similar to "design," which means not only "drawing" (*dessin*) but also the "ability to grasp patterns"; see STRUCTURE, IV.

See also, for the role of *dessin* in aesthetics, MANIERA, MIMÊSIS, TABLEAU.

DESTINY

The use of "destiny," from the Latin *destinare* (to fix, to subject), is in Romance languages one of the ways in which we designate the part of what happens to us that escapes us or is not in our power. The terminological networks of Greek and German are especially well furnished in this regard.

I. The Important Constellations

A. The fortune of Greek representations

The Greek words related to the idea of destiny are numerous, and they carry images and representations along with them that are always present: death, one's lot, thread, linkage, constraint, completion, suspense. See KÊR [MOIRA, AISA, HEIMARMENÊ, ANAGKÊ, PEPRÔMENÊ, TUCHÊ]. While *fortuna* translates the occurrences characteristic of *tuchê* [τύχη] (see KÊR, Box 3, and VIRTÙ, I), the Latin *fatum*, from *fari* (to speak) opens up another paradigm (see KÊR, I.C; see also PORTUGUESE, Box 1). See also DAIMÔN, THEMIS.

B. Calling, destination, historicity

In German, Heidegger brings out the connotations belonging to *Schicksal* in which determinism and history are interwoven. See SCHICKSAL; cf. EREIGNIS, GESCHICHTLICH. The network includes *Verhängnis* (suspense, in the Stoïc sense of *heimarmenê* [εἱμαρμένη]), and *Bestimmung*, which opens up a new swath of terminology related to call and response (see BERUF, STIMMUNG, *VOCATION*) and to determinism. See also ES GIBT, HISTORY, *TO BE*.

II. Destiny, Freedom, and Necessity

1. "Destiny" relates to necessity, whatever its nature may be, reasoning or divine decision, the natural or cosmological course of events that controls human life and therefore expresses determinism, finality, and freedom. See *LIBERTY* [ELEUTHERIA, Box 2; SVOBODA], WILL.

2. For the relationship between God and humans, see especially *ALLIANCE* [BERĪT, PIETAS, RELIGIO, SOBORNOST'], BELIEF, DAIMÔN, DEVIL, GOD, *HUMANITY*.

3. For causality, see EPISTEMOLOGY, FORCE, NATURE, PRINCIPLE, *THING, WORLD*. For probability and chance, see CHANCE and KÊR, Box 2.

4. For human life, see *MALAISE, LIFE* [AIÔN, ANIMAL, DASEIN, ERLEBEN].

5. For the relationship between necessity, freedom, and moral action, see GLÜCK, MORALS, POSTUPOK, PRAXIS, *PRUDENCE,* VIRTÙ.

6. It is also possible to imagine other ways, referring to humans themselves, of theorizing that part of human life that escapes us; see DRIVE, ES, UNCONSCIOUS, VERNEINUNG; cf. GENDER, GESCHLECHT, *MALAISE,* PATHOS, SEX.

➤ LAW, PERFECTIBILITY, *PROGRESS*, SECULARIZATION

DEVIL

FRENCH	*diable*
GERMAN	*Teufel*
GREEK	*diabolos* [διάβολος], *daimôn* [δαίμων]
HEBREW	*sāṭān* [שָׂטָן]
ITALIAN	*diavolo, demonio, demone*
LATIN	*diabolus, daemon*
SPANISH	*diablo*

➤ DAIMÔN, DUENDE, GOD, GOOD/EVIL, *IMAGE* [EIDÔLON], INGENIUM, MADNESS, PLEASURE, *RUSE*

Within the theologies and demonologies of the different religious and philosophical systems of the East and the West, we find questions such as that of whether, if they accord individual existence and power to an agent of Evil, that agent is fully autonomous (as in dualist systems) from the principle of Good or, on the contrary, acts only under the power of the latter, the supreme god who alone is eternal, to whom all evil influence in the world is subordinate. There follow questions concerning the relationship between the Prince of Evil and the lesser demons who function as his instruments. Regardless of the possible answers to these questions, the Evil One is designated in most European languages by reference to the *daimôn* [δαίμων] of Greek or Latin antiquity, as well as to the Semitic (*sāṭān* [שָׂטָן] in Hebrew, *šayṭān* [شيطان] in Arabic, and *satanas* [Σατανᾶς] in Greek), designated by the name of *diabolos* [διάβολος] in the Greek Bible. Thus, in French, Satan may be called Diable or Démon indifferently (with a variety of synonyms). In German, on the other hand, the two semantic paths remain distinct. The second, that of *daimôn* [see DAIMÔN] or "demonic" remains clearly detached from that of *diabolos,* that is, what we understand by the words "diabolical" or "satanic."

I. From Satan to the Devil

The Hebrew name *sāṭān* is given to the Prince of Demons in the Hebrew Bible, as well as the New Testament and the Qu'ran. The Septuagint translates the name by the Greek noun *diabolos* [διάβολος], created from *diaballein* [διαβάλλειν] (*ballein* [βάλλειν], "to throw," "to push"; *dia* [δια], "between," "across," "from one end to the other"; hence "to divide," "to separate," "to accuse," "to slander"). The biblical Satan (from the root *satan*, derived from the Akkadian *sattânu*, which means "to attack," "to urinate on," "to fight") is named as "the adversary" (cf. 2 Sm 19:23; 1 Kgs 5:18; 11:14, 23, 25) or "the accuser [before a tribunal], the slanderer, the denigrator" (cf. Ps 109:6). But in Job 1:6, as well as Zechariah 3:1–2, this name, preceded by an article, is still only a common noun. It does not seem to become a proper noun until the first book of Chronicles, where it is said that "Satan rose" (21:1), behavior arising from pride.

In the Qu'ran, "Satan" is not at first a proper noun. It is used sometimes in the singular, *šayṭān* [شيطان], sometimes in the

plural, *šayāṭîn* [شياطين], and usually with an article. *Al Šaytân* thus designates the Demon, while *al šayâṭîn* designates the various demons. *Satan* is the same word in Arabic and Hebrew, related to a verb meaning "to be separated [from the truth or divine mercy]". The Qu'ran also mentions this same Satan by the name of Iblis, which is related to the Greek *diabolos* and designates the rebel angel, head of the revolt against God and of unbelief: "And when we said to the angels 'Prostrate yourselves before Adam,' they all prostrated themselves except Satan, who hid his pride, refused and became an unbeliever" (2:32). The six other passages mentioning the name of Iblis in a similar context also describe him as an angel, cursed and fallen because of his disobedience, like the demon of the Jewish and Christian traditions. In effect, the three great monotheistic religions originally viewed the angels as members of a celestial court, then as messengers from the Most High, some of whom revolted against the divine order.

The spread of the Greek Septuagint among the early Christian communities led the holy writers and the church fathers to adopt the Greek *diabolos* and the Latin *diabolus* to indicate the Satan of the Hebrew texts. The book of Revelation (12:9) designates the evil spirit as "the *Diabolos* or the *Satanas* [Σατανᾶς]": "And the great dragon was cast out, that old serpent, called the Devil, and Satan, which deceiveth the whole world (of the *oikumene* [οἰκουμένη])." In the Gospel of John (8:44), Jesus tells his coreligionists at the height of a quarrel with them: "Ye are of your father the devil (*humeis ek tou patros tou diabolou este* [ὑμεις ἐκ τοῦ πατρὸς τοῦ διαβόλου ἐστὲ; in the Vulgate, *vos ex patre diabolo estis*])." In the same way, Latin Christian literature, for example, Tertullian (*De anima*, 35), adopts the term *diabolus* from the Septuagint to designate Satan, even while giving a number of other names to the principle of evil, such as the Demon, the Adversary, the Tempter, the Father of Lies, the Prince of This World, the Antichrist, the Beast, the Clever One, the Prince of Darkness, Lucifer. In addition, the New Testament, the apocryphal Christian writings, and the church fathers use the term "demon" to designate fallen angels, as well as the pagan

gods, which they call "the idols" (*eidôla* [εἴδωλα]: 1 Cor 12:2; cf. Septuagint, 4 Kgs 17:12).

■ See Box 1.

Rabbinic and Talmudic Judaism could not accept the translation of the Bible by the Alexandrian diaspora without reservation, and remained faithful to the name of Satan (or Sammaël, the Angel of Death), mentioned, however, with the definite article. "The Satan" reigns, then, over a certain number of demons (*šĕdīm* [שֵׁדִים]) described as "pernicious" (*mazzīqīm* [מַזִּיקִים]) by the Midrash and the Talmud, such as Beelzebub, Azazel (the personification of the desert into which the scapegoat is sent in the ritual of Yom Kippur), Belial (or Beliar), Asmodeus (the demon who kills in succession the first seven husbands of Sara, the future wife of the young Tobias), Behemoth, and Leviathan. We also find female demons in these writings, such as Lilith, Adam's first wife according to Rabbinic Judaism, or even the consort of Sammaël: according to the Targums and the midrashim, Sammaël was the serpent from Genesis 3 who seduced Eve, fathering Cain, henceforth known as the "son of the Devil." However, it is the Hellenistic tradition of *diabolos* that has been taken up in our current languages to name the Evil Angel, as we see with "devil," *diavolo* (Ital.), *diablo* (Sp.), and even with *Teufel* (Ger.), as well as the *Iblis* of the Qu'ranic tradition.

II. From the Slanderer to the Tempter

In the three monotheistic traditions, the Devil commands a legion of demons as his servants or instruments, so that it is difficult to tell from one text to another whether we are dealing with Satan himself or one of his acolytes. With the exception of the aforementioned passage in Chronicles, the Hebrew Bible generally refers indeterminately to a *satan* (or *diabolos*). It may be the same with the angel who becomes Job's accuser in the midst of his trials, before the tribunal of God. And even in the first part of Goethe's *Faust*, when the hero meets Mephistopheles (a name whose etymology is uncertain but recalls the Low Latin adjective *mephiticus*,

---

1

Lucifer

The name Lucifer (Lat. "bringer of light"), which designated the planet Venus among the ancients, was incidentally attributed in the New Testament to Christ himself, who is there referred to, according to Ecclesiastes (50:6), as *Stella matutina*. The name remains, however, in the early centuries of the church and under the persistent influence of Judaism, one of the names of Satan. Beginning with Saint Jerome and especially in the Middle Ages, the Prince of Demons comes to be assimilated, as in Dante (*Inferno*, 31, 143; 34, 89; etc.), with

the figure of the fallen angel. The source is no doubt the biblical passage in Isaiah on the fall of the king of Babylon, either Nebuchadnezzar or Nabonidus, or perhaps another Assyrian tyrant, either Sargon or Sennacherib:

How art thou fallen from heaven, O Lucifer, son of the morning! [how] art thou cut down to the ground, which didst weaken the nations!

For thou hast said in thine heart, I will ascend into heaven, I will exalt my throne

above the stars of God: I will sit also upon the mount of the congregation, in the sides of the north. . . . Yet thou shalt be brought down to hell, to the sides of the pit.

Isaiah 14:12–15.

Thus, for Christianity, Lucifer, the angel of light, becomes Satan through his revolt against God. According to some esoteric traditions, this revolt took place in the framework of a cosmic battle.

"exhaling a pestilential and harmful odor"), he only sees him as "the frozen fist of the Devil [*die kalte Teufelsfaust*]," that is, one of the many "negating spirits" constituting an anonymous infernal society. However, the texts of the New Testament and the Jewish and Christian apocrypha, as well as the Mishna and the Talmud, designate the Devil more and more frequently by his proper name, presenting him most of all as the Tempter (Lat., *temptator*; in Gr., *ho peirazôn* [ὁ πειράζων]; in Hebrew, the equivalent would be *massâh* [מַסָּה], which means "test"; cf. Ex 17:7). In this way, according to Matthew 4:1–3, "was Jesus led up of the Spirit into the wilderness to be tempted of the devil [*peirasthênai hupo tou diabolou* (πειρασθῆναι ὑπὸ τοῦ διαβόλου)]. . . . And when the tempter came to him, he said. . . ."

The fact that the Devil goes from being the "accuser" to being the "tempter" or "seducer" may be explained by the emphasis on the notion of envy or jealousy (*phthonos* [φθόνος] in the Septuagint; *invidia* in the Vulgate). That notion is in fact not far from some of the recognized meanings of the Hebraic *sāṭān*, notably that of the denigrator, the malevolent, the divider. It is envy that prompts the Evil One to introduce death into the world (Wis 2:24), and to persuade Eve to disobey and eat the forbidden fruit, as Flavius Joseph (*Antiquities of the Jews*, 1.1–4) and especially Philo of Alexandria (*De opificio mundi*, §151–69; *De agricultura*, §95–110) point out. According to the *De opificio mundi*, it is because he loves pleasure (*philêdonos* [φιλήδονος]), especially pleasures of the senses (*aisthêsis* [αἴσθησις]), that man may be tempted by the serpent, the personification of sensual pleasure and its charms (*hêdonê sumbolon* [ἡδονὴ σύμβολον]): "It is said that of old the venomous reptile . . . having one day approached the wife of the first man, reproached her for her slowness of mind . . . since she postponed and delayed gathering the most beautiful fruit to be seen, the most pleasant to taste [*hêdiston* (ἥδιστον), superlative of *hêdus* (ἡδύς), pleasant], and besides the most useful, since, thanks to it, she could know good and evil." For the serpent's part, it is not a matter of persuading (*peirô* [πειρῶ]) his victim, but of tempting, in the sense taken on by the Greek *peirazô* [πειράζω] (derived from *peira* [πεῖρα], "test") in the Bible and the New Testament. Thus, Jesus says in his agony, "Pray, that ye enter not into temptation" (*eis peirasmon* [εἰς πείρασμον]) (Lk 22:40), just as the prayer that he teaches his disciples, the Our Father, ends with the phrase "And lead us not into temptation" (*eis peirasmon* [εἰς πείρασμον]) (Lk 11:4).

Neither Josephus nor Philo identifies the serpent-tempter with the Devil himself. The genre of allegory, however, which, especially in Alexandrian literature, consists of "philosophizing by symbols," provides the basis for a psychotheology that turns the serpent into a symbol, not for just any demon, but for the Tempter himself. Under the aspect of a serpent, portrayed here in his capacity as a seducer of the feminine soul (by the intervention of sensation or *aisthêsis*), the Tempter here represents according to the Jewish and Christian traditions the Devil's role as the "Counselor of Man" with regard to perversity. The role of *sumboulos* alluded to by Philo in his *De agricultura* (§97) may be an allusion, though attenuated and unique to Philo, to the *diabolos* of the Septuagint: "counselor of man [*sumboulos anthrôpou*

(σύμβουλος ἀνθρώπου)] who enjoys ruining what is better than him."

■ See Box 2.

III. Devil or Demon?

While "Devil" and "Demon" seem to function as equivalents in Christian theology or ordinary ways of speaking, the same cannot be said for the German *Teufel* and *Dämon*. The latter, which is synonymous with *Unhold* (malevolent or harmful spirit—antonymous with *hold*, "gracious," "charming"), corresponds to the ancient idea of a *daimôn* [δαίμων] in the sense of a divinity or personal spirit, even a goblin, good or bad. The religious sense of "demon," on the other hand, can only be adequately rendered by *Teufel*. Thus, Freud's work entitled "Eine Teufelneurose im Siebzehnten Jahrhundert" was translated into French in 1933 by M. Bonaparte and E. Marty as "Une névrose *démoniaque*," then in 1985, in a new edition by J.-B. Pontalis, as "Une névrose *diabolique*"—the two translations being semantically identical. In the reverse case, however, the expressions *névrose démoniaque* and *névrose diabolique*, when they relate to a pact between a person and the Devil (*Teufelsbund* or *Teufelspakt*), as they do in Freud's work, would both be translated into German as *Teufelsneurose* rather than *Dämonsneurose*—the latter could possibly refer to a case of pathological enthusiasm.

In English, the Devil is also called the "Evil One" or the "Fiend." "Fiend," like "demon," has rather the same sense as *Dämon* in German; in Shakespeare's *The Merchant of Venice*, Lancelot calls Shylock "the fiend who is the devil himself." The different contemporary languages use the terms "devil" and "demon" in derivative senses which seem to downplay or exorcise the malignance retained by these other terms. Thus, in French and English we find various locutions that involve sympathy mixed with indulgence or admiration (*petit diable*, *pauvre diable*, *bon diable*, *un diable d'homme*, little devil, poor devil, the devil of a time, the devil's luck), a nuance of rejection or repulsion (*envoyer au diable*, *aller au diable*, go to the devil), obsessions or volatile situations (*avoir le diable au corps*, *tirer le diable par la queue*, *démon de midi*, *démon de jeu*, face one's demons, needs must when the devil drives). These generally have to do with metaphorical senses whose extreme character is indicative of the personality of the possessed (Ger. *besessen*) or the "energumen" (*energumenos*, formed by the early Christian writers from the passive of *energein* [ἐνέργειν] to indicate someone who is "worked on" by an evil spirit, but also, in the first instance, someone who is struck with a physical disability preventing him from being baptized). Along these lines, we find Dostoyevsky's novel translated into French with the title *Les possédés* (and in English, *The Possessed*), even though the novel deals precisely with demons—the book cites a passage from the Gospel of Luke (8:32–36) in which Jesus drives a multitude of tormenting spirits from the body of a victim, and allows them to enter a herd of pigs, which then throw themselves into a nearby lake and drown.

In fact, while the French *diable*, the Latin *diabolus*, the Italian *diavolo*, the English "devil," and the German *Teufel* may have figurative meanings like those listed above (not to mention interjections like *que diantre* invented in order

Satan the Contradictor as "historical being" according to Schelling

➤ OIKONOMIA, SUBLIME

Schelling develops his conception of the figure of Satan, and particularly "of his eminent place and function" in the history of Christianity, in his *Philosophy of Revelation* (especially Lesson XXXIII). He contests the standard representation of the Prince of Shadows common to pagan as well as Jewish mythology, according to which he is an angel, originally good, a spirit created as an individual, who wished to rise above God, and was for this reason cast down, bringing the world and humanity down along the way. Schelling clarifies straightaway that this act of opposition, which is peculiar to him, does not diminish Satan's dignity in any way, but rather ascribes to him a great reality and a more pre-eminent significance, although these are inscribed in determinate moments of the history of salvation.

He notes that in the Hebrew Bible, the name of Satan in the first instance refers only to the notion of "contradictor in general," and then—only with the article—to that of a determinate contradictor, as when, for example, said Satan argues with Yahweh concerning the suffering Job. The Hebrew verb *saṭan* [שָׂטַן] in effect has the very general meaning of contradicting someone or opposing an undertaking. Thus, in the story of Balaam (Num 22:22), "when the Lord's Angel places himself in his path in order to 'resist' him and hold him back, the Hebrew uses the verb *saṭan*, which consequently means nothing more than 'to hold back,' to thwart or hinder a movement. The Hebrew noun was translated into Greek as *diabolos* [διάβολος], from *diaballein* [διαβάλλειν], which means nothing more than '*interjicere se ad obstinendum*,' whence our German word *Teufel*." The same Greek word "is also originally used in a completely general way . . . with regard to any *contrarium*, to anything by which one is led astray" (*Philosophy of Revelation*).

This role of Contradictor, however, is one that Satan exercises most notably with regard to Christ himself. The Scripture informs us that a *kingdom* belongs to this adversary, just as one belongs to Christ, even if the former's is "opposed to and resistant to that of Christ." Thus, Satan "finds himself to a certain extent placed on the same footing as Christ, even if it is as a contradictor, as he whose reign and works Christ has come to destroy." It follows that a certain sublimity (*Erhabenheit*) is attributed to him, just as to Christ, in such a way that this elevation entitles him, according to a large part of the New Testament, to be considered the prime author of evil. In his role as master of such a kingdom he "appears . . . as a principle belonging to the divine economy" and is recognized by God as such. Facing God, Satan places himself at determinate moments as the great skeptic and contradictor who casts doubt on all belief, notably in the creation, through the seduction he works on the first man and in his debate with God regarding the tests of Job.

As a part of the divine economy, Satan is thus defined, according to Schelling, as a "historical being" who one day sees his work completed. "His mission ends and, with it, his power," which consisted in "maintaining contradiction, malediction, discord and disunity," but which needed to be broken by Christ and by the triumph of the cause of God (*Sache Gottes*). Until that time, "it is a great power, necessary to the final glorification of God, and which for this reason must be neither criticized nor held in contempt." Such a representation of Satan as a principle of the divine economy that is *necessary* at a given time thus breaks with the traditional mythological representations, which persist in seeing in this Contradictor an absolutely bad (although created) principle of self, universal and as eternal as God himself.

to avoid naming the Unnamable One directly), those terms which, in contemporary languages, are derived from the Greek *daimôn* or the Latin *daemon* are not used to refer to the person of the biblical Satan himself, not even to evil spirits when it is a matter of demons in the extended, religious sense. For example, with regard to those among them who wish, according to Luke the Evangelist, to enter the herd of pigs, Luther invariably translates the Greek plural *daimonia* [δαιμόνια] (or *polla daimonia* [πολλὰ δαιμόνια]) by *Teufee* (or *viel Teufee*). As a result, in Anglo-Saxon languages, the "demonic" (a term known by 1422, and no doubt borrowed from the Greek *daimonikos* [δαιμονικός], an adjective that means "possessed by a god" in Clement of Alexandria) remains distinct from what is called in French the *démoniaque* (demoniacal). This is still the case in German, where *démoniaque* would be translated as *teuflisch* (or *satanisch*), and *démonique* as *dämonisch*.

The fact that Satan is known in French, on the other hand, as either "le Démon" or "le Diable," unlike in other languages (especially Anglo-Saxon ones), seems to be due to the distance these other languages have acquired from ecclesiastical vocabulary. In Jewish and Christian writings, there is no semantic difference between Satan (Hellenized as *Satanas* [Σατανᾶς]) and *diabolos*. The latter term is more common in the Septuagint, but it is found with equal frequency as *Satanas* in the New Testament. The Alexandrian Bible, however, also gives the name of *daimonia* (neuter plural of the adjective *daimonios* [δαιμόνιος]) to the infernal spirits, such as Asmodeus (Tob 3:8). The same term is used in the New Testament (along with *pneumata* [πνεύματα]) to designate these harmful beings. The Vulgate and Church Latin translate *daimonion* by *daemonium*, but with the unique meaning of malevolent spirit, and with no trace of the ancient sense of divinity, guiding spirit, or inner voice. Considering in addition that the *daimôn* in Matthew 8:16 is a hapax in the New Testament, we can see that Christian demonology creates a turning point with regard to the Greek and Latin meaning of the term. Thus, in French, *demoygne* appears in the thirteenth century, and *démon* in the sixteenth, which corresponds to just such a change, whereas Anglo-Saxon languages, especially German, remain faithful to the primitive meaning of *daimôn*, as though they held back from fully adhering to this semantic transformation. Moreover, French, like Italian and other Romance languages, furnishes itself with the metonymy assimilating the "Démon" to the "Diable" of the Septuagint Bible.

In these languages, the title of Demon (in the singular) simply reinforces the authority of the leader over his agents and accomplices, the innumerable demons or demonesses and she-devils, among which popular, romantic, and religious imagination places a host of infernal spirits of varying degrees of lewdness: werewolves, incubi, succubi, ghouls (from the Arabic *ġūl* [غول], "demon"), vampires, and so on. In the eighteenth century, these satanic fiends were also called *oupires*, from the Russian *upyr'* [упырь]—and perhaps from the Turkish *uber*, "witch"—whence the first occurrence of the term in Europe, as the German *Vampir*. This monarchy of the Devil or the Demon at the head of a kingdom of evil was already present in Iranian dualism, but unknown in the majority of other Eastern cultures; it is explained by the monotheism on which it is based, in the medieval demonology of the religions of the Abrahamic tradition. Satan represents, in effect, the One God's antagonist, and is characterized in the image of his adversary. Nor is this uniqueness compromised when his medieval mask is removed, and he is transformed into the angelic lord of the revolt by the literary Satanism of the nineteenth century.

In reality, the role that Western imagination assigned to the Devil has, according to Freud, the same origin as that which it assigned to God—the antagonism between the two figures both derive from a single source, namely, the figure of the father. In his study of the "diabolical neurosis" of an Austrian painter in the seventeenth century, Freud shows that the Devil of Christian mythology originally constituted, with God, a single figure, that this unitary being was then divided into "two clearly contrasted opposites"—one good, the other bad—and finally, that this antagonism only reflects the ambivalence, in a cultural deployment, which affects the paternal figure himself. Thus the Devil is "the substitute for the father," according to Freud, and the vocabulary of demonology takes up the tyrannical and cruel aspects of the father figure. What made the troubles of Freud's Austrian painter so memorable was that he reinforced these aspects of the figure of the Devil in his nostalgia for his dead father, by way of a pact with Satan.

DIALECTIC

The history of "dialectic," of the understandings and reinterpretations, of the appraisals and reappraisals, of the term beginning with Plato, Aristotle, and the Stoics, and continuing through the modern age, would by itself be a good account of the history of philosophy. The word, however, travels across competing senses while itself remaining the same, starting with the Greek and by way of its Latin transliteration, through different European languages. For this reason, we will give only an indirect presentation of it here.

1. The Greek *dialektikê* [διαλεντιή] (classified as a *technê* [τέχνη], and sometimes as *epistêmê* [ἐπιστήμη], thus, the craft or science of dialectic) derives from *logos* [λόγος]. It refers to the art of discussion (*dia* [διά], from "dialogue") by question and answer, practiced by Socrates, and thus opposed to long discourses and Sophistic *epideixis* [ἐπίδειξις]; see SPEECH ACT, I. Plato invests the term with great significance; in his hands it designates the practice of philosophy itself, reaching up to the "ideas"; see SPECIES, Box 1, and BEAUTY, MIMÊSIS. For Aristotle it refers to a part of logic, related to the rhetoric of what is probable, in contrast with scientific demonstration; see DOXA. The Stoics bestow upon it the status of a science (and make it a virtue), dealing with language and reasoning, the true and the false, the signifier and the signified; see WORD, SIGNIFIER/SIGNIFIED, and BEGRIFF, Box 1. These terminological tensions among Aristotelianism, Stoicism, and Neoplatonism determine the complexity of medieval usage, notably visible in Augustine's *De dialectica*; see also PROPOSITION. On all of this, obviously, see LOGOS.

2. Beginning with a negative interpretation of Scholastic usage, according to which dialectic is a rhetorical exercise making use of subtleties in formal logic (see *SOPHISM*), the moderns, from Descartes to Kant, see in dialectic an appearance of logic or a logic of appearance; on "transcendental dialectic," the logic of transcendental appearance, see ERSCHEINUNG. The positive re-evaluation is related to the Hegelian and Marxist analysis of the processes at work in the history of being and thought; see AUFHEBEN, PLASTICITY, and GERMAN, ATTUALITÀ, COMBINATION AND CONCEPTUALIZATION, PRAXIS, RUSSIAN, II; cf. *IDENTITY*. *Dialectic* is part of cutting-edge philosophical metadiscourse today; see, for example, CONSCIOUSNESS or CONTINUITET.

➤ EPISTEMOLOGY, OIKONOMIA, PRINCIPLE, SUBJECT, TERM, WORK

DICHTUNG (GERMAN)

ENGLISH   literature, poetry, fiction
FRENCH   *littérature*, *poésie*, *fiction*, *invention*, *affabulation*

➤ *POETRY,* and ERZÄHLEN, *FICTION*, HISTORY, LOGOS, PRAXIS, SPEECH ACT, WORK

The German word *Dichtung* does not, properly speaking, have an equivalent in other European languages, except for those Scandinavian languages that borrowed it. To translate it, English and French must resort to the words "literature" (*littérature*), "poetry" (*poésie*),

or more vaguely, "fiction" (*fiction*). These words certainly get close to the meaning of the German noun but do not nearly exhaust the multiple notions of semantic unrealities (invention, confabulation, poetry). The German language also has the terms *Literatur*, *Poesie*, and *Fiktion*—but *Dichtung*, while it participates in all of these, contains and goes beyond them. This German-specificity confers peculiar density upon *Dichtung,* a sort of closure that was well exploited in German discussions on language, from Herder—who played knowingly on the essentially German character of the word—to Heidegger. Further, in 1973 the Germanist K. Hamburger emphasized that the concept of *Dichtung* is "superior to that proposed by the terminology of other languages, and in the first instance, to the very concept of literature [*Literature*]." By *Dichtung,* the German language tends to define for itself a specific operation of thought and language. The proximity of *Dichtung* with *dicht* (dense, sealed) is therefore not the result of purely accidental homophony. *Dichtung* yields such a dense succession of strata of meaning that the word becomes effectively sealed off from other languages.

I. *Dichtung* and *Dichten*: The Natural Language of Humanity, between Literature, Poetry, and Fiction

Dichtung is derived from the verb *dichten*, which even in the Old High German period had two principal meanings. In the broad sense, firstly, *dichten* means to invent, to imagine, to make up—a meaning that may also have negative connotations. Close to *erdichten* in that regard, *dichten* thus means to invent in order to delude, or to imagine in order to deceive. In the narrow sense, on the other hand, the word refers to the action of conceiving a poem or text so that it may then be written down and read. According to this meaning, the word has a particular predilection for the domain of poetic creation and thus means to versify, to compose a poem (even if the application to prose is not ruled out).

From *dichten*, *Dichtung* inherited its semantic substance as well as its difficulties. Like the verb, the noun has at its core the complex relationship between fiction and reality. In a pejorative sense *Dichtung* relates to the idea of fallacious invention or confabulation, of lying. In a positive sense, however, the term designates the creation of a fictional world, invested with a singular truth. *Dichtung* evokes the creation of an imaginary universe, self-contained, produced by the power of invention of a single individual—the elaboration of an unreal space, in sum, but for all that no less veridical than concrete reality. In this sense *Dichtung* is intimately related to the romantic consecration of artworks. This meaning oscillates between the negative and positive kinds of virtuality of *Fiktion*, but a narrower meaning may be added to it. *Dichtung* may simply designate literary creation in the precise sense of the term, especially poetic creation, hence merging the terms *Literatur* and *Poesie*.

Even though *Dichtung* participates in these three meanings of *Literatur*, *Fiktion*, and *Poesie*, it has nonetheless continuously strived to distinguish itself from them by assimilating unique meanings, born of the historical and philosophical circumstances that created it. The term, in fact, is a recent creation. It is certainly attested from 1561 onward, but only in the 1770s does it make its real and imposing entrance into the German language, even though its verbal template, *dichten*, had existed for centuries (see RT: *Deutsches Wörterbuch*, vol. 2, s.v. "*dichte*" and "*Dichtung*"). Sulzer completely ignores the noun

in the *Allgemeine Theorie der schönen Künste* (General theory of the fine arts), and Adelung cites it as a "new term" in the first edition of his dictionary (see RT: *Versuch eines vollständigen grammatisch-kritischen Wörterbuches der hochdeutschen Mundart*, vol. 1, s.v. "*Dichtung*"). Herder gives us what is essentially the introduction of *Dichtung* to the German language—a paternity that also explains the unique aura that surrounds it. In his 1770 essay on the origin of language, Herder resorts to the hitherto unused word to refer to the faculty of poetic invention that presided over the first language of humanity—this original and natural language that preceded prose. *Dichtung* is "the natural language of all creatures [*Natursprache aller Geschöpfe*]," transposed into images according to which, to cite a later variation on the theme, its source lies in nature (*Über den Ursprung der Sprache*, *Sämtliche Werke,* vol. 5:¶ 56, 1772; *Über Bild, Dichtung und Fabel*, *Sämtliche Werke*, vol. 15:535ff., 1787). Beginning with its birth, then, the notion of *Dichtung* is invested with a triple meaning. It is poetic, original, and natural, to which qualities an ultimate one is added: it is authentic. An idea, in effect, consistently underlies the Herderian usages of the term: the fictional universe to which *Dichtung* relates is no less real than reality itself. It is not opposed to the sensible world but in fact, rather, is its "distillate"—a principle that is given hidden support by the lucky homophonic proximity of the term to the words *Dichte* and *dicht* (density, dense). The idea will be developed in a philosophical mode a little later by Kant (*Kritik der Urteilskraft*, 1790, §53) and then by Schlegel.

> The limit between science and art [*Wissenschaft und Kunst*], between the true and the beautiful, has at this point become so blurred that the certainty of the fixity of these eternal boundaries has been shaken practically everywhere. Philosophy creates poetry [*poetisiert*] and poetry [*Poesie*] philosophizes [*philosophiert*]: history [*Geschichte*] is treated as fiction [*Dichtung*], and the latter is treated as history.
>
> (Schlegel, *Über das Studium der griechischen Poesie* [1795])

■ See Box 1.

II. *Deutsche Dichtung* and *Französische Literatur*

Over the course of the nineteenth century, however, *Dichtung* quickly became loaded with heavy national associations. In a Germany seeking a national identity, it was easy to see how much could be wrought from this specifically German noun, rich in multiple semantic or homophonic connotations and, for these reasons, difficult to translate into other languages. *Dichtung* allowed the German language to refer to a specific mode of intellectual invention, whose products—literature, language, and poetry—became loaded with singular qualities: unmediated relations with nature, original naïveté, poetic inspiration, brilliance, and so on. The Herderian distinction between *Naturpoesie* and *Kunstpoesie*, partially directed against French classicism, was reinterpreted by posterity in the sense of an opposition between a *deutsche Dichtung* and a *französische Literatur*, with the Germanic *Dichtung* designating literary production blessed with originality and

Verum factum and poetic wisdom in Vico

➤ ACT, CIVILTÀ, CORSO, FICTION, GOD, HISTORIA UNIVERSALIS, ITALIAN, RELIGION, TRUTH

In *De antiquissima Italorum sapientia* (On the very ancient wisdom of the peoples of Italy), 1710, one of his first works, Vico affirms that in Latin, "verum et factum convertuntur" (the true and the fact are convertible), and as a consequence *verare* (to tell the truth) and *facere* have the same meaning: "it follows from this that God knows the physical things, and man the mathematical ones" (chap. 1). As early as 1709, in the discourse *De nostri temporis studiorum ratione* (The method of studies of our time), he had written that "the propositions of physics are merely likely," because God alone is able to know Nature, insofar as he created it: "we will demonstrate geometrical things, since we create them; if we could demonstrate physical things, we would create them" (chap. 4).

Vico has a positive use for this metaphysical and epistemological principle, which initially seems to condemn human knowledge to what is merely likely, reserving the title of "science" for mathematicians alone; he uses the principle as the basis of his *Principi di scienza nuova d'intorno alla comune natura delle nazioni* (Principles of the new science concerning the common nature of nations), the first edition of which dates from 1725 and the last, extensively revised, from 1744. In this last text he lays out, in effect, the foundations of the "new science," which he prides himself on having invented, in the following terms:

> But in this night of thick shadows that covers early antiquity, so far away from us, appears the eternal light which is never extinguished of this truth that one can in no way call into question: this civil world was certainly created by men, and as a result we may, because we must, find its principles in the modifications of our human mind itself. Whoever thinks about it can only be surprised to see how all the philosophers have spent their best efforts trying to acquire the science of the natural world, of which God alone, since he created it, possesses the science, and how they have neglected to consider the world of nations, or the civil world, of which men, since they created it, may acquire the science. (*Principles of the new science*, 1744, § 331)

What is the meaning of this famous claim, which has been interpreted in a variety of ways and in which Michelet and many others have wished to discover a "Promethean" proclamation? In fact, Vico's claim is unequivocal: the principles of the world made by man must be sought in the "modifications of [the] human mind." Classically, these modifications are, according to Vico, the modes of the thinking substance—sensation, imagination, and understanding. Vico's originality consists in placing these modes in order, both chronological and logical, in the evolution of humanity (Vico speaks rather of "nations"), as they are manifested and developed in the individual. This means that the fully human man, whose reason is "fully developed" and whose *umanità* is fully realized, has not always existed. He was preceded, rather, and prepared by a man who was practically entirely animal, "immersed in the body," given only to sensation, only to passion, then by a man dominated by a powerful imagination (*fantasia*), that is, a function that is still largely dependent on the body. Vico is primarily interested in this "imaginative" moment, which Descartes and his successors refused to accept, and does not rest with merely rehabilitating the imagination; he gives it a primary role, "poetic," properly speaking—that is, "creative"—in the genesis of the institutions that characterize the humanity of all nations:

> The first men of the pagan nations, as the children of the nascent human race . . . created things by imagining them, which is why they were called "poets," which in Greek means "creators." (Ibid., § 376)

Vico devotes Book II of the *New Science*, entitled *On Poetic Wisdom*, to this "poetic" creation of things. What does this creation, discussion of which occupies almost half the book, consist in? To analyze what we call the "primitive mentality," he uses tools provided by classical poetics and rhetoric (he was a professor of rhetoric), in particular the theory of metaphor and of tropes in general.

> The most sublime work of poetry is to give sensitivity and passion to things that lack sensitivity, and it is characteristic of children to take inanimate things in their hands and, in play, to speak to them as if they were living persons. This philosophico-philological axiom proves that the men of the world were, in their infancy, sublime poets by nature. (Ibid., § 186–87)

Men are therefore sublime poets by nature by virtue of the fundamental axiom according to which "man, because of the indefinite nature of the human mind, makes himself the measure of the universe when he falls into ignorance" (ibid., § 120). Another axiom makes it clear that "men who are ignorant of the natural causes that produce things give things their own nature, when they cannot explain them by similar things" (ibid., § 180). It is thus that man, "by himself, made an entire world [di se stesso ha fatto un intiero mondo]":

> In the same way in which the metaphysics born of reason teaches that "homo intelligendo fit omnia," this metaphysics born of the imagination likewise demonstrates that "homo non intelligendo fit omnia"; and this latter claim may be more true than the first, since man, by understanding, spreads his mind and grasps things themselves, while when he does not understand, he makes things from his own self, and by transforming himself into them, he becomes those things. (Ibid. § 405)

This "metaphysics born of the imagination" is at work in fables and in pagan mythology, of which Vico has an extremely original reading: he distances it from purely literary analyses and turns it into the testimony of the way in which people from the "dark times" understood the natural world and constructed their human world. Poetic metaphysics, in effect, is nothing other than a "theology": "Poetry may be considered as a poetic metaphysics, by which the theologian poets imagined that bodies were for the most part divine substances" (ibid., § 400). The "theologian poets" are the first men, not insofar as they speak poetically of the gods, but rather insofar as they "speak gods," as one speaks a language. Their speech is the "fantastic speech of animate substances, imagined for the most part as divine" (ibid., § 401). These gods are what Vico calls "poetic characters," or again "fantastic universals," that is, "marks" or signs, concrete images allowing people without any capacity for abstraction or universalization to escape the infinite diversity of the sensible world, to perceive stabilities, to have a first experience of the world. By creating gods, men began to think in a human way.

However, one cannot simply create gods with impunity. Vico cites the dictum of Tacitus: "*fingunt simul creduntque* [they imagine, and at the same time, they believe]." This is to say that these imagined gods speak to men, give them orders, make themselves feared by them. The lives and actions of men will be determined by these animated substances that were created by their own imagination. This is what is expressed so well by the story in the *Scienza nuova* of the birth of the first divine "character," the "first of all the human thoughts of paganism," of

(continued)

the first god, Jupiter, a radical event that will place men on the road to the fulfillment of their destiny. In the "immense forest" that has covered the earth since the flood, barely human beings, *bestioni*, wander about without end. Suddenly the first thunderclap rings out.

> Horrified and astonished by this great effect whose reason they do not know, they raise their eyes and pay attention to the sky. And because in such a case the nature of the human spirit is led to attribute its own nature to the effect, and since the nature of these beings was that of men who were only the robust forces of body and who expressed their violent passions by screaming and roaring, they imagined that the sky was a big animate body, which, under this aspect, they named Jupiter . . . and who wished to tell them something through the whistling of the lightning bolts and the noise of the thunder. (Ibid., § 377)

According to Vico, in effect, Jupiter was first named *Ious* by the Latins, after the noise of thunder, and Ζεύς by the Greeks, after the whistling of lightning (ibid., § 447). And he clarifies:

The first men, who spoke by signs, believed according to their nature that lightning bolts and thunderclaps were signs made by Jupiter (this is why "divine will" was called *numen*, from *nuo*, "to indicate with the head"), that Jupiter gave commands by signs, and that these signs were real words [that is, having the character of "things"], and that nature was the tongue of Jupiter. (Ibid., § 379)

Thus was imagined "the first divine fable, the greatest of all that were imagined later, that of Jupiter, king and god of men and gods, casting a lightning bolt: a fable that was so popular, so troubling, and so instructive that even those who invented it believed it, and with dreadful religious practices . . . feared him, revered him, and honored him" (ibid., § 379).

The effects of this initial fear are religion, family, property, the law, cities (first aristocratic, then popular, finally monarchical), until such time as "fully developed reason" should rule. Having reached this point, however, nations risk losing the "poetic" force, which Vico also calls "heroic," and which allowed the birth of the civil world. Cynicism, skepticism, materialism, and atheism thus led to the dissolution of social bonds and to "barbarity of thought." Thus begins a new

corso, a *ricorso*, which will run through the same stages whose succession constitutes the "eternal ideal history" (see CORSO).

authenticity, while the Latin-derived *Literatur*, on the other hand, evoked artifice and complexity.

These diffuse connotations, implicit in use but rarely mentioned in the dictionaries, are what explain the remarkable ascent of the term in the German lexicon between 1770 and 1850. Still largely dominated by its rivals, *Poesie* and *Literatur*, at the end of the eighteenth century, *Dichtung* appears to have completely supplanted them by the middle of the nineteenth century. The process was tentative at first. Thus, only in the second edition of the essay *Über naive und sentimentalische Dichtung*, in 1800, does Schiller decide to introduce the word *Dichtung* in the title; the term itself, as it happens, is noticeably rare in the actual work. The publication, starting in 1811, of Goethe's autobiography, *Dichtung und Wahrheit* (usually translated into French as *Poésie et Vérité*), marks an important stage in this ascent: the word *Dichtung* is, according to the author's repeated declarations, complementary rather than in opposition to the word *Wahrheit*. "Therein lies all that results from my life, and each of the facts recounted here only serves to support a general observation, *a higher truth* [*eine höhere Wahrheit*]" (Eckermann, *Gespräche mit Goethe*, 30 March 1831). Already by 1787, in the poem *Zueignung*, Goethe had described himself as receiving "the veil of poetry from the hand of truth [der Dichtung Schleier aus der Hand der Wahrheit empfangen]" (v. 96). The growing success of the term is confirmed by Hegel, who, in his *Lectures on Aesthetics* given between 1818 and 1829, baptizes *Dichtung* as the third "romantic" art (the others being music

and painting). In 1853 G. G. Gervinus reedits a history of German literature, originally published in 1835–42 as *Geschichte der poetischen Nationalliteratur der Deutschen*, with the new title of *Geschichte der deutschen Dichtung*. It is under the name of *Dichtung* rather than that of *Literatur* or *Poesie* that German literary production reaches a veritable historical consecration in the nineteenth century.

Very often used between 1900 and 1950, from Dilthey to E. Staiger by way of T. Mann or J. Petersen, the word nonetheless seems to undergo a decline in the second half of the twentieth century. The very connotations that had been the basis of its ascent rendered it suspect in postwar Germany. In 1973 the Germanist Rüdiger pleads on that basis for the proscription of the term from scientific usage and suggests replacing it with the wider, more neutral term *Literatur* ("Was ist Literatur?"). Restricted to the henceforth abandoned tradition of belles lettres, *Dichtung* seems moreover to be too tarnished with romantic holiness and nationalist connotations. This abandonment, clear in usage and sanctioned by dictionaries, did not take place without some resistance, as indicated by Hamburger's plea ("Das Wort 'Dichtung'"). It is worth noting that the term, though abandoned by literary types, is given a central role by the philosopher Heidegger, even in his last works.

■ See Box 2.

Although *Dichtung* certainly takes its meaning from a conceptual network peculiar to Heideggerian language, it is

2

Heidegger's *Dichtung*: Poetry and thought

The term *Dichtung* begins to stand out beginning with § 34 of *Sein und Zeit* (*Being and Time*, 1927), in a way that is still discreet, but whose importance should not, according to Hermann ("Poétiser et penser…," 2000, p. 78), be overlooked:

> Die Mitteilung der existenzialen Möglichkeiten der Befindlichkeit, das heißt das Erschließen von Existenz, kann eigenes Ziel der "dichtenden" Rede sein. (*Sein und Zeit*)

> La communication des possibilités existentiales de l'affection, autrement dit l'ouvrir de l'existence, peut devenir le but autonome du parler "poétique." (The communication of the existential possibilities of affection, in other words the opening of existing, can become the autonomous goal of "poetic" language.) (*Être et Temps*)

> La communication des possibilités existentiales de la disposibilité, c'est-à-dire la découverte de l'existence, peut être la fin que se fixe la parole qui "parle en poème." (The communication of the existential possibilities of arrangeability, that is the discovery of existence, may be the end that is set for itself by the word that "speaks in poems.") (Fr. trans. F. Vezin)

The quotation marks surrounding the term *dichtend* (poetic, speaking in poetry) are at least the formal indication of a completely new way of approaching poetry, such that it is no longer subordinate to but coordinate with thought: poem and noema. Such a gesture supposes a return to the revelatory character of *Dichtung* and a distinction between *Dichtung* in the strict sense ("poetry") and in a wider sense.

The return to the revelatory character of *Dichtung* can be accomplished, but in fact it is rather rarely the case, in light of the etymology of the term, which suggests a distinction into four stages, as the following text shows:

> "Dichten"—was meint das Wort eigentlich? Es kommt von ahd. tithôn, und das hängt zusammen mit dem lateinischen *dictare*, welches eine verstärkte Form von *dicere* = sagen ist. *Dictare*: etwas wiederholt sagen, vorsagen, "diktieren," etwas sprachlich aufsetzen, abfassen, sei es einen Aufsatz, einen Bericht, eine Abhandlung, eine Klage—oder Bittschrift, ein Lied oder was immer. All das heißt "dichten", sprachlich abfassen. Erst seit dem 17. Jahrhundert ist das Wort "dichten" eingeschränkt auf die Abfassung sprachlicher Gebilde, die wir "poetische" nennen und seitdem "Dichtungen." Zunächst hat das Dichten zu dem "Poetischen" keinen ausgezeichneten Bezug. . . .

> Trotzdem können wir uns einen Fingerzeig zunutze machen, der in der ursprünglichen Wortbedeutung von *tithôn—dicere* liegt. Dieses Wort ist stammesgleich mit dem griechischen *deiknumi*. Das heißt zeigen, etwas sichtbar, etwas offenbar machen, und zwar nicht überhaupt, sondern auf dem Wege eines eigenen Weisens. (Heidegger, *Hölderlins Hymnen*)

Dichten—what does that word actually mean? It comes from the Old High German *tithôn* and is related to the Latin *dictare*, which is an intensified form of *dicere* = to say. *Dictare*: to say something repeatedly, to say out loud, to "dictate," to set something out in speech, to compose, whether it is an essay, a report, a treatise, a complaint—or a request, a song, or whatever. All of this is called *dichten*, to express linguistically. It is only in the seventeenth century that *dichten* was restricted to the composition of pictures in language, which we call "poetic," and since then *Dichtungen* (poems). Originally *dichten* had no privileged relation to the "Poetic." . . .

Nevertheless, we can make use of a quick indication contained in the original meaning of the word *tithôn*. This word has the same root as the Greek *deiknumi*. This means: to show, to reveal, to make visible or manifest, and not as a general revelation but as an indication leading up to a specific path. (Ibid.)

Whence the necessity of distinguishing wide and strict senses of *Dichtung*. In the strict sense, which thus corresponds to its modern meaning dating from the seventeenth century, *Dichtung* is equivalent to *Poesie* (poetry), that is, one art among others, which Heidegger calls "a mode among others of the project of clarifying the truth" (*Pathmarks*). In the wide sense *Dichtung* is this very "project of clarifying the truth" in all its fullness—what Heidegger also calls *Dichten*, to poetize (ibid.): poetry comes from the Poem, as do architecture, sculpture, or music. Every work of art is thus a Poem, insofar as it is rooted in the deployment or the domain of the word, which is only *Urpoesie* (primordial poetry), in its turn by virtue of being a Poem (ibid., 84).

nonetheless worth recalling that it is not to be understood solely within the bounds of that philosophy. The word brings with it a semantic history—of which Heidegger is highly conscious—beginning with Herder in the eighteenth century and still resonating with nationalist sentiments about the genius of the German language expressed in the nineteenth century.

DICTUM / ENUNTIABILE (LATIN)

ENGLISH   stateable
FRENCH   *dictum, dit, énoncé; énonçable; exprimable*
GREEK   *lekton* [λεκτόν]

➤ PRÉDICABLE, PREDICATION, PROPOSITION, SACHVERHALT, SIGN, SIGNIFIER/SIGNIFIED, TRUTH, WORD

The terms *dictum* and *enuntiabile* are used, beginning in the twelfth century, to indicate of a proposition "what it says" or "what it may state." This begins with a series of questions that are not only semantic in nature (do propositions have a signification, like words, and if so, of what nature—real or in the world or in the mind), but also logical (the problem of truth-bearers), and ontological (the problem of what makes a proposition true). Further, a host of different questions of a theological nature arise as well; when we inquire as to the nature of divine knowledge, which is necessarily eternal (if God knows eternally that *P*, what is *P*?)

I. *Lekton* and *Dictum*

Seneca uses the terms *effatum*, *enuntiativum*, *enuntiatum* in a passage from letter 117 (117.13; RT: *Die Fragmente zur Dialektik der Stoiker* 892), to characterize what is in fact only a subgroup of *lekta*, (a) those that are complete, and (b) those that are capable of being true or false, that is, assertions or *axiômata* (see SIGNIFIER/SIGNIFIED, PROPOSITION).

The term *dicibile*, as used by Augustine in the *De dialectica*, cannot be considered a translation of *lekton* for two reasons: first, Augustine focuses his discussion on the basic unit, the word, *dictio*, whence the use of a term formed from the same verb *dicere*, that is, *dicibile*, whereas the Stoic *lekton* is not necessarily simple. Second, the *lekton* is more often than not a thought insofar as it is expressed by words. Augustine, however, defines the *dicibile* as something that exists in thought before being expressed (*ante vocem*), that can be expressed, and that is created in the mind of the hearer by the sign (see WORD, Box 3). *Dicibile* seems rather to translate the Greek *ekphorikon* [ἐκφορικόν], as used by the Stoics (see Nuchelmans, *Theories of the Proposition*). The claims of equivalence between *lekton* and *dictio* or *dictum* are isolated and derive from Isidore of Seville (*Etymologiae*, 2.22.2: "nam *lekton* dictio dicitur"), followed by Alcuin, who explains that dialectic deals with *dicta*, then in the twelfth century, by Jean of Salisbury in the *Metalogicon* (2.4: "*lekton* greco eloqui [sicut ait Isidorus] dictum appellatur"). The latter only appeals to Augustine's *De dialectica* in order to align the Boethian triad of *vox-intellectus-res* with a supposedly Augustinian triad

of *diction-dicibile-res*, and the omission of the fourth term, *verbum*, completely distorts the sense of the original (*Metalogicon*, 3.5: "Est autem res de quo aliquid, dicibile quod de aliquo, dictio quo dicitur hoc de illo").

II. Abelard and *Dictum*

Whereas Abelard gives *dictum* a technical sense in the exposition of his theory of propositions, as we will see, the term *enuntiabile* becomes generalized a bit later, both in logic and in theology. An author from the end of the twelfth century considers it a novelty in his time:

> In reading and rereading Aristotle and Boethius, I have not found a single passage in which it is written that the true and the false were "statable," or inversely, and Aristotle has always taken "statable" for "predicable," saying "statable of something", i.e., "predicable of something," and "to be stated" for "to be predicated," from which it follows that the proposition is the statement of something about something [Aristotle, *De interpretatione*, 5.17a 25–27, *translatio Boethii*, *Aristoteles latinus* II, 1–2].

Later, both terms were perceived as equivalent (cf. *Ars Burana*). They have distinct histories, however, which are divided into two periods in which different problems are discussed.

We should note, first of all, that the discussions of *dictum* or *enuntiabile* are related to the existence in Latin of infinitive clauses. "Socrates currit" says that Socrates runs; the infinitive "Socratem currere" (or the completitive "quod Socrates currit") is the name (*appellatio*) of what the proposition (*dictum*) says. The statable is "called" by the "appellatio dicti" ("hominem esse animal") (just as the individual Socrates is called by the proper name Socrates), and "signified" by the proposition ("homo est animal"). One may speak of modality *de dicto*, when the modality bears on the *dictum*, in contrast with modality *de re*: "Socrates currit est possibile" according to the *de dicto* interpretation signifies "(that Socrates runs) is possible"; or the *de re* interpretation, "Socrates can run." A single phrase may naturally be capable of different truth values depending on the interpretation given to its modality. Thus, to take a Sophistic example, "possibile est stantem sedere" is false *de dicto*: it is impossible for the proposition "he who is standing is sitting" to be true; on the other hand, the same proposition is true *de re*: the "thing" that is standing can certainly sit. Classical Latin tended to prefer infinitive clauses, with the subject in the accusative, for the *de dicto* interpretation—"Dicitur Homerum caecum fuisse"—and the attribute in the nominative, constructed with the infinitive, for the *de re* interpretation: "Homerus dicitur caecus fuisse." In medieval Latin, logicians considered the first example to be capable of two interpretations. There are various possibilities for translating the infinitive clause: one may use the complement clause ("it is possible that Socrates runs"), but then we lose the distinction with the Latin complement phrase as well as its status as a nominal phrase, or a gerundive phrase ("Socrates-running is possible").

The introduction in the beginning of the twelfth century of the notion of *dictum* is motivated by logico-grammatical questions. Abelard is inquiring as to the nature of the declarative proposition, to demonstrate that what characterizes

it cannot be its meaning: in effect, "Socrates currit" means the same thing as "Socratem currere" or "Socratem currens," and we find in each the expression of the inherence of a quality in a subject. All of these expressions involve "complex intellections," though this point was not unanimously agreed upon at the time. What characterizes the first is that it says (*dicit*) or "proposes" (*proponit*) something, that something is the case ("state" in English is a good approximation; see PROPOSITION). These expressions mean the same thing, have the same intellection (*intellectus*), but only the first has a *modus enuntiandi* or *modus proponendi*. A proposition thus signifies a complex intellection, composed of the intellections of its categorematic parts, but beyond this, "says" or "poses" its *dictum*. For Abelard, the statement of a declarative sentence (such as "Socrates est albus") corresponds, in effect, to a threefold action of the intellect, consisting in focusing one's attention on something (Socrates), on a quality (the individual whiteness), and associating the two objects by a further act. For this reason, Abelard maintains that the *dictum* is "not absolutely anything," that it is "not a thing": in effect, if a proposition (understood here as a significant sequence) speaks of things ("agit de rebus") and not intellections of words, what it says is not a thing, but rather corresponds to the way in which the intellect puts things in relation to one another, or in which it posits their existence. Only as a subsequent step, by confronting what the proposition says with the state of things ("eventus rerum" or rei, "esse rei," "status rerum" or rei, "natura rerum"; cf. "natura rerum ex qua veritatem vel falsitatem [propositiones] contrahunt [the nature of things from which propositions take their truth or falsity]; *Glossae super Peri hermeneias*), may the *dictum* be declared true or false ("Et est profecto ita in re, sicut dicit vera propositio, sed non est res aliqua quod dicit [It is indeed thus with things [or with reality] as the true proposition says, but what the proposition says is not a thing]"; *Dialectica*). The *dictum* is thus not the state of things, that is, the truth-maker, but the truth-bearer, which can receive the predicates "true" and "false." It is not itself a "something" since the intellect may liberally "posit" relations between things, or, in other terms, put forward a hypothesis about things, whether things are as it says or not. I may just as easily say "Socrates est homo" (Socrates is a man) as "Socrates est lignum" (Socrates is wooden): each of these propositions says something—has a *dictum*—and the "existence of things" said by the proposition are no more a part of reality in the first case than in the second. The proposition is true when what it posits corresponds to what is ("Omnis enim propositio vera dicitur, qui ita est in re, ut proponit"; *Glossae super Peri hermeneias*). The expression *eventus rerum* contains a remarkable ambiguity, in fact, as Abelard explains in a discussion of future contingents (*Glossae super Peri hermeneias*). In one sense, it relates to reality as it exists, to the things as they come about ("res ipsas quae eveniunt"), independently of the way in which they are conceived or spoken of, to the objective "event" (in the sense of what "happens" or "occurs"; *evenit*), which makes the proposition true or false ("veritas propositionum ex eventu rerum pendet"). In another sense, the expression relates to reality as we speak of it ("id totum quod propositio dicit") and which in that sense has no reality other than that of being said: it is the event as it is posited by the proposition or *eventus propositionis*

(cf. "If someone says, for example, *Socrates will eat* or *will die tomorrow*, he posits an indeterminate event which the nature of things can in no way make certain for us [indeterminatum eventum proponit de quo scilicet nulla natura rei cujusquam nos certificare potest]; "eventus proprie dicimus dicta propositionum"), and it is in this sense that the *dictum* is "nothing at all."

Even if the terms *dictum* and *enuntiabile* are sometimes seen as equivalents, it is often noted that the second has a nuance of potentiality that the first lacks (whence its translation as "stateable," correlative with "statement" for *enuntiatio*, in Lewis, "William of Auvergne's account of the *enuntiabile*"): "The stateables, according to the *Ars Meliduna* (ca. 1170) are what propositions signify; they are thus called in virtue of the fact that they are stated or apt to be stated." The anonymous author can thus claim that the *enuntiabile* remains true even if it is not stated, even if there were no longer any expression for stating it, since it would still be possible to "impose" a new *vox* in order to state it: "the stateable, in effect, is not so-called according to the act, but according to aptitude (non ab actu, sed ab aptitudine)." Thus, whereas Abelard's *dictum* resembled a conception of the proposition as an "act" or "statement," the *enuntiabile* is better placed alongside the objectified and independently existing propositions of the Fregean tradition. That said, the nature of the *enuntiabile* varies greatly from theory to theory, but these differences are related to a problem that is not strictly logical.

III. The Question of Divine Knowledge

The theological implications of the notion of *dictum* become apparent when we inquire, as Robert de Melun does, as to the eternal nature of *dicta*: if *dicta* exist for all eternity, this implies that something other than God himself is eternal. That unfortunate implication was the object of lively debate until the end of the fifteenth century, in the wake of the Parisian condemnations of 1241, when William of Auvergne declared that it was forbidden to teach "quod multae sunt vertates ab aeterno quae non sunt Deus" (that there are a large number of eternal truths distinct from God). In the twelfth century, the notions of *dictum* and *enuntiabile* were used more specifically to discuss the problems related to the immutability of divine knowledge, power, and will. Although he does not use the notion of *dictum* developed in his logic textbooks, Abelard is the first to introduce a thesis often considered characteristic of nominalism, called *semel/semper*: what God knows once, he knows forever, since "what is true once, is true forever [quidquid semel est verum, semper est verum]." The term *dictum* designates the object of knowledge among his contemporary theologians, who are also divided as to the nature of the *dictum* or *enuntiabile*, its truth, and its changeless character. The Nominales think that stateables are the objects of divine knowledge, that, once true, they are always true, and are thus independent of time. A single stateable-type (e.g., "Christ is born") uttered at t1 (before the birth of Christ), t2 (at the moment of Christ's birth), t3 (after Christ's birth), corresponds to three different stateables (a given stateable associates Christ and his birth at a given time, and so if it is true at a given moment, it will always be true). A single stateable ("Christ is born") is expressed at different moments in time by three statements, at t1 by "Christ will be born," at t2

by "Christ is born," and at t3 by "Christ has been born." On the other hand, the Reales think that the objects of divine knowledge are the *res*, and that the stateables vary in their truth conditions. Subsequently, the analysis of propositions expressing divine knowledge (e.g., "Deus praescivit Antichristum esse") is expanded to include propositions containing a belief-verb, and thus return to the domain of logic.

There are multiple opinions as to the nature of an *enuntiabile*: several are mentioned by the *Ars Meliduna* (see De Rijk, *Logica modernorum*; Iwakuma, "*Enuntiabilia*"). The differences turn on (a) the simplicity or complexity of their nature, (b) the nature of what is composite: *terms* (mental, spoken, or written), or the *things signified* by these terms; (c) their eternal or temporally bound character; (d) their mode of existence: some posit that they do not exist (cf. Abelard), others that they do; for the latter, they are therefore things (*res*), but some consider them to be substances, others accidents, and still others consider them "extracategorial" (*extrapredicamentale*) entities, enjoying their own distinct mode of existence, as universals do.

While there is no clear path from the Stoic *lekton* to the medieval *dictum* or *enuntiabile*, the doctrinal relations between these notions are not evident either. We may note, however, that when Seneca associates the *lekton* with *quod nunc loquor* (what I say now), he is close to Abelardian formulations of *dictum* as "what the proposition says." There is nothing mental about Abelard's *dictum*, however: it is precisely by explaining that the predicates "true" and "false" cannot apply to either words or intellections that he is able to show that they apply to *dicta*. These *dicta* are more on the side of things, even if they are not existent things: just as names have a signification in thought (a simple intellection) and a signification in things, propositions have a signification in thought (a complex intellection) and a *dictum*. As for subsequent theories, we have seen that at the ontological level, the *dictum* or *enuntiabile* may be of different natures, real or mental, depending on the theory.

IV. The "Complexly Signifiable"

In the fourthteenth century, *dictum* and *enuntiabile* are replaced by the notion of the "complexly signifiable," *significabile complexe* (Gregory of Rimini) or "signifiable by complex," *significabile per complexum* (Adam Wodeham), that is, what is signifiable only by a linguistic *complexum* (an infinitive clause, or what English-speaking logicians call a "that-clause," in German, *Daß-Satz*). Since Hubert Élie, the "complexly signifiable" has been considered a medieval formulation of the notion of a state of affairs (*Sachverhalt*), interpreted more or less in a realist sense, making it related to Meinong's *Objektiv* (see SACHVERHALT). That is how its medieval adversaries understood it; using the support of the condemnation of 1241, they accused those who accepted the *significabile complexe* of maintaining that *mundum fore* ([the fact] that the world would exist) and *Deum esse* ([the fact] that God exists) have been throughout eternity, "without being God." This interpretation does not take account of all aspects of the theory, however. Gregory of Rimini affirms, as Abelard sometimes does, that the *significabile complexe* is "nothing"—that it does not exist. This claim suggests that the "signifiable by complex" cannot be something in the world that would make true a

truth of any sort (contingent or necessary). But the claim can only be fully understood by noting that Gregory's goal is not, contrary to what is often said, to build a nominalist theory of the proposition (or, a fortiori, a "realist" one), but only to explicate the notion of *notitia judiciaria* (judicial knowledge) of God. The difference between "things" and *Sachverhalte* may be confirmed in Gregory's thought only insofar as it is fundamentally related to the problem of divine knowledge. That being the case, two incompatible semantic theories confront one another over the "signifiable," whose "offspring" are still observable at the end of the nineteenth and beginning of the twentieth centuries. One, standard "reductionist" nominalism, distinguishes *truth-maker*, the individual thing signified by the subject term, and *truth-bearer*, the *token* proposition; the other, that of Gregory of Rimini, ultimately identifies *truth-maker* and *truth-bearer* in the form of the "complexly signifiable," called "true" or "false" by an "intrinsic denomination" on the basis of the uncreated Truth.

Take, for example, Mark 14:40: "Verily I say unto thee, That this day, [even] in this night, before the cock crow twice, thou shalt deny me thrice." Was the corresponding stateable, that is, "Petrum esse paccaturum in A" (that-Peter-would-sin-at-time A) true for all eternity? Gregory sets aside the hypothesis according to which the "created statement," the oral proposition reported in Mark 14:30, would have been true for all eternity: since it did not exist for all eternity, it could not have been true for all eternity. As for the stateable that the proposition states, he distinguishes "being for all eternity" from "being true for all eternity." If the proposition of "created statement" had existed for all eternity (which is not the case), it would be true for all eternity, but contingently so. The complexely signifiable "Petrum esse peccaturum in A" was, on the other hand, true for all eternity, but it was neither eternal nor everlasting. The importance and the meaning of the thesis affirming the non-existence of the *significabile complexe* here clearly appear. The complexly signifiable "is nothing": it is not and never was an "entity by itself." It cannot therefore be or have been for all eternity. On the other hand, the "signified complex" of Mark 14:30 was true for all eternity, not necessarily, but contingently, "by an extrinsic denomination coming from the uncreated Truth and from the eternal judgment of God judging that 'Peter-would-sin-at-time A.'"

The expression "extrinsic denomination" derives from a widely used medieval distinction between two types of denomination, that is, paronymic attribution (see PARONYM): (a) formal denomination in which what gives the name is in what is named "as in a subject"—this is the case with the whiteness that denominates *x* in "*x* is white," and (b) causal denomination, in which what gives the name is in the agent or efficient cause, not in the patient—this is the case with the thought or intellection that the thinking mind has of it in "*x* is [a] thought" or "*x* is thought." The thought is "as in a subject" with respect to the thinking mind, not what is thought. This second type of denomination is what Gregory calls "extrinsic denomination." The truth of the stateable relative to Peter's sin is thus in the first instance, and causally speaking, in God, who makes the judgment—in his judgment or act of judging; it is only an attribute of the stateable in an external, "paronymic" way. It

is insofar as it is judged by the primary Truth that the stateable is called "true" and hence also "true for all eternity." The structure of "extrinsic denomination" expresses a central thesis of Gregory's ontology: the alethic modality "true" is an attribute of the Judge and his eternal act of judging, not of the object of judgment or its content, which are all called true by causal denomination (Gregory of Rimini, *Lectura*, I, d. 38, q. 2). In other words: a stateable is called "true" paronymically by extrinsic denomination on the basis of the primary uncreated Truth and its eternal judgment, and, in turn, this stateable, which is not itself an "entity," is what verifies our own judgment, our own propositions. There are thus two stages of correspondence, or "rightness," for a true stateable according to Gregory: a stateable is true insofar as it corresponds to the act of divine judgment, and it is that to which thought makes itself correspond ("consents," "acquiesces," or "assents") when it judges—what makes judgment and proposition true. The second correspondence brings the Gregorian theory close to the phenomenological theory popularized at the beginning of the twentieth century by Anton Marty, who redefines truth (see TRUTH)—in Latin—as "adaequatio cogitantis et cogitatum" (correspondence of the thinker with the content of thought), instead of "adaequatio rei et intellectus" (correspondence between the thing and the intellect). The "complexly signifiable" is, as we can see, an important element in the genealogy of the theory of *Sachverhalte*.

| DISCOURSE

"Discourse" is a transposition of *discursus*, from the Latin *discurrere* (to run here and there, run through in all directions). *Discursus* acquires the sense of "conversation, dialogue" rather late, following a metaphor that highlights the hazardous nature of verbal exchange (RT: *Dictionnaire Historique de la Langue Française*). Philosophers, however, focus on the order and method with which propositions and thoughts succeed one another: "discursiveness" implies entailment and correct reasoning, and practically becomes a synonym for "rationality."

It is thus that "discourse" is one of the received translations for the Greek *logos* [λόγος], which is just as well translated by "reason," although *logos* refers as well to each of the elements that compose language: see LOGOS.

I. Discursiveness, Rationality, and Humanity

Discursiveness, as a faculty and exercise of language and reason, is conceived (explicitly by Aristotle) as peculiar to man: see, besides LOGOS (under which, notably, the Hebrew *dābār* [דָּבָר] and the German *Sprache, Rede,* are also discussed), CONSCIOUSNESS, *DIALECTIC,* DICHTUNG, HOMONYM, II.B, *HUMANITY, REASON* [CONCEPTUS, INTELLECT, INTELLECTUS, UNDERSTANDING], TRUTH; cf. BILDUNG, GEISTESWISSENSCHAFTEN, PLASTICITY, SUBJECT.

DISEGNO (ITALIAN)

ENGLISH	design, drawing
FRENCH	*dessein*, *dessin*
GERMAN	*Zeichnung*
LATIN	*designo*

➤ *DESSEIN, DESSIN,* and ART, BAROQUE, CONCETTO, *IDEA, IMAGE,* INGENIUM, INTENTION, SIGN

Disegno is one of the major concepts of the Renaissance theory of art. It means both design and project, outline and intention, idea in the speculative sense as well as in the sense of invention. It thus refers to a thoroughly intellectual activity. The French word *dessein,* as used by theorists of art in the seventeenth century, is an adequate translation of the Italian meaning of *disegno* as used in the preceding century, and preserves its double meaning, but the distinction between *dessin* and *dessein* (design and drawing), which comes into use around the 1750s, yields a fundamental break with the Italian tradition. In the eighteenth century, Racine may still write, "le dessein en est pris, je pars cher Théramène" (the plan is made, I am leaving, dear Theramenes), but from that time on at the Académie Royale of Painting and Sculpture, the arts of "dessin" were taught, but not of "dessein." The two semantic fields that were unified in *disegno* are separated from then on in French, as in English and German.

I. From *Disegno* to *Dessein* and *Dessin*, to "Design," to *Zeichnen*

In the seventeenth century, what the French now call *dessin*, that is, the part of painting that is distinct from color, was always written *dessein*, sometimes even *desseing*. It is derived from the Italian *disegno*, and it kept all the richness of the Italian word. Antoine Furetière defines it thus in his RT: *Dictionnaire universel*: "Project, enterprise, intention. . . . Also, the thought one has in the imagination of order, of the distribution and construction of a painting, a poem, a book, a building. . . . Also said in painting of images or paintings that are without color." There is no homonymy here, however. When used about painting, *dessein* means something more but not something different. Though it has a specialized usage, it continues to signify the project or intention. The word expresses here in the most explicit way what the thing is for the artist, an art theorist, or an expert on the seventeenth century. It implies a certain way of thinking about drawing, as the realization of a design—that is, an intellectual project. The word *dessin*, which would be substituted for it a century later has a much narrower meaning, restricted to the last sense given by Furetière. It no longer

evokes a necessary relation between the drawing and the thought. The loss of a letter thus does not simply lead to a loss of meaning. Rather, it corresponds to a genuine semantic mutation that implies a completely different conception of drawing than that which the French took over from the Italians. Since *dessein* became *dessin*, French no longer has an equivalent to *disegno*. Several words are henceforth required to say in French what a single word, faithful to its Italian roots, said in the seventeenth century through several meanings. This is why the modernization of spelling in the publication of French texts on the art of the seventeenth century actually leads to serious confusions of meaning.

The same is true for English and German, which borrow from different lexica in order to say either drawing or intention. English thus distinguishes "drawing," in the sense of an outline, from "design," which corresponds to the French *dessein* and thus retains a part of the semantic field that the Italian *disegno* covered. In fact, it was starting with the Italian word that Anthony Ashley Cooper, Earl of Shaftesbury, constructed the concept of design, which he is the first to have introduced into English (*Letter Concerning the Art, or Science of Design*, 1812). Faithful to the double meaning of the Italian and French words, Shaftesbury constantly plays on the senses of "design" as the unity of a project and as a drawing. In this sense, "design" is a pure translation of *disegno* and *dessein*. As in French, however, the two meanings come apart very quickly in English, and the separation arises from the same transformations in the theory of art. The double meaning of conception and execution nevertheless reappears in the modern and worldwide usage of "design" today, as referring in all languages to a certain kind of industrial art coming out of the Bauhaus tradition. In German, *Zeichnung* (drawing) is not related to the terms for intention or intellectual projects either, terms such as *Absicht* or *Entwurf*. Like *disegno*, which comes from *signum*, *Zeichnen* derives from *Zeichen*, which means sign. It can mean a plan or project, but only in a material sense (for example, an architectural plan), not in a purely speculative sense like *disegno* and *dessein*. The fact that *Zeichnen* is derived from *Zeichen* (sign), that it is related to *bezeichen* (designate), indeed to *zeigen* (to show), may justify the strongly logocentric presuppositions of some contemporary research on the nature of pictorial images. Thus, Walter Benjamin, in a text entitled "Über die Malerei oder Zeichen und Mal," builds his definition of painting using *Zeichen* as the source from which *Zeichnen* is a sort of derivative product, akin to a stain or spatter (*das Mal*). This means that all figurability would in the end be predetermined by a *Zeichen*, that is, an act of naming (*Benennung* or *Benennbarkeit*), such that the end of all figuration would be referred implicitly and necessarily to the word as such (*Ästhetische Fragmente*, in *Gesammelte Schriften*, 2:603f.).

The lexical distinctions that exist in English and German thus make a mockery of any attempt to translate *disegno* in the sense intended by the Renaissance writers. Conscious of this difficulty, historians and art theorists tend more and more to keep the Italian word without attempting to translate it into their own language, and speak of Raphael's *disegno* or Vasari's definition of *disegno*.

II. *Disegno* in the Renaissance

Disegno certainly has the sense of "drawing" in the Renaissance, as in Benvenuto Cellini, who distinguishes between several types of *disegni*, each corresponding to a *modo di disegnare* (Barocchi, *Discorso sopra l'arte del disegno*, 8:1929). Like *disegnare* however, which means both to draw and to formulate a plan, *disegno* embeds the notion of drawing in a special configuration, made up of a twofold network of meanings that overlap with one another. *Disegno* is in a way a topical term that refers to the spread of this entanglement. To indicate drawing in the sense of line, outline, or contour, the theorists use other terms, notably *circonscrizione*, which we find, for example, in Leon Battista Alberti's *De pictura* (It., *Della Pittura*; Eng., *On Painting*). In the first version of the treatise, published in Latin, Alberti writes, "Nam est circumscriptio aliud nihil quam fimbriarum notatio" (Circumscription is nothing other than the notation of contours) (trans. C. Grayson, *De pictura / On Painting*). When he adapts his text into the vernacular a short time later, Alberti translates *notatio* as *disegnamento*—"la circonscrizione é non altro che disegnamento dell'orio"—which goes into English as "Circumscription is nothing but the drawing of the outline" (trans. J. R. Spencer, *Della Pittura Della Pittura / On Painting*, 68). *Disegno* is thus not *circonscrizione*, nor *linea*, nor *orlo*, even if it implies all of these. It is not drawing. *Disegno* brings drawing into a completely different semantic field from that to which its properly physical characteristics belong. It means drawing as an expression of a mental representation, of a form present to the mind or imagination of the artist. Giorgio Vasari defines it thus:

> This is like the form (*forma*) or idea (*idea*) of all the objects of nature, always original in its proportions. Whether it is a matter of the human body or those of animals, plants or buildings, sculpture or painting, one grasps the relation of the whole to its parts, the parts amongst each other and with the whole. From this grasping (*cognizione*) a concept (*concetto*) is formed, a reason (*giudizio*) engendered in the mind (*mente*) by the object, the manual expression of which is called drawing (*disegno*). The latter is thus the perceptible expression, the explicit formulation of a notion internal to the mind or mentally imagined by others and developed as an idea [si pu conchiudere che esso disegno altro non sia che una apparente espressione e dichiarazione del concetto che si ha nell'animo, e di quello che altri si è nella mente imaginato e fabricato nell'idea].

> (trans. L Bondanella and P. Bondanella, *The Lives of the Artists*)

By linking *disegno* to *forma*, *concetto*, and especially to *idea*, this text illustrates the way in which the Renaissance used the categories inherited from the rhetorical tradition, and, through it, Aristotle's philosophy, in order to develop a new theory of art. As Panofsky showed, the meaning of "idea" among art theorists results from a transformation of the idea into an ideal, which derives from the passage in Cicero's *De oratore* in which he defines the Platonic Idea as a form, an interior model existing prior to and informing its realization:

> As, therefore, in mere bodily shape and figure there is a kind of perfection, to whose ideal appearance every production which falls under the notice of the eye is referred by imitation; so the semblance of what is perfect in Oratory may become visible to the mind, and the ear may labour to catch a likeness. These primary forms of thing are by Plato (the father of science and good language) called Ideas.

> (trans. E. W. Sutton and H. Rackham, *De oratore* [On the orator])

Giovanni Pietro Bellori, indeed, defines "idea" in the following way, just before citing the same passage from Cicero: "The idea of the painter or the sculptor is this perfect and excellent model in the mind which things before our eyes resemble, since they imitate the imagined form" (Idea del Pittore et scultore é quel perfetto ed eccellente esempio della mente, all cui immaginata forma imitando si rassomigliano le cose, che dadono sotto la vista) (trans. A. Sedgwick, "Idea of the Painter," in *The Lives of the Modern Painters*). *Disegno* is not just "idea," however; it is also, as Vasari says, the perceptible expression of the idea. The difficulty we may have in grasping the problem of *disegno* in its full complexity derives from the fact that it is both a pure act of thought as well as its visible result, in which the physical work of the artist participates as well. As the act of the painter's mind, *disegno* corresponds to invention, in the rhetorical sense of the term—that is, to the choice of subject. As the action of the painter's hand, it presupposes a technical skill. "*Disegno,*" writes Vasari, "when it has extracted the invention of something from thought, requires the hand, practiced through years of study, to be able to render exactly what nature has created, with the pen or the point, the pencil, the stone, or any other means" (*The Lives of the Artists*). Material *disegno*, which we call drawing, is thus always the realization of a mental *disegno*. This is why *disegno* is, according to its theoreticians, superior to color. Unlike drawing, they say, whose quality demonstrates not only the skill of the painter but also the beauty of the idea that animates and directs the hand, color owes its luster entirely to the materials that compose it.

Several decades later, Federico Zuccaro systematizes his theory of *disegno* by distinguishing *disegno interno* from *disegno esterno*:

> Per questo nome di disegno interno io non intendo solamente il concetto interno formato nella mente del pittore, ma anco quel concetto che forma qual si voglia intelletto.

> (By the word *disegno interno* I mean not only the internal concept formed in the mind of the painter, but also the concept which any intellect forms.)

> (Zuccaro, *Idea de'pittori*, in P. Barocchi, *Scritti d'arte del Cinquecento*, 2065; Eng. trans. based on Fr. trans. by C. Alunni in *La Peinture*, ed. J. Lichtenstein, 147)

The definition of *disegno interno* thus extends well beyond the domain of art: "e il concetto e l'idea che per conoscere et operare forma chi sia" (the concept or the idea formed by anyone in order to know and to work) (ibid.). Zuccaro,

in fact, recognizes that he could just as well have used the terms *intenzione*, *essemplare*, or *idea*, but he preferred to leave those to the philosophers and theologians, as he was writing as a painter, addressing artists. Thus, though it comes out of a usage peculiar to the domain of art, the concept of *disegno* has a theological underpinning according to Zuccaro. It allows for an analogy between artistic creation and divine creation: "To work externally, God . . . necessarily looks at and contemplates the internal *disegno* in which he knows all the things that he has accomplished, that he is accomplishing and that he will accomplish, or that he could accomplish at a single glance" (ibid.). In forming his internal *disegno*, the painter thus resembles God. The operation by which he conceives it in his mind is a pure act, a spark of the divine within him, which makes *disegno* a veritable *segno di dio*, Zuccaro writes, playing on the word to get the meaning across. As for *disegno esterno*, "It is nothing other than *disegno* delimited as to its form and denuded of any material substance: pure line, delimitation, proportion and shape of anything imagined or real" (altro non é che quello che appare circonscritto di forma senza sonstanza di corpo. Simplice lineamento, circonscrizzione, misurazione e figura di qual si voglia cosa imaginata e reale) (in Barocchi, 2084; in Lichtenstein, 150).

By defining painting as an *arte del disegno*, Italian theorists thus do not rest with affirming the superiority of drawing over color. They proclaim the intellectual nature of pictorial activity, which they raise up to the nobility and dignity of a liberal art. It is *disegno* that makes painting *una cosa mentale*, to take over Leonardo's expression. This explains why the concept of *disegno* often takes on a polemical function, and why it could be used against all pictorial forms that seemed to endanger the newly acquired status of painting as a liberal art, from the "Gothic" manner of drawing to the practices of the colorists.

III. From *Dessein* to *Dessin*

The French adopt more or less the same use of *dessein*, though they add a slightly more polemical touch. This is, first, in order to defend a certain style of drawing—the grand manner—whose grandeur comes from the fact that it is the expression of a grand design, as Michel Anguier states in the lecture he gave on 2 October 1677, at the Académie Royale of Painting and Sculpture, "Sur le grand goût de dessein": "Great design [*dessein*] is a fire that illuminates the understanding, [inspires] the will, strengthens memory, purifies the mind, in order to penetrate the imagination. One would have to be Prometheus to steal the fire from heaven in order to illuminate this beautiful intelligence for us." A second reason is to respond to Rubenists who, starting in 1670, increased their attacks against the prestige of drawing. Thus, Le Brun praises drawing by adopting Zuccaro's distinction:

> One ought to know that there are two sorts of drawing: one which is intellectual or theoretical, the other practical. That the first depends purely on the imagination. . . . That practical drawing is produced by the intellectual and thus depends on the imagination as well as the hand. The latter, by means of the pencil, gives the form and the

proportion, and imitates all the visible things, going so far as to express the passions.

> (Lecture of 9 January 1672, in A. Mérot, *Les Conférences de l'Académie*, 219)

It is precisely this distinction that calls the colorist doctrine, as formulated by its exponent, Roger de Piles, into question. Upending a hierarchy that was believed to be solidly established by tradition, the latter in effect reduces drawing to its purely practical dimension. For him, drawing constitutes the "mechanical" part of painting, though he means this word in a very different sense from that given to it in the Middle Ages, and which bears witness to a new way of understanding technique. Drawing comes from training based on the imitation of ancient work, the study of perspective and anatomy, all indispensible knowledge for the acquisition of "accuracy of the eyes and facility of the hand" (*Cours de peinture par principes*, 194). This part, common to painting and sculpting, is certainly necessary to the work of the painter, but is insufficient to define the particularity of his or her art. Obeying the rules of accuracy of proportion and correction of contours, drawing is no longer the expression of an intellectual design, for Piles, but a manual dexterity that is based on a technical kind of knowledge, in which theory is entirely subordinated to practice. All the characteristics that gave *disegno* its intellectual and metaphysical, even theological, significance—genius, fire, invention, idea, form—are stripped from drawing and attributed to color. There is thus no longer any reason to use *dessein* for *dessin*. With the victory of colorist ideas at the dawn of the eighteenth century, a profound change was thus produced in the theory of art, which its language takes into account several decades later.

DISPOSITION

"Disposition," from the Latin *disponere*, refers to an arrangement, an organization, in particular in the rhetorical (*dispositio/inventio*, cf. COMMONPLACE and COMPARISON) and religious (*dispositio/dispensatio*, see OIKONOMIA) traditions. But a related group of words in French, such as *disponible* and *dispositif*, is enjoying a resurgence, notably by way of Gilles Deleuze and his translations of Heidegger.

I. "Disposition," *Disponible, Dispositif,* "Utility"

Disponible is not a technical philosophical term, but rather a translators' expedient for rendering Heidegger's distinction between *vorhanden* and *zuhanden* (adj.), or *Vorhandenheit* and *Zuhandenheit* (n.). *Zuhandenheit* is the mode of being of what is manipulable, at hand, or within reach (*procheira* [πρόχειρα]), while *Vorhandenheit* is the more neutral or indifferent mode of being of what is present, what is there (for example, books on the shelves of a library), what is subsistent. See VORHANDEN.

Similarly, *dispositif* is a possible translation of *Gestell* (frame, mount; a shelf, in fact), which for Heidegger characterizes the essence of modern technique. See COMBINATION AND CONCEPTUALIZATION; cf. DASEIN, ES GIBT, *IL Y A.*

This mode of being intersects with the ways of saying and understanding what a *thing* is: see RES, Box 1, on the Greek *chrêma* [χρῆμα], *pragma* [πρᾶγμα], and cf. GEGENSTAND, OBJECT, REALITY.

Finally, English confers a special value on utility, through the neologism "utilitarian" invented by Bentham: see UTILITY, and cf. ECONOMY, FAIR, *VALUE.*

On the arrangement that constitutes a *dispositif*, especially in the Deleuzian sense, cf. STRUCTURE and FRENCH.

II. Subjective Disposition

"Disposition" is one of the possible translations of *Stimmung*, although it lacks the musical resonance emphasized by Heidegger to designate a certain "harmony" of the subject: see STIMMUNG (with the term *Befindlichkeit*, sometimes translated into French as *disposibilité*); cf. ANXIETY, DASEIN, GESCHICHTLICH, HEIMAT, *MALAISE, SERENITY,* SORGE, SUBLIME.

On the disposition of the soul, particularly in ethics (*diathesis* [διάθεσις]), related to one's habitual way of being (*hexis* [ἕξις]), see MORALS, I, PHRONÊSIS, VIRTÙ; for Stoic "diathesis" and the relation between physics, ethics, and grammar, see I/ME/MYSELF, Box 1. On the relation to naturalness implied by "disposition," and its link with aesthetics, see also GENIUS, GOÛT, INGENIUM; cf. GEMÜT.

More generally, for the network of terms that detail the strict relation between agency and passivity, objectivity and subjectivity, with respect to being affected as well as to action, see AGENCY, PATHOS; cf. DRIVE, GEMÜT, LOVE, PLEASURE. The neologism "affordance" picks out in particular the intersection between perception and the possibility of acting; see AFFORDANCE; cf. LEIB, REPRÉSENTATION.

➤ UTILITY

DOMINATION

Etymologically, "domination" suggests the power of the master (*dominus*) over things (*dominium*, "property rights"), and even more, the power of the master over the slave (*potestas dominica*); cf. OIKONOMIA and ECONOMY, PROPERTY.

"Domination" is, according to the RT: *Dictionnaire de la langue française*, an "authority which, accepted or not, exercises itself fully"; the language of law and political theory is faithful to this idea, since it uses "domination" to refer to an asymmetric relation, which may be legitimate, but which exists prior to the consent of which it may be the object; compare the significant hesitation of Max Weber's translators over the German *Herrschaft*, which they render in French not only by *domination* but also by *autorité*; see HERRSCHAFT and MACHT; cf. *AUTHORITY*, *POWER.*

➤ *DROIT*, DUTY, LAW, *LIBERTY*, PRINCIPLE, RIGHT

DOR (ROMANIAN)

ENGLISH	melancholy, homesickness, spleen, loneliness
FRENCH	*désir, douloureux, deuil, tristesse, nostalgie*
GERMAN	*Sehnsucht*
ITALIAN	*duolo*
LATIN	*dolus*
PORTUGUESE	*saudade*
SPANISH	*duelo*

➤ *NOSTALGIA*, and ACEDIA, DASEIN, *MALAISE*, MELANCHOLY, PATHOS, PLEASURE, SAUDADE, SEHNSUCHT, WUNSCH

The Romanian word *dor,* like "spleen," *acedia, Sehnsucht,* or *saudade,* is related to the notion of malaise, but gives it a particular meaning by turning it toward an object or toward being. It is a lyrical expression of the feeling of finitude, between folk metaphysics and philosophical reflection, and is self-consciously Romanian. It does not have an equivalent in French, where it is related to painful desire, mourning, sadness, melancholy, nostalgia, languor, the feeling of erotic desire, of internal malaise. The word is related to *dol* in Catalan, Provençal, and Old French (from the last of these come the expressions *dolent, faire dol, avoir dol*). The Romanian *dor* comes from *dolus,* a vernacular Latin noun referring to pain, suffering, mourning (from the classical Latin *doleo, dolere,* from which derive *deuil* in French, *duelo* in Spanish, and *duolo* in Italian). Two verbal and semantic branches come into Romanian from the single Latin root *dolus*: *a dori* (noun *dorință*), which means "to desire"; and *a durea* (noun *durere*), which means "to be in pain," "to feel a physical pain."

I. The Asymptotic Experience of *Dor*

The word *dor* is at the center of a constellation of meanings related to the experience of a specific pain: that which one feels as a result of missing something or someone (a person or a cherished place), or as a result of an intimate hope (a desire for what one considers to be a deep fulfillment, for example, the return of a lost relative or friend, a return home, and so on). This experience may have physical manifestations and be made apparent by visible signs (expressions or clothing related to mourning, for example), but the origin of the pain and related feelings is not physical in nature. *Dor* is an affect of the soul, but it is not the expression of a vague feeling; it is always directed at an object, even if the latter is not always identified or definable, and it never expresses a state of passivity, of submission, of withdrawal into oneself or acceptance of one's fate (as is the case with the Portuguese *saudade*, where the presumed solitude is also felt). It refers, on the contrary, to a straining after something, a mobilization of being that seeks actively to acquire or recover a missing object. The frustration felt as pain yields to the quest for a return (like the Greek *nostos* [νόστος]), a search that perpetually feeds itself.

The closest term to *dor* is probably the German *Sehnsucht*. For both terms, the pain is a consequence of absence and is expressed as an impulse, impatience, hope, an internal need, a burning desire to overcome this absence or imperfection. Further, even though it refers to a hope or a despondence aimed at a more or less precise and discrete object, *dor* suggests the impossibility of attaining that object in this life. The tension is positive, but the desire remains unsatisfied and fulfillment impossible. The geometrical figure that best illustrates this tension is the asymptote. *Dor* thus feeds a feeling promising only failure, the impression of desire and the painful experience of the impossibility of attaining fullness. As a lyrical expression of the metaphysical sentiment of being, *dor* is the primeval witness in contemporary language of being qua being, that is, of finite being hoping to go beyond its limits.

II. *Dor* in Romanian Philosophy

The notion of *dor* is widespread in popular poetry and arises in many idiomatic expressions, such as *dor de ducă* (the desire to leave without a particular destination—to go wandering) and *în dorul lelii* (to accomplish something without a precise objective, and reluctantly). *Dor* has been lexicalized and has numerous variations and diminutives (*doruleţ, doruţ*), but it is, in fact, ahistorical, and is mainly discussed in the field of literary studies. However, because of its frequency, popularity, and connection with a sort of folk metaphysics, practically untranslatable and indefinable given its diversity of nuance, it has inspired philosophical reflection. Thus, in the poet and philosopher Lucian Blaga and the philosopher Constantin Noica, both very close in their thought to Martin Heidegger, we find developments of *dor* as an expression of the constitution of a self-consciousness and as a characterization of a peculiarly Romanian type of metaphysical research.

Blaga, in "Despre *dor*," determines the philosophical content of *dor* starting from the personifications given to the term in popular poetry and Romanian folklore. He calls this sort of personification, both basic and subtle, "hypostasis," a term borrowed from Neoplatonism and the theology of the first Christian councils. This leads him to define *dor* as an impersonal force, almost malevolent and invincible, which comes to take over the soul, to subordinate it and, having joined with it, to become a sort of cosmic illness, a second nature or a material and spiritual alter ego for the individual. *Dor* as a hypostasis would thus be the equivalent of existence as the unrealization of being and would represent a sort of plea that gets lost, a hope to pierce the horizon and to make being dissolve into something unnamable and indefinite.

For Noica, preoccupied with building up a Romanian philosophy beginning with certain terms and certain specific expressions, *dor* practically has the value of a key word, and all philosophical research in Romanian should, according to him, begin with "an introduction to *dor*" (see Noica, "Introducere la *dor*"). The term represents, in effect, the prototype of a fusion of contraries that does not take place through composition; it is a sort of organic fusion, or a whole that does not admit of being distinguished into parts. Thus, in *dor*, pain meets pleasure and pleasure is born without knowledge of pain. The translation of *dor* should therefore be "pleasure of pain," as the translation of the German *Sehnsucht* should be, according to Noica, "the search for the unfindable." If every word has a share of pain—the pain of not being able to say anything without an inexpressible part remaining, the pain at the fact that no word is genuine speech—then *dor*, with its straining after the infinite, belongs to the common and archaic basis from which thought has extracted both its means of expression and its reason for being.

DOXA [δόξα] (GREEK)

ENGLISH   appearance, false appearances, reputation, expectation, glory, opinion, esteem, hallucination, received idea, prejudice

➤ *APPEARANCE*, BELIEF, *PHÉNOMÈNE*, and EIDÔLON, EPISTEMOLOGY, BOX 3, ERSCHEINUNG, GLAUBE, LOGOS, PHANTASIA, *TO BE*, TRUTH

Doxa, from *dokeô* [δοκέω], "to appear" (from the same family as *dechomai* [δέχομαι], "to receive, to welcome, to accept"; cf. Lat. *decet*), is one of the most polysemic Greek words.

To understand the breadth of its meaning, we must combine what we call the objective and the subjective with a spectrum of values ranging from the most positive to the most negative: we can thus range, across different times and doctrines, from the opinion of mortals (subjective negative) to the glory of God (objective positive). Since the term has never ceased to be the subject of

philosophical working and reworking, the history of the senses of *doxa* is bound up with a good portion of the history of philosophy.

I. Breadth of Meaning

Doxa combines what a distinction between subjective and objective separates: the former being what one expects, what one believes, what one judges to be good (in Homer we find only *apo doxês* [ἀπὸ δόξης], "against expectation"; *Iliad*, 10.324, and *Odyssey*, 11.344), the latter being what appears, what seems to be the case. The range of meanings on each side covers the full range of values as well, from the most negative to the most positive: from hallucination (false opinion, imagination, conjecture) to the normative rightness of the accepted idea (expectation, esteem, conjecture, belief, dogma, reputation), and from deceptive appearance (illusion, false appearances) to appearance in all its splendor (phenomena, glory). The common translation of "opinion" obviously does not get all that across.

II. Philosophical Elaborations

Doxa has been constantly reworked and reappropriated from system to system. It constitutes, in fact, a sort of indicator for the history of philosophy.

A. The *alêtheia/doxa* distinction

Parmenides gets things started (see TRUTH). The goddess of the poem, for one thing, deploys a distinction between *alêtheia* [ἀλήθεια] and *doxa*, truth and opinion, to structure her revelation: "You must be instructed in everything, both of the untrembling heart of the persuasive truth [*hêmen alêtheiês . . . êtor* (ἠμὲν ἀληθείης . . . ἦτορ)], and of what appears to mortals [*hêde brotôn doxas* (ἠδὲ βροτῶν δόξας)], where there is no true belief [*pistis alêthes* (πίστις ἀληθής)]" (1.28–30); this is picked up again in 8.50–52: "I stop there the faithful speech [*piston logon* (πιστὸν λόγον)] for you and the thought about truth [*êde noêma amphis alêtheiês* (ἠδὲ νόημα ἀμφὶς ἀληθείης)]. Learn henceforth the opinions of mortals [*doxas . . . broteias* (δόξας . . . βροτείας)], by listening to the deceptive ordering [*apatêlon* (ἀπατηλὸν); see TRUTH, Box 7] of my words."

Furthermore, she makes all of the ambiguity of *doxa* manifest, both negative and positive: "You will also learn this: how the things which appear [*ta dokounta* (τὰ δοκοῦντα)—neuter plural participle of *dokein* (δοκεῖν)] must be in their appearing [*chrên dokimôs*—adverb derived from *dokein*, "as is fitting, honestly" according to RT: *Dictionnaire grec-français*, "really, genuinely" for the RT: LSJ—*einai* (χρῆν δοκίμως εἶναι)], those which through all penetrate all things" (1.31–32). We can gauge the adventurous despair of Parmenides's translators by comparing the translations, all accurate and inaccurate at the same time. Thus, in French, Jean Beaufret gives us, "Apprends aussi comment la diversité qui fait montre d'elle-même devait déployer une présence digne d'être reçue" (*Parménide: Le Poème*); and Marcel Conche, "Tu n'en apprendras pas moins encore ceci: comment il était inévitable que les semblances aient semblance d'être" (*Parménide: Le Poème*; cf. Cassin, *Parménide*). German has more of an even match, but no less diverse. RT: DK gives us, "wie das ihnen Scheinende auf eine probehafte, wahrscheinlich Weise sein müsste"; Ernst Heitsch gives us, "wie das Geltende notwendigerwe

gültig sein musste" (*Parmenides*). The problem is that talk with and about *doxa* is always double-sided: from the point of view of Truth and the One Being, it is ontologically contradictory ("they have chosen to name two forms, thinking that one might not be, in which they are mistaken. They have divided the structure into contraries"; 8.53–55); from the point of view of *doxa* and the *kosmos* [κόσμος], it is phenomenologically splendid and physically dominant, a vector of the beauty of the world captured in poems, myths, and forms of wisdom (cf. Cassin, *Parménide*).

B. *Doxa as metaxu,* "intermediate"

In developing an ontological and epistemological system in the *Republic*, Plato elaborates the distinction between "science" (*epistêmê* [ἐπιστήμη]), a faculty or capacity (*dunamis* [δύναμις]) that deals with being and knows it as it is ("*to on gnônai hôs echei*" [τὸ ὂν γνῶναι ὡς ἔχει]; 6.478a), and "opinion," an intermediate (*metaxu*) faculty between knowledge and ignorance, which deals "neither with being nor with non-being" (478c), but grasps "what wanders in between" (*to metaxu planêton* [τὸ μεταξὺ πλανητόν]; 479d). *Doxa* thus constitutes a middle way between the way of non-being (that which is not an object at all, neither an object of science nor an object of opinion) and the way of being or the science of "ideas": thus, "philosophers" look at *auto to kalon* [αὐτὸ τὸ καλόν], "the beautiful itself" (479e), while the mass of "philodoxes" (*philodoxous* [φιλοδόξους]) prefers only to look at "beautiful colors" (480a). The distinction is structured as a separation between the intelligible world and the sensible world, with the image of the line on which *epistêmê* and *dianoia* [διάνοια] jointly constitute *noêsis* [νόησις], which deals with *ousia* [οὐσία] (let us allow, in E. Chambry's terms—it is a nest of untranslatables, however—that "science" and "discursive thought," brought under the head of "intelligence," aim at "essence"), while *pistis* [πίστις] and *eikasia* [εἰκασία], brought under the head of *doxa*, deal with *genesis* [γένεσις] ("faith" and "conjecture," forming "opinion," aimed at "becoming"; 7.533e–534b; cf. 6, end). The Platonic phrase *orthê doxa* [ὀρθὴ δόξα], "right opinion," signals this intermediate status: "right opinion is intermediate between intelligence and ignorance" (*metxu phronêseôs kai amathias* [μεταξὺ φρονήσεως καὶ ἀμαθίας]; *Symposium*, 202a); unlike false opinion, it brings together good sensation with good thought ("*en têi sunapsei aisthêseôs pros dianoian*" [ἐν τῇ συνάψει αἰσθήσεως πρὸς διάνοιαν]; *Theaetetus*, 195d), and is enough that it should be *meta logou* [μετὰ λόγου] (201c, accompanied by reason; but see LOGOS, Box 3) to become science. But, as *doxa*, it can only achieve a lesser truth and a lesser being.

C. The endoxic

The Aristotelian reworking of *doxa* proceeds by way of a re-evaluation of this world, the individual, the contingent, the probably, the persuasive, the common. There can be science, with definition and demonstration, only of the universal and necessary, agreed; but that is then to say, more positively, that there is *doxa* of the individual, which is at the level of "each" (*to kath'hekaston* [τὸ καθ' ἕκαστον]). There is *doxa* of what can be other than it is ("*doxa esti tou endechomenou allôs echein*" [δόξα ἐστὶ τοῦ ἐνδεχομένου ἄλλως

ἔχειν]; *Metaphysics* Z, 15, 1039b34–1040a1). The object of *doxa* (*to doxaston* [τὸ δοξαστόν]) may be true and existing ("*tina alêthê men kai onta*" [τινὰ ἀληθῆ μὲν καὶ ὄντα]), but it remains contingent (*Posterior Analytics*, 1.33.88b30–33). This is why opinion is defined as a grasping of immediate and nonnecessary premises ("*hupolêpsis tês amesou protaseôs kai mê anagkaias*" [ὑπόληψις τῆς ἀμέσου προτάσεως καὶ μὴ ἀναγκαίας]; 89a3–4). These "premises in accordance with opinion" (*ek ton kata doxan protaseôn* [ἐκ τῶν κατὰ δόξαν προτάσεων]) serve for the construction of "dialectical syllogisms," as opposed to scientific or demonstrative syllogisms (*Prior Analytics*, 1.46a8–10). Aristotle's use of the word *endoxon* [ἔνδοξον] (literally, that which is "in *doxa*") as a term for this type of premise is an innovation: "A syllogism is dialectical if it proceeds from probable premises [in Brunschwig's translation; 'from accepted ideas' in Tricot's translation]" (*dialektikos de sullogismos ho ex endoxôn sullogizomenos* [διαλεντικὸς δὲ συλλογισμὸς ὁ ἐξ ἐνδόξων συλλογιζόμενος]) *Topics*, 1.100a29–30; and he defines *endoxa* [ἔνδοξα] as distinct from "true and primary" propositions as "that which is accepted [*ta dokounta*] by all or by the greatest number, or by the wise [*sophois* (σοφοῖς)], and among the latter, either by all or the greatest number, or by the best known [*gnôrimois* (γνωρίμοις)] and most respected [*endoxois* (ἐνδόξοις)]" (100b21–23). We see how *ta endoxa*, likely premises and received ideas, imply the *doxa* of the *endoxoi*, the opinions of illustrious thinkers. We may thus understand why Aristotle's treatises should begin by the structured review of these opinions, which make up the history of the different disciplines: physics (*Physics*, 1), metaphysics (*Metaphysics* A), and so on; and how "doxography," literally "the writing of opinions," should become a genre of its own beginning with Theophrastus's *Phusikôn doxai* (the *Placita* in Latin).

D. The rays of divine glory

The semantic high-point for *doxa* is in the biblical tradition, where the "glory" (*kabod* [כָּבוֹד] in Hebrew) of God is pronounced as soon to be manifested by the crushing of the Egyptians once the Hebrews have crossed the Red Sea: "In the morning, you will see the glory of God" (*kai prôi opsesthe tên doxan tou Kuriou* [καὶ πρωῖ ὄψεσθε τὴν δόξαν τοῦ Κυρίου]) (Exod. 16:7). In the same book (33:18), Moses addresses this prayer to God: "Let me see your glory." The New Testament mentions the spreading of God's glory in the great events of the life of Jesus, especially his baptism (Luke 4:21) and his transfiguration (9:28f.). The disciples see in it the advance signs of "the arrival of the Son of Man in his glory" (Matt. 24:30; Mark 8:38). The glory or splendor of God is often mentioned in the passages of the New Testament or the patristics, especially the Eastern ones, which deal with the blessed vision of the divine essence. The Byzantine theologian Gregory Palamas considers this vision to be inaccessible to created beings, however, and substitutes an understanding of the vision of divine glory as a simple radiance of the energies by which God communicates in his works (see SVET, Box 1).

The bursting forth of the "Presence of God" in the world also occupies an important place in Rabbinic literature, where it is called Shekhinah. This Shekhinah, the name of

which corresponds to the Hebrew *kabod* (though it is not found in the Bible), is often the personification of the "Presence of God" and evokes the mysticism of the celestial light.

DRIVE, INSTINCT, IMPULSE

FRENCH   *pulsion*
GERMAN   *Trieb*
LATIN   *pulsio*

➤ ANXIETY, ENTSTELLUNG, ES, FORCE, GENDER, GESCHLECHT, LEIB, LOVE, PATHOS, PLEASURE, SOUL, UNCONSCIOUS, VERNEINUNG, WUNSCH

The translation of the German psychoanalytic concept *Trieb* into French gave new life to the French word *pulsion*, derived from the Latin *pulsus* or *pulsio* and previously reserved for the physical domain, as the equivalent of force or thrust. Drawing on the romantic tradition (the life-force), on psychophysiology (measurable strength), and on biology (where *Trieb* designates instinct), Sigmund Freud's *Trieb* made it possible to understand the physical transcription of the major somatic forces. Though the translation of *Trieb* as *instinct* was long standard in France, that was chiefly because the specificity of the Freudian notion had not been clearly defined: the object of a *Trieb* is not predetermined. The translation as *pulsion* was established in order to indicate that specificity. On the other hand, the various English translations ("instinct," "drive," and "instinctual drive") remain independent of a precise theoretical choice: the choice of "drive," a term that derives from the same proto-Germanic root as *Trieb*, may very well be accompanied by a biological reading of Freudian theory.

I. The Old Use of the French Term *Pulsion*

Despite a period of fluctuations and hesitations arising from the notion's complexity, French adopted the term *pulsion* rather than *instinct* to translate the German word *Trieb* in Freud's work.

Pulsion, a technical term in the Freudian vocabulary, has become part of ordinary language, which may be explained by the popularization of psychoanalysis. Nonetheless, it was not necessary to create a neologism to translate *Trieb* into French, because *pulsion* was already present in the language,

although rarely used before the twentieth century. It is not found, for instance, in Jean-François Féraud's *Dictionnaire* in 1788 (RT: *Dictionnaire critique de la langue française*), or in the 1890 RT: *Dictionnaire général de la langue française du commencement du dix-septième siècle jusqu'à nos jours*. On the other hand, it does appear in Jacob Stoer's *Grand dictionnaire français-latin* (1625), in the sense of "action of impelling." We find an occurrence in Voltaire with the same meaning: "La substance du feu, en entrant dans l'intérieur d'un corps quelconque le dilate en poussant en tout sens ses parties; or cette 'pulsion' . . ." (The substance of fire, entering the interior of any body, dilates it by impelling its parts in all directions. Now, this pulsion . . . : Voltaire, *Essai sur la nature du feu*). *Pulsion* was thus used as a scientific doublet of *poussée*, probably because of its proximity to Latin. The term *pulsion* is in fact directly derived from Latin *pulsum*, the supine of *pellere*, which means "to put in motion, to impel, to repel." Note that the substantive of *pellere* is *pulsus*. *Pulsio*, which means precisely "action of repelling," is a late and rare usage (fourth century CE). Moreover, according to W. von Wartburg's *Französisches Etymologisches Wörterbuch* (1959), *pulsion* does not come from *pulsio* but from a "scholarly derivation from the radical of *pulsare*, *pulsare* being an intensive form of *pellere* and meaning strike, impel violently."

II. The Meaning of *Trieb*

We find this sense of "impel" in the meaning of the German *Trieb*, which derives from the verb *treiben*, whose general meaning is "to put in motion." But why did the requirements of translating Freud's works lead to reviving a disused term? As is often the case in German, we are dealing with a Germano-Latin doublet: *Trieb* is a word derived from a Germanic root that forms a doublet with the word of Latin origin, *Instinkt*, whose use began to spread in scientific literature only in the nineteenth century (in 1760, H. S. Reimarus entitled his book on animal instincts *Triebe der Thiere*). But as is also often the case, the two terms are not equivalent. *Trieb* is an old word in common use, whereas *Instinkt* is a learned word that has the precise meaning of "instinct" in biology, namely, "the innate tendency to determinate acts (depending on the species), executed perfectly without previous experience, and subject to the conditions of the environment" (RT: *Le nouveau petit Robert*, s.v.). *Trieb* has more senses that offer variations on a common theme, the action of driving or impelling: (1) a mechanical impulsion; (2) starting in the late eighteenth century, an internal impulse, exercised either on the organism (particularly the force that makes a plant "grow") or on the mind, on the psychic apparatus. According to the 1984 edition of the Grimms' German dictionary (RT: *Deutsches Wörterbuch*), the main meaning given for *Trieb* is "an internal force that impels, that puts in motion [*innere treibende Kraft*]." Very roughly, we can thus already say that German *Instinkt* contains the idea of a determinate object or action, whereas *Trieb* emphasizes the motive force that puts the organism or the psyche in motion.

■ See Box 1.

III. *Trieb* in Freud's Work

In his translations of a few texts by Hippolyte Bernheim (1888, 1892), Freud uses *Instinct* (or *Instinkt*) and *Trieb*

interchangeably. However, he moves toward his own later concept of *Trieb*, first regarding the great needs of psychic activity, in his *Project for a Scientific Psychology* (*Entwurf einer Wissenschaftlicher Psychologie*), a study dating from 1895 that was published after his death, and then in the *Interpretation of Dreams* (*Traumdeutung*, 1900), where he mentions desire as a "driving force" (*Triebkraft*) necessary to the formation of dreams. Not until 1915 do we find precise definitions of *Trieb* in his work, in the metapsychological article "Instincts and Their Vicissitudes" ("Triebe und Triebschicksale") and in a reworked paragraph of *Three Essays on the Theory of Sexuality* (*Drei Abhandlungen zur Sexualtheorie*), whose first edition goes back to 1905. In this later version he writes:

> By an "instinct" is provisionally to be understood the psychical representative of an endosomatic, continuously flowing source of stimulation, as contrasted with a "stimulus," which is set up by *single* excitations coming from *without*. The concept of instinct is thus one of those lying on the frontier between the mental and the physical. The simplest and likeliest assumption as to the nature of the instincts would seem to be that in itself an instinct is without quality, and, so far as mental life is concerned, is only to be regarded as a measure of the demand made upon the mind for work. What distinguishes the instincts from one another and endows them with specific qualities is their relation to their somatic sources and to their aims. The source of an instinct is a process of excitation occurring in an organ and the immediate aim of the instinct lies in the removal of this organic stimulus.

> (*Drei Abhandlungen zur Sexualtheorie* 1.5, in *Gesammelte Werke*, 5:67–68; trans. Strachey, *Three Essays on the Theory of Sexuality*, 34)

The article "Instincts and Their Vicissitudes" adds two elements to the definition of the *Trieb*, one relating to its source and the other to its end. First, it gives a name to the quantitative element in a drive, to its "motive factor, the sum total of force or the measure of the demand for work that it represents" (in *Gesammelte Werke*, 10:211; trans. Strachey, 14:110): this is *der Drang*, rendered in the first French translations as *poussée*. Here we have the action of impelling in its quantitative form, which Voltaire called *pulsion*. Freud explains, in the French version, that "ce caractère de poussée . . . est l'essence même de la pulsion" (This driving-character is . . . the very essence of the drive: *Les pulsions et leurs destins*, 32–33). The redundant nature of the formula is peculiar to the translation. In German, *Trieb* is an extension of *Drang* to the mind-body as a whole; in French, *pulsion* is initially used as a learned, technical form of *poussée*. Second, the same article indicates that the drive has an object. And the definition of the relation between the drive and its object has strongly influenced the choice of a term other than *instinct* to translate *Trieb*: "The object of the drive is that in which or by which the drive can attain its goal. It is what is most variable in the drive, but is assigned to it only by virtue of its ability to make satisfaction possible" (Freud, *Instincts and Their Vicissitudes*, in *Gesammelte Werke*, vol. 10, trans. Strachey).

1

TRIEB in Kant and Goethe

➤ ANIMAL, BILDUNG

We find a trace of the distinction between *Trieb* and *Instinkt* in Kant's *Critique of Judgment*. In §83, *Trieb* is used to designate animal desire in *man*: ". . . the despotism of desires [*Begierden*]. By these, tied as we are to certain natural things, we are rendered incapable even of choosing, while we allow those impulses [*Triebe*] to serve as fetters which nature has given us as guiding threads, that we should not neglect or injure the destination of our animal nature" (trans. Bernard). In a note to §90, *Instinkt* signifies the determined activity of the animal: "We then try at the same time to show that the ground of the artisan faculty of beasts [*des tierischen Kunstvermögens*], which we call instinct [*Instinkt*], specifically different as it is in fact from reason, has yet a similar relation to its effect (the buildings of the beaver as compared with those of men)" (trans. Bernard).

But the distinction is not actually so sharp: in the nineteenth century, *Trieb* could be used in the precise sense of instinct as "innate tendency to specific acts," and *Instinkt* could

have the more general sense of "natural internal force" (Goethe to Schiller: "Last week I fell under the sway of a strange instinct [*Vorige Woche bin ich von einem sonderbaren Instincte befallen worden*]"). But the meanings remain distinct, and *Trieb* is not a simple doublet of *Instinkt*.

In addition to its common meaning, in the eighteenth century, *Trieb* was used to Germanize a Latin expression, *nisus formativus* (the formative impulse), which designates living matter's organizing principle, or, more precisely, the activity of organized matter in its formative operation. In §81 of the *Critique of Judgment*, which is about epigenesis and preformation, Kant cites the work of the epigeneticist Johann Friedrich Blumenbach, *Über den Bildungstrieb* (1781). He notes that Blumenbach distinguishes this "formative impulse" as "faculty of matter [*Vermögen der Materie*]" from the "merely mechanical formative power [*bloß mechanische Bildungskraft*]" (trans. Bernard). *Bildungstrieb* is rendered in A. Philonenko's

French translation (1986) as *tendance formatrice* and in A. J.-J. Delamarre's translation (1985) as *pulsion de formation*. In his work on morphology, Goethe adopts this distinction: "The word 'force' [*Kraft*] refers first of all to something purely physical, or even mechanical, and what is to be organized on the basis of this matter remains for us obscure and incomprehensible. It was Blumenbach who invented the definitive and perfect expression by giving an anthropomorphic twist to the solution to the riddle and calling the subject of debate a *nisus formativus*, an impulse [*Trieb*], an intense activity that was supposed to be the actual principle of formation" (Goethe, *Zur Morphologie*).

BIBLIOGRAPHY

Kant, Immanuel. *A Critique of Judgment*. Translated by John Henry Bernard. London: Macmillan, 1914.

Thus Freud's *Trieb* combines several dimensions:

1. The biological dimension: the reference to the body's major needs, which indicates the biological nature of the drive, is constantly present. This is shown in the opening lines of the first edition of *Three Essays on the Theory of Sexuality*, which were never changed: "The fact of the existence of sexual needs in human beings and animals is expressed in biology by the assumption of a 'sexual instinct,' on the analogy of the instinct of nutrition [*Trieb nach Nahrungsaufnahme*], that is, of hunger" (in *Gesammelte Werke* 5:33; *Three Essays on the Theory of Sexuality*, trans. Strachey). In his preface to the fourth edition, Freud speaks of a "part of the theory which lies on the frontiers of biology" (*Three Essays on the Theory of Sexuality*, trans. Strachey). We can assume that he is alluding to the drive.

2. The romantic dimension: in the late eighteenth century, when *Trieb* acquired its meaning of "natural internal force acting on the mind and the body," this term became a key concept in German romanticism. The relation to a determinate object was less important than the idea of multiple activities. In Goethe, who identifies multiple *Triebe* (*Goethes Werke*, vol. 47), we find *Äußerungstrieb* (drive to externalize), *Lusttrieb* (drive to pleasure), *Nachahmungstrieb* (drive to imitate), and *Bildungstrieb* (drive to education). Henri Vermorel emphasizes the importance of the term in the poets and naturalists (starting with Goethe), the philosophers (e.g., Johann Gottlieb Fichte), and the

German romantic psychiatrists (notably J.C.A. Heinroth): "In founding a psychology incorporating the concept of the unconscious, the romantics used the word *Trieb* in the sense of a psychic life force" (Vermorel, "La pulsion de Goethe à Freud").

3. The psychophysical dimension: the *Project for a Scientific Psychology* testifies to the importance of an energetic schema of physical origin applied to psychic functioning. Freud, through his teacher E. W. von Brücke, was connected with the psychophysical trend of the second half of the nineteenth century, and especially with Hermann von Helmholtz, who used the term *Triebkraft* to designate mechanical force (Vermorel). We can note, however, that Helmholtz's school, beneath its apparently strict positivism, remained closely dependent on the *Naturphilosophie* that came out of F.W.J. Schelling in particular: the romantic inspiration thus seems central, and allows us to understand, for instance, Freud's speculations on the death drive and his constant references to Goethe's *Faust*.

It is the precise meaning that *Trieb* acquires in Freud starting in 1915 that will enable us to follow the avatars of the sexual "drive," especially in the form of "partial drives" (*Partialtriebe*). References to biology are not, of course, eliminated, but Freud no longer speaks of the drive's determinate relation to an object. And the connection with biology seems still more problematic when Freud forms the hypothesis of a "death drive" in *Beyond the Pleasure Principle* (1920).

IV. French Translations of Freud's *Trieb*

The complexity of Freud's notion explains the hesitations of French translators. We can say of Freud what Charles Du Bos said of Goethe: "To render all the essential connotations of the word *Trieb* in Goethe, we would need our three words *instinct*, *besoin*, and *propulsion*, not to mention *impulsion*" (cited in Vermorel, "La pulsion de Goethe à Freud"). The task is to render the idea of motive force and tendency without prejudging the question of the innate or acquired nature of the process (for Freud, while partial sexual drives are innate, their vicissitudes are largely connected with the individual's history, but only in part, because *Three Essays on the Theory of Sexuality* emphasizes the hereditary character of the psychic dikes—disgust, shame, and so on—erected against partial pulsions during the so-called latency period). *Besoin* is reserved for *Bedürfnis*, and *impulsion* for *Impuls*. But how has the term *Trieb* itself been translated into French?

Although translations of Freud into French began very late—with one exception, not before 1920—the problems of standardizing their vocabulary were raised quite early. Shortly after the creation of the Société psychanalytique de Paris (1926), a linguistic committee was set up to standardize the French psychoanalytic vocabulary. In the review of the meeting held on 31 May 1927, we read: "At M. Hesnard's suggestion, the term *pulsion* is unanimously adopted to translate *Trieb*" (*Revue Française de Psychanalyse*, no. 1 [1927]). But before the 1967 publication of RT: *Vocabulaire de la psychanalyse*, which established this terminological choice, the committee's decision had little effect. The discussion here will be limited to the translation of two major texts.

The 1934 French edition of *Trois essais sur la théorie de la sexualité*, translated by Blanche Reverchon (1923), ignores the committee's decision to use *pulsion*. *Trieb* is rendered as *instinct* (in the most "biological" expressions) or *tendance* (notably when Freud gives a rigorous definition of the concept); sometimes the word is not translated at all (thus *sexuelle Triebkräfte* is rendered as *forces sexuelles*). In 1936, Marie Bonaparte and Anne Berman translated *Triebe und Triebschicksale* as *Les pulsions et leurs destins*. But the title is misleading. There are some surprising hesitations: "Comment l'instinct se comporte-t-il par rapport à l'excitation? Rien ne nous empêche d'intégrer le concept de la pulsion dans celui de l'excitation, ni de dire que l'instinct est une excitation au sens psychique" (How does instinct behave in relation to excitation? Nothing prevents us from including the concept of drive within that of excitation, nor from saying that instinct is an excitation in the psychic sense: *Les pulsions*, 30). But the term *instinct* was later used almost exclusively.

We can see which interpretation of the notion of *Trieb* prevailed in France by following a theoretical study by Bonaparte that appeared in the *Revue Française de Psychanalyse* in 1934, entitled "Introduction à la théorie des instincts." Although it paraphrases the text of *Three Essays on the Theory of Sexuality*, it interprets it in a clearly biological way:

> People have long said that the two great instincts that motivate living beings are hunger and love. But whereas the term "hunger" itself already implies the dynamic notion of a biological drive [*pulsion*], the drive [*pulsion*] that is the source of amorous tendencies does not have an

equivalent name in ordinary language. However, this kind of drive is to be postulated, and that is why the psychoanalytic science created by Freud has given the generic name of *libido* to the biological force that manifests itself in all the phenomena of sexuality.

Freud's originality seems to come down to having granted a preponderant place to the "sex drive," and not to having given the concept of *Trieb* a meaning that is irreducible to its common biological meaning. We see that with the term *pulsion* being interpreted in a biological sense, *instinct* can be used in the rest of this text, and particularly in the title.

Thus it was the *Vocabulaire de la psychanalyse* that determined the use of *pulsion* to translate *Trieb*, a usage reaffirmed in the *Œuvres complètes de Freud/Psychanalyse*. Laplanche and Pontalis stress the difference between *Trieb* and the Freudian use of *Instinkt*, which designates "a behavior determined by heredity and appearing in an almost identical form in all individuals of a single species" (RT: *Vocabulaire de la psychanalyse*, s.v. *Pulsion*). According to them, translating *Trieb* by *instinct* or *tendance* would be tantamount to "blurring the originality of the Freudian conception, notably the thesis of the relatively indeterminate character of the motivating impulse, the notions of the contingency of the object, and the variability of the goals" (RT: *Vocabulaire de la psychanalyse*, s.v. *Instinct*).

■ See Box 2.

V. English Translations: "Instinct" and "Drive"

Regarding English translations of *Trieb*, we must once again distinguish several questions. From a strictly terminological point of view, "drive" is the equivalent of *Trieb*: the two words come from the Gothic *dreiban*. Although "drive" well expresses the idea of movement ("to drive" retains mainly the first, physical meaning of *treiben*: "to set in motion"), the meaning of "natural internal force," which was established by German romanticism, appears very late in English: it is still absent from the 1933 edition of the *Oxford English Dictionary*. The 1980 edition mentions a psychological meaning that amounts to making "drive" a synonym of "instinct," a word that has long been used to designate an innate tendency of living beings to perform certain acts: "What instinct hadst thou for it?" (Shakespeare, *Henry IV, Part 1*, 2.4.299). "Instinct" is the term adopted by James Strachey, the main translator of the English version of Freud's complete works (1953–66). He explains the reasons for this choice in his "Notes on Some Technical Terms Whose Translation Calls for Comment" (*Standard Edition*, 1:xxiv–xxv). (His justification is itself, once again, an interpretation: "There seems little doubt that, from the standpoint of modern biology, Freud used the word '*Trieb*' to cover a variety of different concepts" [ibid.]). But is this point of view the only pertinent one? Didn't Freud give a precise definition of what he meant by *Trieb*?

We must note that, unlike the French *pulsion*, "drive" is a very common word (especially in American English), but one whose psychobiological use is recent. It is not rigorously distinguished from "instinct." We can observe an odd effect of intersection: Strachey's note is contemporary with the *Vocabulaire de la psychanalyse*, but its meaning and its effect were inverse. The *Vocabulaire* definitively established the

2

The *libido* as the driving force of sex life

Whereas the adjective *libidineux* (from Lat. *libidinosus*, frequent in Cicero and Seneca) appeared in French in the eighteenth century (in the *Roman des sept sages*) and was adopted by the French Academy in 1762, the substantive *libido* appeared in French, as in other European languages, only in the nineteenth century, as a term in the vocabulary of medical psychology and sexology, especially in German. In the early twentieth century, it took its place as one of the untranslatable terms in psychoanalysis, with the sense of "the driving force of sex life" that Freud gave it, for example, in his *New Introductory Lectures on Psychoanalysis* (1933). It was around this notion that Freud developed the stages of his theories of the drives and of the role of sexuality in the psyche. In 1905, in the first of *Three Essays on the Theory of Sexuality*, he explained the choice of this word by analogy with the instinct of nutrition that is called hunger. "Everyday language possesses no counterpart to the word 'hunger,' but science makes use of the word 'libido' for that purpose" (*Gesammelte Werke*, vol. 5, trans. Strachey). In a note added to this study in 1910, Freud remarks: "The only appropriate word in the German language, *Lust*, is unfortunately ambiguous, and is used to denote the experience both of a need and of a gratification" (ibid.; see PLEASURE).

The Latin *libido* (or *lubido*), which derives from the impersonal *libet* (or *lubet*), with the meaning of "it pleases," and which signifies "desire, craving, and particularly sensual and erotic desire" (RT: *Dictionnaire étymologique de la langue latine*, s.v. *lubet*), comes from an "Indo-European root that was probably popular in nature," notably from the Sanskrit *lubh* (*lúbhyati*, "he desires"), and is found in German *Liebe* and English "love." Present particularly in Cicero, who prefers it to *cupiditas* as a translation of the Greek *epithumia* [ἐπιθυμία] (desire), in Ovid the term *libido* seems to suggest the idea that such a form of desire is in some way a prerogative of feminine sexuality. That is an idea that reappears in German *Sexualwissenschaft* when it makes the clitoris the *sedes libidinus* (cf. P. Kaufmann,

in *Encyclopædia Universalis*, s.v. *Libido*), whereas Freud combats it by writing that "there is only one *libido* that is put in the service of both the masculine and the feminine sexual function," and that although the connection conventionally made between virility and activity inclines us to describe it as virile, it is nonetheless not without passive goals (*New Introductory Lectures on Psycho-analysis*, in *Standard Edition*, trans. Strachey, vol. 22).

The *libido* occupies a major place in Christian moral theology, especially in Saint Augustine, that deeply influenced later periods on this point. Of the three terms *cupiditas*, *concupiscentia*, and *libido*, which are not, moreover, univocal, Augustine makes the latter a synonym of *concupiscentia carnis*, that is, of sexual desire, except when it is specified that the *libido* has an object other than a sexual one (such as drink, money, or power). But the principal characteristic of this Augustinian *libido* is that it is a desire morally unbalanced by a vehemence that perverts the will. It becomes a pleasure in evil that proceeds from the first pleasure that humanity experienced in original sin and that arouses the appetite for new sins, the personal sins of every descendent of Adam through which "the obscene areas of the body are excited." Despite his insistence on the moral disorder of the will that the *libido* represents in his view, in connecting it essentially with the sex drive, which has its own dynamism, Augustine nonetheless appears to be closer to Freud than are the sexologists of the late nineteenth century, and especially than Carl Jung. The former—figures such as Albert Moll, Henry Havelock Ellis, and Richard von Krafft-Ebing—used the Latin expression *libido sexualis*, which was considered more "scientific," to designate the subject of a new discipline that sought to describe the characters, classified as either normal or pathological, of an "instinct" connected with biology or with culture in general. As for Jung, whereas Freud's *libido* is the desire for an object whose enjoyment constitutes the goal of the sex drive, in his *Wandlungen und Symbole der Libido* (1912), he makes it a completely

desexualized tendency turned toward the world and not toward an object of erotic satisfaction, just as it can also change its goal, as in open to the future rather than determined by the subject's past, assimilated to a kind of *élan vital*, and reduced to a simple "interest" of an existential nature.

In Freud, the *libido*, which is identified with the energy of the sex drive, is cathected on objects in whose investment it can change at will, just as it can also change its goal, as in sublimation. In reality, it is through this *libido* understood in the sense of an appetite for an object throughout a series whose initial moment goes back to the "first helping presence," that of the nursing mother, that Freud, despite the importance—secondary, in fact—that he accords to the "*libido* of the self," opposes most radically Jung's theory, which is based on "introversion," that is, the withdrawal of the *libido* toward the subject's inner world. And even when he posits a new dualism between the life-force and the death-drive and assimilates the *libido* to the *Eros* of the poets and philosophers, the author of *Beyond the Pleasure Principle* retains all of the life-force's power in its Latin form, which renders the universality of the concept of sexuality and therefore does not require transcription into other languages. In this respect, by retaining the Latin term, Freud subverted the old jargon of the specialists. He made the *libido* the focus of a scandal that began in 1910 with the multiple forms of resistance with which psychoanalysis met in each country, where it was always and everywhere described as a pansexualist doctrine: "Too 'Germanic' in the eyes of the French, . . . too 'Jewish' for Nazism, too 'bourgeois' for communism—that is, as for Jung, always too 'sexual'" (RT: *Dictionnaire de la psychanalyse*, s.v.).

Freud, Sigmund. *Gesammelte Werke*. 18 vols. Frankfurt: Fischer, 1940–52. Translation by James Strachey: *The Standard Edition of the Complete Psychological Works of Sigmund Freud*, edited by James Strachey. 24 vols. London: Hogarth Press, 1953–66.

choice of an unusual word to translate a complex concept, on the borderline between the biological, the psychological, and the physical. All subsequent French translations have adopted this choice. Strachey's choice was immediately criticized. Before the *Standard Edition*, English translations rendered *Trieb* by "drive," "instinct," or "impulse" (E. Jones, A. A. Brill, H. W. Chase, J. Rivière).

If we examine the *Psychoanalytic Quarterly* over an extended period, from the 1940s to the 1980s, we find three terms used to translate (or to refuse to translate) Freud's *Trieb*: "instinct," "instinctual drive," and "drive." We should not conclude from this that Freud's definition and the distinction between *Instinkt* and *Trieb* are not taken into account, as is shown by the following:

Every attempt to apply the idea of instinct to human beings was made difficult by the fact that since Antiquity, it has been thought that animals in particular are guided in their actions by instincts. So that in the nineteenth century instinct was generally conceived not only in its physiological and hereditary dimension, but also as more specifically animal than human. In English, the term was ambiguous. But scientists writing in German, like Freud, were capable of distinguishing *Instinkt*, the instinct of animals, from *Trieb*, the drive in humans, the latter term referring to the idea of impulse and implying, up to a certain point, thought processes: its nature is thus not purely automatic or reflex.

(Burnham, "Medical Origins," 196–97)

The theoretical recognition of Freud's *Trieb* thus does not necessarily affect language (e.g., a work that appeared in 1970 has the title *Basic Psychoanalytic Concepts of the Theory of Instincts*). The situation is comparable to that in France before Laplanche and Pontalis, under Jacques Lacan's influence, emphasized the specificity of Freud's concept and the necessity of a translation that does it justice. It is striking that in the articles published in the *Psychoanalytic Quarterly*, the terminological variation is accompanied by an interpretation of *Trieb* in the most diverse senses: ego-psychology, behaviorism, and even Pavlovian conditioning.

DROIT

Droit comes from *directus*, "in a straight line, without deviation," from *dirigere*, "to trace paths," then "to trace the path," from the root **reg'-*, which indicates movement in a straight line, and which is also the source of *règle* (*regula*) and *roi* (*rex*). This metaphor of rectitude is found in most European languages (Eng. "right," Ger. *Recht*). *Droit* today refers to a body of rules considered to be just or legitimate that link the legal domain to the moral domain, as is especially visible in the English "right"; see RIGHT/JUST/GOOD.

I. *Droit* and Law

In Greek, the originally geometrical concept *orthotês* [ὀρθότης], "straightness," is strictly logical or moral in its extension; see TRUTH and THEMIS. Even though *dikê* [δίκη] can be used to refer to the same thing as *jus* (what one applies when rendering a judgment), the network of law, justice, and right is only established later, in Latin—*lex*, *jus*, and *directum*—a crucial component of the Roman Empire, which considers itself to have a proprietary claim over *jus*; see LEX, and LAW, TORAH. See also *AUTHORITY, JUSTICE* [FAIR, RIGHT/JUST/GOOD].

II. *Droit, Droits, État de Droit*

Topics of interest include the relationship between law (*droit naturel*, *droit positif*), rights (*droits de l'homme*, *droit des minorités*), and the rule of law (*l'État de droit*, *Rechtsstaat*), as reflected in different histories and national traditions; see, besides LEX, which provides the matrix of principal distinctions, CIVIL RIGHTS, CIVIL SOCIETY, *JUSTICE,* RULE OF LAW; cf. CIVILTÀ, *STATE* [POLIS, STATO].

III. *Droit*, Duty, Fact

1. *Droit* arises in morality as related to permission and promising, in counterpoint to duty and debt; see DUTY, SOLLEN, WILLKÜR; cf. *ALLIANCE, DESTINY, OBLIGATION,* PARDON.
2. The legal question "*Quid facti/quid juris?*" (What is the matter of fact, what is the matter of law?) is echoed in the moral distinction between being and how one ought to be, which cuts across a grasping and an appreciation of the real, and of the requirements that demand satisfaction; see CLAIM, MATTER OF FACT, REALITY, RES, TATSACHE; cf. ES GIBT, *FACT, IL Y A,* SACHVERHALT, *TO BE.*

➤ MORALS, *SOCIETY*

DRUGOJ [другой] (RUSSIAN)

ENGLISH   the other, others

➤ *AUTRUI*, MITMENSCH and I/ME/MYSELF, LOVE, POSTUPOK, RUSSIAN, SAMOST', SOBORNOST', STRADANIE, SVOBODA, TRUTH

In Russian, the numerical distinction between *odin* [один] (the one) and *drugoj* [другой] (the other) implies proximity: *drugoj*, "other, second," is formed from the root *drug*, "friend, comrade." Thus, in philosophy, in Florensky and Bakhtin, *drugoj* has the connotation of "friend, loved one, *philos* [φίλος]."

I. The Semantic Constellation

The Old Slavic root *drug* is still found in most Slavic languages: in the Russian *drug* [друг], the Polish *druh*, "friend," the Serbo-Croatian *drug*, "companion, comrade," the Czech *druh*, "species, kind." It has in addition a number of derived forms that express, in one way or another, the idea of association: Russian *družba* [дружба], "friendship," Serbo-Croation *družba*, "organization, group, coterie," Czech *družice*, "satellite," Polish *družyna*, "team, detachment," Ukranian *družyna* [дружина], "spouse," etc. (see RT: *A Dictionary of Slavic Word Families*, 109–11).

Most etymological dictionaries link the Old Slavic *drug* with the Indo-European root **dhrugh*, "to be firm, solid," and **dhreu*, "firm, faithful" (see, for example, RT: *Etymological Dictionary of the Russian Language*, 198; *Etimologičny*, 2: 134). Among the terms with the same origin, we find the German *trauen*, the English "trust" and "truth," the Greek *drus* [δρῦς], "tree, oak" (cf. "tree," Slavonic *drevo* [древо], "tree," *dryad*, etc.—see RT: *Le Vocabulaire des institutions indo-européennes*, vol. 1). The secondary sense of *drug*, as a numerical pronoun and adjective, was developed by way of the expression "*drug druga*" (one another). This kind of development, from a primary sense of the root, "friend" (*amicus*), toward the sense of "other" (*alius*) and of "second" (*secundus*) by inversion, is a widespread phenomenon in Slavic languages (see RT: *Ètimologičeskij slovar' russkogo jazyka*, 543; *Etimologičny*, vol. 2).

The word *drug* in modern Russian refers to "a person related to another by mutual trust, devotion, friendship" (see RT: *Ètimologičeskij slovar'slavianskykh jazykov*, vol. 5). In fact, the simple numerical distinction between *odin* [один] (the one) and *drugoj* (the other) implies in Russian proximity rather than externality or difference. That is why in philosophy *drugoj* connotes not only difference but also intimacy and friendship.

II. *Drugoj* as a Personalist Term

Philosophy has often taken advantage of this unique linguistic feature. Thus, Paul Florensky, in *The Pillar and the Ground of Truth*, claims that in *družba* (friendship) a person goes beyond his own limits and discovers another (*drugoj*)—a friend, *drug*. Florensky compares the Russian *drug* and the Greek *philos* [φίλος]; he writes that *družba* is based on "the love of friendship" or "friendly love" (*družeskaja ljubov'* [дружеская любовь]). According to Florensky, the love of friendship is "the love that includes a part of *erôs* [ἔρως], of *philia* [φιλία] and *agapê* [ἀγάπη], which the Ancients attempted to indicate by the compound *philophrosunê*, [φιλοφροσύνη] (ibid.). *Philophrosunê*, translated by "benevolence" or "good mood,"

is formed from *philophroneô* [φιλοφρονέω], "to think, to feel *philia* ("love/friendship"; see LOVE)." A common life of friendship "means that joy (*radost'* [радость]) and suffering (*stradanie* [страдание]; see STRADANIE) are common" (ibid.); the soul (*duša* [душа]) itself is shared between friends. For Florensky, *družba* is the discovery of another I (*drugogo ja* [другого я]) in a friend (*v druge* [в друге]) (ibid.).

Similarly, Bakhtin, in his early work, puts the relationship between *ja* [я] (I) and *drugoj* (another) at the center of his personalist aesthetics. "To contemplate aesthetically means to refer an object to the valuative plane of the *other*" (Bakhtin, "K folosofii postupka"). The task of the author (*avtor* [автор]) consists in finding "an essential approach to life from outside" (*izvne* [извне])" (Bakhtin, "Avtor i geroj"). To do this, he must see in his *drugoj* (in the heroic character of the novel) what the *drugoj* is incapable of seeing in himself. The author must complete and perfect the life of the hero until it forms a totality. He only succeeds, however, if he approves with a love (*ljubov'* [любовь]) that accepts all (*priemlet vsü* [приемлет всё]), the *drugoj* as a living and mortal [смертный] human being. The aesthetic vision of Bakhtin is a sort of creator's love, "loving contemplation," a compound of *philia* and *theôria* [θεωρία]. "Only love is capable of being aesthetically productive; only in correlation with the loved is fullness of the manifold possible." In this way the relationship of *philophrosunê* to *drugoj*, which makes no judgment, can achieve the meaning of a universal aesthetic principle.

DUENDE (SPANISH)

ENGLISH   spirit, wit, charm, spell, cunning

➤ *DEMON* [DAIMÔN], and DEVIL, GOD, *GRACE*, INGENIUM, LEGGIADRIA, MÊTIS, OIKONOMIA, PIETAS, RELIGIO

The Spanish word *duende*, marked by folklore and by its regional origins, does not have a stable definition, although more and more it becomes clearly related to the demonic and to poetic creativity. For approximations, we need to use two different registers, one more archaic, which is related to the will o' the wisp, goblins, and sprites; the other more figurative, which is related to notions of charm, enchantment, and spells but also to grace.

The noun *duende* appears in Leonese in the thirteenth century with the meaning "master [of the house]," from

duen (*de casa*), derived from *dueño* (master, owner), which itself comes from the Latin *dominus* (master, lord). In fifteenth-century Castilian, it sometimes has the meaning of "mischievous spirit," but more commonly that of a "spirit which haunts the house." It became widespread in this popular sense, as shown by RT: *Tesoro de la lengua castellana o española* (1611): "*Duende*: one of the spirits who fell with Lucifer . . . , of whom some stayed at the surface of the Earth. They have a habit of frightening people by appearing in houses, mountains, and caves, taking on a fantastical body." A variety of legends appeared concerning these evil spirits: they guard mysteriously buried treasures; they fight greedy men; they have a possibility of becoming all-powerful. It was even claimed, for revenge, for gain, or as a joke, that certain houses were indeed haunted by a *duende*.

An evil spirit of this sort is related to local genii, lemures, larvae, lares, and penates of Roman mythology. In RT: *Tesoro de las dos lenguas española y francesa* (1607), Oudin, the interpreter for King Henry IV of France, defines it thus: "Goblin, sprite, wisp, spirit which travels through houses at night. In jargon, the rounds [that is, the rounds of argousins who burst in without warning]." RT: *Diccionario de autoridades* (1726) gives an unexpected etymology for the word (the Ar. *douar* [دُوَّار], "house," is given as the source) but nonetheless offers a precise report of the meaning that was accepted from then on: "Species of goblin or demon who is so called because it usually infects houses." This meaning is indeed the one that Calderón de la Barca uses, with humor, in his comedy entitled *La dama duende* (1620), in which the heroine plays a dazzling game of amorous hide-and-seek.

In the eighteenth century, with the rise of the press, the word became the title of an eclectic publication by a certain Juan Antonio Mercadal, whose identity is unknown: *El duende especulativo, sobre la vida civil* (The speculative spirit, on civil life; 1761). In the nineteenth century, no doubt inspired by this example, the romantic writer José Mariano de Larra founded the short-lived magazine *Duende satìrico del día* (Feb.–Dec. 1828), to which he was in fact the only contributor. RT: *Diccionario nacional ó gran diccionario clásico de la lengua española*, by R. J. Dominguez, notes the following sense, henceforth established: "Spirit that, according to the common people, resides in certain houses, worrying the inhabitants and causing a great amount of noise and destruction at night." He adds two expressions that are still in use today: *tener duende* (to be preoccupied by something), and *parecer un duende*, *andar como un duende* (to spring up like a devil).

Later, the word acquires a more and more figurative sense. The satirical meaning takes a virulent turn in one of B. Pérez Galdós's historical novels, *Los duendes de la camarilla*, which describes the corruption of the regime and the wild political intrigues under Isabella's reign on the eve of the Revolution of 1868. The 1956 edition of the dictionary of the Real Academia Española takes over the definition of R. J. Domínguez word for word but adds a new meaning, which is fundamental: that of "mysterious and ineffable charm." This last one is a regional meaning, but it became firmly established. The meaning of *duende* had

become somewhat frozen in the dictionaries, but it nevertheless flourished in a region of Spain with which it had a deep affinity: Andalusia.

In his famous lecture entitled *Play and Theory of the Duende*, given in Havana in 1933, Federico García Lorca, himself possessed by a *duende*, that is, by the pure genius of speech, song, and music or dance that is expressed in the *cante jondo* or *cante flamenco*, declared: "Throughout Andalusia, . . . people constantly speak of *duende* and detect it as soon as it is manifested with an accurate instinct." And, taking up Goethe's and Eckermann's idea according to which "the demonic is what is insoluble by intelligence and reason," the poet defined *duende* as a "mysterious power which everyone feels and no philosopher can explain." He added:

> The duende, then, is a power, not a work; it is a struggle, not a thought. I have heard an old maestro of the guitar say, "The duende is not in the throat; the duende climbs up inside you, from the soles of the feet." Meaning this: it is not a question of ability, but of true, living style, of blood, of the most ancient culture, of spontaneous creation. . . . The duende I am talking about is the dark, shuddering descendant of the sprightly marble-and-salt demon of Socrates, the one who angrily scratched him on the day he swallowed the hemlock, and of that melancholy demon of Descartes, a demon who was small as a green almond and who sickened of circles and lines and escaped down the canals to listen to the songs of blurry sailors.

After evoking the awakening of the *duende*, under several forms, "in the furthest reaches of blood," and after distinguishing it from the muse or the angel, García Lorca concluded his talk with these words:

> Where is the duende? Through the empty arch comes a wind, a mental wind blowing relentlessly over the heads of the dead, in search of new landscapes and unknown accents; a wind that smells of baby's spittle, crushed grass, and jellyfish veil, announcing the constant baptism of newly created things.

With that, in the *duende*'s going from the home, of which, according to its initial meaning, it is the master, over to the "furthest reaches of blood," which it inhabits in secret, it merely, so to speak, changes location; it remains the master of the domain, always present, always absent—the ungraspable genius of all creation.

DUTY, DEBT

FRENCH   *devoir, dette*
GERMAN   *Schuld, schuldig sein, fallen, müssen, sollen*
ITALIAN   *debito, dovere*
LATIN   *debitum, debere, fallere*
SPANISH   *deuda, deber*

➤ *DESTINY*, *DROIT*, ENTSTELLUNG, *JUSTICE*, *OBLIGATION*, PARDON, SOLLEN, TRUTH, *VALUE*, WILLKÜR

In many European languages, both Romance and Germanic, the verbs or nouns that evoke the idea of duty (for example, *dovere* and *debito* in Italian, *deber* and *deuda* in Spanish, "debt" in English [*det* and *dette* in Middle English]), coming from the Latin verb *debere* and the noun *debitum*, give rise to ambiguity that connects three distinct meanings: debt, that is, the fact of being "indebted" to someone, obligation ("I must [legally or in good conscience]"), and finally evaluation, presupposition, or reckoning ("He ought to have received it by now"). In some languages this equivocity becomes more complicated. In German for example, while *müssen* is an auxiliary verb (related to the English "must") that indicates the fact of being subject to necessity or an unavoidable obligation, a different verb—*sollen*—is used to express moral obligation or eventuality, probability, or approximation. The latter does not, however, directly express the meaning of being in debt, even though it is literally present in the phrase *ein Soll haben*, which means "to have a debt." Additionally, the idea of debt is combined in German with the idea of fault, such that the two notions are both expressed by the same noun, *Schuld*, just as the adjective *schuldig* means both guilty and indebted—even though, among the words derived from *Schuld*, some relate almost exclusively to the notion of debt (like *schulden*, "to be indebted"; *Entschuldung,* "repayment of debts"), and others exclusively to the notion of fault (*Entschuldigung,* "to excuse, demand pardon"; *Schuldhaftigkeit,* guilt; *entschuldbar,* excusable, pardonable), and others like *Schuldigkeit,* to the idea of obligation or duty in the strict sense.

I. The Combined Notions of Obligation, Probability, and Debt

For languages in which the word for duty covers not only obligation or simple possibility but also the notion of debt, it is possible to translate wordplay that turns on these meanings from one to another. Charles Malamoud opens one of his remarkable studies on the notion of debt with a brief exchange between Sancho and Tosillos in *Don Quixote*. Tosillos says to Sancho: "Sin duda, este tu amo, Sancho amigo, *debe* de ser un loco [No doubt, friend Sancho, your master must be crazy]." Sancho replies, "Como debe? No *debe* nada a nadie. . . . [What do you mean must? He owes nothing to no one. . . .]." Malamoud notes that this ambiguity exists in English as much as in Romance languages (but by playing with the neighboring verbal forms *ought* and *to owe*), as well as in German and even Russian. In most of our languages, this is explained by the semantic evolution of the Latin verb *habeo*, which comes from *de-habeo* and which means "to have [something] that has been received from someone." Whence *debitum* (what is "due"), then *debitor*, which is opposed to *creditor*. And as the *Dictionnaire étymologique de la langue latine* by Ernout and Meillet points out, "in the later period, the sense of obligation had a tendency to weaken such as to form only a sort of future periphrastic . . . or introduce a

hypothesis." These different meanings of the Latin verb *debere* thus found their way into French, but appeared in what was in a way a reverse sequence, the stages of which are given by RT: *DHLF*: "[T]he idea of obligation, necessity (842), its weakening into the future (around 1050) indicating probability, wish or intention (1080), as well as the idea of owing something to someone (before 1188)."

We should note, however, that there are some ways of expressing the idea of "must-ness" in the sense of probability that do not relate to *debere*. In Italian, for example, the future tense is used: in "*Sarà felice* [He *must* be happy]." It is in German, however, that the vocabulary related to the notion of "duty" is especially interesting. The fact that different senses of the notion of necessity are expressed by two distinct verbs, *sollen* and *müssen*, can lead to difficulties of translation. There was a question, for example, as to how to translate into French the title of one of Arnold Schönberg's *A capella choruses opus 27* (1926): *Du sollst nicht, du musst. . . .* Illustrating the composer's return to the Jewish faith, the work defines that faith as forbidding all representation in the following way: "You must not [*Du sollst nicht*] make images of the Divinity; it is necessary for you [*du musst*] to cleave to the Spirit." In reality, *ich soll*, which comes from *sollen* ("must" in the sense of "must be"), functions in the mode of giving positive or prohibitive orders, and means "I have an obligation to. . . ." This obligation may itself derive from an understood *Schuld* or from a debt to be repaid, or from a mistake to be rectified. On the other hand, *ich muss* comes from *müssen*, which also means "must," but implies a duty understood as a necessity deriving the idea of requirement, that is, to stay within the same etymological domain, from an idea of a defect to be repaired or a lack to be filled (see WILLKÜR). Further, when Kant asks the second question of his philosophical program ("What must I do?"), he uses the verb *sollen*: *Was* soll *ich tun*? Similarly, when he gives himself a moral imperative that escapes from the "pathology" of human interests and so derives only from the law of "respect" (and in which Nietzsche will see, like Sade, an "imperative of cruelty"), he takes care to formulate it in the mode of *sollen*: *Du sollst*, and not *Du musst* (which would appeal to a constraint belonging to the order of necessity or need).

In addition, the idea of debt combined with that of obligation presents an interesting peculiarity in German, as Malamoud points out: "[T]here is an echo to the verb *sollen*, '*devoir*' (here expression of the modality of probability), in order to express the notion of 'being in debt,' not from another construction or another form of the same verb, but from the expression *ein Soll haben*, 'to owe, to have a debit'; in accounting, in effect, *Soll* is the amount owed as opposed to the amount possessed" ("Dette [Anthropologie]"). We may also note, to return to Kant, that the idea of obligation may be rendered in German by the abstract noun *Schuldigkeit*, corresponding to *Schuld*, which means both "transgression" and "debt." In effect, while we generally translate Kant's *Verbindlichkeit* (from *binden*, to bind), by "obligation" (from Lat. *ligare*, "to bind," see RELIGIO), some Germanists suggest using "obligation" to translate *Schuldigkeit*, which literally contains the idea of a fundamental guilt, which itself becomes a source of obligation (see Kant, *Critique of Practical Reason*, trans. M. Muller and M. Weigelt; for the relationship between the formulations of debt, transgression, and obligation, see R. B. Onians, *Origins of European Thought*).

The same combination of the three meanings that we have just described is found in English, in which the ideas of obligation and of possibility are expressed by "ought," which is none other than the past tense of "to owe," meaning "to be in debt" or "to have an obligation to someone"—as is the case in *The Merchant of Venice* and the *bound* (or the *bond*) that binds Antonio to Shylock. Nietzsche could have been thinking of this example of a pact and a "conscientization" of debt when he wrote the following:

> The debtor (*Der Schuldner*), in order to inspire confidence that the promise of payment will be honoured (Um Vertrauen für sein Verspreche der Zurückbezahlung einzuflössen*), in order to give a guarantee of the solemnity and sanctity of his promise, and in order to etch a duty and obligation of repayment into his conscience (um bei sich die Zurückbezahlung als Pflicht, Verpflichtung seinem Gewissen einzuschärfen), pawns something to the creditor by means of the contract in case he does not pay, something that he still "possesses" and controls, for example, his body, his wife, or his freedom or his life.

<div align="center">(trans. Carol Diethe, On the Genealogy of Morality)</div>

The allusion to the "pound of flesh" to be taken by Shylock from the body of his debtor Antonio seems even more plausible when Nietzsche, even though he is only mentioning the Egyptians, continues in these terms:

> [T]he creditor (*Der Gläubiger*) could inflict all kinds of dishonour and torture on the body of the debtor, for example, cutting as much flesh off as seemed appropriate for the debt: from this standpoint there were everywhere, early on, estimates which went into horrifyingly minute and fastidious detail, legally drawn up (*zu Recht bestehende*) estimates for individual limbs and parts of the body.

<div align="center">(Ibid.)</div>

II. Error and Falsehood; Failure and Requirement

There is, thus, in most modern European languages a close relationship between on one hand, the senses of "must" as in "I must forgive him" and "That must happen to me" and, on the other, the idea of owing something to someone. But within the notion of debt, that of duty is also combined with that of error, as we see in German, where the same word *Schuld* means both "debt" and "error":

> *Schuld* comes from a Gothic form *skuld* which itself belongs to a verb, *skulan*, "to be obliged," "to be in debt" (it translates the Greek verb *opheilô*, which has both meanings), as well as "to be in error." Further, from the same Germanic root **skal*, but with a different treatment of the first letter, descends the German verb *sollen*, "ought (to do)," and the English *shall*, which, though today restricted to the expression of the future tense, meant "ought" in the full sense of the word at an earlier stage of the language.

<div align="center">(C. Malamoud, "Dette [Anthropologie]")</div>

Referring to Jakob Grimm's *Deutsche Mythologie*, Freud points out in this regard that the name Skuld, that of the third Norn from Scandinavian folklore, "recalls the English words *shall*, *should*, and the German *soll*, *Schuld*, which connote the idea of

duty and some of which express the future." He adds that "we can therefore suppose that the three names [of the Norns] appeal respectively to the past, the present, and the future" ("The Uncanny"). The fact that *Schuld* in German has the double meaning of "debt" and "transgression" means that we must look to the context in order to know which meaning is at issue in a given occurrence. Still, we may note that Nietzsche, attacking the "genealogists of morals" for their ignorance of philology, distinguishes the two meanings while explaining that "the concept of *Schuld* [transgression], for example, the fundamental concept of morality, derives from the very material concept of *Schulden* [debts]," where this plural had at the time a very concrete force (*On the Genealogy of Morality*).

However, this link between the idea of debt and that of transgression leads to another terminological configuration that includes, in French, for example, the verbs *faillir* and *falloir*, the expression *il faut* (one must, it is necessary), and the nouns *faute* (fault) or *défaut* (default, defect). This collection of notions forms a skein that sometimes gets tangled through the evolution of language—to the point where RT: *Dictionnaire étymologique de la langue latine* declares their etymology to be confusing The French "*faute* comes from the vernacular Latin *fallire*, which is a modification of the classical verb *fallere* (from the Gr. *sphallein* [σφάλλειν] and meaning "to deceive, to fail, throw off balance") and which yields *faillir* and *falloir* in French. Within the field of derivation we find the following to be notable, starting with Old French: *faille* (error, lie), *faillement* (fall, annihilation, defect), *faillance* (fault, weakness), *faut* (lack, starting in the sixteenth century), *faute* (in the sense of *faute de* [for lack of]; lack, sin), *defaillir* (to default, to be extinguished), *mesfaillir* (to commit an error, from the sixteenth century). The impersonal *il faut* (which is translated by the Ger. *es muss*, *es ist nötig*, or by *ich soll, du sollst*, and so forth, with the infinitive) therefore contains either the idea of obligation or that of necessity.

In German the same etymology yielded the verbs *fehlen* (to fail, to sin) and *fallen* (intransitive, which means "to fall, to sink"), the nouns *der Fehler* and *das Fehlen* (fault, error, lack), the adjectives *fehlerfrei* and *fehlerlos* (perfect, without defect). The verb *fallen* has as a derivative the noun *Einfall*, which may be translated by "fall" but also by "intuition," and even by "eruption." It is for this reason that, as Georges-Arthur Goldschmidt notes, "[T]he entirety of Freud's oeuvre was perhaps a constant modulation on the verb *fallen*. Failed actions, the celebrated *Fehlleistungen*, which have such pride of place in Freud's work, are what we notice, what arises suddenly in speech; they are that which *fällt auf, es fällt auf*; it is striking, we notice it, even if it comes about only by chance, by *Zufall*, by "what happens to fall in front of you" (G.-A. Goldschmidt, *Quand Freud voit la mer*).

In English, while "duty" (*dewe* in Middle English) and "due" seem to derive from the Latin *debere*, the configuration that comes from *fallere* includes notably the verbs "to fall" and "to fail," the nouns "fault" and "failure." In Romance, Anglo-Saxon, and Germanic languages, the idea of lacking and defect or failure is joined with that of falsehood, falsification, the fallacious, and so on: "false" in English and *falsch* in German come from *falsus*, the past participle of *fallere*, a verb whose principal meanings of "to deceive" and "to escape" would seem to go back to a single earlier meaning of "to hide, to be hidden," or "to elude" (cf. *Dictionnaire étymologique de la langue latine*, s.v. *fallō*).

III. Vedic Debt: Debt Which Does Not Arise from Fault, and Exists Prior to Responsibility

We can then measure what was lost from the idea of debt in this network centered around the notion of transgression and deriving from the root *faill-*. On this topic, taking up the subject of the institution of loaning money on interest, Malamoud shows in effect that if debt is close to duty, this is because

> [D]uty is debt when there is an obligation not to do but to return something. There is debt when the task or expense or sacrifice demanded by duty is presented or thought of as restitution, a return, compensation. "To have to pay a hundred francs" is not the same thing as "to owe a hundred francs." More precisely, "to owe a hundred francs" is a special case of "having to pay a hundred francs." . . . As a model of duty, having-to-return is the guise taken up by other duties . . . . We go astray from duty pure and simple when debt becomes a relation that makes not just the debtor and the creditor present, but the borrower and the lender, when debt becomes a regulated institution, when it deals with material and measurable goods, and especially when interest must be paid.
>
> ("Dette [Anthropologie]")

The link between duty, debt, and transgression does not exist in all languages, even if we come across it in many Indo-European languages and others such as Hebrew. Thus, the Sanskrit term corresponding to "debt," *ṛṇa*, "is without any etymological relation of any sort to a verbal root that means *devoir* nor with the nouns that designate the different forms of obligation." In reality, what characterizes Indian thought is the idea that every man, simply in virtue of being born, is from the beginning loaded with debts to such an extent that he is defined as being himself a "debt" by origin and constitution: "Debt to death, on one hand: his very existence is a deposit that the god of death, Yama, will necessarily reclaim; and on the other hand, debt to a fourfold group of creditors: the gods, ancestors, the seers who transmitted the sacred texts of the Veda . . . , and finally other people" (ibid., 297–98). In this way a man who has a son will be freed from this essential debt, or who fulfills the prescribed sacrificial rites, or who leads a life of Brahmanic study. But Vedic theology does not offer an answer to the question of what makes man thus indebted or of the nature of the loan by which he became a debtor. This forces the exegete to come back to problems of vocabulary:

> [T]he term *ṛṇa*, debt, has a precise technical sense; it belongs to the vocabulary of economics, and refers to the obligation to return borrowed goods, or their equivalent, and cannot be a synonym for "duty" or "obligation" in general. We are thus in the presence of the following paradox: a debt without prior borrowing, or at least without awareness of the event of the borrowing, a consequence without a cause, a present without a past. The current constraint therefore cannot be perceived as the result of a fault which has been committed; if the congenital debt is a failure (to be overcome by the execution of a program of rites), it is not a defect, even less a sign of sin, the endpoint of a fall; and the restitutive obligations that are demanded of man are not an expiation, are not

dictated by a condemnation, and there is no occasion for the feeling of guilt. Not that the Vedic religion does not contain the notions of sin and stain; on the contrary.

> (C. Malamoud, in *L'Apport freudien*, ed. P. Kaufmann)

Nevertheless, even though Vedic theology is unclear as to the origin of the congenital debt affecting every man, it remains open to connotations of the term *ṛṇa* in which "the notions of 'fault' and 'debt' (the two senses of the German word *Schuld*) are conjoined." This explains how individuals may end up questioning themselves in fear of any past mistakes, as though they could allow for an understanding of their current misfortunes and the "unpaid debt that they have down here" toward Yama, the god of death and the controller of all debts.

■ See Box 1.

At the very least, in languages where the equivalent of *devoir* belongs to the same family as the Latin *debere*, and perhaps as well in Vedic India, the "symbolic debt" seems to delimit a lexical field in which the obligation involves a deeper sense than that which comes from the legal or financial context in which one must return a thing or a borrowed sum. The first of these two registers, in effect, "deals with obligation in the sense of reciprocity (one would therefore be in the domain of gifts and counter-gifts)," in a sphere governed by the exchange of gifts— this gift calls for one in return (cf. M. Hénaff, *Le prix de la vérité*, 274). On the other hand, in the pecuniary relationship established between creditor and debtor, the latter is, in virtue of his contractual obligation, exposed to punishment that can be without mercy if the debt is not repaid. It is on this model that Nietzsche seems to base his entire conception of a debt that cannot fail to create in the debtor a state of dependency and humiliation with its train of fear, bad conscience, and the feelings of guilt or worthlessness characteristic of shame (cf. F. Tricaud, *L'Accusation*).

"Symbolic debt" in Lacan

➤ SIGN

One might wonder whether it is possible to find an echo of this Vedic theology regarding man as an indebted creature in what Jacques Lacan calls "the implacable game of debt," referring to the cosmic metaphor (*Écrits*) that Rabelais puts thus by way of Panurge, in the *Tiers Livre*:

> You ask me when I will be out of debt. Well, to go yet further on, and possibly worse in your conceit, may Saint Bablin, the good saint, snatch me, if I have not all my lifetime held debt to be as a union or conjunction of the heavens with the earth, and the whole cement whereby the race of mankind is kept together; yea, of such virtue and efficacy that, I say, the whole progeny of Adam would very suddenly perish without it. Therefore, perhaps, I do not think amiss, when I repute it to be the great soul of the universe, which, according to the opinion of the Academics, vivifieth all manner of things.

Throughout his *Séminaire*, in fact, Lacan makes this idea of a fundamental debt an important key to his theory of the symbolic:

> The commandment of death is there [in ancient tragedy]. And to be there in a veiled form, it may be formulated and received as coming from this debt which accumulates without a guilty party and is discharged on a victim without his deserving any punishment.

(Lacan, *Le transfert* [*Transference*])

> The Word [of the Gospel] is for us not at all only the law where we insert ourselves in order to carry, each of us, the debt which is our destiny. It opens for us the possibility, the temptation whence it is possible for us to curse ourselves, not only as a particular destiny, as life, but as the very way where the Word engages us and as a meeting with Truth, as the hour of truth. We are no longer simply within range of being made guilty by symbolic debt. It is having the debt on our account for which we can be, as closely as this word can indicate, reproached. In sum, it is the debt itself where we had our place which may be stolen from us, and it is there that we may feel completely alienated from ourselves.

(Ibid., 354)

In reality, before he considered this theme in relation to death and to the law given by the Word, Lacan made debt the pillar of a system that he defined, inspired by Claude Lévi-Strauss, as the "symbolic chain," as opposed to the "chain of experience" in which nothing is articulated or built up. Lived experience, in effect, is not ordered, does not take on meaning, and cannot be analyzed "except beginning with the moment when the subject enters into an order which is the order of symbols, the legal order, symbolic order, symbolic chain, order of symbolic debt" (*La relation d'objet*). Such an order exists prior to anything which, in experience, happens to the subject, its events, its satisfactions, its disappointments.

| DYNAMIC

"Dynamic" is formed from the Greek *dunamis* [δύναμις], "force" (cf. *dunasthai* [δύνασθαι], to be capable of, to be able, to have a power; in speaking of a word or currency: to be worth, to signify; in mathematics: the square [i.e., second power]), and it refers to the study of force, from the physical-mathematical perspective as well as the ontological one, notably in Leibniz, who introduced the term. The Greek *dunamis*, like the Latin *potentia*, and "power," contains an essential ambiguity: it is power in the sense of "in potentiality," *potentia*, potential, as opposed to the actualization and the act; but it is also "the power to X," *potestas*, capacity, ability.

I. Dynamics, Potentiality, Actuality

The collection of physical and ontological networks, and the difference between "force" and "energy," are explored in the entry on FORCE. See also MOMENT and STRENGTH (as opposed to "force"). Cf. EPISTEMOLOGY.

For more on the Greek, see FORCE, Box 1, PRAXIS, TO TI ÊN EINAI; cf. ESSENCE.

2. On the relation between dynamics and the psyche, especially with respect to the Freudian dynamic, see DRIVE; cf. ES, PLEASURE, SVOBODA, UNCONSCIOUS, WILL, WUNSCH.

➤ SENSE

ECONOMY

FRENCH   *économie*
GERMAN   *Wirtschaft*

➤ BERUF, CIVIL SOCIETY, OIKONOMIA, PEOPLE, POLIS, POLITICS, PROPERTY, *PRUDENCE*, UTILITY

The word "economy" is a direct import from Greek, used in a number of European languages, although German prefers *Wirtschaft* over *Ökonomie*. It has retained a number of senses related to its original one (the "rules," *nomoi*, of having a well-run "house," *oikos),* which are very similar from one language to the next. Behind this apparent unanimity, however, there are fundamental and far-reaching differences. As a starting point, we have taken the current extension of the meaning in English, according to which "economy" is a synonym for "country." French has not adopted this extension, which encroaches on the domain reserved for political matters. English and French thus fall on either side of the distinction between the economic and the political, which is decisive for the definition of "economy." The German *Wirtschaft* seems to escape from the dilemma since it rests on the metaphor of the innkeeper (*der Wirt*), which allows for the inclusion of both economic and sociopolitical agents in an organic whole. Nevertheless, the claim of economics to be the incarnation of collective rationality must then fall back on the word "people" (*Volk*) in order to be clear (*Volkswirtschaft*).

The aristocratic Homeric domain can no longer be used to describe the modern economy. By way of the link with *oikos*, however, the word "economy" continues to carry the mark of its origins, though confined to material tasks and day-to-day subsistence.

I. *Économie* and Economy

The words *économie* and "economy" come from the Greek *oikonomia*, which means the direction and administration of a "house," that is, in the Homeric era, a manorial estate.

In French, *économie*, like the adjective *économe*, refers to a virtue or quality, a kind of prudence; the result of the exercise of that virtue (*faire des économies*); a social science and its subspecies (*économie appliquée, économie monétaire*); the object of those sciences (*économie des pays développés*); finally, the harmony or organization of the parts of a whole (*économie libidinale*) (see OIKONOMIA). Except for this last sense, which can be applied to anything from a literary work to divine creation to the human body, the use of the word delimits the field of the material activities of production, distribution, and consumption of goods. The field has a technical character: a text on economics will most often contain figures and symbols of physical magnitudes. It is, further, defined by the economic/political distinction. In this way the transformation of the European Economic Community into the European Union—i.e., the disappearance of the word "Economic" from the name—represents what is considered to be an important evolution for this group of countries.

The border that separates the economic from the political is a sensitive point in contemporary society. Some say it is odious for multinational corporations to overturn a government; some say it is odious for the state to intervene and micromanage the economy.

The English word "economy" covers all of the French senses except for that of the science, which is designated by "economics." On the other hand, one of the senses has developed so much that it goes beyond the French one. This is the sense that designates a part of social life, but also an autonomous part, and by a metonymy that is less and less perceptible, a whole, which in English can be the whole of society itself. In this case, it is translated into French as *pays* (country).

Thus, Paul Samuelson and William Nordhaus write in their widely read economics textbook, "How can we explain that a country like Japan . . . has become the world's most productive economy?" (*Economics*, 700). Japan is an economy. An economy is a being endowed with a personality, and there can be many of them: "Market economies are many times wealthier than they were at the age of Adam Smith" (ibid., 724). The synonymy appears even more clearly in other cases: "At the end of the 1980s, the walls of the centrally planned economies of Eastern Europe were knocked down and these countries began the swift transition to market economies" (ibid., 375).

The use of "economy" to refer to countries has developed especially in Asia. Two of the Asian "dragons," Hong Kong and Taiwan, are not "countries" in the diplomatic sense. Their presence in the Asia Pacific Economic Co-operation (APEC) forum requires the member countries, including the United States, to refer to themselves as "economies" in this framework. This sense does not exist in French, where we find, on the other hand (see RT: *Le nouveau petit Robert*), that of "activity, economic life; a group of facts related to the production, distribution, and consumption of wealth in a human group. *Ministère de l'Économie nationale*." Thus stated, the economy is a part of the collectivity, as is emphasized by the example chosen.

The Organization for Economic Cooperation and Development (OECD) is an organization whose two official languages are English and French. Since it deals primarily with economies, it has had to face this question. The *Glossary* of the OECD, which was set up to resolve this sort of difficulty, suggests translating "economy" as *pays* (country). For example, "adv*économie de marché.*

II. Economics and Politics

It looks as though French is saturated with the priority of the political. It is not possible, for the moment, to say "*la France est une économie*," whereas "the United States is an economy" is acceptable in English.

Understandably, "policy" poses a reciprocal problem of translation. As the sense of "economy" expands to include

a political dimension, that of "policy" diminishes. Thus the sense of "policy" is more restricted than that of *politique* in French, since it only designates the nonpolitical aspects of the actions of the state—questions that are, properly speaking, political are referred to as "politics." Its usage is extremely broad, however, and it does much to encourage the idea that the actions of the state are not necessarily political.

The problem may be resolved when "policy" is used as a noun: one can say "*politique gouvernementale*" or speak of a plurality of *politiques* in French. It is more difficult when "policy" is used as an adjective. Thus, "policy action" would be translated as *action gouvernemental, action publique, mesures gouvernementales*; "policy area" by *domaine / secteur d'action (des pouvoirs publics)*; "policy debate" by *débat sur les mesures à prendre / les politiques à suivre*; "policy context" by *cadre d'action* (*Glossary*, OECD, 1982). None of these translations uses the word *politique* in the singular. There is an obstacle to avoid: the word *politique* has an almost sacred status in French. It casts a wide shadow. To translate "policy debate" by *débat politique* would be a serious mistranslation, whereas the reverse is not true. To know whether a *débat politique* is a "political debate" or a "policy debate," it is necessary to determine whether it deals with goals or with means of application, which may be difficult.

Thus, the difficulty with translating *économie* by "economy" is related to the relationship between economics and politics. The problem lies in knowing whether there is a master of the house (*oikos*) and what his prerogatives are. The watchword of economic liberalism, on which Western societies are based, is that the production and distribution of wealth ("economic" activities) should be left as much as possible to private initiative. If that is the case, and in particular if private initiative is the initiative of all the citizens, the state's scope for intervention—that is, the political—may be reduced to a lesser portion, or even to zero. A system of pricing and markets would be capable of coordinating people and businesses without any central intervention.

In French the economy is a part of the social whole and remains subordinate to a master, the nation-state, which is the only thing representing the whole. English and French have thus each received one of the two halves of liberalism's legacy. These languages remain marked by this historical experiment, and each develops one of the poles of the economic/political distinction.

III. *Wirtschaft*

German seems to evade this dilemma, since it mainly uses *Wirtschaft*, whose primary meaning is "collection of methodical actions combining to satisfy needs" (see RT: *Der Neue Brockhaus*, vol. 5, s.v. "Wirtschaft"). The word comes from *der Wirt*, which means "innkeeper, host," as well as "head of household." There is thus clearly a master of this household. One cannot have an inn without an innkeeper. The existence of politics is thus not threatened by the wide sense of *Wirtschaft*, since it is neither above nor below it; the two are consubstantial. By transposing the Greek estate into the metaphor of the inn, German preserves the link between economics and politics. The inn, however, is a private place, despite being open to the public. The metaphor of the host is powerful in German. Thus, foreign or immigrant workers are called *Gastarbeiter*

(guestworkers). However, it does not suffice for the representation of a national reality.

The problem of the extension of the meaning of *Wirtschaft* to an autonomous social reality, able to exist in the plural (international), is solved in German by the word *Volkswirtschaft*:

> Die Moderne Wirtschaft ist eine gesellschaftlicharbeitsteilige Tauschwirtschaft, die ihrer regionalen Ausdehnung nach über die nationalen Grenzen der einzelnen Volkswirtschaften hinaus sich zu einer die Erde umspannenden Weltwirtschaft entwickelt hat.

> (The modern economy is an economy of exchange based on the form of society and the division of labor, which has gone beyond the regional divisions of the different national economies to become a worldwide economy encompassing the entire earth, beyond national borders.)

> (Ibid., "Volkswirtschaft")

But even in its domestic sense, *Wirtschaft* does not extend to economic rationality. Max Weber feels the need to define the word precisely. It is often the object of "inappropriate usage" that involves speaking of *Wirtschaft* to refer to "any behavior that is rational with regard to its goals," or to refer, on the Leibnizian model of a "principle of economy," to the "universal technique of the optimal, that is, the pursuit of the greatest result with the least expense"—which for Weber is only a technique. According to Weber, one should only speak of *Wirtschaft* "when, in order to satisfy a need, we find ourselves faced with means that seem limited in the eyes of the actors, and when this state of affairs becomes the foundation of a specific behavior that takes that into account" (*Economy and Society*). The economy is the specific activity of agents occupied with the satisfaction of needs, insofar as this satisfaction is in turn specific with respect to the rest of social life. It is, in a way, their profession (*Beruf*).

Weber makes it clear that the action takes two forms:

> Mann kann unter zwei verschiedenen Gesichtspunkten wirtschaften. Einmal zu Deckung der Alltagsbedürfnisse. . . . Gegenüber der Wirtschaft zur Deckung des eigenes Bedarfs ist die zweite Art des Wirtschaftens Wirtschaft zum Erwerb: die Ausnutzung des spezifisch ökonomischen Sachverhalts: Knappheit begehrter Güter, zur Erziehung eigenen Gewinn an Verfügung über diese Güter.

> (There are two ways of behaving economically. The first consists in seeking to satisfy one's daily needs. . . . Besides the economy aiming to satisfy needs, there is a second way of acting economically: the use of the specific state of economic affairs, that is, the poverty of desired goods, to attain the personal goal of a profit in the disposition of these goods.)

> (Weber, *Economy and Society*)

The legitimation of personal profit in Western societies (the Protestant ethic) is a modality of this action.

Once again, the simple rational action of the human being seeking to satisfy his material needs cannot serve to legitimate a social system—when it is not expressed by a Greek word.

Wirtschaft seems closer to "economy" than to *économie*, since it can encompass all the agents of economic action. If each citizen becomes an economic actor, the social class envisaged by Weber comes to apply to the whole of society. But *wirtschaften* is just as distant from French as it is from English, which thus find themselves on the same side of the barrier; in effect, the verbs *économiser* and "to economize," which both have the sense of "to save," prevent the notion from becoming dynamic and prevent the appearance of economic actors and aspects of economic action that have nothing to do with the act of "saving" (for example, investment). These remain hidden in English and in French behind the watchword of prudence in spending, which decorates the economy in the feathers of virtue.

EIDÔLON [εἴδωλον] / EIKÔN [εἰκών] / PHANTASMA [φάντασμα] / EMPHASIS [ἔμφασις] / TUPOS [τύπος] (GREEK)

ENGLISH	image, picture
FRENCH	*image*
LATIN	*figura, effigies, forma, imago, pictura, simulacrum, species*

➤ *IMAGE* [BILD], and DOXA, ERSCHEINUNG, *IMAGINATION* [PHANTASIA], INTENTION, LIGHT, MEMORY, MIMÊSIS, OIKONOMIA, PERCEPTION, REALITY, SPECIES, TRUTH

The French *image* is based on the Latin *imago*. The Latin term itself does a poor job of transmitting the multiple echoes that accompany the Greek vocabulary related to images, which includes *eidôlon* [εἴδωλον], *eikôn* [εἰκών], *phantasma* [φάντασμα], *emphasis* [ἔμφασις], *tupos* [τύπος], etc., and is much richer and more evocative than Latin. But none of these terms is an exact equivalent for the French *image*, nor are they equivalents among themselves. Hence, serious difficulties arise for translation, whether it is a matter of what a drawing represents or what is presented in a mirror. For this richness is not a matter of chance: far from being simple, the notion of image itself is something multiple and ambiguous. It is neither one thing, nor one concept, but "a visible thing that yields the vision of another"; a second-order visible that itself may not be the direct result of a sensation, but a product of memory or imagination. In addition, the way in which the image has been conceived has greatly evolved, owing to theories of vision and the successive discoveries of optics. From these, other misunderstandings become possible, since even for a term for which the translation *image* seems natural, any anachronistic interpretation may lead to missing the point of a passage as a result of a specifically cultural misunderstanding.

I. The Greek Terms and the Archaic Features of the Image

The ancient Greeks were prompted to thought by what they saw in a mirror or a painting. The standard terms by which they referred to images had archaic features that left traces in their philosophical reflection.

The most common term for image, *eidôlon* [εἴδωλον], has as its root the verb meaning "to see," through its aorist infinitive *eidon* [εἶδον]. The *eidôlon* is what we see as if it were the thing itself, but which is in fact a double: shadows of the dead in Hades (*Odyssey*, 11.476); Helen's double created by Hera (Euripides, *Helen*, 33); an effigy or portrait, which places someone absent before our eyes; or finally what is displayed in a mirror, which is not really there. In other words, the *eidôlon* is the bearer of visual illusion, as opposed to the *eidos* or *idea* [ἰδέα], from the same root—the true and perfect *form*, which becomes Plato's "idea." Epicurus chose the plural *eidôla* as a technical term to refer to the thin envelopes of atoms emanating from the surfaces of objects, which cause us to see them by penetrating our eyes (*To Herodotus*, 46.9). They are a kind of traveling duplicate, remaining invisible during their journey, and which are the sources of mental images or *phantasiai*, which allow us to validate or invalidate what we see (ibid., 50.2). Because of its illusory and insubstantial aspect, *eidôlon* acquired a sometimes pejorative meaning, which is found in the "idol" of the Septuagint (2 Kings, 17, 12), and the "idolaters" of the iconoclasts.

The second term, also common, is *eikôn* [εἰκών], which comes from **Feikô* (to resemble). The primary sense thus reveals an aspect of images, related to the first, namely, their similarity to the objects. The classical uses are analogous to *eidôlon*, but the sense of statue or portrait is prior to that of a mirror image or a ghost. An effigy always preserves some aspect of its model, even though there are degrees of resemblance. When Plato performs a division of the art of mimesis in the *Sophist*, he defines *eikôn* as a faithful reproduction, which strictly preserves the proportions and the colors of the original (235d–e). *Eikôn* thus tends to evoke the positive aspect of imitation, that which sticks to what exists, and so it is understandable that the term gave us *icon* and its cognates. Plato contrasts *eikôn* with *phantasma* [φάντασμα], a noun derived from the verb *phainesthai* [φαίνεσθαι] (to shine, to show oneself, to appear), by way of *phantazesthai* [φαντάζεσθαι] (to appear, to show oneself). He defines *phantasma* by taking as an example the practice of painters who represent objects not as they are, but as they appear according to their position and the point of view of the observer (236b). It seems imprecise to translate *phantasma* here as *simulacrum*, which has often been used, but which today evokes something in which we do not really believe (as when we speak of a simulacrum of peace), whereas *phantasma* strongly suggests an appearance that we could mistake for reality, bearing all the credibility possessed by a successful trompe l'oeil. Characteristically, with regard to the ontological status of the image, whereas we would attribute error or illusion to a *subjective* mistake, Plato thinks that the art of imitation confers a presence in the world upon the false. To say the least thing about the false, it is necessary to establish that "non-being is," whether we hear it in opinions or speeches that say what is not the case, or see it in images (*eidôla*), reproductions (*eikôna*), imitations (*mimêmata*), or trompe l'oeils (*phantasmata*), which depict what is not (241e).

■ See Box 1.

1

To eikos, or how what is likely is the measure of truth

The terms deriving from *Feikô (mainly seen in the perfect, *eoika* [ἔοικα]), constitute an instructive semantic family. Besides *eikôn* (image, representation, as well as comparison and indication), we find verbs such as *eiskô* [εἴσκω], "to make similar," "to compare to" (in Homer and Sappho), and *eikazô*, "to represent by an image," "to deduce from a comparison," "to conjecture." The group formed by *eikazô* and its related terms, according to Chantraine (RT: *Dictionnaire étymologique de la langue grecque*, s.v. *eoika*), "illustrates the shift from the sense of 'image, resemblance' to that of 'comparison, conjecture.'" *Eikasia* [εἴκασια], for example, indicates not only the image (Xenophon, *Memorabilia*, 3.10.1) but also conjecture, both that of soothsayers and of doctors (Plato, *Republic*, 534a; Hippocrates, *On Diseases*, 1; cf. *to eikastikon* [τὸ εἰκαστικόν], Lucian, *Alexander*, 22).

More widely, "a semantic group came out of the notion of image and resemblance, related to the intellectual and moral world" (RT: *Dictionnaire étymologique de la langue grecque*). This is especially clear in cases of the adjective *epieikes* [ἐπιεικής] and the noun *epieikeia* [ἐπιείκεια] (literally, in keeping with what resembles), which refer not only to the "fitting," but in Aristotle, for example, as a technical use, to the "equitable" and "equity." That is, it indicates the indulgence that is a good quality of the virtuous man—the *spoudaios* [σπουδαῖος], whose zeal, nobility, and qualities as a citizen are contrasted with the bad or common, *phaulos* [φαῦλος]; it is the virtue of the judge who is capable of correcting the laws by considering cases, unlike *dikaion* [δίκαιον] and *dikaiosunê* [δικαιοσύνη], "the just" and "justice," which deal with the strict application of the law, which as such is general (*Nicomachean Ethics*, 5.14; see THEMIS).

The most remarkable is no doubt the importance for rhetoric of the nominalization of the neuter perfect participle, *to eikos* [τὸ εἶκος]. *Eikos* is what resembles and seems, that is, in fact, what seems to be true, good, or normal—what is likely, as opposed to what is true and to what is implausible. We must note, however, the distortion introduced by the common translation into French, *vraisemblable*—this imposes truth as a model, unlike the Greek. The primary characteristic of the *eikos* is that it follows the law of the comparative: the "more likely" (*eikoteros* [εἰκότερος]) wins out over the likely, and this is the domain of the debates between the prosecution and the defense. Antiphon's *Tetralogies* provide the model: "Apparently [*eikotôs* (εἰκότως)], he killed the man," says the accuser (1.a.6); the defendant responds, "if it is likely [*eikotôs*] that I appear guilty to you, it is even more likely [*eikoteron* (εἰκότερον)] that I would have foreseen the suspicion of today" (1.b.3). In other words, rhetorical likelihood never justifies a conclusion that something is true, and only persuasion (*peithô* [πείθω]) is able to determine the listener's belief (*pistis* [πίστις]), as well as the strength of the evidence, which is also related to the trust (*pistis* again) accorded to the orator.

The political utility granted by Aristotle to rhetoric, in contrast to Plato's contempt, finds its source here: "the true and the just have a greater natural force [*kreittô têi phusei* (κρείττω τῇ φύσει)] than their contraries." However, the litigators who are telling the truth sometimes lose; thus help is required from the *technê rhêtorikê* [τέχνη ῥηθορική], which allows us to discover what is persuasive in each case (*to endechomenon pithanon* [τὸ ἐνδεχόμενον πιθανόν])—for it is even more shameful to be unable to defend oneself with one's *logos* [λόγος] than with one's body (*Rhetoric*, 1.1.1355a21–b7).

If that is the case, it is because the *eikos*, what is likely, is always capable of being truer than the truth. That is, in fact, the domain of poetry, and therein lies its superiority: "the poet's function is to describe, not the thing that has happened [*ta ginomena* (τὰ γινόμενα)], but a kind of thing that might happen, i.e., what is possible as being probable or necessary [*kata to eikos ê to anagkaion* (κατὰ τὸ εἰκὸς ἢ τὸ ἀναγκαῖον)]" (*Poetics*, 9.1451a36–38). It is indeed because the likely is on the side of the necessary and general (*ta katholou* [τὸ καθόλου]), and not that of the reality of particular facts (*ta kath'hekaston* [τὰ καθ' ἕκαστον]), that poetry is "more philosophical and more virtuous (*philosophôteron kai spoudaioteron* [φιλοσοφώτερον καὶ σπουδαιότερον])" than history (b5–7). This is why "we must prefer the likely but impossible to the unpersuasive but possible [*adunata eikota mallon ê dunata apithana* (ἀδύνατα εἰκότα μᾶλλον ἢ δυνατὰ ἀπίθανα)]" (24.1460a27–28). It is, besides, "likely that even the unlikely should take place" [*eikos kai para to eikos ginetai* (εἰκὸς καὶ παρὰ τὸ εἰκὸς γίνεται)]" (25.1461b15). In rhetoric as in poetics, the likely is the measure of the true, or in other words, resemblance is the measure of the real.

BIBLIOGRAPHY

Antiphon. *Speeches*. Edited by M. Gagarin. Cambridge: Cambridge University Press, 1997.
Aristotle. *Poetics*. Vols. 1 and 2 in *The Complete Works of Aristotle*, edited by J. Barnes, translated by Ingram Bywater. Princeton, NJ: Princeton University Press, 1984.

Another, more technical term, is that of *emphasis* [ἔμφασις], which, like *phantasma*, comes from *phainesthai*. Aristotle uses it to refer to the visual effect of a "break" or reflection (*anaklasis* [ἀνάκλασις]) of vision that meets an obstacle, whether the effect is a clear image or not, since it may be reduced to simple colored patches (*Meteorology*, 372a30–372b8). The term is to be compared with *enoptron* [ἔνοπτρον] or *katoptron* [κάτοπτρον] (mirror), which refers to "that *in which* (or *in the depths of which*) we see." *Emphasis* is "what appears in" water or the bronze of armor: a pure appearance, which may only be appearance, like the rainbow that offers multiple reflections of the sun in the droplets of water of a cloud, but does not exist in its own right. It is appearance in the sense of the apparitions (*phantasmata*) of our dreams, whose mutable character is reminiscent of an image trembling in the water at the slightest breath (*On Divination in Sleep*, 464b8–13). The optical sense of *emphasis* thus lends itself to anachronism despite its new technical meaning. To take the *visual* effects of reflection into account, the analyses of the *Meteorology* rest on the idea that it is *vision* and not light that bounces off an obstacle, as does all geometrical optics up until the eleventh century. In addition, there is still only one word (*anaklasis*) to refer both to reflection and to refraction. *Emphasis* remains clearly, in the fourth century BCE, that which is seen behind a reflective or refractive surface, an illusion without substance, which is not really where we see it, or how we see it.

Finally, another term is that of *tupos* [τύπος] (imprint), which has led to many misunderstandings. In the first instance, it is the trace of a footstep in the sand, or of a seal on wax. This was one of the models used up until the fourth century BCE to explain the presence of images in mirrors, as though they were imprinted there by the intervening air.

It even explains vision in Democritus, starting with the image-imprint that is seen in the eye of another when we look at it closely (*Sense and Sensibilia*, 437b5–10). René Mugnier here translates *emphasis* by *reflected* image, and thus the meaning of the passage escapes him (*Petits Traités d'histoire naturelle*). It is explained that in the *Timaeus* (71b), Plato compares the smooth surface of the liver to "a mirror where forms (*tupoi*) are imprinted and yield visual images (*eidôla*)" in order to explain how the impressions sent by the intellect can dominate those imprinted there by the visions and phantasms of the desiderative soul. The meaning and the import of the text are missed if we introduce modern concepts of vision by translating, as does Albert Rivaud in Plato's *Timaeus*: "comme un miroir qui reçoit des rayons et laisse apparaître des images" (like a mirror that receives the *rays* and allows the images to appear), or as does Mugler in *Dictionnaire historique de la terminologie optique des Grecs*: "comme un miroir qui reçoit des impressions lumineuses et permet de voir des images" (like a mirror that receives *luminous* impressions and enables us to see images; s.v. *eidôlon*). What is in play is not just the explanation Plato gives of our dreams on the basis of these nocturnal impressions or imprints, and his concomitant justification of dream interpretation. Also at stake is the origin of later conceptions of imagination and memory (see PHANTASIA), the surprising relation between Platonic dream interpretation and Etruscan haruspicy, and finally, the long-standing belief concerning the ability of pregnant women's desires to produce birthmarks on newborns, which we still find in Descartes's *La dioptrique* (discourse 5).

The image is one of those notions whose supposed obviousness is deceptive, and must be resisted. Among the Greeks, it is defined by the brute fact of its visibility, and it is only beginning in the third century BCE, approximately, that it comes to be explained by reflection—and that only in a learned theory of mirrors, and only by the notion of *visual rays.* We misunderstand the famous text of *Republic*, 6.510a, where Plato places mirror images with shadows in the last type of being—the least clear one, which produces illusions and beliefs—if we forget that he has in mind visible fictions imitating real visible objects—insubstantial reproductions that haunt and falsify this world. Any reference to reflection of *luminous* rays confers on this ancient Greek image a physical objectivity that is not there.

II. The Latin *Imago* and the Technical Vocabulary of Medieval Optics

Of all the Latin terms that answer in some way or other to the notion of "image," such as *simulacrum, figura, forma, effigies, pictura*, or even *species* (derived from *specio*, to look at), the term *imago* corresponds best to our term *image*. It is still best to be wary of its apparent obviousness, since the notion was made internal over time, as attested by our derived terms *imaginary* and *imagination.*

Imago suggests in the first instance, because of its origin (its root is *im-*, which is found in *imitor*), a material imitation. It refers in fact to statues or portraits (Cicero, *Epistulae ad familiares*, 5.1.7), and in particular to the wax effigies that nobles would have carried in funeral processions (idem, *In C. Verrem actio secunda*, 2.5.36). Thus, it is something that appears as a double, which may also be the shadow of a dead

person (Virgil, *Aeneid*, 4.654), a specter (ibid., 4.773), or a mirror image (Lucretius, *De rerum natura*, 4.156). But although the *imago* may appear in a hallucinatory or virtual way, it most often has the reality of a reproduction. Cicero (*De finibus*, 1.21) translates the Epicurean material *eidôla* by the plural *imagines*; they are what we receive in our eyes and what make us see the things from which they emanate. Lucretius most often uses the term *simulacra*, derived from *simulo* (to copy, to imitate) (*De rerum natura*, 4.159, etc.). The meanings of the two words are very close; in both cases, they refer to image-portraits of the object, an idea that we associate with results of methods of reproduction, variously called *figura, forma, effigies*, or *pictura*. Because of the resemblance between the *imago* and that of which it is an image, the meaning is involved with the two opposing directions of truthful similarity: that of the son who is a *portrait* of the father (Cicero, *Epistulae ad familiares*, 6.6.13), or, in contrast, that of deceptive similarity, such as the usurpation of someone else's appearance (Plautus, *Miles gloriosus*, 151). Further, there are the figurative uses, according to which the face is the *mirror* of the soul (Cicero, *De oratore*, 3.221), or ambition takes on the *mask* of modesty (Tacitus, *Historiae*, 4.86). The internalized notion only appears later, with the *evocation* of sad or pleasant things (Tacitus, *Annales*, 2.53), or again of an absent friend (Pliny the Younger, *Epistulae*, 7.5.1).

No doubt it is along these lines that *imago* led to *imaginari* and *imaginatio* in the Imperial period, which is where "to imagine" and "imagination" come from, with the sense of "to represent to oneself," without the extreme semantic diversity of the Greek term *phantasia*. We may see the difficulty Latin writers had in getting beyond the strict sense of material reproduction toward that of mental representation found in Saint Augustine. In book 10.7–21 of the *Confessions*, he analyzes the contents of what he calls the palace of his memory. A careful reading shows that the metaphor is developed with the idea of a receptacle of images (*imagines*) of sensible impressions, classed as visual, auditory, and so on (like so many portraits?), of which he asks "how they have been made" (10.13). The study develops further with the memory of the sciences, of the affects, of remembering itself, arriving at the limiting case of the memory of forgetting. How can the image of forgetting subsist in memory, if it is itself a forgetting imprinted upon us (10.25)? This is not an issue of paradoxical subtleties, as some have supposed. Rather, we must see this as an attempt to get beyond the idea of a mental image as a strict reproduction of what it represents, an idea that still lies beyond some conceptions of memory and imagination in the nineteenth century. Again, it is not so much a difficulty about choosing a modern equivalent of the term, as about the archaic content that the term carries with it.

The subsequent evolution of optics adds a great deal of complexity to these first personal extensions of the notion of *imago*. Unlike the Epicurean theory, the hypothesis of a visual flux, on which ancient geometrical optics was based, could do completely without the journey of some image through the air and into the eye and body, since in this theory, it was vision itself that supposedly reached out to touch the external object in order to sense it. In the beginning of the eleventh century, however, the Arab scholar Ibn al-Haytham

(Alhazen) conceived an optics based on the entry of light rays into the eyes, which required him to think seriously about the formation of a quasi-image of the object on the lens, which he held to be a sense organ, and about its transmission to the encephalon. The image of an external visible object thus also became an internal object formed in the eye and traveling along the optic nerve to the seat of the visual faculty. His *Optics* was translated into Latin, no doubt at the very end of the twelfth century, and led to a transformation of the vocabulary of vision, based on his Arabic.

One ambiguous term is that of *forma*, whose equivocality leads to its being transposed to *form*. As A. I. Sabra points out (*The Optics of Ibn al-Haytham*), it is translated from the Arabic *ṣūra* [الصورة], which ordinarily relates to all of the notions we have seen connected to that of the image, such as form, figure, effigy, appearance, and so on. The first Arabic translators used it to translate a number of Greek words, including *eidos*, *idea*, *eidôlon*, *morphê*, *tupos*. In Ibn al-Haytham's optical works, *ṣūra* has at least three meanings. First, the term indicates light, and by extension color, insofar as these exist in luminous or colored objects as *essential or accidental forms*, according to whether the objects are luminous or colored by themselves or in virtue of an external source. It thus refers to a property or quality *of the thing*. In the theory of vision, *ṣūra* also has two meanings, which the author does not always distinguish. The first is what the sense organ (the lens) periodically receives from an external, luminous, and colored point: it is thus the sensory image of a point—the two proper sensibles of sight being light and color. Second, it is the grasping of the object in all of its visual determinations: its outline, of course, as a collection of luminous and colored points, which also corresponds to our notion of an image—but also the twenty other *intentiones visibiles* that characterize it, from its size, its shape, its position or movement, to its smooth or rough character, its continuity or discontinuity, beauty or ugliness. In other words, it is what the final visual faculty transmits to memory for recollection, or to the intellect for judgment.

Related to the notion of *forma*, a second, even more equivocal term thus appears, namely, *intentio*. It translates the Arabic *ma'nā* [المعنى], which an ancient lexicographer, Ibn al-Arabi, defines as "the intention that externalizes itself, and that manifests itself in the thing when it is sought" (see INTENTION). The Arabic translators of the ninth century use the word in a rather wide sense, to translate *noêma* [νόημα], *logos* [λόγος], or *pragma* [πρᾶγμα] in philosophical texts. Isḥāq ibn Ḥunayn uses it in the plural to translate *ta pragmata* in Aristotle's *De interpretatione*, where it refers to the "things" whose affections are signified by the sound of words and the marks of writing. In the translation into Latin of Ibn al-Haytham's *Optics* it takes on a technical sense, in expressions such as *intentiones visibiles*, *intentiones subtiles*. It refers to the collection of qualities, relations, and properties thanks to which an object is completely manifested to those who look at it. The latter grasp them of course thanks to the luminous and colored image that comes to them, but also because of the interpretation they give it out of habit, judgment, or reasoning. However, unlike Avicenna, for whom *ma'nā* refers to the sighting of what is associated with an object without itself being visible—such as the dangerousness of a wolf—the

term in Ibn al-Haytham lies entirely in the scope of genuine vision. But it lends the vision of form (*forma*) a status that cannot be reduced to our contrast between subjective and objective, between mental image and the thing *stricto sensu*. As a result, the medievals have a theory of knowledge that does not match up with our own.

Further, being by nature luminous, the image that is created in a mirror acquires as such a primary consistency, while according to the theory of visual rays, it would have its being only derivatively from the object against which the visual ray ricochets. Characteristically, it finally receives a technical and univocal designation itself in the Latin texts: "Et forma comprehensa in corpore polito nominatur imago" (And we call image the form apprehended in a polished body; *Opticae thesaurus*, *Alhazeni arabis libri septem*, 5, proemium). This usage becomes standard in the thirteenth century. Witelo's *Optics*, which was inspired by Ibn al-Haytham and became a classic, also says: "Imago dicitur forma in speculo comprehensa" (We call image the form apprehended in a mirror; *Vitellonis Thuringopoloni opticae libri decem*, 5, def. 13).

III. Optical Images and Mental Images

The notion of image evolves again during the early modern period with the progress of optics. For Kepler, the image *seen* in a mirror or through a refractive surface, which he refers to as *imago*, remains an object of vision that is deceptive in its localization, and sometimes in its proportions and colors. Like the medievals, he believes that it is "almost nothing," "a thing composed of real luminous and colored species, and of intentional quantities" (*Ad Vitellionem paralipomena*, proposition 2, def. 1). He distinguishes it from *pictura*, the painting one can *collect* on a screen in a *camera obscura* (ibid., proposition 5). However, despite his reference to the medieval *imago*, Kepler modifies the situation profoundly. He shows that the lens does not have the function of receiving the sensory form of the object, but of making the rays entering the pupil converge, in order to yield a *pictura*—a real stigmatic image—on the retina. We must then ask how this authentic "painting" can travel along the obscure and tortuous conduits of the optic nerve. The problem of the transmission from eye to brain is posed afresh.

Descartes, in discourse 4 of his *Dioptrique* (1637), responds by noticing that resemblance to the object is not necessary for the mental image, especially because if it were, we would need another set of eyes in the brain in order to apprehend it. It suffices that the soul should be able to distinguish the different properties of things on the basis of differential signs transmitted by the nerves to the brain, as it does for example with the sounds of language. Early modern reflection thus moves decisively in considering mental life from the image-portrait to the image-sign. The model of language begins to compete with that of the effigy or mirror. The psychological description of what is evoked in us by things becomes a major philosophical issue. The old term *idea* changes its use, becoming for Locke (1690) simply a conscious representation (see CONSCIOUSNESS), without further metaphorical reference to the form, or, by way of it, to the visible. And what our ideas correspond to becomes problematic.

In parallel fashion, the image we see in a mirror or through glass ceases to be the evanescent and deceptive wisp of the

ancient opticians. Following the discoveries made possible by Galileo's telescope (1610), it acquires a respectable kind of objectivity over the years, thanks to the understanding of its role in enlargements produced by optical instruments. Subsequent progress only amplifies this objectification of the image, which is no longer held to be only a means of creating illusion, but becomes more and more a way of perfecting vision. By the techniques that, beginning with the era of photography, capture and manipulate it, it even becomes a thing among others, rigorously definable, and thus no longer offering any problem of translation from one language to another.

Has it lost its mystery and power then? To retain them, we may first come back to the immediacy of seeing. In *L'œil et l'esprit*, Maurice Merleau-Ponty reintroduces, regarding painting, the "suspect" aspect of the resemblance of mirror images, and the "power of icons," which somehow cannot be pinned down. To give an account of it, he is required in *Le visible et l'invisible* to make a fresh start and reformulate the immersion of the seeing person in the material world, with terms like *chair* (flesh), *entrelacs* (interlacing), *réversibilité* (reversibility), and so on, which do not always have equivalents in other languages, since they fall outside of the classical philosophy of perception (see LEIB). But to recapture the fullness and the value of the image, we may also explore the sources of drives related to our imagination, the direction in which psychoanalysis rapidly turned with the concept of *imago*.

▪ See Box 2.

As an immediate object of vision, the image has always both been and not been the thing. Even though our sciences and our techniques attempt to reduce it to its objective character of faithful reproduction, it has retained its symbolic equivocality through this existential ambivalence.

Imago in psychoanalysis

The term *imago*, which is also used in zoology to refer to the definitive state of insects that undergo metamorphosis, was adopted in psychoanalysis around 1910. It remained untranslated in all the languages used, and so kept, like *libido*, its Latin spelling. The Freudian milieu had taken special note of it in 1906, when a novel titled *Imago* was published by a Swiss writer, Carl Spittelberg (1845–1924), who would receive the Nobel Prize in 1919. In it, the author recounts the story of a poet, Victor, who spends his time inventing an imaginary woman who fulfills his deepest desires, instead of with a more prosaic but real lover. The publication in 1903 of Wilhelm Jensen's *Gradiva* had already opened psychoanalysts up to the literary theme of a woman who is as fascinating as she is unreal, and to the art of creating one or cultivating her image. Freud titled the new journal that he created with Otto Rank in 1912 *Imago*, as a reference to Spittelberg's work. The journal was meant to deal with nonmedical applications of psychoanalysis, as a complement to the *Internationale ärtzliche Zeitschrift für Psychoanalyse* (*Standard Edition*, 19:168n2).

In Freud's work itself, it is true, we find only five occurrences of the word *imago*, and terse ones at that. There, it is a question only of "foreign objects chosen according to the model [*imago*] of childhood objects" (*La vie sexuelle*, 57), of the case in which "the libido has revived the childhood *imagos* of the subject" (*Standard Ed.*, 12:102), or, again, of the father-*imago* (ibid., 12:100)—but here with the mention of Jung as the originator of such an "appropriate" notion. Jung, indeed, not long before their rupture, described *imagos* (paternal, maternal, and fraternal), in *Metamorphoses and Symbols of the Libido* (1911), as being primordial representations (*Urbilder*), which he then categorized among the impersonal archetypes of the collective unconscious.

Jacques Lacan makes an appeal to the notion of *imago* in a work considered to be a precursor to his official teaching (his contribution to volume 8 of the *Encyclopédie française* in 1938). He compares this notion to that of a complex. While a complex characterizes the effect on the subject of the interpersonal constellation that is the institution of the family, *imago* refers to an imaginary survival, which may become reshaped, and is often unconscious, of one or another relation of the same subject with a familial experience. Thus we have the *imagos* of the maternal breast, or one's fellow creatures, or of the body itself, this last corresponding to the specular image contemporary with the initial phase, called the mirror stage, in which the infant becomes alienated in his identification with the image of the other.

ELEUTHERIA [ἐλεύθερια] (GREEK)

ENGLISH	liberty, freedom
FRENCH	*liberté, libre arbitre*
GERMAN	*Freiheit, Willkür*
LATIN	*libertas, liberum arbitrum*

➤ *LIBERTY,* SVOBODA, and *DESTINY,* DUTY, LAW, LIBERAL, LOVE, MORALS, NATURE, PEOPLE, PHRONÊSIS, POLIS, PRAXIS, WILLKÜR

The vocabulary of freedom is divided along etymological lines: while some languages privilege the idea of a kind of growth that is deployed and then fully flourishes—*eleutheria* [ἐλεύθερια], *libertas*, "liberty"—others determine freedom based on "the belonging to a closed group of those who call each other friends" (Benveniste)—"freedom," *Freiheit*. English even has both terms, "liberty" and "freedom." However, the most basic division for the history of philosophy runs between the Greek meaning of the word *eleutheria*, which, for Plato at least, refers to the regulated development of the natural philosopher, and the medieval and modern sense of *libertas*, related to free will and the invention of the will.

I. Etymology as a Means of Accessing the Greek Philosophical Meaning of Liberty

The striking thing about the Greek vocabulary relating to freedom is its extreme richness. Besides the fundamental notion of *eleutheria*, we also find the adjectives *hekôn* [ἑκών], *hekousios* [ἑκούσιος] (antonym: *akôn* [ἄκων]), "willingly," the first referring primarily to a disposition of the agent, the second to the act performed. The term is fundamental not only in the tragedies of Euripides, in which it refers to the hero's consenting to death, which is contrary to a death imposed from outside (cf. Nestle, *Eleutheria*), but also in the Platonic problem of the so-called involuntary error, according to which "there is not a single man who commits error willingly" (*Protagoras*, 345e), as well as in the theory of decision (*proairesis* [προαίρεσις]) and responsibility in book 3 of the *Nicomachean Ethics*. Later the notion of *ta eph' hemîn* [τὰ ἔφ' ἡμῖν] refers, in Stoic contexts, to what depends on us rather than on fate; it is accompanied by a new word, *to autexousion* [τὸ αὐτεξούσιον], which appears along with *exousia* [ἐξουσία] (authority, mastery), to refer to the mastery of oneself. Finally, there is the whole vocabulary of intention, wish, and hope (*boulêsis* [βούλησις], *boulesthai* [βούλεσθαι], *thelêsis* [θέλησις], *(e)thelein* [(ἐ)θέλειν]), of deliberation (*bouleusis* [βούλευσις], *bouleuesthai* [βουλεύεσθαι]), and of decision (*hairesis* [αἵρεσις], *proairesis* [προαίρεσις]), which comes up in passages that we would tend, in a modern discussion, to interpret uniformly in terms of "freedom." Such a translation, though, not only tends to homogenize the diverse meanings and to flatten the richness of Greek; it also projects onto these different terms an interpretive schema that itself flows entirely from a historical evolution. We thus risk understanding Plato and Aristotle based on a medieval or modern discussion of *libertas* that is entirely foreign to their philosophical perspective.

When we speak about liberty in French, we transpose, rather than translate, a Latin word that is loaded with a philosophically weighty past. *Libertas*, in the Scholastic and then in the modern sense, includes both: (1) the idea of the absence of compulsion or constraint (*libertas a coactione*), the idea of pure spontaneity; and (2) the notion of a will that is not in any way determined to choose one or another of two contraries (*libertas a determinationis, ad utrumlibet*), and which can therefore: (a) act or not act (*libertas quoad exercitium actus*, freedom of action), (b) choose an action or its contrary (*libertas quoad speciem actus*, freedom of specification). The second of these determinations corresponds to the concept of free will, as formulated by Molina (*De concordia*, 14.13.2): "Illud agens liberum dicitur, quod positis omnibus requisitis ad agendum, potest agere et non agere, aut ita agere unum ut contrarium etiam agere posit" (We call an agent free when, all the conditions for his action being posited, he can act and not act, or act in such a way that, if he performs one of the two contrary actions, he could equally well have performed the other). This definition is partially taken up by Descartes (cf. *Meditations*). Liberty as we understand it, then, expresses the notions of absence of constraint, spontaneity, not making any difference, and self-determination.

Some of these senses may well be present in Greek, but none of them seems sufficient, or even necessary, for understanding what is involved in the concept of *eleutheria*.

For a long time, it was common to attempt to understand the primary sense of the word based on the etymology that the Greeks themselves gave it, according to which *eleutheria* had a root, ελυθ-, with ελευθ- expressing the idea of "going where one wants"—"*to elthein hopou erai*" [τὸ ἐλθεῖν ὅπου ἐρᾷ], "going where you like." This etymological explication is often paired with a philosophical interpretation of the term that gives priority to its political meaning: the free man is one who, unlike the slave, could move as he wished and was not restricted in his movements. (cf. Hegel, *Encyclopedia*, §486; Arendt, *Life of the Mind*; Festugière, *Liberté et civilisation chez les Grecs*; Pohlenz, *Griechische Freiheit*). The negative meaning of the term—the free man as opposed to the slave (where "free" is practically synonymous with "citizen" since the free man is the one who participates in power in the city, defined by Aristotle as the "community of free [men]" (*koinônia tôn eleutherôn* [κοινωνία τῶν ἐλευθέρων]) (*Politics*, 3.6.1279a21; see POLIS)—could be considered along these lines to be the only authentic Greek sense of the word. Hannah Arendt sums up this thesis, in its most radical form: "There is no concern with freedom [in a nonpolitical sense] in all of the history of great philosophy from the Presocratics up to Plotinus, the last ancient philosopher" (*Between Past and Future*).

This etymological explication is now outdated. Contemporary research by H. Frisk (RT: *Griechisches etymologisches Wörterbuch*) and Benveniste (*Le vocabulaire des institutions indo-européennes*) (cf. also RT: *Dictionnaire étymologique de la langue grecque*) has revealed that the term was semantically richer than that. In fact, the primary sense of *eleutheria* is not a negative one ("not being prevented from going where one wishes"), related to constraint and restriction, but a positive one. As Benveniste showed, the radical from which *eleutheros* is drawn [ἐλεύθερος], namely, **leudh-*, means "to grow, to develop," and also yielded the terms for "people" in Slavic and German (*Leute*). The word *eleutheria* thus articulated two primary meanings, whose relationship must be understood:

the belonging to an ethnic stock (people), and the idea of growth that leads to a complete form, which ends in its full flourishing. We must therefore conclude that "the primary sense is not, as one might imagine, 'relieved of something'; it is that of belonging to an ethnic stock designated by a metaphor of the growth of plants. This belonging confers a privilege which the foreigner and the slave never enjoy" (*Le vocabulaire des institutions indo-européennes*). To be "free" is thus to belong to a "growth group" that defines "an ethnic subdivision, the collection of which were born and developed together." The primary sense of *eleutheros* might thus be: "belonging to the people," "with one's own," as opposed to *barbaros* [βάρβαρος]. This is how Modestus van Straaten interprets the first known occurrence of the term in a controversial passage of the *Iliad* (6.455): Andromache, brought far away from Troy, loses *eleutheron êmar* [ἐλεύθερον ἦμαρ], "the day of liberty." This translation as "liberty," according to van Straaten, does not capture the primary signification of the word in Greek: "belonging to the people, at home" ("What Did the Greeks Mean by Liberty?"). To lose *eleutheria* is first and foremost to lose the day that breaks over the homeland, where Andromache is at home: "it seems to be quite possible that in those ancient times the Greeks felt this *home* as the primary element in the phrase and *free* only as a consequence" (cf. also Muller, "Remarques sur la liberté grecque").

Eleutheria thus does not at first have a political meaning, but a biological (stock, line, people) or physical ("growth," and more precisely completed growth, which concludes with the full flourishing of the form—whence "form, figure, stature") one. Is this, as Benveniste thinks, a matter of a simple "metaphor"? That, in a sense, is the whole question.

■ See Box 1.

II. Freedom, Growth, Nature: *Eleutheria* and *Phusis*

The growth that ends in a fully present flourishing, as a movement from oneself and toward oneself, is in effect what the Greek *phusis* [φύσις] refers to. As Heidegger emphasizes in *The Principle of Reason*, *phusis* was not, for the Greeks, a being among others, but rather the original determination of being: "Being is *phusis*, that is, what is manifest of oneself." *Phusis* is the kind of mobility that belongs to moving things *according to their mode of being*, that is, their entry into presence: "Only when such understanding has become possible is *phusis* graspable in its mode of deployment as the original power over the motion of the movable object from itself and in the direction of itself" ("Ce qu'est et comment se détermine la *phusis*," 212). It designates the mode of flourishing of being in presence, as growth, deployment, blooming, flourishing. In that sense, does not *phusis* prescribe its primordial meaning for the Greek notion of *eleutheria*? One could argue this on the basis of a number of texts; we will take only two examples.

A passage from the *Theaetetus* (173a–b) clearly shows that the "free man" is first and foremost the one who has flourished as a man, that is, who has managed to fully express his human form and shape (cf. Muller, "Remarques sur la liberté grecque"). Socrates compares the Sophists, clever in legal arguments, who have spent their time in the courts of law from

a young age, with the philosophers. The former are, compared to the latter, like people raised to serve compared to free men (*eleutherois* [ἐλευθέροις]). The litigants have no leisure: for them, the time for their speeches is always counted. Thus, the education they receive makes them clever, but "[causes their souls] to be small and warped" (*smikroi de kai ouk orthoi tas psuchas* [σμικροὶ δὲ καὶ οὐκ ὀρθοὶ τὰς ψυχάς]). And Socrates adds:

> His early servitude prevents him from making a free, straight growth; it forces him into doing crooked things by imposing dangers and alarms upon a soul that is still tender. He cannot meet these by just and honest practice, and so resorts to lies and to the policy of repaying one wrong with another; thus he is constantly being bent and distorted.
>
> (*Theaetetus*, 173a–b)

From this Socrates can infer that only the philosopher makes use of freedom (*eleutheria*) in his discourse (*logos* [λόγος]) and in moving from one discourse to the next (173b). This text associates freedom and growth (*auxê* [αὔξη]) in an extremely clear way, leading to straight posture, rectitude in behavior (*to euthu* [τὸ εὐθύ]), whereas the slavery of the litigants and nonphilosophical rhetors is the product of a constraint (*anagkazousa*) by which this growth is seemingly blocked, unable to flourish freely, and yields twisted, stunted, and devious beings (cf. Muller, "Remarques sur la liberté grecque"). To be free, on the other hand, is nothing other than to achieve one's fulfillment as a man (cf. *Laws*, 1.635d: the goal is to raise, by education, brave and free men, that is, complete men), just as a plant comes to its full flourishing in a flower.

By this standard, *eleutheria* is not contrary to *phusis* the way modern liberty is contrary to natural determinism, but rather leads back to it. Indeed, if, as Aristotle maintains, "For what each thing is when fully developed, we call its nature [*phusis*]" (*Politics*, 1.2.1252b32–33), then *eleutheria* completes *phusis*. This is shown, for example, in the passages Aristotle devotes to natural slavery, in which the same "physical" or "plant-like" paradigm appears. We read in the *Politics* that if there are natural slaves, that is because there are men whose stature and shape are distinct from those of free men, because of an incomplete growth: if the natural slave is not entirely a man, it is because "he who can be, and therefore is, another's, and he who participates in reason enough to apprehend, but not to have, is a slave by nature" (*Politics*, 1.5.1254b22). The natural slave stoops, unlike the free man who stands erect (1254b27), where this rectitude is what, along with reason, gives man his divine character (*De partibus animalium*, 4.10.686a28), since, he adds, *phusis* does not always produce what it wishes (*Politics*, 1.5.1255b3–4). These descriptions of the natural slave would remain entirely unintelligible to us if we did not grasp that liberty, understood as the goal of *phusis*, signifies the full completion or flourishing of the man as such—that is, a s being such, having such or such a "nature." Aristotle is not here speaking of real slaves as they existed in fourth-century Athens since he immediately clarifies that "the opposite often happens—that some [slaves] have the souls

1

The two paradigms: "Freedom"/"liberty"

The English language has two words, "freedom" and "liberty," which are both opposed to serfdom or slavery, but whose connotations are very different. "Freedom" is the more general term, which designates the power a person possesses to act according to his or her will, without constraint or, at least, without legitimate constraint; it is therefore used equally in general philosophy to speak of the "freedom of the will," "free will," and so forth, and in political philosophy to designate the state enjoyed by the citizens of a "free" community. "Liberty" has a more specifically juridical and political meaning: it designates the absence of all restrictions other than those that are justly required by the law, and it thus has positive connotations that explain the use made of it by liberal thinkers or republicans attached to political liberty, that is, to the fact of living according to the law.

English thus functions as the moderator between the two paradigms, highlighted by Benveniste (*Le vocabulaire des institutions indo-européennes*, vol. 1, chap. 3), at work in Indo-European languages to construct the idea of liberty. "Liberty" looks back to the Latin *liber* and *libertas*, as well as to the Greek *eleutheros* (ἐλεύθερος), *eleutheria* (ἐλευθερία): Latin and Greek can effectively be superimposed on the linguistic plane and have (via the old Venetian **(e)leudheros*), the same root **leudh-*, "to grow, to develop," from which come seemingly heterogeneous terms like *Liber* (Lat.), the ancient god of the vine, *liberi* (Lat.), "the children" who are well born, legitimate, and *Leute* (Ger.), "people." Hence the insistence on the ethnic stock and on growth.

But there is another genealogy, which first sets in play a set of notions relating to the individual: the English "free" like the German *frei* stems from an Indo-European adjective, *priyos*, which expresses the belonging to oneself, the relation with oneself and others (dear). What is decisive in this instance is belonging to the closed group of those who call each other friends (*Freunde* in German): it is not birth but the affective and institutional mutuality of the group that constitutes freedom. A whole array of words can be mobilized to indicate that one is only "oneself" when one is among other similar "selves": thus we find the Indo-European **swe* to indicate the self, the reflective, the proper (Gr. *idios* [ἴδιος]; see PROPERTY) as well as to signify the ally, the relative (Gr. *etês* [ἔτης]), the companion, the colleague (Gr. *hetairos* [ἑταῖρος], Lat. *sodalis*) (see SVOBODA).

This double linguistic paradigm, which reveals two ways of making freedom/liberty perceptible and of identifying a person, helps to throw light on certain distortions in history and philosophy, including no doubt confusions between terms that arise from the same paradigm.

and others have the bodies of freemen" (1254b31). In this ideal portrait of what a slave "ought to be"—and what the slaves existing in fact at Athens are precisely not!—the nature of the slave is thus grasped "by contrast" with the free man (and not the reverse) as a failed man, "the free man [being] the completed, flourishing man, since he is not restricted in his development, and is thus in conformity with his own nature" (Muller, "La logique de la liberté dans *La Politique*"). Thus, "since" the completed man has the capacity to deliberate (*to bouleutikon* [τὸ βουλευτικόν]), prudence (*phronêsis* [φρόνησις]; see PHRONÊSIS), and acts by choice (*proairoumenos* [προαιρούμενος]), the slave must be lacking these three traits (*Politics*, 3.9.1280a34). This is why he can neither command nor participate in the goals of the city: well-being, or happiness (1280a31). A fortiori the "natural" slave cannot participate in the highest activity of man, in which he fully flourishes as himself and completes his own nature, coinciding with his *telos* [τέλος]: contemplation. Aristotle refers to the contemplating man as *eleutheros* (*Politics*, 3.23.1325a19), not only because he is freed from political obligations, but because he fully actualizes his essence as a man, while at the same time rising up to the most divine part of man, by imitating divine self-sufficiency.

III. Greek Free Will?

For both Aristotle and Plato, in this sense, *eleutheria* does not necessarily entail the modern notion of undetermined choice. If we absolutely had to find an ancestor for the modern concept of freedom, we would more likely find it in the Sophists, by virtue of their different understanding of the *phusis/nomos* [φύσις/νόμος] relationship. In the *Gorgias*, Plato uses Callicles, a disciple of the Sophists and a radical defender of the pleasure principle, to incarnate a conception of freedom as a frenzied permissiveness in the search for one's own good, the absence of any external restraint, and, consequently, a pure subjective will (491e–492c). This conception is based on a completely different relationship between law and nature. "Freedom" (*eleutheria*) no longer refers to unrestrained flourishing "in accordance" with *phusis*, such that *phusis* is in fact what regulates development and gives it its own law, and where flourishing consists precisely in this agreement or conformity of the individual with the law of his essence. Rather, the idea behind the Sophistic conception of freedom is that of a development that is its own law unto itself, as long as it meets no obstacles, of a force that follows through completely and is only limited by another force. "Freedom" is not understood by Callicles as the perfect flourishing of a being in accordance with the law of its essence, but as a growth, a development that is not regulated by any law or essence, by any *phusis* in the Platonic sense (which always presupposes a norm or *telos*), and is its own measure. The only *phusis* of man, from that point on, is not to have a *phusis*, to be able to realize one's most extreme possibilities without any opposing restraint or restriction.

Plato's response is that this kind of absolute permission is only a false freedom. First, it rests on a purely negative idea of freedom: independence from any restraint and all obligation does not give *eleutheria* any positive content. This becomes the power to do anything, good or bad, and can be summed up in a single phrase: "do what one wishes" (*poiei ha bouletai* [ποιεῖ ἃ βούλεται]) (*Republic*, 10.577d). Second, this sort of power without restraint may be an illusion. Are we not prisoners of opinion when we act just as we please? And is not the restraining force of opinion the strongest, most unbreakable of bonds? We must counter the maxim "do what seems good" with the true knowledge of the good, which alone yields freedom. Thus, Sophistic *eleutheria* is put down to a tyrannical disposition according to which a man is "pushed towards a general disorder [*pasan paranomian* (πᾶσαν παρανομίαν)], to which the people who do the pushing (the bad educators) give the name of complete freedom [*eleutherian hapasan* (ἐλευθερίαν ἅπασαν)]" (*Republic*, 10.572e). However, "the soul which rules a tyrant will do what he pleases least of all "(*kai hê turannoumenê ara psuchê hêkista poiêsei ha an boulêthê* [καὶ ἡ τυραννουμένη ἄρα ψυχὴ ἥκιστα ποιήσει ἃ ἂν βουληθῇ]) (577e). Plato thus turns the Sophists' concept of freedom against them: doing what one wishes in complete ignorance is the very definition of slavery: "*ho tôi onti turannos tôi onti doulos* [ὁ τῷ ὄντι τύραννος τῷ ὄντι δοῦλος]" (he who in his being is a tyrant is in his being a slave) (579d).

Unlike a tyrannical disposition, the philosopher, the kingly man, does not in the first instance exercise his royalty upon others; rather, he cannot do so except insofar as he first exercises it on himself, that is, insofar as he is free: "This person is the most kingly, and he exercises his royalty upon himself" (*basileuonta hautou* [βασιλεύοντα αὑτοῦ]) (580b–c). This perfect royalty lies in the priority of *nous* [νοῦς], the intellect, over the other two parts of the soul distinguished in the *Republic*, *epithumia* [ἐπιθυμία] (desire) and *thumos* [θυμός] (courage). In effect, *nous* alone is free by itself, as the key text of the *Laws* clarifies: "*Nous* cannot be a servant or a slave of anything without impiety; it must be, on the contrary, the universal master, if it is really true and free as its nature demands" (*Laws* 9.875c–d). *Eleutheria* can thus be defined by Plato as this "symphony internal to the soul" (*tês en tôi psuchei . . . sumphônias* [τῆς ἐν τῇ ψυχῇ . . . συμφωνίας]) (*Republic*, 591d), which cannot be dissociated from the reigning justice among its faculties, or again, for the free man, from the good "constitution of the city which is in him" (*tên en hautôi politeian* [τὴν ἐν αὑτῷ πολιτείαν]) (591e). There is harmony or "symphony" in his internal city—"freedom"—only because *nous* is not commanding by restraint or violence, but by a mild persuasion (cf. *Timaeus*, 47e–48a). Under its authority, all the parts of the soul are in agreement, seek the common good together, and harmonize. The harmony that is put into place, like any harmony, presupposes the agreement of the different parties for the sake of the whole, that is, with an eye toward a goal, the good of the whole soul, which only the intellect knows. Freedom thus understood is at the furthest remove from the capacity to do either a thing or its contrary, as we can see from a fundamental text in the *Laws* (1.645a), where the free man is compared to a puppet created by the gods, which does not allow itself to be dragged along by the iron thread of the passions (pleasure, pain, hope, and fear), but only by the "golden thread" of *nous* and law. To understand this text in light of the modern notion of freedom would only accord human beings a poor kind of "freedom" since, even worse that the "freedom of the turnspit" that Kant criticizes with regard to Leibniz, this would be a freedom of puppets! But the sense of this passage is completely different: insofar as "the god is the measure of all things" (*Laws*, 4.716c), to be subordinate to the gods is to be free, since it is knowing the good that provides the measure of what is human, and thus what it is to be a man in the full sense of the term. Freedom for man thus means the development of his being, not at all as a disorderly and anarchic growth, but as flourishing in accordance with *phusis*—flourishing that operates thanks to the harmony and the justice that obtains among the faculties, the noblest commanding the other two. As an internal submission to *logos*, freedom is at the same time a knowledge of the good by which the soul becomes, so to speak, similar to the *logos*, that is, good; it is a submission to the gods by which *nous* reveals its "divine" character, such that freedom as the knowledge of the good is justice. Only the just man is free, since justice as *aretê* [ἀρετή] (excellence; see under VIRTÙ) constitutes the highest achievement of human development.

IV. Choice, Decision, Freedom

But do we not find in Aristotle's theory of *proairesis* at least a foreshadowing of the modern concept of "freedom"? This may be doubted, and for several reasons. First, *proairesis*, often translated as *electio* into Latin, does not always indicate a "choice," which would involve an alternative. One of the examples from the *Nicomachean Ethics* will suffice: deliberation is like a kind of "calculation," Aristotle claims, and *proairesis* like a syllogism. Let the desired end be health; health is produced by the balance of the humors, and that by heat, and heat by friction; we are able to create friction; thus, we must create friction (6.2.1139a11). There is no "choice" here since there is no alternative, but rather a "decision" regarding the execution of means with a view to an end that is already given. Second, and this point is crucial, *proairesis*, unlike *electio*, is in no way the act of a "will," as this concept is entirely missing from Aristotle's conceptual scheme. Aquinas completely misunderstands things when he translates *proairesis* by *electio* and *boulêsis* by *voluntas* (cf. *Summa theologica*, I, q. 82, art. 1, obj. 2, where he interprets the passage from *De anima*, 432b5, "*en te tôi logistikôi gar hê boulêsis ginetai* [ἔν τε τῷ λογιστικῷ γὰρ ἡ βούλησις γίνεται]," as saying that "the will is in reason"), and even by *liberum arbitrium*: "*Boulêsis* is the free will. For . . . it is the desire for one thing as compared with another" (*Summa theologica*, I, q. 83, art. 4, obj. 1). Indeed, whereas *proairesis* refers to an act of reason for Aristotle (*nous haireitai* [νοῦς αἱρεῖται]; *Nicomachean Ethics*, 9.9.1169a17], and more precisely, the judgment of practical reason that terminates deliberation and yields actions, *electio* is understood by Aquinas as an act of the will aimed at the goal, which has hitherto been revealed by reason deliberating on its means. Here again, Aquinas thinks he can appeal to

a passage from the *Nicomachean Ethics* (6.1139b4–5), where Aristotle defines *proairesis* as "desiring reason [*orektikos nous* (ὀρεκτικὸς νοῦς)] or reasoning desire [*orexis dianoêtike* (ὄρεξις διανοητική)]," to attribute the act to the choice of the faculty that combines desire and reason, to the *appetitus rationalis*, that is, to the *voluntas* (*Summa theologica*, I, q. 82, art. 2, obj. 3). This is obviously a misinterpretation. Nothing in Aristotle's theory of *proairesis* allows it to be the locus of a free will, as Pierre Aubenque makes clear: "To approach the notion of *proairesis* from the point of view of the problem of the 'freedom of the will' is to condemn oneself to expect what is not there from these Aristotelian texts, and to ignore what is" (*La prudence chez Aristote*). It would thus be more appropriate to translate this word that Aristotle introduces into philosophical vocabulary by "decision" rather than by "choice" or "free choice": literally that which, in advance (*pro-*), allows us to examine the means with a view to a good end (*to haireton* [τὸ αἱρετόν], "the good").

The strangeness of the Aristotelian conception of *eleutheria* with regard to any modern conception of freedom comes out in a decisive passage from the *Metaphysics*. Aristotle asks, in this passage, as to the manner in which the good is present with respect to the whole: as something separate, or as the order that reigns throughout the whole itself? He responds that the good is not immanent to the world, but rather transcendent, like the Prime Mover. To establish that, he emphasizes the amount of arbitrariness and contingency that we find in the world and that prevents it from being entirely in conformity with the good:

> But it is as in a house, where the freemen are least at liberty to act as they will [*etuche poiein* (ἔτυχε ποιεῖν)], but all things or most things are already ordained for them [*tetaktai* (τέτακται)], while the slaves and the beasts do little for the common good, and for the most part live at random [*to de polu ho ti etuchen* (τὸ δὲ πολὺ ὅ τι ἔτυχεν)]; for this is the sort of principle that constitutes the nature of each.

> (*Metaphysics*, Γ, 10, 1075a19–23)

Eleutheria thus does not consist in an unrestricted will, in the possibility of acting however it may chance (*etuche poiein*); on the contrary, it consists in action in accordance with the rule, that is, subordinate to the good. Only slaves and animals, who are precisely not free in the true sense, are likely to act in an arbitrary way. Free men, on the contrary, are those whose behavior is the most constant, and who thus become closer to the undisturbable regularity of the stars and the immutability of the Prime Mover. The indiscriminate behavior of someone who can choose one thing or another "indifferently" is thus the exact opposite of *eleutheria*.

One may still object that we do find, in other texts of Aristotle, and especially in chapter 9 of *De interpretatione*, a "freedom of choice" that resembles the modern notion of free will. Aristotle claims there, in effect, that if Diodorus's necessitarianism were true, "So there would be no need to deliberate or to take trouble (thinking that if we do this, this will

happen, but if we do not, it will not)" (18b31–32). Is this not an affirmation that choice is somehow undetermined? In fact, what Aristotle is trying to preserve in this passage is the existence of some amount of "objective" chance in the world, of contingency, of some indeterminacy among events in virtue of which it is possible to deliberate and to decide one way or another. He is not affirming indeterminacy of choice itself, but rather of the circumstances in which choices must be made.

This is why it seems necessary to distinguish Aristotle's position clearly from that of a later commentator such as Alexander of Aphrodisias, whose conceptual scheme is steeped in Stoicism, and who reinterprets Aristotelian freedom as a sort of "internal chance" (cf. *De anima*, *liber alter*): there is non-being, he asserts, which when it is found among the causes that are outside us, yields chance or luck (*tuchê* [τυχή], *automaton* [αὐτόματον]), and which, when found among the causes internal to us, makes it the case that some things are in our power (*ta eph' hêmin* [τὰ ἔφ' ἡμῖν]), and whose opposites are equally possible (cf. Hamelin, *Le système d'Aristote*). That is the origin of our freedom. But the affirmation of freedom as "internal chance and freedom of choice" (*exousia tês haireseôs* [ἐξουσία τῆς αἱρέσεως]; *On Fate*, 11.179.10) is not at all Aristotelian. Alexander of Aphrodisias is here reading Aristotle through the lens of Epictetus, Cicero, and Stoicism.

V. *Eleutheria/To Autexousion*

Before coming to the Latin translations of *eleutheria* (*libertas*, *liberum arbitrium*), we should pause on a term that appears as a noun in the second century CE, both in a nonphilosophical context (Philo of Alexandria, Flavius Josephus, Clement of Alexandria, Origen) and as a technical term in Imperial Stoicism (Epictetus): this is the substantival adjective *to autexousion*. The primary sense of the adjective *autexousios* [αὐτεξούσιος] is "master of oneself." This is the term, present especially in Christian thought (from Clement of Alexandria to Nemesius of Emesa and John of Damascus), which is later translated into Latin as *liberum arbitrium*.

However, the Stoic notion of *autexousios* is not a liberty of choice or will, but rather independence with respect to the passions. *To autexousion* is practically synonymous with *to eph' hêmin*, "what is up to us." This is attested by a passage from Epictetus's *Discourses*:

> What did [God] give me which is mine and independent [*emoi kai autexousion* (ἐμοὶ καὶ αὐτεξούσιον)]? What did he keep for himself? He gave me things which come from choice [*ta proairetika* (τὰ προαιρετικά)], which he made up to me [*ep' emoi* (ἐπ' ἐμοί)], without my meeting any obstacle or hindrance.

> (*Discourses*, 4.1.99)

Authority over oneself (*autexousion*) here has the sense of autonomy (*autonomon* [αὐτόνομον]) with regard to any emotional obstacle, and freedom (*eleutheria*; cf. *Discourses* 4.1.56), for the sage, lies in this apathy. Unlike the meaning that develops bit by bit through the translation of

autexousian by *liberum arbitrium*, the Stoic meaning of the term does not, therefore, contain the idea of indifference with regard to opposite actions, precisely insofar as the concept of "will" in the modern sense, as essentially rational appetite, is not relevant. Freedom, for Epictetus and Chrysippus before him, does not have anything to do with "voluntary" action, but rather determines assent (*sugkatathesis* [συγκατάθεσις]), which is given to a representation (*phantasia* [φαντασία]) and assent is a function of reason (*logos*). Freedom thus resides in the correct use of representations, that is, in the assent that is conscious and in accordance with reason, unlike the false judgment that gives rise to passions.

How do we get, then, from *to autexousian* to its Latin translation, *liberum arbitrium*? This question intersects the whole history of the invention of the unified concept of will (see WILL). We may put forward the following hypothesis, however: in order to think of something as a "free will," it was first necessary for the locus of freedom to move from the judgment of the intellect in accordance with *logos* to choice, or to the choosing (*arbitrium*) between two contraries. It is possible that late Stoicism may have in fact played a major role in that evolution (cf. Gauthier, Introduction to *L'Éthique à Nicomaque*). For Antipater of Tarsus, the technical notion of *eklogê* [ἐκλογή], which the Latin writers translated by *electio* or *selectio*, "choice," applies exclusively to the selection of things to which wisdom is "indifferent": health or sickness, richness or poverty, honor or dishonor, and so on. The choice of health, for example, does not derive from right action (*katorthôma* [κατόρθωμα]), but is only a simple function (*kathêkon* [καθῆκον], *officium*) since these things that make no difference in themselves only receive their moral shading from the choice, insofar as it is made in conformity with nature or not.

While right action consists, therefore, in adherence (*hairesthai* [αἱρεῖσθαι]) to the good or in fleeing (*pheugein* [φεύγειν]) evil, function (*kathêkon*) consists only in choosing (*eklegesthai* [ἐκλέγεσθαι]) from among the indifferents the ones that are in conformity with nature: the notion of *eklogê* refers here to a much weaker link than adherence or flight (cf. Pohlenz, *Die Stoa*). In Imperial Stoicism, however—for example, in Cicero—the decline of the ideal of the sage and the emphasis placed on function (*officium*) lead to an increased importance for the notion of choice (*electio*). Thus, even the fundamental concept of *phronêsis*, *prudentia*, wisdom, is reinterpreted as a choice (*electio*) between goods or evils (whereas there was only *eklogê*, for Antipater, and only between indifferents): "*prudentia est enim locata in dilectu bonorum et malorum*" (*De officiis*, 3.17.71). Saint Augustine no doubt owes his definition of wisdom to this misinterpretation of Cicero: "prudence is a love which knows how to choose" (*De moribus ecclesiae catholicae*, 1.15.25, in RT: *CSEL*, 90). If prudence consists in knowing how to choose, however, freedom consists, in the end, in the choice itself. From the originally Stoic notion of a choice of things that make no difference, we thus slide, over the

centuries, to the modern notion of a choice that makes no difference.

VI. *To Autexousion/Liberum Arbitrium*

Thus, it is following this emphasis on the concept of *electio*, which soon comes to translate and to eclipse Aristotle's *proairesis*, that the translation of *to autexousian* by *liberum arbitrium* becomes established in the heart of Christian thought. In Clement of Alexandria, for example, "free will" (*to autexousian*), which is necessary for faith (cf. *Stromates*, 5.1.3.2) and indissociable from grace (5.13.83.1) puts the Christian's faculty of choice (*proairesis*; 5.1.7.1) in play each time.

But the most powerful and radical analysis of free will comes from Saint Augustine. His notion of free will is defined less by the power of choosing between good and evil (otherwise, God himself would be deprived of free will: "if only he who can will two things, that is, good and evil, is free, then God is not free, since he cannot will evil"; *Contra Julianum opus imperfectum*, 1.100) than by the power not to sin: "I say that the first man who was created possessed the freedom of his will [*liberum voluntatis arbitrium*]. He was created in such a state that nothing would have blocked his will had he wished to observe the commandments of God" (*Contra Fortunatem*, §22 [RT: *CSEL*, 25]; cf. Gilson, *Introduction à l'étude de Saint Augustin*). On this account, free will is abandoned in original sin and can only be restored through grace. For, insofar as it is a good given by God, free will must itself reach out toward the good. Sin, which is non-being, is unable to define it. It is thus the correct use of free will confirmed by grace that defines freedom as *determinatio in bonum*; free will is only really free when it is itself liberated by grace, that is, when it adheres to God by love and "delights" in him: "Ecce unde liberi, unde condelectamur legi Dei: libertas enim delectate" (That is what makes us free, that is how we find our delight in the law of God: freedom is, in effect, a cause of joy) (*In Johannis evangelium tractatus*, 41.8.10 [RT: *CCSL*, 36]).

Freedom for Saint Augustine is thus not yet a pure power for opposite actions, a freedom of indifference in the modern French sense. That, among other reasons, is because the concept of *voluntas* still includes, for him, a nontechnical meaning (see WILL), distinct from its medieval sense of *appetitus rationalis*, and remains a synonym for "desire" in general and for "love" in particular (*De Trinitate*, 15.21.41 [RT: *CCSL*, 50]). Only with the rise of the technical concept of the will, in Maximus the Confessor, John of Damascus, Nemesius, and Thomas Aquinas, can free will take on the meaning of a pure power of contrary actions, completely undetermined. Free will, writes Aquinas, is "the will for one thing by comparison with another" (*per comparationem ad alterum*) (*Summa theologica*, I, q. 83, art. 4, obj. 1). In other words, the *liberum arbitrium* is "free choice"; its proper action is *electio*: "We must therefore consider the nature of free will according to choice [*ex electione*]" (I, q. 83, art. 3 reply). Choice, however, connects the will to the intellect. According to this new formulation of the problem, which becomes fundamental for all modern philosophy, the problem of freedom thus becomes that of the relationship that links the will to the understanding: in the case in which the will has

primacy in the act of choosing, we speak of "voluntarism"; in the other case, of "intellectualism" (see INTELLECTUS).

Thus the modern problem of free will seems to be the fruit of a long history. Far from being, as Descartes thinks, "that which is known without proof, by the experience we have of it alone" (*Principles*, I, §39), it may well be that

"freedom of the will" is one of the most sophisticated and least obvious inventions of the "legacy of Western philosophy."

Enslaved judgment

Alongside the French term *libre arbitre*, "free will" or "free judgment," the concept of the *serf arbitre*, the "enslaved will" or "enslaved judgment," deserves to be noted for its rarity and for what it reveals about the history and the difficulties of its glorious antonym. The Latin expression *servum arbitrium* has its first occurrence with Saint Augustine, in the context of the anti-Pelagian controversy:

> But you, you are in haste, and in your haste you rush to abandon your premise. Here you wish man to be perfect, and if possible by a gift of God and not by the free, or rather the enslaved judgment of your will [*et non libero, vel potius servo proprie voluntatis arbitrio*].

The passage is cited several times by Luther, notably in the great treatise *De servo arbitrio* (1525), to which it gives its title:

> This is why Augustine qualifies the judgment as enslaved rather than free, in the second book of *Against Julian*.

There is an obvious distortion here. What in Augustine is a quickly forgotten phrase becomes in Luther a slogan that is supposed to summarize the Augustinian position on free will.

This explains the difficulty experienced by Luther's translators when faced with the expression *servum arbitrium*. The first German translation, by Justus Jonas, a disciple of Luther, transforms the original title *De servo arbitrio* into a complete proposition: *Daß der freie Wille nichts sei* (That free will is nothing) (Wittenberg, 1525). Later translations do not go so far, but they still avoid literal translation. *Vom unfreien Willen* (Of unfree will) is the most current title; in England there is the paraphrase *The Bondage of the Will*.

Without taking into account the transformation that leads from *arbitrium* to *Wille* and from the paradigm of judgment to that of the will (see WILLKÜR), we see that French is the only language that renders the Latin pairing *liber/servus*. In any case, where does this rejection of literal translation come from, since it does not seem to be grounded in any linguistic need? The first reason for

it lies in the difficulty of the text *Contra Julianum*. The expression *servum arbitrium* is used there in an ambiguous manner, in an argument (a "premise") attributed to the "enemies of grace" (2.8.22). Furthermore, this "Pelagian" argument, that is, in favor of free will against grace, is not a direct argument. It applies to texts by Saint Ambrose that Augustine has just used, and seeks to limit their conception of the paths of salvation to an opposition between the gift of God alone and free will alone. For Augustine, who is defending Ambrose against this interpretation, free will left to itself can only be *servus*, unfree, since grace, far from "evacuating" free will, rather permits us to "establish" (*statuere*) it. (cf. *De spiritu et littera* 30.52 [RT: *CSEL*, 60]).

So Luther distorts the Augustinian usage of *servum arbitrium*, and the refusal of literal translation is already related to a discomfort experienced in the face of this undue radicalization of the proposition. But it is more deeply related to the impossibility of thinking to its logical end the notion of the enslaved judgment, as well as the opposition it forms with free judgment. We may doubt that the *servum arbitrium* is an Augustinian notion; at the same time, Augustine's conception does pose the problem, which appears in the pairing *liberum arbitrium captivatum/liberum arbitrium liberatum,* and in the difficult idea that free judgment must previously be liberated by grace in order to be what it is (cf., e.g., *Contra duas epistolas Pelagianorum*, 3.8.24 [RT: *CSEL*, 60]; on the question of whether one can still speak of free judgment, cf. the discussion by Williams, *Grace of God*). Similarly Luther is constrained to recognize the existence of free judgment in temporal affairs (cf. *De servo arbitrio*; with the distinction between affairs that are "higher" and "lower" than man, free judgment is admitted among the latter). What is more, and very significantly, the expression *servum arbitrium* never appears in Luther's treatise except in the title and in the quotation from Augustine; what Luther opposes to *liberum arbitrium* is most frequently *necessitas*.

The refusal to translate *servum arbitrium* literally thus makes apparent a doubtless fundamental impossibility: that of creating a hypostasis of the opposite of free judgment (and one understands that translators have preferred to conceive this opposite as a simply logical possibility, *unfrei,* or like a certain state of the will, "bondage"). More generally, the opposed pairs always appear unbalanced: it is the case even in Augustine, who to the *liberum arbitrium* (*captivatum*) opposes the lost *libertas* of the Christian (cf. *De natura et gratia*, 46.77 [RT: *CSEL*, 60] and Gilson's commentary, *Introduction a l'etude de Saint Augustin*), while Luther allows the *servum arbitrium* to exist alongside *libertas Christiana*, the Latin title of a treatise from 1520, *Von der Freiheit eines Christenmenschen*. It seems that the very idea of judgment (or will) attached to free judgment implies that we must expel its opposite from the argument, into an external "necessity"— and in this respect the *servum arbitrium*, a strange discovery, a possibility scarcely translated and never realized, allows us both to test and to feel the solidity of the historical linkages between subjectivity and interiority.

ENGLISH

The English Language, or The Genius of the Ordinary

➤ AGENCY, ASPECT, CLAIM, COMMON SENSE, FEELING, MATTER OF FACT, SENSE, SPEECH ACT

A refusal to rise above the facts of ordinary life is characteristic of classical English philosophy (from Berkeley to Hume, Reid, and Bentham) and American philosophy, whether in transcendentalism (Emerson, Thoreau) or in pragmatism (from James to Rorty). But this orientation did not become truly explicit until after the linguistic turn carried out by Wittgenstein, Ryle, and especially Austin, when it was radicalized and systematized under the name of "ordinary language philosophy."

This preponderant recourse to the ordinary seems inseparable from certain peculiar characteristics of the English language (such as the gerund) that often make it difficult if not impossible to translate. It is all the more important to emphasize this paradox because English claims to be as simple as it is universal, and it established itself as the dominant philosophical language in the second half of the twentieth century.

English-language philosophy has a specific relationship to ordinary language, as well as to the requirements of everyday life, that is not limited to the theories of the "philosophy of language," in which English philosophers appear as pioneers. It rejects the artificial linguistic constructions of philosophical speculation (that is, metaphysics) and always prefers to return to its "original home," as Wittgenstein puts it: the natural environment of everyday words (*Philosophical Investigations*, §116). Thus we can discern a continuity between the recourse to the ordinary in Hume, Berkeley, Reid, and Bentham and what will become in Moore and Wittgenstein (after he started using English, at least orally) and then Austin ordinary language philosophy.

This continuity can be seen in several areas: first, in the exploitation of all the resources of the English language, which is considered as a source of information and is valid in itself; second, in the attention given to the specificities—and even the "defects"—of English which become so many philosophical characteristics from which one can learn; and finally, in the affirmation of the naturalness of the distinctions made in and by ordinary language, seeking to challenge the superiority of the (technical) language of philosophy—the former being the object, as we will see, of an "agreement" deeper than the latter.

■ See Box 1.

I. The Variety of Modes of Action

A. The passive

In English there are several modes of agency, and these constitute both part of the genius of the language and a main source of its problems in translation. Agency is a strange intersection of points of view that makes it possible to designate the person who is acting while at the same time concealing the actor behind the act—and thus locating agency in the passive subject itself (see AGENCY). A classic difficulty is illustrated by the following sentence from John Stuart Mill's

1

Langage, langue, parole: A virtual distinction

➤ LANGUAGE

Contrary to what is too often believed, the English language does not conflate under the term "language" what French distinguishes (following Saussure) with the terms *langage, langue,* and *parole*. In reality, English also has a series of three terms whose semantic distribution makes possible exactly the same trichotomy as French: "tongue," which serves to designate a specific language by opposition to another; "speech," which refers more specifically to *parole* (but which is often translated in French by *discours*); and "language" (in the sense of *faculté de langage*). Nonetheless, French's set of systematic distinctions can only remain fundamentally virtual in English, notably because the latter refuses to radically detach *langue*

from *parole*. Thus in *Chrestomathia*, Bentham uses "tongue" and "language" interchangeably and sometimes uses "language" in the sense of *langue*: "Of all known languages the Greek is assuredly, in its structure, the most plastic and most manageable." He even uses "speech" and "language" as equivalents, since he speaks of "parts of speech." But on the contrary, he sometimes emphasizes differences that he ignores here. And he proceeds exactly like Hume in his essay "Of the Standard of Taste," where we find, for example,

> But it must also be allowed, that some part of the seeming harmony in morals may be accounted for from the very

nature of language. The word, *virtue*, with its equivalent in every tongue, implies praise; as that of *vice* does blame.

Considerations on Representative Government: "I must not be understood to say that . . ." To translate such a passive construction, French is forced to resort to the impersonal pronoun *on* and to put it in the position of an observer of the "I" (*je*) as if it were considered from the outside: "On ne doit pas comprendre que je dis que . . ." But at the same time, the network of relations internal to the sentence is modified, and the meaning transformed. Necessity is no longer associated with the subject of the sentence and the author; it is made impersonal. Contemporary English philosophical language also makes frequent use of the diverse characteristics of the passive. Here we can mention the crucial turning point in the history of linguistics represented by Chomsky's discovery (*Syntactic Structures*, 1957) of the paradigm of the active/passive relation, which proves the necessity of the transformational component in grammar. A passive utterance is not always a reversal of the active and only rarely describes an "undergoing," as is shown by the example "She was offered a bunch of flowers." In particular, language makes use of the fact that this kind of construction authorizes the ellipsis of the agent (as is shown by the common expression "English spoken"). For philosophers, the passive is thus the privileged form of an action when its agent is unknown, indeterminate, unimportant, or, inversely, too obvious. Thus without making his prose too turgid, in *Sense and Sensibilia* Austin can use five passives in less than a page, and these can be translated in French only by *on*, an indeterminate subject (defined as differentiated from *moi*, I):

> It is clearly implied, that . . . Now this, at least if it is taken to mean . . . The expression is here put forward . . . We are given, as examples, "familiar objects" . . . The expression is not further defined . . .

> (On sous-entend clairement que . . . Quant à cela, du moins si on l'entend au sens de . . . On avance ici l'expression . . . On nous donne, comme exemples, des "objets familiers" . . . On n'approfondit pas la définition de l'expression . . .)

To gauge the naturalness of the passive construction in English, it suffices to examine a couple of newspaper headlines: "Killer's Car Found" (*On a retrouvé la voiture du tueur*), "Kennedy Jr. Feared Dead" (*On craint la mort du fils Kennedy*); or the titles of an American philosophical article and book: "Epistemology Naturalized" (*L'Épistémologie naturalisée*; translated by J. Largeault as "L'Épistémologie devenue naturelle"; a famous article by Quine that was the origin of the naturalistic turn in American philosophy) and *Consciousness Explained* (*La conscience expliquée*) by Daniel Dennett. We might then better understand why this kind of construction—which seems so awkward in French compared with the active voice—is perceived by its English users as a more direct and effective way of speaking.

More generally, the ellipsis of the agent seems to be a tendency of English so profound that one can maintain that the phenomenon Lucien Tesnière called *diathèse récessive* (the loss of the agent) has become a characteristic of the English language itself, and not only of the passive. Thus, for example, a French reader irresistibly gains the impression that a reflexive pronoun is lacking in the following expressions: "This book reads well" (ce livre se lit agréablement); "His poems do not translate well" (ses poèmes se traduisent difficilement); "The door opens" (la porte s'ouvre); "The man will hang" (l'homme sera pendu). In reality, here again, English simply does not need to mark (by means of the reflexive pronoun *se*) the presence of an active agent.

B. "Do," "make," "have"

English has several terms to translate the single French word *faire*, which it can render by "to do," "to make," or "to have," depending on the type of agency required by the context. Because of its attenuation of the meaning of action, its value as emphasis and repetition, the verb "to do" has become omnipresent in English, and it plays a particularly important role in philosophical texts. We can find a couple of examples of translation problems in the work of Austin. In *Sense and*

Sensibilia, he has criticized the claim that we never perceive objects directly and is preparing to criticize its negation as well:

> I am not going to maintain that we ought to embrace the doctrine that we do perceive material things.

> (Je ne vais pas soutenir que nous devons embrasser la doctrine selon laquelle nous percevons vraiment les choses matérielles.)

Finally, let us recall Austin's first example of the performative, which plays simultaneously on the anaphoric value of "do" and on its sense of action, a duality that seems to be at the origin of the theory of the performative (see SPEECH ACT, IV): "I do (take this woman to be my lawful wedded wife)—as uttered in the course of the marriage ceremony" [Oui (à savoir: je prends cette femme pour épouse)'énoncé lors d'une cérémonie de mariage; *How to Do Things with Words*].

On the other hand, whereas *faire* is colored by a causative sense, English uses "to make" and "to have"—"He made Mary open her bags" (il lui fit ouvrir sa valise); "He had Mary pour him a drink" (il se fit verser un verre)—with this difference: that "make" can indicate, as we see, coercion, whereas "have" presupposes that there is no resistance, a difference that French can only leave implicit or explain by awkward periphrases.

Twentieth-century English philosophers from Austin to Geach and Anscombe have examined these differences and their philosophical implications very closely. Thus, in "A Plea for Excuses," Austin emphasizes the elusive meaning of the expression "doing something," and the correlative difficulty of determining the limits of the concept of action—"Is to sneeze to do an action?"

> There is indeed a vague and comforting idea . . . that doing an action must come down to the making of physical movements. . . . Further, we need . . . to ask what is the detail of the complicated internal machinery we use in "acting."

> (*Philosophical Papers*)

No matter how partial they may be, these opening remarks show that there is a specific, intimate relation between ordinary language and philosophical language in English-language philosophy. This enables us to better understand why the most prestigious representatives of contemporary English-language philosophy are so comfortable resorting to idiomatic expressions (cf. H. Putnam) and even to clearly popular usage: "Meanings ain't in the head"; "It ain't necessarily so." As for the title of Quine's famous book *From a Logical Point of View*, which at first seems austere, it is taken from a calypso song: "From a logical point of view, / Always marry women uglier than you."

II. The Operator "-ing": Properties and Antimetaphysical Consequences

A. "-ing": A multifunctional operator

Although grammarians think it important to distinguish among the forms of "-ing"—present participles, adjectives, the progressive, and the gerund—what strikes the reader of scientific and philosophical texts is first of all the free circulation among these forms. This formal continuity promotes a great methodological inventiveness through the interplay among the various grammatical entities that it enables.

1. The gerund: The form of "-ing" that is the most difficult to translate

English is a nominalizing language. Any verb can be nominalized, and this ability gives the English philosophical language great creative power. Nominalization is in fact a substantivization without substantivization: the verb is not substantivized in order to refer to action, to make it an object of discourse (which is possible in any language, notably in philosophical French and German), but rather to nominalize the verb while at the same time preserving its quality as a verb (see SENSE), and even to nominalize whole clauses. French can, of course, nominalize *faire, toucher,* and *sentir* (*le faire, le toucher*, even *le sentir*), and one can do the same, in a still more systematic manner, in German. However, these forms will not have the "naturalness" of the English expressions: "the making," "the doing," "the feeling." Above all, in these languages it is hard to construct expressions parallel to, for example, "the making of," "the making use of," "my doing wrongly," "my meaning this," "his feeling pain," etc., that is, mixtures of noun and verb having—and this is the grammatical characteristic of the gerund—the external distribution of a nominal expression and the internal distribution of a verbal expression.

These forms are so common that they characterize, in addition to a large proportion of book titles (for example, *The Making of the English Working Class*, by E. P. Thomson; or, in philosophy, *The Taming of Chance*, by I. Hacking), the language of classical English philosophy. The gerund functions as a sort of general equivalent or exchanger between grammatical forms. In that way, it not only makes the language dynamic by introducing into it a permanent temporal flux, but also helps create, in the language itself, a kind of indeterminacy in the way it is parsed, which the translator finds awkward when he understands the message without being able to retain its lightness. Thus, in *A Treatise of Human Nature*, Hume speaks, regarding "the idea," of "the manner of its being conceived," which a French translator might render as *sa façon d'être conçue* or perhaps, *la façon dont il lui appartient d'être conçue*, which is not quite the same thing. And we see agency and the gerund connected in a language like that of Bentham, who minimizes the gaps between subject and object, verb and noun: "much regret has been suggested at the thoughts of its never having yet been brought within the reach of the English reader" (*Chrestomathia*).

Translators often feel obliged to render the act expressed by a gerund by the expression *le fait de*, but this has a meaning almost contrary to the English. With its gerund, English avoids the discourse of fact by retaining only the event and arguing only on that basis. The inevitable confusion suggested by French when it translates the English gerund is all the more unfortunate in this case because it becomes impossible to distinguish when English uses "the fact" or "the case" from when it uses the gerund. The importance of the event, along with the distinction between "trial," "case," and "event," on the one hand and "happening" on the other, is

crucial in discussions of probability. The very definition of probability with which Bayes operates in *An Essay towards Solving a Problem*, the first great treatise on "subjective probability," is based on this status of the "happening," the event conceived not in terms of its realization or accomplishment but in terms of its expectation:

> The probability of any event is the ratio between the value at which an expectation depending on the happening of the event ought to be computed, and the value of the thing expected upon its happening.

2. The progressive: Tense and aspect

If we now pass from the gerund to the progressive, another construction that uses "-ing," a new kind of problem appears: that of the aspect and temporality of actions. An interesting case of translation difficulty is, for example, the one posed by Austin precisely when he attempts, in his presentation of performatives, to distinguish between the sentence and the act of saying it, between "statement" and "utterance": there are "utterances," such as "the uttering of the sentence is, or is part of, the doing of an action" (*How to Do Things*). The translation difficulty here is caused by the combination in the construction in "-ing" of the syntactical flexibility of the gerund and a progressive meaning. Does the "-ing" construction indicate the act, or the progressiveness of the act? Similarly, it is hard to choose to translate "On Referring" (P. F. Strawson) as "De la référence" rather than as "De l'action de référer." Should one translate "On Denoting" (B. Russell) as "De la dénotation" (the usual translation) or as "Du dénoter"?

The progressive in the strict sense—"be" + verb + "-ing"— indicates an action at a specific moment, when it has already begun but is not yet finished. A little farther on, Austin allows us to gauge the ease of English in the whole of these operations: "To utter the sentence is not to describe my doing of what I should be said in so uttering to be doing." The French translation gives, correctly: "Énoncer la phrase, ce n'est pas décrire ce qu'il faut bien reconnaître que je suis en train de faire en parlant ainsi," but this remains unsatisfying at best, because of the awkwardness of *en train de*. Moreover, in many cases, *en train de* is simply not suitable insofar as the "-ing" does not indicate duration: for example, in "At last I am seeing New York." It is interesting to examine from this point of view the famous category of verbs of perception. It is remarkable that these verbs (see, hear) can be in some cases used with the construction "be" + verb + "-ing," since it is generally said (even in grammar books) that they can be used only in the present or simple past and not in the progressive. This rule probably is thought to be connected with something like the immediacy of perception, and it can be compared with the fact that the verbs "to know" and "to understand" are also (almost) always in the present or the simple past, as if the operations of the understanding could not be presented in the progressive form and were by definition instantaneous; or as if, on the contrary, they transcended the course of time. In reality, there are counterexamples: "I don't know if I'm understanding you correctly"; "You are hearing voices"; and often

in philosophy, "You are seeing something" (Austin, *Sense and Sensibilia*, regarding a stick in water); "I really am perceiving the familiar objects" (Ayer, *Foundations of Empirical Knowledge*). The passage to the form "be" + verb + "-ing" indicates, then, not the progressiveness of the action but rather the transition into the metalanguage peculiar to the philosophical description of phenomena of perception. The sole exception is, curiously, "to know," which is practically never used in the progressive: even if we explore the philosophical and epistemological literature, we do not find "I am knowing" or "he was knowing," as if knowledge could not be conceived as a process.

In English, there is a great variety of what are customarily called "aspects," through which the status of the action is marked and differentiated in a more systematic way than in French or German, once again because of the "-ing" ending: he is working / he works / he worked / he has been working. Unlike what happens in Slavic languages, aspect is marked at the outset not by a duality of verbal forms but instead by the use of the verb "to be" with a verb ending in "-ing" (imperfect or progressive), by opposition to the simple present or past (perfect). Moreover, English mixes several aspects in a single expression: iterativity, progressivity, completion, as in "it cannot fail to have been noticed" (Austin, *How to Do Things*). These are nuances, as Labov and then Pinker recently observed, that are not peculiar to classical or written English but also exist in certain vernaculars that appear to be familiar or allegedly ungrammatical. The American black vernacular seems particularly sophisticated on this point, distinguishing "he be working" from "he working"—that is, between having a regular job and being engaged in working at a particular moment, standard American usage being limited to "he is working" (Pinker, *Language Instinct*). Whether or not the notion of aspect is used, it seems clear that in English there is a particularly subtle distinction between the different degrees of completion, of the iterativity or development of an action, that leads English-speaking philosophers to pay more attention to these questions and even to surprising inventions.

B. The linguistic dissolution of the idea of substance

1. Fictive entities

Thus the verb + "-ing" operation simply gives the verb the temporary status of a noun while at the same time preserving some of its syntactic and semantic properties as a verb, that is, by avoiding substantivization. It is no accident that the substantiality of the "I think" asserted by Descartes was opposed by virtually all the English philosophers of the seventeenth century. If a personal identity can be constituted "by the making our distant perceptions influence each other, and by giving us a present concern for our past or future pains or pleasures" (Hume, *Treatise of Human Nature*), it does not require positing a substance: the substantivization of "making" and "giving" meets the need. We can also consider the way in which Russell (*Analysis of Matter*, chap. 27) makes his reader understand far more easily than does Bachelard, and without having to resort to the category of an "epistemological obstacle," that one can perfectly well posit an atom as a series of events without according it the status of a substance.

This sort of overall preeminence in English of the verbal and the subjective over the nominal and the objective is clear in the difference in the logic that governs the discourse of affectivity in French and in English. How would something that "one is" correspond to something that "one has," as in the case of fear in French (*avoir peur*)? It follows that a Frenchman—who takes it for granted that fear is "something" that one feels or senses—cannot feel at home with the difference that English naturally makes between something that has no objective correlative because it concerns only "feeling" (like fear; see FEELING) and what is available to sensation, implying that what is felt through it has the status of an object. Thus in English something is immediately grasped that in French seems a strange paradox, namely that passion, as Bentham notes in *Deontology*, "is a fictive entity." Thus what sounds in French like a nominalist provocation is implicated in the folds of the English language. A symbolic theory of affectivity is thus more easily undertaken in English than in French, and if an ontological conception of affectivity had to be formulated in English, symmetrical difficulties would be encountered.

2. Reversible derivations

Another particularity of English, which is not without consequences in philosophy, is that its poverty from the point of view of inflectional morphology is compensated for by the freedom and facility it offers for the construction of all sorts of derivatives.

a. Nominal derivatives based on adjectives and using suffixes such as "-ity," "-hood," "-ness," "-y." The resulting compounds are very difficult to differentiate in French and to translate in general, which has led, in contemporary French translations, to various incoherent makeshifts. To list the most common stumbling blocks: privacy (*privé-ité*), innerness (*intériorité*, not in the same sense as "interiority"), vagueness (*caractère vague*), goodness (*bonté*, in the sense of *caractère bon*), rightness (*justesse*), sameness (*similarité*, in the sense of *mêmeté*), ordinariness, appropriateness (*caractère ordinaire, approprié*), unaccountability (*caractère de ce dont il est impossible de rendre compte*).

b. Adjectival derivatives based on nouns, using numerous suffixes: "-ful," "-ous," "-y," "-ic," "-ish," "-al" (e.g., meaningful, realistic, holistic, attitudinal, behavioral).

c. Verbal derivatives based on nouns or adjectives, with the suffixes "-ize," "-ify," "-ate" (naturalize, mentalize, falsify), and even without suffixes when possible (e.g., the title of an article "How Not to Russell Carnap's Aufbau" ([i.e., how not to "Russell" Carnap's Aufbau]).

d. Polycategorial derivatives based on verbs, using suffixes such as "-able," "-er," "-age," "-ism" (refutable, truthmaker).

The reversibility of these nominalizations and verbalizations has the essential result of preventing the reification of qualities or acts. The latter is more difficult to avoid in French and German, where nominalization hardens and freezes notions (compare *intériorité* and "innerness," which designates more a quality, or even, paradoxically, an effect, than an entity or a domain). But this kind of ease in making compounds has its flip side: the proliferation of "-isms" in English-language philosophy, especially in America, which makes their translation particularly indigestible, especially in French, where *-ismes* gives a very Scholastic feel to the classifications translated. In addition to the famous term "realism," which has been the object of so many contradictory definitions and so many debates over past decades that it has been almost emptied of meaning, we may mention some common but particularly obscure (for anyone not familiar with the theoretical context) terms: "cognitivism," "noncognitivism," "coherentism," "eliminativism," "consequentialism," "connectionism," etc. Such terms (in which moral philosophy is particularly fertile) are in general transposed into French without change in a sort of new, international philosophical language that has almost forgone translation.

More generally, in English as in German, words can be composed by joining two other words far more easily than in French—without specifying the logical connections between the terms: "toothbrush," "pickpocket," "lowlife," "knownothing"; or, for more philosophical terms: "aspect-blind," "language-dependent," "rule-following," "meaning-holism," "observer-relative," which are translatable, of course, but not without considerable awkwardness.

3. Toward an international philosophical neo-language?

Contemporary philosophy in English seeks to establish a language that is stylistically neutral and appears to be transparently translatable. Certain specific problems—the translation of compound words and constructions that are more flexible in English and omnipresent in current philosophical discourse, such as "the thesis that" (*la thèse selon laquelle*), "the question whether" (*la question de savoir si*), and "my saying that" (*le fait que je dise que*)—make French translations of contemporary English philosophical texts very awkward, even when the author writes in a neutral, commonplace style. Instead, these difficulties, along with the ease of construction peculiar to English, tend to encourage French analytical philosophers to write directly in English, following the example of many of their European colleagues, or else to make use of a technical "vernacular" (we have noted the "-isms" and compounds) that is frequently heavy going and not very inventive when translating terms which are usually transliterated). This situation is certainly attributable to the paradoxical character of English, and then to American English, which established itself as the dominant philosophical language in the second half of the twentieth century: it is a language that is apparently simple and accessible and that thus claims a kind of universality but that is structured, both linguistically and philosophically, around major stumbling blocks (to do, -ing, etc.) that often make it untranslatable. It is paradoxically this untranslatability, and not its pseudo-transparency, that plays a crucial role in the process of universalization.

■ See Box 2.

III. The Austinian Paradigm: Ordinary Language and Philosophy

The proximity of ordinary language and philosophical language, which is rooted in classical English-language philosophy, was theorized in the twentieth century by Austin and can be summed up in the expression "ordinary language philosophy." Ordinary language philosophy is interested

2

A "defect" in the English language? "Between" according to Bentham

English philosophers are not very inclined toward etymology—no doubt because it is often less traceable than it is in German or even in French and discourages a certain kind of commentary. There are, however, certain exceptions, like Jeremy Bentham's analysis of the words "in," "or," "between," "and," etc., through which English constructs the kinds of space that belong to a very specific topic. Let us take the case of "between," which French can render only by the word *entre*. Both the semantics and the etymology of *entre* imply the number *three* in French, since what is *entre* intervenes as a third term between two others which it separates or brings closer (in Lat., *in-ter*; in Fr., *en tiers*; "as a third"). This is not the case in English, which constructs "between" in accord with the number two (in conformity with the etymology of this word, "by tween," in pairs), to the point that it can imagine an ordering, even when it involves three or more classes, only in the binary mode:

> . . . *comparison between three? relation between three?*—the hue of self-contradictoriness presents itself on the very face of the phrase. By one of the words in it, the number of objects is asserted to be three: by another, it is asserted to be no more than two. . . . To the use thus exclusively made of the word *between*, what could have given rise, but a sort of general, howsoever indistinct, perception, that it is only *one to one* that objects can, in any continued manner, be commodiously and effectually compared. . . . The English language labours under a defect, which, when it is compared in this particular with other European langues, may perhaps be found peculiar to it. By the derivation, and thence by the *inexcludible* import, of the word *between* (i.e., *by twain*), the number of the objects, to which this operation is represented as capable of being applied, is confined to two. By the Latin *inter*—by its French derivation *entre*—no such limitation seems to be expressed.

Bentham, Jeremy. *Chrestomathia*. Edited by M. J. Smith and W. H. Burston. Oxford: Clarendon Press, 1983.

in "what we should say when. . . ." It is, in other words, a "philosophy of language," but on the condition that we never forget that "we are looking not *merely* at words (or 'meanings,' whatever they may be) but also at the realities we use the words to talk about," as Austin emphasizes ("A Plea for Excuses," in *Philosophical Papers*).

During the twentieth century (or more precisely, between the 1940s and the 1960s), there was a division of the paradigms of the philosophy of language between the logical clarification of ordinary language, on the one hand, and the immanent examination of ordinary language, on the other.

The question of ordinary language and the type of treatment that it should be given—a normative clarification or an internal examination—is present in and even constitutive of the legacy of logical positivism. Wittgenstein's work testifies to this through the movement that it manifests and performs, from the first task of the philosophy of language (the creation of an ideal or formal language to clarify everyday language) to the second (the concern to examine the multiplicity of ordinary language's uses). The break thus accomplished is such that one can only agree with Rorty's statement in his preface to *The Linguistic Turn* that "the only difference between Ideal Language Philosophers and Ordinary Language Philosophers is a disagreement about which language is ideal." In the renunciation of the idea of an ideal language, or a norm outside language, there is a radical change in perspective that consists in abandoning the idea of something beyond language: an idea that is omnipresent in the whole philosophical tradition, and even in current analytical philosophy.

A. Critique of language and philosophy

More generally, Austin criticizes traditional philosophy for its perverse use of ordinary language. He constantly denounces philosophy's abuse of ordinary language—not so much that it forgets it, but rather that it exploits it by taking liberties with the natural uses of the language. The philosophers ask, for example, how they can know that there is a real object there, but the question "How do I know?" can be asked (in ordinary language) only in certain contexts, that is, where it is always possible, at least in theory, to eliminate doubt.

> The doubt or question "But is it a *real* one?" has always (*must* have) a special basis, there must be some "reason for suggesting" that it isn't real, in the sense of some specific way . . . in which it is suggested that this experience or item may be phoney. . . . The wile of the metaphysician consists in asking "Is it a real table?" (a kind of object which has no obvious way of being phoney) and not specifying or limiting what may be wrong with it, so that I feel at a loss "how to prove" it *is* a real one. It is the use of the word "real" in this manner that leads us on to the supposition that "real" has a single meaning ("the real world," "material objects"), and that a highly profound and puzzling one.

(Austin, *Philosophical Papers*)

This analysis of "real" is taken up again in *Sense and Sensibilia*, where Austin criticizes the notion of a "sense datum" and also a certain way of raising problems supposedly "on the basis of" common opinion (for example, the common opinion that we "really" perceive things)—but in reality on the basis of a pure construction. "To state the case in this way," Austin says, "is simply to soften up the plain man's alleged views for the subsequent treatment; it is preparing the way for, by practically attributing to *him*, the so-called philosophers' view." Philosophy's (frequent) recourse to the ordinary is characterized by a certain condescension toward the common man.

The error (or deception) consists in arguing the philosopher's position against the ordinary position, because if the

latter exists, it is not on the same level. The philosopher introduces into the opinion of the common man particular entities, in order then to reject, amend, or explain it.

B. The method of ordinary language: "Be your size. Small Men."

Austin's immanent method comes down to examining our ordinary use of ordinary words that have been confiscated by philosophy, such as "true" and "real," in order to raise the question of truth:

> "Fact that" is a phrase designed for use in situations where the distinction between a true statement and the state of affairs about which it is a truth is neglected; as it often is with advantage in ordinary life, though seldom in philosophy. . . . So speaking about "the fact that" is a compendious way of speaking about a situation involving both words and world.

(*Philosophical Papers*)

We can, of course, maintain (along with a whole trend in analytical philosophy from Frege to Quine) that these are considerations too small and too trivial from which to draw any conclusions at all. But it is this notion of fact that Austin relies on to determine the nature of truth and thus to indicate the pertinence of ordinary language as a relationship to the world. This is the nature of Austin's approach: "the foot of the letter is the foot of the ladder" (ibid.). For Austin, ordinary words are part of the world: we use words, and what makes words useful objects is their complexity, their refinement as tools (ibid.):

> We use words to inform ourselves about the things we talk about when we use these words. Or, if that seems too naïve: we use words as a way of better understanding the situation in which we find ourselves led to make use of words.

What makes this claim possible is the proximity of dimension, of size, between words and ordinary objects. Thus philosophers should, instead of asking whether truth is a substance, a quality, or a relation, "take something more nearly their own size to strain at" (ibid.). (The French translators render "size" by *mesure*, which seems excessively theoretical; the reference is to size in the material, ordinary sense.)

> One cannot know everything, so why not try something else? . . . Advantages of slowness and cooperation. Be your size. Small Men.

(Conversation cited by Urmson in "A Symposium")

Austin emphasizes that this technique of examining words (which he ended up calling linguistic phenomenology) is not new and that it has existed since Socrates, producing its "slow successes." But he is the first to make a systematic application of such a method, which is based, on the one hand, on the manageability and familiarity of the objects concerned and, on the other hand, on the common agreement at which it arrives in each of its stages. The problem is how to agree on a starting point, that is, on a given. This given, for Austin, is language, not as a corpus consisting of utterances or words, but as the site of agreement about "what we should say when." Austin regards language as an empirical datum or experimental data.

To my mind, experience proves amply that we do come to an agreement on "what we should say when" such and such a thing, though I grant you it is often long and difficult. . . . I should add that too often this is what is missing in philosophy: a preliminary *datum* on which one might agree at the outset. . . . We do not claim in this way to discover all the truth that exists regarding everything. We discover simply the facts that those who have been using our language for centuries have taken the trouble to notice.

("Performatif-Constatif")

Austinian agreement is possible for two reasons:

1. Ordinary language cannot claim to have the last word. "Only remember, it is the *first* word" (*Philosophical Papers*). The exploration of language is also an exploration of "the inherited experience and acumen of many generations of men" (ibid.).
2. Ordinary language is a rich treasury of differences and "embodies all the distinctions men have found worth drawing, and the connections they have found worth marking, in the lifetimes of many generations." These are certainly more subtle and solid than "any that you or I are likely to think up in our arm-chairs of an afternoon" (ibid.). It is this ability to indicate differences that makes language a common instrument adequate for speaking things in the world.

C. Who is "we"? Cavell's question

It is clear that analytical philosophy, especially as it has developed in the United States since the 1940s, has moved away from the Austinian paradigm and has at the same time abandoned a certain kind of philosophical writing and linguistic subtlety. But that only makes all the more powerful and surprising the "return to Austin" advocated by Stanley Cavell and the new sense of ordinary language philosophy that is emerging in his work and in contemporary American philosophy. What right do we have to refer to "our uses"? And who is this "we" so crucial for Austin that it constantly recurs in his work? All we have, as we have said, is what we say and our linguistic agreements. We determine the meaning of a (given) word by its uses, and for Austin, it is nonsensical to ask the question of meaning (for instance, in a general way or looking for an entity; see NONSENSE). The quest for agreement is founded on something quite different from signification or the determination of the common meaning. The agreement Austin is talking about has nothing to do with an intersubjective consensus; it is not founded on a convention or on actual agreements. It is an agreement that is as objective as possible and that bears as much on language as on reality.

But what is the precise nature of this agreement? Where does it come from, and why should so much importance be accorded to it? That is the question Cavell asks, first in *Must We Mean What We Say?* and then in *The Claim of Reason*: what is it that allows Austin and Wittgenstein to say what they say about what we say? A claim (see CLAIM) is certainly involved here. That is what Wittgenstein means by our "agreement in judgments," and in language it is based only on itself, "on the

we," as Cavell says in a passage that illustrates many of the difficulties of translation we have discussed up to this point:

> We learn and teach words in certain contexts, and then we are expected, and expect others, to be able to project them into further contexts. Nothing ensures that this projection will take place (in particular, not the grasping of universals nor the grasping of books of rules), just as nothing ensures that we will make, and understand, the same projections. That we do, on the whole, is a matter of our sharing routes of interest and feeling, modes of response, senses of humor and -of significance and of fulfillment, of what is outrageous, of what is similar to what else, what a rebuke, what forgiveness, of when an utterance is an assertion, when an appeal, when an explanation—all the whirl of organism Wittgenstein calls "forms of life." Human speech and activity, sanity and community, rest upon nothing more, but nothing less, than this. It is a vision as simple as it is (and because it is) terrifying.
>
> (*Must We Mean What We Say?*)

The fact that our ordinary language is based only on itself is not only a reason for concern regarding the validity of what we do and say, but also the revelation of a truth about ourselves that we do not always want to recognize: the fact that I am the only possible source of such a validity. That is a new understanding of the fact that language is our form of life, precisely its ordinary form. Cavell's originality lies in his reinvention of the nature of ordinary language in American thought and in the connection he establishes—notably through his reference to Emerson and Thoreau, American thinkers of the ordinary—between this nature of language and human nature, finitude. It is also in this sense that the question of linguistic agreements reformulates that of the ordinary human condition and that the acceptance of the latter goes hand in hand with the recognition of the former.

In Cavell's Americanization of ordinary language philosophy there thus emerges a radical form of the return to the ordinary. But isn't this "ordinary," for example, that of Emerson in his *Essays*, precisely the one that the whole of English philosophy has been trying to find, or rather to feel or taste, since its origins? Thus we can compare the writing of Emerson or James, in texts like "Experience" or *Essays in Radical Empiricism*, with that of the British empiricists when they discuss experience, the given, and the sensible. This is no doubt one of the principal dimensions of philosophical writing in English: always to make the meaning more available to the senses.

ÉNONCÉ

Énoncé, from the Latin *enuntiare* (to express, divulge; from *ex* [out] and *nuntiare* [to make known]; a *nuntius* is a messenger, a "nuncio"), ranges over the same type of entity as do "proposition" and "phrase": it is a basic unit of syntax, the relevant question being whether or not it is the bearer of truth values. An examination of the differences among these entities, and the networks they constitute in different languages (especially in English: "sentence," "statement," "utterance"), appears under PROPOSITION. See also DICTUM and LOGOS, both of which may be acceptably translated by *énoncé*. Cf. PRINCIPLE, SACHVERHALT, TRUTH, WORD (especially WORD, Box 3).

The essential feature of an *énoncé* is that it is considered to be a singular occurrence and thus is paired with its *énonciation*: see SPEECH ACT; cf. ENGLISH, LANGUAGE, SENSE, SIGN, SIGNIFIER/SIGNIFIED, *WITTICISM*.

➤ *DISCOURSE*

ENTREPRENEUR (FRENCH)

ENGLISH   adventurer, contractor, employer, enterpriser, entrepreneur, manager, projector, undertaker, superintendent

➤ *ACT*, AGENCY, BERUF, ECONOMY, LIBERAL, OIKONOMIA, PRAXIS, UTILITY

At the end of the nineteenth century, a new word appeared in the vocabulary of anglophone economists: "entrepreneur." It was explicitly borrowed from French political economy, and in particular from Jean-Baptiste Say, for whom the *entrepreneur*, the primary agent of production, must be distinguished from the owner of the capital. According to anglophone commentators, the naturalization of this word answered a need, since the English language did not have any term that could express the concept necessary for economists, and especially theoreticians of "free enterprise."

The concept of an entrepreneur, developed over the twentieth century in Anglo-American literature, there acquired its proper substance. The recent adoption of the English "entrepreneurial" (led by a spirit of enterprise) by French economic vocabulary marks in turn the desire to give the French word *entrepreneur* the specific values acquired by its English, and especially its American, usage, in particular to indicate that someone resolutely embraces the dynamics of free enterprise. Thus, at the end of the twentieth century in France, as at the end of the nineteenth century in the United States and England, *entrepreneur* is a concept that arrived from outside and is indeed a transnational linguistic creation.

I. The French History of the Word

When the economic concept of the *entrepreneur* appeared in France at the beginning of the eighteenth century, the word already had a rich history. Its origin lay in the Old French *emprise*, then *entreprise*, which refers to an action insofar as it is an engagement with a project that implies risk. The semantic field of *entrepreneur* extends to the military domain: an *entrepreneur* is someone who leads a campaign or siege; to the political domain: someone who undoes the bonds that form the basis of the kingdom by means of calculated plans; to the legal domain: someone who contravenes the hierarchical order of the professions and subverts their rules; finally, to the economic domain: someone who agrees, on the basis of a prior contract (an established price) to execute a project (collection of taxes, supply of an army, a merchant expedition, construction, production, transaction), assuming the hazards related to exchange and time. This last usage corresponds to practices that became more and more socially prominent starting in the sixteenth century.

Let us focus on the term in economics. The engagement of the entrepreneur in his project may be understood in various ways, and the noun *entrepreneur* translated in various ways into English: by "contractor" if the stress is placed on the engagement with regard to the client to execute the task according to conditions negotiated in advance (a certain time, a fixed price, firm price, tenant farming); by "undertaker" (now rare in this sense) when we focus on the engagement in the activity, taking charge of the project, its practical realization, the setting in motion of the transaction; and by "adventurer," "enterpriser," and "projector," to emphasize the risks related to speculation. At the end of the eighteenth century, the French word *entreprise* acquired the new meaning of an "industrial establishment." *Entrepreneur* accordingly acquired the sense of the head or direction of a business of production (superintendent, employer, manager).

In France, at the beginning of the eighteenth century, the noun *entrepreneur* had strong political connotations, in particular in the abundant pamphlets containing *mazarinades* denouncing the entrepreneurs of tax farming. The economist Pierre de Boisguilbert wrote the *Factum de la France*, "the largest trial ever conducted by pen" against the big financiers, "*entrepreneurs* of the wealth of the kingdom," who take advantage of its good administration (its political economy) in the name of the "entrepreneurs of commerce and industry," who contribute to the increase in its wealth). Boisguilbert failed in his project of reforming the tax farm, or tax business, and it was left to a clever financier, Richard Cantillon, to create the economic concept of the *entrepreneur*.

II. Chance in Business: Risk and Uncertainty

There is no trace of Boisguilbert's moral indignation in Cantillon's *Essai sur la nature du commerce en générale* (Essay on the nature of commerce in general). Having shown that "all the classes and all the men of a State live or acquire wealth at the expense of the owners of the land" (bk. 1, chap. 12), he suggests that "the circulation and barter of goods and merchandise, like their production, are conducted in Europe by entrepreneurs and haphazardly" (bk. 1, of chap. 13). He then describes in detail what composes the "uncertain" aspect of the action of an entrepreneur, in which he acts "according to his ideas" and "without being able to predict," in which he conceives and executes his plans surrounded by the hazard of events. The uncertainty related to business profits turns especially on the fact that it is dependent on the forms of consumption of the owners, the only members of society who are independent—"naturally independent," Cantillon specified. Entrepreneurs are those who are capable of breaking

out of their natural dependence by means of their frugality (which is the renunciation of the subsistence provided by their wages) and by their industriousness (which allows them to take on the risks of uncertainty). They thus acquire a relative independence, as much as is allowed by their capacity for acquisition and that is related to their ability to anticipate. Thus, Cantillon manages to reconcile the two values of the term that Boisguilbert could only make mutually exclusive, and he creates the concept of the entrepreneur.

Cantillon, an Irish banker established in France, dabbled in the financial practices of entrepreneurs, to his advantage. But his analysis is markedly English, both in terms of the essay form employed and by the content. He relies on Petty for his calculations and for the "equated pairs"— consumption and production, land and work—which he draws out. He also is indebted to John Locke for the starting point of his theory of the origin of society, the importance given to freely entered contracts in the formation of political ties. However, he sharply criticizes each for their hasty empirical generalizations, whether it is Locke's conventionalism or Petty's inductions on the basis of a few calculations, and for their indifference to concrete conditions, especially sociopolitical ones, that determine the cycles of wealth and contribute to the uncertainty confronted by the entrepreneur. As a result, both the content and the importance of the concept of the entrepreneur seem to be the fruit of a confrontation between French political economy—understood as good administration of the kingdom, which can only be attained if we take the concrete determinations of the circulations of wealth such as currency, merchandise, and credit into account and in detail (*Détail de la France* is the title of a major work by Boisguilbert)—and English political economy, which is more focused on discovering the general laws of the market. Cantillon's theory constitutes a paradoxical episode in relation to the commonplace that the French are theoreticians whereas the English deal with practice.

III. Business and Innovation, "Projector" and "Contractor"

In 1787, a second episode took place with the publication of Jeremy Bentham's *Defence of Usury*. There, Bentham argues against Adam Smith on behalf of the entrepreneur (projector), who, by taking the risks related to invention and innovation, not only contributes to the opening of new avenues for industrial progress, but even by his failures, reduces the field of investigation for his successors and helps them avoid errors. Bentham's attachment to the French intellectual tradition is well known. Less well known is the fact that his defense of the *projector* is part of a debate that was very active at the time in France among administrators and engineers over *hommes à projets* (project men). The same year, in *Panopticon*, he emphasized the importance for business of relying on contract management and on the interest of the entrepreneur, or contractor, rather than on the system of trust management used for putting prisoners to work. This question of the choice between business, where activity is motivated by the quest for profit, and trust management, where the "household"—the running of activities—is led by one's attachment and faithfulness to the service of the king, is the crucible in which the representation of

the entrepreneur was forged in France. It is at the center of the reflections and inquiries conducted by politicians and administrators, beginning with Sully, then Colbert, Vauban, and Turgot. More essentially, the distinction between business and trust management is in fact that of conscience—taking care to fulfill the details of one's obligations as described in the stipulations of the contract—and confidence—the immediate exercise (without the mediation of calculation of reciprocal interests) of faithfulness to the king, where action has no other motive than the attachment to the general interest of the kingdom. The tension between these two modes of realizing the general interest, and thus the search for their appropriate balance, animated the debates belonging to the history of French political economy and allowed the concept of business profits to be discovered.

By taking over the opposition between "contract" and "trust," Bentham introduced the logic belonging to the French debate over business profits into English economic analysis. His attempt was bound to fail, as it was in conflict with the conception of political economy being constructed by Adam Smith and David Ricardo: a science dealing with laws of exchange and the creation of value and prices in which profit can only be that of capital.

IV. The Industrial Entrepreneur

For Jean-Baptiste Say, the social importance of the "industrial entrepreneur," who conducts the organization of his business, that is, the distribution of time, men, materials, and machines, is part of a radical position in the debate over business: an action is moral, he claims, if it is performed with a view to one's own interest. "People complain that everyone only listens to their own interests: I am worried about the opposite! Knowing one's true interests is the beginning of morality," he writes in *Olbie, ou essai sur les moyens de réformer les moeurs d'une nation*, a utopia that is an "essay on the means of reforming the morals of a nation." By formulating this idea in a utopia that allows him to give these principles the force of an absolute beginning, Say turns his back on French debates over business as a subversion or realization of the ties of the State and resolutely takes on a twofold project: to thrust the theoretical approach founded by Smith—whom he "reveres" and recognizes as his master (introduction to his *Traité*)—into French political economy and to give France, which was obsessed with the goal of closing the industrial gap with England, the means of doing so. Political economy can only contribute to this if it is restricted to "the knowledge of the laws which govern the creation, distribution, and consumption of wealth" (Say, *Cours*, vol. 1). It must not be separated from the analysis of the moral and political conditions of its realization, since it is "the economics of society," "social economy," or even more generally, "social science." Say actively spread his analysis in society and, in particular, among heads of industry. As an ideologue—he was one of the founders and editors in chief of the *Decade Philosophique*—Say believed in the virtues of instruction understood as the education of judgment, of the entrepreneurial capacity to invent adequate solutions. His goal remained that of his teachers at

the École Normale in the year 3 who wished to transform minds to produce an enlightened opinion capable of influencing governmental decisions.

John Stuart Mill, who was familiar with Bentham's and Say's works and a staunch francophile, takes up Say's criticism of Smith and his disdain for "'this supposed labour of inspection and direction' [*Wealth of Nations*, bk. 1, chap. 6] of the work of the person he calls the undertaker" in his *Principles of Political Economy* (1848). Mill notes that the word *entrepreneur*, in the sense given it by Say, is not familiar to English speakers, which restricts the powers of analysis of English political economy. "French political economists enjoy a great advantage in being able to speak currently of 'les profits de l'entrepreneur'" (bk. 2, chap. 15, §1). We thus owe the introduction of the term into English political economy to Mill.

Francis A. Walker, the first president of the American Economic Association, echoed Mill in 1876 in *The Wages Question* (chap. 14), noting:

> It is much to be regretted that we have not a single English word which exactly fits the person who performs this office in modern industry. The word "undertaker," the man who undertakes, at one time had very much this extent; but it has long since been so exclusively devoted to funereal uses as to become an impossible term in political economy. The word "adventurer," the man who makes ventures, also had this sense; but in modern parlance it has acquired a wholly sinister meaning. The French word "entrepreneur" has very nearly the desired significance; and it may be that the exigencies of politico-economical reasoning will yet lead to its being naturalized among us.

However, the economic role of the entrepreneur as a driving force could not find a place in neoclassical economics. Alfred Marshall's *Principles of Economics* (1890) contains remarks that indicate both the impossibility, after Mill and Walker, of entirely ignoring the economic action of the entrepreneur, and the impossibility, in a moral way, of thinking that "exceptional habilities, which are not made by human effort, and are not the result of sacrifices undergone for a future gain" might justify anything other than a surplus income, a "quasi-income." Such action could in no way be considered "the prime mover of the whole economy," as Charles Gide wrote in 1884. The idea of "business profits" and a "spirit of business" here comes into conflict with a moral position analyzed by Max Weber as the "spirit of capitalism" (only effort deserves compensation by profit), as well as with the attempts at mathematical formalizations that characterize neoclassical economics and does not allow for factors that are not reducible to scientific analysis. The word *entrepreneur* nevertheless entered into English economic vocabulary. In 1904, W. A. Veditz, an American professor of economics who translated—or rather adapted for anglophone students—Charles Gide's *Principes d'économie politique*, noted that "The French term entrepreneur, literally meaning undertaker (the person at the head of any undertaking), has now acquired current usage in English."

V. Probability and Uncertainty

It was left to Frank H. Knight to produce a theory of the entrepreneur and of business profits for Anglo-American discourse in *Risk, Uncertainty and Profit* (1921). He clarifies in his preface:

> The particular technical contribution to the theory of free enterprise which this essay purports to make is a fuller and more careful examination of the role of the *entrepreneur*, or enterpriser, the recognized "central figure" of the system, and of the forces which fix the remuneration of his special function.

Knight is attacking at the strong point of economic theory by trying to look closely at the irreducible aspect of innovative business: he distinguishes "insurable risk" from "non-insurable uncertainty"; this uncertainty, where the judgment of the entrepreneur enters the picture, yields situations that cannot be captured by science and calculation since they are not repeatable: "situations in regard to which business judgment must be exercised do not repeat themselves with sufficient conformity to type, to make possible a computation of probability" (*Economic Organization*). Since then, and in the same spirit, attempts have been made to further reduce the irreducible components of business profits, which has led to an emphasis on the action of the entrepreneur, which has thus become "the phenomenon which is more emphasized yet least understood by economists" (Kanbur, "Of Risk Taking"). Whether it is a matter, as with Schumpeter, of the will to innovate of the rebel entrepreneur; or, as with Keynes, of "animal spirits" (Keynes, *General Theory of Employment*) that animate the drive of undertaking something; or more recently, as with Shackle, of the entrepreneur as *originator*, in the same mold as an artist or great mathematician (Hebert and Link, intro., *Entrepreneur*), the fundamental question of business and the entrepreneur has been psychologized. What in French economic literature was related to the political order, then to the social one, has become in Anglo-Saxon countries that part of human nature which resists or goes beyond the rationality of economic discourse.

VI. A French Word, an American Concept?

Knight's effort is part of a theory of economics that energetically claimed to be a theory of free enterprise. The same project drives French economists, who have adopted the adjective "entrepreneurial" into their vocabulary. Similarly, the recent transformation of the CNPF (Conseil du patronat français) into the MEDEF (Mouvment des entreprises de France) aims to contribute to spreading a different image of the entrepreneur. This change of name was accompanied by a publicity campaign, *En avant l'entreprise* (Forward, Business), whose founders noted their desire to "put business at the center of French society" by "promoting the freedom to undertake (*entreprendre*), entrepreneurial vocations, and their success in the economy" and "by pursuing the spirit of business and its spread throughout all the parts of society" (*Le Monde*, 28 October 1998).

This falls entirely within the tradition of French political economy of the nineteenth and twentieth centuries, as expressed by Say or Gide. Either one could have written

those sentences. We may even discern the echoes of the meaning of *entrepreneur* proper to the eighteenth century in France, in the desire expressed in this campaign to lead "a veritable ground war against State interventionism" (ibid.). However, in the booklet aimed at explaining the change of the organization's name, E. A. Sellière explains that " 'Entreprises' replaces 'Patronat,' and completely naturally invokes 'entrepreneurs,' a term that has become part of ordinary language." Along with all of current economic literature, this confirms that the Anglo-American liberal economy constitutes the reference point: it created a new concept of an *entrepreneur*, which has since been naturalized into everyday language in France. This elusive concept, once again, smuggles in a word from abroad.

ENTSTELLUNG (GERMAN)

ENGLISH   deformation, disfiguration, alteration, displacement

➤ *DEFORMATION* and ANXIETY, COMBINATION AND CONCEPTUALIZATION, CONSCIOUSNESS, DRIVE, *FALSE*, MEMORY, *NEGATION*, SIGNIFIER/SIGNIFIED, TRUTH, VERNEINUNG

Derived from *stellen*, "to place something so that it stands upright," "to put something on its feet" (*Stellung*, position), the noun *Entstellung* has two main meanings in ordinary language: deformation (change in something's form) and falsification (change to the truth of, *verfälschen*). The second meaning clarifies the first one: deformation and disfiguration can extend to falsification (a report, an event, the truth). Freud uses *Entstellung* to refer to a mechanism that is the effect of a process: that of repression (*Verdrängung*), first, and later that of denial (*Verleugnung*). The meaning differs depending on the processes at work.

I. *Entstellung* and Deformation

Repression produces a deformation (*Entstellung*) of the contents of memory or fantasies. Memory, outside of the conscious part where everything is felt but nothing recorded, is made up of several layers of traces that undergo a number of deformations (lacunae, chronological disorder, unintelligibility). These deformations are the result of repression. Repressive psychic forces may be witnessed in the resistance, in therapy, to the reappearance of the memory: "The greater the resistance, the greater the deformation (*Entstellung*)" ("Freud's Psychoanalytic Procedure," in *Standard Edition*, vol. 7). Thus, in order to make the unconscious available to consciousness, the deformed materials must themselves undergo deformation. Similarly, "a piece of forgotten truth is present in the delirious idea, which, in returning, must have undergone deformations (*Entstellungen*)" (Freud, *Moses and Monotheism*). Deformation is the only means of access to this forgotten truth.

II. *Entstellung* and *Verschiebung* (Displacement)

In French, the term *déplacement* is used to render *Entstellung*, instead of *déformation*. It has the linguistic sense of metonymy, no doubt related to the contiguity of *Entstellung* and *Verschiebung* (displacement, slippage) in Freud's *Traumdeutung*. Thus, Lacan speaks of the "displacement of the signifier" (*Écrits*, 11) or of "slippage of the signified under the signifier" (ibid., 511). *Entstellung* is a transposition of the dream in which the signification masks the desire of the dream; it is also a de-position (*Ent-stellung*) of the drives (ibid., 662) in the manner of a cohort of displaced persons. It is a distortion (disfiguring) in the grammatical forms of negation (ibid., 663).

But in reality Freud distinguishes *Entstellung* from *Verschiebung*, displacement being an effect of deformation:

> Thus the fact that the content of dreams includes remnants of trivial experiences is to be explained as a manifestation of dream-distortion (by displacement); and it will be recalled that we came to the conclusion that dream-distortion was the product of a censorship operating in the passage-way between two psychical agencies.
>
> (*Interpretation of Dreams*, *Standard Edition*, vol. 4)

This displacement is one of the essential procedures of deformation: "The consequence of the displacement (*Verschiebung*) is that the dream-content no longer resembles the core of the dream-thoughts and that the dream gives no more than a distortion (*Entstellung*) of the dream-wish which exists in the unconscious" (ibid.). Deciphering the dream unmasks the unconscious desire underneath its disfigurement, just as the access to a repressed memory or a forgotten truth is nothing less than the revelation of the deformations they have suffered.

III. *Entstellung* and *Verfälschung* (Falsification)

In 1939 *Entstellung* is used by Freud in a sense leaning toward that of falsification:

> The distortion (*Entstellung*) of a text is not unlike a murder. The difficulty lies not in the execution of the deed but in the doing away with the traces. One could wish to give the word "*Entstellung*" the double meaning to which it has a right, although it is no longer used in this sense. It should mean not only "to change the appearance of," but also "to wrench apart," "to put in another place." That is why in so many textual distortions (*Entstellung*) we may count on finding the suppressed and abnegated material hidden away somewhere, though in an altered shape and torn out of its original connection. Only it is not always easy to recognize it.
>
> (Freud, *Moses and Monotheism*)

The notion of *Entstellung* as the trace of a process in the psychic apparatus is still present; however, by being applied here to any text whatsoever, whether metapsychological or biblical, it is no longer a trace of repression but of denial (*Verleugnung*). Thus, the meaning it acquires (*Verfälschung*: falsification, alteration, denaturing, counterfeiting) comes from the denial (*Verleugnung*) of the murder (of the father, of Moses) of which it is the written trace, by displacement of a letter or a date. The falsification of traces gives access, in the recording of its after-effects, to their origins: we read a text with the traces that have deformed it, and the modalities of deformation give access to what has been deformed in the text (true, real). *Entstellung* treats the letter of the text the way it treats the impressions of memory recorded, by displacing it, deforming it—by falsifying it. Even while he pulls *entstellen* closer to *verfälschen*, Freud continues to separate them:

> The text, however, as we find it today tells us enough about its own history. Two distinct forces, diametrically opposed to each other, have left their traces on it. On the one hand, certain transformations got to work on it, have falsified (*verfälscht*) the text in accord with secret tendencies, maiming and extending it until it was turned into its opposite. On the other hand, an indulgent piety (*schonungsvolle Pietät*) reigned over it, anxious to keep everything as it stood, indifferent to whether the details fitted together or nullified one another.
>
> (Ibid.)

Deformation is, of course, an effect of falsification ("all later distortions [*Entstellungen*] . . . serve another aim. . . . An endeavour was made to date back to an early time certain laws and institutions of the present . . . , the picture of past times in this way became falsified [*verfälscht*]," ibid.). But Freud distinguishes them from each other. The first is reserved for tradition: of the religion of Moses, "a kind of memory of it had survived, a tradition perhaps obscured and distorted (*entstellt*)" (ibid., 87). The second applies to written narrative: the compromise at Kadesh was made in writing, but

> a long time was to elapse, however, before historians came to develop an ideal of objective truth. At first they [the people from Egypt] shaped their accounts according to their needs and tendencies of the moment, with an easy conscience, as if they had not yet understood what falsification (*Verfälschung*) signified.
>
> (Ibid.)

In 1970, in *L'envers de la psychanalyse*, Lacan extracted the *falsus* as the fall of the written from the *Verfälschung* of the letter. The equivocity between *falloir* and *faillir* (see DUTY) is reunified in the etymology of *fallere* (in the past participle), the notions of "to miss, to fall" and "to mistake, to be deceived." *Falsus* combines the defect of an error and the failure of duty in written mistakes, when a letter drops out or is displaced.

EPISTEMOLOGY

FRENCH   *épistémologie*
GERMAN   *Erkenntnistheorie*

➤ ANSCHAULICHKEIT, BELIEF, CHANCE, GEISTESWISSENSCHAFTEN, PERCEPTION, REPRÉSENTATION, TRUTH

When the term *épistémologie* enters French, no doubt upon the translation in 1901 of Bertrand Russell's *Essay on the Foundations of Geometry*, it is met above all with the apparent serenity of a consensus. As Louis Couturat writes, "Epistemology is the theory of knowledge (*connaissance*) based on the critical study of the

sciences, or, in a word, *Critique,* as Kant defined and founded it." When Émile Meyerson, for his part, writes the introduction to his *Identité et Réalité* in 1907, he clarifies, "The present work belongs, in its method, to the domain of the philosophy of science or epistemology, to use a more or less appropriate term which is becoming widely used." He thereupon places the work under the aegis of Hermann von Helmholtz and his theory of unconscious psychic processes. Kant, Russell, Helmholtz: we are dealing with a study of the general laws of thought with reference to the sciences, and there seems at this point to be no difference of emphasis or usage among the terms "epistemology," *épistémologie / philosophie des sciences,* and *Erkenntnistheorie* (or *Erkenntnislehre/ Wissenschaftslehre*).

Today almost none of that homogeneity, posited or hoped for, remains among the different names given to the various discourses concerning science in German, English, and French. The French term *épistémologie*, as well as the German *Wissenschaftstheorie*, simply absorbs under a somewhat superficial harmony a multiplicity of approaches—general theory of knowledge, technical and logical analysis of scientific theories, historical analysis of their development—which English tends to distinguish (epistemology, philosophy of science, history of science). In reality, however, there remains neither a foundational doctrine nor a unified direction in the domain of the theory of knowledge and science. The experience of translation has correspondingly become that of a proliferation of "untranslatable" terms: German terms without exact correlates in English or in French (*Anschaulichkeit, Zusammenhang*), English or American terms without exact correlates in German or in French ("inference to the best explanation," defeasibility). The work of epistemologists today makes the loss of unity in their vocabulary very clear, and they work as though under the assumption that in order to identify their problems, a map of the words is required first.

I. *Erkenntnistheorie*

A. First occurrences of the term

The term *Erkenntnistheorie* appears rather early in the history of German philosophy in the nineteenth century, at least, well before the standard attribution to E. Zeller, who in fact fixes the academic meaning only in the 1860s (see his *Bedeutung und Aufgabe der Erkenntnistheorie*, 1862). Despite the diversity of its meanings, *Erkenntnistheorie* is used into the 1930s to refer to discourse that analyzes the power of knowing by the different sciences (*Wissenschaften*), whether "of the mind" (*Geisteswissenschaften*) or "of nature" (*Naturwissenschaften*). But the history of the term is also in large part that of the reception of Kant over the course of the nineteenth century, a history that evolves from a polemical embrace to a recognition of the intrinsic limitations of the Kantian approach.

The term *Erkenntnislehre* is mentioned as early as 1827, in W. T. Krug's lexicon, which defines it as "the philosophical theory of human knowledge, also called Metaphysics" (see his *Allgemeines Handwörterbuch,* 447). According to K. Köhnke, following F. Ueberweg, the general meaning of *Erkenntnistheorie* had already appeared in Schleiermacher's lectures on dialectic, given in 1811 and published in 1839, the first post-Kantian attempt to develop a theory of knowledge founded not only on pure thought but on sense perception as well. To find the first precise references to a *Theorie der Erkenntnis*, it is no doubt

necessary to look at E. Reinhold's *Theorie des menschlichen Erkenntnisvermögen* (1832); in 1876, H. Vaihinger attributes the beginnings of *Erkenntnistheorie* to Reinhold.

B. Embracing Kant's legacy

Although we do not know the exact date when the term *Erkenntnistheorie* took its place in the language, its meaning is clearly tied to the embrace of Kant's legacy as against that of Hegel's philosophy of nature and German idealism in general. The aim of *Erkenntnistheorie* is, in the most general sense, the study of the presuppositions of knowledge, both in the exact sciences and in historical ones. According to A. Diemer and C. F. Gethmann, we may thus distinguish the following in nineteenth-century German philosophy: (a) a psychological trend, which begins with J. Fries and later develops as empirical psychology—*Erkenntnistheorie* as an "analysis of sensations" (Beneke, Schopenhauer, Helmholtz, Wundt, Stumpf, Avenarius, Mach); (b) opposed to this, a logico-transcendental trend, placing its emphasis either on the methodology of natural sciences with the Marburg School (H. Cohen, P. Natorp, then E. Cassirer), or on moral and historical knowledge (W. Windelband, H. Rickert, E. Lask); (c) a metaphysical realist trend inaugurated by J. F. Herbart and F. A. Trendelenburg, in which *Erkenntnistheorie* is composed of *philosophia prima* (E. Zeller, F. Überweg, E. von Hartmann, and so forth). The diversity of these references to *Erkenntnistheorie*, though irreducible to a single orientation, nonetheless indicates a single general direction: that of a return to an analysis of the power of knowledge and the process of the objectification of phenomena, in opposition to those successors of Hegel and Schelling who claimed to legislate for the natural sciences. Köhnke suggests, thus, that *Erkenntnistheorie* marks three successive returns to Kant: around 1830 with Reinhold, around 1860 with Helmholtz (*Schriften zur Erkenntnistheorie*), and finally at the beginning of the twentieth century with the Marburg School. In all three cases, the term *Erkenntnistheorie* seems to act as a reference point or a sign of recognition for preoccupations that are, in fact, not really Kantian in the strict sense, and are in any case very different from one another (logic, philosophy of language, psychology, physiology, sociology, history, hermeneutics, and methodology of the natural sciences).

■ See Box 1.

C. Generalizations and ambivalence in early twentieth-century usage

Though the term *Erkenntnistheorie* is still in use around 1920–30, more than ever in fact, its usage is almost purely symbolic: it serves to maintain a general requirement of rationality and an interest in the problem of knowledge, but in a context in which it is recognized that Kantianism has reached certain principled limits. We may take four examples of this ambivalence.

a. For Husserl, philosophy is still *Erkenntniskritik*, as distinct from the "ingenious and methodical work of the individual sciences" (*Logical Investigations*), and assigned to the elucidation of the essence of the concepts of thing, event, cause, effect, space, time, and so on (ibid., II.15). However, this *Erkenntniskritik* is understood in the new sense of intentionality. In the first of

1

Epistemology

Louis Couturat, in the *Lexique philosophique*, cited by B. Russell (*An Essay on the Foundations of Geometry*), writes,

> ÉPISTÉMOLOGIE (English: *Epistemology*) — This term, which epistemologically signifies "theory of science," corresponds to the German *Erkenntnistheorie* or *Erkenntnislehre* (Theory of Knowledge), and to the French expression *Philosophie des sciences*.
>
> It refers to a fundamental part of philosophy, which is wrongly confused in France either with Psychology or with Logic. It is distinguished from Psychology insofar as it is, like Logic, a normative (Wundt) science, that is, its object is not the empirical laws of thought as it is in fact, a mixture of truth and error, but the ideal laws (rules or *norms*) to which thought must conform in order to be correct and true. It is distinguished from Logic insofar as the latter studies the *formal* rules or the *directive* principles that thought must obey in order for its conclusions to follow and to be internally consistent, whereas Epistemology seeks *constitutive* principles of thought, which provide it with a starting point and assure it an objective value. Finally, it is distinguished from applied Logic or Methodology insofar as the latter studies the methods proper to the different sciences (axioms, hypotheses, or postulates) which serve as their bases, and discusses their value and origin (empirical or *a priori*). In sum, Epistemology is the theory of knowledge based on the critical study of knowledge, or, in a word, *Critique* as Kant defined and founded it.

the *Logical Investigations*, we find *Erkenntnislehre*, *Erkenntnistheorie*, and *Erkenntniskritik* used to refer to any approach distinct from empirical psychology, biologism, and skepticism. Phenomenology, for its part, bases its critique of knowledge in a completely different way, relying on a pure ontology of experience. Although the continuing use of the term *Erkenntnistheorie* reveals Husserl's retention of a large part of Kant's approach to the constitution of objectivity, it is in this new perspective of the phenomenological method that he uses the word.

b. According to Moritz Schlick, in the *Allgemeine Erkenntnislehre* [*General Theory of Knowledge*] (1918), philosophy is identified in a very classical way as the "theory of knowledge," with the latter being rigorously distinguished from psychology. The theory of knowledge is defined as the search for the universal foundations of the possibility of valid knowledge in general, which must make possible the clarification of the fundamental concepts of the sciences (that of consciousness in psychology, that of axiom and number in mathematics, those of space and time in physics, and so on). However, Schlick claims to continue the thought of Helmholtz, Kirschhoff, and Hilbert. He understands knowledge as a process of "designating objects" that is radically different both from "intuitive penetration" and from the search for "subject-object correspondence"; he relates this process of designation to a "recognition of the like," which must lead to a reduction of the number of explanatory principles, and claims that the only rigorous method is that of mathematics. Schlick's *Erkenntnistheorie*, though based on an analysis of the power of knowing, thus already represents a clear departure from Kant, and opens the way for the principled kind of anti-Kantianism that characterizes the first writings to come out of the Vienna Circle.

c. The term *Erkenntnistheorie* is just as ubiquitous for Cassirer. Besides the four volumes of *Das Erkenntnisproblem* (1906, 1907, 1920, 1957), his 1920 book on the theory of relativity is entitled *Zur Einsteinchen Relativitätstheorie, erkenntnistheoretische Betrachtungen*, and the aim of his 1936 book on quantum mechanics, *Determinismus und Indeterminismus in der modernen Physik*, is to measure the displacement of the center of gravity of theoretical physics from the point of view of knowledge (*erkenntnistheoretisch*), that is, from the point of view of the determination of the concepts of object and reality, of thing and attribute, of substance and accident. As early as *Substanzbegriff und Funktionsbegriff* (1910), however, the term *Erkenntnistheorie* is released by Cassirer from its strict affiliation with neo-Kantianism, since his aim is to widen the *erkenntnistheoretisch* project at its very base. The *Philosophie der symbolischen Formen* (1923, 1925, 1929) suggests a "critique of culture" and a morphology of the human mind in all its manifestations—sciences, myths, languages, religions—unified by the notion of symbolic form, seen as a rule governing cognitive functions in their concrete diversity. The 1936 book on quantum physics, then, describes the definitive limitation of simplification and profound changes in the forms of thought. Here again, as a result, the Kantian aspect of the term *Erkenntnistheorie* is weakened to the point of almost disappearing entirely.

d. As a last example, the term *Erkenntnistheorie* is spontaneously used by the founders of quantum mechanics: it is common in the titles of N. Bohr's articles (thus, in 1939, "Erkenntnistheoretische Fragen in der Physik und die menschlichen Kulturen," or in 1949, "Diskussion mit Einstein über erkenntnistheoretische Probleme in der Atomphysik"), as well as in publications by W. Heisenberg, W. Pauli, M. Born, and so on. The use of the term in these cases no longer has any association with Kantianism, which is explicitly rejected by Bohr, Heisenberg, and Pauli at the end of the 1920s. The term is used, rather, to indicate a series of philosophical questions concerning the "new situation of knowledge," which requires us to "make a fresh start": the foundations of the description of nature; the widening of the concept of *Anschauung* and of the criteria of *Anschaulichkeit* of a physical theory; the transformation of the conditions of objectivication through the renunciation of simultaneously spatial and causal determinations of phenomena; the necessary redefinition of objectivity with reference to the possibility

of unambiguous communication; the critique of the traditional concept of the subject as pure and isolated understanding, placed at the first level of language; the transformation of the concept of reality; the displacement of the opposition between *Wissen* and *Glauben*; and so on. Here then, on the scientific side, the internal difficulties among the questions peculiar to *Erkenntnistheorie* come to a head.

II. "Epistemology"

A. From the problem of objectification to that of "justified belief"

Can we translate *Erkenntnistheorie* by "epistemology"? *Erkenntnistheorie*, however generally we construe it, remains essentially related to the problem of knowing how a subject turns a phenomenon into an object of knowledge, to a certain relationship between an intuition (that is, to the representation of a phenomenon in space and time) and a concept. No doubt "epistemology"—the term appears in English in 1856 in the works of the Scottish philosopher James F. Ferrier—is still defined in dictionaries today as the study of the sources, nature, and limits of human knowledge. However, it is immediately clarified that the central occupations of epistemology, determined by the Fregean starting point and by the "linguistic turn," concern logic and formal systems, language and the concept of truth, mind and mental states, and that one of its major projects is to understand what a "justified belief" is (where "belief" refers to the act of holding a statement to be true), as well as a "justified true belief." Several types of responses are offered to this question and to the questions associated with it (the concept of truth, the notions of truth and demonstration, the theory of valid inference, and so on): there are "normative" responses, "naturalistic" responses, or "skeptical" responses; understanding these responses requires in turn that one master a specific tradition and its vocabulary. The paradoxes are no longer the same: we move from L. Nelson's argument for the impossibility of the theory of knowledge (*Die Unmöglichkeit der Erkenntnistheorie*, 1912; cf. *Gesammelte Schriften*, ed. P. Bernays et al.) to Gettier's problems (E. Gettier, "Is Justified True Belief Knowledge?" 1963). Nor do the divisions occur in the same places: foundationalism unifies classical empiricism and rationalism in the idea that there is a foundational structure comprising fundamental beliefs, by contrast with "coherentism," which claims that each belief receives its justification from other beliefs. But both are in conflict with naturalized epistemology, which considers that human understanding is a natural entity, interacting with others, and that the results of its scientific study are crucial for the epistemological enterprise. Concepts or topics that are universally known in current English-language literature sometimes provoke no particular reaction in other languages. To take some particularly gross examples: though distinctions such as that between sense and reference or examples like "the present King of France is bald" are now classic, it remains difficult in French to discuss the import of Bayesianism or different interpretations of the notion of probability, or problems related to the underdetermination of theories by experience, the private language argument, the notion of projectible predicates, or the notion of

a degree of evidential support, and so on. Even proper names do not have the same meaning. Aristotle, Descartes, Anselm, and Thomas Aquinas are terms that function as "definite descriptions," which differ from one language to the next. It is clear that "epistemology" refers to different preoccupations from *Erkenntnistheorie*, and that it makes sense only within the network of specific concepts associated with it.

B. The evolution of "epistemology"

How was this difference between two worlds of thought in the philosophy of knowledge established? To understand it, it would be necessary to delve into the history of English-language philosophy in detail. Here, we will only briefly recapitulate four moments in this history.

a. The first, usually considered to be the birth of analytic philosophy, is the revolt of Russell and Moore against the Hegelian idealism that had become fashionable in English philosophy at the end of the nineteenth century. According to Russell, a "new philosophy" began with Moore's article, "The Nature of Judgment," published in *Mind* in 1899, in which he rejects both the Kantian problem of the possibility of knowledge and the Hegelian one of the Absolute Spirit. This beginning is more sensational than subtle, but we must grasp its polemical necessity: "With a sense of escaping from prison, we allowed ourselves to think that grass is green, that the sun and stars would exist if no one was aware of them, and also that there is a pluralistic timeless world of Platonic ideas" (B. Russell, "My Mental Development," 12).

b. Established from the beginning in opposition to Kantianism and to German idealism, the English tradition of epistemology subsequently acquires its distinctive character with the creation of a new link between empiricism and symbolic logic. Russell's theory of definite descriptions ("On Denoting," in *Mind* [1905]) thus gives a model for the resolution of a philosophical problem by means of logic. Philosophy is thus grouped with mathematics and logic, as a deductive and a priori approach whose function is clarification and analysis—while the natural sciences are seen as the essential route to any new knowledge about the world. The ideas, common to Russell and Wittgenstein, that logical analysis makes it possible to break language up into a collection of atomic propositions and that the structure of propositions and the structure of reality mirror one another, persist throughout all the subsequent developments of epistemology. The hypothesis that there is a logical form hidden in ordinary language continues to divide the two branches of Wittgenstein's legacy today: the one being that of his *Tractatus* and the other that of his *Philosophical Investigations*.

c. A third essential moment is that of the appearance of "logical positivism" and "logical empiricism." The movement of the Vienna Circle, born informally in 1924 and endowed in 1929 with a manifesto entitled "The Scientific World-Conception" (see English translation in *The Emergence of Logical Empiricism*), takes up the opposition to idealism and metaphysics and amplifies it further, as well as the faith in the power of logic

and the idea that the function of philosophy is to clarify the meaning of scientific statements and concepts. Associated with an analytic-synthetic distinction that is rejected by W. V. Quine in 1951, the different versions of the criterion of empirical verifiability (verifiability criterion of factual meaningfulness), whose first formulation by M. Schlick simply stated that the meaning of a statement was its means of verification, were tirelessly discussed between 1930 and around 1960—first in the context of the theory of protocol sentences and physicalism, then in that of the different conceptions of "testability," of confirmation, falsifiability, of the structure of the theories, and of reductionism.

d. Finally, a fourth moment that characterizes the tradition of epistemology is that which marks, at the end of the 1960s, the recognition of the failure of logical empiricism and the rather chaotic search for new directions. Leaving to one side the philosophy of mind and its debates about the new materialism, as well as the sociology of science, we may say that in the domain of the philosophy of science, the epistemology of the past twenty years has attempted in several ways to move beyond the opposition between a normative theory of knowledge and a skeptical or historicist conception. It is in this perspective that we must situate the debate over "scientific realism" and its alternatives—"antirealism," "constructive empiricism," "fictionalism"—or more technically, over conceptions of physical theories that are, respectively, syntactic, semantic, or structuralist.

- See Box 2.

C. "Untranslatability"

Given all this, is it still possible to translate *Erkenntnistheorie* by "epistemology," even though the latter is based on an open opposition to the German tradition of the analysis of the conditions of the possibility of knowledge, as well as on a collection of new theses in logic and the philosophy of language? No doubt the term *Erkenntnistheorie* was sufficiently broad to include numerous alternatives to Kantianism, from Helmoltz's theory of signs to the positivism of Schlick and the Vienna Circle, as well as to Cassirer's critique of culture. There is, however, a profound difference between the ways of posing the question of knowledge that respectively characterize *Erkenntnistheorie* and epistemology: the former beginning with a relationship between intuitions and concepts, and reflections concerning the mode of presentation of phenomena; the latter beginning with the analysis of language and the logical form of theories. This difference does not derive from anything essential to either language, nor to any grammatical characteristic of their structure. Some aspects of epistemology, indeed, were developed thanks to works (those of Frege, Wittgenstein, and Carnap) that are rooted in the German language. We might thus think that the existence of an "untranslatability" is primarily a sign of an evolution within philosophy itself, because of a recognition of the limits of the approaches of *Erkenntnistheorie* and the search for fundamental reformulations of the problem of knowledge.

III. Conclusion

What does the foregoing sketch of a map of words show? That if we allow that the alleged current loss of homogeneity in the vocabulary proper to philosophical discussions of science comes from a precise and datable break in the history of philosophy, then the most plausible hypothesis is one that locates this break at the beginning of the twentieth century, in the divisions made then between German *Erkenntnistheorie* and English "epistemology." The term *Erkenntnistheorie*, regardless of the diversity of its meanings, referred in German philosophical language to an approach whose aim was a determination of acts of objectification—that is, that would allow for an understanding of how the knowing subject transforms given phenomena into objects of knowledge. Opposed to this approach of objectification or constitution inherited from Kant, and providing a common language to the natural sciences up until the 1930s, the utterly different approach of epistemology is defined first by B. Russell and G. E. Moore by a polemical affirmation of "the independence of facts with regard to experience," and then develops in the direction of the logical analysis of language and the structure of physical theories. The untranslatability between the two traditions is, as it turns out, so large that the epistemology of German scholars between 1850 and 1930 was long suspected of being unintelligible in English-language words of philosophers of science after 1945, or it was simply ignored.

This division of the field by *Erkenntnistheorie* and epistemology is what this article has so far attempted to analyze. It remains to retrace more precisely the development of the numerous differences that have since deepened within languages, especially in French, where epistemology takes on a distinctive character with the introduction of theories of the nature of concepts supported by the history of science and a reflection on the notions of value and power (G. Bachelard, G. Canguilhem, M. Foucault). But it bears repeating that the break between *Erkenntnistheorie* and epistemology, if it marks a turning point, should not be viewed as the effect of an irreducible divergence between the philosophical thought of the two languages, or between traditions of thought that do not communicate with one another. In the 1930s, the term *Erkenntnistheorie* ended up referring to such a variety of positions that it could no longer strictly be associated with the Kantian approach in which it originally appeared. Similarly, in the 1970s, the term "epistemology" comes to refer to a variety of positions that are just as distant from Russell's original claims. The linguistic difference thus clearly expresses only a difference of perspective regarding the problems posed by discourse on science and the philosophy of knowledge since the first third of the twentieth century, under the influence of the crisis in logic, mathematics, and physics. These problems, in turn, are driving the search for very different avenues in philosophy even today, and it is natural that the untranslatability of these conceptual networks is revealed more strongly where the avenues have diverged the most.

Major trends in contemporary epistemology

Just as the term "knowledge" refers both to ordinary knowledge and to scientific knowledge, the word "epistemology"—from the Greek *epistêmê* [ἐπιστήμη], knowledge—refers to the theory of knowledge understood either in the narrow sense of a theory of scientific knowledge, or in the wider sense of a theory of knowledge without any distinction as to its objects. This latter sense is the more prevalent for the English term "epistemology," relating to the study of knowledge and the justification of belief, that is, what may be called the "theory of knowledge" and, in French, *gnoséologie*. In this sense of the term, science is neither the only nor even the primary domain of inquiry for epistemology, since the question of the justification of beliefs and knowledge is also raised in the ordinary case of judgment from perception, memory, or beliefs formed on the basis of testimony from others. Epistemology understood in this sense is not called upon to describe or to evaluate particular systems of argument or proof, but rather to make explicit what, exactly, constitutes justification for true beliefs, such that they achieve the status of knowledge. The concept of justification may itself be understood either as an "internalist" requirement, dealing with the characteristics of the knowing subject and the reasons he or she has for holding a given proposition true, or as an "externalist" demand that there be an appropriate link—causal, or more generally, nomological—between the knowing subject and the known object.

There are two ways of approaching epistemological problems: one is "normative" and seeks to clarify the principles that justify the rational acceptance of a belief; the other is "naturalist" and derives the status of a belief from the conditions in which it is acquired.

The normative sense of epistemology is subdivided into two trends. "Foundationalism" starts with the empiricist thesis according to which all knowledge derives from experience. In its strongest version, it maintains that all of our beliefs are built up from basic beliefs whose content is immediately given in sensory experience, and that beliefs about these contents of experience are infallible (R. Chisholm, *Theory of Knowledge*). The main objection to foundationalism is that no belief is infallible. By believing that things seem to be thus, the subject is not infallible, since he or she may use the wrong term to qualify the experience. A weaker version of foundationalism posits that certain beliefs have prima facie justification, that is, they may be contradicted by other, subsequently acquired true beliefs (they are "defeasible").

"Coherentism" maintains, for its part, that the system of beliefs is not deployed in an asymmetrical way from basic beliefs obtained through perception up to inferred beliefs, but rather constitutes a coherent totality of mutually explanatory beliefs: no belief is in principle "immune to revision" (K. Lehrer, *Knowledge*). From the coherentist point of view, justification is a question of degree, which depends on the support given to each belief by the others. The rules of inference, equally, find their justification in the increase in coherence resulting from their adoptions. Fallibilism does not constitute a defect, as it does in foundationalism, but is rather an integral part of the work of revising beliefs in order to achieve greater coherence. Coherentism, unlike foundationalism, considers the acquisition of knowledge to be a social phenomenon: the testimony of others can increase the coherence of a system of beliefs and its degree of justification.

These two normative currents were endangered in spectacular fashion by E. Gettier ("Is Justified True Belief Knowledge?). In a three-page article, the author shows that a true belief may be derived from a proposition that is "justified" but false. Gettier thus shows that the truth of the belief in question, which is justified from the foundationalist and from the coherentist points of view, is a matter of coincidence—and we cannot call such a belief "knowledge." The normative tradition has responded to Gettier by offering a theory of defeasibility (according to which knowledge is a justified true belief that is not defeasible by other truths).

Naturalist epistemology has, for its part, adopted a different strategy, consisting in the search for the properties of a process that leads to the formation of knowledge. We may again discern several meanings covered by the term "naturalist epistemology," depending on the part played, respectively, by rational evaluation and the pursuit of truth or the description of psychological and social processes of knowledge formation. The naturalist/evaluative trend explores the notion of a "reliable" method of belief acquisition by examining the cognitive properties that allow the subject to deal with information and to reason (A. Goldman, *Epistemology and Cognition*). "Social epistemology" pursues this "reliabilist" approach, while extending the role of social factors in the formation and justification of beliefs.

"Evolutionary epistemology" (the term comes from Donald T. Campbell) places epistemic norms in the context of the history of approaches and the choice of theories. Karl Popper, one of the philosophers who reinvigorated this Darwinian-inspired trend, developed all the consequences according to a strictly "falsificationist" point of view, according to which knowledge (scientific or ordinary) consists in hypotheses that have survived competition.

The most descriptive sense of naturalist epistemology attaches to the attempt to retrace the stages of development of operational and conceptual capacities at work in knowledge, which inspired the genetic epistemologist Jean Piaget. It is often objected that the neutralization of the critical and reflective dimension of epistemological inquiry forces the term "epistemology" to undergo a semantic mutation that goes beyond what doctrinal flexibility may authorize.

"Knowledge," *savoir*, and *epistêmê*

➤ DOXA

Though the works of Michel Foucault have received a great deal of attention in English-speaking countries, it has largely focused on his questioning of the established order of dominant morality, and only to a lesser degree on the critical aim of his approach to the sciences. The specifically epistemological import of his work has not excited much interest, and remains largely ignored (or a subject

of irony) by specialists in the history of science. On the continent, on the other hand, and especially in France, it has had lasting influence. No doubt the works of Bachelard and Canguilhem prepared the way: they drew attention to the notion of epistemological rupture, and the latter taught that we should use caution when handling the notions of a precursor or a source, if we wish to avoid the retrospective illusion that consists in retaining from the past only what might foreshadow a future that leads to our present. However, is this only a matter of opposing schools of thought and context? It may also be that what can seem imprecise or even confused in Foucault's work is accentuated by the necessity of translating it, because of subtle differences in the senses of certain key terms.

The first of them is *savoir*. The most natural and most legitimate term to render it is "knowledge." But is this an exact equivalent? *Knowledge* is dominated by the notions of acquaintance and understanding (*connaissance*). There is, first, a subjective sense: that of which we have experience, of which we are informed, or which we have learned; second, an objective sense: that which is the material of experience, information, or learning. In both cases, it is a matter of positive cognition, whether empirical, factual, theoretical, or scientific. There are various meanings for *savoir*. However, where English uses a single term, *to know*, French has two, *savoir* and *connaître*, which are not always interchangeable. To say that one knows Pierre, *connaît* may be used, *sait* may not (except in a nuanced way of indicating that one knows which Pierre is "ours"). On the other hand, to say that we know Pierre has arrived, *sait* is used, not *connaît*. From this difference, there arise semantic distinctions that are difficult to translate.

Savoir indicates a more performative state than *connaître*, which implies the intellectual grasping of an objective given. To know-*savoir* a language is to be able to understand it, to speak it, to read it, and write it a little; to know-*connaître* a language is to have a grasp of its vocabulary and grammar such as may lead to an inspired vision of it—it is to have a more or less reflective consciousness of what it is. It is not for nothing that we translate *know-how* by *savoir-faire* and not by *connaissance du comment*. *Savoir* relates to a technical and cultural domain that one has mastered; *connaissance* relates to reasons one has to think that one's beliefs are true. The distinction is present starting with classical French: "And anyway, as for bad doctrines, I considered myself already to know [*connaître*] well enough what they were worth, so that I would no longer be deceived, not by the promises of an alchemist, nor by the predictions of an astrologer, nor by the magician's fraud, nor by the artifices or puffery

of any of those who claim to know [*savoir*] more than they know [*plus qu'ils savent*]" (R. Descartes, *Discours de la méthode*).

It is not a recent development that *savoir* refers to a cultural achievement conferring prestige and power on its possessor, which may or may not derive from objective understanding (*connaissance*).

Foucault deepened this distinction between *savoir* and *connaissance* by contrasting the depersonalized anonymity of knowledge-*savoir* in which one moves after having found it already built up (it is a historical a priori that we all appropriate for ourselves) with the subject of knowledge-*connaissance* in classical theories (empiricism, critical philosophy, and so on), going by degrees from perceptual awareness to conceptualization and science.

> Rather than running along the consciousness-knowledge (*connaissance*)-science axis (which cannot be freed from the index of subjectivity), archaeology runs along the practical axis of discourse-knowledge (*savoir*)-science. And, while the history of ideas finds the equilibrium of its analysis in the element of knowledge-*connaissance* (finding itself thus forced, even against its will, to meet with transcendental interrogation), archaeology finds its equilibrium point in knowledge-*savoir*—that is, in a domain where the subject is necessarily situated and dependent, without ever being able to be the owner (either through transcendental activity, or empirical consciousness).
>
> (M. Foucault, *L'Archéologie du savoir*; trans. A. M. Sheridan Smith, *Archeology of Knowledge*)

Of course, Foucault includes under knowledge-*savoir* everything left unsaid concerning the order in which things are classified in a given culture, changes that lead to decisive transformations.

> What we would like to uncover is the epistemological field, the *epistêmê* where understandings (*connaissances*), seen outside of any criteria referring to their rational value or their objective forms, bury their positivity and thus manifest a history which is not that of their increasing perfection but rather that of their conditions of possibility. . . . Rather than a history in the traditional sense of the word, it is an "archaeology."
>
> (Ibid.)

However, the choice of the term *epistêmê* to refer to an *epistemological field* that makes knowledge of a certain type possible, to the exclusion of others (the analysis of wealth and not political economy, natural history

and not biology, and so forth) was an unhappy one: in Greek, *epistêmê* usually refers to knowledge and science, whereas the term here refers, by contrast, to the historical a priori without which they cannot be built up. Besides, as Foucault indicated himself (*L'Archéologie du savoir*, 27), "the absence of methodological markers may have created the belief in analyses in terms of cultural totalities," further blurring the initial intention.

Foucault's analysis of knowledge-*savoir* remains, in addition, nourished by the continental conception of philosophy and the theory of knowledge. No doubt he repeats often enough his rejection of anything that might recall the primacy of the subject, and in his critique of a history of ideas he places the transcendental point of view of an underlying subject on the same level as the empiricist point of view of a genesis of the known entity from a sensation that is supposedly its origin. But this double rejection in fact masks a false symmetry. For, with the notion of an a priori, he takes up in terms of cultural historicity what was dealt with in the Kantian tradition in terms of human nature, and thus goes further than Kant in affirming the idea of a preconstituted rationality that organizes experience, in opposition to the Lockean *tabula rasa*. A given epistemological field, even if it characterizes a culture and is transitory, even if it is a question of things left implicit that must be discerned by the analysis of the archaeologist, is the directing element of interpretation of the data for the people of that time, and what determines the distribution and the norms of their statements. This presence of a *tertium quid* between the said and the perceived puts Foucault at the furthest remove from logical positivism and analytic philosophy.

Thus, between Foucault's *savoir* and the term "knowledge," there is a deep divide, for reasons that are both semantic and philosophical, which may have produced reactions of incomprehension and rejection—especially in the domain of epistemology, where his contribution remains largely unknown in English-speaking countries.

EPOCHÊ [ἐποχή] (GREEK)

ENGLISH	epochê
FRENCH	*epokhê*
GERMAN	*epochè*

➤ CONSCIOUSNESS and BELIEF, EPISTEMOLOGY, ERLEBEN, GREEK, OBJECT, PERCEPTION, PHANTASIA, *PHÉNOMÈNE*, REPRÉSENTATION, TRUTH

This Greek term, which originates in ancient skepticism and is taken up with slight modifications by Stoicism, literally means "stop, interruption, rupture" and has endured through the centuries in its original linguistic form. It is used frequently by Montaigne as early as the sixteenth century but especially by Husserl in the twentieth, without either substituting a standard French or German term. The question is thus: why choose this Greek term? Why was it preserved in its initial form, without ever being translated?

I. The Two Greek Sources for *Epochê*: A Double Inflexion

A. From Skeptical suspension to Stoic assent

Epochê [ἐποχή] is a central term for ancient Skepticism. Introduced into philosophy by the Pyrrhonian school, it

refers to the stopping of all search for truth, which corresponds to a decisive step in attaining happiness. In effect, the Pyrrhonist finds himself initially destabilized by the variety of philosophical systems, which contradict one another. Trying in vain to discover which one is true, he resolves to cease (*epeschen* [ἐπέσχεν]) looking—makes a stop (*epochê*)—and in doing so discovers ataraxia, the peace of the soul (Sextus Empiricus, *Outlines of Skepticism*, I: 49): "Suspension of judgment gets its name from the fact that the intellect is suspended (*epechesthai* [ἐπέχεσθαι])."

In its Skeptical meaning *epechein* [ἐπέχειν] is used in the intransitive sense of "to stop" or "to cease," but it may also be used in the transitive sense of "to stop judging" or "to withhold one's judgment." It is this transitive sense that is later taken up by the Stoic academician Archesilas: "I suspend my judgment" here means "I abandon any claim to truth" or again, "I consent to not knowing as long as I do not have complete certainty." In effect, in the Stoic doctrine as Cicero presents it (*Academica priora*, II: 59; *Letters to Atticus*, XIII: 21), the freedom of the sage comes from his capacity not to make rushed (*propetôs* [προπετῶς]) judgments, that is, to restrain himself from giving his assent (*assensus*) as long as he is not entirely certain of his possession of the truth.

B. Assent and suspension: The later Pyrrhonism

In Sextus Empiricus (Hossenfelder, *Einleitung*, 54ff.), we find the two semantic inflections of *epochê* mixed together. There is the initial Skeptical sense, that is, the stopping of all search for truth because of the contradictions among different philosophical systems, and the later Stoic sense, that is, the ethical requirement not to affirm anything, not to assent to anything as long as absolute certainty concerning truth is not established, which can, in fact, lead to the same result: suspension extended to all judgment.

Such is the syncretic position of the late Pyrrhonist Aenesidemus, who combines Stoic suspension of judgment with the skeptical arrest in the face of contradiction among different positions, while at the same time eliminating the ethical dimension peculiar to Stoicism. By doing so, he comes very close to the initial Skeptical position (Sextus Empiricus, *Outlines of Skepticism*).

II. From Antiquity to the Present Day: Montaigne

> Their sacramental word is *epechô*, that is, I stay still, I do not move. That is their refrain, and others of similar substance. Their effect is that of a pure, complete, and perfect surcease and suspension of judgment.
>
> (Montaigne, "Apologie de Raimond Sebond," *Essais*, Bk. 2, chap. 12, ed. Strowski, 2: 229–30)

The "epechists," as he calls them, are characterized by their immobilism ("I do not move"), and consequently by the fact that they abstain from making any judgment whatsoever ("a perfect surcease"). In this sense Montaigne inherits immobilism from Skepticism, and from the Stoics the suspension of judgment made in full freedom. In any case he paraphrases *epechô*, rather than translating it.

III. The Central Methodological Role of *Epochê* in Husserl's Phenomenology: What Legacy, What Continuity?

The importance accorded by Husserl to *epochê* in its ancient Greek origin may be seen through his abundant use of the Greek term, accompanied, depending on context, by "phenomenological," "transcendental," or even "ethical" adjectives (no fewer than thirty occurrences in the Lectures of 1923–1924 of *First Philosophy* alone): a recent work is devoted to the Skeptical theme of suspension in phenomenology, including its meaning of suspicion (March). Further, the forty-third lesson, which contains the first occurrence of *epochê* in the lectures, analyzes the activity of the spectator who abstains from acting and from manifesting an interest in the objects of the world, who thereby suspends all belief in the world. However, the Stoic origin of phenomenological *epochê* is equally attested (Migniosi); finally, it has been clearly shown how Husserl both based his model directly on the Cartesian method of doubt as a source and radically modified its import without, nevertheless, returning to Skeptical *epochê* (Lowit). Phenomenological *epochê* is a complex act that retains characteristics at least of its three sources, while also freeing itself from them in order to present its own originality. This is probably one of the reasons for which Husserl retains the Greek term.

A. *Ausschaltung*: Placing the object's existence out of bounds

Husserl retains from Skeptical *epochê* the move of halting, interrupting the flow of our natural attitude by an act that removes our contradictory beliefs and prejudices from the field (March), what Merleau-Ponty calls in the *Phenomenology of Perception* the "faith of the world" (371). It is, in fact, a question of placing objects out of bounds, of excluding them, with respect to the validity of their contingent existence. However, though Skeptical *epochê* throws radical doubt on the truth of any given object, phenomenological *epochê* consists simply in abstaining from positing the existence of the object.

B. *In Klammer Setzung*: Bracketing the character of being of the object

What remains is only the object's meaning for me. There is also a methodical dimension that comes back to Cartesian doubt; the latter, however, is provisional (I doubt in order to leave doubt behind), whereas phenomenological *epochê*, like skeptical *epochê*, is definitive: the suspension is an attitude that I adopt in a lasting way (Lowit).

Though it involves putting aside the contingent existence of the object, this is in order to better include the sense of its being for me. The object is literally bracketed insofar as it is for me an appearance in flesh and bone.

C. *Beschränkung*, not *Einschränkung*: Liberation, not delimitation, of the immanent sphere of pure consciousness

Such is the deep meaning of *epochê*: the liberation of a pure field of consciousness whose objects are invested with meaning and are not realities that remain external to it. Such a liberation with regard to objectivism allows the ethical import of *epochê* to shine through, which takes place, in fact, in complete freedom. This is a feature that recalls the early Stoic meaning (Migniosi), which presupposes the reflective activity of a subject put to the test of a decision that has matured over a long period of time: that of not assenting until the evidence of truth is truly undeniable.

EREIGNIS (GERMAN)

ENGLISH   event, appropriation, surprise
FRENCH   *événement, appropriation, appropriement, sidération, amêmement*

➤ *APPROPRIATION*, *EVENT*, and *DESTINY*, ES GIBT, OIKEIÔSIS, PROPERTY, TRUTH, VORHANDEN

Ereignis, the key word in Heidegger's thought from 1936 onward, is an equivocal term, which makes it difficult to translate into other languages. "Event," the standard sense of *Ereignis*, does not capture the other dimensions that Heidegger associates with the word, those of an appropriation (*Ereignung*) and of a demonstration (*Eräugnis*, from *das Auge* ["eye"]). It is a case in which the standard sense of a word hides the depth of its philosophical import.

I. Semantic Arc: To Display, to Show, to Show Oneself, to Occur

"*Ereignis* since 1936, the leading term of my thought": this comment by Heidegger (*Gesamtausgabe*, vol. 9, 1976) raises questions concerning the meaning of this *Leitwort* (leading term) from the middle of the 1930s, with the *Beiträge zur Philosophie* of 1936–1938 (*Gesamtausgabe*, vol. 65), which were published only in 1989. The subtitle, *Vom Ereignis*, in fact, announces "the real title of the 'work,' which only finds its start here." *Ereignis* is not the object of the *Beiträge* at all but rather the origin (*von*). Heidegger is not

using the term here in its standard sense of "event" (Ger. *Begebenheit*, *Vorkommnis*, or *Geschehnis*, "that which has happened," "what took place") but rather in terms of *eigen*, "one's own," or even *Er-äug-nis*, "what is placed before one's eyes."

"*Er-eignis* (as long as we understand *eignis* from *eigen*: what is one's own, proper to one) means the movement that leads to being properly one-self" (Fédier, *Regarder voir*). In this sense *Ereignis* means an "appropriation," which presupposes the contrary possibility of a dis-appropriation (*Ent-eignis*). This term retrospectively clarifies the pair *Eigentlichkeit/Uneigentlichkeit*, laid out in paragraph 9 of *Sein und Zeit*: "propriety/impropriety," rather than "authenticity/inauthenticity," since Heidegger has already distinguished an *unechte Eigentlichkeit* (inauthentic proper-being) and an *echte Uneigentlichkeit* (improperly being in an authentic way) (*Gesamtausgabe*, vol. 21, 1976). The *Eigentlichkeit* of 1927 is itself not possible except through *Er-eignis* (*Gesamtausgabe*, vol. 66, 1997), in "the captious figure, in fact already ap-propiated [*er-eignete*] from 'fundamental ontology'" (ibid.).

Nevertheless, as Wolfgang Brokmeier emphasized, *Ereignis* recalls, even more properly speaking, *Eräugnis*, from the verb *eräugen*, which the *Deutsches Wörterbuch* by the Grimm brothers paraphrases using *vor Augen stellen* (to place before the eyes) or in Latin *ostendere*, *manifestare*.

> The matrix of the meaning is indeed the verb *äugen*, which also used to be written *eugen* or *eigen*. There are thus two homonyms whose meaning must not be confused: one is (like the English *own*) the indication of what is proper to one, whereas the other indicates the fact of *placing something before one's eyes*. To use *Ereignis* in a sense faithful to its etymology requires above all retaining the ostensive aspect that is manifested in it.
>
> (Fédier, *Regarder voir*, 116)

> Though the translation of this leading term of Heidegger's late thought seems certainly to be thoroughly insufficient, the one that is most commonly offered in its place, "appropriation," which emphasizes the root *eigen*, proper, is just as insufficient.
>
> (Romano, *L'événement et le monde*)

> *Ereignis* (event, appropriation—Kahn: "propriation") comes from *eräugen*—thus, *Auge* ["eye"]—to look at fixedly, "to astonish [*sidérer*]," and from *eigen*: "properly." That which is grasped by *Ereignis* is not alienated but transformed into what it has most properly. . . . *Ereignis* is thus event, arrival, "appropriating astonishment [*sidération*], the fact of being looked at, concerned by, deeply touched. It is the permanence of a look. Cf. in Greek: Μοῖρα [*Moira*].
>
> (Beaufret, *Leçons de Philosophie*, 1:27)

II. Import of the Term

Ereignis pertains to us and takes hold of us before we can exercise or influence anything at all, just like that which constitutes "in a way the photographic negative" (*Gesamtausgabe*, 15: 366, 1986) of the essence of modern technique, interpreted by Heidegger as *Ge-stell*.

But what pertains to us is not necessarily what we are looking at. It is not even rare that we lack a view of what pertains to us properly speaking. It is not a chance happening nor a regrettable failure, but a structure, and Heidegger's thought reserves the term *Ereignis* for that structure. What pertains to us is never reducible to what we look at, but inversely, we would be unable to look at anything if there were not something that pertained to us which we were not looking at.

(David, "Heidegger," 104–5)

The thought about *Ereignis* takes us back to the foundation of modern philosophy, considered as a "metaphysics of subjectivity." In this sense it consists in "restoring to being what makes it into something other than an object. That which makes it the case that water is not a simple liquid, for example, or light a simple lighting; that nothing, in a word, is trapped in functionality. The manifestation of the independence and of the gratuitousness of everything which is—that is precisely what Heidegger successively called *being* and later *event*" (Crétella, *Heidegger Studies*, 9:70).

As for translation, however, the event-related or eventual dimension that comes into the foreground in the standard sense of *Ereignis* in German does not authorize us to translate it in Heidegger by "event," rather the contrary. We would have to be able to indicate both the appropriating (*Er-eignung*) and the ostensive (*Eräugnis*) dimensions at the same time. We should note, finally, that if the leading term of *Ereignis* becomes such from the middle of the 1930s in Heidegger's thought, this coincides with that thought's becoming open to poetry, in an elective relationship with Hölderlin's poetry, whose *Mnémosyne* made emphatic use of *Ereignis* and *sich ereignen*.

The difficulty of the thinking concerning *Ereignis* comes no doubt in part from the fact that it resists any thoughts about causality, even divine causality, as is emphasized by a passage from Heidegger's *On the Way to Language*:

> What Appropriation [*Ereignis*] yields through Saying is never the effect of a cause, nor the consequences of an antecedent. . . . What is yielding is Appropriation itself—and nothing else [*Das Ereignende ist das Ereignis selbst—und nichts außerdem*]. . . . There is nothing else from which the Appropriation itself could be derived, even less in whose terms it could be explained. The appropriating event is not the outcome (result [*Ergebnis*]) of something else, but the giving yield [*die Er-gebnis*], whose giving reach alone is what gives us such things as an "es gibt."

Reflection from and of *Ereignis*, which must not be confused with reflection that has *Ereignis* as its object, tilts toward the dimension of the *Es gibt*, "there is," as irreducible to a disguised form of exchange and even to a gesture whose initiative comes only from the human being. The resistance of the term to translation does not come from complexity but rather from a strange simplicity, from its singular equivocity. As Heidegger says in *Identity and Difference*, "As such, it is just as untranslatable as the Greek *Logos* or the Chinese *Tao*."

ERLEBEN / ERLEBNIS (GERMAN)

ENGLISH	to live, to experience, lived experience
FRENCH	*vivre, faire l'experience, faire l'épreuve, le vécu*
GREEK	*biônai* [βιῶναι], *zôê* [ζωή], *bios* [βίος]
SPANISH	*vivir, experimentar, vivencia*

➤ *EXPERIENCE, LIFE/LEBEN,* and ANIMAL, CONSCIOUSNESS, DASEIN, EPOCHÊ, INTENTION, LEIB, PATHOS, POLIS

Does life reside in the simple fact of living? Is it natural life as given and nothing more, an experience of the immediate? How did the various languages fashion this simple and self-blind fact of living? They attempted to grasp its modes of deployment, whether in communities (as inscribed in the Greek *polis* [πολις] or the practical sociability of the *Lebenswelt*) or as individuals (its reflexive interiorization or its "meaning for me," which the terms "experience" and "existence" also state in their own ways). From *Leben* to *Erleben* and *Erfahrung*, from life to experience, from *zôê* [ζωή] to *bios* [βίος], such a mediation can be seen. Romance languages, which have only one word for life (e.g., *vie*), seem to have folded an excess of life into itself, which seems constitutive of it by means of the term "experience." Does the latter suffice to cover this spectrum?

I. The First Sense of *Erleben*: A Manifestation of the Given

In both its current meaning as well as its classical definitions, whether in the scholarly philosophy of the eighteenth century—in romantic thought or in German idealism (from Kant to Hegel)—or in nineteenth-century psychology, *erleben* is practically indistinct from *leben*, "to live." *Erleben* is characterized by immediacy, immanence, and passivity, which equally define the simple fact of living, as opposed to the abstract meditation represented by reflection and speculation (RT: *Historisches Wörterbuch der Philosophie*). This is the case of the proverb: *wir werden es ja erleben* (lit., we shall live to see it). More often, nevertheless, the word is translated into French by appealing to the paradigm of experience rather than to that of life. Thus, *ich habe etwas erlebt* becomes, in addition to *j'ai vécu ceci ou cela, j'ai fait telle experience, j'ai connu tel évenement*. Similarly, *das war ein Erlebnis*: c'était une expérience

(*marquante*), whereas German makes immediate reference to a cognitive, though elementary, process (*etwas erfahren:* to learn something, even by hearsay). In fact, in all these contexts, an intimate experience whose meaning escapes us is privileged (RT: *Deutsches Wörterbuch*, vol. 12, "Leben"). Having a given of this sort within us pushes us beyond ourselves. We thus live every day without reflecting upon what is lived or appreciating the intertwining of these individual experiences with the social and political context, which is always present, if sometimes unperceived.

Only toward the middle of the nineteenth century did *Erlebnis* acquire conceptual significance and find itself bound up with the fundamental notions of the theory of knowledge. In this respect, Fichte is the precursor, who noted the implicit transitional moment where the subject forgets himself in a state of unreflective fullness, by the conjunctive expression *leben und erleben* (*Sonnenklarer Berich*). The first, remarkably precocious, definition of *Erlebnis* is found in the third edition of Krug's *Enzyklopädisches Lexikon* of 1838: "*Erlebnis* means everything one has oneself lived [*erlebt*]: felt, seen, thought, wanted, done, or allowed to happen. Such experiences are by consequence the foundation of internal experience [*eigene Erfahrung*]." Following him, Lotze tends to use *Erlebnis* in his 1841 work *Metaphysik* as a synonym for "interiority," whereas Dilthey, in the framework of a veritable "theory of *Erlebnis*" makes it equivalent to "psychic" (*Einleitung*).

Phenomenology makes this psychic and internal life its central theme: *Erlebnis* is understood as a subjective immanent experience that nevertheless, in order to be known and thus communicated, must be linked to the world through the axis of intentionality, which gives sense and reference to objects. An *Erlebnis* without intentional reference cannot be treated as an object, that is, it cannot be known. Nor is *Erleben* an isolated experience of the subject, but rather is part of the intentional and temporal dynamics of consciousness, which links one *Erlebnis* to the next.

■ See Box 1.

Under the subsidiary expressions of "natural attitude," of "flux of experiences" (*Erlebnisstrom* [Husserl]; cf. RT: *Historisches Wörterbuch der Philosophie*, "Erlebnisstrom"), of "perceptual faith," of Merleau-Ponty's "recomprehension" (*Le visible et l'invisible*), and of Husserlian *Erlebnis*, phenomenologists attempted to capture this highly peculiar quality of our presence in the world as subjects. We are, in effect, living beings who are always behind in our capacity to make what we live from day to day explicit.

II. The Reflexive Mediation of *Erleben*

However, to live is only the simple fact of living for a living thing without self-consciousness, that is, reflexivity. In this respect, German has a term that captures this pure life without self-consciousness: *dahinleben*, which is judiciously translated into French as *végéter*. Though plants are living things without self-consciousness, we cannot say the same for animals, which do indeed have an immanent consciousness of themselves that is visible in the way they displace themselves and nourish themselves and in the different forms of social life they manifest.

Phenomenology gave itself the task of describing this folding-over that life does upon itself, in which I consciously

---

1

The Spanish translation of *erleben* by *vivencia*

It was started by Ortega y Gasset. Translating the first volume of the *Ideas Pertaining to a Pure Phenomenology and to a Phenomenological Philosophy*, he renders *Erlebnis* by *vivencia*, thus choosing an immanentist interpretation of experience, as opposed to a reflexive one. In this regard, if we were translating *vivencia* back into French, we would do so by way of *vivacité* rather than *vécu* (experience).

Javier San Martin, an active Spanish phenomenologist, perpetuates this choice of translation in *La estructura del metodo fenomenologico*. Jorge Semprun, a contemporary writer, has the following judicious note regarding the different translations of *Erlebnis* in French and Spanish (*L'écriture ou la vie*):

In German, there is *Erlebnis*. In Spanish, *vivencia*. However, there is no French word to grasp at one blow the notion of life as experience itself. They must resort to periphrasis, or use the word "*vécu*," which is approximative. And disputable. It is a weak and soft word. First and foremost, it is passive. And in the past tense. The experience of life, however, which life has by itself, of itself while living, is active. And in the present, necessarily. This is to say that it is nourished by the past in order to project itself into the future.

In sum, Spanish grasped what French missed in *Erlebnis*, namely, pure living, whereas

French, when translating the German, stops with a simple nonprocessive *vécu*.

perceive myself living a given moment of my life. Thus the German term *Erlebnis*, in addition, expresses a state rather than an action. Its translation by the past participle *vécu* captures this moment of arrest, practically in the past, in which I perceive that "I have lived." There is discontinuity between the blind push of life, which generates itself, emerges from itself, and the consciousness we have of it (Henry, *C'est moi*; Varela, *Principles*) in a temporality of the moment after, however immediate. Reflexivity (in its dynamic *in statu nascendi*) is constitutive of the apprehension of life, as is the case for Lipps with the notion of natural epoch (*Psychologie des Schönen*). For Husserl, who takes up this notion of immanent life from Lipps (*Erleben/Ausleben*), life appears constantly in his writing, whether it is to characterize consciousness (*Bewußtseinsleben*), its experiences (*Erlebnisse*) modalized as "transcendental," constituting and phenomenologizing life (Fink, *Sixth Cartesian Meditation*), or to refer to the world as the world of life (*Lebenswelt*), weaving together the universal correlation of consciousness and the world (Depraz, "La vie").

If we stay for a moment with the mediation of reflexive consciousness, experience refers to this very intimate quality that consciousness has at the moment it perceives itself in the past. It is thus the upwelling of reflexivity itself from the unreflected given, the reflecting activity that is in play with *Erlebnis.* In this regard, one may also speak of *Erfahrungsleben* (life as experience), as if to separate (the prefix "ex") life that is immanent through experience from its explicit rendering: in phenomenology, "living" is interiorized straightaway, even reflexive. Beside, to speak of a "natural attitude" (*natürliche Einstellung*) to refer to "natural life" is the indication of a phenomenological life that already contains, in virtue of the position occupied by the observing self, a reflexive distance with respect to itself.

III. The Social Mediation of *Erleben*:
From the Greek *Polis* to Husserlian *Lebenswelt*

Erleben's reflexive distance in its phenomenological sense with regard to immediate and natural life is captured

precisely in Greek with the distinct usage of the terms *zôê* [ζωή] and *bios* [βίος].

■ See Box 2.

In this respect, the Husserlian "lifeworld" (*Lebenswelt*) lies in between the two forms of community distinguished by Aristotle. It is both a natural world of living beings—perceptible, immanent, and practical, situated in close proximity to the natural, prereflective attitude—and also a social, lived world, already penetrated with the common reflexivity proper to the intersubjective experience of the collective being. *The Crisis of European Sciences* brings out this ambivalence in section 38, which the translation "lifeworld" awkwardly renders, refusing to choose between the world of the living and that of experience (Biemel, "Réflexions").

The world of life is this social a priori, the correlative of the a priori of transcendental subjectivity, which aims to hold together the immanent possibility of a self-organization in the natural world of living beings and its irreducibility to the lived social consciousness that emanates from it. In this respect, the most antireductionist contemporary cognitive approach uses the term "emergence," and, more specifically, the expression *couplage structurel autopoiétique* between consciousness and the world (Varela, *Principles*) to refer to that dynamic of collective life.

G. Agamben: The pertinent distinction between *zôê* and *bios*

➤ AIÔN, OIKONOMIA

Like *Leben*, *zôê* captures the simple fact of living and characterizes living beings—animals, men, or gods—at the biological level. *Bios* further indicates a mode or a kind of qualified life: *bios theorêtikos* [βίος θεωρητικός] (contemplative life), *bios apolaustikos* [βίος ἀπολαυστικός] (life of pleasure), *bios politikos* [βίος πολιτικός] (political life). These are attitudes or behaviors that when confronted with life place it straightaway in an ethical or social framework (Plato, *Philebus*; Aristotle, *Nicomachean Ethics*). The dividing line is thus drawn between natural, biological life (*zôê*) and the life of the *polis* [πόλις] (*bios*) to the point where the former is confined to the private life of the family and reproduction (*oikos* [οἶκος]) and is excluded from the *polis* (Aristotle, *Politics*, 1252a26–35).

Even if natural life is a good in itself (ibid., 1278b23–31), and even if God is apprehended as being the bearer of a *zôê aristê kai aidios* [ζωὴ ἀρίστη καὶ ἀίδιος] (a most noble and eternal life; *Metaphysics*, 12.1072b28), political life nevertheless does not refer to an attribute of the living being but rather to a specific difference of the genus *zôion*. Further, although Aristotle refers to the *political man* as a *politikon zôion* [πολιτικὸν ζῷον] (*Politics*, 1253a4), one may equally maintain that this is due to the fact that the use of the verb *bionai* in Attic prose is practically nonexistent.

There is thus a discontinuity between the natural community of living beings, whose primary figure is that of the family, and the political community, which introduces a specific kind of life that includes language and the awareness of justice and injustice.

➤ APPEARANCE, DOXA, EPOCHÊ, ERLEBEN, GERMAN, *IMAGE*, INTENTION, OBJECT, PERCEPTION, *PHÉNOMÈNE*, REALITY, *THING*, TRUTH

The vocabulary of phenomenality is distributed in German over several linguistic registers: alongside terms of Germanic origin based on the verb *scheinen* (to shine, to appear, to seem) and on the adjective *offenbar* (manifest, clear, obvious)—terms such as *Erscheinung* (phenomenon, appearance) and *Offenbarung* (revelation)—we find terms from foreign languages that constitute the technical vocabulary of modern philosophy, such as *Phänomen*, borrowed from the Greek, or *Manifestation*, taken from Latin.

It is Kant who, with his rigid distinction between *Erscheinung* and *Phänomen* on one hand and *Schein* on the other, gives "phenomenon" its modern definition, whereas Lambert, who was probably the first to use the term "phenomenology," continues to operate under the traditional distinction between truth and appearance. In Hegel, the vocabulary of manifestation appears alongside the Kantian distinction between *Schein* and *Erscheinung*, which he renews; and Schelling, following Fichte, gives the concept of *Offenbarung* (revelation) its fullest range. However, it is in the framework of phenomenology that the concepts of *Phänomen*, *Erscheinung*, and *Schein*, in a new distribution, will return to the center of philosophical debate with Husserl, who emphasizes their "equivocations" and Heidegger, who assigns

himself the task in 1927 of providing a fundamental clarification of their meaning.

I. *Schein* and *Erscheinung*: The Kantian Distinction between Phenomenon and Appearance

The work written in Latin and known as the *Dissertation of 1770* that earned Kant the rank of ordinary professor at the University of Königsberg contains the first properly Kantian definition of the *phänomenon* as an object of perception (*objectum sensualitatis*), as opposed to the *noumenon* or intelligible object, which is only knowable through intelligence (*per intelligentiam cognoscendum*):

> The object of sensibility is the sensible; that which contains nothing save what must be known through intelligence is the intelligible. The former was called, in the ancient schools, *phenomenon*; the latter, *noumenon*.

> (Kant, *Dissertation of 1770*, II, § 3, p. 54)

Kant thus breaks with the sense that Descartes and Leibnitz gave to the term *phaenomenon*, a transposition into modern Latin of the Greek *phainomenon* [φαινόμενον], itself a substantive use of a participle of the verb *phainesthai* [φαίνεσθαι], which means "to be visible, to appear," itself derived from *phôs* [φῶς], "light." *Phaenomena* in the Kantian sense no longer refer to known empirical facts, to *apparitiones,* to what appears to consciousness, but simply to perceptible objects, and it is as such that they are opposed not only to *noumena* but also to simple appearances (*apparentiae*):

> In things of sense and in phenomena (*Phaenomenis*), that which precedes the logical use of intellect is called *appearance (Apparentia)*, and the reflective cognition that arises from the intellectual comparison of a number of appearances is called *experience*.

> (Ibid., II, §5)

A complex game of differentiations is thus presupposed here. We move from the distinction between *phänomenon* and *apparitio* to a double distinction between *phänomenon* and *noumenon* at the highest level, but also between *phänomenon* and *apparentia.*

These distinctions are taken up again in the *Critique of Pure Reason* of 1781, in which, alongside *Phänomenon*, borrowed from Latin, appear the terms *Erscheinung* and *Schein*. *Erscheinung* is usually translated into French as *phénomène* (whereas in English it is translated as "appearance") in order to distinguish it from *Schein*, which is translated as *apparence* (and by "illusion" in English), which of course creates some confusion. The difficulty of *Erscheinung* is marked by the fact that *apparence* and "appearance," despite being related, are aligned with the most widely opposed terms, with "appearance" seeming, further, to retain only one aspect of Kantian *Erscheinung* (the first aspect of *phänomenon* of 1770, distinguished from *experientia*); as for the English "illusion," it does capture the aspect of deception contained in *Schein*, but the latter must be immediately corrected by the doctrine of transcendental—that is, necessary—illusion (see infra).

The term *Phänomenologie* itself, probably invented by Johann Heinrich Lambert (1728–77), first appears in his work of 1764, *Neues Organon*, the fourth part of which is entitled "Phenomenology as a Doctrine of Appearance (*Schein*)." In his letter to Lambert on 2 September 1770, Kant takes up this terminology and seems at this time to wish to consider the science of the perceptible only as a simple propaedeutic to metaphysics:

> A quite special, though purely negative science, general phenomenology (*phaenomologia* [sic] *generalis*), seems to me to be presupposed by metaphysics. In it the principles of sensibility, their validity and their limitations, would be determined, so that these principles could not be confusedly applied to objects of pure reason, as has heretofore almost always happened.

> (Kant, *Correspondence*, 108)

At this time, Kant, like Lambert, is still working with the traditional distinction between being and appearing, the intelligible and the perceptible: "It is clear, therefore, that representations of things *as they appear* are sensitively thought, while intellectual concepts are representations of things *as they are*" (Kant, *Dissertation of 1770*, § 4, p. 54).

Later, the *Critique of Pure Reason* offers the "transcendental aesthetic" as an elucidation of *Erscheinung*, in opposition to Lambertian "phenomenology." What Kant refers to with the term is defined as the "undetermined object of an empirical intuition." This definition presupposes that we distinguish between its matter and form: "I call that in the appearance which corresponds to sensation its *matter,* but that which allows the manifold of appearance to be intuited as ordered in certain relations I call the *form* of appearance" (Kant, *Critique of Pure Reason*, B 34, 155–56). This form, which structures perception, cannot be given a posteriori as the matter is and must therefore be found in the mind a priori. With the distinction between matter and form, Kant thus showed that "appearances" are characterized by an intrinsic order. However, they may be further subordinate to a superior order, which is that of the understanding and which alone distinguishes the objectivity of genuine phenomena:

> Appearances, to the extent that as objects they are thought in accordance with the unity of the categories, are called phaenomena.

> (Erscheinungen, sofern sie als Gegenstände nach der Einheit der Kategorien gedacht werden, heissen Phänomena.)

> (Ibid., A 249)

A new distinction is drawn here between *Erscheinung* and *Phänomen*, with the *Fremdwort* being given a special nuance. It is by moving from apparitions to phenomena that Kant is able to break out of the traditional division between truth and appearance. We can only know what appears to us, of course, but our knowledge is not exclusively drawn from the appearances themselves, since it deploys the a priori forms of our understanding, which, though they can only apply to appearances, nonetheless do not originate in them but rather in the human mind.

The "apparition" (*Erscheinung*) is therefore not a simple, fallacious "appearance" (*Schein*) and must be considered as something real and objective, even though we must distinguish between the object as *Erscheinung* and the object in

itself (B 69). Kant defines *Erscheinung* very precisely in a note added to this passage in the *Critique of Pure Reason*: "What is not to be encountered in the object in itself at all, but is always to be encountered in its relation to the subject and is inseparable from the representation of the object, is appearance [*Erscheinung*]" (ibid. B 70, note).

This object in itself, which is the nonperceptible cause of our representations and which remains entirely unknown to us, is what Kant called the transcendental "object" (B 522), and which he notes in the first edition is simply "=X" (A 109). This distinction between appearance and the thing in itself is nevertheless not simply a reiteration of the classical distinction between appearance and truth but on the contrary the logical consequence of the definition of *Erscheinung* as *apparition*. For, as Kant explains in the preface to the second edition of the *Critique of Pure Reason*:

> Yet the reservation must also be well noted, that even if we cannot *cognize* these same objects as things in themselves, we at least must be able to *think* them as things in themselves. For otherwise there would follow the absurd proposition that there is an appearance [*Erscheinung*] without anything that appears [*ohne etwas . . . was da erscheint*].
>
> (Ibid., B 26)

The concepts of *Ding an sich*, "thing-in-itself," and of *Erscheinung*, "appearance," are thus correlatives and do not refer to two different objects. This is what Kant emphasizes most clearly in the *Opus postumum*:

> What is an object in appearance, however, in contrast to the same object but as *thing in itself? . . .* The [*aspectabile* of Space and Time] is, a priori, as unconditional unity, the formal element of *appearance,* in contrast with the *thing in itself* [*ens per se*] = x, which is not itself a separate [*absonderliches*] object, but is only a particular *relation* (*respectus*) in order to constitute oneself as object."
>
> (Kant, *Opus postumum*, 22:43, p. 179)

As for fallacious illusions (*Schein*), they arise precisely when we take appearances for things in themselves (B 70, note). For illusion does not arise from perception at all but from judgment:

> Still less may we take *appearance* [*Erscheinung*] and *illusion* for one and the same. For truth and illusion are not in the object, insofar as it is intuited, but in the judgment about it insofar as it is thought. Thus it is correctly said that the senses do not err; yet not because they always judge correctly, but because they do not judge at all. Hence truth, as much as error, and thus also illusion as leading to the latter, are to be found only in judgments, i.e., only in the relation [*Verhältnis*] of the object to our understanding.
>
> (Kant, *Critique of Pure Reason*, A 293/B 350)

The transcendental dialectic, as a "logic of illusion," does not deal with either empirical appearances, which come, like optical illusions, from judgments that are led astray by imagination, nor with logical illusions, which come from a failure to attend to the logical rule. Rather, it deals with what Kant calls "transcendental illusion," which is a "natural and unavoidable *illusion* (*Illusion*)," and which derives from the substitution of objective principles for merely subjective ones (A 298).

The *Critique of Pure Reason* thus teaches us not only "that the object should be taken in a *twofold meaning,* namely as appearance [*Erscheinung*] or as thing in itself [*Ding an sich*] (B 27)," but also to distinguish all objects in general into phenomena (*Phänomena*) and noumena (*Noumena*), which Kant attempts to explicate in the last chapter of the "Transcendental Analytic." For if the objects of the senses, the *Erscheinungen*, may be named *Phänomena* insofar as they are subordinated to the categories of the understanding, it remains possible to allow for things, which, as simple objects of the understanding, may be given to nonperceptual intuition: these are what Kant called *Noumena* (A 249). As objects of nonperceptual intuition, *Noumena* have only negative signification (B 342) and do not serve any purpose other than to mark the limits of our perceptual knowledge (B 345). The distinction between *Phänomena* as objects of the senses and *Noumena* as intelligible objects (B 306) is thus superimposed on that between *Erscheinung* and *Ding an Sich.*

II. From *Erscheinung* to *Offenbarung*: Phenomenon, Manifestation, and Revelation in Post-Kantian Idealism

To the extent that what unifies the post-Kantians is the desire to complete what Kant began by attempting to place metaphysics on the safe ground of science, it is not surprising to see them attack what Kantianism retains as unrepresentable for human reason, that is, the "thing-in-itself" and the "noumenon." The stress is thus placed in post-Kantianism on the dimension of appearance, of *Erscheinen*, as a dimension that is internal to the absolute itself, which would be completely ineffective without it. This leads Hegel to claim, in the preface to the *Phenomenology of Spirit*, that

> Appearance (*Erscheinung*) is the arising and passing away that does not itself arise and pass away, but is "in itself" [i.e., subsists intrinsically], and constitutes the actuality and the movement of the life of truth.
>
> (Hegel, *Phenomenology of Spirit*, § 46, 27)

Hegel nonetheless retains the distinction between *Erscheinung* and *Schein*, between appearance and illusion, as he explains in the third chapter of *Phenomenology of Spirit*, which deals precisely with *Erscheinung*, where illusion is defined as "*being* that is directly and in its own self a *non-being*," whereas phenomenon or appearance is "a *totality* of show" ("ein Ganzes des Scheins," ibid., 87), insofar as it refers not only to the moment of disappearance, to non-being, but to the whole movement of coming into being and passing away.

Insofar as an *Erscheinung* no longer reveals anything other than itself, since, as Hegel says, "it is manifest that behind the so-called curtain which is supposed to conceal the inner world, there is nothing to be seen unless *we* go behind it ourselves" (ibid., 103), it may be understood as the dimension itself of manifestation. That is, in fact, the term by which Jean Hyppolite, the first French translator of *Phenomenology of Spirit*, often translated *Erscheinung*, though the translations *apparition* or *apparition phénoménale*, used by another

translator (Jean-Pierre Lefebvre), are perhaps preferable. We may thus construct the following table, in which the various translations make the difficulty of *Erscheinung* clear:

	Erscheinung	*Schein*	*Phänomen*
Kant	*manifestation sensible* (Barni), *image sensible* (TP), appearance (English)	*apparence* *illusion*	*Phénomene* *Phainomenon*
Hegel	*manifestation* (Hyppolite) *apparition* (Lefebvre) *phénomène* (Labarrière-Jarczyk)		

For Hegel, however, the term *Manifestation* itself, as well as *Offenbarung*, "revelation," which he uses as a synonym, only truly acquire their technical senses in the *Science of Logic*.

In effect, *Erscheinung* is again in question in the "Doctrine of Essence," the second book in the first volume of Hegel's *Science of Logic*, where "Die Erscheinung" is the title of the entire second section of the "Doctrine." The general movement of *Erscheinung* is summed up at the end of the introduction to the second book as follows: "At first, essence *shines* (*scheint*) or *shows within itself*, or is reflection; secondly, it *appears (erscheint)*; thirdly, it *manifests* itself (*offenbart sich*)" (*Science of Logic*, vol. 1, bk. 2, p. 391).

These three verbs characterize the stages of the process of externalization of essence, as it unfolds in the first two sections of the logic of essence and as it culminates in the third, which deals with actuality (*Wirklichkeit*). The vocabulary of revelation (*Offenbarung*) and manifestation (*Manifestation*) appears in this last section, in order to express the "identity" at this level between form and content, internal and external, whereas their difference is what is made evident in the language of illusion (*scheinen*) and appearance (*erscheinen*). As Hegel emphasizes: "As this movement of exposition, a movement which carries itself along with it, as a way and manner which is its absolute identity-with-self, the absolute is manifestation not of an inner, nor over against an other, but it *is* only as the absolute manifestation of itself for itself (sich für sich selbst Manifestieren). As such it is *actuality*" (ibid., 536). It appears clearly here that the terms *Manifestation* and *Offenbarung* refer to the absolutely non-Kantian idea of an externalization without anything left over. The German term *offenbar*, which derives etymologically from the idea of openness or obviousness, is in fact most often translated by the adjective "manifest." Finally, we must add that in German *Manifestation* and *Offenbarung* are terms that belong to theological vocabulary.

In effect, *Offenbarung* is most often translated by "revelation," making use of another Latin term, in which we find an idea that is absent from the term *manifestatio*, namely that of an action consisting in removing a veil (*velum*) and thus uncovering something that was previously hidden. As a term belonging to religious vocabulary, *Offenbarung* is a concept that acquires great importance in post-Kantian philosophy. Here we must mention Fichte's first work, *Attempt at a Critique of All Revelation*, published in 1792, in which

we find an analysis of the concept of *Offenbarung* characterized from the formal point of view as a kind of "making known (*Bekanntmachung*)" (Fichte, *Attempt at a Critique*, 51), and a rational deduction of the concept that allows it to be defined as "a special appearance [by God] in the world of sense, determined expressly for this purpose" and by which he "would therefore have to proclaim himself as moral law-giver" (ibid., 65). Fichte's goal in this essay, which made him famous since, though published anonymously, it was taken to be Kant's fourth *Critique*, is in effect to reduce religion to morality, as is made clear by one of the conclusions that this critique of the concept of revelation arrives at: "The universal criterion of the divinity of a religion with respect to its moral content is, therefore, the following: *only that revelation can be from God which establishes a principle of morality that agrees with the principle of practical reason and only such moral maxims as can be derived therefrom*" (ibid., 103).

We should place Schelling's posthumous work, the *Philosophy of Revelation* (*Philosophie der Offenbarung*), in the same philosophical rather than strictly religious perspective. The project of these lectures given in Munich and Berlin between 1827 and 1846 was not to lay out a Christian philosophy but only to understand the specificity of Christianity. Schelling explains this point very clearly at the end of the first book, by contrasting his *Philosophie der Offenbarung* with an *Offenbarungsphilosophie*, a revealed philosophy, and he clarifies that he takes the Revelation "as an object, not as a source or authority" (Schelling, *Philosophie der Offenbarung*, 165). The concept of Revelation in effect undergoes an extension with Schelling beyond what Fichte understood by it. The word does not here indicate only "the act by which the divinity would become the cause or author of representations in a given individual human consciousness," but in fact relates to "the *universal* of Revelation" (ibid., 166–67)—to its content, which, though revealing itself factually in history, relates nevertheless to "a more elevated historical sequence, that is to a sequence which goes beyond history itself and Christianity taken as a particular phenomenon" (ibid., 169). What is thus in question in the *Philosophy of Revelation* is not the historical phenomenon of Christianity but the very object of philosophy for the post-Kantians, namely the effectivity of the absolute. The young Schelling, still very Fichtean, affirms this in one of his very first texts, *On the Self* (*Vom Ich*): the ultimate end of philosophy is "absolute pure being" and its duty is "to unveil and to reveal that which can never be reduced to concepts." His *Philosophy of Revelation*, which, from the fact that it gives itself the task of thinking that which goes beyond reason, constitutes the ultimate goal of speculative idealism, continues with the same goal: "It will understand even more and something other than the Revelation alone; what is more, it will only understand the latter because it has earlier understood something else, namely the actually real God" (ibid., 166).

III. *Erscheinung* and *Phänomen*: The Phenomenological Concept of Phenomena (Husserl and Heidegger)

In 1901 the term "phenomenology" reappears in the title of Husserl's work, *Studies in Phenomenology and the Theory of Knowledge*, which is the second part of the *Logical Investigations*, whose first volume had appeared the year before under the title *Prolegomena to Pure Logic*. At this time, still under the

influence of Brentano and his *Psychology from an Empirical Standpoint*, Husserl gives the term the sense of a "descriptive analysis," which restricts itself to the pure phenomenal given without presupposing the existence of what it describes. This analysis allows it in effect to distinguish what belongs to the object itself from what belongs to the experience or, in Husserlian vocabulary, the immanent from the transcendent. Take the example of color used by Husserl in the fifth Investigation: we often confuse the colored sensation (immanent) with objective coloration (transcendent). However, the object as such is neither perceived nor conscious, any more than the color that is perceived as belonging to it. It is "outside," not "in" consciousness; however, "in" consciousness there is a corresponding colored perceptual experience. This is not a simple difference of perspective according to which the same phenomenon is considered either objectively or subjectively. The confusion in question comes from the ambiguity in the term "phenomenon" (*Erscheinung*):

> We cannot too sharply stress the equivocation (*Äquivokation*) that allows us to use the word "*appearance*" (*Erscheinung*) both of the experience in which the object's appearing consists (*Erscheinen*) (the concrete perceptual experience, in which the object itself seems present to us) and of *the object which appears as such.* The deceptive spell (*Trug*) of this equivocation vanishes as soon as one takes phenomenological accounts as to how little of the object which appears is as such to be found in the experience of its appearing. The appearing of the thing (the experience) is not the thing which appears (Die Dingerscheinung [das Erlebnis] ist nicht das erscheinende Ding) (that seems to stand before us *in propria persona* [*in leibhaftiger Selbstheit*]). As belonging in a conscious connection, the appearing of things is experienced by us, as belonging in the phenomenal world (als der phänomenalen Welt zugehörig erscheinen uns die Dinge), things appear before us. The appearing of the things does not itself appear to us, we live through it (die Erscheinungen selbst erscheinen nicht, sie werden erlebt).

> (Husserl, *Logical Investigations*, Investigation V, 1, §2, 2:83)

In the final appendix to the *Investigations*, Husserl comes back to the "ambiguities" of the term *Erscheinung* that make it possible to refer to both objects and experiences in which they figure as "phenomena." In this regard he distinguishes three different meanings given to the word: the concrete experience of an object, the appearing object itself, and, wrongly, the real components of the experience of the object, for example, sensations, which may prompt us erroneously to see phenomenal objects as simple compounds of perceptual contents. Husserl's concern is the strict distinction between the transcendent and the immanent: he aims to distinguish himself from his teacher, Brentano, who considers the intentional object to be immanent in consciousness, whereas for Husserl, on the contrary, consciousness is not a container, nor is the object a real part of the experience. In a passage added to the second edition of 1913, Husserl emphasizes that of the three meanings attributed to the term *Erscheinung*, the second is the one that constitutes "the original concept of *Erscheinung*," that is, "the concept of what appears or what can appear, of the intuitive as such." Insofar as all experiences, whether they derive from an internal intuition or an external one, may be objectified in reflection, it is possible to call all of these experiences *Phänomene*, which thus become the object of phenomenology defined as the "theory of experiences in general" (*Logical Investigations*).

For what was not clear in 1901 was the status of what Husserl called, in his 1907 lectures on *The Idea of Phenomenology*, the "*pure phenomenon* (*Phänomen*) in the sense of phenomenology," which is to be distinguished from the "*psychological phenomenon*," the object of psychology as a science of nature (ibid., 68). Such a *Phänomen*, insofar as it is an absolute given, is the result of what Husserl here calls, for the first time, "phenomenological reduction," which consists in bracketing—submitting to an *epochê*—the entirety of the transcendent. The pure phenomenon, the object of a pure phenomenology, is thus the "reduced" phenomenon, that is, the appearing object as such, independent of its existence outside of consciousness. Husserl has thus managed to account for the two sides of the phenomenon—subjective and objective:

> The word "phenomenon" (*Phänomen*) is ambiguous in virtue of the essential correlation between *appearance (Erscheinen) and that which appears (Erscheinenden). Phainomenon* in its proper sense means that which appears, and yet it is by preference used for the appearing itself, for the subjective phenomenon (*Phänomen*) (if one may use this expression which is apt to be misunderstood in the vulgar psychological sense).

> (Husserl, *The Idea of Phenomenology*, 11)

The phenomenon in the sense of phenomenology is thus radically distinguished from Kantian *Erscheinung*, which derives from the unknown thing-in-itself or that X that is the transcendental object. In his 1913 work, *Ideas Pertaining to a Pure Phenomenology and to a Phenomenological Philosophy*, Husserl insists on the contrary that it is an "error of principle" to imagine that God "should possess the perception of the thing in itself which is refused to us, finite beings," for that implies the reduction of the perceived thing to an image or a simple sign (ibid., § 43). In effect, according to Husserl it is "absurd" to consider what appears as deriving from anything else that is separate and that would be considered its "hidden cause" (ibid., § 52). For it is of the very essence of the spatial thing to present itself by way of the mediation of *Erscheinung* (which Ricoeur, the French translator of the *Ideas*, always translates by *apparence*) which, precisely because they are not a simple appearance (*blosser Schein*, *pur simulacre* in Ricoeur's translation), do not derive from some "in itself," since everything must *in principle* be able to become a phenomenon. Husserl's break with the Kantian limitation of the phenomenon by the noumenon is here manifest.

Nonetheless, for Husserl as for Kant, *Phänomen* and *Erscheinung* are not clearly distinguished. Heidegger, by contrast, insists on precisely this distinction when he attempts to clarify the sense of the word *phenomenology* on the basis of its two components, *phainomenon* and *logos* [λόγος], first in his lectures of 1925, devoted to the "Prolegomena to the history of the concept of time," then later in the introduction

to his 1927 treatise, *Being and Time* (*Sein und Zeit*). Returning to the primitive meaning of the Greek work *phainomenon*, Heidegger defines *Phänomen* as "*that which shows itself in itself*," "the manifest" (*das Offenbare*), and sees in appearance (*Schein*) a privative modification of *Phänomen* by which a thing shows itself precisely as it is not:

> Only when the meaning of something is such that it makes a pretension of showing itself—that is, of being a phenomenon (*Phänomen*)—*can* it show itself *as* something which it is *not*; only then *can* it "merely look like so-and-so" (*nur so aussehen wie*).

<p align="right">(Heidegger, Being and Time, § 7, 51)</p>

Heidegger insists on the fact that the term *Phänomen*, like *Schein*, has nothing to do with that of *Erscheinung*, which he claims in his lectures from 1925 has caused more ravages and confusion than any other (*Prolegomena zur Geschichte des Zeitbegriffs*, 112). *Erscheinen* has, in effect, as Kant himself had emphasized, the sense of an indication by one thing of another, which latter precisely does not appear. *Erscheinen* (to appear) is thus paradoxically a "not-showing-itself," which implies that "phenomena (*Phänomene)* are *never* appearances (*Erscheinungen*)," and that one therefore cannot explain the first term by means of the second, since on the contrary *Erscheinung*, insofar as it is an indication of something that is not shown by means of something that is shown, presupposes the notion of *Phänomen* (*Sein und Zeit*, 52).

It is thus of the utmost importance for Heidegger not to place *Schein* and *Erscheinung* on the same level: the former, as a privative modification of *Phänomen*, includes the dimension of the manifest, while the latter, like all indications, representations, symptoms, and symbols, already presupposes in itself the dimension of the self-display of something, that is, the *Phänomen*: "In spite of the fact that 'appearing' (*Erscheinen*) is never a showing-itself (*Sichzeigen*) in the sense of 'phenomenon' (*Phänomen*), appearing is possible only *by reason of a showing-itself* of something" (*Sein und Zeit*, 53).

Sometimes, however, without regard for the difference in meaning of the two terms, *Phänomen* is defined as the *Erscheinung* of something that does not reveal itself, which leads on the one hand to an opposition between the realm of appearance and that of being in itself, and on the other, insofar as we tend to give ontological priority to the "thing in itself," to devalue *Erscheinung* as "*blosse Erscheinung*"—*mere* appearance—which is itself identified with *Schein*, illusion. As Heidegger emphasizes in his Lectures of 1925, "Confusion is then carried to extremes. But traditional epistemology and metaphysics live off this confusion" (*Prolegomena*, 114; *History of the Concept of Time*, 83).

Kant himself fell into this confusion, since by defining *Erscheinung* as the object of sense, he understands the latter both as *Phänomen*, that is, what shows itself by itself and is opposed to *Schein*, "illusion," and as *Erscheinung*—the appearance of what never shows itself, the thing in itself. So, in the end, what is a phenomenon in the sense of phenomenology? For Kant himself, it is not what he calls *Erscheinung*, "apparition," that is, the object of perceptual intuition, but what shows itself in the appearances themselves in a nonthematic way, namely time and space as forms of intuition that must be able to become phenomena, that is, to show themselves by themselves in philosophical analysis. For the phenomenon of phenomenology is not "given." It must have, on the contrary, an "explicit exhibition" in order to be perceived. A phenomenon properly speaking is thus what is "hidden" in what is shown at first glance and most often, but nonetheless constitutes the essence and basis of what is manifested, namely the *existence* of being. Between phenomenon and appearance there is thus the same difference as between existence and being. Phenomenology and ontology are thenceforth one: "Only as phenomenology, is ontology possible" (*Sein und Zeit*, 60). Heidegger has thus managed to show, like Husserl, that "behind the phenomena of phenomenology, there is essentially nothing else" and that nonetheless what becomes a phenomenon may well be hidden. For "just because the phenomena are proximally and for the most part *not* given, there is need for phenomenology" (ibid.).

ERZÄHLEN / BESCHREIBEN (GERMAN)

FRENCH   *raconter/décrire*

➤ *RÉCIT,* and ART, BILD, DESCRIPTION, DICHTUNG, EREIGNIS, *FACT, FICTION,* HISTORY, *IMAGE*, LOGOS, MIMÊSIS, ROMANTIC, STRUCTURE, TRUTH

The very different styles of literary studies and the textbooks on which they rely in France and in Germany provide interesting perspectives on the notion of a story and the way in which it is determined by different linguistic and national traditions. The language of the story (and its cognate notions: event, history, description) is marked in German both by the weight of the tradition and by the character of terminological adjustments coming in large part from French literary theory. On the basis of a few key terms—*Erzählung, Bericht, Geschehen, Geschichte, Begebenheit, Beschreibung, Schilderung*—it is possible to see how the untranslatable coming from the tradition is combined with the difficulties entailed by the recent acclimations of vocabulary in this domain.

I. The Collapse of the Romantic Terminology

By including the terms *narrativ/Narrativität* in the sixth volume, Joachim Ritter's *Historisches Wörterbuch der Philosophie* celebrated the entry into philosophical language of terms that until the late 1960s were welcome neither in German-language philosophy nor in the language of poetics and literary critique. From the eighteenth century through the 1950s, not only was there no real textual analysis that required its own vocabulary (even today, terminological questions are neglected in the reedited versions of Gero von Wilpert and Wolfgang Kayser's reference works), but in addition the terminology of *Literaturwissenschaft* ("the science of literature," where French would say "*théorie littéraire* [literary theory]") was still entirely subordinate to the romantic perspective of a literary absolute. The language in which the analysis of texts and questions of poetic narrative were expressed in German, up through the great canonical texts that maintained their influence through the postwar period (Emil Staiger, Günther Müller, Karl Vietör), thus remained that of Goethe, Hegel, or the Schlegel brothers. A literary work was a *literarisches Kunstwerk* (work of literary *art*), literature was a *Dichtkunst* (see DICHTUNG), and the concepts upon which the analysis of narrative texts was based were those of *Gebilde, Gestalt, Gefüge, Fügung, Gliederung, Aufbau, Dichtwerk*, all untranslatables, composite words that are equivalent—but only equivalent—to the ideas of structure, composition, or organization, for the first six. As for the term *Dichtwerk*, made up of *Werk* (work), and *Dicht* for *Dichtung*, we might be able to translate it by the term "work of literary art." There is not a single *Fremdwort* in the 590 pages of Günther Müller's *Morphologische Poetik* (1968), which collects studies from the years 1923 to 1954. Müller himself, in fact, in the article "Über das Zeitgerüst des Erzählens," published in 1950 (*Gerüst* meaning "scaffolding," so that *Zeit gerüst* might be translated as "temporal structure"), writes that

It is a well-known fact that the study of literature in Germany (*die deutsche Literaturwissenschaft*), in conformity with its Herderian, Schlegelian, and Hegelian origin, is essentially based on the perspective of a historical consideration of facts and that it barely has a tradition

of literary critique behind it, or even a vocabulary appropriate to what would be called *art* in France and *craft* in English. The result is a knowledge and consciousness that are not secure in the specificity of literary works (*literarische Kunstwerke*) and a sort of inhibition in speaking, in discussions of literature (*Dichtung*), about that for which we only have the deceptive term "technique."

(Müller, "Zeitgerüst," 389–90)

Everything changes in the 1950s. Important works such as Lämmert's *Bauformen des Erzählens*, Stanzel's *Typische Formen des Romans*, or Käte Hamburger's *Die Logik der Dichtung* mark the transition to a rigorous analysis of fiction with its own language. Their terminology is both new, suited to their breakthrough in terms of analysis (*Erzählakt* [act of narration], *Erzählstimme* [narrative voice], *Ich-Origo*: new words for new problems), and respectful of the classical and romantic tradition. However, if we compare the language of poetics and the analysis of narratives as generally practiced in German-language *Literaturwissenschaft* through the end of the 1960s with the language in which those same questions are currently treated, we see that the old romantic vocabulary was replaced by a language introduced in the 1970s by importing semiotic and structuralist research, especially from France (though also from English-speaking and Soviet countries, as Germany had to catch up in the space of a few years after lagging behind in the theory of texts, from Russian formalism to French structuralism). Thus, *Struktur* replaced *Aufbauform*, *Form* replaced *Gebilde*, *Figur* replaced *Gestalt*, *Konfiguration* replaced *Gefüge*, *Artikulation* replaced *Verknüpfung*, and so on. Nothing makes the naturalization of this radical change clearer than the language in which Rainer Rochlitz translated the three volumes of Paul Ricoeur's *Temps et Récit*: *Kompositionsregeln, Konfiguration, Refiguration, Konfigurationsvorgang, Rekonstruktion, relogifizieren, entchronologisieren, Modalitäten der Fabelkomposition*, etc. (*règles de composition, configuration, refiguration, . . . reconstruction, relogification, déchronologization, modalités de la mise en intrigue*). All of that would have been unthinkable thirty years earlier.

In some cases it would not have been possible to import the concept except through familiarization with the *Fremdwort*, without which the box for its idea would have remained empty. This is the case, for example, with *Semiotik*, *Aktant*, and *Funktion*, three concepts that did not exist under the old vocabulary: the first two because they could not have been transformed without compromising the rigor of the Greimasian theory (just as for *Diegese*, a calque of Genette's *diégèse*), the third because, before the terminological upheaval of the 1970s, the idea of function had no place in the vocabulary, which had remained resistant to a logico-semantic treatment of the art of language. Nevertheless, it would be false to speak of a radical change in the environment. In general, rather, we have a cohabitation of two vocabularies: German, to which analytic terminology is now turning for revitalization after having purged the language of its "old-language" obstacles to rigorous analysis, and words of French or English origin (*mise en abyme*, "stream of consciousness," *intradiegetisch, implotment*), when it seems that clarity is gained by using the foreign word.

II. *Erzählung / Bericht*: *Récit* and Its Untranslatables

How can we translate the French *récit*: *Bericht, Geschichte, Erzählung*? Germany never had anything like Gérard Genette's attempt in this domain, which led to the trio of *narration*, *diégèse*, and *histoire*, and the language must either make use of its own resources or fall back entirely on Genette's analysis and look for correlates term by term. Before this terminological cleaning, it was necessary to proceed in a different manner. Thus, for the *récit* as a process, we could use the term *das Erzählen*, literally "the telling" (that is how Käte Hamburger, for example, refers to the narrative process), as opposed to *die Erzählung*, the product of the narrative process. If we wish to avoid all ambiguity, we may appeal to a second distinction, as Käte Hamburger also does, between *das Erzählte* (what is narrated) and *das Erzählende* (the narration), so as to avoid any collision between the intratextual product of the narrative process and the product of the narration as a formal category of the narrative genre (where *Erzählung* corresponds to what we would call "stories": Kafka's *Erzählungen* are Kafka's "stories." This is the only dimension taken into account by Wilpert, for example).

▪ See Box 1.

Though there is no fundamental ambiguity in the distinction between *Erzählen/Erzählung*—as long as we are as clear as Käte Hamburger was in the usage of the traditional vocabulary—there is nevertheless much that is untranslatable about the relations between *Erzählung* and *Bericht*.

The Latin equivalents that Grimms' dictionary gives for the term *Bericht* are *relatio, expositio, nuntiatio* [*Kunde, Nachricht*, and *Unterricht*], which cover a wide field, both rhetorical and narrative, and do not distinguish between an act of discourse, an artifact of discourse, and the transmission of a piece of information or knowledge. *Bericht*'s origin is the same as that of *richtig* (right), and in the sixteenth century *berichten* meant either "to correct mistaken information" (today *berichtigen* is used) or, in its pastoral meaning, "to administer a sacrament." Luther explicitly gives the Greek and Latin equivalents of *synaxis* and *communio* (*synaxis griechisch, cummunio lateinisch, und Berichten auf Deutsch*, cited by Grimms, "*Bericht*"). In both cases, whether it is a matter of transmitting information or of administering a sacrament, the issue is one of truth: *berichtet werden / sein* (today

unterrichtet werden / sein would be used) is to be in possession of the true version of things and of just wisdom (today, *einer Sache kundig sein*). A *Bericht* is thus a true message (*Kunde*). It is only later that a schism arises in the language between the transmission of truth (or of the sacrament of the Truth) and the narrative and that *Bericht* evolves toward the protocol-based semantics that it essentially has today (*ein Bericht*: a report, as in Kafka, *Bericht an eine Akademie* [Report addressed to an academy]). However, even though this shift has been attested by Adelung and Heyse (Heyse defines *Bericht* as "pflichtgemäße, meist schriftliche Meldung oder Darstellung eines Herganges oder Sachbestandes [official communication, usually written, or representation of an event or state of affairs]"), the *Bericht* of literary theory could not affirm it and take on its dominant contemporary meaning of an objective report as long as the vocabulary for describing narratives did not have a word to refer to the articulation of the narrative language. This is still the case, for example, with Emil Staiger: in his *Grundbegriffe der Poetik* (Basic concepts of poetics), which was an authority for a long time and continues to be one in German studies, he placed the words *Erzähler* and *Bericht* as a pair to express the relation of narrator/story, and this with regard to Homer:

> Er redet die Musen an. Er unterbricht nicht selten einen Bericht, um eine Bermerkung, eine Bitte an die Himmlischen einzuschalten.

> (He [Homer] speaks to the Muses. It is not rare for him to interrupt a *Bericht*, in order to insert a remark or prayer addressed to the gods.)

> (Staiger, *Grundbegriffe der Poetik*)

How should we understand *Bericht* here? The term opposes the intrusion of the narrator to what we can only translate as "narrative," but a narrative where the narration and what is narrated form a single continuum: such is the classical use of the term in German literary theory.

We ought to be astonished to find the use of the same term in Käte Hamburger's *Logik der Dichtung*, that is, in the fundamental work that creates a break with the very tradition represented by Staiger, who had only contempt for any technical treatment of the untouchable *Dichtung*. Yet, in a passage where she demonstrates that in certain cases

---

1

Narration, "diegesis," "story"

If diegesis is the *recounted world* as it appears in a fiction, narration is the *universe in which one recounts*, that is, the set of acts and narrative procedures that give rise to and govern this fictive universe. This distinction, analytic in nature, requires that we do not confuse the different instances and levels of a narrative fiction and that we maintain the distinction between these two universes. We must, for example,

distinguish in principle between a character and a narrator, or a narrator included in a story and a narrative voice at the source of a "recounted world" into which other elements of fiction (words, acts, and events) may be inserted. As for the *story* as a sequence of actions and events, it does not necessarily correspond to the *diegesis*, or "recounted world," which implies other fictive elements like descriptions,

for example. Gérard Genette, who has developed these definitions (borrowing from Souriau the use of the term "diegesis" in this sense) and has shown their application through the example of an analysis of *À la recherche du temps perdu* by Marcel Proust (*Figures* III, Seuil), returned to these distinctions in an attempt to clear up certain misunderstandings in his *Nouveau discours du récit*, 5–10.

it becomes impossible to find a criterion of distinction between the narration and what is narrated because the narrative voices become one, Hamburger does say that in such cases "Bericht und Rede fließt uns zusammen in der gestalteten Welt der betreffenden Dichtung [The *Bericht* and the discourse only reach us as a single flux, in the world created in the *Dichtung*]." The *Bericht* here is not a protocol, or the communication of a truth, but the continuum of what is narrated, where the narrative structure dissolves in the flow of the fiction. For Staiger, there was *Bericht* because there was still no conceptual distinction between "narration" and *diégèse* (the fictional world was the work of Homeric diction). For Hamburger, by contrast, insofar as it yields the disappearance of the procedure in the fictional image, the narrative as *Bericht* is the undifferentiated *product* of the word of differentiation. *Bericht* is the mixture of the narrative sequence, the *naturalization* of the narration in the language of fiction, as Barthes would have said. In a sense closer to rhetoric than to narratology, *Bericht* may mean narration without ornament (*sachlichnüchtern*), as opposed to description (*Beschreibung*) or the presence of reflections and commentary (*Erörterungen*) in the narrative. This, for example, is the definition given by Wilpert. However, the question of *Bericht* comes for him from *Stilkunst* (that is, from the stylistics of literary forms). If narrative fiction is not simply an art of discourse on paper but a language in itself, *Bericht* is therefore both what seems not to be a part of the narrative and the mark of the power of narrative language (of its "magic," as Borges would say).

Thus, *Bericht* turns its back on contemporary usage, just as *Erzählen* moves beyond its origins, since *erzellen*, in Middle High German, meant "to count" (the number of facts). The Grimms give two groups of synonyms for *erzählen*: *narrare, enarrare, recitare*, on one hand, *enumerare, recensere, aufzählen* (to count), *vortragen* (to report, to present) on the other. Between *berichten* and *erzählen* we therefore have a chiasmus: whereas *berichten* means initially "to transmit truth" and then "to transpose the given in the continuum of the narrative artifact," *erzählen* is "to make actions and events follow one another in the proper order of the narrative presentation, to order the sequence." From one to the other, the issue is that of an antagonism between Aristotelian poetics, where the account gives order, and a Platonic poetics, where the given is re-given—between recitation and citation.

III. The Narrative of the Event:
Geschichte / Geschehen / Begebenheit

Suppose we follow Genette and give the name of *histoire* (story) to the sequence of actions and events organized by a certain narrative mode. German has an equivalent term—*Geschichte*—and Genette's German translators did indeed translate *histoire* by *Geschichte* and *diégèse* by *Diegese*. It remains the case that, if we define "story" as a sequence of recounted events, the German words at the disposal of translators are problematic. We may translate "recounted event" by *Ereignis*, but we could also use *Geschehen* (or *Geschehnis*). The two terms come from the same root as *Geschichte* (Old High German *gisciht*, Middle High German *gesciht, sciht*, or *schiht*, coming from the Old High German *scehan*, from which *Geschehen* comes as well). When the Grimms define *Geschichte* (narrative? story?) as "der zusammenhängende bericht über diese

begebenheiten, das geschichtswerk," we might translate it as "the narrative cohesion of events, the story as a work." However, there is not a single word here that does not pose problems: neither *bericht, begebenheit*, nor *geschichtswerk*, nor even the sense of *zusammenhängend*. Of course, Aristotle's *Poetics* is indeed about the "*sustasis tôn pragmatôn*" [σύστασις τῶν πραγμάτων] of the "presentation of facts," but *Begebenheit* does not translate *pragmata*, and the distinction we should respect between *Bericht* and *zusammenhängend* (the narrative continuum that a narrative holds together as a whole) is not found in Greek. What, then, is the relation between *Geschichte* and *Geschehen*, *Geschehen* and *Ereignis*, *Ereignis* and *Begebenheit*?

A. *Begebenheit, casus narrativus*

Let us consult the Grimms again, for *Begebenheit.* They give *eventus, vorfall, ereignis, geschichte* as synonyms. *Begebenheit* is "what happens," derived from the verb *sich (hin) begeben*, "to go somewhere." In the eighteenth century many novels were titled as *Begebenheiten*—the equivalent of the French *histoire* (*Histoire du chevalier des Grieux et de Manon Lescaut*). Goethe greatly contributed to establishing its meaning. First, he used it, contrary to the norm, in the singular: *die Begebenheit* is thus "what happens to us," the force of accident—"Stürzen wir uns in das Rauschen der Zeit, ins Rollen der Begebenheit [Let us throw ourselves into the roar of Time, in what happens to us like the roll of a wave which carries us]" (*Faust I,* around 1775). Second, he distinguishes it from *Tat* (action), so that *Begebenheiten* takes the meaning of *gesta, Taten* of *pragmata*: "Im Roman sollen vorzüglich Gesinnungen und Begebenheiten vorgestellt werden, im Drama Charaktere und Taten [In the novel opinions and *Begebenheiten* are what should mainly be presented, whereas in drama, characters and *Taten*]" (*Wilhelm Meisters Lehrjahre*, bk. 5, chap. 7, Weimar ed., 22:178).

In this sense, *Begebenheit* would be the *casus narrativus*, an important occurrence of life or history worthy of being taken into account by the narrative, since it contains both chance and meaning at the same time. It would be a "prenarrativity" in Ricoeur's sense. According to Goethe in *Literarischer Sanculotism* (Weimar ed. 40:148), a *Nationalautor*, a classical national author, is someone who "in der Geschichte seiner Nation große Begebenheiten und ihre Folgen in einer glucklichen und bedeutenden Einheit vorfindet [finds in the history of his nation great *Begebenheiten* and their consequences (gathered) into a significant unity]." Deliberately mixing the "pre-narrative" given and the narrative organization, Goethe says, with regard to a subject that he seeks to exploit in narrative and whose content is suicide:

> Es wollte sich nichts gestalten; es fehlte eine Begebenheit, eine Fabel, in der sie sich verkörpern konnten.

> (Nothing wanted to take form (*sich gestalten*); there was lacking a *Begebenheit*, a Fable, in which they [i.e., his thoughts on suicide] could have been embodied.)

> (Goethe, *Dichtung und Wahrheit*, Weimar ed., 28:200)

Though the structure of the narrative is the *body*, its object here is not an idea but a "Fable." "Fable" (*Fabel*), however, is the word that, from the Middle Ages to Brecht, translates the Aristotelian *muthos* [μῦθος], the *sustasis*—not just *Ereignis,* but also *Begebenheit*—a prearticulated given.

It is on the basis of this conception that Goethe was able to give one of the most pertinent formulations of the genre of the story (*nouvelle*): "Was ist eine Novelle anders als eine sich ereignende unerhörte Begebenheit?": "What is a story other than an incredible <sensational and catastrophic value of the content of the (bad) news> *Begebenheit* <important narrative given> that takes place (*sich ereignend*)?" The event (*Ereignis*), the *casus*, is here explicitly distinguished from the *casus narrativus*. As for the rest, Goethe adds, call it what you wish: *Erzählung* or otherwise.

B. The (re)appearance of a collective-singular: *das Geschehen*

If *Begebenheit* is a prearticulated given, what is the situation with regard to the relations between *Geschichte* (history) and *Geschehen*—or *Geschehnis* (recounted event)? In everyday language *Geschehen* may be a synonym of *Ereignis*, and it is often used as such by the traditional language of *Literaturwissenschaft*. Gero von Wilpert moves quite simply from *Geschichte* to *Erzählung*, which he defines as "Darstellung des Verlaufs von wirklichen oder gedachten Geschehnissen [representation of the unfolding of true or imagined events]." Here again, it is only by importing the terminology of theories of narrativity that the term finds a new precision and becomes reserved, not for the *how*, but for the *what* of narration. In the most current state of play (M. Martinez and M. Scheffel, *Einführung in die Erzähltheorie*), *Geschehen* and *Geschichte* are the objects of a strict differentiation: a series of events (*Ereignisse*) when related for a *Geschehen*—corresponding to the English "story" or *histoire* in Genette's sense. The term *Geschichte* is reserved, however, to indicate that we are no longer considering the whole of a sequence of actions and events but their unfolding insofar as it reveals a logic of causality and responds to a motivation in the sense of the Russian formalists (thus to a presentation of this plausible series according to the causality inferred by the narration). In this case *Geschichte* corresponds to the English "plot." As for *Geschehen*, it would be, according to this definition, the Whole of the narrative at the level of the *story*—*histoire* in Genette's sense, that is, insofar as it is a sequence of recounted events. However, if we no longer envisage the difference between the unfolding that is recounted in the continuum of history and the unfolding that is motivated by the structures involved in placing it in a narrative, and we consider the fact that this Whole is also the continuum of the fictional, then we may say that *Geschehen* is also the Whole of what is recounted. This is how Käte Hamburger saw it: "Das Erzählen ist das Geschehen, das Geschehen ist das Erzählen [the telling is the story, the story is the telling]."

It is interesting to note that this promotion of *Geschehen* from the status of event (*Ereignis*) to that of the Whole of a series of events or of the Whole of the telling only repeats, some 200 years later, the move from *Geschichten* (narratives) to the collective-singular *die Geschichte*, whose appearance—which does not take place without resistance (we still find *die Geschichten* [here still in the plural] in Herder for stories in the sense of *res gestae*)—accompanied the emergence of a philosophy of history starting in the second half of the eighteenth century (cf. R. Koselleck; see HISTORY, II).

IV. *Beschreibung / Schilderung*: From Images to Writing

The vocabulary of description also has its untranslatables, since the idea of description is distributed over two words, *Beschreibung* and *Schilderung*. Far from being simple equivalents, the words come from two different worlds: that of writing and that of painting. Gero von Wilpert's definition of *Beschreibung* in his *Sachwörterbuch der Literatur* explains them in terms of one another, and both of them through a third, *ausmalen* (to paint). BESCHREIBUNG: "Schilderung und ausmalende Wiedergabe eines Sachverhalts, Gegenstandes (Landschaft, Haus, Raum) oder einer Person durch sprachliche Mittel."

Beschreibung is the *Schilderung*, i.e., the "reproduction" (*ausmalend*, literally "what paints") of a state of affairs, an object (landscape, house, room), or a person by means of language.

A. Painting and writing
