Sometimes the disparity with which human love is confronted when it has as its object not a peer or an inferior but God himself is considered impossible to render using oppositional terms taken from the common vocabulary. When the Swedish Lutheran theologian Anders Nygren found himself in this situation, he compensated for this difficulty by appealing to the two Greek terms *erôs* [ἔρως] and *agapê* [ἀγάπη]. But he considered them as far more than simple polarities of love; between them he saw an opposition that broadened "to the point of becoming a philosophical antithesis" that presented itself as an irreconcilable conflict between "two fundamental motives" (*Agape and Eros*). Nygren indicates what is at stake through an epigraph borrowed from the Hellenist Ulrich von Wilamowitz-Moellendorff: "Although the German language is so poor that it has to use the single term 'love' [*Liebe*] in both cases, the two ideas [*erôs* and *agapê*] nonetheless have nothing in common." Believing that he saw in the Greek conception of *erôs* both a synthesis of nonpossession and possession, on the one hand, and on the other hand a demonic intermediary that allowed the subject to move from the crude forms of desire to truth and immortality, Nygren thought Christianity had radically overthrown this monist conception of love by promoting, in opposition to the Platonic *erôs*, the *agapê* revealed by the New Testament writings of Paul and John.

- See Box 5.

The special problem posed for theologians and mystics by the human soul's love for God also led them to invent specific words in their own vernacular languages, usually by derivation from a common word in these vernaculars or from a Latin word. That is what happened, precisely with regard to "love," in the work of the creator of philosophical and literary Catalan, Ramon Llull (ca. 1235–1315).

- See Box 6.

3. Lexical investments and reinvestments in Christian Latin

In fact, to translate the Hebrew *'āhёv*, which is applied to the love of God, Christian authors initially adopted relatively new terms, either Greek ones like *agapê* (whereas *agapan* [ἀγαπᾶν] is older) rather than *erôs* or *philia*, or Latin ones such as *caritas* rather than *amor*. In Latin, they even invented *dilectio*, built on the older verb *diligere*.

a. *Caritas* in the church fathers

The notion of *caritas* was established by the first Christian authors writing in Latin when they had to translate the Bible into that language. At that time they were dependent on Greek—that of the books of the New Testament and the translation of the Bible made by Alexandrian Jews (the Septuagint). As we have seen, the translators of the Septuagint, who had had three verbs to render the Hebrew verb *'āhёv*: *eran* [ἀρᾶν] (*erôs*), *philein* [φιλεῖν] (*philia*), and *agapan* (*agapê*), showed a marked preference for the last, probably because, having classically a much less determinate meaning, it lent itself to a semantic innovation corresponding to the stronger and deeper meaning of the Hebrew *'āhёv*. As G. Kittel and Friedrich's RT: *Theologisches Wörterbuch* notes in the article "*agapê*," "the old word *'āhёv* imbued the pale Greek word with its rich and yet precise meaning. . . . The whole group of words in the family of *agapan* received a new meaning through the translation of the Old Testament."

4

The Germanic *Minne*

Although the erotic ideal advocated by the Provençal troubadours and the *trouvères* in northern France has only recently been given the name of "courtly love" (which amounts to defining such an original experience by the place where it developed: the seigneurial or royal courts—*corteis*—of the period), in the Middle Ages the German language already had a specific term, *die Minne*, to designate this form of love and more particularly what characterizes it in its essence. Moreover, down to Wagner's *Tristan und Isolde*, we find it personified, in the same way as *fin'amor* in courtly literature, as the goddess of love (*Liebesgöttin*), as Lady Minne (*Frau Minne*).

According to the usual etymology (Lat. *memini*, "remember," and *mens*, "mind"), the noun *Minne* (like the verb *minnen* and the adjectives *minnig* and *minniglich*) emphasizes the presence of the beloved in the consciousness of the lover and the fact that this presence continues over time in the form of phantasm and memory. In short, *Minne* is love insofar as it occupies the lover's mind and leads him to resort to poetry, for instance, to testify to his psychic experience. The latter corresponds to the experience medieval theologians described, in order to stigmatize it, as *delectatio morosa*, that is, the habit of dwelling with pleasure on thoughts of the absent beloved. It is illustrated still more clearly by the passion that the courtly poet cultivates for the "lady of his thoughts," especially in the extreme situation of *amour de loin*. Thus, around this courtly adventure of *fin'amor*, the Germanic lexicon acquired the following components: *der Minnesang* (the poetry of the troubadours), *das Minnelied* (love song), *der Minnedichter* and *der Minnesänger* (troubadour), *der Minnedienst* (service to the lady), *der Minnetrank* (love philter). But the term *Minne* and the characteristics of Provençal "pure love" were also used by the thirteenth-century Flemish members of a lay sisterhood (the Béguines) in developing a theory of the love of God. For Hadewijch of Antwerp (d. ca. 1260), the love-experience designated by the expression *Minnemystik* included two phases. The first takes the form of an impetuous, passionate desire (*aestus amoris*; in Dutch, *orewoet*); this is the element of joy (*ghebruken*) in total union. The second is marked by an experience of ravishment and privation (*ghebreken*), of suffering and distress. However, this is more of an alternation; indeed, a coexistence of apparent contradictions corresponding to the antithetical feelings of joy and desolation in which courtly poetry saw the expression of the essential transcendence of love.

5

The "true" Christian notion of love according to Nygren

In his work *Agape and Eros*, Nygren maintains that even when it takes the form of "celestial love," the primary characteristic of Orphic or Platonic *erôs* is "aspiration, lust, desire" and remains ineluctably faithful to its basic nature as man's appetite for an object to be possessed, whereas the *agapê* celebrated in the New Testament is supposed to be essentially a gift of oneself, a totally disinterested descent, and for that reason a sacrifice of which God alone is capable. Moreover, Nygren seeks to identify the "transformations" to which, since the end of the Middle Ages, theology is supposed to have subjected the "true" Christian notion of love, which is *agapê*. It is supposed to have adulterated the latter by developing the theory of *caritas ordinata*, or "the order of love," that is, the order of a love that has the property of necessarily conforming to the value of the object itself. In Nygren's view, such a theory represents a "fatal synthesis" from which Luther was to seek to free theology and that amounts to including in *agapê* one of the essential elements of *erôs*, namely an interested desire motivated by the qualities that can be discerned in the love object.

The Scholastic adage according to which a thing must be loved in proportion to its value (*magis diligendum quia magis bonum*) would thus take us back to the kind of love that is traditionally described as mercenary and that is in reality radically foreign to the New Testament conception of love.

Nygren's work, which had a wide impact, has a weak philological basis. Interpreters pointed out, in particular, that unlike the Hebrew language, which had only the verb *'āhëv* [אָהֵב] and the noun *'ahav āh* [אַהֲבָה] to designate all forms of love (sacred or profane, noble or impure, selfish or disinterested, etc.), the Greek of the Septuagint had several words to render the diversity of these forms, such as *agapê*, *erôs*, and *philia*. Even when the Hebrew text refers to sensual love, the Septuagint prefers *erôs*—a word that is, moreover, extremely rare in the Septuagint as a whole—the term *agapê* (which the Latin Vulgate renders as *caritas*). It is the word *agapê* that we find in the most erotic passages of the epithalamium of the Song of Songs. Thus lines 7–10 in chapter 7, which express a passionate desire for the physical possession of the beloved, begin with these words: "How fair and pleasant you are, O love [*agapê*], delectable maiden!"

But if the term *agapê* has been thus used by the Greek Jews of Alexandria to designate forms of love other than spiritual love, and inversely, Christian authors have traditionally interpreted this biblical poem attributed to Solomon as an allegory of mystical love, that is no doubt because beneath the instability of the vocabulary, we can discern a certain semantic malleability and, more precisely, a certain legitimacy in passing from one kind of affect to another. Thus Nygren's "systematic" dichotomy would be replaced, as Paul Ricoeur puts it (in *Liebe und Gerechtigkeit*), by a "process of metaphorization" by virtue of which, for example, erotic love, *erôs*, has the power to signify and express *agapê*, thus rendering the real analogy that connects distinct affects.

Amistat and *amistança*

Catalan words ending in *-ança* or *-ància* designate the action of the verb and are derived from it. Thus *contemplança* means the action of contemplating (*contemplar*). In the case of *amistança*, the verb *amistansar* is not attested before 1373. It has two meanings: "reconcile," "make friends"; and "live in concubinage with." Thus it is because a third term is required alongside *amor* and *amistat*, and not by derivation, that Ramon Llull created the word *amistança*.

This term is never translated as "action of reconciling." Whereas in common usage *amistat* acquires the sense of amorous friendship outside marriage ("women's *amistat* is deceiving," Llull, *Blanquerna*, chap. 27), *amistança* is reserved for loyal, pure, disinterested friendship between two persons (Ausiàs March, poem 92: "But the other love, *amistança pura*, / After death its great strength endures . . ."). *Amistança* (whose character is emphasized by the use of *pura*) is felt by the poet for a dead woman. For the poet, who never mentions God's love or love for God, *amistança pura* constitutes the major elevated form of love. *Amistança* subsequently underwent the same development in meaning as did *amistat*: in the seventeenth century, the word could mean "concubinage."

For Llull, *amor* is reserved for God, along with the verb *enamorarse*, which frequently reinforces the verb *amar*. In his *Llibre d'amic et amat* (*The Book of the Lover and the Beloved*), he describes the *amor* of the *amic*; it is never a question of carnal *amistat*: "Blanquerna [the fictional author of the *Llibre*] wanted to make them [his hermit-readers] to love [*enamorar*] God." Similarly: "The *amic* says to the *amat*: You who fill the sun with spendor, fill my heart with love." In this context, *amistat* would have an unacceptable sexual connotation and *amistança* would be too human. The doublet *amic/amat* takes into account the intentionality of *amor* and the duality Ramon Llull considered constitutive of the love between man and God.

In their turn, Christian authors writing in Latin had to wonder how to render the word *agapê* as used in the Septuagint and in the New Testament. At that time, Latin had two verbs meaning "to love": *amare* (with the broad sense of amorous passion as well as that of disinterested affection) and *diligere*, and also two nouns, *amor* and *caritas*. *Caritas*, which we frequently find in Cicero and which later became an important term in the Christian Scriptures and in Christian theology, is

derived from *carus*, which had the twofold meaning of what one "cherishes" and what is "of great price"—whence the proximity of the terms *charité* and *cherté* in French. *Caritas* adds to the meaning of *amor* that of esteem and respect, as we see, for example, in Seneca and especially in Cicero. For the latter, *amor* designates the affection two spouses or two brothers have for each other or that of parents for their children, but the use of *caritas* was considered preferable when speaking of the love one has for the gods, for the fatherland, for one's parents, for superior men, or for humanity, notably in the expression *caritas generis humani* (*De finibus*, 5.23, 65).

But the first Latin Christian authors adopted none of the words of this classical vocabulary to render the word *agapê* in the Septuagint and the New Testament. Thus in the first half of the third century, Tertullian and Cyprian of Carthage limited themselves to transcribing the word as such, as was also done with other Hellenisms, like *baptizein* [βαπτίζειν] and *charisma* [χάρισμα], that were permanently established. Nonetheless, in their commentaries on the Scriptures and in their theological writings, they tended to render the verb *agapan* by *diligere* and the substantive *agapê* by either *dilectio* (especially Tertullian), a word that had just appeared in the language of the Church, or by *caritas* (especially Cyprian). It was only later on, and mainly with Saint Jerome at the end of the fourth century, that the latter two terms entered into the translation of the Bible itself, but with a preference for *caritas*, which occurs 114 times as opposed to 24 times for *dilectio*. Thus, as Hélène Pétré points out, "the term which in everyday language served to designate the affections, and whose use Cicero had broadened in the expression *caritas generis humani*, expresses for Christians the highest virtue that contains both the love of God and love for humans." It is notably by *caritas* that the Vulgate renders *agapê* in the famous Pauline hymn in 1 Corinthians (13:1–8): "If I speak in the tongues of men and of angels, but have not *caritas* [King James: ". . . have not *love*"], I am a noisy gong or a clanging cymbal. . . . If I give away all I have, and if I deliver my body to be burned, but have not *caritas* I gain nothing. . . . *Caritas* never ends." Nonetheless, Augustine, for instance, sometimes declares that the three terms *amor*, *dilectio*, and *caritas* are more or less equivalent.

Among the church fathers, *caritas* designates the love man has for God and for his neighbor *propter Deum*, in conformity with the evangelical principle, as well as the love that is in God himself (*Caritas summa* or *Caritas in Deo*) and that is expressed particularly in the mutual relations among the three persons of God. In the Middle Ages, Peter Lombard (ca. 1100–60) maintained in his *Sentences* that *caritas* is a love so sublime that it can be conceived only as identical with the presence of God himself (and more precisely of the Holy Spirit) in the soul. At the end of the twelfth and the beginning of the thirteenth centuries, most theologians rejected this theory (which was officially condemned by the Council of Vienna in 1311–12) and made *caritas* a *habitus* in the Aristotelian sense of the term, that is, a peculiarly human capacity for action and merit, like faith and hope, over which it has precedence as the "mother of all virtues." These theologians thus came to distinguish this supernatural *caritas* from *dilectio naturalis*, or the love of God and one's neighbor, of which the first spiritual creatures (Adam, Eve, and the angels) were capable

before the Fall—that is, without grace, a state that according to some writers corresponded to the state of pure nature.

In twelfth- and thirteenth-century theological summas, the treatises dealing with the virtue of *caritas* gave particular attention to the notion of *caritas ordinata*, or *amor discretus*, that is, supernatural love's property of conforming to the value of its object. This property derives from the diversity of the measure implied in the double commandment that demands that man love God "with all his heart" and his neighbor "as himself." Thus the *quantum* of love that serves as a basis for these two movements of incommensurable love is the one that one must have for oneself, *amor sui*, which Aristotle calls *philautia* (*Nicomachean Ethics*, 9.8) and Hobbes calls "self-love" (*Leviathan*, chap. 15). This Scholastic notion seems to be the origin of a proverb that is usually used ironically and is translated in French as "Charité bien ordonnée commence par soi-même." Other languages translate it more prosaically, omitting the dimension of *ordo amoris*. Thus in German, people say, "Jeder ist sich selbst der Nächste," and in English, "Charity begins at home."

b. From *caritas* to "charity"

In addition to the specifically theological meaning of the love of God and neighbor, in the third century *caritas* acquired the meaning of "gift" or "alms." In the tenth century it was gallicized in the form of *caritet* and then *charité*, which designated the theological virtue, particularly in its dimension of mercy and benevolence with regard to the poor and deprived. Thus this word was later adopted to designate congregations or associations (Brothers or Sisters of Charity, Ladies of Charity) that were especially attached to this form of religious devotion. Then the term was extended to the various manifestations of aid and assistance in social life (*vente de charité, bureau de charité*). The epithets *charitable* (sometimes used ironically) and *caritatif* derive from the word *charité*. *Caritatif*, which was relatively rare, came to be widely used in the twentieth century to refer to Catholic charitable movements, under the influence of the English "caritative," which was originally part of the vocabulary of political economy. Thus while retaining, especially for moral theology, its meaning of supernatural virtue turned toward God and neighbor, "charity" assumed more and more the restricted meaning of mercy, humanity, and philanthropy, whereas in modern times, debates about the theological virtue itself, notably those in which Fénelon and quietism were involved, are recentered more specifically on the believer's love of God, and more precisely on the question "in what sense it must be disinterested," as Malebranche put it in the subtitle to his treatise *De l'amour de Dieu* (1697).

The semantic evolution of the French word *charité* (like that of the Italian *carità*, the Spanish *caridad*, and the Portuguese *caridade*), in the sense of mercy as a feeling and benevolence as an act, is unknown in German. In German, the New Testament *agapê* (the supernatural love of God and neighbor) is rendered by *Liebe* (notably in 1 Cor 13:1–8, where the clause "If I . . . have not *agapê*" is translated by Luther as "wenn ich hätte der Liebe nicht") and charity toward one's neighbor, in a literal way, by *die Nächstenliebe*, but when it is a matter of the feeling of mercy and generosity, by *die Mildtätigkeit*, and for charitable action, by *die Hilfsbereitschaft* or *die Barmherzigkeit*.

Finding it easier than other languages to do without periphrases, German translates "mutual love" by *Gegenliebe*. Max Scheler even proposed the neologisms *miteinanderlieben* for "to love in mutual contiguity" and *Liebensgemeinschaft* for "community of love"—a reality that was, according to him, introduced into history by Christianity.

II. The Latin and Greek Vocabulary of Love

A. Latin: *Amare, amor, amicitia*

In Latin, as in modern languages, the uses of *amare* cover the whole spectrum of sexual, amorous, familial, and friendly relationships, so that the expression of a specific bond requires the adjunction of other terms. In Cicero's language, the implementation of distinctions through juxtapositions and contrapositions of other terms involves precise stakes, since it is a matter of defining, on the one hand, *amor* in relation to the tradition of the Platonic theory of love and, on the other hand, *amicitia* as a notion constructed on the basis of Roman practices. But the distinction between the two substantives is a constructed effect that is all the more obvious because they derive from *amare* (*De amicitia*, 27.100) and because it is *amor* that gives *amicitia* its name. In his *Tusculan Disputations* (4:68–76), quoting numerous examples of *amor* in the poets, Cicero tries to show that *amor* is usually "borne by desire" (*libidinosus*) and that this desire leads to an illicit sexuality (*stuprum*) or even to madness (*insania/furor*); consequently, one cannot "accord authority to love [*amori auctoritatem tribuere*]" as Plato does or accept the Stoics' definition, in which love is "the drive that moves us to make friendships on the basis of a vision of beauty" (*conatum amicitiae faciendae ex pulchritudinis specie*). Connoting *amor* in this way, Cicero refuses to accept the positive values of the Platonic theory of love, and he elaborates a notion of *amicitia* in which *amor* does not play a major role. In the dialogue *De amicitia*, he takes the various levels on which the bond of friendship was expressed in Rome as a basis for a definition of *amicitia* that includes, with numerous mediations, the Greek traditions, whose lexicon is in this case untranslatable. Friendship is a special relationship, the one that unites two great statesmen, Scipio and Laelius, which makes it possible to articulate the connections between political friendship and private friendship: the choice of the interlocutors allows Cicero to emphasize something to which the language itself testifies, namely the identity of the vocabulary of political relations and private relations.

Amicitia is an active relationship that is expressed above all in *benevolentia*, the will to act for the good of the friend, and it is precisely *benevolentia* that enables us to distinguish the bond of family relationship (*propinquitas*) from friendship: "Whereas you may eliminate [goodwill] from [family] relationship, you cannot do so from friendship. Without it, family relationship still exists in name, friendship does not" (translation modified). This active goodwill gives the service rendered (*prodesse*) and pleasure (*delectare*) equal weight, and they mutually correct each other: the attraction to the other may then be expressed by *amor* and *motus animi*; it grows and is confirmed only through the exchange of services (*beneficium*) and lasting attachment (*studium consuetudo*). The association of pleasure with services rendered seeks to refute both the Epicurean thesis that friendship arises from need and weakness and the conflations of friendship with flattery (*blanditia*) characteristic of relationships with a tyrant, in which the absence of *fides* and *caritas* are manifest. It is, on the contrary, a question of guaranteeing the equality of exchange that alone can provide pleasure: "There is nothing more pleasant than performing duties for one another with devotion" (nihil vicissitudine studiorum officiorumque jucundius). It is on this basis that the sweetness of private relationships can flourish (*suavitas-comitas-facilitas*).

B. Greek: The two poles of *eran* and *philein*

Greek distinguishes very clearly between two ways of loving, *eran* and *philein*. Thus it has a verb, and a whole terminological complex, for each of these poles, which most modern languages now differentiate only by means of adjuncts. *Eran* is presented as a passion that comes from outside, like Cupid's arrows, and is connected with desire (*epithumia* [ἐπιθυμία]), pleasure (*hêdonê* [ἡδονή]), and the enjoyment (*charis* [χάρις]) of an object; it designates an essentially dissymmetrical relation between an *erastes* who feels love and makes it (he is the Corneillian *amant* or, rather, *amoureux*, because it is never taken for granted that his love is shared) and an *eromenos* who is its object (the "beloved"). *Philein* ("to love as a friend," "to cherish," and "to like to . . .") is on the contrary an action or activity freely consented to and deployed from within an (ethical) character or a (political, social) position; it determines a relationship that is not always symmetrical but is in any case mutual and reciprocal, whether it is a matter of similarity, equality, or commensurability.

That is how we can understand, in the first cosmogonies, difference as an originary power between *erôs* and *philia* or *philotês* [φιλότης], both of which are usually translated by "love." Hesiod's *erôs* "softens the sinews" (*lusimelês* [λυσιμελής]; *Theogony*, 121) and intervenes to pass from parthenogenesis to the embrace of Earth and Sky (137ff.); in Parmenides's *Poem* (28B12 DK), *erôs* causes the elementary polarities to be deployed and dispersed. On the contrary, Empedocles's *philotês* unites similars with similars, which Discord (*neikos* [νεῖκος]) separates again (e.g., 28B22 DK).

But the peculiarly philosophical use of these terms is determined by Plato, on the one hand, and Aristotle, on the other. Plato seeks to capture *philein* under *eran* and proposes erotics as the very model of philosophy; Aristotle makes *eran* a special and accidental case of *philein* and describes in terms of *philia* the whole of the relations constitutive of the human world. We are justified in supposing that modern languages are rather Platonic, since they combine everything under the pole of the erotic, hierarchizing objects and affects.

▪ See Box 7.

1. *Eran* or dissymmetry: Plato's philosophy as a generalized erotics

Plato reveals the dissymmetry inherent in the erotic relationship connecting pederasty with Socratic dialectic and makes *erôs* a condition of philosophy. In *Lysis*, which is considered one of the dialogues of Plato's youth, Socrates's whole operation consists in treating *erôs* as if it meant *philia* or, to put it another way, in eroticizing *philia* (the subtitle of the dialogue is *peri philias*), so as to convince little Lysis that

7

An etymological romance: *Amare*, the maternal breast; *eran*, the male body; *philein*, the sociability of the bond

Etymological and semantic disputes rage about whether fantasies and repression are to be compared or distinguished.

Ernout and Meillet (RT: *Dictionnaire étymologique de la langue latine*) acknowledge the plausibility of the derivation of *amare* from *amma*, "mother," which is closely related to *amita*, "aunt," the father's sister, and of course to *mamma*, "nurse," "mother," "breast." On the other hand, *eran*, which also translates *amare*, tends to be on the side of the male. Chantraine (RT: *Dictionnaire étymologique de la langue grecque*) stands by an unknown etymology, rejecting, along with Benveniste (RT: *Le vocabulaire des institutions indo-européennes*), the series of comparisons proposed by Onians (RT: *Origins of European Thought*, p. 177, n. 2; p. 202, n. 5; pp. 472–80) and instead connecting "damp desire" (*pothos hugros* [πόθος ὑγρός]) and *erôs* with *hersê* [ἕρση], "the dew" (like *houreô*, "urinate," from the Sanskrit word for "rain," *varsa-*) and dew with the male, *arsên* [ἄρσην] which we find in the "sap" of "spring" (both designated by the Greek *ear* [ἔαρ], or in "spring," as in the Latin words for "man" (*ver* and *vir*).

Whatever the word's etymology may be, Onians suggests that the primary meaning of *eraô*, is "I pour out (liquid)," and in the middle voice, "I pour out myself." Dictionaries try to avoid this lexical oddity by distinguishing two *eraô*s, one meaning "to love" and the other, used only in compounds, meaning "to pour" (for *exeraô* [ἐξεράω], "pour out," "vomit"; Chantraine proposes a derivation from *era* [ἔαρ], which is preserved in *eraze* [ἔραζε], "on earth"). In general, dictionaries that take this path do not succeed in maintaining a clear separation (thus according to

RT: LSJ, *suneraô* [συνεράω] is a single verb with two meanings, "pour together" and "love jointly," and not two distinct verbs as in Bailly's RT: *Dictionnaire grec-français*). For Onians, the meaning of *eran* thus merges with that of *leibô* [λείβω], "pour drop by drop" (in the middle voice, *leibesthai* [λείβεσθαι], "to spread out," "to liquefy"), which he compares with *liptô* [λίπτω], *liptesthai* [λίπτεσθαι], "desire" (with its "lipidic" family of fat, gluey, shining) to the point of identifying *ho lips* [ὁ λίψ], "rainy wind"; *hê lips* [ἡ λίψ], "the running, the drop or libation"; and *lips* [λίψ], "desire." He then proposes a truly remarkable cluster combining liquid poured out (Gr. *leibein*, Lat. *libare*, "make a libation"), desire (Lat. *lubet* or *libet*, *libido*), love (Ger. *lieben*), and procreation and freedom (*Liber*, the Italic god of fertility; *liberi*, "children"; *libertas*, "liberty"), which he finds in the same form in the Saxon cluster *froda*, "foam"; *Freyr* and *Freyja*, the gods of love and fertility; and "free" and *frei*.

This is probably an etymological fiction and is censured at every step by Chantraine and Benveniste, who distinguish, for example, between *leibô* and *libare*, *liptô* and *libet/lubet*, "desire"; but their censure is also acrobatic, because to account for the "disturbing polysemy" of Latin *libare*, Benveniste has to retain from the ancient meaning of "pour a few drops" that of "take a very small part" (RT: *Le vocabulaire des institutions indo-européennes*, 2:209).

For *philein*, we must begin from the adjective *philos* [φίλος], which enters into the construction of several hundred words in the Greek lexicon; and since, Benveniste writes (ibid., 1:353), the debate about its origin is ongoing, "it is more important to

begin to see what it means." Benveniste starts over from the fact, "peculiar to a single language, Greek," that the adjective *philos*, which means "friend," also has, apparently as early as Homer, the value of a possessive: "mine, thine, his, etc." (*philos huios* [φίλος υἱός] means "his son," *philon êtor* [φίλον ἦτορ], "my heart" [*Iliad*, 18.307]; *phila heimata* [φίλα εἵματα], "your clothes" [*Iliad*, 2.261]). Nevertheless, the possessive does not constitute the matrix of the word's meaning. Benveniste finds the latter in the connection between *philos* and *xenos* [ξένος], in the "relationship of hospitality" through which a member of a community makes a foreigner his "guest": this is a reciprocal obligation that may be given material form in the *sumbolon* [σύμβολον] (a sign or token of recognition, for example, a broken ring, of which the partners have kept corresponding halves), which establishes a pact (*philotês*) that can be seen in the word *philêma* [φίλημα], "kiss." To translate *philein*, Benveniste resorts to a neologism: *hospiter* (ibid., p. 341; for example, *Illiad*, 6.15: "C'était un homme riche, mais il était *philos* aux hommes; car il hospitait [*phileesken* (φιλέεσκεν)] tout le monde, sa maison étant au bord de la route"). Rooted in the society's oldest institutions, *philos* thus designates a type of human relationships: "All those who are bound to each other by reciprocal duties of *aidôs* [αἰδώς] ("respect," see VERGÜENZA) are called *philoi*" (Benveniste, ibid., p. 341), since combatants who make a pact, including relatives, allies, servants, friends, and particularly those who live under the same roof (*philoi*)—that is, the wife, designated as *philê* when she is made to enter into her own home. In that very way the term acquires its affective value.

he should submit to his lover without shame (222b). That is why one of the central questions concerns the difference between active and passive, "the person who loves" and "the person who is loved," in a relationship of *philia* conceived on the model of that of *erôs*: "As soon as one man loves [*philei* (φιλεῖ)] another, which of the two becomes the friend [*philos* (φίλος)]—the lover of the one loved [*ho philôn tou philomenou* (ὁ φιλῶν τοῦ φιλουμένου)], or the loved of the lover [*ho philoumenos tou philountos* (ὁ φιλούμενος τοῦ φιλοῦντος)]?" (212b). The strategy consists in making "desire" (*epithumia*), *erôs*, and *philia* equivalent (221b–e) and in deducing the necessity of loving (*eran*) one's lover under cover of the reciprocity inherent in *philein*, which is expressed by the creation of the verb *antiphilein* [ἀντιφιλεῖν], "love in return": "Though [lovers] [*hoi erastai* (οἱ ἐρασταί)] love [*philountes* (φιλοῦντες)] their darlings as dearly as possible, they often imagine that

they are not loved in return [*antiphileistai* (ἀντιφιλεῖσθαι)], often that they are even hated" (212b–c). The fact that from the point of view of the *eromenos*, *philia* is thus simply a more suitable or socialized lure for *erôs* is clear in Socrates's recantation in the *Phaedrus*, where the seduced beloved sees himself in his lover as in a mirror: "he possesses that counterlove which is the image of love [*eidôlon erôtos anterôta* (εἴδωλον ἔρωτος ἀντέρωτα)], though he supposes it to be friendship rather than love, and calls it by that name [*erôs*]" (255d–e; cf. *Symposium* 182c, where the *erôs* of the *erastes* has as its complement the *philia* of the *eromenos*).

This play between *eran* and *philein* is particularly difficult to render in French: the French translation of both *philein* and *eran* by *aimer* erases any trace of the Platonic operation, as if French had already registered it. But in the Socratic dialogues, if *erôs* can take on the traits of *philia*, that is because *philia* is

never more than one of the possible kinds of the comprehensive class of *erôs*. In the *Symposium,* Diotima explains to Socrates that through synecdoche, a name that is in reality the name of the whole has been limited to a small part (the erotic *erôs*, that of the *erastes*, the lovers): "You see, what we've been doing is to give the name of Love [*erôta* (ἔρωτα)] to what is only one single aspect of it [*tou erôtos ti eidos* (τοῦ ἔρωτός τι εἶδος)]; we make just the same mistake, you know with a lot of other names" (205b); so that one does not talk about *eran* in relation to those who love money, gymnastics, or wisdom, but rather about *philein*: whence "philosophy" (205d). It is understandable that this is naturally followed by the demonstration of a perfect continuity between the desire for sensual beauty and the love of the beautiful that in itself is *monoeides* [μονοειδές], "a single idea," a "unique form" (210b, 211e). The right path thus consists in "mounting the heavenly ladder, stepping from rung to rung—that is, from one to two, and from two to *every* lovely body, from bodily beauty to the beauty of institutions, from institutions to learning, and from learning in general to the special lore that pertains to nothing but the beautiful itself—until at last he comes to know what beauty is" (211c). Although this exposition of the asceticism of pederastic *erôs* practiced by Socrates (212b) is delivered by a foreigner, a woman, and a Sophist (the subject is beauty and speech, not the Good), it continued to define Platonism, Platonic love, and its process of sublimation. All the more because this asceticism itself is contagious, taught de facto, since Alcibiades, who is loved so "Platonically" by Socrates that he ends up pursuing him as a lover, notes that the *erastes* is not the person people think he is: in these dialogues in which the person who is questioned starts answering (Plato often plays on the proximity of *eromai* [ἔρομαι], "I question," and *erômai* [ἐρῶμαι], "I love"), Socratic irony consists in trading roles and making others who have been "bitten" by his philosophy (218a; 222b) fall in love with him. Thus erotic dissymmetry determines the practice of philosophy.

2. *Philein*: The equality of roles, equalization, and commensurability. Aristotle or an ethics and politics of friendship
To give a sense of the difference between *eran* and *philein*, we can begin again from the compounds *antiphilein* and *anteran* [ἀντερᾶν]. There is nothing more misleading than a parallel, for *anti-* sometimes indicates reciprocity: *antiphilein* means "love in return," "to return *philia* for *philia*," which in Aristotle refers to the very definition of *philos* ("*philos* is the person who loves [*ho philôn* (ὁ φιλῶν)] and who is loved in return [*kai antiphiloumenos* (καὶ ἀντιφιλούμενος)]"; *Rhetoric*, 2.4.1381a 1; Aristotle's and Cicero's uses [*redamare*, "love in return," *Laelius*, 14.49] thus function as displacements of the *Lysis* and returns to common usage) and sometimes antagonism. Before Plato, *anteran* meant essentially "compete in love," when the problematics of love was not deliberately inflected in terms of *philia* ; political office should be reserved for philosophers who do not seek power (see, e.g., *Republic*, 7.521b: "those who take office should not be lovers of rule [*erastas tou archein* (ἐραστὰς τοῦ ἄρχειν)], otherwise there will be a contest with rival lovers [*anterastai* (ἀντερασταί)]"). Compare Calame (*Poetics of Eros*), where in the apocryphal dialogue *Anterasti* (*The Rivals*), the rivalry concerns the dignity of the object of love, wisdom, or gymnastics.

Books 8 and 9 of *Nicomachean Ethics* (cf. *Eudemian Ethics*, 7, and *Rhetoric*, 2.4) testify to the breadth of the notion of *philia*: it designates all the positive, mutual relationships between the self and others, in the home and in civil and political society, on the basis of the bond between self and self. "Friendship" is the customary translation, but it is obviously untenable because it cannot cover this whole set of meanings that includes, in particular, love for those of one's own species ("philanthropy," 1155a 20; the master even has *philia* for a slave, insofar as the slave is a man, 1161b 6), the bond between parents and children (affection, paternal, maternal love / filial piety), husband and wife (tenderness, conjugal love), companions ("camaraderie" or "love" among *hetairoi* [ἑταῖροι]), age groups ("benevolence" in the elderly, "respect" among the young), mutual-aid relationships (charity, hospitality), trade and business (esteem, confidence, fairness), specifically political relations that are vertical (rulers' "consideration," subjects' "devotion") and horizontal ("sociability," "harmony"; thus *homonoia* [ὁμόνοια], "concord," "consensus" of citizens, is "political friendship," 1167b 2), and even the relationship between men and the gods (piety, indulgence). Thus it is, conversely, in Aristotelianism that *philia* becomes generic, and *erôs* becomes simply one of its species, based on the consideration of "pleasure" (*di' hêdonên* [δι' ἡδονήν], 1156a 12), which is frequent among the young, just as friendships among older people are based on the "useful" (*to chrêsimon* [τὸ χρήσιμον], 1156a 10). But both of these are only "accidents" of the third and essential kind of *philia*: "friendship" properly so called, which is based on virtue (true friends are *kat' aretên* [κατ' ἀρετήν], "like in virtue," 1159b 4). Only the last expresses the essence of friendship, because it is situated from the outset in an exchange, a stable and equal reciprocity: "Now equality and likeness are friendship [*hê d' isotês kai homoiotês philotês* (ἡ δ' ἰσότης καὶ ὁμοιότης φιλότης)], and especially the likeness of those who are like in virtue" (1159b 2–4). Let us note also the peculiarity, which is consonant with *philein*, of the English expression "to like," whose etymology includes the idea of "similar to," in which affection and resemblance agree in the attraction of the same by the same.

Whence the clear relationship between *philia* and democracy, "for where citizens are equal they have much in common" (1161b 10). But when inequality is evident, and the superiority of one party over the other is constitutive of the relationship (man/woman, dominant/dominated, etc.), then it is "proportion that equalizes the parties and preserves the friendship" (to analogon isazei kai sôizei tên philian [τὸ ἀνάλογον ἰσάζει καὶ σῴζει τὴν φιλίαν]; 1163b 29f.); the inferior's *philia* compensates by its intensity and constancy the merit of the superior, for example, by returning in honor what he receives in money: "even unequals can be friends; they can be equalized" (*isazointo gar an* [ἰσάζοιντο γὰρ ἄν]; 1159b 2; cf. 7.15 and 16). This characteristic of commensurability enables us to understand why the institution of money (*nomisma* [νόμισμα], 1164a) depends on *philia*, and how, more generally, the passage to the symbolic makes it possible to acquit oneself of what is unacquittable with regard to relatives and with regard to the gods (e.g., 1163b 15–18).

8

Aimance / "lovence"

Aimance, in spite of its romantic sound (parallel to "romance") and its association with ideas that trace back to *amour courtois* and the troubadours, is apparently a recent term. It was coined in 1927 by the French linguist and psychoanalyst Edouard Pichon, a figure who influenced Lacan. *Aimance* was interestingly picked up by the francophone Moroccan writer Abdelkebir Khatibi, who used it as a general title for his poetic works. It is from Khatibi, a close friend, rather than from Pichon, that Jacques Derrida borrowed the term. He used it extensively in his *Politiques de l'amitié* (1994), and when the work was translated into English as *The Politics of Friendship* in 1997, the translator, George Collins, coined the neologism "lovence."

The reference to Pichon is interesting, however, because his intention was to provide an equivalent for Freud's concept of *libido* that would avoid its overly sexualized connotations and point to a broader concept of object attraction, one that would not necessarily entail sexual satisfaction. Pichon's move was symptomatic of a general "French" resistance to "German" psychoanalysis in the name of a more civilized culture of sentiments. This appeal to the tradition of *amour courtois* and the troubadours formed part of a larger trans-European conflict over definitions of desire and sublimation (which is evident in C. G. Jung's critique of Freud's "hypersexualism").

In a sense, what Derrida performs in *Politics of Friendship* through the deconstructive reading of a philosophical tradition ranging from Aristotle to Nietzsche is a complete displacement of this ill-formulated sex/*amour* debate. One of Derrida's reasons for having recourse to a third term that is neither love nor friendship is to identify an indeterminate affect that circulates among modalities of love and friendship on a spectrum of sentiments that defy description or enumeration. Derrida's use of *aimance* parallels, in this respect, Freud's use of the category *pulsion*, with its neutralization of the active/passive opposition in desire. *Aimance* also fosters a phenomenology of the transference processes through which love, friendship, hostility, and rivalry are institutionally and sentimentally constituted and undone. This phenomenology of *twoness* (what Nietzsche in an extraordinary wordplay called *Zweisamkeit*, literally "loneliness-in-two") significantly questions the rigid distinction between the public and private spheres, as well as conventional, gendered views that sustain the "double interdiction" against friendship with and among women in the philosophical tradition. Recent reclamations in English of the word "amity" (as in Sharon Marcus's *Between Women: Friendship, Desire and Marriage in Victorian England*), to signal forms of female friendship and affection that fall outside heteronormative *and* same-sex vocabularies of love and sexual relation, might well be considered a fair approximation of the French *aimance*.

MACHT, GEWALT (GERMAN)

ENGLISH   might, power, violence

➤ POWER and DROIT, FORCE, HERRSCHAFT, JETZTZEIT, RIGHT/JUST/GOOD, VALUE

When Luther comments on Romans 13 ("Let every person be subject to the governing authorities"), he writes that "one must not resist authority (*Obrigkeit*) by force (*Gewalt*), but only by confessing the truth" (*Weimar Ausgabe*, 11: 277). This interpretation underlines one of the connotations—rebellious force—that gradually, and especially toward the end of the Middle Ages, came to be added to the traditional meaning of *Gewalt*, which originally referred to the entire range of acts connected with the exercise of temporal power: administering, reigning, organizing (the root of the term goes back to the Latin *valere*). It is clear that the associated notions of *potestas* and of *vis* (force) are directly linked to this exercise of power, and because *Gewalt* implies the use of force, the meaning of the term moves easily, by extension, toward the idea of violence, that is, a rebellious, even revolutionary, force exerted against power (*Macht*). *Gewalt* and *Macht* thus share the idea of *potestas*, with *Gewalt* inflecting this idea toward *vis* and *violentia*, while *Macht* tends more toward *potentia*.

I. An Uncertain Division:
The Arbitrary and the Free Deployment of Force

It is not so much the etymology of these terms or the tradition of their usage that suggest or anticipate the semantic value they assume in philosophical reflections but rather a terminological decision that establishes a division at the heart of their fields of connotation, whose borders are blurred. When Kant calls *Macht* a "power which is superior to great hindrances," and *Gewalt* this same force "if it is also superior to the resistance of what is also endowed with *Macht*," we can say on the one hand that *Gewalt* is understood as a modality of *Macht*, and on the other that these definitions transpose what is normally a political and legal linguistic usage into the domain of nature. This well-known quotation is the beginning of paragraph 28 of the "Analytic of the Sublime" where Kant talks of natural force (which should be expressed rather by the term *Kraft*, referring to physical force in general, see FORCE). He simply wants to emphasize that the force of nature can be understood as a power that, on certain occasions, is unleashed and turns violent. This violence is understood as an avatar of power that, as such (that is, as *potentia*), is synonymous with possibility (here the connection with "potentiality" is of importance) in the broad sense of the term.

In contemporary usage *Macht* might be best understood in Max Weber's definition of the term: "Any possibility, within a social relationship, of imposing one's will, even in spite of a resistance, and regardless of what this possibility is based on" (*Wirtschaft und Gesellschaft*, 28). *Gewalt* in turn refers first and foremost to the exercise of a constraint (and it matters little

whether it is legitimate or not). The minimal distinction between the two notions comes down to the following: *Gewalt* always refers to the idea of "free" control of something or of someone; consequently, the connotations of arbitrariness, of instrumentalization, or of reification belong logically to this semantic field. *Macht*, on the other hand, refers essentially (if not exclusively) to the *vita activa*, to using one's will and establishing aims that one attempts to achieve. The connotations of *Macht* thus have more to do with autonomy and coherence of action, and its adequacy to the goals pursued, which implies that *Macht* inevitably requires legitimacy and recognition.

II. From *Potestas* and *Potentia* to *Macht* and *Gewalt*:
The Different Stages in the Critique of Domination

The evolution of the semantic fields of these two terms, which have continually cut across one another, has had at least three clearly identifiable phases.

The first has accompanied the formation of modern political forms of authority since the end of the Middle Ages, which have, with increasing concentration, placed the exercise of domination into the hands of the state apparatus. One effect of the reception of Roman law, and of conflicts between princes, imperial power, and papal authority, which appealed to divine omnipotence (*Allmacht*), has been to make the notions of *potestas* and of *potentia* increasingly abstract terms. This phase has ended with a distribution of "domination" among the state (which has been able to "monopolize the legitimate use of constraint" [M. Weber, *Wirtschaft und Gesellschaft*, 29]), civil society, the economy, and the remains of the different spiritual authorities.

The second phase concerns the vast domain of the legitimization of power and the use of force. In the article on *Gewalt* in his dictionary, Grimm points out that the meaning of "a misuse of power was barely formulated" in the Middle Ages: this sense of the term arises with the convergence of a concentration of powers, the move toward secularization, and the rationalization of the conception of law. It was only then that the terms of power and of constraining force departed from their status as normative notions expressing the legitimate need to conserve a *social* and political order, whose essentially Christian foundations were never questioned. *Gewalt* and *Macht* thus became either descriptive notions (whose connotations remained relatively "neutral"), or states of things that, while they had no clear and explicit justification, nevertheless aroused the suspicion that they were potentially illegitimate. From the sixteenth century onward, political thought would continually reflect upon the opposition between right and force, just as, in parallel, moral thought would oppose the "power" of reason to the "violence" of passions. The term *Gewalt* was interpreted from the perspective of natural

justice, for example, as referring at the same time to the space of freedom belonging to each individual, the illegitimate intrusion of an individual into the private sphere of another individual, and the legitimate force that preserves this natural space of freedom. It is difficult to avoid noting how much *Macht*, in this semantic extension, can cut across each of the values attributed to *Gewalt*, with the one partial exception that the connotations of *Macht* are slightly less negative.

The third phase, in the eighteenth and nineteenth centuries, was the phase of contestation that came with the fact of power and force being concentrated in the hands of the apparatuses of the state and of domination. Revolutionary phenomena, modern wars, the analysis of the structure of society in terms of conflict and exploitation, the critique of law in the name of the ideological interests it served and whose "reality" it masked, all brought about a shift in the understanding of these two notions. They were no longer understood in the general context of law but became poles of social and political theories, whose objective was the critique of domination with a view to its redefinition, its control, or even its disappearance in history. At the same time these two terms were notions that became as much concepts of theoretical reflection as they were notions usurped for instrumentalized ends (revolutionary "violence" [*Gewalt*], for example, could be said to be "legitimate" from the perspective of an ideology of history judging the present in the name of a "scientifically" guaranteed future, based on a belief in the "power" [*Macht*] of the exploited classes).

When Fichte develops the idea, in his 1796 work *Grundlage des Naturrechts nach Prinzipien der Wissenschaftslehre*, that the "law must be a power (*Macht*)," and when he asks what the nature of this power should be, such that it goes beyond the law of the will of each individual, from a contractual perspective directly inspired by Rousseau, he will use the term *Übermacht*, which immediately becomes a synonym for *Übergewalt*, in other words, a superior power, or the supreme force/power of the law. The "common will" of the contracting parties must have a "superior power in view of which the power of each individual is incommensurably restrained, so that this will can be preserved beyond itself and ensure it is maintained: this is the force of the state (*Staatsgewalt*)" (ibid., 153). The only distinction one can make in the use of these two terms is that *Macht* here appears as more abstract and general, whereas *Gewalt* is explicitly referred to the *potestas executiva*, since then the use of force is concretely required for the constraining force of the law to be effectively realized.

In Hegel, as in Kant, the distinction between the two notions is thematized—"Force (*Gewalt*) is a manifestation of power (*Macht*), or it is power as exteriority" (Hegel, *Logik*, 2: 200). The *Enzyklopädie* (1830, §541) talks about *Staatsgewalt* in the same sense as Fichte and uses *Gewalt* to refer to the distribution of the power of the state into different powers (executive, legislative, judicial). When the *Enzyklopädie* discusses the state of nature (ibid., §502), however, *Gewalt* signifies less "force" than "freely disposing of something" (according to its first meaning):

> The law of nature—strictly so called—is for that reason the predominance of the strong (*Stärke*) and the reign of

force (*Gewalt*), and a state of nature a state of violence (*Gewalttätigkeit*) and wrong, of which nothing truer can be said than that one ought to depart from it. The social state, on the other hand, is the condition in which alone right has its actuality: what is to be restricted and sacrificed is just the willfulness and violence of the state of nature (*Gewalttätigkeit*).

> (*Encyclopaedia of the Philosophical Sciences,* trans. and with introduction by William Wallace, 1894).

However, in his *Philosophy of Right* §95 (cf. also §93 add.), Hegel will use *Gewalt* to designate constraint (*Zwang*), that is, the use of brute force against a natural existence that is an agent, the bearer or the product of will (the existence of a man, or what he has produced or built). But *Gewalt* also serves here as a synonym for "possession" (*Besitz*), which is defined by the fact of disposing externally of something in whatever way one wishes. This first level of possession will be overcome to reach the level of property (*Eigentum*), which is no longer defined in terms of free disposition but also of the right which of course guarantees this free disposition (within certain limits) over and against the arbitrary power of another person.

Marx will not depart radically from this distribution of connotations. His now celebrated expressions—"the proletariat must abolish political power when it is in the hands of the bourgeoisie. They must themselves become a power (*Gewalt*) and, first and foremost, a revolutionary power" ("Moralisierende Kritik und kritisierende Moral," 4: 338); "force (*Gewalt*) is the midwife of every old society pregnant with a new one. It is itself an economic power" (*Capital*, I, §8, chap. 31)—do not essentially modify the meanings of the two terms, and the differences between them are more of degree and of modality than of nature.

■ See Box 1.

III. *Macht* and *Gewalt,* "Power" and "Violence": Arendt and Benjamin on the Functions of Violence

There have been only two real and original departures from these meanings. The first of these is Walter Benjamin's use of the term *Gewalt*, in the extreme extension of its sense, that is, the violence against all tradition, to which he is not afraid of adjoining the adjective "divine" (*göttliche*) violence. The second is to be found in the decisive opposition between power (*Macht*) and violence (*Gewalt*) that Hannah Arendt develops in the essay bearing this title (*Macht und Gewalt*).

In his 1920 essay "Critique of Violence" (*Selected Writings*, vol. 1), Benjamin opposes the mythical, foundational, and conservative violence of law with divine, destructive, and purifying violence: "For only mythic violence (*schaltende Gewalt*), not divine, will be recognizable as such with certainty, unless it be in incomparable effects, because the expiatory power of violence is invisible to men. Once again all the external forms are open to pure divine violence, which myth bastardized with law. Divine violence may manifest itself in a true war exactly as it does in the crowd's divine judgment on a criminal. But all mythic, lawmaking violence (*verwaltende Gewalt*), which we may call 'executive,' is

1

The "will to power" ("*Wille zur Macht*") in Nietzsche

This expression, "will to power," first appears at the time Nietzsche was writing *Thus Spoke Zarathustra* in 1883, thus in the final phase of this thinking. It is understood first of all as another, more precise way of referring to what is commonly called life. But in Zarathustra itself, the "will to power" is directly related to the evolution of cultures across time and history, as a way of establishing control over the whole of phenomenal reality. This expression returns at several points in 1885, especially in *Beyond Good and Evil*, and refers there to the furthest level that our own reflection can reach when it attempts to interpret reality (what Nietzsche designates as the "original text"). So the "will to power" is the highest level attained by our hypotheses, and it thus becomes identified with philosophy as the attempt to think the totality of what is. The "will to power" thus refers to the general dynamic of our instincts, from the most basic to the most refined drives, to the dynamic of the body, and even that of the inorganic world. But we must never forget that instincts constantly adjust themselves and evaluate circumstances with a view to satisfying themselves and that they necessarily enter into conflict with one another. There are thus only transient and fragile states of equilibrium between these different movements, and this is what we call the "self," for example, or a "cause," or "knowledge," or "will." Since Nietzsche on the one hand says that "will" (*Wille*) is an esoteric term, that it does not exist as such—there is only an instinctual dynamic that is absolutely inseparable from the dynamic of the mind—and since on the other hand what he declares as his most profound thought is that of the "eternal return" (*ewige Wiederkunft*, an expression we find in 1882, before the notion of the "will to power" makes its appearance), we are entitled to consider the "will to power" as the "mask" of the eternal return. Nietzsche explains in a posthumous fragment (7 [54], end 1886–spring 1887) that the "supreme will to power" is the fact of "impressing upon becoming the character of being . . . that everything returns is the most extreme convergence between a world of becoming and a world of being."

In 1887 Nietzsche planned to write a book that would bear the title "Will to Power." He worked on this plan during the course of the year in 1888, explaining that, on the one hand, the 372 fragments mentioned in relation to this plan were only to help him clarify his own thoughts, and that any publication of them was consequently prohibited (letter to P. Gast, February 1888), and on the other hand, that this same project from then on was to be called "Transvaluation of All Values" (letter to F. Overbeck, 13 February 1888). In September of that same year, Nietzsche abandoned the expression "will to power" as a designation of what he was about to publish, and the foreword to the *Twilight of the Idols* was completed on 30 September, identifying this date as year one of the "transvaluation of all values." The different editions of the *Will to Power* that appeared after Nietzsche's death were simply compilations of posthumous fragments, grouped more or less coherently according to the themes defined by the successive teams at the Weimar Archives (under the aegis of Nietzsche's sister).

pernicious. Pernicious, too, is the law-preserving, 'administrative' violence that serves it. Divine violence (*göttliche Gewalt*), which is the sign and seal but never the means of sacred dispatch, may be called 'sovereign' (*waltende*) violence" (ibid., 252). This violence, whose conception is manifestly inspired by the ideas of Georges Sorel, is also said to be revolutionary; it is a "pure violence exerted on behalf of living beings against all life," it is a "liberation from all law," whereas mythical violence "imposes all at once both guilt and expiation." A manifestation of divine violence can be found in the element of "educative power" that is "outside of all law." In essence, the backdrop to this divine violence is a transposition of a conception derived from Jewish mysticism into terms that are Sorelian rather than Marxist (even though the idea of pure violence is very close to the Hegelian Marxist sense of *Gewalt* as negativity). This is Isaac Luria's cabalistic notion of the "breaking of vases," this catastrophe that is responsible both for the dispersion into the world of the sparks of evil and for the "exile" of God himself, the "divine contraction" whose consequence is creation itself. Divine violence is also manifested in the idea of the here and now (see JETZTZEIT), the potential sudden eruption of the messianic dimension at the heart of the mythical, and thus fallacious, continuity of time.

Arendt, for her part, opposes the domain of "force," that is, the domain of technology (production, and making the material means adequate to the ends), to that of "power," or of institution, supported by a greater or lesser number of individual wills. "Power" (*Macht*, *pouvoir*) is thus both the condition of any sociopolitical order and a finality in itself, whereas "force" (*Gewalt*, or violence) only has aims that change each time. In addition, power has no need for justification, but only for legitimacy, whereas force is never legitimate. The use of force can in certain circumstances be justified in terms of an anticipation of what it could achieve; power, in contrast, derives its legitimacy instead from the past, from a tradition. At the same time revolutions are only the results of redistributions of power, and force itself cannot set them in motion (its function being instead to introduce reforms). When "revolutionary violence" (*revolutionnäre Gewalt*), however, brings about a transformation of reality, it only achieves one result: "the world has become more violent (*gewalttätiger*) than it was before" (*Macht und Gewalt*, 80). Power is normative, while force as violence is instrumental; power is not identifiable with domination, since it is lacking constraint, manipulation, and conflict. Neither is defined by its capacity to overcome resistance (it does not pertain, as in Max Weber, to a relation of order and obedience). To refer to a "power without violence" (*gewaltlos*) is a pleonasm. Violence can destroy power; but it is absolutely incapable of creating power" (ibid., 57).

2

"Forcing" (*Forçage*)

"*J'aimerais l'appeler un forçage, si scandaleuse-ment autoritaire soit la connotation du mot*" (I would prefer to call it [the psychoanalytic act, which 'forces' a particular sort of knowl-edge to appear] a forcing, however scandal-ously authoritarian the word may sound) (*Conditions*). So writes Alain Badiou, toward the end of his 1991 lecture "La vérité: forçage et innommable," thus hesitating ever so slightly around the problem of conceptual nomination, the problem, that is, of the rela-tion between the *word* ("la connotation du *mot*") and the *concept* this word is to *name* ("j'aimerais *l'appeler* un forçage," "*call it* a forc-ing"). Badiou's scruple is to the point: defined in French as "*l'action de forcer, de faire céder par force*," "the act of forcing, making some-thing occur on account of, or making some-thing bend to, a force," *forçage* is thick with connotations of violation, sexual violence, un-naturalness, and impropriety. To the degree that word and concept are never in a simple relation of exteriority to one another and that concept-invention is therefore always an *inventio* in the rhetorical sense, working *with* the *historicity* of the term in question, Badiou's well-founded scruple necessarily doubles as a provocation. After all, one might think of *forçage*, intuitively, as the very other of the idea of philosophy, a virtual synonym for the absence of reason; or, alternately, at a somewhat more advanced level of reflection, *forçage* might be understood as a figurative description of the philosophical malady par excellence, a kind of rapacious idealism that acknowledges no alterity, no gap between concept and object, forcing everything that stands in its path. The provocation is only heightened when one realizes that Badiou's concept of *forçage* bears upon nothing less philosophically central than the relation of truth to knowledge. Assuming that the provocation is not an empty one, what kind of philosophical situation might demand such a paradoxical alignment of *forçage* with values such as truth and knowledge? To what exigency does a concept of *forçage* respond? The fact that Badiou adapts *forçage* from Paul Cohen's mathematical technique of "forcing" does not lessen the paradoxicality of the con-cept or the urgency of the questions raised by its formulation. Similarly, other English-language usages such as "forcing bulbs" in horticulture or "forcing bids" in the game of bridge may give the term a technical inflec-tion, but they do not fundamentally alter its connotation. (Indeed, given philosophy's his-torical ambivalence to *technê*, these usages could hardly be said to prepare or anticipate a distinctly philosophical conceptualization of the term.)

Without further delay, let us turn back to the text of Badiou's lecture: *forçage* is "a matter of the point at which, although in-complete, a truth authorizes anticipations of knowledge, not statements about what is, but about what will have been if the truth reaches completion." Already in this brief description, not quite yet even a proper definition, questions of time and decision are clustered, somewhat unexpectedly, with the problem of epistemology, the problem of knowledge. It is to this knot that the para-doxical concept of *forçage* corresponds. As is by now well known, a truth for Badiou is an event in the robust sense, which means that it, by definition, eludes knowledge; *forçage* bears, in turn, on the knowledge *of* truth, the consequences of truth for a knowledge to which it nonetheless necessarily remains heterogeneous.

Because a truth cannot be *known*, it is undecidable and therefore subject to deci-sion. Yet the theory of *forçage* is not as such a decisionism. It is, rather, a paradoxical epis-temology of the *future effects* generated *by* groundless decisions—a meta-decisionism, perhaps. One decides on the basis of the fu-ture anterior—what *will have been* if the truth comes to completion, what *will have been* if the situation is altered to accommodate what was previously an anonymous multiple or subset. What this means, in practice, is the introduction of a new *name* into a situation, a name that corresponds to nothing in the cur-rent situation and therefore has no referential value in the present but instead "refers" to its "completed" existence in a "*situation à-venir*" (*Being and Event*).

Two additional points must be made concerning the technical aspects of *forçage*. The first is that of the paradox of "authorized anticipations of knowledge" or of *forçage* as "method" (*Conditions*). For the modern (i.e., Cartesian) theory of knowledge is founded on the notion of intuitive (or *sensible*) evi-dence; "method" as such was conceptualized precisely as a guard *against* anticipation. The initiation, under the sign of *forçage*, of an epistemology of "authorized antici-pation" is therefore remarkable to say the least. Second, and following from this point, the equivocal character of *forçage* in rela-tion to various twentieth-century philoso-phies of time is worthy of interest. On one hand Badiou's thought is premised on the non-self-identity and non-self-sufficiency of the historical present; and insofar as the event inaugurates a sequence, it might be said to "temporalize," to bring about a par-ticular acute sense of historicity. And yet, on the other hand, *forçage* effects a kind of telescoping of the future into the present, a telescoping that necessarily drains the future of its futurity; the negation of the historical present thus ultimately leads for Badiou not to a heightened sense of temporality, but to an affect of *eternity*.

To round out this entry, several additional notes are in order. First, the equivocal relation throughout Badiou's *oeuvre* between *forçage* and force as such is worthy of note, though there is not room for an extended treatment here. In *Théorie du sujet* (1980), for instance, Badiou mobilizes *forçage* alongside Hegel's concept of *Kraft* from the *Wissenschaft der Logik*, using both to think the *rupture dialec-tique* between subject and structure. *Kraft* is theorized as the positing of externality, whereby the seemingly reactive subject, in *understanding itself to posit* the structure that seems to determine it, transforms struc-ture into a moment of its own development (*Théorie du sujet*). *Forçage* approaches the same problematic from a different angle, juxtaposing the classical logic of implica-tion ("p *implies* non-q"), which by definition cannot think rupture, with the logic of for-çage, according to which "p *forces* non-q" is a *contingent development from the absence of a constraint*, a consequence of the fact, in other words, that *nothing more powerful than p forces q* (Ibid.).

Thus Badiou can write the following, im-plicitly aligning force and *forçage*: "Between formal implication and *forcing* there lies all the ambivalence that the dialectic introduces in the old problem of determinism. The sub-ject's surrection is the effect of *force* within the place. This does not mean that the place implies it" (Ibid.). In *L'être et l'événement*, by contrast, the critique of political ontology leads to a *rejection* of the language of force, even as *forçage* becomes an ever more impor-tant theoretical construct. Badiou thus writes, in regard to Hobbes: "To suppose that the po-litical convention results from the necessity of having to exit from a war of all against all, and to thus subordinate the event to the ef-fects of force [*subordonner l'événement aux effets de la force*], is to submit its eventness to an extrinsic determination. . . . Politics is a *creation*, local and fragile, of collective hu-manity, it is never the treatment of a vital ne-cessity" (*Begin and Event*).

Second, the concept of *forçage* has an interestingly ambiguous psychoanalytic background. Though Badiou cites Lacan in his lecture on *forçage*, he does not cite any of the instances in which Lacan in fact writes of *forçage*, referring instead to the theory of the "half-saying" [*mi-dire*] of truth elaborated in *Seminar 17*. Badiou does suggest, however,

that there may be a Freudian precedent to the concept in what he cites as "*fray-age*," a term rendered as "working-through" [*Durcharbeiten*] in the English translation of Badiou's essay (*Conditions*, 206/138). *"Fray-age"* is in fact the term Jacques Derrida uses, on the basis of the French idiom "*se frayer un chemin*," to translate Freud's *Bahnung* (pathbreaking, pioneering, forging), in his famous 1966 essay on "Freud and the Scene of Writing" (in *L'écriture et la différence*). Alan Bass in turn renders *frayage*/*Bahnung* as "breaching," a term that captures the implicit violence of the concept far more effectively than the comparatively euphemistic "facilitation" favored in the *Standard Edition*. The reference to *frayage* (*Bahnung*) thus not only

links *forçage* back to the discussions of "force and place" in *Théorie du sujet* but also points toward a comparison between Derridean *différance* and Badiouian *forçage* as distinct modes of "spacing" that find a common precedent in Freud's *Bahnung*.

Third, and finally, the question of a modernist *aesthetics* of *forçage* remains to be addressed. For Badiou writes in passing, in reference to Rimbaud and Mallarmé, of "*un forçage de la langue par avènement d'une autre langue à la fois immanente et créée*" (the forcing of language by the advent of another language at once immanent and created) or again, this time in relation to Beckett, of "*une invention dans la langue, un forçage poétique*" (an invention in language,

a poetic *forcing*) (*Petit manuel d'inésthétique*, *Beckett, l'écriture et la scène*). This conceptualization of *forçage* in fact resonates with the use made of the term by Lacan in *Seminar 23*, in which he writes, in reference to his own appropriation of knot-theory, of "the forcing of a new writing [*le forçage d'une nouvelle écriture*] . . . and the forcing of a new kind of idea [*et le forçage d'un nouveau type d'idée*]" (*Séminaire 23*). Lacan, however, draws attention to what Badiou does not—the status of mathematical formalization as such, here grasped under the sign of *forçage*, as a formidable intervention in the *aesthetics* of *philosophical* writing.

MADNESS / INSANITY

FRENCH	*folie, démence*
GERMAN	*Schwärmerei, Wahn; Unsinn, Verrücktheit*
GREEK	*mania* [μανία], *phrenitis* [φρενῖτις], *aphrosunê* [ἀφροσύνη], *paranoia* [παράνοια]
ITALIAN	*follia, pazzia; demenza*
LATIN	*furor, phrenesis; dementia, insania, insipientia*

➤ DRIVE, GENIUS, LOGOS, *MALAISE* [MELANCHOLY], MEMORY, MORALS, PATHOS, *PRUDENCE*, *REASON,* SOUL, *WISDOM*

The terminology of madness follows two distinct models in most languages. On the one hand, there is a positive model, which treats madness as a distinct entity subject to the highest valuations: thus Greek *mania* and, in another register, Latin *furor*, which indicate exceptional states. These persist in literary modernity in the ideas of inspiration, enthusiasm, and genius, as well as *Schwärmerei*, the extravagance in terms of which Immanuel Kant characterizes both the madness of Emanuel Swedenborg and that of dogmatic idealism. On the other hand, we also find a negative or privative model: madness and the insane are outside or past reason or even wisdom (*aphrôn*, *insipiens*, *insania*, *dementia*, from which come our terms "insanity," "dementia," "paranoia," and others). Unreason in this sense is in danger of being run together with irrationality (the *aphrôn* [ἄφρων] is the opposite of the *phronimos* [φρόνιμος], the morally sensible sage).

Cicero, with the goal of personally overseeing the shift from Greek vocabulary to Latin, opens the latter up to the symmetry of the health of the body and that of the soul. The medieval terminology of the subject confers a sort of technical value, even in theological controversies, upon terms like *insipiens* and *phreneticus*. The many terms of antiquity, which were initially based on Greek *mania* [μανία], were retained in modern languages until the advent of modern psychiatry, at the end of the eighteenth century, though at the cost of semantic shifts and new linguistic choices owing in particular to translations and definitions of Cicero, the Stoics, and Augustine.

I. Greek *Mania* and Its Modern Destiny: From Enthusiasm to Psychosis

A. The *mania* of philosophers and the *phrenitis* of doctors

Concerning *mania* [μανία], Boissier de Sauvages writes: "From the Greek *mainomai*, I am crazy, furious; in Latin, *furor, insania*; in French, *folie & manie*" (*Nosologie*, 7.389). The word is thus trapped in its equivalences in Latin and in French. We may consider it the most general, the most available, both in extension and in understanding (*mainomai* [μαίνομαι] answers to a Sanskrit root that means "to believe, to think," from which we derive both *menos* [μένος], "warrior spirit," and *mimnêskô* [μιμνήσκω], "I remember" (see MEMORY). *Mania* initially refers to what we tend to place under the vague word "madness," and continues to do so in ordinary language. In Hippocrates, we may say that mania is only found as a symptom, as are all changes of *êthos* [ἦθος], "character." It does not yet exist as a concept of sickness.

Plato describes four forms of divine madness (*mania, Phaedrus* 265b, and esp. 244–45). The first, inspired by Apollo, is mantic delirium, divination. The "moderns," says Plato, are the ones who, lacking a sense of beauty, introduced a *t* to the word and called the art of divination *mantikê* [μαντική] rather than *manikê* [μανική]. The second form is "telestic" delirium, given by Dionysus, who "accomplishes" (*teleô* [τελέω]) in the sense that he initiates one into mysteries. The third is the delirium inspired by the Muses, namely poetic delirium. The fourth form, a gift of Aphrodite or Eros, is that which incites love, *erôtikê mania* [ἐρωτική μανία]. This text, which ancient medicine carefully recalls, is of primary importance for understanding this medicine's definition of mania. Thus, Caelius Aurelian, a doctor in the fifth century CE (who is transposing a second-century doctor, Soranus of Ephesus, into Latin), writes:

> Plato, in the *Phaedrus*, declares that madness is twofold: one comes from a tension of the mind, having a cause or origin in the body, the other is divine or sent down, and is inspired by Apollo; now we call this divination.

(*Chronic Illnesses* 1.5, ed. Bendz, 144)

Continuing to cite the text of the *Phaedrus* in the *Chronic Illnesses*, Caelius is right to speak of the duality of madness. For whatever the number of distinctions Plato makes, alongside these "meaningful" madnesses, there is the sickness of madness. In fact, we may speak of a "double madness," a good one ("the greatest gifts come by way of madness," Plato, *Phaedrus* 244b) and a pathological madness. It is this duality that is put to the test in Euripides's tragedy *The Bacchae*.

Something happened, however, that we could not better show than by citing Galen. When he reads in a Hippocratic constitution (*Epidemics* 3 = RT: Littré, *Dictionnaire de la langue française*, 3:92) that "none of the frenetics had an attack of mania . . . but instead of that they were prostrate," he is perplexed. The conjunction of mania and *phrenitis* [φρενῖτις] is incomprehensible to him. Since Hippocrates cannot be wrong, Galen thinks we must give *phrenitic* a metaphorical sense. In truth, the Hippocratic text is a problem for him because a very important epistemological break had taken place, namely, the development of definitions of illnesses. As for the systematic

contrast between *phrenitis* and *mania*, no doubt we must place it in the second half of the second century BCE. Thus, since diagnosis follows definition, we could not confuse *phrenitis*—that is, insanity with fever, *crocudismos* [κροκυδισμός] (the gesture of ripping out strands of tissue or blades of straw) and *carphologia* [καρφολογία] (permanent and involuntary movements of hands and fingers)—and *mania*, insanity without fever. With regard to this text, Galen has the same problems of translation and understanding as we do.

The determination and definition of illnesses like mania, *phrenitis*, or melancholy presuppose a certain number of complex cultural facts, including in particular: the constraint of the definition according to the model of philosophy and rhetoric; the definitive separation between illness of the body, reserved for doctors, and that of the soul, reserved for philosophers; the victory of soul-body dualism; and the triumph of the Stoic theory of passion as an illness of the soul (see PATHOS). Celsus attempted a new grouping. He classified under the notion or "genre" of *insania* the three major illness among which "madness" is essentially distributed, namely, *phrenitis*, melancholy (the fear and sadness attributed by Hippocratics to "black bile"), and *mania*. Why *insania*? We would be at a loss to give a semantic analysis, but a shift has occurred in any case from a positive entity, mania, to a privation, insanity, that authorizes and promotes the parallel between illness of the soul and illness of the body. The determinations of madness, or the ways of expressing it in the widest sense in Latin, are numerous. It seems indeed that this is Celsus's choice. The semantic field of madness is henceforth determined by the history of medicine.

B. Psychiatric frenzy and mania

These problems are not restricted to Greco-Roman antiquity. This is not only because these texts were well known and scrutinized through the middle of the nineteenth century, and play a role in the foundation of psychiatry, but also because a certain number of problems were dealt with in antiquity in a way that was decisive for psychopathology, and for the very meaning of the word "mania."

When psychiatry was created (at the end of the eighteenth century), the question of terminology returned. Philippe Pinel writes then: "The happy influence exercised on medicine recently by the study of other sciences can no longer allow giving the general name of madness, which may have an indeterminate scope, to insanity" (Pinel, *Traité médico-philosophique*). There are in his writings, however, two concepts of madness. One, in his *Nosographie philosophique*, corresponds to the tradition; another one, wider and newer in its definition, creates problems of categorization with the first, in his *Traité médico-philosophique* (128–29).

However, Pinel's student Esquirol wrote, in 1816, an article entitled "On Madness." In 1818, he wrote another, "On Mania," in which he returns to the classic definition: "Mania is a chronic affection of the brain, usually without fever, characterized by perturbation and exaltation of the senses, mind, and will." "I shall use," Vincenzo Chiarugi had written, on the other hand, "the word *insanity* [*pazzia*] without having to adopt a term taken from a foreign language, thus avoiding the risk of confusion and misunderstanding" (*Della pazzia in genere e in speczie*, trans. Mora).

Finally, outside of any medical context, it is prudent to avoid translating *mania* by "mania," since the English term is reserved for technical use; "madness," which remains the most general and least technical term, is used instead. It is common to see translators, out of a desire to avoid repetition, go so far as to translate *mania* by "frenzy." This is unfortunate, since in traditional nosography, *mania* is in fact opposed to "frenzy" (*phrenitis*). Translating *mania* by "delirium" should also be avoided, as since Pinel, we know that there are manias without delirium. *Mania* remains a technical term today, defined thus: "State of intellectual and psychomotor excitation, and exaltation of mood, with morbid euphoria, of periodic and cyclic evolution, entering the framework of manic-depressive psychosis" (RT: Postel, *Dictionnaire de psychiatrie*, s.v.).

■ See Box 1.

We may note, furthermore, that traditional nosography found itself overlaid, from the end of the eighteenth century on, with a "scientific" nomenclature derived from the medicalization of madness, henceforth defined as "mental illness." However, as Michel Foucault noted, between these two lexica of madness—that is, before the era of medicalization—an intermediate, purely descriptive terminology developed. A person was described as a "stubborn litigant," a "big liar," a "mean and quibbling" person, a "worried, despondent, and gruff mind":

There is little sense in wondering if such people were sick or not, and to what degree. . . . What these formulae

indicate are not so much sicknesses as forms of madness perceived as *character faults* taken to an extreme degree, as though in confinement the sensibility to madness was not autonomous, but linked to a moral order where it appeared merely a disturbance.

(Foucault, *A History of Madness,* 133)

II. The Latin Terminology: *Furor / Insania / Dementia*

A. Cicero as a translator of the Greeks

The uses of Latin terminology for madness are marked by the influence of Stoicism, the distinctions and analyses of which are taken up in contexts that are not strictly Stoic. Thus Cicero:

I shall . . . follow the time-honoured distinction made first by Pythagoras and after him by Plato, who divide the soul into two parts: to the one they assign a share in reason, to the other none. . . . Let this then be our starting point; let us nevertheless in depicting these disorders employ the definitions and subdivisions of the Stoics who, it appears to me, show remarkable penetration in dealing with this problem.

(Cicero, *Tusculan Disputations* 4.11, trans. King, 339)

A first attempt deals with the distinction of passions and illness, which the Greek groups under the general expression *pathê*:

1

Contemporary nosography

The conceptions of "madness" that were developed in antiquity did not find a place in the nomenclatures established by contemporary psychiatry, in which, for example, we find words or expressions like *aliénation mentale* (P. Pinel, 1797; "insanity" in English), *psychosis* (E. Feuchtersleben, 1844), *paranoia* (C. Lasèque, 1852) or *Verrücktheit* in German (W. Griesinger, 1845, then E. Kraepelin), *schizophrenia* or *dementia praecox* (E. Bleuler, 1908), and *phobia* (1880). In this new nosography, the denotations of ancient terms like *mania* [μανία], *phrenitis* [φρενῖτις], and *pathos* [πάθος] for the Greeks, or *furor*, *insania*, and *perturbatio* for the Romans (whose symptomatology generally went back to Hippocrates or Galen), often only retained from that point on a literary or popular usage.

The modern and contemporary nosography of madness relies on a wide variety of neologisms borrowed from Greek, such as "phobia" (from *phobos* [φόβος], illness whose primary symptom is a paralyzing and irrepressible fear when faced with an object or situation that in reality presents no danger; psychoanalysis refers to this rather as "anxiety hysteria"), "manic-depressive psychosis" (from the beginning of the twentieth

century, the third, after paranoia and schizophrenia, of the major current psychoses that is characterized by a disturbance of mood in which states of manic euphoria and fits of melancholy or depression alternate), "hysteria" (an eighteenth-century term; then, at the end of the nineteenth century, a collection of disorders that was initially believed to be related to eroticism originating in the uterus—from the Greek *hustera* [ὑστέρα]— and that relate to unconscious conflicts manifested by bodily symptoms and in the form of symbolizations), "paranoia" (from *paranoia* [παράνοια], a kind of systematic delirium in which interpretation predominates and which does not include intellectual deterioration; Freud saw it as a defense against homosexuality).

However, note that, alongside these various terms, psychiatry and psychoanalysis place emphasis on the idea of a *schize* or a defect in the personality of the subject, notably with regard to what is called "schizophrenia." This last term, by which Bleuler replaces the expression *dementia praecox* used by Kraepelin, comes directly from the Greek verb *schizô* [σχίζω], which means "to separate, split, dissociate," and which had already yielded "schism" in the sense of "separation." Thus schizophrenia

would be characterized by symptoms of mental dissociation, discordance of affects and frenzied activity that lead to a general withdrawal into oneself (autism) and a breaking off of contact with the external world. The same idea is found in the German noun *Spaltung* used by Freud, which French psychoanalysts translate by *clivage*, though often using it rather loosely, with the meaning of a dissociation of consciousness, or of the object, or of the ego—regarding this Freudian *Ichspaltung*, Lacan translates the expression as "refente du sujet" (*Écrits*, 842).

Terror, lusts, fits of anger—these belong, speaking generally, to the class of emotions which the Greeks term *pathê* [πάθη]: I might have called them "diseases," and this would be a word-for-word rending: but it would not fit in with Latin usage. For pity, envy, exultation, joy, all these the Greeks term diseases, movements that is of the soul which are not obedient to reason; we on the other hand should, I think rightly, say that these same movements of an agitated soul are "disorders," but not "diseases" in the ordinary way of speaking.

(Ibid., 3.7, trans. King, 233)

It is in the context of this general distinction that we must understand the etymological connection between *insania* (madness) and *insanitas* (ill health), on the basis of which Cicero develops the Stoic doctrine of passion/illness: "The word *insania* refers to a weakness and a sickness of the intelligence [*mentis aegrotatio et morbus*], that is, the ill health [*insanitas*] of a sick mind [*animus aegrotus*]" (ibid.). Thus the appeal to a play on etymology makes it possible to find a linguistic correlate of the symmetry between bodily and mental health, which is a philosophical construction. In this way, Cicero gives Latin a capacity that neither the general term *pathê* nor *mania* (which *insania* translates) has in Greek, at the expense of forcing Latin usage: whereas *sanus* may mean either healthy of body or healthy of mind, *insanus* only means "mentally ill / crazy."

Once this symmetry has been established, Cicero can interpret the only legal text from the classical period that refers to a person as a madman (*furiosus*), so that the oldest legal usage of the language coincides with the Stoic approach: *furor* is, just as much as *insania*, an imbalance of the mind, but it is such that it prevents one from fulfilling the obligations of life.

I cannot readily give the origin of the Greek term *mania:* the meaning it actually implies is marked with better discrimination by us than by the Greeks, for we make a distinction between "unsoundness" of mind, which from its association with folly has a wider connotation, and "frenzy." The Greeks wish to make the distinction but fall short of success in the term they employ: what we call frenzy they call *melancholia,* just as if the truth were that the mind is influenced by black bile only and not in many instances by the stronger power of wrath or fear or pain, in the sense in which we speak of the frenzy of Athamas, Alcmaeon, Ajax and Orestes. Whosoever is so afflicted is not allowed by the Twelve Tables to remain in control of his property; and consequently we find the text runs, not "if of unsound mind," but "if he be frenzied." For they thought that folly, though without steadiness, that is to say, soundness of mind, was nevertheless capable of charging itself with the performance of ordinary duties and the regular routine of the conduct of life: frenzy, however, they regarded as a blindness of the mind in all relations.

(Ibid., 3.11, trans. King, 237–39)

The distinction suggested on the authority of the Twelve Tables allows for a better account of what separates the state of fury of the great tragic heroes from the madness that the paradoxical definition of the Stoics attributes to the non-sages: this distinction does not exist in the verb *mainesthai*, which refers equally to the madness of Heracles, prophetic fury, and non-wisdom. The paradox "*hoti pas aphrôn mainetai* [ὅτι πᾶς ἄφρων μαίνεται]" is translated "*omnem stultum insanire*" (Cicero, *Stoic Paradoxes* 27). The choice of the Latin *stultus*, which does not connote madness, to render the Greek *aphrôn* [ἄφρων], whose most well-attested meaning is "demented/crazy," reinforces the effect of distinguishing them and expresses what is most characteristic of the Stoic doctrine of the passions: all passion comes from an error of judgment.

However, the distinction drawn does not simply dispose of *furor* as an illness of "great natures": Cicero refuses to attribute it to black bile, and presents it rather as a complete blindness that results from excess. In this way, he maintains the Stoic point of view by taking advantage of everything that, with regard to *furor*, connotes excess—from heroic fury to the self-dispossessions of erotic poetry—without appealing to a precise form of judgment. The term is also absent from the list of forms of anger that yields, in the Ciceronian translation, *ira, excandescentia, odium, inimicitia, discordia* (anger, irascibility, hate, enmity, resentment) (*Tusculan Disputations* 4.21).

B. *Furor* and *insania* in the Stoics

Cicero's attempts at drawing distinctions are largely adopted by Seneca, who nevertheless takes advantage of them to explore the confusion of moral and physical causes of collective disorder:

Between the insanity of people in general and the insanity which is subject to medical treatment, there is no difference, except that the latter is suffering from disease and the former from false opinions. In the one case, the symptoms of madness may be traced to ill-health; the other is the ill-health of the mind.

(Seneca, *Ad Lucilium epistolae morales* 94.7,
trans. Gummere, 3:21–23)

However, *furor* and *insania* are used conjointly to refer to evils of body and mind, the evil of the individual in civilization: *furor* refers to a state of ingratitude that has become so general that it threatens the foundation of all social bonds ("*Eo perductus est furor ut periculosissima res sit benificia in aliquem magna conferre,*" ibid., 81.31–32), or the blindness comparable to that of the clown who, having lost his sight, believed that the house had gone dark (ibid., 50). It is the state of all who can no longer perceive that they are affected, since the organ of judgment is too sick: Seneca's language exploits the symmetry between *insania* and *insanitas* more widely than Cicero does, to apply the Stoic paradox to a state of civilization: "We are mad, not only individually, but nationally [*non privatim solum sed publice furimus*]" (ibid., 95.30, trans. Gummere, 77).

III. Scholastic Expressions for Unreason and Christian Faith as "Madness"

A. The *fol*

From the eleventh century on, under the influence of the Gregorian reform and of Cluny, all the different components of European society came to be integrated into what

was called Christendom. Those who were excluded—Jews, Saracens, heretics—ran the risk of being accused of thinking or acting "differently." Their deviance was then classified as a major defect of confusion or madness. In the vernacular, the "other" was called a *sot* (in Old French *soz, sos*, from the medieval Latin *sottus*, of unknown etymology), a maniac, a *dervé*, insane, *fol*. This last term, which would take up a prime position in the language of madness, comes from the Latin *follis*, which means "pouch of sealed leather, goatskin flask, balloon or bellows for fires." Only in the Middle Ages does it take on a derisive second meaning, designating a stupid person or idiot.

In their own academic disputes in Latin, theologians did not refrain from stigmatizing their adversaries as incapable of correct reasoning, stricken with *stultitia, amentia*, or *furor*. However, among the terms related to unreason or mental confusion that they exchanged in more or less insulting ways, there are two terms that assume, in the disputes, a properly technical sense: *insipiens* and *phreneticus*. The first is the Vulgate translation of the epithet *aphrôn*, found in the Septuagint in the incipit of Psalm 52 (53 today), which stigmatizes unbelief. This incipit, in effect, appears in Latin bibles in the following form: "*Dixit insipiens in corde suo: Non est Deus*" (The fool said in his heart: There is no God). This is why medieval iconography illustrating madmen or madness takes as its frame the illuminations of the letter *D*, which is the initial letter of this verse of the psalm.

B. The *insipiens*

Unlike *fol*, *insipiens* is etymologically close to the idea of mental derangement, coming from *sapio*, "to have taste, discernment," and from *sapiens* as a noun or adjective "sage," referring to the non-sage—someone whose reason is faulty. It is translated into French as *insensé*, that is, someone whose statements are contrary to good sense and whose mind wanders (from *sensus* and, in the language of the Church, *insensatus*, an adjective that evokes absurdity, stupidity, idiocy, like "nonsense" in English).

Yet, even though this same attitude of mind, this unreason, was also imputed to the Jews, guilty of not having recognized Jesus as the Messiah, it is Anselm of Canterbury who pronounces it of its most emblematic figure, the monk Gaunilo, for refusing to accept the proof of God's existence offered by the author of the *Monologion* and the *Proslogion*. When Anselm attacks him, especially in chapters 2 and 4 of the latter, he never refers to Gaunilo by name—only, and often, as the *insipiens*. He asks in particular how this fool par excellence "could say in his heart what cannot be thought [*quomodo insipiens dixit in corde suo, quod cogitari non potest*]." What "cannot be thought" is that God does not exist, once one has in one's mind the idea of a being such that it is impossible to conceive a greater one. It is necessary, indeed, that he exists both in thought and in reality ("*et in intellectu et in re*"). "Why then *did the fool say in his heart: God is not*, . . . unless it is because he is stupid [*stultus*] and foolish [*insipiens*]?" (See SENSE.)

C. The *phreneticus*

Among the most violent attributions the authors of the Latin Middle Ages hurled at their opponents, we also find *phreneticus*. Thus, in the twelfth century, Richard of Saint-Victor

defends the constricting character of his argument relative to the Trinity by falling back on dialectic: "This hard to break triple-bond by which any frenetic destroyer of our faith finds himself firmly chained [*unde phreneticus quivis fidei nostrae impugnator fortiter alligetur*]," *De Trinitate*, 3.5). Yet the term *phreneticus* comes here not from a scriptural source, but from the tradition of Augustine, himself well aware of ancient medico-psychological terminology.

The bishop of Hippo first recalls the clinical table (cf. Guimet, "*Caritas ordinata* et *amor discretus*," 226–28). *Phrenesis* (from the Greek *phrenitis*) is a mental illness that engenders the loss of reason and that, for example, leads the subject to laugh when he should cry (*Sermo 175*, 2.2, RT: *PL* 38.945). It is sometimes accompanied by delirium, visions, and extravagant divinatory phenomena (*De Genesi ad litteram*, 12.17.35–36, RT: *PL* 34.468). It is indicated by disorders such as fever, abuse of wine, and insomnia, and leads to crises that become increasingly violent as death approaches (*De quantitate animae*, 22.38, RT: *PL* 32.1057, 40.1058; *Ennaratio in Psalmum 58*, RT: *PL* 36.696). In all of these symptoms, the "frenetic" is contrasted with the "lethargic," who founders constantly in inertia and in sleep (*Sermo 87*, 11.14; RT: *PL* 38.538).

Augustine then puts this classic schema to a moral and spiritual use. In his eyes, the two components of *phrenesis*, confusion and violence, are found in particular in the case of the Jews. It is under the influence of a virulent furor that they, refusing the salvation brought to them by Christ, made themselves executioners. And it is with respect to their blindness that the Messiah begs divine forgiveness for them: "They know not what they do." Attributing this same pathological state to his other adversaries, the Donatists, Augustine suggests binding the *phreneticus* with constrictive arguments (*Sermo 359*, 8, RT: *PL* 39.1596), a remedy taken up by Richard of Saint Victor in attempting to restrain this lunatic by means of dialectic.

Nevertheless, the *phrenesis* of late antiquity and the Middle Ages is paradoxically rehabilitated in the romantic period, continuing into surrealism, by so-called frenetic literature, which, especially in Charles Nodier (1781–1840), is presented as a deliberate intensification of sensuality, passion, imagination, revolt, and fantasizing.

■ See Box 2.

IV. Kantian *Schwärmerei* and the Relation to Belief

A. The "swarm of bees"

Originally, the German noun *Schwärmerei* meant the agitation of bees, which move about without stopping; more precisely, on the one hand, it means the disorderly movements of each of the bees considered independently, and on the other hand, it means the compact flight of the swarm forming a group, equally uncontrollable. This double meaning made it possible to apply the term to religious beliefs that could be stigmatized as "wandering" and "sectarian." Thus it was often used by Luther starting in the 1520s to denounce the "left wing" of the Reformation, which condemned the flesh in an exalted manner, interpreting the Gospel of John (6:63) in a fanatical sense: "It is the spirit that quickeneth; the flesh profiteth nothing." *Schwärmerei* connotes the exalted

2

The Pauline praise of madness

The parable of the wise virgins and the mad virgins (Matthew 25:1–2) only invokes madness as a synonym of distraction, casualness, lack of foresight: "Five among them were mad and five prudent [*pente de ex autôn êsan môrai kai pente phronimoi* (πέντε δὲ ἐξ αὐτῶν ἦσαν μωραὶ καὶ πέντε φρόνιμοι)]."

It is in Paul that the paradoxical situation in virtue of which Christian faith is a form of madness radically opposed to reason and common wisdom is described (1 Cor. 1:23–25): "We declare a Christ crucified, scandal for Jews and madness for pagans [*ethnesin de môrian* (ἔθνεσιν δὲ μωρίαν)] . . . for what is madness of God is wiser than men [*hoti to môron tou theou sophôteron tôn anthrôpôn estin* (ὅτι τὸ μωρὸν τοῦ θεοῦ σοφώτερον τῶν ἀνθρώπων ἐστίν)]." Paul adds (1 Cor. 3:18): "If someone among you thinks himself wise in the way of the world, let him become mad [*môros genesthô* (μωρὸς γενέσθω)]." And later in the same epistle (4:10): "We are mad [*êmeis môroi* (ἡμεῖς μωροὶ)], we, because of Christ."

To express this idea of madness and scandal applied to devotion to the crucified Christ, Paul appeals to the term *môria* [μωρία], which, present notably in Aeschylus and Plato, is related to the verb *môrainô* [μωραίνω], which means, in the transitive sense, first "to dull" or "to stultify" (cf. Matthew 5:13: "If the salt becomes bland [*môranthê* (μωρανθῇ)] . . ."), then "to make mad." Thus the adjective *môros* [μωρός] has the primary sense of "dulled" or "insipid," and the secondary sense of "mad" or "insane." Translated into the Vulgate as *stultitia*, *môria* comes in composition in Greek terminology with *sophos* [σοφός] and *phrôn* [φρῶν] to yield *môro-sophos* [μωρό-σοφος] and *môro-phrôn* [μωρό-φρων], terms meaning equally "madly wise" and "wisely mad," as though they were especially apt to express the Pauline paradox.

---

imagination that moves outside of accepted paths, the uninhibited stubbornness of beliefs, and sectarian behavior. It is truly an untranslatable term, since neither Latin, nor English, nor French has a term with any sort of link to the image of the swarm of bees, in which the evocation of the isolated adventure of a dreamer meets up, contradictorily, with that of the fanaticism of an uncontrollable group. In French, the term is translated as *exaltation*, *fanatisme*, or *enthousiasme*, depending on the case. In German military terminology, the image of the swarm is also invoked to refer to the activity of a scout who is detached from the group on a personal adventure, as well as the compact but uncoordinated movement of a group of soldiers.

B. Kant: From Swedenborg's hallucinations to Leibniz's idealism

The term *Schwärmerei* was used until the eighteenth century in theological controversies to refer to heretics, schismatics, and innovators who deviated and disturbed the equilibrium and calm of the Church. All of these uses involve insulting or stigmatizing labels rather than a clear concept. Kant transforms the polemical usage into a concept when, in 1766, in the *Dreams of a Spirit-Seer, Explained through Dreams of Metaphysics*, he describes the thought of the visionary Swedenborg as deriving from *Schwärmerei*, contrasting it with Leibnizian idealism. In this work, Kant analyzes at length the system of beliefs and thoughts that, based on the idea of the unreality of death, allows the seer to communicate with the spirits from beyond, who speak to him in virtue of the ecstatic transformations of his senses. The sensory hallucinations are interpreted by Swedenborg as a message from angels and the Christ, which reveal to him the true order of things under the appearance of laws of nature. The content of the images in these visions, which dwell in him, is related by this "prophet of the other world" to the text of Genesis, of which Swedenborg claims to give the correct interpretation by arguing that his "internal being is open" and that he is therefore himself the oracle of the spirits.

The terminology of *Schwärmerei* is thus related, in 1766, to that of ghosts and interaction with spirits. If, as we have just seen, the extravagance of the speeches and practices of the seer do not give rise only to ridicule but also to conceptual elaboration, the link between extravagance, madness, and the belief in spirits gives Kant the opportunity to play with these different terms. Indeed, besides *Schwärmerei*, German has another term that comes from the life of insects to express the ideas that populate the heads of deranged individuals: *Hirngespinst* (in RT: *Ak.*, 2:926). *Spinnen* means "to spin." *Hirngespinst*, just as untranslatable as *Schwärmerei* (except perhaps by "chimera" or "fantasmagoria"), refers to having a spider in the brain, or, as is sometimes said more colloquially, "to have spiders in the belfry." However, the images of bees and spiders are conjoined in the *Dreams of a Spirit-Seer* in such a way that the reference to the extravagance of interaction with the spirits yields another term, *Hirngespenst*, by which Kant means the notion of a "ghost in the head." The system of these different terms is what also transforms the sense of the word *Wahn*, which thenceforth means not so much illusion, understood as perception of an appearance, as madness—and this sense is maintained in the *Critique of Pure Reason*. The word *Wahn* is thus distinguished from all of those that Kant uses, from the *Essay on Illness of the Head* (1764) through *Anthropology Considered from a Pragmatic Point of View* (1798), where he attempts to classify all the forms of mental derangement according to the faculties, perceptual or intellectual, that are affected. Besides the common forms of head and heart sickness, which range from stupidity (*Blödsinn*) to clownery (*Narrheit*), derangement (*Verkehrtheit*) is the inversion (*Verrückung*) of empirical notions. Delirium (*Wahnsinn*) is the disorder that strikes judgment at the point closest to this perceptual experience; dementia (*Wahnwitz*) is the upsetting of reason in its most universal judgments. Of course, the term *Wahn* is related to *Wahnsinn*, "delirium," and in 1766 Kant writes that what interests him about Swedenborg is the disturbance of judgment at its closest resemblance to perceptual disorder, that is, the latter's hallucinations. But *Wahn* gets its specific meaning from the philosophical discussion that links Swedenborg's delirium to that of reason in the idealism represented by Leibniz.

When Kant comments on Swedenborg's *Arcana Coelestia*, he insists on the fact that, more than the wild construction in itself, what *Schwärmerei* really consists in is consistent sensory hallucination, when it feeds the belief in the unreality of death and in the communication with spirits, and, last but not least, when it constructs a philosophy of nature as simple appearance, which enters into the minds of men through the conversations they have with spirits from the beyond. It is as an idealist theory of nature that Kant connects *Schwärmerei* to Leibniz's thought. He makes the connection since, in 1766, Kant challenges rationalists to say in what the difference between the two systems of thought consists. However, the reformulation introduced in 1781 in the *Critique of Pure Reason*, when he gives a transcendental definition of the modality of our judgments, retains the imprint of this closeness established in 1766 between *Schwärmerei* and Leibniz's thought. Kant distinguishes, in effect, that which "without being impossible in the sense of contradiction, cannot be counted among the things that are possible." There are two forms of this impossibility in the transcendental sense: the Leibnizian intelligible world, and the fanatical world system of the *Schwärmer*. Further, in the preface to the first edition of the *Critique of Pure Reason*, Kant creates a composite word that unites once again the ecstatics and the dogmatists, against which the critique of reason will teach us to preserve ourselves. The critical response that he brings to bear on the problems of metaphysics will not be content, he says, with "the extravagant-dogmatic desires for knowledge" ("*Zwar ist die Beantwortung jener Fragen gar nicht so aufgefallen, als dogmatischschwärmende Wissbegierde erwarten mochten,*" in RT: *Ak.,* 3:14).

We may note that Kant uses *Schwärmerei* as a synonym for *Fanatismus* when he insists on the practical function of the extravagance that determines the will in these cases. This explains why, in the *Critique of Practical Reason*, the term "fanaticism" is most often used to refer to the insane illusion of moral and political reformers who wish to convince us that a good determined in its content is the absolute achieved. The formalism of morality according to Kant has the function of avoiding the madness of the will that is fanaticism. And we know that, in the *Kritik der Urteilskraft* (Critique of the power of judgment, usually translated as "Critique of the faculty of judgment"), Kant returns to the closeness of enthusiasm and fanaticism. It is this usage of the term *Schwärmerei*, and not its meaning as strictly related to critical and transcendental themes, that is taken up by all the authors, writers, philosophers, and poets of the romantic era in Germany. Its mild forms make it equivalent to whim, but a whim that cannot be uprooted, that develops into fantasies or all-pervasive beliefs.

▪ See Box 3.

V. The Right to Madness

At the end of the Middle Ages, in a register similar to that of the Pauline dialectic between the madness and the wisdom of the Cross, several currents of thought attempted to give a positive view of madness using the same terms that had thus far been considered pejorative, or at least to mitigate their seriousness. The fifteenth century locked up the cargo of the insane in the strange "Ship of Fools" (*Narrenschiff*), which long wandered the rivers and canals of the Rhineland

and Flanders. By contrast, Erasmus made his *Praise of Folly* (1509) the tool of a reversal that made it possible to see two very different aspects of all human things, one seeming glorious despite being pathetic (such as the conceits of scholars and theologians), the other held to be extravagant and contemptible, but in reality filled with a noble prudence and genuine wisdom. Montaigne does the same in making wisdom of madness and madness of wisdom. At the start of the seventeenth century, Cervantes's *Don Quixote* is a comic interrogation of the indefinite boundary between delirium and good sense, between enchantment and disillusionment (see DESENGAÑO). Fascinated by and basking in the feats of chivalry from old novels, the noble hidalgo of La Mancha leaves his village, wearing his armor, to make what he has read become real. In this way, though himself bewitched, he ends up bewitching the world and preserving truth through the lies of fiction.

In its turn, rationalism, especially that of Descartes and Spinoza, aims to banish the insane from the order of reason and to deny their psychic states any positive reality, whereas the *philosophes* of the Enlightenment make their position more nuanced by interpreting insanity as a ruse of nature that is only harmful past certain limits. The latter view clears of all charges, for example, the "literary madmen" of Raymond Queneau and Andre Blavier, and those who have given approval to what is called "the art of the mentally ill," inheritors of part of the positivity of Greek *mania*. However, the same attempt at understanding will underwrite the idea that madness can appear in anyone, even if its extravagance is not always perceptible.

Toward the end of the eighteenth century, indeed, the symbolic softenings attributed to Pinel with regard to the treatment of madness paradoxically liberate a highly vengeful language opposing the so-called scientific approach to psychiatry that accompanied them. Visiting the "lunatics" in a hospital, Charles Nodier, in *La fée aux miettes* (1832), defines the "madman" as "a discarded or chosen creature like you or me, who lives by invention, fantasy, and love in the pure regions of the intelligence." From romanticism to surrealism, with André Breton, Maurice Blanchot, and Michel Foucault, in relation to Gerard de Nerval, Comté de Lautréamont, Antonin Artaud, Vincent Van Gogh, Friedrich Nietzsche, and Friedrich Hölderlin, the claim "he is mad" is dropped in the face of the question, "Is he mad?" Thus, as Blanchot says about Hölderlin's extreme and genuinely schizophrenic fits:

> Madness would be a word perpetually in disagreement with itself, and thoroughly interrogative, so that it calls into question its possibility, and thereby, the possibility of the language which would compose it, hence the questioning as well, insofar as it belongs to the game of language . . . a language, as such, already gone mad.

Freudian *Schwärmerei*

Curiously, we find the term *Schwärmerei* in Freud, in a very specific sense. It does not refer, in the writings of the founder of psychoanalysis, to any form of delirium, nor any belief, but to the stories that adolescents tell each other when they bestow a worshipful love upon someone of the same sex: oaths of fidelity, daily correspondence, declarations of the absolute. These whims or flames usually disappear as if by enchantment, says Freud in *Drei Abhandlungen zur Sexualtheorie* (Three essays on the theory of sexuality [1905], in *Gesammelte Werke*, vol. 5), and in particular when love for someone of the opposite sex appears. However, there again, the paradox of the *Schwärmerei* is to be an uncontrollable belief despite its fragility, and to construct an imaginary world in which one is ecstatic. As a result, the term *Schwärmerei* is also used by Freud in two other cases. The first is in the exalted love of what is called "the young (female) homosexual" for a mature woman of low morals, to whom she attaches herself. The seriousness of the passion is shown when, meeting her father one day while she is walking with the woman of her thoughts, she throws herself off a bridge that overlooks a railway ("The Psychogenesis of a Case of Homosexuality in a Woman," [1920], in *Standard Edition*, 18:145–72). In another case, Freud describes as *Schwärmerei* the dedication of martyrs who do not feel pain when they suffer for their God ("Psychical [or Mental] Treatment" [1890], in *Standard Edition*, vol. 7). He insists there on the transition that takes place, in these experiences, between the perverse components of drives and the self-sacrifice that ensures belief (see "On the History of the Psychoanalytic Movement," in *Standard Edition*, vol. 14).

MALAISE (FRENCH)

➤ GOOD/EVIL

Malaise (the opposite of *aise* [ease] in French, from the Latin *jacere* [to throw], itself linked to the idea of dwelling, then to the idea of convenience and of pleasure), refers to a painful sensation, as much moral as physical, and in particular implies the more or less conscious, or more or less confused, perception of a dysfunction in the relationship between the soul and the body. The term *malaise* can cover a multitude of experiences of suffering, whether fleeting or chronic, slight or keen, that a person, but also a group, might undergo. An era, a language, a culture, or a nation can distinguish itself by naming, defining, or expressing its *malaise*, in literature as well as in philosophy.

I. A Dysfunction between Soul and Body

1. On the relationship between soul and body, the networks of affect and passion, see in particular CONSCIOUSNESS, DRIVE, GEFÜHL, GEMÜT, GOGO, LEIB, *PASSION,* PATHOS, PERCEPTION, PHANTASIA (and *IMAGINATION*), STIMMUNG, STRADANIE, UNCONSCIOUS, WUNSCH; cf., ANIMAL, LOVE, PLEASURE, SOUL, *SUFFERING.*

2. The physiological location in which malaise is rooted varies with the organic cause to which one attributes the dysfunction: so it could be the bile, see MELANCHOLY; the spleen, see SPLEEN; or the throat, see ANXIETY. The degree of its possible medical diagnosis and treatment varies as well: see MELANCHOLY; cf. GENIUS, MADNESS, PATHOS.

II. Sketch of a Typology of Different Kinds of *Malaise*

A. Individual suffering, ontological suffering, national suffering

Individual *malaise* can lead one to question one's relationship to being, and one's sense of belonging to the world; see ANXIETY, DOR, HEIMAT, Box 2, SAUDADE; cf. CARE, DASEIN, SORGE, *SOUCI,* and TRUTH, Box 8. It can also have a moral, religious, or social register, or bear witness to a whole era: see ACEDIA, SEHNSUCHT, SPLEEN.

In more general terms, these affects form part of a national cultural register, with the word used to designate them functioning as a password, even when it is "imported," like "spleen," for example: see ACEDIA, DESENGAÑO, DOR, SAUDADE, SEHNSUCHT, SPLEEN.

B. Models and expressions

A number of different temporal and spatial models are involved, one of the richest being the Greek *nostalgia*, always turning back to the past and seeking to return to the place of origin: see SEHNSUCHT, Box 1 and *NOSTALGIA*; cf. HEIMAT. But the future and the unknown beyond can be no less determining: see SAUDADE, SEHNSUCHT, cf. *DESTINY.*

The expressions of *malaise* and of pain are also significantly different from one another, implying syntactically the whole (Lat., *me dolet,* "I am suffering") or the part (Eng., "my foot aches"), and determining a relation to philosophy (*angst, Sehnsucht*), and/or to poetry (nostalgia, *saudade,* spleen), to literature (*desengaño*), or to silence (*acedia*): see all of these terms.

➤ PORTUGUESE, SVOBODA

MANIERA (ITALIAN), MANNER, STYLE

DUTCH	*manjer; handeling; wijze van doen*
FRENCH	*manière, faire, style*
GERMAN	*Manier; Stil*
ITALIAN	*maniera; stile*

➤ AESTHETICS, ART, BAROQUE, CLASSIC, CONCETTO, DISEGNO, GENIUS, GOÛT, INGENIUM, MIMÊSIS, ROMANTIC, TABLEAU

The word *maniera* as it was used in different languages, and understood in its different senses, was at the heart of the language of art criticism from the sixteenth to the end of the eighteenth century. It refers to the personal nature of an artist's work, to the taste of a whole school, and to the use of a formal language associated with a particular time and place (the Florentine manner, the Roman manner, the Flemish manner). When used with other adjectives (grand manner, strong or clashing manner) or with proper names (in the manner of Michaelangelo, of Carrache, of Raphael), it refers to the modes of expression chosen by artists. It can take on a negative connotation: a mannered artist is one who copies a manner, who neglects to imitate nature. This diversity of meanings led to a number of substitutes (in particular *faire* in French*, Stil* in German, "style" or "stile" in English, all with different nuances), and finally to the word being abandoned at the end of the eighteenth century.

I. *Maniera* and the Origin of Art Theory

It seems that the word *maniera* first appeared in Italian art literature. The first known occurrence is in the *Libro dell'arte* by Cennino Cennini, written at the end of the fourteenth century: "Always attach yourself to the best master and, following him everywhere, it would be unnatural for you not to take on his manner [*sua maniera*] and his style" (chap. 25). *Maniera* is here the characteristic hallmark of an artist, his signature style, but also the particular qualities that could, paradoxically, be acquired by others. For Raphael, in his letter to Pope Leo X (in *Gli scritti*) on the conservation of ancient monuments, the term can suggest the formal characteristics of a monument: "The monuments of our time are known for not having a *maniera* that is as beautiful as those of the time of the Emperors, or as deformed as those of the time of the Goths," which he describes later on as "dreadful and worthless"; these Gothic buildings, he writes, are "*senza maniera alcuna* [without any manner]." It was, however, in Vasari's *Le vite* that *maniera* became a key term in the language of art criticism. The different meanings and the frequency of its use made it one of the richest notions of Vasari's text. *Maniera* referred to the particular character of a people (Egyptian *maniera*, Flemish *maniera*. . .), and to the different stages in the evolution of art history (*maniera antica*, *maniera vecchia*, *maniera moderna*). Each artist had his own *maniera*, comparable to writing, and it was also sometimes defined with the help of adjectives ("hard," "dry," "great"). *Maniera* was also something like an artistic recipe, used to express the nonrepresentable effects of nature: sculptors tried to find a *maniera* to represent horses. It was above all the hallmark of the greatest artists (with Michaelangelo the foremost among them) who knew how to surpass nature. It could, finally, be a form of infidelity to nature, a simple artistic practice.

This meaning became more clearly developed in the seventeenth century, and the most famous expression of a critique of *maniera* is without doubt that of Bellori, in his introduction to the life of Annibale Carracci:

> Artists, abandoning the study of nature, have corrupted art with *maniera*, by which I mean a fantastic idea, based on practice and not on imitation.

> (*Le vite*, 31; *Lives of the Modern Painters*, trans. A. S. Wohl)

An art that is too dependent on *maniera* is removed from nature, and must therefore be condemned.

II. The Double Meaning of "Manner" in European Languages

The adaptation of the word *maniera* was a determining factor in the transmission of the Italian conception of the work of art to the different countries in Europe. It is striking, then, that in Dutch art criticism, the term *manier* was used in combination with the term *handeling*, which had an equivalent

meaning. So Van Mander (1604) talked about the *vaste stoute handeling* (the assured and bold manner) of painting, like the *vaste manier van Schilderen* of Cornelis van Haarlem. The word *manier* could also refer to a comparative art criticism: Van Eyck painted his draperies, according to Van Mander, *op de manier van Albertus Durerus* (in the manner of Dürer). Samuel van Hoogstraten, in his *Inleyding tot de hooge schoole des Schiderkonst* (Introduction to the high school of painting) (1678), uses different expressions incorporating the term—each with a slightly different meaning—within a span of two pages. He uses the word *manier* in a negative sense in talking about painters who adopt the habit of coloring "als of de dingen aen haere manier, en niet haere manier aen des aerd verbonden was" (as if things were dependent upon their manner, and not their manner dependent upon things). Yet the following chapter is entitled "Van der handeling of maniere van schilderen [Of handling or the manner of painting]," where *maniere* is spelled with an *e* at the end. In commenting on the word *handeling*, he talks about *wijze van doen* (way of doing), and the word *manier* in Holland indeed seemed to remain linked to the particular nature of the hand.

In France, the word had different meanings, and was used in different ways depending on the authors. Abraham Bosse, in his study of the manner of the greatest painters, adjudged that "if the natural was well copied according to the rules," there would not be so many different manners; but "because ignorance reigned for a period of time among the practitioners of this art, many of them as a result came to formulate manners that pleased their particular fancies" (*Sentiments sur la distinction des diverses manières de peinture* [Sentiments on the distinction between different manners of painting], 1649, p. 142). Manner was both the characteristic hallmark of an artist and a proof of whim opposed to nature. For André Félibien, manner was "the habit painters adopted in the practice of all the aspects of painting, whether it be composition, or design, or use of color" (*Des principes de l'architecture* [Principles of architecture], 1676). As he goes on to explain, "Painters normally adopt a habit that is related to the masters they have learned from, and whom they have wished to imitate. So we recognize the manner of Michelangelo and of Raphael in their students." Depending on which master or model a painter chose, the manner could be good or bad. As the result of this kind of training, manner was the equivalent of an "author's style," or the "writing of a person who frequently sends one letters" (ibid.). Roger de Piles borrows Félibien's definition and inflects it: "What we call Manner is the habit painters have adopted, not only in how they use the paintbrush, but also in the three main aspects of Painting" (*Conversations* [1677], unpaginated first draft of a dictionary). He eliminates the reference to the acquisition of manner from the masters, and goes on to compare manner to the "style and the writing of a man from whom one has already received a letter," whereas Félibien compares it to both. Although his formulation is close to Félibien's, Piles gives a wider sense to his definition. Manner was both a characteristic of the "hand" of an artist (handling a paintbrush, writing) and a characteristic of his mind (style). "All kinds of manner are good when they represent Nature, and their difference comes only from the infinite number of ways in which Nature appears to our eyes" (ibid.). Manner was the way in which each artist interpreted nature personally, and not the result of a scholarly apprenticeship.

The negative meaning gradually prevailed, however. Within the Académie Royale de la Peinture et de Sculpture, manner was condemned in a lecture delivered in 1672 by Philippe de Champaigne, "Contre les copistes de manière" (Against artists who copy manner), which would be delivered five more times between 1672 and 1728. The topic would be taken up again in 1747 in a lecture by the comte de Caylus, "Sur la manière" (On manner), which would also be delivered four times over the next twenty years. While Champaigne restricted his condemnation to the lack of originality of the painters who appropriated the manner of others, Caylus defined manner as "a more or less happy failing . . ., a habit of always seeing in the same way . . ., a thing we put in place of nature to be approved, by means of an art that consists merely of its perfect imitation." Painters who were renowned for having no manner would be deserving of the greatest praise. The lecture by Charles Antoine-Coypel on the "Parallèle entre l'éloquence et la poésie" (Parallel between eloquence and poetry) (1 February, 1749; published in 1751), though, was more in the tradition of Roger de Piles:

> Everyone knows that in talking about different kinds of writing we use the word "style," which thus signifies figuratively the manner of composition or of writing. As painters each have their own manner of composing and writing with a paintbrush, they could use this word, just as orators do. But they simply call this large part of their art "manner." So when I say that this painting is in the manner of Raphael, I put in the art lover's mind an idea that is equivalent to what a man of letters would think if I said this speech is in the style of Cicero.

Most dictionaries from the second half of the seventeenth century, which were often compilations, systematically presented these two meanings of the word "manner," namely the way of doing things that characterized the works of a particular artist, and the artistic failing that consisted in "departing from what was true, and from nature." They would generally distinguish between "having a manner" and "being mannered," even though there was often no clear distinction between this latter expression, and "having a bad manner." When "manner," understood in the sense of "a way of doing," was qualified by other adjectives ("strong and deeply felt," "weak and effeminate," "gracious," and finally "gentle and proper"), it enabled a series of categories to be established into which one could place all of the greatest painters. As for the "great manner," it was defined as a knowing exaggeration that created a distance from the baseness of the natural. This expression characterized paintings in which nothing is small, in which details are sacrificed for the idea, and it was, above all, the definition of a genre of painting.

Artists themselves, however, remained critical and used the word "manner" in a predominantly negative sense. For the painter Michel-François Dandré-Bardon, "Manner is an improper assortment of exaggerated traits and of excessive forms" (*Traité de peinture* [Treatise on painting]). He goes on to explain,

> This definition states clearly enough that by manner we do not here mean the way of doing things, the style

that distinguishes one master from another master, for in this sense everyone has his own manner . . ., besides the shame of ignorance, nothing is more insulting to an artist than being called mannered.

Manner understood in this sense was condemned less forcefully by the engraver and secretary of the Académie, Charles-Nicholas Cochin, than it was by Dandré-Bardon. In a lecture delivered in 1777 at the Académie of Rouen, Cochin took "manner" to mean not "the manner of painting or of drawing," but everything that was at a remove from nature, every "convention learned or imagined that is not based on what is true, either because it comes from imitating the masters, or from our own mistakes" (*Discours sur l'enseignement des beaux-arts*). For him, manner was associated with the search for an ideal beauty that was superior to nature. But he was nevertheless keenly aware of the technical limits of painting, and considered that it "is very difficult, and almost impossible, not to be somewhat mannered in painting shadows" (ibid., 21). This assimilation of "manner" to convention led to the word entering ordinary language, as is illustrated by Diderot's essay "On manner," published in the *Salon* of 1767:

> It would seem, then, that manner, whether in social mores, or criticism, or the arts, is a vice of a civilized society. . . . Every person who departs from the appropriate conventions of his state and of his nature, an elegant magistrate, a woman who despairs and swings her arms, a man who walks in an affected manner, are all false and mannered.

> (*Les Salons*, 3:335–39)

III. The Search for a Substitute in French: *Faire* (*Technique*)

This negative sense of *manière* prompted critics to look for an alternative term to describe an artist's personal way of painting or of drawing. The word *goût* (taste) had been used since the sixteenth century as a synonym for *manière*, and dictionaries would systematically cross-reference the two terms. Expressions such as "painted with great taste" or "a picture that shows a great taste in painting," "a taste like Raphael's," and so on, would continue to be found in many texts of art criticism. By the seventeenth century, however, the meaning of the word *goût* had become too broad for it to be able systematically to replace the word *manière*. Charles Nicholas Cochin attempted to substitute the noun *faire* for *manière*, and indeed refused to use *manière* to refer to the technical qualities of a painting, which in his view were the only ones that mattered:

> One of the greatest beauties of art . . . is . . . the singular effect of the sentiment that moves an artist while painting; it is this artistry in the work, this assuredness, this masterly ease, that often distinguishes beauty, that beauty which arouses admiration, from mediocrity, that always leaves us cold. It is that *faire* [technique] (as artists call it) that separates the original of a great master from a copy, no matter how well executed, and that characterizes so well the true talents of an artist, that the smallest, even most uninteresting detail of the

painting reveals to the connoisseur that the piece must be the work of a great master.

> ("De l'illusion dans la Peinture [On illusion in painting]," 1771)

Faire, used in the sense in which Bosse and Piles use *manière*, was thus the subject of long, enthusiastic definition, which allowed Cochin to defend *faire* against the accusation that it described just a kind of mechanics. Even in poetry, he would say, *faire* is essential, and is what distinguishes Racine's *Phèdre* from Pradon's. Dictionaries, however, would mention the term only very briefly, and would refer to *manière*, thus demonstrating the other term's relative failure. Watelet, in the RT: *Encyclopédie* of Diderot and d'Alembert, considered it to apply to the "mechanism of the brush and the hand." Dandré-Bardon, in his *Traité de peinture,* instead preferred *beau-faire* (fine technique).

Watelet and Lévesque's *Encyclopédie méthodique: Beaux-Arts* (1788–92) attests to the aesthetic revolution that was taking place around 1790. In the entry "Illusion," Watelet reproduced in its entirety a lecture by Cochin in which the word *faire* is foregrounded. Lévesque, who was responsible for completing the dictionary after Watelet's death (1786), asked the painter Robin for an article on "Beau-Faire" (which, under the same heading "Faire," had followed the former entry by Watelet in Diderot's *Encyclopédie*). Robin radically condemned the term: "It is not, however, that good technique [*le bien-fait*] or bad technique [*le mal-fait*] in art do not have their charm and their unpleasantness; but woe betide anyone who does not see them as the least worthy or most insignificant vice of a work of art!" The failure of the word *faire* is linked to the failure of an aesthetics that wanted to emphasize the technical qualities of painting.

IV. The Emergence of the Notion of "Style"

The notion of "style," which would ultimately replace that of manner, emerged gradually in art theory. It was used above all comparatively, but from the seventeenth century, certain writers tried to give the word some of the meanings of *maniera.* Thus, for instance, this passage, cited approvingly in his notes by Nicholas Poussin, which he found in and borrowed from A. Mascardi's treatise *Dell'arte istorica* (Rome, 1636):

> La maniera magnifica in quattro cose consiste: nella materia overa argumento, nel concetto, nella struttura, nello stile. . . . Lo stile è una maniera particolare ed industria di dipingere e disegnare nata dal particolare genio di ciascuno nell'applicazione e nel uso dell'idee, il quale stile, maniera o gusto si tiene dalla parte della natura e dell'ingenio.

> (The magnificent manner consists of four things: the matter or argument, the idea, the structure, the style. . . . Style is a particular manner or talent in painting and in drawing, which comes from the particular genius of each person in the application and use of the idea. This style, or manner, or taste, are on the side of nature and genius.)

> (Notes cited in Bellori, *Le vite de' pittori, scultori et architetti moderni* [1672], 480)

Style, or the particular manner, is thus subordinate to the grand manner, and is inherent in a creative personality. Despite the confused nature of the language, Poussin and Mascardi are certainly trying to draw a distinction between two meanings of the word *maniera*: one that has to do with the particular character of an artist, and the other that is presented as a rhetorical category characterizing the painting.

In France, the notion of style had been used as a comparative term by Félibien and Piles. Coypel's lecture cited earlier ("Parallèle," 1751) helped to determine the meaning of the word *style* as it applied to painting. Style was a reflection of content, and Coypel established the traditional distinction for painting among the heroic and sublime style (that of the frescoes of Michaelangelo and of Raphael in the Vatican), the simple style (landscapes and animals), and the tempered style (the historical paintings of Alabani or Maratta, subjects that were more graceful than impassioned). Style characterized as much the subject as the way in which it was handled. This parallel influenced dictionary definitions, which all noted that style was an inherent part of composition and execution. While the word indicated a reflection of the genre and the content as far as the composition was concerned, and a formal quality as far as the artistic execution was concerned, it was almost never used in isolation; it could be heroic, simple, tempered, and so on, or dry, polished, assured, harsh, and so forth. The term remained fairly marginal in France, however, and it was the translations of English and German texts that would help make "style" into one of the key notions of art theory.

While Johann Georg Sulzer, in his *Allgemeine Theorie der Schönen Künste* (General theory of art), used *Manier* in a sense very close to the French and Italian meanings, the word *Stil* began to appear in Johann Joachim Winckelmann almost simultaneously, and in a much broader sense. Winckelmann in 1764 made reference to "dem verschiedene Stile der Völker, Zeiten und Künstler" (*Geschichte der Kunst des Altertums* [*History of the Art of Antiquity*]), which his French translator J. Huber rendered in 1789 as "les différents styles et les différents caractères des peuples, des temps et des artistes" (the different styles and the different characters of the people, the times, and the artists)." *Stil* borrows certain of the connotations of "manner," but eliminates the particular role of the artist. Styles are characteristic of peoples and times, like manners for Vasari. Winckelmann thus studied the Egyptian style, the Etruscan style, and identified four styles among the Greeks: *Älter Stil*, which could be translated as "ancient style" or "style of imitation"; *hohe Stil* or *Stil der Grosse*, sublime or grand style; *schöne Stil*, beautiful style; and finally *Stil den heinlichen oder den platten*, minor and vulgar style. "Style" for Winckelmann, and similarly for Anton Raphael Mengs, thus replaced "manner" as a means of talking about the formal characteristics of a civilization, while "manner" introduced a personal dimension.

In England, there was a similar shift: the reflection on "manner" referred to *connoisseurship*, and the word was used in the senses Abraham Bosse gave to it. "Manner" still had a positive connotation in Jonathan Richardson, but a much more ambiguous one in William Hogarth:

What are all the manners, as they are called, of even the greatest masters, which are known to differ so much from one another, and all of them from nature, but so many strong proofs of their inviolable attachment to falsehood, converted into established truth in their own eyes, by self-opinion?

(*The Analysis of Beauty*, [1753])

Joshua Reynolds reversed the terms, and used the term "manner" negatively:

[T]hose peculiarities, or prominent parts, which at first force themselves upon view, and are the marks, or what is commonly called the manner, by which that individual artist is distinguished. . . . A manner, therefore, being a defect, and every painter, however excellent, having a manner.

(*Discourses on Art*, 6th Discourse [1774])

Reynolds introduced the term "style," while he spelled "stile" and "style" in a somewhat unsystematic fashion. "Stile" could be the equivalent of "manner" in the sense of designating the ways in which a subject is expressed: "Stile in painting is the same as in writing, a power over materials, whether words or colours, by which conceptions or sentiments are conveyed" (2nd Discourse [1769]), whereas "the style" would refer to the rhetorical category to which the work corresponds: "The *Gusto grande* of the Italians, the *Beau idéal* of the French and the 'great style,' 'genius,' and 'taste' among the English, are but different appellations of the same thing" (3rd Discourse [1770]). But the two meanings and the two spellings are also used interchangeably: "And yet the number is infinite of those who seem, if one may judge by their style, to have seen no other works but those of their master, or of some favourite whose manner is their first wish and their last" (6th Discourse [1774]).

In the *Encyclopédie méthodique*, Lévesque devoted an entry of five-and-a-half columns to the word *Style* (as much as the two combined entries of *Manière* and *Maniéré* [Mannered]). His definition, which he acknowledged was essentially taken from the writings of Mengs and of Reynolds, was an attempt to synthesize the meaning of *Stil* in Winckelmann and Mengs, and the second sense of "style" in Reynolds: "The combination of all the elements that come together in the conception, the composition and the execution of a work of art make up what we call its style, and one might say that it constitutes the manner of being of this work" (Watelet and Lévesque, *Encyclopédie méthodique*, "Style").

So even though the word "style" had been used previously in art criticism, it was only through the detour of its translation that it became established within a critical metalanguage and replaced "manner," at the expense, however, of a narrowing of its semantic field. "Style" quickly assumed all of the meanings that until then had been associated with "manner," with the exception of the sense of practice pure and simple, which was seen as negative. It did not encompass the particular character of the hand of an artist, and subordinated painting to style as a means of expressing an idea. In the nineteenth century, however, the contradictory senses of "manner" reappeared in relation to the word

"style," and brought into play at the same time the particular style of the artist, that of his time and his school, the mode of representation chosen, and the difference relative to a natural model. The nuances introduced by each artist in the use he made of this term make any single definition impossible, and leave translators no other solution but to adapt this catchall word to each of their respective languages so as to enrich their own treatises.

MATTER OF FACT, FACT OF THE MATTER

FRENCH   *fait, réalité*

➤ *FACT* and BELIEF, ENGLISH, NATURE, PROPOSITION, REALITY, SACHVERHALT, SENSE, TATSACHE, *THING*, TO TRANSLATE, *WORLD*

We will here be less interested in fact, than in the rather strange expression "matter of fact," which is found in English philosophy, and notably in Hume. "Matter" means (a) "material substance, thing" and (b) "affair, subject," and "matter of fact" thus in a sense replicates the word "fact." We might mention a number of typical common expressions, such as "for that matter," "a matter of time," "what's the matter with you?" but "matter" in its derived verbal form also indicates importance and implication: "no matter," "it matters." This specifically English double-meaning enables a number of clever plays on words, such as the title of Peter Geach's book *Logic Matters*, or Bertrand Russell's *What Is Mind? No Matter? What Is Matter? Never Mind*. It is an integral part of the semantics of the expression "matter of fact," which both refers to factuality and posits it as necessary and essential. This duality is found in the (absolutely untranslatable) inverted form of the expression, as it is used by the American philosopher W. V. O. Quine: "fact of the matter," which is a particularly forceful statement of factuality, while adding to this notion a physicalist dimension (the "fact of the matter" as a physical reality), but also, paradoxically, an ontological question.

I. "Matters of Fact"

"Matters of fact" (it is frequently in the plural in Hume) is normally translated into French as *faits* (facts), but also sometimes, with a surprising literalism, as *choses de fait* (factual things) (see the French translation of Book 1 of the *Treatise of Human Nature* by G. Tanesse and M. David, 1912; the term was retained in a recent edition by Didier Deleule). This translation, in addition to demonstrating the paradoxical nature of the expression "matter of fact," highlights the "hardness," or at least the reality of a fact defined in this way. It does seem

at first sight as if for Hume the expression "matter of fact" means an empirical fact, a state of affairs, which is part of reality: "This is a matter of fact which is easily cleared and ascertained" (*Treatise of Human Nature*, 1.1 §7, 19). "Fact" and "reality" sometimes appear to be synonymous: "If this be absurd in fact and reality, it must also be absurd in ideas" (ibid.).

"Matters of fact" are thus questions that concern the existence of objects, and empirical reality:

It is evident, that all reasonings from causes or effects terminate in conclusions, concerning matter of fact; that is, concerning the existence of objects or of their qualities.

(*Treatise of Human Nature*, 1.3 §7, 94)

We have to add that these "matters of fact" are objects of "belief." They are "conceived" by us; we have an idea of them, but a particularly strong and lively idea. This liveliness defines belief, which "super-adds nothing to the idea":

It is certain we must have an idea of every matter of fact which we believe. . . . When we are convinced of every matter of fact, we do nothing but conceive it.

(Ibid., 1.3 §8, 101)

These are the two aspects we also find in the famous definitions of *Enquiry Concerning Human Understanding*, a work in which Hume draws a distinction between "matters of fact" and "relations of ideas." Facts, by contrast with relations of ideas, are not known by understanding alone: their opposite is always possible, and the certainty proper to them is different:

All the objects of human reason or enquiry may naturally be divided into two kinds, to wit, *Relations of Ideas*, and *Matters of Fact. . . .* Matters of fact, which are the second objects of human reason, are not ascertained in the same manner; nor is our evidence of their truth, however great, of a like nature with the foregoing. The contrary of every matter is still possibility.

(*Enquiry*, 25)

We might wonder first of all what Hume means in referring to the "contrary" of a fact when he has defined a fact as an empirical fact, and not as an idea, a belief, or a proposition (whose object is a fact). Here we encounter a peculiarity of "fact" that "encapsulates" a state of affairs and a proposition, a specific characteristic indicated by the English expression "that-clause": a fact is expressed in the form "that *p*," which refers both to a fact and to a proposition:

That the sun will not rise tomorrow is no less intelligible a proposition, and implies no more contradiction, than the affirmation, *that it will rise.*

(Ibid., 25–26)

"That the sun will not rise tomorrow" is an "intelligible" proposition, which can be affirmed, but also a fact (see SACHVERHALT). To believe a proposition is not to have a feeling of belief that would be attached to a given proposition, it is to "believe a fact," directly so to speak, which is indicated by the construction "believe that."

If you were to ask a man, why he believes any matter of fact, which is absent; for instance, that his friend is in the country, or in France; he would give you a reason. . . . All our reasonings concerning fact are of the same nature.

(Ibid., 26)

"That-clauses" of this kind have been subsequently explored by contemporary philosophers of language, notably Ramsey, Austin, Strawson, and Davidson, in order to challenge the idea that there are objective "facts" (see BELIEF, PROPOSITION) that are objects of belief, or of statements. So they explore expressions such as "true to the facts" and "unfair to facts," as well as the question of what we say when we "say that" (see "On Saying That" in Donald Davidson, *Inquiries into Truth and Interpretation*). What is at stake is knowing whether we can eliminate the notion of fact from the theory of language.

II. The Expression "Fact of the Matter"

In several well-known texts, Quine used the expression "fact of the matter," as a rather puzzling inversion of Hume's expression "matter of fact" (the reinvention of Humean naturalism being one of Quine's goals, Hume is naturally one of Quine's main philosophical points of reference). The expression, first used in a negative form ("no fact of the matter"), suggests that some questions have no reality or foundation. Quine expresses this idea in the context of his thesis concerning the indeterminacy of radical translation. The situation of radical translation is the case where we are dealing with a radically foreign language, with no dictionary or tradition of translation, nor any bilingual interpreter, and where a linguist has to compose a translation manual from his or her empirical observations of the verbal behavior of an indigenous people. According to Quine's thesis, there are several possible, empirically equivalent, and incompatible translations of one and the same expression. It is meaningless to ask which is *the* correct translation, the correct reconstitution of the foreign language. In *From a Logical Point of View*, he summarizes his method using the expression *ex pede Herculem*: we can reconstitute the statue of Hercules from his foot, but there is nothing from which the language can be reconstructed, no "fact of the matter," no (physical) reality that allows us to ask the question:

In projecting Hercules from the foot we risk error, but we may derive comfort from the fact that there is something to be wrong about. In the case of the lexicon, pending some definition of synonymy, we have no statement of the problem; we have nothing for the lexicographer to be right or wrong about.

(*From a Logical Point of View*, 63)

Quine explains the meaning of the expression in the context of a polemical exchange with Chomsky by comparing the indeterminacy of translation to the underdetermination of theories by their data. Just as several theories can account for the same set of empirical data, several theories of language can account for the same verbal behavior. Linguistic theory, as part of science, is underdetermined by the data

of indigenous verbal behavior. But this is not sufficient to account for the indeterminacy of translation, which is a banal epistemological problem, since, as Quine explains, the indeterminacy of translation is *additional* to this empirical undeetermination:

> Though linguistics is of course a part of the theory of nature, the indeterminacy of translation is not just in-herited as a special case of the under-determination of our theory of nature. It is parallel but additional.

> (Reply to Chomsky, in *Words and Objections*, 303)

This is where the "fact of the matter" comes into play, with respect to empirical data as well, or even in a "physicalist" context, where reality is defined solely by the natural sciences: "This is what I mean by saying that, where indeterminacy of translation applies, there is no real question of right choice; there is no fact of the matter even to *within* the acknowledged under-determination of a theory of nature" (ibid.).

Translation has no "fact of the matter"; it translates "nothing." When a linguist thinks he has discovered something, he is only projecting his own hypotheses, "catapulting" himself, as Quine puts it, into a native language using the categories of his own language:

> There is no telling how much of one's success with ana-lytical hypotheses is due to real kinship of outlook on the part of the natives and ourselves, and how much of it is due to linguistic ingenuity or lucky coincidence. I am not sure that it even makes sense to ask.

> (*Word and Object*, 77)

There is no sense, or rather no reality (of "fact of the matter") to the question, since the translator, to a large extent, "reads" his or her own language into the native language. The absence of "fact of the matter" repeats in a particularly radical form Quine's critique of meaning: nothing is translated in translation, and no meanings or senses (see SENSE) of which the expressions in different languages would be the counterpart or the expression.

The "fact of the matter," as the redundant nature of the expression suggests, gestures toward a physicalist point of view, as Quine says in an article entitled "Facts of the Matter." If the question of translation—knowing which manual of translation is the "correct" one—is deprived of the "fact of the matter," it is because it has no physical relevance:

> My position was that either manual could be useful, but as to which was right and which wrong there was no fact of the matter. . . . I speak as a physicalist in saying that there is no fact of the matter. I mean that both manuals are compatible with the fulfillment of just the same elementary physical states by space-time regions.

> ("Facts of the Matter," in *Essays on the Philosophy of W. V. Quine,* 167)

A real difference for "fact of the matter" would be a dif-ference in the way elementary physical states are distrib-uted. However, we should not deduce from this that the notion is just a physical one, which would weaken Quine's thesis. It is a naturalist notion (and here, very character-istically, the reference to Hume reappears): the notion of "fact of the matter" is intrinsic to scientific theory; this factuality is defined by our theory of the world, as a prod-uct of human nature. The "fact of the matter" is no longer a physical substratum ("a distribution of elementary physi-cal states") that is independent of language, but also turns out to be, by an effect of *mise en abyme*, part of our con-ceptual schema: "Factuality, like gravitation and electric charge, is internal to our theory of nature" (*Theories and Things*, 23). The notion "fact of the matter" is itself to be considered immanently. This is Quine's conclusion in *Theo-ries and Things*: "The intended notion of matter of fact is not transcendental or yet epistemological, not even a question of evidence; it is ontological, a question of reality, and to be taken naturalistically within our scientific theory of the world" (23).

So the truly radical nature of his notion of "matter of fact" comes to the fore in Quine's late texts: it refers not only to empirical evidence, like the Humean "matter of fact," but also to a radical ontological indeterminacy. "What counts as a fact of the matter" is, as such, subjected to indeterminacy: "We can switch our own ontology too without doing violence to any evidence, but in so doing we switch from our elementary particles to some manner of proxies and thus re-interpret our standard of what counts as a fact of the matter" (*Theories and Things*, 23).

MEDIA / MEDIUM (of communication)

I. The Magic of Words

Here is Freud in 1890 on "Psychische Behandlung (Seelenbehandlung)" for a medical manual whose title, *Die Gesundheit*, needs no translation:

> Wir beginnen nun auch den "Zauber" des Wortes zu verstehen. Worte sind ja die wichtigsten Vermittler für den Einfluß, den ein Mensch auf den anderen ausüben will; Worte sind gute Mittel, seelische Veränderungen bei dem hervorzurufen, an den sie gerichtet werden, und darum klingt es nicht länger rätselhaft, wenn behauptet wird, daß der Zauber des Wortes Krankheitserscheinungen beseitigen kann, zumal solche, die selbst in seelischen Zuständen begründet sind.

> (*Gesammelte Werke*, 5:301–2)

The French edition of this text, translated and edited by Jean Laplanche, renders the paragraph:

> A présent, nous commençons également à comprendre la 'magie' du mot. Let mots sont bien les instruments les plus importants de l'influence qu'une personne cherche à exercer sur une autre; les mots sont de bons moyens pour provoquer des modifications psychiques chez celui à qui ils s'adressent, et c'est pourquoi il n'y a désormais plus rien d'énigmatique dans l'affirmation selon laquelle la magie du mot peut écarter des phénomènes morbides, en particulier ceux qui ont eux-mêmes leur fondement dans des états psychiques.

> ("Traitement psychique [traitement d'âme]")

Finally, here is Strachey's translation in the *Standard Edition*:

> Now, too, we begin to understand the "magic" of words. Words are the most important media by which one man seeks to bring his influence to bear on another; words are a good method of producing mental changes in the person to whom they are addressed. So that there is no longer anything puzzling in the assertion that the magic of words can remove the symptoms of illness, and especially such as are themselves founded on mental states.

> ("Psychical [or Mental] Treatment")

Even after setting aside the problems of translation in general and of the Freud translation in particular, we are left to wonder over Strachey's choice of the word "media" where Freud wrote *Vermittler* and the French translators opted for *instrument*—not because "media" works poorly, but because it works so well, perhaps better than the original. A *Vermittler* is a person who acts as a broker or intermediary; to suggest that words are the most important, *Vermittler* is to offer us a metaphor that evokes a person in a well-tailored suit working on commission. The French *instrument* presents still other challenges of interpretation, not metaphorical this time, but metonymic. The claim that words are instrumental in exercising influence is clear enough. But what about the claim that they are the "most important" instruments? Compared to what? The dictionary offers us such examples of the word *instrument* as "compasses" (*un instrument de bord*)

and "tractors" (*un instrument agricole*) but nothing that would make a compelling alternative to "words," which is what it would take for Freud's argument to make sense.

By contrast, the English word "medium" raises far fewer difficulties, and the ones it does raise are much more interesting. The RT: *Oxford English Dictionary* tells us that a medium is "any intervening substance or agency." We understand right away that Freud is arguing that of the various substances or agencies through which men and women seek to intervene in one another's lives—drugs, money, caresses, and so on—words are the most effective when it comes to producing beneficial changes in mental states. It would have been helpful if Freud had specified whether he meant spoken words or written words, or both, but that is a problem of argumentation rather than of language or translation. In short, the term makes it easier to understand Freud's claim and then to have an argument about it. After centuries of untranslatability, "medium" has been welcomed into French and German and a number of other languages for precisely this reason. It allows authors to join an argument long dominated by Anglo-American philosophy, social science, and industry.

II. A Wonderfully Perfect Kind of Sign-Functioning

The Latin adjective *medius* has roots in the Sanskrit *madhya* and the Greek *mesos*, all three terms meaning something like "in the midst" or "in the middle." One could be in the midst or middle of any number of things, some quite concrete—the distance from here to there—and others more abstract. Hence Quentin Skinner cites Cicero's maxim in *De officiis* that "our highest duty must be to act in such a way that *communes utilitates in medium afferre*—in such a way that the ideal of the common good is placed at the heart of our common life." This idea was taken up by Renaissance civic humanists, who held that classical virtues "ought to be in medio, in our midst; they ought indeed to be actively brought forth in medium, into the center of things" (*Visions of Politics*).

"Medium" approaches a recognizably modern sense when, in addition to being a place where ideas or affects can be brought forth, it becomes a way of bringing them forth. One of the first appearances of this notion is in book 2 of Bacon's *Advancement of Learning* (1605), where Bacon takes up Aristotle's claim that "words are the images of cogitations, and letters are the images of words." This may be true, he writes, "yet it is not of necessity that cogitations be expressed by the medium of words." Bacon mentions the gestures of the deaf and dumb, Egyptian hieroglyphs, and Chinese characters. One could even say it with flowers: "Periander, being consulted with how to preserve a tyranny newly usurped, bid the messenger attend and report what he saw him do; and went into his garden and topped all the highest flowers, signifying, that it consisted in the cutting off and keeping low of the nobility and grandees" (in *The Major Works*).

This argument may well have been influenced by Montaigne, who, in one especially beautiful passage in the "Apology for Raymond Sebond" (1580), reflected on the many forms of communication available to animals and men: "After all, lovers quarrel, make it up again, beg favors, give thanks, arrange secret meetings and say everything, with

their eyes." Not only eyes, but heads, eyebrows, shoulders, and hands communicate "with a variety and multiplicity rivalling the tongue." Montaigne called these *moyens de communication* (John Florio's 1603 translation of the essay translates this as "meanes of entercommunication"). But there is a crucial difference between Montaigne and Bacon's theories of media: Montaigne is concerned to show the many ways men and women can communicate with one another; Bacon wants to find the most effective ways. The introduction of "medium" into English-language theories of communication shifted the grounds of philosophical debate toward pragmatic matters.

This shift was helped by the word's associations with natural philosophy, which classified media according to how they assisted or resisted whatever passed through them (e.g., light, magnetism). "When the Almighty himself condescends to address mankind in their own language," James Madison writes in Federalist Paper no. 37 (1788), "his meaning, luminous as it must be, is rendered dim and doubtful, by the cloudy medium through which it is communicated." Madison's pun neatly captures this conflation of the two senses of medium in English; such a pun would not have been possible in French or German (the French translation of 1792, usually attributed to Trudaine de la Sablière, misses it entirely by describing His will as "obscurcie par le voile dont elle s'envelope"; a translation of 1902 by Gaston Jèze does much better with "le nébuleux moyen par lequel elle est communiquée").

As chemical and mechanical technologies for reproducing words and images proliferated in the nineteenth century, so too did the sense that these technologies were members of the same conceptual family: the family of media. Thus a treatise on libel from 1812: "Libel in writing may be effected by every mode of submitting to the eye a meaning through the medium of words; whether this be done by manual writing, or printing, or any other method" (George, *A Treatise on the Offence of Libel*). The formula "medium of words" evokes Bacon, but the emphasis is now on the "symbolical devices," as the author calls them, rather than on the symbols themselves. The word "medium" could expand to include nearly anything that facilitated communication. In his 1864 account of the analytical engine, one of the first general-purpose computers, Charles Babbage explains that it functioned through the "medium of properly-arranged sets of Jacquard cards" (*Passages from the Life*)—the punch cards engineered by Joseph-Marie Jacquard to operate his automatic looms. By the turn of the twentieth century, the concept had expanded yet again to include new electrical means of communication. (On electrification's contribution to the unification of a concept of media, see Gitelman and Collins, "Medium Light.")

■ See Box 1.

This proliferation was such that Charles Sanders Peirce attempted to arrive at a formal definition in his 1906 essay "The Basis of Pragmatism in the Normative Sciences." What do all these media have common? "A medium of communication is something, A, which being acted upon by something else, N, in its turn acts upon something, I, in a manner involving its determination by N, so that I shall thereby, through

A and only through A, be acted upon by N." He offered the example of a mosquito, which is acted upon by "zymotic disease," which it in turn transmits to a new host animal in the form of a fever. It was an odd example, logically and biologically, and Peirce recognized its oddness. "The reason that this example is not perfect is that the active medium is in some measure of the nature of a vehicle, which differs from a medium of communication in acting upon the transported object, where, without further interposition of the vehicle, it acts upon, or is acted upon by, the object to which it is conveyed." In other words, the mosquito did not simply transmit the zyme unchanged; it transformed the zyme into a fever. This logic of the parasite stood in contrast to a classically logocentric scenario: "After an ordinary conversation, a wonderfully perfect kind of sign-functioning, one knows what information or suggestion has been conveyed, but will be utterly unable to say in what words it was conveyed, and often will think it was conveyed in words, when in fact it was only conveyed in tones or facial expressions" ("The Basis of Pragmatism").

III. A Somewhat Cumbrous Title

Samuel Weber has argued that the modern era is characterized by a theological stance that attributes to media "the function of *creatio ex nihilo*." "The 'singularization' and simplification of the complex and plural notion of 'the media' would be a symptom of this theology" (*Benjamin's -abilities*). He credits this sacralization to Hegel, whose notion of mediation (*Vermittlung*) elevates the process to world-historical importance. However, it was not only, or even mainly, speculative philosophy that gave us "the media" as an uncountable noun with innumerable powers. It was Anglo-American social science.

By the beginning of the twentieth century, the recognition of a family resemblance between the various "implements of intercommunication" (to take another phrase of Peirce's) meant that they could be compared and contrasted in profitable new ways (Weber, ibid.). "The medium gives a tone of its own to all the advertisements contained in it," writes Walter Dill Scott, a student of Wilhelm Wundt, who was a professor of applied psychology at Northwestern University, in his *Theory of Advertising* of 1904. Scott made this remark in a section of his book entitled "Mediums," but this form was soon obsolete. The plural would vacillate in grammatical number before settling into a singular that could be labeled as "mass," "mainstream," "new," and so forth. Indeed, as late as the 1940s, it was still necessary to explain what one meant by "mass media." Julian Huxley, presiding over the newly formed UNESCO in 1946, announced that "Unesco is expressly instructed to pursue its aims and objects by means of the media of mass communication—the somewhat cumbrous title (commonly abbreviated to 'Mass Media') proposed for agencies, such as the radio, the cinema, and the popular press, which are capable of mass dissemination of word or image" (the English text of Article I reads "means of mass communication"; the French text, "organes d'information des masses").

The term "mass media" found its niche in scholarly articles by such influential American midcentury thinkers as Hadley Cantril, Harold Lasswell, and Paul Lazarsfeld.

1

Ordinateur/Computer/Numérique/Digital

For the advocates of a purity of the French language jeopardized by the multiplication of imports from English, computer science and digital culture have represented an important battleground because of the Anglo-American preeminence that has marked them since their beginnings in the 1940s. In their perspective, the adoption of terms like *ordinateur* and *informatique* to designate computer and computer science appeared as clear victories. These words not only sounded French, they also conveyed a different take on what computing was about. More recently, however, the line of demarcation has become less evident because of the ambiguity that surrounds the definition of *numérique* versus digital.

Ordinateur was proposed in 1955 by the Latin philologist and Sorbonne professor Jacques Perret, who had been asked by one of his former students to suggest French names for the new machines that IBM was about to commercialize in the country. Perret suggested *ordinateur*, which applied to the capacity of someone to arrange and organize. *Ordinateur* used to have strong religious connotations. According to the RT: *Le Littré*, the adjective had been applied to God bringing order to the world. It also designated the person in charge of ordaining a priest. But very few persons would be aware of this religious dimension, argued Perret, so that the name would essentially relate to the notions of ordering and accounting, just like the other French term, *ordonnateur*, which was used in the administration for officials with power to authorize expenditures. *Ordinateur* was from the start a success. It was even transposed in Spanish and Catalan as *ordenador* and *ordinador*. (It is however worth noting that most other Romance languages preferred to translate the word "computer": *calcolatore* in Italian or *calculator* in Romanian.) This success coincided with a major evolution in the public perception of computers. Whereas the first machines had been generally envisaged as mere computing devices, the accent was shifting toward their capacity to order logical propositions, a capacity that seemed to announce the possibility of an artificial intelligence. Thus, despite its French particularism, *ordinateur* was in profound accordance with a worldwide transformation epitomized by the 1968 science fiction film *2001: A Space Odyssey*. In charge of every aspect of the mission to Jupiter staged in the film, the HAL 9000, the ship's computer, was definitely more an *ordinateur* than a computing device.

Informatique was another major success. Coined in 1962 by a former director of the computing center of the French company Bull, Philippe Dreyfus, from the contraction of *information* and *automatique*, the term was officially endorsed during a cabinet meeting by President Charles de Gaulle, who preferred it to *ordinatique* to name the science of information processing (see Mounier-Kuhn, *L'informatique en France*). Around the same time, the German *Informatik*, the English "informatics," and the Italian *informatica* also appeared. But the French term has enjoyed a widespread use without equivalent in other countries. Since its adoption, first by the government, then by the French Academy, the term has evolved in two seemingly discrepant directions. On the one hand, it covers a much broader range of subjects and domains than was envisaged by its creator and early promoters. Beside computer science proper, it applies to information technology as well as to the entire computer industry. On the other hand, it retains a distinctive scientific flavor. In French, *informatique* seems to belong to the same disciplinary family as mathematics, thus putting the emphasis on the abstract dimension of computer science, on its logic and algorithmic content. It is worth noting that until recently, computer science was often associated with mathematics in the programs of study of French higher-education institutions. Such an association bore the mark of the long-standing approach of technology as an "application" of pure science, a conception epitomized by institutions such as the École Polytechnique. At this stage it would be tempting to contrast a French propensity toward abstraction when dealing with computer and digital subjects with a more concretely oriented English vocabulary. Browsing through the various official publications devoted to French alternatives to the use of English words and expressions (the feared *anglicismes*), such as the *Vocabulaire des techniques de l'information et de la communication* published in 2009 by the Commission Générale de Terminologie et de Néologie, the official committee for seeking such alternatives, seems to confirm such an opposition. The contrast between the French *numérique* and the English "digital" could easily pass for a typical instance of this divergent orientation. A closer examination reveals, however, a more confusing set of relations between the two terms, as if the full meaning of what is at stake in their contemporary use could be apprehended only by playing on the interwoven resonances that they evoke. This ambiguous relation might represent an incentive to question the opposition mentioned above between allegedly French and English approaches to computer and digital subjects.

Numérique versus "digital": both terms derive from a similar reference to numerals. The French term is directly related to *nombre* and *numération*, whereas the English comes from "digit." Contrary to its French equivalent, "digit" refers to the concrete operation to count on one's fingers: *digitus* means "finger" or "toe" in Latin. The term "digital" is thus well adapted to the most recent evolution of computer culture, namely, its more and more concrete, almost tactile, turn. Conceived initially as mere electronic calculators, then as logical machines that could possibly become intelligent in the future, computers have become emblematic of a new cultural condition giving priority to the individual and his/her sensations and emotions. This evolution had been foreseen by Nicholas Negroponte, the founder of the Massachusetts Institute of Technology Media Lab—an institution devoted to the exploration of the new possibilities of interface between human and machine. In his 1995 book, *Being Digital*, Negroponte opposed the information age to the digital age about to unfold. According to him, whereas the former was all about anonymity, standardization, and mass consumption, the new cultural era would see the rise of individual experience and preferences.

The French *numérique* definitely misses this individual and sensory dimension. But the full scope of what is at stake in the rise of digital culture is perhaps better understood by playing on the extended resources that a comparison between English and French offer. The lack of direct tactile connotation of *culture numérique* is partly compensated by the fact that the adjective "digital" is more clearly related to fingers in the French language. It applies among other things to fingerprints: *empreintes digitales*. With the new importance given to biometrics in emergent digital culture, this connection matters. It reveals that what is at stake today is not only individual experience but also identification by institutions and corporations. From numbers to fingers and back, it becomes then interesting to work constantly on the border between French and English, on a moving threshold marked by disconcerting exchanges and uncanny inversions of meaning.

But European philosophers resisted this tendency. Their attitude is summed up by Sartre in a fragment from his notebooks of 1947–48 entitled "The American Way: Technical Civilization, hence Generality": "This is what mass media, best seller, book of the month, best record, Gallup, Oscar, etc., tend to do," he wrote, leaving all the important words in English. "It is a matter of presenting to the isolated exemplar the image of the totality" (*Notebooks for an Ethics*). Back in Germany, Adorno also took his distance from a term that he had resorted to repeatedly while in exile. In "The Culture Industry Reconsidered," first delivered as a radio address in 1963, he argued that "the very word mass-media [*Massenmedien*], specially honed for the culture industry, already shifts the accent onto harmless terrain. Neither is it a question of primary concern for the masses, nor of the techniques of communication as such, but of the spirit which sufflates them, their master's voice." For Sartre, Adorno, and their contemporaries, "mass media" was less an untranslatable than an untouchable sullied by intellectual and institutional associations with American cultural imperialism. The entry in the current edition of the RT: *Dictionnaire de l'Académie Française* reflects this sense of its origins: "Média. n. m. XXe siècle. Abréviation de l'anglais des États-Unis mass media, de même sens."

This resistance was soon exhausted. In the late 1960s, the German publishers of Marshall McLuhan's *Understanding Media* settled on the weirdly operatic title *Die magichen Kanäle*. At the end of the century, a collection of McLuhan's writings appeared under the title *Medien Verstehen: Der McLuhan-Reader* (1998). In France, in the 1990s, Régis Debray launched the excellent *Cahiers de médiologie*, devoting issues to themes like theatricality and bicycles; more recently he started a review entitled, simply, *Médium.* Cognates like "multimedia," "remediation," and "mediality" proliferate globally. This reflects less the dominance of English than the collective urgency of an intellectual project. "For the moment," Jean-Luc Nancy writes, "it is less important to respond to the question of the meaning of Being than it is to pay attention to the fact of its exhibition. If 'communication' is for us, today, such an affair—in every sense of the word . . . —if its theories are flourishing, if its technologies are being proliferated, if the 'mediatization' of the 'media' brings along with it an auto-communicational vertigo, if one plays around with the theme of the indistinctness between the 'message' and the 'medium' out of either a disenchanted or jubilant fascination, then it is because something is exposed or laid bare" (*Being Singular Plural*).

MELANCHOLY

FRENCH	*mélancolie*
GERMAN	*Melancholie, Schwermut*
GREEK	*melagcholia* [μελαγχολία]
LATIN	*melancholia, furor*

➤ ACEDIA, DESENGAÑO, DOR, ES, FEELING, GEMÜT, GENIUS, INGENIUM, I/ME/MYSELF, LEIB, MADNESS, *MALAISE*, PATHOS, SAUDADE, SEHNSUCHT, SPLEEN, STIMMUNG

Although we can date the origin of what we know as modern psychiatry back to the work of Philippe Pinel—whose *Medico-Philosophical Treatise on Mental Alienation or Mania* (year IX, 1801) signaled both the autonomy of mental illness as a field of study separate from physiology and the application of new clinical and institutional practices to the treatment of patients—the study of mental illness, or of madness, as a discipline has a longer history that goes back to antiquity. The word "melancholy" at that time referred to a state of sadness and anxiety, without a fever, and most often accompanied by an obsession, or near delirium, this state being marked by an excess of black bile, which some authors considered to be the cause of the illness and others as a concomitant symptom.

The word "melancholy," then, comes originally from the Hippocratic theory of the humors (*melas* [μέλας]), "black"; *cholê* [χολή], "bile"), as well as from a chemical theory of fermentation and of vapors, and would continue to be understood more or less explicitly as such until the nineteenth century, even though "melancholy" tended by then to refer to a state of mental alienation that was increasingly distinct from physiology. By exploring the history of the term and the shifts in its meaning, we can thus identify four themes and points of reference to consider diachronically: the conception of humor, the symptom of obsession, lovesickness, and the nature of genius. The way in which we will discuss them will help us to differentiate between the major trends of English, German, and French psychiatry, and the typologies that they propose.

One might have thought that the general application in psychiatry of the assessment scales of humor—in its psychological sense, close to the Greek *thumos* [θυμός], and its disorders (*dusthumia* [δυσθυμία])—would have attenuated the former denotations of the term "melancholy." It seems, however, that modern approaches to melancholy—particularly as it is manifested in mourning, psychomotor slowing down, generalized negativism, or intellectual hyperlucidity—are on the contrary reviving the figures as they were used by writers in antiquity, in that they pertain more to actual psychological mechanisms than to simple semantic analogies.

I. The Ambiguity of the Concept

From the perspective of contemporary psychiatry, melancholy is something of a paradox, in that it has to take account both of the relativity of a nosology that has largely been superseded by our understanding of how complex affections are, and also of the uniformity of a semiology determined by the different scales of assessment of the symptoms (for the most part American) which European psychiatry is compelled to use as its points of reference. Nevertheless, melancholy still seems to elude any attempt at a definitive classification, as can be seen, for example, in the shift from *DSM III* (*Diagnostic and Statistical Manual of Mental Disorders*) (1980) to *DSM III-R* (1987), and then *DSM IV* (1994), which sees a modification of the diagnostic signs of melancholy, as well as in the CIM (Classification internationale des maladies de l'OMS), known as the ICD in English, which practically eliminates it.

The problem is not a new one, and Jean-Étienne Esquirol, in his work *De la lypémanie ou mélancolie* (On lypemania or melancholy) (1820), already wrote that "the word *melancholy*, widely used in ordinary language to express the habitual sadness of a few individuals, must be left to the moralists and poets, who do not have to be as rigorous as doctors with their expressions. This term can be retained and used to describe the temperament in which the hepatic system is predominant, and to refer to the disposition to obsessive ideas and sadness, while the word *monomania* expresses an abnormal state of physical or moral sensibility, with an unconscious and permanent delirium." Esquirol adopted the word *lypemania* (*lupê* [λύπη], "sadness") in place of "melancholy," and used the latter term to refer on the one hand to a disposition of the temperament—a permanent state (*hexis* [ἕξις]), a predisposition (*proclivitas*)—and on the other, to the open manifestation of the illness, a punctual, accidental state (*diathesis* [διάθεσις]), the manifestation of the ill (*nosos* [νόσος], *nosêma* [νόσημα]).

The interest of this ambiguity particular to "melancholy" as a term is expressed throughout the history of psychiatry, whose origin can be traced back to the end of the eighteenth century with the practice of "moral treatment," via two paradoxical semiological forms, made up of contradictory traits, such as the signs of genius and of madness on the one hand, and the signs of what was permanent and accidental on the other. The dispositional characteristics of genius were thus manifestations of a humor that could just as easily lead to madness, as a result of a momentary disturbance of thymic equilibrium. Although European psychiatry is still relatively young, it does not for all that challenge the traditional historical sources from which it emerged, both medical and philosophical, however attentive it appears to be to international (for the most part originally American) systems of diagnosis. As testimony to this, we might take current debates, often inspired by psychoanalysis, about the meaning of the term "melancholy," in other words, about the specific signs that guide its classification in the three main traditional nosographic groups (neuroses, psychoses, and perversions). Already in 1915, at the beginning of his article "Mourning and Melancholia," Freud wrote: "Melancholia [*Melancholie*], whose concept [*Begriffsbestimmung*] fluctuates even in descriptive psychiatry, takes on various clinical forms the grouping together of which into a single unity does not seem to be established with certainty; and some of these forms suggest somatic rather than psychogenic affections." The study of the concept is further complicated if we take into account another tradition, in parallel with the medical history of the shifts in its uses and meanings, that is, the ethological tradition (*ethos* [ἔθος], "custom," but which also designates a set of cultural characteristics; see MORALS), which is no doubt more literary, but which still has an influence on the psychiatric approach. This is the very tradition that Esquirol advised leaving to the moralists and poets, and which draws on the mythical resources particular to different groups.

II. The Humoral Conception of Melancholy

The word "melancholy," as its etymology indicates, locates the affection it refers to within the Hippocratic theory of the four humors (black bile, yellow bile, phlegm, and blood), which persisted into the nineteenth century, even though interest in humoral theory waned in the second half of the seventeenth century as scholars and others switched their focus toward mental alienation, understood increasingly as a form of distraction or wandering. Indeed, around this time a number of works appeared which, imbued with the scholarship of the Renaissance, itself built upon Greek and Arabic sources, progressively made way for a more mentalist conception of obsession or *idée fixe*, the therapies for which took the form of purging and amusement or distraction (see CATHARSIS). So starting with the conception of a complex chemistry in which heating and fermentation were the main agents of transformation of natural elements, the Hippocratic description of temperament (one could be melancholic, choleric, phlegmatic, or sanguine) understood as a combination (*krasis* [κρᾶσις]) of the four humors (*chumoi* [χυμοί]), depending on how much of each of them was present in different organs, would be

integrated into an already more modern conception of a pathology centered on mental disorders, and in relation to which humor would only be one cause among several others.

The first definition of melancholy is to be found in aphorism 23 of book 6 of the *Aphorisms* of Hippocrates: "If a fright or despondency (*dusthumia* [δυσθυμία]) lasts for a long time, it is a melancholic affection" (*The Genuine Works of Hippocrates*, Eng. trans. Francis Adams). And Galen, who resurrected humoral theory in the second century CE and can serve as a representative of Greco-Roman medicine, completed Hippocrates's definition as follows: "Melancholy is a sickness that damages the mind (*gnome* [γνώμη]), with a feeling of malaise (*dusthumia*) and an aversion toward the things that are most cherished, without a fever. In some of those who are ill, an abundant and black bile also attacks the esophagus, so much so that they vomit and at the same time their mind is considerably affected" (Galen, *Medical Definitions*, 19 K 416). One could not express better than in this description of melancholy, which is both etiological and semiological, the reciprocal influence of the soul and the body, as if, in this case, temperament (*krasis*) suffered from an excess of black bile which, damaging the stomach (*stomachos* [στόμαχος]), affected the soul in its vital energy. Melancholy indeed suggests a mental pathology with a double cause, in humoral chemistry and in an organic dysfunction. But Galen's definition does further work still. Although it is the excessive vapors of back bile that most often cloud the brain, the same result can be seen with the combustion of the other three humors, to such an extent that the term "melancholy" ends up referring not only to the harmful effects of black bile, but also to those of the other three humors when they are affected in the same way. So "melancholy" became a generic and representative term for madness, which comes from a complexion or temperament that, even though it remains natural, nonetheless predisposes an individual to this kind of distraction.

It was for this very reason that other writers, and in particular Aretaeus of Cappadocia, extended the semiology of melancholy well beyond the simple effects of black bile, to include a more multiform disorder of the understanding. Cicero, who favored this extension of the term, went as far as to translate the melancholy of the Greeks using the term *furor*, thus reducing melancholy to a "deep anger" or to a "fury," as J. Pigeaud explains in his seminal work *La maladie de l'âme*. In book 3 of his *Tuscalanae*, Cicero wrote: "The Greeks, indeed . . . have no one word that will express it: what we call furor, they call μελαγχολία [*melagcholia*], as if the reason were affected only by a black bile, and not disturbed as often by a violent rage, or fear, or grief. Thus we say Athamas, Alcmæon, Ajax, and Orestes were raving [*furere*]." And according to R. Klibansky, E. Panofsky, and F. Saxl, Cicero's intention was to "describe a convulsion of the soul which could not be gathered from the mere concept of 'atrabiliousness'" (*Saturn and Melancholy*).

This extension of the term "melancholy" still lies at the heart of the problematic in contemporary psychiatry, in the sense that some psychiatrists like to keep "melancholy" within the category of psychoses, whereas others prefer to consider it as a specific structure, and yet others still are keen to eliminate it from the nosology—but it does not originate with the Neo-Stoics (Hippocrates, Galen, and their followers). It was already present in Plato and Aristotle, who compared melancholy to the state of inebriation, and considered that the multiple forms of melancholy reproduced drunkenness's different degrees of distraction. Plato writes in *The Republic*: "Then a precise definition of a tyrannical man is one who, either by birth or by habit or both, combines the characteristics of drunkenness, lust, and madness (*melagcholikos* [μελαγχολικός])." And in the famous *Problem XXX*, Aristotle, or Pseudo-Aristotle, maintains that the word "melancholy," following the variety of manifestations of inebriation according to the nature of the individuals, designates the excessive and incomprehensible changes they undergo whenever too great a quantity of black bile is acting upon them, or whenever some external occurrence stimulates it too aggressively: "In most people then black bile engendered from their daily nutriment does not change their character, but merely produces an atrabilious disease. But those who naturally possess an atrabilious temperament immediately develop diverse characters in accordance with their various temperaments."

III. "From Humor to Mood": The Age of Quantitative Measure

As a result of these successive shifts in the meaning, then, the word "melancholy" does not refer to a precise pathological entity, and in this respect, its overwhelmingly diverse and extensive semiology makes it impossible to establish a definitive and stable nosology. It suggests an "essentially polymorphous" temperament, to borrow J. Pigeaud's expression from his commentary on *Problem XXX*, which possesses in their potential state "all the characteristics of all men." The numerous attempts at a psychiatric classification of melancholy have accordingly relied on privileging some aspect or particular mechanism. This has meant isolating such aspects or mechanisms from the whole range of manifestations of the illness so as to make them a distinctive sign that corresponds to a system of classification, whose relevant criteria can then be shared in advance. But the experimental studies that were conducted with a view to achieving this aim did not confirm the hypothesis of differential biological reaction, so researchers then focused their efforts on somatic treatments, in particular, medication using antidepressants. These positive studies are part of an active attempt to establish the meaning of the word "melancholy," retrospectively as it were, since it is according to how patients respond to the different treatments administered to them that researchers hope to confirm whether they can be classified as melancholic or depressive. In any case, we are forced to return to the need to determine international assessment criteria, one of whose manifest paradoxes is that they give renewed credibility to a humoral theory by trying to understand and measure melancholy according to a quantitative assessment scale.

Given the inherently variable nature of the nosography of melancholy, we cannot but be skeptical a priori of the many ventures nowadays to isolate analytically the symptoms of the identified affection in order to then evaluate them using a comparative scale of measure. Furthermore, to proceed in

this way one would have to envisage a nosographic category sufficiently broad to cover all of the apparently characteristic signs of melancholy according to their intensity. This was the category of depression, and the debate surrounding the distinction between melancholy and depression, far from disappearing, has grown even more complex as a result.

It would also be worth looking more closely at diagnostic classifications, as well as the assessment scales of the intensity of the symptoms, in particular, those relating to the psychomotor disorder that is seen increasingly as an indication of melancholy. This is because they show, on the one hand, the mobility of the semiology of melancholy—and this is far from insignificant when it is sometimes assigned psychotic characteristics—and on the other hand, the interest there is in retaining the notion of humor (or mood, in the Anglo-Saxon tradition). Humor or mood in this sense is obviously different from the humoral theory of Hippocrates, and more closely resembles the Greek notion of *thumos* [θυμός], understood as the way in which one feels oneself, the self-perception of one's own relationship to the world, a kind of psychic coenesthesia (see CONSCIOUSNESS, Box 1). Anglo-Saxon psychiatry is most explicit in this regard, and uses the word "mood" for this "coenesthetic" humor. We are now far removed from the physical register in which the humors operated, however; no longer would the word "moisture" be in any sense applicable to this "coenesthetic" humor, though "moisture" is indeed related to the liquid humor in the Hippocratic sense and, for someone like Ben Jonson, already referred metaphorically to the general character of a man when all of his humors flowed in the same direction:

> So in every human body,
> The choler, melancholy, phlegm, and blood,
> By reason that they flow continually
> In some one part, and are not continent,
> Receive the name of humours. Now thus far
> It may, by metaphor, apply itself
> Unto the general disposition:
> As when some one peculiar quality
> Doth so possess a man, that it doth draw
> All his affects, his spirits, and his powers,
> In their confluctions, all to run one way,
> This may be truly said to be a humour.

(*Every Man Out of His Humour*, I.1)

In the same way, spleen would be considered as that vague and sad humor which, as in ancient times, comes from an accumulation of humor/moisture in the spleen, which was where black bile was to be found, according to many physicians (R. Blackmore, 1725). (See INGENIUM, Box 2, and SPLEEN.)

While contemporary psychiatry attempts to assess the intensity of certain characteristic signs of humor, or mood, with a view to establishing a psychiatric nosography that is intended to be universal, it approaches melancholy in a number of different ways. These alternative approaches include, on the one hand, phenomenological psychiatry, with its notion of endogeneity, which goes back to clinical observation of the behavior of the patient, and the description he himself gives of his mood, and on the other hand, psychiatry inspired by psychoanalysis, which identifies within the patient's

discourse the psychic mechanisms underlying the formation of the symptoms. Here again, the meaning of the word "melancholy" will be subject to many modifications and shifts, depending on the methodological approach adopted. So phenomenological psychiatry will refer to melancholy as an illness of endogeneity by emphasizing its generic nature, and psychoanalytically inspired psychiatry will describe it as a narcissistic illness and will consider the nosological question as secondary. If the former approach is still attached to the notion of humor, this time in the sense of the inner sentiment of the unfolding of a personal history (*innere Lebensgeschichte*), the latter approach is attached to the various figures of melancholy, understood as formal models of psychic function, some of which are already to be found in the annals of modern psychiatry, dating from the end of the eighteenth century.

IV. The Clinical Tradition: The Age of the Great Classifications

A. *Endon, Stimmung, Schwermut*

Endogeneity, then, might provide a new interpretation of modern humor, as useful to positivist psychiatry (with the category of "endogenous depression") as it is to phenomenological psychiatry, which attempts to account for the notion of melancholy itself. Hubertus Tellenbach, heir to the great German phenomenological psychiatric trend of the first half of the twentieth century (with, among others, E. Strauss, V. E. von Gebsattel, and L. Binswanger), proposed a definition of endogeneity accompanied by its substratum: the *endon*, which we should no doubt understand as a formal schema that is useful for the overall configuration of the notion. The term "endogenous" appeared around the beginning of the twentieth century (A. Mechler), and was often a synonym for "constitutional," which did little to explain the nature of melancholy since other affections could also be related to it, in particular, psychoses and neuroses, which were said to have a "depressive basis." The term concerned the "disorders of the humor," or even the "vital feelings" in their stuporous or maniacal disturbances. This is where some located those affects whose anomalies derived from a primary organization of drives, and which were thus relatively independent from external events and psychological motivations. This simply indicates how vague the notion still was, and how it seemed to call out for a third etiological field alongside the somatic and the psychic. Indeed, Tellenbach's definition of melancholy is more an overall description than an actual definition: it emphasizes the importance of vital rhythms, and the coherence of their combination, in other words, their historial aspect:

> By endogeny, then, we mean what emerges as the unity of the basic form in any life event [*als Einheit der Grundgestalt in allem Lebensgeschehen*]. The *endon* is by its origin the *phusis*, which opens out and remains within the phenomena of endogeny.

(*Melancholie*)

The word "melancholy" thereafter refers, in a phenomenological context, to an endokinesis, to a movement of the *endon*, or even a rupture with the *endon*, understood as a blockage of the basic manifestations of life (stupor, despondency, despair), a blockage that the individual endeavors

to prevent by a defensive behavior focused entirely on a respect for, and conformity to, an established order (*Ordentlichkeit*). If Tellenbach's phenomenological approach to melancholy still reflects the relevance of German psychiatric thought, in spite of the pressure exerted by the obligation to apply international classificatory norms, it is because the humoral tradition has its roots not only in a clinical practice that attempts to analyze its manifestations, but also in a philosophical tradition that psychiatrists are not averse to exploiting in elaborating their theoretical models.

Like psychiatrists from the English-speaking world, German psychiatrists use an original term to designate modern humor: *Stimmung*, whose meanings have an even wider resonance than the corresponding English term, "mood" or "humor" in the nonphysical sense. *Stimmung* comes from *stimmen*, to make one's voice (*Stimme*) heard, to establish, to name (*bestimmen*, "to determine"), and to play an instrument in order to tune it. This latter meaning, when extended to humor, suggests the fact of putting oneself in a certain frame of mind (see STIMMUNG). The lexicon of the French translation of Tellenbach's work retains the following composite nouns: *Gestimmtsein* (being-in-a-mood); *Gestimmtheit* (color of the mood); *Verstimmung* (change of mood); and *Stimmbarkeit* (suppleness, affective mobility). The richness of this vocabulary (beyond its application to melancholy, which makes melancholy not so much a morbid entity as a frame of mind, or even a *typus*, as Tellenbach puts it) echoes in this sense the great movements of German psychiatry from the end of the nineteenth century. This tradition, beyond the clinical and nosographic conception of someone like Kraepelin in particular, was still very much in line with the work of J. Herbaert: a dynamic of associations of ideas in which the antagonisms between representations were related analogically to intracortical antagonisms. As far as melancholy specifically was concerned, the German classification made a distinction between a simple melancholy (*melancholia simplex*) and a stuporous melancholy (*melancholia errabunda, melancholia agitans sine active*); relative to these two forms, there were then a melancholy without delirium; a precordial melancholy; a delirious melancholy, which was also still called religious; and a hallucinatory melancholy, which was still called hypochondriacal. W. Griesinger, for example, follows this classification of melancholy (*Mental Illnesses*, 1845), and places melancholy properly speaking (*Melancholia*), along with hypochondria, in the more general category of "states of mental depression. Melancholy (*Schwermut*)." This latter term, a synonym for despondency or depression (*schwer*, "heavy, weighty," and *Mut*, "feelings, qualities, or states of mind"), conveys the main quality of humor, much as does the term "tristimania," coined by the American B. Rush in 1812, or *lypémanie* (lypemania), coined by J.-É. Esquirol in France in 1820, or L. Delasiauve's *dépression* (1860). From this perspective, and in order to distinguish *Melancholia* from simple *Schwermut*, R. Krafft-Ebing and H. Schüle would emphasize the accidental or nonaccidental nature of the etiological factor, as well as the presence or lack of anxiety. But it was E. Kraeplin who would foreground most explicitly the difficulty of establishing a stable semiology of melancholy, and of putting it in a relevant classificatory category.

B. Manic depression

French psychiatrists before Kraepelin had included melancholy in the group of thymic psychoses broadly named "manic depressive" (or what Farlet in 1851 called *folie circulaire* [circular madness], and Baillarger in 1854 called *folie à double forme* [double-formed madness]). Kraepelin, however, distinguished it clearly from manic depression up until 1913, when he included it in the eighth edition of his *Lehrbuch der Psychiatrie*, emphasizing the identity of the clinical symptoms of the two illnesses, even if the variations of mood in melancholy often remain very slight, to the point of being imperceptible. From that point on, manic depression constituted a disease in the same way that paranoia and schizophrenia did, and it encompassed all of the symptomatic variations of melancholy, of mania, and of the different combined states, as well as pure mono-symptomatic forms. The interest of such a classification as regards melancholy lay in what would henceforth appear to continue to distinguish it from other simple forms, that is, the integrity of ideation. From psychomotor inhibition to the state of stupor, from delirious ideas to confused states, three types of pure melancholy emerge, all characterized by an aggravation of what we might call a fullness of the idea, from the point of view of the mechanism; and by moral suffering and psychomotor inhibition, from the point of view of the classic syndrome.

Kraepelin's nosography remains a key reference point in the history of psychiatry, not just in Germany, but in Europe more generally, insofar as, according to a detailed semiology, all the simple forms of the illness are grouped under more general forms (so, for example, "pure melancholy" is under the form "manic depression" [*maniac-depressive Psychose*]), and thus retain their characteristics almost autonomously. For this reason, melancholy is still nowadays classed as manic depression or neurotic depression depending on the assessment of the disturbances of ideation, of the intensity of sadness and anxiety, as well as of the degree of psychomotor slowing, to use the modern expressions. The second half of the nineteenth century, and the start of the following century, witnessed an explosion of great German treatises in psychiatry, which were vast systems of classifications of mental illness that relied on the most detailed of semiological methods, drawn up during close clinical observation. The mechanisms of the different ideas, the very ones brought to light and favored by the organo-dynamist approach that would be developed in France, and even more so by psychoanalytically inspired psychiatry, could already be glimpsed as a number of metaphorical figures at work in these treatises. For melancholy, for example, one finds in the figures of the hole and of the cavity (T. Meynert, Freud), as well as the figure of the whirlwind and the spiral movement (H. Schüle, H. Emminghaus), characteristics of the loss of psychic investment, and of the flux of thought. After this, the psychosomatic or psychic mechanisms underlying the symptomatic manifestations would enter the definitions of mental affections at the expense of a semiology, whose endless reworkings made the establishment of a universal nosology extremely difficult.

V. Melancholy as a Paradigm of Narcissistic Illness

A. Melancholic discourse

In spite of the delirious or confused appearance that certain forms of melancholy can take, the illness that corresponds to this name is said to be distinguished from manic depression in that it preserves the integrity of intellectual processes, even if the full weight of the obsession often causes a patient to sink into extreme pathological behaviors, such as total mutism or systematic negativism. German psychiatry and French psychiatry attach a similar importance to the discourse of the patient through the repetitive figures he presents, and which is said to translate the nature of the affections from which it derives. In 1891 G. Dumas, in his medical thesis *Les états intellectuels dans la mélancolie* [Intellectual states in melancholy], makes a distinction between an organic melancholy and an intellectual melancholy, depending on the whether the state prior to melancholy was affective or intellectual, and according to the possible variations of the causal order, conceived as follows: organic facts, mental productions, and confused perceptions of these facts, or melancholy. Melancholy is thus less a pathology than a psychic operation whose aim is to justify the organic or affective disorders of which the patient continues to be aware. Melancholy would not simply have an organic etiology—which neither the Germans nor the French were yet able to do without—but also a rational logic. This logic prompts the patient to translate his impressions of diminution and of weakness into a type of discourse and behavior, which then precisely becomes part of the definition of melancholy. "In all cases," writes G. Dumas, "the affective effect, melancholy, appears to be merely the awareness of the movements made, the confused idea of the body. We are no longer in the presence of an ill-defined power succeeding an idea, and being expressed by physical organs; we are only ever dealing with intellectual states, ideas, images or sensations, and with physiological states." W. Griesinger, to whom G. Dumas refers in his thesis, had already emphasized this impression of great coherence that emerges from melancholic discourse. For Griesinger, this is a testimony to the mind trying to understand cenesthetic states or apparently inexplicable movements of the body, and which, in order to do this, conceives of logical arguments that are more or less removed from the lived context, more or less artificial in relation to the still uninterpreted affective base.

B. The mechanism of melancholy

We find in Germany as well as in France, besides an interest in nosology, a continued and no less powerful interest in the study of the particular forms of discourse of the patients, insofar as these forms might reveal the underlying etiological mechanisms of the different types of affections. Alongside the descriptive semiological description of melancholy, then, a morphological definition explaining the illness is also elaborated, in both Germany and France, whose medical traditions are nonetheless distinctly different: German alienists remained attached to the theory of the association of ideas since J. Herbart, who attributed to representations a force of attraction and repulsion, and French alienists remained attached to the organo-psychic approach of the Greco-Latin tradition. This organo-psychic influence is still largely present not only among French psychiatrists, but also more widely across the Mediterranean, insofar as it determines two otherwise unrelated directions for research and treatment of melancholy: the neuro-pharmacological approach, and the psychodynamic approach, whose essentially psychoanalytic points of reference are still very much alive in France. Melancholy then comes to be discussed in terms of mechanisms, and in this it follows Freud, who drew this conclusion from V. Tausk's lecture on melancholy on 30 December 1914:

> The essential criterion by which we must circumscribe the symptoms (which, in practice, never appear in their pure form) and the forms of illness is its mechanism. The observation of benign cases, offers, as Hitschmann mentioned, the only possibility of drawing up a chart of pure symptoms. If this is true, there is only one melancholy, which has the same mechanism, and which should be curable by psychoanalysis.

Freud's call for circumscribing and unifying the concept of melancholy was followed, however, in a less-than-unified way by psychoanalytically inspired psychiatrists. The result is a vast nosographic panorama within which melancholy shifts from being a manic-depressive psychosis to a major depression, and even a narcissistic illness (still described as an "illness of the ideal"). The 1914 formulation comes close to the category of "narcissistic neuroses" that Freud, in 1924, would distinguish from psychoses and neuroses, and of which for him melancholy was the paradigm: "We may provisionally assume that there must also be illnesses which are based on a conflict between the ego and the super-ego. Analysis gives us a right to suppose that melancholia is a typical example of this group; and we would set aside the name of 'narcissistic psychoneuroses' for disorders of that kind" ("Neurosis and Psychosis"; see *E5*). Psychiatric practice, while necessarily distinct from psychoanalytic practice in the sense that its primary aim is the medical objective of the disappearance of the symptom, through well-established therapeutic knowledge, nevertheless shares with psychoanalysis a recognition of those unconscious mechanisms identified by Freud, which it finds at the heart of the melancholic patient's discourse. Three such mechanisms are commonly encountered in psychiatric literature. They attach respectively to the figure of mourning, understood as an impossible psychic resolution; to the figure of a generalized negativism, which results in a logical, hyper-formalized discourse; as well, finally, as to the figure of a narcissistic rift, whose consequences would manifest themselves through a devalorization of one's self-image.

C. The figures of melancholy: Lovesickness

It is curious to note how similar contemporary figures of melancholy are to those that were already present in the history of the illness, from antiquity up through the seventeenth century, in the form of different kinds of melancholy, such as "divine melancholy" (Marsilio Ficino), "white melancholy or white bile" (Agrippa of Nettesheim), and even "amorous or erotic melancholy" (Jacques Ferrand and the authors of the various "Treatises on Lovesickness" of the seventeenth century).

If the ancients had already provided a good description of these different manifestations of melancholy, the Renaissance and the classical age established them as almost autonomous models. In this regard, "erotic melancholy" offers one of the most instructive examples, insofar as it provides the raw material for a number of specialized treatises written by doctors, as well as philosophers and theologians. We find many allusions in antiquity to the discomfort of the state of being in love (Hippocrates, Caelius Aurelianus, Rufus of Ephesus, Aretaeus of Cappadocia), either from *erôs* [ἔρως], or from *epithumia* [ἐπιθυμία], passionate longing, lust, desire (the latter, provided that we understand the transcendental movement that *epithumia* leads to as the overcoming through love of simple covetousness or bodily desire). And it is indeed the state of being in love, and its crisis of passion, which causes unreliability of judgment, as well as languor and the stupor that accompanies it when the absence of the object is felt all too cruelly. Aretaeus of Cappadocia tells of one such case when he describes an adolescent boy who, having sunk into melancholy and been abandoned by his doctors, was cured by the love of a young girl: "But I think, he added, that he was in love from the beginning and that, having been disappointed in his advances on the young girl, he became languorous, which made him appear melancholic to his compatriots" (quoted in J. Pigeaud, *De la mélancolie*). This passion thus gave way in the sixteenth and seventeenth centuries to a particular category of melancholy: "erotic melancholy," which was compared to a kind of "fury of love" or "amorous folly," an expression that a doctor such as Jacques Ferrand translates using the word *erôtomania* [ἐρωτομανία]. It could certainly be considered as an "illness of desire," an expression that would not really be anachronistic since the author specifically makes desire an efficient cause of the malady:

> We therefore say that, according to this doctrine [the doctrine of Hippocrates], love or erotic passion is a kind of reverie, which is caused by an excessive desire to enjoy the loved object. Now, if this kind of reverie is without fever, and accompanied by ordinary fear and sadness, it is called melancholy. *Res est solliciti plena timoris amor* [Love is a thing that is filled with fear and worry].
>
> (Ferrand, *Traicte de l'essence et guerison de l'amour et de la mélancolie érotique*)

Ferrand, following his master du Laurens, classifies melancholy as a kind of hypochondria, attaching to it the symptoms of the latter, such as stomach upsets and disorders associated with the organs. While he claims that the heart is the seat of the cause of the illness, the liver the seat of love, and the genitalia the seat of combined causes, the symptoms are said to be in the brain, which is responsible for the general alteration of one's mind and temperament. His contemporaries, in particular, A. de Laurens, J. Guibelet, T. Bright, and R. Burton, also respected this classification, and while none of their works was devoted to lovesick melancholy, they did discuss it in particular chapters. These authors, and especially Burton, talk in this regard of "heroic melancholy," an expression that is also mentioned by Ferrand, who traces it back to Arabic writers:

> Avicenna, and the whole Arabe family, call this illness *Alhasch* or *Iliscus* in their language: Arnaud of Villanova [de Villeneuve], Gordon, and their contemporaries call it heroic or lordly Love, either because the ancient heroes or half-gods were greatly affected by this ill, as the Poets recite in their fables, or because the great Lords and Ladies were more prone to this illness than the people, or finally, because Love dominates and masters the hearts of lovers.
>
> (Ferrand, *De la maladie d'amour ou mélancolie érotique*)

Now, the term "heroic melancholy" no doubt comes from a semantic confusion of the Greek *erôs* (love) with *herus*, *heroycus*, or *hereos* (words whose meaning has long eluded lexicographers), if not even with the Greek *hêrôs* [ἥρως] (hero), Arnaud de Villeneuve in the thirteenth century, in his *Liber de parte operativa* being the first to make this mistake, which was later adopted by Burton. Lovesick melancholia, the object of many specific treatises, is thus offered, from the point of view of mood or affect, as the model for a behavior characterized by a withdrawal of investment in the outside world, a turning in upon oneself, and a moral suffering fueled by feelings of self-deprecation and guilt. Mourning or separation merely provides melancholy with an opportunity to manifest itself; the illness is here understood as a constitutive mode of psychic structuration for some, and a physic-chemical anomaly for others, which are present well before any precipitating event. The fact remains that, as the works on "lovesickness" show so clearly, melancholy is affirmed as an "illness of desire," in the sense in which desire, attacked at its core, gives way as it collapses to a number of different expressive formulations, such as, for example, Seneca's *taedium vitae*, close to boredom, or even nostalgia (see SEHNSUCHT), understood in the seventeenth century as an illness of exile, or homesickness (J. Hofer, 1688).

To classify melancholy as a specific category of psychiatric nosography seems, then, to be an impossible task, given the different epistemological contexts that govern such a classification on the one hand, and the variability of symptomatological descriptions that work against any precise semiology on the other. However, alongside these descriptions, phenomenological and psychoanalytical trends continue to inform a different kind of practice, which is based on an approach toward the illness that, for phenomenology, focuses on the nature of the patient's temperament and on an awareness of his or her biographical history, and for psychoanalysis, focuses instead on unconscious mechanisms and psychic structuration. What is understood by melancholy is therefore understood in terms of the symptoms themselves which, first identified in antiquity, would nowadays be defined by a metaphorical displacement: mood and moral suffering, obsession and partial delirium, lovesickness and mourning, as well as the characteristic of genius, and the hyper-lucidity of a discourse reduced to a pathological authenticity. We might say that desire can no longer be sustained by narcissistic projection, for want of a sufficiently stable specular image, and that this originary failure points to a fundamental anomaly in the relationship to the other, the advent of which psychoanalytic metapsychology tries to reconstruct. Melancholy is a narcissistic

illness, an illness of desire and of truth, in the sense that, as Freud states, the melancholic subject has come so close to this truth that it falls ill as a result (*Mourning and Melancholia*, 1915). Beyond the seduction of an eminently protean philosophical and literary discourse, melancholy defies any attempt at reductive classification in the field of psychiatry. It is thus held captive by the Aristotelian *kairos* [καιρός], if we are willing to understand this *kairos* as the opportunity offered to the temperament to manifest itself as a structural effect.

MEMORY / FORGETFULNESS

FRENCH	*mémoire, oubli*
GERMAN	*Erinnerung, Gedächtnis, Vergessen*
GREEK	*mnêmê* [μνήμη], *mnêmosunê* [μνημοσύνη], *memnêmai* [μέμνημαι], *lêthê* [λήθη], *lêsmosunê* [λησμοσύνη]
LATIN	*subvenire, menini, obliviscor*

➤ CONSCIOUSNESS, DICHTUNG, HISTORY, *IMAGE*, MADNESS, MIMÊSIS, PARDON, PRESENT, SOUL, *TIME*, TO TRANSLATE, TRUTH, UNCONSCIOUS, VERNEINUNG

The specialized words denoting the faculty of mastering and actualizing the past, that is, memory-thought, split off from a group encompassing the activity of the mind in the broadest sense, and opening out onto many different associations, including warlike violence and delirium. The root *men-* covers everything to do with the mind in general, with *men* in *menos* [μένος] (force), and *man* in *mania* [μανία] (delirium), and for memory in Greek: *mimnêskomai* [μιμνήσκομαι], *mnêmê* [μνήνη], *mnêmosunê* [μνημοσύνη], and in Latin: *memini* and *memor, memoria*.

Memory has a double status: it can be referred to and invoked, or it can be experienced. There are different models for thinking memory. First and foremost of these is writing (Gr. *graphê* [γραφή]), with a trace that is left and then found again; imprinting (Gr. *tupos* [τύπος]); and a trail (Ger. *Spur*) that can be followed. We find, relatedly, the notion of a "treasure" trove, present in various models of thought (see the connotations of the Ger. *Gedächtnis*). When this memory-treasure is possessed, it lends itself to the progressive work of internalizing the world (see the Ger. *Erinnerung*), which is more dynamic than the different models of memory in the Romance languages. The close association of memory with gratitude is prefigured in the German language (*Dank*, "thanks," alongside *Gedanke*, "thought"), and thought is concentrated into acknowledgment (*reconnaissance*), to the point where knowledge (*connaissance*) becomes nothing more than a fixation on history (*Denken* as *Gedenken,* commemoration).

French clearly marks the duality between effective action and sudden, almost involuntary memory, by making a distinction between *se rappeler* (to recall) and *se souvenir* (to remember).

Forgetting has a constant relation to memory, which is not-forgetting, or a form of counter-forgetting, which then becomes a natural state, established through a selective effort of the mind. The English (forget) and the German (*vergessen*) suggest a kind of fluid power that carries away the traces of an experience, which is then out of reach. The effacement in the French word *oubli* (Low Lat. *oblitare*, "to erase, to efface") conveys the idea of a more controlled relation: here, effacement is an object of analysis in itself; forgetting ceases to be the counterposition of a methodically selective process of remembering or recollecting, and in artistic creation, it characterizes the condition of a decisive transition to another order of meaning.

I. Memory-Thought

A. The Greek and Latin roots: "Memory" and "mental"

Memory perhaps does not exist by itself, as a distinct intellectual faculty. The support it offers to man in his life is so central that it cannot be separated from the manifestations of thought in several of its forms. Thought represents to itself the choices it makes and endlessly recalls the paths and values it sets for itself. It becomes attached to what it knows, to what it knows it must not lose from sight, or to what one could not think, that is, what one could "forget." Memory and warlike force are thus closely related in language, and converge as two forms of concentration. Where they diverge is when action splits into two and becomes, in the language of tales and songs, the object of an autonomous reminiscence.

"I remember" is *memini* in Latin and *memnêmai* [μέμνημαι] in Greek, but historically these do not express the same thing. Both are perfect tenses, expressing a state, and are closely related through their linguistic genealogy. In Latin we find the same, rich root *men-* (all that is "mental"), denoting in a wider sense "the movements of the mind." The corresponding words in Greek, *menos* [μένος], "force," or the perfect tense *memona* [μέμονα], took on somewhat different meanings. In "to think forcefully," the object and intensity of a commitment was retained, and as a result one could hear a passion in it, and above all the ardor of being in combat, a will which, when one has it, is irresistible. One would like to have it when one encounters it in the enemy, and one can never acquire it when the primary and spontaneous manifestation of the fundamental value of courage is lacking. The force that is thereby revealed lays claim to its superiority; it creates the social order of the heroic world, and of the world before it.

The Latin words *memor*, "remembering," and *memoria*, "memory"—which has become a catch-all term in several languages—are based on the supplemental intensifier of yet another root, but which is also attached to *men-*, and which we find in *memini*. It highlights no less forcefully how closely interconnected, outside of any specialized sense, the art of "remembering" and the contents of "thought" are (we have the related word in Sanskrit, *smarati*, "to think," and in Greek, *merimna* [μέριμνα], "concern," with the intensification in the adjective *mermeros*

[μέρμερος], "causing concern"). Ernout-Meillet's RT: *Dictionnaire étymologique de la langue latine* mentions that the expressive value one hears in *memor* has, according to him, become "attenuated." It has had to go from a powerful energetic representation to the presence of a system of stabilized memory.

But one can still think differently about the faculty of memory. The Greek language developed an independent group from *mna-*, another form of the same root, alongside *men-* (*mimnêskomai* [μιμνήσκομαι], "to recall"; *mnêmê* [μνήμη], "memory"; *mnêma* [μνῆμα], "monument"; *mnêmôn* [μνήμων], "who remembers"). What happens is unusual. Memory staked out a terrain for itself within the order of spoken language, and it is hard not to connect this fact to the cultural importance of remembering the past, and to the formation of specialized castes who were guardians of a culture's own language, a language that was inherent in its poetry. This is the key distinction: two core meanings radiate out in different ways, with physical battle on one side and verbal ability on the other, and the overlapping play of these two meanings can be seen clearly in early texts.

B. Force and delirium: *Menos, mania*

Homer shows that memory in action is put in the service of the social order. The soothsayer instructs the hero, who defends the town and the kingdom. The intrusion of unbridled passions reveals that the order is doubly threatened, whether this order is manifest at home or on the battlefield, by the raw nature that reigns within. Rules against the evasion of forgetting within, and against fleeing from the excess outside, are invoked in consequence.

Rage is concentrated and deployed, as the uses of the verb *memona* [μέμονα] show in Homer's *Iliad*: the hero, Hector, gives in to his passion, which remembers itself as if it had been the sole object of his will, and merges with his force ("Remember," he says to the other Trojans, "your irresistible force [μνήσασθε] . . . [ἀλκῆς]"; 6.112). When the Trojans out of cowardice retreat in the face of war, they are embodied in the contrasting figure of Paris, and for a while the pleasures of lovemaking replace the heroic acts of war. Memory is associated with exhorting and actualizing social values, and forgetfulness with not respecting them. Helenos, the Trojans' soothsayer, exhorts the two leaders, Hector and Aeneas, to stop the warriors from throwing themselves into the arms of their women, to the great delight of their enemies (6.80–82). He shows that their army is divided; it destroys itself, whereas nothing stops the champion of the Greeks. Diomedes rages like a second Achilles, and no one can measure up to his force (*menos* [μένος], which has been transformed into pure delirium; he is mad, *mainetai* [μαίνεται]). Achilles is the son of a goddess, but Diomedes is truly delirious ("*all' hode liên mainetai*" [ἀλλ' ὅδε λίην μαίνεται]; 6.100ff.); no ordinary force of war can oppose him ("*oude tis hoi dunatai menos isopharizein*" [οὐδέ τίς οἱ δύναται μένος ἰσοφαρίζειν]; 6.101).

C. The two forms of forgetfulness: Too much or not enough intensity

Memory, as a creator of values, is implicitly defined in terms of a contradiction. Thought's freedom disengages itself from,

but remembers, the constraints of the social order. The two domains touch and overlap, and it is as if the struggle brings out an inherent tension within language.

1. A thought without limits

Delirium in Greek, or *mania* [μανία], is always, in another form, "to think" (the same root *men-* with a zero vowel pattern): "the Greek *mainesthai* [μαίνεσθαι] is dissociated from the general notion and applies to a wild and furious passion" (RT: *Dictionnaire étymologique de la langue grecque*, s.v. *"mainomai"* [μαίνομαι]).

Delirium is freed from rage. Hector meets Diomedes, who is invincible. At the same time, the soothsayer urges him to go into the town so that he can implore the support of the protective goddess there. This is impossible, if not absurd, since Athena, as everyone knows, favors the Greeks.

Helenos had a vision of disaster the moment Diomedes appeared, a vision of an absolute force. With a disregard for all principle, this force makes no pretense of commanding or ordering, and simply prepares for a crushing defeat. Pure delirium, *mania*, fills the heart of this warrior. No one can do a thing against his rage, which is potentially limitless. Language historians have focused on the way in which passion and madness come together in this text, as if the poet were highlighting their linguistic kinship. Homer's verses here do reveal a certain excess (whether this is linguistically correct or inaccurate), related to what it means to put someone to death, outside of the social bounds that normally circumscribe the power to execute. Force is now helpless when faced with delirium since all the rules have been obliterated: the point of view that the text constructs leads to the discovery of a gaping hole, formed when collective memory is set aside. In its place we find the exorbitance of a form of thought that has no limits, and this becomes the basis on which memory is founded.

Ulysses, in his visit to Achilles, presents in the same way Hector's omnipotence as victor and conqueror, when he attempts to set fire to the Greek ships. Excess has a new master, and the gods give him free rein according to their will. They are playing with total annihilation, which will go in whatever direction they wish: "He leaves it up to Zeus and goes into a frightening delirium (*mainetai ekpaglôs pisunos Du* [μαίνεται ἐκπάγλως πίσυνος Δύ]) . . .; the rage which possesses him sweeps everything away (*kraterê de he lussa deduken* [κρατερὴ δέ ἑ λύσσα δέδυκεν])" (*Iliad*, 9.237–39). The soothsayer's vision is again overcome by the persuasion of Ulysses the orator. He goes immediately into a delirium. Nothing will now stop Hector, just as nothing stopped Diomedes; he is beside himself, in the grip of an acute fit of madness.

2. The perils of forgetfulness

Forgetfulness (*lêthê* [λήθη]) can come, though not from an excess of intensity, but from a failure to hold on to thought.

When he leaves the battle (in books 2 and 6) and returns to his mother, Hector does not want to drink the wine she offers him (6.258–62). "Do not break my limbs: I am afraid of forgetting force and combat" (*mê m' apoguiôsêis meneos, d'alkês te lathômai* [μή μ' ἀπογυιώσῃς μένεος, δ' ἀλκῆς τε λάθωμαι]); to forget is to lose. He does not want to lose his warrior-like force, and knows that he only has this force if he has a clear head, and in his heart, the force to think about

it, which is how he constitutes it. Forgetfulness opens the way for the opposite to happen, leading to loss, alienation, and disaster.

II. The Making of the Past

A. Making history and the war of memories

Remembered values concern the life of the cities in their present, but there is another more autonomous form of memory, which integrates the past. It is represented in the epic by a character such as Nestor, who is old and who remembers. He is the indispensable witness, who is present in both the *Iliad* and the *Odyssey*.

Actualizing the past relies on former conflicts and their political dénouements, which serve as models. The action itself verges on excess, and is in danger of being thereby weakened. Memory intervenes in the action, and is focused between these two poles. One of its forms consists of recalling the conditions of its incarnation. The other separates and distances itself from the action by imagining the form of the experiences of the past as if it were a matter first of all of knowing, and then acting.

The creation of meaning implies the distance of a past and of remembered facts. But since the masses are incommensurable and in a sense immemorial, and thus "unmemorable" (*amnêmoneutos* [ἀμνημόνευτος], or *unvordenklich* in German), as impossible to grasp as the present that passes, small and large societies, states, and communities within states, all construct various horizons, which are all more or less mythical. Through memory they transform what is known, which had already been transformed. What is historical are not facts, which can often be embroidered, but the fact that a tradition was at a certain moment in time rearranged and reorganized, reordered in such a way that the guiding principles, even the finality, are intelligible to us. This is how we can grasp the importance of memory in the world of Greek culture. It takes the form of mastering a tradition, and of a particular mnemotechnic that is necessary because of the extent of the historical corpus, which increases when all of the different regional actualizations of that tradition are added to it.

The stakes are extremely high. The struggles to preserve memory, of such immense importance in our times, are part of these traditions, within and between nations, which redefine their identities. Any event can be accepted, gaining a "right to memory," or on the contrary be repressed, or challenged, because it is out of place, embarrassing, or burdensome. So while historical knowledge is progressing and attaining a previously unknown degree of precision, it still remains shot through with taboos and things left unsaid, amnesias by command, political constraints, and the need to hold on to mythical beliefs. The past is both unknowable and available, and this is what we might call the war of memories.

B. Nietzsche: Becoming as ontology

Faced with an investigative openness that encompassed all areas and ages of the modern world, which was exposed to their arbitrary nature and forced certain choices, and at a time when historicism was in the ascendant, Nietzsche described history in terms of corresponding periods of superior

dominance. While some periods stood out, they were all essentially seen as concentrations of energy. For Nietzsche, knowledge is all the richer for restricting itself to what is essential, which is constantly reborn and returns in identical form in the immensity of becoming.

The dialectical discussion of history and non-history in chapter 1 of the second part of *Untimely Meditations* ("On the Use and Abuse of History for Life" [*Vom Nutzen und Nachteil der Historie für das Leben*]) only apparently defends forgetting (*das Vergessen*). Nietzsche articulates an aporia: man is condemned to escape the forgetfulness of childhood (*die Vergessenheit*), and destined to know his past, yet this past crushes him. All that counts are the strong concentrations in which life is manifest. Nietzsche broadens the frame of reference, starting with the personal, progressing to the historical, the anthropological, and then to the evolution of all societies. He talks deliberately and insistently about "the creative force of an individual, of a people, of a civilization" (*die plastische Kraft eines Menschens, eines Volks, einer Kultur*) in order to encompass a totality, when he is in fact thinking of the embodiment of these forces in the superior individual, the super-man. The speculative categories of ontology are for him transferred to the history of the triumphant man who abandons himself to becoming. The forces of dispersion and becoming in all its diversity are turned back against themselves, and they produce their own negation. Through an accumulation of vital forces, in an almost biological sense, becoming is pushed to the point where it can acquire the name of "being," and paradoxically be immobilized at the moment of culmination. This is not so much a triumphant liberation from the weight that inhibits life, as a non-history.

Nietzsche adapts, develops, and reinterprets the historian Niebuhr's disenchanted conclusion on chance, where the eye of "the most powerful minds turned to the particular structure that commands their vision." He invests in a supra-historical (*überhistorisch*) perspective, as a science of the past in its totality. For Nietzsche, a lucid analysis should enable us to recognize the conditions in which a particular force was able to become a dominant one within the arbitrary circumstances of history. One immediate consequence of this is that knowledge of the past (historical phenomena as an object of knowledge, *Erkenntnisphänomen*) is no longer the objective; if this were the case, it would be dead ("*Ein historisches Phänomen, rein und vollständig erkannt und in ein Erkenntnisphänomen aufgelöst, ist für den, der es erkannt hat, todt*"). Knowledge is living (blind power is not wasted "for someone who is alive" [*für ihn, den lebenden*]), only when it is applied to the content it is useful to know, for anyone who can use it to his advantage. Science is nothing by itself, it is destined for those in power, and past regimes serve the regimes of the future. Memory is rehabilitated as a site of reincarnation or resurrection ("in the wake of a powerful new current of life, of a culture which is becoming" [*im Gefolge einer mächtigen neuen Lebensströmung einer werdenden Kultur*]). By emphasizing the superior concentration of forces ("*von einer höheren Kraft beherrscht*"), Nietzsche thus eliminates the meaning of history, and moves in the direction of freedom and utopia, although it is true that his vision of what might replace it, since it is overly intellectual, is no less "supra." It

frees itself from and leaves behind the stranglehold of the past, and responds to an expectation and desire to make the future ("*der Blick in die Vergangenheit drängt . . . zur Zukunft hin*"). Nietzsche's speculation is more realist: it considers the actualization of the forces in the course of a history that does not change and opens itself up to reincarnation. Memory is saved when its brilliance is recovered within this other messianism that he finds in the cyclical culminations of life. The remembered life of history is reaffirmed in the fulfillment of life ("*Historie zum Zwecke des Lebens*"), and individual moments are dissolved in the identity of a force. Memory then relates essentially, if not exclusively, to whatever force has been dominant; there is never anything inferior, and no projection into the future (see HISTORY).

C. Poetic memory: Mnemosyne and Lesmosyne

Memory is the mother of Muses, and Immortality is secondary. Remaking the past, conceived broadly as bringing together all human knowledge, was transformed in ancient societies when it was entrusted to specialists who brought the past alive through words and music. Memory became a professional activity, whose function was linked to feasts and celebration, and to a body of knowledge susceptible to invention, and to the reinventions of multiple horizons.

The word *mnêmê* [μνήμη], which will assume so much importance, is absent from Homer, and only once does he use the word *mnêmosunê* [μνημοσύνη], which gave its name to Memory, mother of the nine Muses, according to Hesiod's *Theogony* (l. 54). In a scene from the *Iliad* in which Hector, in his delirium (8.181), dreams of destroying the Greek ships, he again says that he has to keep the fire "in his memory" (*mnêmosunê tis . . . puros . . . genesthô* [μνημοσύνη τις . . . πυρὸς . . . γενέσθω]). The two forms of delirium, the desire for death and poetic power, are joined together. The poet shows, at this crucial moment of an illusion, that he knew the word and uses it. He makes the delirious hero into a poet like himself, arranging reality in his ecstasy as he likes, and at the same time shows that he has chosen to make him speak in this way.

Zeus, in the *Theogony*, makes love to Mnemosyne, and fathers the Muses over the course of nine nights, outside of the circle of the gods. When they are born, they find a home in a world apart, close to the summit of Olympus, where they share with the gods (while being separated from them) freedom from all cares, at an appropriate distance: this is the condition of song (vv. 53–67). The divine reproduces itself with the daughters of Memory; it re-creates itself within a zone of marvelous and unreal autonomy. The gods have access through voice to the joy that they feel from identifying themselves in this mirror, and men allow themselves, through the intervention of the Muses, to be transported far away; through them, they become part of the divine. Art makes them forget their misfortune, and through a temporary cessation of their cares, tears them away from the normal laws of an everyday temporality.

A second Olympus is established next to the gods, a domain of forgetfulness. After all, the gods themselves are involved in the affairs of mankind, whether they control them or not. Forgetting as a way of repairing evil becomes, more absolutely, the condition of the conquest of another world, where in theory nothing is ever forgotten, nothing good, but also nothing evil.

From the word *mnêmosunê*, the poet creates in this same passage the antithetical word *lêsmosunê* [λησμοσύνη] (v. 55), the power of forgetfulness that is communicated. This is not an "intentional paradox" (as West says of v. 55 [Hesiod, *Theogony*]). Forgetting is not the absence of memory, nor its effacement, but more positively, a tearing one away from the avatars of an ordinary alienating existence. Initiating us into the history of the world drives evil out of this world. The word is created not as a negation, but as an analogy and as an active counterpart to memory, a complementary power, which is said to possess the art of driving away misfortune, as Helen's drugs are able to do in volume 4 of the *Odyssey*. Lesmosyne provides a respite from sorrows and pains, and forgetfulness is her work of magic. This counter-term to memory is only attested once more that we know of in Greek literature, in the *Antigone* of Sophocles (v. 156), with the same allusion to an extraordinary overcoming of an ominous reality, the threat of nothingness.

D. The fiction of total knowledge

1. Homer's Muses

The Muses know everything, and represent the abstraction of an all-powerful art. Totality in space and time, in the world or in history, is part of a limitless superhuman memory.

When Homer asks for the help of the Muses, the daughters of Memory, he mentions a particularly precise knowledge, and above all a superlative distinction—"who was the first?" or "the best?": see, for example, *Iliad*, 2.760ff.: "These were the leaders of the Danaans and their lords. But who was far the best among them, do you tell me, Muse—best of the warriors and of the horses that followed with the sons of Atreus?" (*su moi ennepe, Mousa* [σύ μοι ἔννεπε, Μοῦσα]; Homer, *Iliad*). The information presupposes a choice; the Muses have the advantage of knowing everything, and the poet does not know it. The appeal is made to an absolute authority, and song renders even more problematic the knowledge to which poets lay claim. These invocations, through their forcefulness, confer the evidence of necessity upon the statement. It is flawless, without forgetfulness or simply true; the Greek of Homer's time has an adjective that expresses what is "true" by saying "that which is not evasive" (*alêthês* [ἀληθής]), that is, small totalities, every time (see TRUTH).

During the chariot race, old Phoenix is stationed at the finish line. He will be able to recall the race—in its entirety—and tell the truth ("*hô memneôito dromou kai alêtheiên apoeipoi*" [ὦ μεμνέῳτο δρόμου καὶ ἀληθείην ἀποείποι]; 23.361). It is not that he could hide the truth, but that he has to see everything to be able to make distinctions (this and not that), and indeed, the author analyzes the nature of his own speech by this means. He knows that the sum of knowledge that it implies is only a fiction or a construction, and thereby demonstrates the two aspects of absolute memory upon which it is itself based. It aspires to be whole, but the poet does not hide the fact that it is a fiction, pointing to its own limits and inadequacy. He knows that his art is an entirely artificial product, something made, precisely, through art.

2. Baudelaire's Andromache: Suffering considered as a Muse

In the age of modernity, the absolute power of memory as restitution is founded upon exclusion. Baudelaire's "Le cygne" (The Swan) in *Les fleurs du mal* (Flowers of Evil) is an orchestration of the universal fecundity of exile and absence. Assimilation via the grandeur of failure, which is clearly situated within a Christian tradition, provides a new principle of unification. The modern poet confronts the immensity of literary tradition, and prefigures Mallarmé's *Le livre*, as well as Paul Celan.

In one of the most far-reaching explorations of the faculty of memory that has ever been undertaken, Baudelaire set out to make the widow, starting with Virgil's Andromache, and then going farther back to Hector's wife in Homer, a symbol of absence, welcomed and surpassed in the poetic pathos of a staged allegory. The mind has this power, and overcomes separation because it reconstitutes itself paradoxically in this separation: "*je pense à vous,*" "*je ne vois qu'en esprit,*" "*je pense à mon grand cygne*" (I think of you, I see only in my mind, I think of my great swan), then: "*Je pense à la négresse*" (I think of the negress): the movement extends to everything that has ever uprooted, exiled, excluded. This determinate absence retracing the fate of all that has not been, but which could or should have been, spreads its influence across every related language that is connected by similar exclusions. As it recalls in the midst of sorrow, the memory of memories is recomposed once again from one language to another (see *MALAISE* [MELANCHOLY, SPLEEN]). In response to the *immense majesté* (giant majesty) of the widow's grieving we have the fecundity of a "memory," which like the earth is already fertile, containing all that could ever have been said and written later on, as in various poetic projects of total synthesis:

Paris change! mais rien dans ma mélancolie
N'a bougé! palais neufs, échafaudages, blocs,
Vieux faubourgs, tout pour moi devient allégorie
Et mes chers souvenirs sont plus lourds que des rocs.

Aussi devant ce Louvre une image m'opprime:
Je pense à mon grand cygne, avec ses gestes fous,
Comme les exilés, ridicule et sublime
Et rongé d'un désir sans trêve! et puis à vous,
Andromaque . . .

Ainsi dans la forêt où mon esprit s'exile
Un vieux Souvenir sonne à plein souffle du cor!
Je pense aux matelots oubliés dans une île,
Aux captifs, aux vaincus!. . . à bien d'autres encor!

(Paris may change, but in my melancholy mood
Nothing has budged! New palaces, blocks, scaffoldings,
Old neighborhoods, are allegorical for me,
And my dear memories are heavier than stone.

And so outside the Louvre an image gives me pause:
I think of my great swan, his gestures pained and mad,
Like other exiles, both ridiculous and sublime,
Gnawed by his endless longing! Then I think of you,
Fallen Andromache . . .

And likewise in the forest of my exiled soul

Old Memory sings out a full note of the horn!
I think of sailors left forgotten on an isle,
Of captives, the defeated . . . many others more!)

(The Flowers of Evil)

Majesty, although wholly objective, is already the product of an immemorial poetic tradition, and it is this in fact that the poet rediscovers, that he recollects and analyzes. The different levels of the Alexandrine verses transpose the triumph over immediate experience into the most mediated layers of literary culture, whose words the poet allows to resonate in the poem, such as the three syllables of "Helenus." It is as if the most tragic separations were the source of all poetic creations, and conversely, that absence was only accessible via literature. The poet's own exile ("*dans la forêt où mon esprit s'exile*" [in the dim forest to which my soul withdraws]) connects him to all those who have ever been exiled. "*Un vieux souvenir sonne*" (An ancient memory sounds); there is only one, and when he has concluded this extended poetic exploration, he is as old as the world, recollecting every loss that has never been gathered in: "*Je pense*" (I think). By the end, it is everything and anything that the poet has fashioned into poetry because he has lost it. It is also a history of poetry, transformed by its Christian past. Suffering becomes a Muse, who knows everything, and the jubilant poet has a key that opens whatever he touches.

3. Mallarmé's break with tradition: The freeing of forgetfulness

With Mallarmé, the Orphic search for a truth hidden within language leads to a more marked break from previous poetic practices. The transition in his poetry from nothingness to a purer and more autonomous space of language means that he is concerned not only with the forgetfulness that the world has suffered through the ages, nor simply with the forgetfulness of the world as a condition of poetic creation, but with the forgetfulness of false forms of presence in the world, which are nevertheless celebrated poetically. Memory is displaced, and folds back upon itself.

This difference in tone and light can be seen in one of his key sonnets, "Le vierge, le vivace . . . ," which is almost certainly a programmatic and defining statement of his art, and which makes forgetfulness a condition of poetic song. It is not poetry itself, which could equally well glorify the immediacy of life, as it has done ad infinitum in the past. There exists another language, whose precision is quite different, one that is transferred and refined through rejection and negation. The poetic élan and desire to overcome separation that we find previously are transported elsewhere, into something more absolute. These are still maintained in order to counter forgetfulness in memory, but memory now re-emerges on the other side of the nakedness of effacement, and performs a radical break with the world. Memory traces harden in this Orphic language as it becomes abstracted within a third space, and as it rises up out of this poetry that is stripped bare. The passage through negation was a necessary one.

Poetry in the figure of a swan leaves behind it "*ce lac dur que hante sous le givre / le transparent glacier des vols qui n'ont pas fui*" (Beneath the frost of a forgotten lake / Clear flights of glaciers not fled away; trans. John Holcombe). The world of life is thus divided, and also leaves behind the raw matter of frozen traces: "*Un cygne d'autrefois se souvient*" (In past magnificence of another day / The swan remembers). It remembers its lost glory as in a mirror: if it escapes, it is because it has resisted and not given in to incantation and

celebration. Its poetic means have transported it elsewhere, and forgetfulness is the line that is crossed by verbal transcendence, with art finding a way to create for itself another world.

Forgetfulness is the primary condition of poetic creation. In the same way, *Vergessen* in German, in Celan's poetry, is the very movement of words being uprooted, and deliberately becomes part of traditions of language in order to make them say something else. The distant separation from the world of the senses that forgetfulness represents is, then, a rejection of the language that evokes this world; it is a space of both transgression and freedom. All that has ever been said can be said again, and is saved from effacement by a system of references that is each time created anew.

III. Models of Thought

A. Writing

One of the key questions in psychology and gnoseology is that of knowing how memory works. What do we retain, and why do we retain in such different ways, not primarily according to the history of each individual, but when we consider more generally the lesser or greater power of the faculty of memory itself? Plato, before Freud, chooses writing as the model.

1. Plato: Memory and knowledge

All men are different and have their own unique mark. However, when Plato analyzes the error of this proposition, the model proves to be inadequate, and he literally makes signs fly. If inscription was originally engraved, it will subsequently become volatile.

Plato first introduces the psychological or intellectual function of memory, without the recourse to anamnesis, in his *Theaetetus* dialogue, during the discussion of erroneous judgment. He admits "for the sake of argument" that the "ideas" or impressions formed in our minds leave an imprint on something, like a block of wax that we have within us, on which an impression (or *ekmageion* [ἐκμαγεῖον]) is made. It is as if we were reproducing the sigil of a ring within our souls. So there is nothing to stop us having such representations, whether true or false, valid or invalid. Plato's model includes a selection stage—forgetting occurs when the inscriptions are erased and lost (191d)—and an explanation of the inequality among men, which he says is due to the volume and quality of the impregnable mass we each possess (191c). He also makes the connection with cultural memory, which we would call collective memory, so we might describe it as the presence of Memory. It is indeed true that everything is written and discussed using memory, and Plato's model is thus a necessary one (see EIDÔLON).

What we still need to consider, however, is the case where an error is not a matter of correctly identifying an object, but of mistakenly making a false substitution in the order of knowledge available to us. The wax tablet no longer works as a model when we imagine the possibility of not representing something to ourselves that we in fact know very well. Knowledge eludes us if we consider that there is such a thing as a false opinion, and that "we are capable of not knowing what we know." In the dialogue, Socrates introduces an important semantic distinction between having at one's

disposal ("possessing," *kektêsthai* [κεκτῆσθαι]), and having concretely in one's hand (*echein* [ἔχειν]), as we would hold a stylus (197b). What we need, more than an erasure or simple virtuality, is a wider effective presence, but a presence that is not actualized. Socrates is thus led, once he presents this deeper understanding of the complex reality of the dynamics of memory in the course of his reasoning, to propose another image. He imagines an enclosure, with a large variety of captive birds that would live in this aviary, whether in large swarms, or in small groups, or even on their own: each has been imagined to conform to the logical structures of thought. The owner tries to catch the one he needs, but does not always succeed. What he wants is there, but he cannot get it—"such that he does not catch and hold in his hands what he had possessed for a long time" (*ha palai ekektêto* [ἃ πάλαι ἐκέκτητο]; *Theaetetus*, 198d).

If Homer, who knew this text well, says *kear* [κέαρ] (or *kêr* [κῆρ]) for "heart," instead of *kardia* [καρδία], as Plato does, this is because he means "wax," *kêros* [κηρός], hiding it by means of the phonic association of poetry: we have to know how to interpret according to the *Cratylus*, and look for wax (*kêros*) in the word "heart" (*kêr*). Memory figured as wax is the "heart" of the soul (*Theaetetus*, 194c), and receptivity is thus defined and attributed to a fundamental technique, like that of the poets. It retains all impressions and ideas, imprinted as a seal is imprinted: the magic of an infinite number of seals is indeed a gift that memory, the mother of the Muses, has made to the human soul (191d).

2. Freud: Writing within the unconscious

Freud's great discoveries—infantile sexuality and repression, and the role of the memory attached to them—can be figured as a kind of writing, as Freud himself does. The history of the transmission of this writing resembles that of his texts, with the phases that precede it, and it follows the period of latency that separates us from the dramas of our inhibited early development. It is the impressions of this resistance and the wounds left behind that enable us to go backward in time, to decipher the "text," and to correct deviations.

The object of the kind of reconstructive memory (*Gedächtnis*) that the psychoanalytic cure attempts to perform exists as a form of writing. For Freud, a language has been primordially engraved in the body, at an age when the infant was merely responding to the urges of its drives and instincts. The infant bears the marks of this phase, like a sigil that has been imprinted, determining its history, or even culture, at a stage that is paradoxically the most vital and energetic of its existence. The deviations from accidents to this natural history set in place an equally primal negation, and they make the body into a text that can be read—or not read.

Freud invokes the model of inscription from the outset, in the founding text of the famous letter to Fliess of 6 December 1896 (no. 52 = 112), written just as he makes his extraordinary discovery. Freud uses the term "writing down" (*Niederschriften*), as if there were within the different layers of the soul a scribe who recorded the perceptions or the accidents and impressions, and put them down on paper, so as to fix them precisely. The basic principle consisted of rigorously separating out consciousness from this memory (*Gedächtnis*), which was buried, and made up of successive inscriptions and different layers. As they are superimposed, there is a process of transcription (or of translation, *Übersetzung*), which is also a kind of rewriting (*Umschrift*), and Freud here also uses the word "transcription" (*Überschrift*). The scribe "transcribes."

According to the model sketched out in his letter, Freud suggests a transcription of the material that was retained in the first level, and made up of pure signs of perception. This transcription first takes place in a second layer, which is defined by the state of non-consciousness (*Unbewußtsein*), then in a third, which is characterized as "pre-consciousness" (*Vorbewußtsein*). This latter phase is dependent on representations of words, communicating with our official ego, and precedes the subsequent development of a "consciousness of thought" (*Denkbewußtsein*). The work of translation takes place at each moment of transition from one phase of life to another, and it occasionally goes wrong. The inhibitions that it runs up against explain the origin of neuroses. There are "residues" or "surviving" remainders. Freud's terminology is innovative and bold. It suggests that something "survives" its previous stage (*Überleben*), and that these survivors are thereafter elements out of place. The different modes of writing enter into conflict, and normal development is arrested. Traumas can be understood as "fixations" in the strong sense of the term, hard obstacles that are the result of something that has not passed through or that did not work properly. Repression (*Verdrängung*) is in no sense the same as forgetfulness, but it is rather conceived as a resistance that redirects the "thrust" (*Drang*) of the drive, as if into a blind alley. It is through a kind of rereading, using the verbal representations acquired during the third stage prior to puberty, that one can go back and reactivate the unconscious. This return through memory is reparative, and can possibly bring about a recovery since the earlier repression may not have been firmly established at the following stage and can be eliminated. A partially intelligible memory opens up a path into the registers and archives of the unconscious, and enables a phased interpretation of the amnesia with the help of a memory. Dimly remembered perceptions, which are nevertheless conscious, force open the door leading to the essential mysteries of early childhood life (see DRIVE and VERNEINUNG).

3. Bergson: The traces of lived experience in involuntary memory

In the chapter on "The Two Forms of Memory" Henri Bergson draws a distinction between, on one hand, a memory that eludes representation, as if it has been learned, and that is revealed to be a rationalist prejudice, an ideology inhibiting the perception of, on the other hand, another kind of memory, one that is "spontaneous" and "perfect from the outset." As he says about this second sort of memory, "time can add nothing to its image without disfiguring it" since it is a possession that is properly our own. Although time moves forward in its duration, it retains "in memory its place and date." The terms Bergson uses here are important since what counts is "a memory" (*souvenir*) that must not become "foreign to our past life," that is, alienated by everything else, by external influences.

Ernst Cassirer, in the third volume of his *Philosophie der symbolischen formen*, reproached Bergson for not having

considered the intuition of time as a more global functional unity, which would include all of the different directions of our perception and our consciousness, future as well as past. Bergson's dissociation of the horizon of memory from the horizon of expectation did not seem legitimate to Cassirer, but these are no doubt two equally valid points of view, and one does not necessarily have to absorb the other.

Bergson wrote *Matter and Memory* at the same time Freud was making his discoveries. What is under debate in both cases is the identity and irreducible experiences of an individual person. Philosophy opens the way for a new form of "self" through the notion of involuntary memory, Proust's reading of which produced a novelistic exploration that was unprecedented in its psychological depth. The fracturing of perspectives was fruitful, and almost fatal for the chosen domain of investigation (we might recall Epicurus, who was already attempting to construct intellectually a trouble-free art of living, in his search for *ataraxia* [see GLÜCK and PLEASURE]). Knowledge of the past becomes a distinct act; it belongs to us, and is devoid of anxiety. We are ultimately indebted to Freud's work for this principle.

Bergson isolates spontaneous memory, as distinct from learned memory, which is part of learning the mechanisms that are indispensable to our role as social actors. He analyzes lived experience and discovers the succession of unitary and irreducible monads of which it is made up. The work of memory is not freely organized, but is preformed in the history of the subject, who provides the self with a multitude of "dates," each one complex. The self tries to find its way among these, hoping to identify the things that count and that he has already retained. His memory will thus be made up of a multitude of memories, which are specifically limited to the experience of the person who lives with them.

4. Benjamin: Layer memory

Walter Benjamin describes the value of Proust's search in terms of its transcendental dimension. The self, in recollecting itself, discovers its being by recognizing the different stages of awareness of what it is doing. As a translator of Proust, Benjamin in a short text "Ausgraben und Erinnern" (Excavation and Memory) retranslates the work of uncovering. He compares it to an archeologist's analysis of the layers of soil: "he will be like a man who digs" (*wie ein Mann der gräbt*). In doing so, he liberates images, which are the buried treasures of our past, provided the digger, or searcher, can indicate the place and the process of discovery: "being epic and rhapsodic in the strictest sense, recollection as true *Erinnerung* has to provide at the same time an image of the person remembering." The act is illuminated in the silhouette of the digger. The image is elevated to the status of a symbol, and Benjamin breaks down into its constituent elements the German "synonym" for *Denkbild* (alongside *Sinnbild*; the title *Denkbild*, borrowed from a series of texts, groups together the disparate texts). By digging down into a word, we learn that what we remember is the image of the "thought" that penetrates this word. The word *Denkbild* has its tradition, and Herder, for example, wrote: "learn to understand these symbols [*diese Denkbilder*]," that is, those images in which thought is held fast (see BILD).

B. Memory as a storehouse

1. German, between the actualization of the past and accumulation, *Erinnerung* and *Gedächtnis*

There are two words in German with quite different values, *Erinnerung* and *Gedächtnis*, to which the French terms *souvenir* and *mémoire* only partially correspond. The first indicates an action, within the individual confines of a person's inner self, as if actualizing one of a thousand possible memories. The second, closer to a cerebral capability than to the soul, calls to mind a casket and its treasures because of the suffix and the analogies one could make between *Gedächtnis* and a word such as *Behältnis*, a box. An object is enclosed and if one has a "good" memory, it is that much more safely preserved. This intensifier is formed from the root of the verb *denken* (to think), through an apophonic play on words. The basic tenses of *denken* are the preterite *dachte*, and the participle *gedacht*, which one could associate with the idea of a cover and a roof (*Dach*). The faculty of memory is in a sense multiplied in this shelter where everything that has been thought is gathered together.

2. Hegel: The concept and its associations

For Hegel, memory becomes an integral part of the dynamics of the unfolding of Spirit. The dimension opened up by language with the word *Erinnerung* allows Hegel to situate memory, and to deepen the link that connects it to the successive structures of history. He understands it, in the *Phenomenology of Spirit*, as a movement toward a superior, and more "inner" appearance, of substance when it is exposed to truth. The movement of interiorization becomes an *internal* memory, or *Erinnerung*. As substance acquires greater depth through this attention to the past, the science of memorized history is founded. Elsewhere, the progression of world history is presented as self-examination and self-discovery. Absolute spirit folding itself back upon its own foundation is translated by a turn of phrase borrowed from religious practice: *insichgehen*, "to enter into oneself." Interiorization encompasses traditional self-examination and the entire dimension of self-reflection.

3. Poetic memory integrated into the philosophical system: *Erinnerung* and *Andenken*

The *Phenomenology* integrates early Greek poetry into the evolution of self-consciousness. The pathos of the poet enables him to escape from domination by raw nature. This is an effect of developing one's memory, *mnêmosunê*, in which a movement of reflexive thought becomes manifest, involving a reconsideration of one's given state (*Besinnung*) and the acquisition of an internal reference. Interiority includes the interiorized memory (*Erinnerung*) of the immediacy of the previous stage, which is thus overcome. It was still deprived of freedom, and with writing, as well as music, the phase including the liberation of consciousness reaches a second level.

The function of memory brings with it the painful rift of poetry. For Hölderlin, who experiences this rupture as a retreat of the gods of antiquity, his last hymns, entitled *Memory* (*Andenken*) or *Mnemosyne*, suggest the primordial role of the poet: it is his "fidelity" (*Treue*) that preserves. Poetry aspires to reconcile the alien with what is properly one's own, all

the while acknowledging concrete differences, and under the threat of memory's collapse.

4. Heidegger's double interiorization

The movement traced by Hegel is taken up again by Heidegger. In his *Kant* from 1929 (*Kant und das Problem der Metaphysik*), Heidegger reinterprets the anamnesis of earlier visions of the soul in Plato in terms of fundamental ontology. He presents it now as a founding act of the human condition of being-there (*Dasein*): "It is indeed a question of remembering again, of anamnesis (*wie der Erinnerung*), as Plato says: but authentic 'remembering' (*Erinnerung*) must at all times interiorize the interiorized object." This doubling of Hegelian interiority may seem surprising ("*das Erinnerte verinnern*"), but the word incorporates an analysis of the concept and moves beyond a tautology by a dimension opened up by the word, which divides the concept. What is "recalled" is not called by consciousness, but comes forth and imposes itself. The object is nothing other than the essential finitude of *Dasein*; it comes and takes hold of what opens itself to finitude. The movement is thus reversed, and the notable difference is that the interiorization is not properly speaking an interiorization of the self, as it was for Hegel. From a more theological perspective, welcoming the fundamental truth defines the authentic existence of the self. Memory will be a matter, then, of "letting [fundamental truth] more and more come to us," in its innermost possibility, where innermost means constitutive or foundational. Memory is determined as a form of re-collection. *Erinnerung:* no other word in any other language would allow one to think and translate this re-collection, and taking it one step further, interiority will be given to the truth itself that encompasses it. German culture based on Lutheranism ultimately focuses on this doubled reintegration of its primary movement.

5. Heidegger's Hölderlin: Truth concentrated into
Andenken and *Verdankung,* the words for memory

After 1934, Heidegger locates "what thinking is" in the sphere of language. His argument unfolds notably in his meditations on and paraphrases of Hölderlin's poem "Mnemosyne," which for him prefigures a source of poetic effusion that relates less to historically determinate memory than to a call emanating from thought itself. In Hölderlin's poem we see a number of words merge together, like *Andenken*, or memory in the sense of a thought that is attached to an object (*An-denken*), or a concentrated accumulation, like *Andacht des Andenken*, where in addition to memory we have, with the apophony, religious fervor or contemplation or, by means of another vector, gratitude in the archaism *Gedanc*, in *Dank* and *Verdankung*: one could easily get lost or go under. It is no doubt as a reaction against Heidegger's emphatic and expansive call for an original thinking, that Paul Celan, in his own semantic network, so clearly connected the word "thought," *Denken*, to the constant memorability of historical truth, assigning to it another kind of origin by playing one "thought" off against another. The title of one of his poems, "Andenken," refers to the most deliberately personal experience.

C. Paul Celan: The breath of memory

Poetry, like art, can be experimental. A short poem, from *Breathturn*, presents memory, inherent in the matter of all poetic language, as able to come alive on its own through a particular effect of concentration. It is as if, reproducing itself by a breath, it were the creator of everything.

The text encompasses a singular moment, marked by an exceptional happiness in which everything is sketched out and writes itself. There is nothing supernatural about the effect of this moment of grace, but as always with Celan, it charts a new path. The poem is composed in a process of self-understanding and self-discovery. A fist (poetry) closes on the emblematic device it is grasping, though these are only stones or pieces of gravel. Poetic speech is in the stones:

DEN VERKIESELSTEN SPRUCH in der Faust,
vergißt du, daß du vergißt,
am Handgelenk scießen
blinkend die Satzzeichen an
durch die zum Kamm
gespaltene Erde
kommen die Pausen geritten
dort, bei
der Opferstaudede,
wo das Gedächtnis entbrennt
greift euch der Eine
Hauch auf.

(THE SILICIFIED SAYING in the fist,
you forget that you forget,
blinking, the punctuation marks
crystallize at the wrist,
through the earth
cleft to the crest
the pauses come riding,
there, by
the sacrifice-bush,
where memory catches fire,
the One Breath
seizes you.)

The "you" is the poet, and an "I" is addressing him. The hand of the "you" is holding the pen, and it is associated here with the reduction of writing and the rendering-rhythmical of nothingness. The blaze of memory itself is absorbed by the virtuality of a speaking that would conform to it entirely.

The debris has been shaped. A piece of glass calls out and attracts punctuation marks, is given form and structure. The movement of concentration is sketched: the earth cracks open, and a ridge bursts forth. A moment of suspension thus rises up out of the verbal magma. It assumes a figure thanks to the pauses, and absence itself folds back on itself. The expectation of something taking a fixed form condenses the incandescence of memory, so it is no longer either the circumscribed object, or any faculty that is unfolding within language, but it is caught within an involuted movement and lets out a simple breath. This unique breath takes hold of the signs, and at the same time of the poet, who in this instance "forgets to forget," as he usually does.

The paradox is only an apparent one. The disconnectedness from the horizons that are set out suggests disappearance, followed by a return of everyday meanings. The dead, in their muteness, find a place where they can be "unforgotten" (*unvergessen*; see the poem "Still Life" [*Stilleben*]). Differentiation is

specific: the survivors from the work of selection are exempted from methodical forgetting, they are its raison d'être and its negation. The word "memory" comes alive, and is expressed in its condensation, it speaks to itself.

IV. Forgetfulness as a Condition of Memory

A. The words for forgetfulness and memory:
Connotations of different languages

Memory has a double status in modern languages. It is either invoked or experienced. How this duality is translated in each language is essential since it results from the fact that the past, whether lived or imagined, personal or collective, is both always there and absent. It is forgotten, or on the contrary comes to meet us and imposes itself, which is why there is a constant crossover between invocation and visitation.

The range of associations relating to the ways one establishes a past or distant event, in one's mind or body, covers a broad spectrum beyond the specialized words.

In French, the abstract value of the intensifier *rappeler* (to remind; *appeler intensément*, to call intensely) appears very early on in the language, in the sense of "to bring to consciousness or memory." It is the origin of the pronominal expression *se rappeler* (to recall; before 1673), which then begins to compete with *se souvenir de* (to remember), derived from the Latin *subvenire*, "to come to the aid of, to help," then "to come to mind, to occur." The impersonal expression *il me souvient* (I recollect) and the intransitive are older than the pronominal verb *se souvenir* (fourteenth century), which became established in parallel with *se rappeler*. In the one case, help comes by itself, it is experienced passively as a gift; the other conveys the idea of effort and the notion of success or of sovereignty, which is perhaps even magical. We can indeed remember the dead, and so enter into the unknown. "Calling" is also expressed in German as *in Erinnerung rufen*. French, though, emphasizes the act, or actualization, and does not directly link the verbal activity to the site itself of memory, nor to the faculty of memory, nor to a present knowledge. In English, for example, "to remember" is also

related more to "remembrance" than the act of memory is to the matter itself that is remembered.

To forget is to not reach, or on the contrary to lose, and can also be an absolute tabula rasa. The etymology of the German word for forgetting, *Vergessen*, like the English "forget," expresses failure or falling short. The search or pursuit has amounted to nothing, the prize has eluded us. In fact, the German ear, because of a phonic play of assonances, associates forgetting with a more widespread loss, by way of the verb meaning "to pour," *giessen* (*ich vergass*, "I forgot"; *ich vergoss*, "I poured out"). It is the opposite of the horn of plenty, a current that sweeps us away. The French word *oubli* does not convey this same dynamism.

The French verb *oublier* goes back to the popular Latin *oblitare*, present in all popular Gallo-Roman dialects, though alongside the more eloquent verb *desmembrar* used in the Southwest (Sp., archaically, said: *desmemorar*), based on *memorare*, to "unremember." In classical Latin, *oblivisci*, along with the participle *oblitus*, is considered a metaphor borrowed from writing (see Bréal, then Ernout and Meillet). The word is related to *oblinere*, "to efface, wipe out," and is also associated with *levis*, "smooth" (from the Gr. *leios* [λεῖος]), implying the absence of any roughness and difference, things being reduced to a white powder. French retains something of this perhaps in the idea of a flat vacuity, and Mallarmé connected the word *oubli* to *aboli* (abolished), which opens out onto nothingness.

■ See Box 1.

B. Forgetfulness within memory

Forgetfulness, with its power to tear one away from fullness of meaning, offers a means of perpetuating memory. Memory thinks, but only manages to do so through forgetting if instead of signifying loss, flight, or abandonment, memory allows us on the contrary to reconstitute a reference. We choose what counts.

While in French one thinks about someone (*pense à quelqu'un*), or has a thought for someone (*une pensée*), in

---

1

French, between thought and dream

While other languages, such as English, German, Spanish, or Italian, only have one word for dream (Ger. *Traum,* Sp. *sueño,* Ital. *sogno*), French has two: on the one hand, *songe* (from the Lat. *somnium*), and on the other *rêve*, derived either from a form of the Latin *rabies* (rabies) or from the popular Latin for "vagabond," *exvagus,* or according to others from a form of Gallo-Roman, *exvagares,* from *exvadere,* "to go out." "Delirium" overlaps with "escape" in our imagination, unless one is in fact superimposed on the other. As well as the "interpretation of dreams (*rêves*)," French also has the expression "key to our dreams

(*songes*)," and this singular duality has its own history. *Songer*, the verbal form, has a noble lineage. Its values can be situated in a context of quite wide semantic freedom. The word oscillates between the rigor of focused thought (*songez-y bien*, "pay close attention to this, think it over carefully"), and the vagueness of the imagination (*à quoi songes-tu donc?* "what are you dreaming about?"). The evolution of the language meant that it rather dominated the field, referring on the one hand to the rational operation of "thinking," derived in Romance languages from the Latin intensive *pensare*, "to weigh," which connects

reflexive activity to evaluation and appreciation, not present in *songer*, and on the other hand, suggests the opposite world of dream experiences. The lexical unity became fractured and split off in two different directions. *Penser* gained the upper hand over *songer*, pushing *songe* into the realm of illusory appearance. *Rêve*, which was used to mean delirium or ecstatic extravagance, has only recently supplanted *songe*, without eliminating it entirely, however, such that when one is *songeant*, one is sometimes thinking, concentrating, or recalling, and sometimes one is dreaming, or letting oneself be carried away.

German the verb *denken* also means "to remember," to the point where no distinction is made between the two verbs, as one does in more formal language with the prefix *ge-* in *gedenken*, which denotes the reverence of a solemn and ritual commemoration. Celan, who makes the extermination of the Jews the central focus of his poetry, uses one word for the other, thinking for remembering, and restricts its meaning, binding thought and memory together. This is a limit case, and perhaps an exemplary one. To think is to "enter forgetfulness"—as one enters a religion—in order to recall, to think about nothing but the object, which never moves away and which shapes the form of every content, whatever it may be, which is created by history. "Thoughts" (*Gedanken*) will thus be determined and structured from within by the power of verbal creation. French is unable to say this because thought and memory are not similarly bound together, nor linked to gratitude (*Dank*),

as they are in English as well ("think" and "thank"). But they were originally, if thought was first of all formed by life returning back to its past, where it was expressed and described. Reflection developed within the autonomy of language which, turning upon itself, masters its own inventiveness.

We can envisage not holding on to one meaning, as a deepening of our understanding of an event in its duration, as if it were a response, an echo, a replica. However, to be free of a (heavy) past—something life demands as time progresses: *this* responds to a very different, and contrary, objective. In this case, the present remains shaped by a choice, and imposes a certain way of doing things, a judgment, a practice, and a politics.

2

Erinnerung (recollection) and *Gedächtnis* (memory) in Hegel

The German word *Erinnerung* (recollection) is based on the verb *erinnern* (to recollect)—literally, "to interiorize"—and signifies the internalizing act whereby one remembers some particular thing one knows or has encountered in the past. *Gedächtnis* (memory), on the other hand, derives from the verb *denken* (to think) and suggests a remembering capacity involving an abstract or generalizing element associated with thinking. The distinction between *Gedächtnis* and *Erinnerung* in Hegel's philosophical system has been traced to Aristotle's treatise *De memoria et reminiscentia*, which was posited as the source of the differentiation of two kinds or modes of memory in medieval philosophy from Augustine to Duns Scotus (see RT: *Etymological Dictionary of Greek*).

Erinnerung is differentiated from *Gedächtnis* in the context of Hegel's analysis of representation (*Vorstellung*) in the *Encyclopedia of Science* as the transition from perception or intuition (*Anschauung*) to thinking (*Denken*). Representation is divided into three stages with intellect progressing from *Erinnerung* (recollection) to *Einbildungskraft* (imagination) and *Gedächtnis* (memory). Here is the passage from paragraph 451 of the *Encyclopedia*:

a. The first of these stages we call recollection (inwardization) in the peculiar meaning of the word according to which it consists in the involuntary calling up of a content that is already ours. Recollection forms the most abstract stage of intelligence operating with representations. Here the represented content is still the same as in intuition; in the latter it receives its verification, just as, conversely, the content of intuition verifies itself in

my representation. We have, therefore, at this stage a content that is not only intuitively perceived in its immediacy, but is at the same time recollected, inwardized, posited as mine. As thus determined, the content is what we call image.

b. The second stage in this sphere is imagination. Here there enters the opposition between my subjective or represented content, and the intuitively perceived content, of the object. Imagination fashions for itself a content peculiar to it by thinking the object, by bringing out what is universal in it, and giving it determinations that belong to the ego. In this way imagination ceases to be a merely formal recollection (inwardization) and becomes a recollection that affects the content, generalizes it, thus creating general representations or ideas. Since at this stage the opposition of subjectivity and objectivity is dominant, the unity here of these determinations cannot be an immediate unity as at the stage of mere recollection, but only a restored unity. The manner in which this restoration takes place is that the intuitively perceived external content is subjugated to the mentally represented content that has been raised to universality, is reduced to a sign of the latter content which is, however, thereby made objective, external, is imaged.

c. Memory is the third stage of representation. Here, on the one hand, the sign is inwardized, taken up into intelligence; on the other hand, the latter is thereby given the form of something external and mechanical, and in this way a unity of subjectivity and objectivity is produced that forms the transition to thought as such.

According to a traditional interpretation, the developmental, historical movement of *Geist* (spirit) in Hegel involves a flowing, cumulative process in which particular *Erinnerungen* are converted into the generality of *Gedächtnis*. This relation is still to be found in the interplay of recollection and memory in Bergson, according to which *souvenir* adds up to *mémoire*: "*Il n'y a pas de conscience sans mémoire, pas de continuation d'un état sans l'addition, au sentiment présent, du souvenir des moments passés. En cela consiste la durée. La durée intérieure est la vie continue d'une mémoire qui prolonge le passé dans le présent*" (*Essai sur les données immédiates de la conscience*). The same pattern can be discerned in the hermeneutic model of experience of Hans-Georg Gadamer, despite his critique of the synthesizing movement of Hegel's dialectic. From the perspective of hermeneutic consciousness "the real" (*das Wirkliche*) or "real experience" (*wirkliche Erfahrung*) is handed down "out of the truth of recollecting" (*aus der Wahrheit des Erinnerns*).

In an influential lecture delivered at Harvard University in 1980 and published later in the posthumous collection of essays entitled *Aesthetic Ideology*, Paul de Man proposed an interpretation of the relationship between *Erinnerung* and *Gedächtnis* in Hegel that challenged the traditional view. De Man approaches Hegel's *Lectures on Aesthetics* and in particular the crucial distinction between symbol (*Symbol*) and sign (*Zeichen*) by way of the account of *Erinnerung* and *Gedächtnis* in the *Encyclopedia*. De Man starts with the following description of the interaction between thinking (*Denken*) and perception or intuition (*Anschauung*): "Thought

subsumes the infinite singularity and individuation of the perceived world under ordering principles that lay claim to generality. The agent of this appropriation is language." A corresponding movement is discerned by de Man on the level of representation in the transition from recollection to memory in the *Encyclopedia*. For de Man, in contrast to Bergson, there is memory only without recollection: "memory effaces remembrance (or recollection)," he argues, "just as the I effaces itself" by entering into or being appropriated by the generality of language. "The faculty that enables thought to exist," de Man continues, "also makes its preservation impossible." Thus, he concludes, Hegel's *Lectures on Aesthetics* are "double and duplicitous": they represent the efforts of *Gedächtnis* and the order of the sign to preserve aesthetics by sweffacing the singularity of *Erinnerung* that is the basis of Hegel's symbolic concept of art. Thus, the famous statement by Hegel—"art for us is a thing of the past"—could be translated on the basis of de Man's interpretation as "*Erinnerung* for us is a matter of *Gedächtnis*."

On the occasion of de Man's death in 1983, Jacques Derrida delivered a series of lectures later published as *Mémoires for Paul de Man* that were in part an extension of the reinterpretation of *Erinnerung* and *Gedächtnis* just sketched. Derrida is especially interested in elaborating an affirmative dimension to de Man's critique of Hegel. "We are quite close here," Derrida observes at one point, "to a thinking memory (*Gedächtnis*) whose movement carries an essential affirmation, a kind of engagement beyond negativity, that is to say, also beyond the bereaved interiority of introjection (*Erinnerung*): a thinking memory of fidelity, a reaffirmation of engagement." Thought, Derrida writes, is not "bereaved interiorization; it thinks at boundaries, it thinks the boundary, the limit of interiority." Thus, for Derrida, thinking affirms itself at the limit of Hegel's distinction between *Erinnerung* and *Gedächtnis*.

Erfahrung (German)—Experience (English)

Experience (*Erfahrung*) which is passed on from mouth to mouth is the source (*Quelle*) from which all storytellers have drawn. . . . "When someone goes on a trip, he has something to tell about," goes the German saying, and people imagine the storyteller as someone who has come from afar. But they enjoy no less listening to the man who has stayed at home, making an honest living, and who knows the local tales and traditions.

Walter Benjamin, "The Storyteller"

Translated by the English word "experience," *Erfahrung* derives from the verb *fahren* (signifying "to go" or "to travel") and contains the sense of knowledge to which one has come through something like a journey. *Erfahrung* is thus rooted in the concept of a knowledge attained from observations made in the course of an event or an encounter. This knowledge is not limited to the person making the observations but rather includes those to whom it can be passed along and handed down as part of a tradition. The evidence of *Erfahrung* is communicable; it is knowledge that can be imparted and learned. "Learning" is another signification of *Erfahrung* in the sense both that one learns something from one's own experience and that one can learn of something communicated by someone else, for example, through a letter or a newspaper: "*durch einen Brief, durch die Zeitung etwas erfahren.*" The adjective *erfahren* is applied to those who are skillful, expert, or practiced in a particular occupation, such as a skillful doctor (*ein erfahrener Arzt*) or an expert tradesman (*ein erfahrener Fachmann*). Unlike the obsolete signification of the English word "experience" or the sense carried still today by the French word *expérience*, *Erfahrung* does not include the scientific meaning of what we now call "experiment" (from the Lat. *experiri* and the Gr. *empeiria* both based on roots signifying "to try"). Nevertheless the path by which *Erfahrung* travels to become a crux in modern German philosophy in the work of Immanuel Kant passes by way of the experimental method developed in natural science during the early modern period.

As with "experience," the philosophical origins of *Erfahrung* are traced to the concept of *empeiria* in Aristotle, especially to his *Metaphysics*, where it is defined as the specifically human capacity or faculty produced by memory: "The animals other than man live by appearances and memories, and have but little of connected experience; but the human race lives also by art and reasonings. Now from memory experience is produced in men; for the several memories of the same thing produce finally the capacity for a single experience" (980b). The product of memory, Aristotle specifies, experience is knowledge of the particular (what the Scholastics would later call *cognitio singularium*), rather than the general, which is the domain of art (981a). This definition of experience as the capacity for knowledge of the

(continued)

particular produced by memory in human beings is cited and recited throughout medieval and early modern philosophy from Albertus Magnus and Thomas Aquinas to Thomas Hobbes and Christian Wolff.

The new scientific theory advanced by Francis Bacon in the seventeenth century with its emphasis on experimentation reinterpreted the concept of experience in effect by reaching back to its etymological roots and insisting on the connection to "trying" and "trial." Most importantly, Bacon argued that experience was not a faculty or capacity but rather a method and a process—not an ability but a way to come to knowledge. Bacon differentiated between *experientia vaga* and *experientia ordinata* and asserted the superiority of regulated experiment over vague experience as the true path to knowledge. Bacon's distinction in the word "experience," more precisely in the Latin word *experientia*, of these two significations is suggested by the nineteenth-century English translation of the *Novum Organum* (1720) that remained a standard for more than a century: "And an astonishing thing it is to one who rightly considers the matter, that no mortal should have seriously applied himself to the opening and laying out of a road for the human understanding direct from the sense, by a course of experiment (*experientia*) orderly conducted and well built up, but that all has been left either to the mist of tradition, or the whirl and eddy of argument, or the fluctuations and mazes of chance and of vague and ill-digested experience (*experientia*)." The two senses discovered by Bacon in the single Latin word *experientia* that are translated into English in this passage as "experience" and "experiment" correspond in German to *Erfahrung* and *Versuch*. The Grimms' dictionary (RT: *Deutsches Wörterbuch*) traces the emergence of *Versuch* in the sense of a scientific experiment to seventeenth-century natural science and cites Wolff's allusion in the early eighteenth century to the distinction between *gemeine Erfahrungen* (ordinary experiences), on the one hand, and *Versuche* (experiments), on the other.

The most important condition for the emergence of *Erfahrung* as a pivotal concept in modern German philosophy was the development of the empiricist theory of experience by John Locke in *An Essay Concerning Human Understanding* (1690) and David Hume in *An Enquiry Concerning Human Understanding* (1748). Locke and Hume returned to and reworked the Aristotelian sense of *empeiria* as a human faculty, rather than deriving from it a method of scientific trial in the

manner of Bacon. Instead of being produced by memory, however, experience for the empiricists was the result of perception. The human capacity for experience, according to these theories of "understanding," is a potentiality to be receptive to inner and outer impressions. The empiricists made the radical claim that receptivity was the source, not just of knowledge of the particular, but of all knowledge. Bacon had ordained that the experimental method was to begin with what he called *experientia literata*—emphasizing the indispensable work of the experimental scientist who writes down and archives the results that form the basis of his "interpretation of nature" (*interpretatio naturae*). At the hands of the empiricists nature writes itself down on human beings who become their own archive. Thus we come into the world, as Locke famously says, as a "white paper, void of all characters, without any ideas" and nature inscribes itself on us as experience.

The ground shifts in Kant's project for a transcendental critical philosophy. With the appearance of the *Critique of Pure Reason* in 1781 *Erfahrung* breaks free of the empiricist context and takes up a position that inaugurates the speculative tradition in German thought and redefines the philosophical landscape of the West. *Erfahrung* for Kant is the result not of receptivity to sense impressions but of the ability to judge inner and outer objects that affect the mind. Transcendental critique is, in other words, concerned with experience as a possibility—with "our mode of cognition of objects insofar as this is to be possible a priori." Kant thus begins the exposition of *Erfahrung* in the first part of the first *Critique* with the deduction of space and time as elements in which the appearance of objects—of experience—becomes possible. Although it does not come from experience, the knowledge to which we come in transcendental critique is *of* experience, specifically, of the possibility of experience. Kant's theory of *Erfahrung* is therefore not to be understood as simply turning away from empirical experience—it might be more accurately described as a translation of this experience into the *Erfahrung* of transcendental critique.

Erfahrung in Kant was the key source of the revival of interest in his work during the second half of the nineteenth century. In the German context, for example, Hermann Cohen's study of this topic, *Kants Theorie der Erfahrung* (first published in 1871 and in a revised and expanded second edition in 1885), became a canonical work among the Neo-Kantians, in particular, those centered at the University of Marburg. At one point in his interpretation Cohen underlines the following sentence at the beginning of the

introduction to the second edition of the first *Critique* as encapsulating Kant's critique of British empiricism, and in particular of Hume: "But although all our cognition commences (*anheben*) with experience," Kant writes, "yet it does not on that account all arise (*entspringen*) from experience." The difference that the transcendental turn makes, Cohen observes, can be understood as the distinction between *anheben* (commencing or beginning) and *entspringen* (arising or springing from) in this assertion. The first part of this sentence acknowledges the skepticism of Hume's insistence on experience as the ground of knowledge; but the second part makes room for the transcendental thesis that sense impressions do not represent the "final formal element of experience." *Erfahrung* also includes a dimension—Cohen calls it an "extension" (*Ergänzung*) or a "complement" (*Complement*)—of a priori possibility. We can have knowledge of objects that we do not encounter in the space and time of a psychological process, Kant proposes, by "only what we ourselves lay into them" (*nur was wir selbst in sie legen*). Cohen glosses: "What kind of ground is it that we ourselves ground? It should be not a beginning but a springing from (*Entspringen*), but this springing from occurs indeed out of a spring (*Quelle*) that we ourselves dig. . . . In ourselves lies the springing point (*Springpunkt*) of all knowing."

Among the most important philosophical developments in the twentieth century that derive from the return to Kant's theory of *Erfahrung* is Walter Benjamin's literary and social criticism. Although he was influenced, especially in his early work, by the writings of Cohen and his student, Ernst Cassirer, Benjamin was by no means an adherent of Neo-Kantianism, much less a mere follower. Cohen and his colleagues in Marburg believed that the "extension" that is the source of *Erfahrung*—its originary possibility—could be discovered and described scientifically through the application of the non-Euclidean geometry of spacetime. Benjamin's early essay, "Two Poems by Friedrich Hölderlin" (1914–15) shows some signs of experimentation along these lines. Yet in another essay from this same early period, "On the Program for the Coming Philosophy" (1917), Benjamin harshly criticizes what he regards as the mechanically "empirical" concept of *Erfahrung* promulgated on the basis of Kant (indeed, he calls this concept "Kantian"). When the question of *Erfahrung* resurfaces in his writings of the 1930s, in particular, in his critical essays such as "Experience and Poverty" (1933), "The Storyteller" (1936), and "On Some Motifs in

Baudelaire" (1939), Benjamin explicitly refers to Henri Bergson's critique of Kant's theory of *Erfahrung*, especially as it extends from Bergson's early work translated as *Time and Free Will: An Essay on the Immediate Data of Consciousness* (1889) to *Matter and Memory* (1896). Bergson's critique in the former of Kant's transcendental deduction of space and time in the first *Critique* becomes the basis of the concept of memory developed in the latter. What especially attracts Benjamin's attention is that Bergson's theory of memory offers an account of the dynamic communicability of experience. Bergsonian *mémoire*, Benjamin proposes, reveals that "*Erfahrung* is matter of tradition"—this, he goes on to explain, constitutes the "philosophical structure" of *Erfahrung*. At this point Benjamin draws on a Hegelian topos and distinguishes between, on the one hand, experience as *Erfahrung*, which is based on *Gedächtnis* (the German translation offered for Bergson's *mémoire*), and, on the other, a kind of experience he calls *Erlebnis* (citing Wilhelm Dilthey), which is derived from *Erinnerung* (a word employed by Hegel to characterize an interiorizing form of subjective memory that has been translated into English as "recollection"). The specific connection between experience and memory in Benjamin's theory of *Erfahrung* is articulated through his manipulation of these four terms for which English equivalents have proven elusive.

If Benjamin's theory of *Erfahrung* attempts to emancipate itself from the scientific concept of experience advanced by Cohen and the Neo-Kantians, on the one side, it also seeks to free itself from the anti-scientific concept of experience proposed by Bergson, on the other. It is therefore important to take note of how Benjamin departs from the Bergsonian project of providing an account of experience, and in particular the experience of time (*la durée*) as it is truly lived. Unlike Bergson, whose critique of Kant argues that true experience occurs in a temporality fundamentally different and apart from spatial extension—indeed, Bergson sees spatialization as the hallmark of the inauthentic, mechanized time of science—Benjamin insists repeatedly on what he calls the "interpenetration" (*Durchdringung*) of time and space. According to a similar logic, Benjamin describes the experience of the "standardized, denatured existence" of the mechanical time against which *Matter and Memory* is directed itself as an *Erfahrung* and goes on to suggest that Bergson's work communicates knowledge of an experience he avoids in the form of an image of what Benjamin calls "large-scale industrialism." The communicability of this image derives, in other words, from what does not take place in the time and space of a cognitive experience. The knowledge communicated by this image springs, not from an object that appears within a psychological process of perception, but from what we ourselves—or perhaps, more specifically, Benjamin himself—lays into this source. This inserting of an "extension," which Benjamin proceeds to characterize as a "synthetic" process in his comments on the interpenetration of involuntary and voluntary memory in the fiction of Marcel Proust, is the basis of an *Erfahrung* of which "only a poet can be the adequate subject." In this sense Benjamin finds in the poetry of Baudelaire and in the novel of Proust, but also in the wanderings of the "historical materialist" in his late study of nineteenth-century Paris the transcendental *Erfahrung* opened up by Kant.

MENSCHHEIT, HUMANITÄT (GERMAN)

ENGLISH   humanity
FRENCH   *humanité, sentiment d'humanité*
LATIN   *humanitas*

➤ *HUMANITY*, and ANIMAL, BILDUNG, GESCHLECHT, MITMENSCH, MORALS, OIKEIŌSIS, PEOPLE/RACE/NATION

Belonging to the human race (*Menschengeschlecht*), the fact of being a human and of being part of humanity (*Menschentum*), does not necessarily mean that one shows one's humanity, or that one is moved by a sense of humanity (*Humanität*). The relatively recent introduction into German of the term *Humanität* (which is not, however, in the Grimms' dictionary) answers the need to make an even more rigorous distinction between the quality of a human being (*Menschlichkeit*) and the virtue of "humanity," since *Menschlichkeit* and *Humanität* can quite easily be confused. But mankind (*Menschheit*) considered as an ethical horizon, and ideal, is in its turn distinct from a simple belonging to the human race.

I. Human, Human Nature: From *Humanitas* to *Humanität/Menschlichkeit*

The classical Latin *humanitas* does not refer to the human race, but contrasts that which pertains to human nature to everything animal, and then by extension refers more precisely to what characterizes human nature and its behaviors, and finally, its virtues and distinctive qualities. This broad range of meanings is illustrated by Cicero. Even though we first see with him the emergence of a "universal society of humankind" ("*societas universalis humanitatis*," *De finibus*

3.19.62), humanity is still envisaged from the Aristotelian perspective of the political nature of man as endowed with language. Yet the term also refers to a series of qualities and virtues, to the extent that we can see a convergence of the two meanings in the attempt to bring together rhetoric, philosophy, history, and law in a single educational program. Although Cicero confessed that he did not really know what man was, or what his essence might be (*De finibus* 5.33), and thus does not strictly speaking allow us to see his thinking as anticipating "humanism," it would be possible to deduce from it, as Leonardo Bruni did in the fifteenth century, the notion of *studia humanitatis*.

■ See Box 1.

The medieval Christian tradition emphasizes the opposition between *humanitas* and *divinitas*, and makes the first term a synonym for everything that has to do with finitude and imperfection, without putting into question the primary meaning of human nature. Molière can thus have his theatrical pedant, Métaphraste, say, "*Si de parler le pouvoir m'est ôté, / Pour moi j'aime autant perdre l'humanité*" (If the power of speech were taken from me / I would just as well lose my humanity: *Le dépit amoureux*, 2.8), in the same sense that Pascal, speaking of Christ, writes, "*Sachant que nous sommes grossiers, il nous conduit ainsi à l'adoration de sa divinité présente en tous lieux par celle de son humanité présente en un lieu particulier*" (Knowing how gross we are, he thus conducts us to the adoration of his divinity, present in all places, by that of his humanity, present in a particular place: *Provincial Letters*, letter 16). Furthermore, the Grimms' *Deutsches Wörterbuch* (RT) takes *humanitas* as its point of reference both for the entry *Menschheit* and for *Menschlichkeit*, but it is precisely this dependency on Latin that Fichte challenged in the fourth of his *Addresses to the German Nation* (1807), criticizing the use of the term *Humanität*. His reaction to the importation of a foreign term was based on the argument that the development of the particular language and thought of the German people had in reality nothing to do with imported terms that were grafted on artificially, especially if the languages from which these terms were borrowed could not compete with the German language in their originality. French was, according to him, too dependent upon Latin, whereas German was perfectly capable of thinking the notion of humanity by giving it its own expressions: *Menschheit, Menschlichkeit*, and *Menschenfreundlichkeit* (which subsumes the idea of kindness, benevolence to others, and philanthropy, in its literal etymological sense). This explicit argument barely disguised the subtext: Fichte was reacting against a French model imported through the Academy of Berlin, which proposed a universalist ideal of humanity, when it was Napoleon's armies that undertook to impose this ideal, by refusing any German specificity. In addition, *Humanität* was too directly linked to a Roman Catholic semantic and cultural context, whose "universalism" was opposed head-on to the Lutheranism that founded the German language.

It was all the more surprising that the Grimms' dictionary, which dates from the first half of the nineteenth century and, as we saw, does refer to the Latin *humanitas*, does not record *Humanität* (RT: Jacob and Wilhelm Grimm, *Deutsches Wörterbuch*). *Humanität*, after all, was already present, sixteen years

1

The complex architecture of *humanitas* in Latin humanism

The Latin term *humanitas* first appeared around 80 BCE (the first instances of its use are in the *Rhetoric to Herennius* [2.24, 26, 50; 4.12, 23], anonymous and of uncertain date, and in Cicero's *For Publius Quinctius* §§51 and 97). At that time it meant a brotherly disposition based on the feeling of belonging to the same species, the *genus humanum* (*humanitas* would not signify "humanity" in this latter sense until the Christian authors; cf. Saint Jerome, *Letters*, 55.3, 4). The concept subsequently assumed the full extent of its meaning with Cicero, who elaborated a theory of both individual and collective human development through culture, particularly the liberal arts and literature, which explains the direct link between the modern term "humanities" and its original Latin meaning. Beginning with his speech *Pro Roscio Amerino* (Roscius was accused of parricide in 80 BCE), Cicero reflects first of all on the specificity of the human as opposed to the state of savagery, and then goes on to discuss the fundamentally enriching effects of civilization, which turn man into a cultural being, in contrast to the forms of barbarism, which abandon him to the state of nature verging on animality (see the speech *On Behalf of Archias the Poet*, and the treatise *De republica*, in particular 1.28). *Humanitas* thus establishes itself as a set of characteristics that supposedly define what a civilized man is, as opposed to what he is not, and from which follow certain duties he has to observe in his relation to himself, and to his fellow humans (this is the theme of Cicero's treatise *On Duties*).

We have, then, a complex architecture, under the constant threat of destruction from the poles against which *humanitas* is defined; animality, savagery, barbarism, monstrosity. *Humanitas* can only be preserved through our constantly exercising the human duties of solidarity, of justice, and of mercy (the term *humanitas* covers all of these meanings). Exercising these duties requires us to draw from the wellspring of the cultural memory to which humanity has consigned its own definitions of values (in philosophical discourse, in particular), and the illustration of its principles (notably through historical *exempla*). This accounts for the importance of the humanities, whose role is not a decorative but a constitutive one. In two exemplary texts, Cicero thus appeals both to the sense of community created in sharing the same culture, and to the adherence to the values of this culture. He does this, on the one hand, in the speech *On Behalf of Archias the Poet*, when he asks the Romans not to exclude the foreign poet from its civic body, and on the other, in the programmatic letter to his brother, the governor of the province of Asia (*To His Brother Quintus* 1.1), when he urges him to show the greatest *humanitas* toward those he administers in Greece. In each case, *humanitas* is opposed to the force of exclusion represented by *acerbitas*, or a harshness verging on cruelty, and *saevitia*, which is one of the characteristics of a moral monster (see Seneca, *On Anger* and *On Clemency*). Anti-*humanis* is then defined as *immanis*: this adjective, the antonym of *manis* (good), refers generally to all that is out of proportion, and thus frightening, or monstrous. This is particularly true of the animal nature of wild beasts, *ferae*, an animality that, when transferred to men, denies all humanity by inverting its values. Seneca thus says of Caligula ("To Polybius," *On Consolation*, 17.5–6) that he "savored in the misfortunes of others the most inhuman consolation [*alienis malis oblectare minime humano solacio*]," a perfect perversion of the motto of Latin humanism we find in Terence (*The Self-Torturer* 77): "I am a man, and I deem nothing pertaining to man foreign to me [*homo sum, humani nil a me alienum puto*]," an even more eloquent echo of which we find in Seneca himself, who defines *humanitas* (*Letters* 88.30) as "not thinking of any misfortune as foreign [*nullum alienum malum putat*]."

It is worth adding the following clarifications to this very general presentation:

1. The contribution of the Greeks was, of course, a determining one (see Cicero's avowed debt, *To His Brother Quintus* 1.27–28). The sense of the unity of humankind is no doubt as old as man, but beyond this immediate awareness, we recognize within the idea of a necessary fraternity between the members of a same species the Greek *philantrôpia*, which was associated with *paideia* through the cultural side of the Roman *humanitas* (the difference being that the intellectual training to which *humanitas* refers is that of a fully developed man, and not the early training of the child, *pais*, as he is being taught). The originality of the Roman term, which has no equivalent in Greek, was first and foremost to associate the two words within a unitary, balanced conception of man. However, this lexical balance would not last a generation, and in the widest sense of the term, *humanitas* would be, generally speaking, the invention of the generation of Cicero and Varro, and would lose its complexity during the Roman empire, when it was reduced either to *philantrôpia* or to *paideia* (see Aulus Gellius, *Attic Nights* 13.17). We can see here the effects of a generation that had been brought up with the cultural contributions of Hellenism, and that expected culture, perceived in its universality, to provide new tools for understanding the drama of contemporary events, and to remedy these by preserving the best of the national tradition, the *mos maiorum*, that is, those aspects in the historical evolution of Rome which marked the full development of civilized man (see Novara, *Les idées romaines*, 1:165–97).

2. Historical relativism has a philosophical counterpart: recent studies have thus emphasized how closely the Roman construction of *humanitas* was bound up with the imperial politics of Rome (see Paul Veyne, "*Humanitas*: Les Romains et les autres," in Giardina, *Les idées romaines*, 421–59; and Braund, "Roman Assimilations," 15–32). The alleged universality of the concept of *humanitas* in fact imposed the model of the Roman equipped with a Greco-Roman culture, gradually dominated by the Latin language, and imbued with the values of the *mos maiorum*. This model worked first of all by casting everything incompatible with it into the void of savagery and barbarism, and then by offering itself as a tool for integrating the conquered populations into the body of the empire through a process of harmonious romanization, which was synonymous with civilization, pure and simple.

3. Roman thinkers were not, however, unaware of any properly universal claims made in the name of *humanitas*. This surfaces specifically in regard to slavery, and with the influence of Stoicism; the limit of this universalism can be seen, however, in the absence of any questioning of slavery, even though slaves were recognized as men (see Cicero, *On Duties* 1.41 and 150, and especially Seneca, *Epistles* 47). Stoicism even provided the means for thinking what appears to us as a contradiction, by making the slave an employee in perpetuity who was looked after by his master. More generally, philosophical

(continued)

cosmopolitanism, which in theory eradicated all inequalities of status, was in no way aiming to overthrow the political and social frameworks of the time, but cultivated respect for the existing structures and institutions by projecting human equality into the ideal state of a utopian City of Wise Men. It is nonetheless remarkable that the philosophical discourse on slavery certainly defined man in terms of the freedom to act well the role given to him by Fortune—a freedom, however, that was seen against the backdrop of a primary enslavement. Every man is a slave to his destiny and also, with the exception of ideal wise men, a slave to his own passions, a secondary enslavement that is ultimately worse than any other because it is voluntary, and involves one's own self-abasement (cf. Cicero, *Paradoxa Stoicorum* 5, on the theme "Only the wise man is free"; and Seneca, *On Tranquility of Mind* 10. 3: "All life is slavery"). Perhaps the Roman *humanitas* testifies not only to an imperialist pragmatism, and to an all-too-human inability to free oneself from the social and institutional framework of a given culture, but also, by contrast to the optimism of contemporary human rights, to an ancient sense of the fragility of human affairs and the weakness of man, who can never be helped enough by the whole of human culture in his attempts to escape a degradation that is often of his own making.

before the *Addresses to the German Nation*, in Herder's great work*, Ideas for a Philosophy of the History of Mankind* (Ideen zur Philosophie der Geschichte der Menschheit), book 4, chapter 4: "I would hope to be able to capture in the term humanity [*Humanität*] everything I have said up until now on the superior formation of man in terms of reason and freedom. . . ." The title of this chapter is explicit: "Man is formed with a view to humanity and religion." *Humanität*, moreover, is emphasized throughout this book, and, like *humanitas* in Cicero, although it is never given a positive definition, Herder's *Humanität* includes everything that enables man to rise above his empirical ground, as well as everything that is aimed for in this movement of overcoming, since humanity is the "finality of mankind": the future of reason is to establish a "lasting humanity."

II. "Humanity" (*Menschheit*) as an Ethical Ideal?

Kant also draws a distinction between *Humanität* and *Menschlichkeit* on the one hand, and *Menschheit* on the other. In the appendix to the second part of the *Critique of Judgment* (§60, "Of the Methodology of Taste," *Critique of the Aesthetic Power of Judgment*), Kant reminds us in discussing the humanities that they are so called "because humanity [*Humanität*] means on the one hand the universal feeling of participation [*Teilnehmungsgefühl*] and on the other hand the capacity for being able to communicate [*mittheilen*] one's inmost self universally, which properties taken together constitute the sociability that is appropriate to humankind [*Menschheit*]." But the problem is no longer one of a semantic differentiation between an originally Latin term and a German term, since Kant introduces a double meaning of the term *Menschheit*. For animality also exists within man, and is opposed to "the idea of humanity [*Menschheit*] that he bears in his soul as the archetype of his actions" (*Critique of Pure Reason*, "Transcendental Dialectic," 1.1, trans. Guyer and Wood, 397), since one cannot determine "the highest degree of perfection at which humanity must stop . . . however great a gulf must remain between the idea and its execution" (ibid.). Humanity is thus both what characterizes man as an "object of experience" and the ideal of his freedom, "*humanity* raised in its Idea" (*Conflict of the Faculties*, §1, General Remark, "On Religious Sects," trans. Gregor, 105). *Menschheit*, then, referred both to a generic humanity, and to what it is within humanity, and only within humanity, that makes it no longer a fact, but a gradual evolution toward an ethical ideal: it is at the very core of this generic humanity that the driving force of its evolution is situated. Defined as freedom, this driving force is generic humanity's final cause, humanity perfected and reconciled, humanity having made real the idea that (by its very nature) it also *is*.

Borrowing this double Kantian sense, Hermann Cohen emphasizes that in Kant, the term both is "equivalent to a rational being," and has a "universalist, cosmopolitan meaning." Cohen, moreover, links Kant to Herder:

> Herder, who was a rebellious and thus ungrateful disciple of Kant, still engaged with his thought . . . through the idea of humanity . . . it is no coincidence that he was also the author of *On the Spirit of Hebrew Poetry*. He recognized the spirit of humanity in the earliest texts of the Old Testament. . . . This was an important intuition which guided Herder in his general conception of the spirit of the Bible: he recognized the messianism in the principle of monotheism.
>
> (*Religion of Reason*, chap. 13:
> "The Idea of Messiah and Humanity," §11)

Three perspectives converge at a sort of future vanishing point: politics has as its ideal the confederation of States, driven by the spirit of cosmopolitanism that ultimately tends toward the disappearance of nation-states, then of sovereign states. The spirit is based on the properly ethical aspiration to the ideal of a reconciled humanity, that is, an *ethics* that coincides with culture to the extent that it would render *religion* useless, since religion will have been, as a messianic monotheism, the revelation of the meaning of

these ideals in the figure of the Messiah. (Christianity and Judaism are not fundamentally opposed if Noah is recognized as "the first Messiah," and if one accepts the essential role played by the prophets in the constitution of the historical and moral ideal of humanity; the real and irreducible point of divergence is, of course, the fact of accepting or refusing Jesus as the Messiah.) Cohen, who is openly hostile to the idea of miracles, does not imagine the Messiah other than in the secularized and rationalized form of a coincidence between the ideal and the real, between the *fieri* and the *factum*; he knows that it is not a matter of a promised effective reality, but of a tendency, of an asymptote. Unified humanity is merely an ideal: monotheistic messianism is its historical expression, and Kantian ethics and cosmopolitanism are its rational formulation. The feeling of humanity—Cohen makes no distinction between *Humanität* and *Menschlichkeit*—is an essential virtue since it is thanks to this virtue that humankind (*Menschentum*, which is merely *Menschengeschlecht* as far as science is concerned) has access to humanity (*Menschheit*), that is, to the true meaning of what would be the progress of humanity.

In Nietzsche's thought, the potential confusion between the different terms used to designate humanity (*Humanität* and *Menschheit*) and the human (*das Menschliche* and *das Humane*) becomes the object of constant critical attention. Nietzsche denounces, in the folding back of *Menschlichkeit* onto *Humanität*, one of the most enduring effects of Christianity on the way we conceive of the human, and the most telling sign of how Christianity has supplanted antiquity. Indeed, it is in studying closely what constituted the humanity of the Greeks, from a philological and historical perspective, that the deceptive, cunning (*witzig*) nature of this folding back becomes apparent. This study enables us to understand the extent to which the idea of the human (*das Menschliche*) becomes confused as soon as one banishes everything that Christianity designates as inhumanity (*Inhumanität*):

The human [*das Menschliche*] which Antiquity shows us should not be confused with the human [*das Humane*]. . . . The human [*das Menschliche*] of the Greeks consists in a certain naivety by which, for them, are distinguished man, the State, art, society, the rights of war and of peoples, the relations between the sexes, education, looking after the home; this is precisely the human [*das Menschliche*] as it manifests itself everywhere, among all peoples, but for them, with no mask and inhumanly [*in einer Unmaskirtheit und Inhumanität*], which one must not overlook if one is to draw any lesson from it.

(Nietzsche, frag. 3 [12], March 1875,
in "Notes for 'We Philologists'")

III. Man and Inhumanity

This confusion is in essence due to the fact that the idea of *Humanität* aims to separate man from nature. Reestablishing the meaning of *Menschheit* assumes that one can show how much "the natural qualities, and the properly called 'human' [*menschlich*] ones have grown up inseparably together" (Nietzsche, "Homer's Wettkampf"). One can thus no longer make any distinction between man and nature. But to get rid of this folding back means taking away from humanity (*Menschheit*) any teleological meaning. Indeed, it is when one considers that humanity (*Menschheit*) is never sufficiently human (*Humane*) that one makes one or the other a goal:

Man, not humanity [*die Menschheit*]. Humanity [*die Menschheit*] is much more a means than an end. It is a question of the type: Humanity [*die Menschheit*] is only material of experience, the enormous excess of what has not succeeded, a field of rubble.

(Nietzsche, frag. 14 [8])

And also:

In our present humanity [*Menschheit*] we have attained a considerable degree of humanity [*Humanität*]. The very fact that we are generally not aware of it is already a proof.

(Nietzsche, frag. 15 [63])

This attachment to the idea of *Humanität* in Nietzsche's late writings, and the regret they express that there is never enough humanity, become a symptom of decadence.

MERKMAL (GERMAN)

ENGLISH	mark
FRENCH	*marque distinctive, marque, note*
ITALIAN, SPANISH	*marca*
LATIN	*nota*

➤ CONCEPT, LOGOS, MOMENT, OBJECT, PREDICATION, PROPERTY, REALITY, REPRÉSENTATION, RES, SACHVERHALT, SENSE, SIGN, *THING* (RES), TROPE

The German *Merkmal* is generally considered as a term from Gottlob Frege's philosophical idiolect. Indeed, the word appears in contrast to *Eigenschaft* (property) in the *Grundlagen der Arithmetik* (Foundations of arithmetic) from 1884, when he introduces a new theory of predication (§53). According to this theory—readily reformulated with the help of a standard example in the history of logic—in a proposition such as "man is an animal," "animal" will not be analyzed in Fregean terms as a property of man, but as a "mark" of the concept of man. However, *Merkmal* is not only a technical term belonging to a particular philosophy; it is at the intersection of two series, whose initial convergence, and then progressive divergence, are linked to a fact of translation between Greek and Latin that is worthy of a philosopher's attention. More than its English or French equivalents, the clarity of the oppositions that structure its domain of application in German allow it to describe the aforementioned "intersection," its sources, its mechanisms, and its philosophical stakes. The first series is the one denoted by the synonymous pair *Merkmal-Zeichen* (sign); the second, which corresponds to Frege's usage, is the one denoted by the antonymous pair *Merkmal/Eigenschaft*. These two series do not normally have any necessary meeting point. Their intersection can only be explained by other philosophical languages: before becoming part of Frege's idiom in opposition to *Eigenschaft*, the notion of *Merkmal* had a protohistory, entailing a certain number of shifts in the understanding of what a concept, a judgment, and an object of judgment are, and how they are expressed in "languages." This is what we will reconstruct briefly here.

I. *Merkmal* and *Zeichen*, "Mark" and "Sign"

The synonymous pair *Merkmal-Zeichen* has its origin in the Latin of Boethius, in this case via the translation of the first chapter of *Peri hermêneias* (On interpretation) (16a2–7), in which Aristotle puts in place what has come to be known, since C. K. Ogden and I. A. Richards, as the "semantic triangle." In the Latin version, Boethius in fact translates two distinct Greek words, *sumbolon* [σύμβολον] and *sêmeion* [σημεῖον], as the same Latin word, *nota*:

> Sunt ergo ea quae sunt in voce earum quae sunt in anima passionum notae et ea quae scribuntur eorum quae sunt in voce. Et quemadmodum nec litterae omnibus eaedem, sic nec eadem voces; quorum autem hae primorum notae, eaedem omnibus passiones animae sunt, et quorum hae similitudines, res etiam eaedem.

> (Spoken words are the symbols of mental experience and written words are the symbols of spoken words. Just as all men have not the same writing, so all men have not the same speech sounds, but the mental experiences, which these directly symbolize, are the same for all, as also are those things of which our experiences are the images.)

> (*Aristoteles latinus*, 2.1–2, p. 5 [4–9]; trans. Edghill)

(See SIGN, and on the current options for translating the Greek original, Box 1 there). Boethius's translation doubly modifies the relation of meaning according to Aristotle: first, through the (relative) elimination of what was conveyed by the distinction between *sumbolon* and *sêmeion*, and second, by bringing signifying and noting closer together. This explains the paired set of terms we find among certain medieval commentators of the *Peri hermêneias*, between *nota* and the speaker on the one hand, and *signum* and the interlocutor or listener on the other. (Cf. the text by Robert Kilwardby, cited in SIGN: "dicendum quod differunt nota et signum, quia nota est in quantum est in ore proferentis, set signum est in quantum est in aure audientis" (We will reply that *nota* and *signum* are different, because *nota* is used for what is in the mouth of the speaker, but *signum* for what is in the ear of the listener), and the commentary by I. Rosier-Catach). The replacement of *nota* by the pair *sumbolum/signum* in Guillaume de Moerbeke's medieval translation of the text plays no part in the genesis of the first series of *Merkmal*; many logicians had become used to reorganizing the semantic triangle with *signum* well before this translation. So there are two all-encompassing linguistic mechanisms in Latin, based on the neutralization of *sumbolon/sêmeion*, that account for the alternation between *Merkmal* and *Zeichen* in common philosophical usage in German, and that identify a mark and a sign (as they also do, more or less, in everyday language): the system of *nota*, and the system of *signum*. "To be a mark of" and "to be a sign of" are considered synonymous, by virtue of the simple fact that *Zeichen* contains, depending on the context, the same dimension of notification as the French *signe* (sign; *signifier* [in French] can have the meaning of "to let know," "to notify"; "donner un signe de" [to give a sign of] is synonymous in French with "donner une marque de"; and so on; cf. the analogous expression "signify" in English: "I signified my assent . . ."; and the use of "signify" and "signifyin'" in the African American tradition). To this is added, however, the transitivity of the posited relationship that Aristotle articulates in the "semantic triangle," and that subsequently acquires a historial dimension. Aristotle's formulation generally appears among Scholastics in the form of a saying based on *signum*: "Quicquid est signum signi est signum signati" (Anything that is the sign of a sign is the sign of its signified)—meaning that the vocal sound (Aristotle's *phônê* [φωνή]), insofar as it is the sign of the "passions" or the "affections of the soul" ("pathêmata tês psuchês [παθήματα τῆς ψυχῆς]"), is therefore also the sign of the things signified (the *pragmata* [πράγματα]) by these passions. There is, though, another expression attested as early as the twelfth century, "Nota notae est nota rei" (The *nota* of a *nota* is the *nota* of the thing), which initially has the same meaning as the first formulation, since it simply says the same thing in the language of Boethius's translation. But it will progressively assume a new meaning, explaining how *Merkmal* becomes part of a configuration we might describe as "pre-Fregean," which will lead to the opposition between *Merkmal* and *Eigenschaft.*

II. Marks of Concepts / Marks of Things

By positing that "animal" is not a property of "man," but a *Merkmal* of the concept of man, a Fregean means that *animal* is a "part" of man, or more precisely, that animal is a "part" of

the concept *man*, whereas, for example, it is a "property" of the concept *man* to "have *n* individuals," and a property of a given individual to "fall under the concept *man*" (which is expressed in the single proposition that the concept has an extension: multiple individuals "fall under the concept"). In a letter published in 1941 (cf. *Unbekannte Briefe Freges*, ed. Steck, 9), Frege himself explains that the mereological and intensional relation of the marks to the concepts they constitute is comparable to the relation that stones have to the house that they are used to build, and that consists of this building ("Ich vergleiche die einzelnen Merkmale eines Begriffes den Steinen, aus denen ein Haus besteht" [I compare the individual marks of a concept to the stones from which a house is built]). In an article from 1903 on "The Foundations of Geometry" (373), the parts of a concept are presented, in a less visually figurative way, as its "logical parts [*logische Teile*]." The question that interests us here is not the origin of this new meaning of *Merkmal*, but rather this: what makes possible, even facilitates, the transition from the pair *Merkmal-Zeichen* to the opposition *Merkmal/Eigenschaft*?

A part of the history of *Merkmal* was traced by Kasimir Twardowski in a essay from 1894, *Zur Lehre vom Inhalt und Gegenstand der Vorstellungen* (On the theory of content and of the object of representations).

■ See Box 1.

It is, however, in a text by Adolf Reinach from 1911, *Die obersten Regeln der Vernunftschlüsse bei Kant* (The supreme rules of reasoning in Kant), that we can find the most original indication of the trajectory that *Merkmal* takes before Frege. This trajectory, however, takes a surprising material form in the radical change of understanding that the Scholastic saying undergoes: "Nota notae est nota rei." When Reinach presents the two main rules of reasoning according to Kant, he refers to the 1672 text *Die falsche Spitzfindigkeit der vier syllogistischen Figuren* (The false subtlety of the four syllogistic figures), and makes a distinction between "the general rule of all affirmative reasonings" and "the general rule of all negative reasonings." The first, R1, is: "Ein Merkmal vom Merkmal ist ein Merkmal der Sache selbst" (A mark of a mark is a mark of the thing itself); the second, R2, is: "Was dem Merkmal eines Dinges widerspricht, widerspricht dem Dinge selbst" (What contradicts the mark of a thing contradicts the thing itself). These rules show that, in the "pre-Fregean" use of the term, *Merkmal* is related to "things," or rather to "the/a thing," and not, as in Frege, to "concept" (*Begriff*) as a part of the concept. Moreover, judgment is defined in relation to "things" in Kant's short text: "Etwas als ein Merkmal mit einem Dinge vergleichen, heißt Urteilen" (Comparing something as a mark to a thing is called judging). How should we therefore translate *Merkmal*? Reinach offers a fortuitous indication for a francophone translator when he makes explicit reference to the "Scholastic sayings adapted by Kant" in his two rules: in other words, for R1, "nota notae est etiam nota rei ipsius" (The *nota* of a *nota* is also the *nota* of the thing itself), and for R2, "repugnans notae repugnant rei ipsi" (What contradicts *the nota* contradicts the thing itself) (cf. Reinach, *Die obersten*

1

Merkmal, moment, "trope"

Paragraph 13 of Kasimir Twardowski's *Zur Lehre vom Inhalt und Gegenstand der Vorstellungen* (On the content and object of presentations) is devoted to *Merkmal*. In referring to the term, Twadrowski does not distinguish between *either* the level of the concept *or* the level of things, but between the level of representation (*Vorstellung*) and that of the object of representation. On this point, he mentions the "eminent authorities" who paved the way for our understanding of the "mark." The first is Kant, and the introduction to his *Logic*, from which he gives a long quotation:

> A distinctive mark is, on a thing, what constitutes a part of the knowledge of this thing, or even a partial representation, which amounts to the same, insofar as it is considered as the basis of the knowledge of the entire representation. . . . All thought is nothing other than the fact of representing itself using distinctive marks.
>
> (In Husserl and Twardowski, *Sur les objets intentionnels*, 171)

The second authority is the Aristotelian Adolf Trendelenburg, if we accept Twardowski's rewriting of the definition proposed in his *Logische Untersuchungen* (2:255): a *Merkmal* is "that which forms the concept in the thing [*Sache*]." Twardowski comments, "Although the meaning of this definition . . . appears to be rather unclear," it can be justified by "making it more explicit that what is understood by distinctive marks is what 'in the thing' provides the necessary material from which the concept of this thing is formed. What corresponds in the thing to the concept are the distinctive marks of this thing" (in Husserl and Twardowski, *Sur les objets intentionnels*, 172; it is worth noting the distinction he makes between *Sache* [thing as affair, matter] and *Dinge* [thing as object]).

The third authority is Albert Stöckl (*Lehrbuch der Philosophie*, vol. 1, §75):

> What we understand by distinctive marks are generally all the moments by which an object is recognized as what it is, and is distinguished from all other objects.
>
> (In Husserl and Twardowski, *Sur les objets intentionnels*, 172)

Merkmal is thus a veritable conceptual "exchanger": with Trendelenburg, it brings together Kant's "mark," the world of representation, and Aristotle's "part of *logos* [λόγος]," the world of essences; with Stöckl, it opens out onto the Husserlian notion of "moment" (see MOMENT), and thus onto the notion of "trope," since the *Rotomomente* (moments of the color red), the *individuelle Röte* (individual reds) of, or in, a red thing, are defined as *Einzelfall* (particular cases) of the *Spezies Röte* (redness species), and for Husserl (*Logische Untersuchungen*, vol. 1, §§31, 34, 39) clearly correspond to the tropes of recent trope theory (see TROPE).

Regeln, 51 n. 2). The obvious translation into French of *Merk-mal* would thus be *note* (note), via the Scholastic Latin. This choice, though, was not uniformly adopted, and *marques* (marks) and *marques distinctives* (distinctive marks) are found more commonly. The use of *marques* in this context has an illustrious precedent. Gottfried Leibniz, writing in French, presents the (Scholastic) notion of a "nominal definition" by proposing that it "explique le nom par les marques de la chose" (explains the name by the marks of the thing) (cf. *Die philosophischen Schriften*, 5:18): the German and the French are here in agreement. But we can find other equivalents, pertaining to a different field. In the *Logique* (Logic) of his *Cours de philosophie*, published in Louvain in 1897, Desiré Mercier uses the term *caractères* to illustrate an *idée inadequate*: "L'idée inadequate nous présente l'objet au moyen de caractères qui ne suffisent pas à nous le faire distinguer de tout autre" (An inadequate idea presents an object to us by means of characters that are insufficient to distinguish it for us from any other object; *Cours de philosophie*, 83). We thus have several pairs expressing the same basic distinction: the distinction *nota/res*, the German pair *Merkmal/Ding*, and the French pairs *marques/choses* and *caractères/objet* (see OBJECT). What in fact is *la chose/Ding* that Kant as well as Leibniz discuss? It is an open question: *la chose* can refer either to man (common or universal), or to this man (singular or particular), or to Ø man (man as neither universal nor particular, what Kant himself sometimes calls *Gegenstand*, in the sense of the "matter" [Ger. *Materie*] of the concept, in other words, the *res* that is neutral, or indifferent to particular or universal, as opposed to the individual *Gegenstand* existing in intuition [Ger. *Anschauung*]). If we consider that Ø "man" refers to the whole set of "marks" taken "in itself" (Man in himself), the universe of *Merkmal* is connected to that of the "triplex status naturae" or the "triplex respectus essentiae" (*in se, in anima, in re*), that of the "indifference of the essence" (see UNIVERSALS).

Kant's rules R1 and R2 open out onto another problematic: the one inaugurated by Aristotle when he postulates in the *Categories* that "as far as definitions are concerned, the first species include the definition both of the species and of the genera, and the definition of the species includes that of the genus," and that, "in the same way, species and individuals also include the definition of the differences." In order to justify this affirmation, Aristotle introduces a rule that recalls R1: "Everything that can be said of the predicate can also be said of the subject [*hosa gar kata tou katêgoroumenou legetai, kata tou hupokeimenou rhêthêsetai* (ὅσα γὰρ κατὰ τοῦ κατηγορουμένου λέγεται, κατὰ τοῦ ὑποκειμένου ῥηθήσεται)]" (*Categories* 3b4–5, trans. Cooke). Besides the paralogisms that are easily dismissed, such as "Socrates is a man, man is a species, therefore Socrates is a species," the problem for commentators is that of the status of the "predicates of predicates" in Aristotle. (See, among others, the thirteenth-century *Fallaciae ad modum Oxoniae* [ed. Kopp, 106–7], which explains that this paralogistic type of reasoning constitutes the third mode of error of the figure of expression, based on a mistaken *commutatio* of the *quale quid*—"described," Greek *poion ti* [ποιόν τι]—as *hoc aliquid*, "this something," Greek *tode ti* [τόδε τι]; the author of the *Fallaciae* exposes the error in the analytical language of the *suppositio*: in the major, *homo* has a

"simply confused [*confusa tantum*]" supposition, and means something that is described; in the minor, it has a "determinate [*determinata*]" supposition, and means "this something"; see SUPPOSITION.) Aristotle touches on the question on several occasions, particularly when he discusses certain predicates of Man in himself (Ø man) that do not apply to man plain and simple (this man or that man)—for example, "immobile being" (cf. *Topics*, E.7, 137b3–10). The clearest passage is, however, in *Metaphysics*, M.4, 1079b3–11, in which he contrasts the theory of Ideas with a "pre-Fregean" argument: if there is an Idea of the circle, a Circle in itself, the Idea of the circle will have to contain all the marks of the essence of the circle as well as the property of "being an Idea (of)." To what part of the essence will this be added? Remarkably, the note by Tricot (*Métaphysique*, 2:738), based on the commentary by Bonitz, quotes the passage in which Bonitz uses the term *nota* to refer to the constitutive elements of the Idea.

The "pre-Fregean" thesis is clearly expressed by Leibniz when, faced with the paralogism "animal est genus, Petrus est animal, ergo Petrus est genus" (Animal is a genus, Peter is an animal, therefore Peter is a genus) (of the kind *poion ti / tode ti*), he replies that the major is not universal, since Ø animal is not a genus ("maiorem non esse universalem, neque enim is qui est animal est genus," *Defensio Trinitatis*, in *Die philosophischen Schriften*, 4:120), which, as Angelelli points out, amounts to saying that " 'genus' is not a mark of 'animal' " (*Studies on Gottlob Frege*, 149 n. 56). We also find this thesis prefigured in Albert the Great, when he explains that in "homo praedicatur de pluribus," the referents of "man" do not have the property of being the predicates of many ("nihil est in appellatis ipsis quod de pluribus praedicatur"), since the predicate "to be the predicates of many" is contingent on the form "man" without being contingent on its referents ("tale enim praedicatum contingit formae, ita quod non contingit appellatis," *Metaphysica*, 7.2.1, ed. Geyer, p. 339, 24–29).

III. *Merkmal* and *Urteil*, "Mark" and "Judgment"

A recurrent difficulty of the notion of judgment as an act of "linking marks together" (*Merkmalsverknüpfung*), governed by Kant's rules R1 and R2, is distinguishing between R1, the rule of *Categories* 3b 4–5, and the rule of the "Dictum de omni." For some authors, there is no difference between the two: "To say: 'If *A* is an attribute of every *B*, and *B* an attribute of every *G*, *A* is an attribute of every *G*,' is the same as saying: 'Everything that can be affirmed of the attribute must be affirmed of the subject' " (Tonqueduc, *Critique*, 54). Others who regularly use the notion of "mark," like Husserl, reject the formulation "Nota notae est nota rei" (cf. *Logische Untersuchungen*, vol. 1, §41). Starting out from the definition of "judgment" as "linking marks together," we cannot fail to notice the difference that exists between this approach and the "logical" approach to judgment, as it is discussed in the second edition of the *Critique of Pure Reason*. There, Immanuel Kant indeed points out that he has "never been able to satisfy [himself] with the explanation that the logicians give of a judgment in general: it is, they say, the representation of a relation between two concepts [*die Vorstellung eines Verhältnisses zwischen zwei Begriffen*]," because it "fits only categorical [*kategorische Urteile*] but not hypothetical [*hypothetische*] and disjunctive [*disjunktive*] judgments (which latter two do not

contain a relation of concepts but of judgments themselves [*als welche letztere nicht ein Verhältnis von Begriffen, sondern selbst von Urteilen enthalten]*)" (*Critique of Pure Reason*, 2nd ed., §19, trans. Guyer and Wood, 251). This implies, among other "troublesome consequences," that the "widespread doctrine of the four syllogistic figures" in effect "concerns only [*betrifft nur*] the categorical inferences [*die kategorischen Vernunftschlüsse*]" (ibid., 251 n. 1). It is also worth noting that this same passage introduces the notion of an "objectively valid" relation of judgment, defining it thus:

> Diese beiden Vorstellungen sind im *Object* d.i. ohne Unterschied des Zustandes des *Subjects*, verbunden und nicht bloß in der Wahrnehmung (so oft sie auch wiederholt sein mag) beisammen.
>
> (These two representations are combined in the *object*, i.e., regardless of any difference in the condition of the *subject*, and are not merely found together in perception [however often as that might be repeated].)
>
> (Ibid., 252 [emphasis added])

With this Object/Subject opposition, we can see that the idea of "combination in the object," which up to a point is very close to R1, invests the "thing" (*Ding*) with a new coefficient, which belongs to the universe of the *Critique* and which assumes the distinction between "empirical intuition" and the "originary synthetic unity of apperception" (the "unity of transcendental apperception"). The change in the lexicon of judgment goes hand in hand with a change in the lexicon of the object.

MÊTIS [μῆτις] (GREEK)

ENGLISH   ruse, skill

➤ *RUSE*, and ART, *DESTINY*, DOXA, INGENIUM, MEMORY, *PRUDENCE*, *SOPHISM*, TALAṬṬUF, TRUTH, UNDERSTANDING, *WISDOM*

Mêtis [μῆτις], in ancient Greek, covers a wide semantic field, including the idea of practical intelligence, of astuteness, of a supple mind. This mental category had only sporadically caught the attention of scholars (Carlo Diano) before the groundbreaking book by Marcel Detienne and Jean-Pierre Vernant, *Les ruses de l'intelligence. La mêtis des Grecs* (*Cunning Intelligence in Greek Culture and Society*). The word derives from a verbal root that means "to measure" (Gr. *metron* [μέτρον], *mêtra* [μήτρα], "measure"; see LEX, Box 1). It is linked to the important root **med-*, whose meaning Benveniste defines as follows: "to take the appropriate measures with authority" (RT: *Le vocabulaire des institutions indo-européennes*; see RT: *Dictionnaire étymologique de la langue grecque*, s.v. "medô"). This root offers a number of terms signifying measure, moderation, and modality (Lat. *modus*), as well as the attention of someone who "meditates," dominates, rules, decides (Gr. *medomai* [μήδομαι], "to attend to"; but also *mêdomai* [μέδομαι], "to meditate a plan, to have in mind"), including in the field of law and "medicine." *Mêtis* characterizes—for better or for worse; between omnicompetence and charlatanism—the posture adopted by the Sophists, "at the intersection between the traditional mêtis and the new intelligence of the philosopher" (Detienne and Vernant, *Les ruses de l'intelligence*). It was destined to become a category in contemporary anthropology, and is associated with the Anglo-Saxon category of the trickster, as well as with Lévi-Strauss's notion of *bricolage*.

Through a number of interconnected studies, M. Detienne and J.-P. Vernant sketched out a vast panorama that presents the whole range of mental attitudes covered by the term *mêtis* (astuteness, flair, shrewdness, foresight, feigning, disguise, resourcefulness, attention, vigilance, etc.), as well as the role of *mêtis* in a series of functions and strategies employed by the gods, by men, and by animals.

The book begins by analyzing the figure of the Oceanid Mêtis, "Prudence" (this is P. Mazon's chosen French translation

in Hesiod's *Theogony*), the first wife of Zeus, who, in an unforeseen move that is more cunning than astuteness itself, grabs her and swallows her while she is already pregnant with Athena (*Theogony*, ll. 886–900). Mêtis, which is no less fundamental than in the Orphic version, is added to force, and in the case of Zeus, renders him unbeatable.

The semantic field of *mêtis* is covered by many other notions, such as that of a trap (*dolos* [δόλος]), of disguise, and above all of *technê* [τέχνη] (art, skill, and the technical crafts), of *kairos* [καιρός], or "the opportune moment" (see MOMENT), of *poros* [πόρος] (open passage), and of *apatê* [ἀπάτη] (ruse, deception; see TRUTH, Box 6). It is under the aegis of this vast semantic field that a number of different strategies are developed in hunting, fishing, war, etc., and used by the gods (especially Athena and Hephaistos), by men (blacksmiths, sailors, etc.), and by animals (the octopus, the fox, etc.). A new horizon is thus invented, opening out onto aspects and ideologies of ancient Greece that had been unknown, and that are symbolized by the practical intelligence of Athena, who distinguishes herself from the master of horses and of the sea, Poseidon, precisely because she uses technique, or *mêtis*, to make the farmer's plow, the bit for the horse's teeth, or the tiller to guide ships.

The section of the book dealing with Chronos, Zeus, and the epic heroes, Menelaus, Antilochus, and, above all, Ulysses, is based on the great epic texts and a number of examples from Greek tragedy. For *mêtis* is essentially a term from the *epos*, and although the comic theater of Aristophanes is full of ruses, the word never appears, just as we never find it in Herodotus, except in a quotation from Homer, nor in Euripides, and very rarely elsewhere in Greek tragedy. This accounts for the many recent studies devoted to the analysis of *mêtis*, particularly in the *Odyssey*, linking the notion to the polytropism of Ulysses, with his "thousand tricks," as well as to the ironic and treacherous writing of Homer's text itself (P. Pucci).

■ See Box 1.

The word *mêtis* is sometimes used in its Odyssean sense by modern critics. Thus, James C. Scott, in *Seeing Like a State* (1999), uses this word to describe the ingeniousness of traditional resourceful peasants who are good with their hands and able to adapt to changing situations, as opposed to rational and scientific technicians, who are abstract and who prefigure industrial agriculture and globalization.

Pietro Pucci

1

Ulysses: "My name is no-one," the first dramatization of *mêtis*

➤ ESTI, *NEGATION, NOTHING, PERSON, WITTICISM*

Ulysses and his traveling companions are imprisoned on their return journey by the man-eating Polyphemus, who, instead of offering them hospitality, devours them two at a time for his meals. How Ulysses carries out his "finest plan" (*aristê boulê* [ἀρίστη βουλή]; *Odyssey*, 9.98) is well known: he offers wine to Cyclops to get him drunk, blinds him while he is asleep using a stake he has hardened in the fire, and he and his companions escape from the den once he has removed the rock from the entrance, each of them hanging underneath a sheep's stomach. But this audacious plan, which entails tricking a monster, would not succeed without a preparatory ruse involving words, and which can be read in the Greek text through what Victor Bérard called "a cascade of puns." All of these puns revolve around the relationship between *outis* [οὖτις] and *mêtis*.

Outis, from the negative particle *ou* [οὐ] (no, not) and the indefinite pronoun *tis* [τίς] (someone), is the hero's name that Odysseus declares to Polyphemus to be his own: "*Outis* [οὖτις], No-one, is my name. I am called *Outis*, No-one, by my mother, my father, and all my companions" (366–67). So that when his neighbors the Cyclops, awakened by the screams of Polyphemus, ask him: "Is one (*mê tis* [μή τίς]) of the mortals coming to steal your flock? Is someone (*mê tis* [μή τίς]) killing you by ruse or by force?" (406), the monster can only reply: "My friends, no-one is killing me (Outis me kteinei [Οὖτίς με κτείνει])"

(408). However, because of the Greek syntax of negation, the sentence as a whole is to be understood, from the point of view of Polyphemus for whom No-one is the name of someone, to mean: "[It is] No-one [who] is killing me by ruse and not by force" (Outis me kteinei dolôi oude biêpsin [Οὖτίς με κτείνει δόλῳ οὐδὲ βίηψιν]), whereas the Cyclops, for whom no-one is negative, have to understand it to mean: "No-one is killing me, neither by ruse nor by force." The negative particle *ne* in the French "*ne … personne*" (no-one) is particularly useful in translating the Greek here since it is linked to the primarily positive meaning of *personne*, so if Polyphemus had been a good Frenchman, he might well have made himself understood. The chorus continues: "If no-one uses force on you" (ei mên dê mê tis se biazetai [εἰ μὲν δή μή τίς σε βιάζεται]) (410), it is because Zeus is inflicting an illness on you, and no-one can do anything about it. Now, in this response, just as immediately before in their questions, they rely upon the other negative particle, not *ou*, a factual negation, but *mê* [μή], the prohibitive negation, also known as "subjective" negation. This sort of negation is indeed very characteristic of Greek, implying a will or thought, and one finds it essentially in other moods than the indicative as a means of expressing all the nuances of prohibition, of deliberation, of want, and of regret, or, as in this case, of eventuality or of virtuality: *ei* mê tis *se biazetai*.

This is where, in focusing on this construction that is so attuned to the subtleties of negation, we find the really telling relationship to *mêtis*. No longer *mê* (negative particle) *tis* (someone), as two words, but *mêtis*, this time as a single word, the celebrated *mêtis* of the Greeks, their practical and cunning wisdom, embodied in the figure of Odysseus, who has any number of tricks up his sleeve. When he sees the Cyclops heading away, Odysseus laughs into his beard and rejoices in his heart: "It is my name that tricked him, and my irreproachable wit" (hôs onom' exapatêsen emon kai mêtis amumôn [ὡς ὄνομ' ἐξαπάτησεν ἐμὸν καὶ μῆτις ἀμύμων]) (414). And he uses the word again in book 20, exhorting his heart to be patient: "How courageous you were, in waiting until the *mêtis* released me from this den where I thought I would die!" (20–21).

One can understand why the *mêtis* of Odysseus, like that of Homer, as an effective mastery of speech, and of the very grammar and syntax of language, and as a play on being and non-being, were the heroic models for Sophistic rhetoric, which philosophers considered to be such a deceptive and scandalous art.

MIMÊSIS [μίμησις]

FRENCH *imitation, représentation*
GERMAN *Nachahmung, nachmachen, kopieren, nachbilden*
ITALIAN *imitazione, rassimiglianze; rittrare*
LATIN *imitatio, similitude*

➤ *IMITATION*, and ACTOR, ANALOGY, ART, BEAUTY, COMPARISON, DESCRIPTION, DICHTUNG, DOXA, HISTORY, *IMAGE* [BILD, EIDÔLON], *IMAGINATION* [PHANTASIA], INGENIUM, PLEASURE, PRAXIS, REPRÉSENTATION, TRUTH

Since the Renaissance, the translation and interpretation of the term *mimêsis* [μίμησις] have been the source of important philosophical and theoretical debates that have played a crucial role in the history of artistic thought. The development of the theory of art, first in Italy in the fifteenth and sixteenth centuries, then in France in the seventeenth century, is fundamentally indebted to the Greek definition of art, in the general sense of *techne* [τέχνη] and the restricted sense of *poièsis* [ποίησις], as a mimetic activity. And that definition, on each occasion, for the French as for the Italians, raised the same questions. In what does artistic imitation consist? What distinguishes it from resemblance, copy, reproduction, and illusion? What is its function: is it in the service of lies or the truth, pleasure, or knowledge? What is its object: is it nature or the idea, the visible or the invisible, the inner world or outer reality? All these questions are inscribed within a problematic largely determined by the semantic ambiguity of the concept of *mimêsis* in Greek philosophy. They correspond to the dual orientation given to the problematic of *mimêsis* by Plato and Aristotle, that is, to the opposition between a concept elaborated with reference to a pictorial model, giving *mimêsis* the meaning of "resemblance," and a concept elaborated with reference to a theatrical model, giving *mimêsis* the sense of "representation." This opposition between two meanings of *mimêsis*, between Platonic and Aristotelian *mimêsis*, is in a way constitutive of the

theory of imitation that developed starting in the Renaissance and that dominated thinking about art for several centuries. It is found in the idea of *imitazione*, as well as in those of imitation and *Nachahmung*, but by way of numerous transformations that affected its meaning deeply. The Italian theorists reinterpreted *mimêsis* on the basis of the idea of *imitatio*, transmitted by the Latin that they continued to use. And it was on the basis of the theory of *imitatio* that they developed a theory of *imitazione*. It was subsequently on the basis of the idea of *imitazione*, and in opposition to it, that the French in turn appropriated the Aristotelian theory of *mimêsis*. And the critique of *mimêsis* that developed in Germany at the end of the eighteenth century was in fact a calling into question of the French doctrine of imitation that had dominated European thought since the seventeenth century. All these displacements, adaptations, and "translations" from one language to another did no more, in a sense, than develop one of the aspects of the concept of *mimêsis* and exploit its prodigious semantic richness.

I. *Mimêsis* in Plato and Aristotle

A. Theater or painting?

Like other words of the same family (*mimêtês* [μιμητής], *mimeîsthai* [μιμεῖσθαι], etc.), *mimêsis* [μίμησις] is related to the noun *mîmos* [μῖμος]. Initially the term referred only to mime, dance, music, in other words, to activities aimed at expressing an inner reality and not at reproducing external reality. Its application to the visual arts was concomitant with the semantic shift that took place in the fifth century when it began to designate the reproduction of the external world. That new use would play a crucial role in the orientation Plato would give to the problematic of *mimêsis*. The philosophical elaboration of the concept of *mimêsis* was in fact born of a reflection on painting and sculpture. To be sure, the first sense of *mimêsis* subsists in Plato, who persisted in applying the term to music, dance (*Laws*, 7.798d), and the theater. We thus find the theatrical origin of *mimêsis* in the distinction between *mimêsis* and *diêgêsis* [διήγησις], mimetic discourse corresponding to the forms of tragedy and comedy, as opposed to a simple narrative in which the poet recounts in his own name, without hiding behind a character (*Republic*, 3.392c–394d). But such uses, which remain traditional, themselves stemmed from the establishment of a new sense of *mimêsis* based on a reference to the visual arts, and more specifically to painting, that is, a mimetic activity whose characteristic is to imitate outer reality and to do so in an image. The pictorial origin of the concept of *mimêsis* as elaborated by Plato thus inscribes the analysis of the concept in a field far removed from the one to which it was linked by the theatrical origin of the word. The problem no longer concerns the identity of the subject, the confusion between the actor and the author (as in the case of theatrical *mimêsis*), but the identity of the object, that is, the relation of the image (*eidôlon* [εἴδωλον]) to its model. The fact of connecting the question of *mimêsis* to that of the image gives *mimêsis* the sense of resemblance or likeness, and the definition of *mimêsis* as resemblance allows one to condemn pictorial *mimêsis* as a false and bad likeness, that is, to reject it in the name of the very criterion that it served to elaborate. To be sure, Plato did not reject all forms of pictorial *mimêsis*, as is evidenced by the division he establishes in *The Sophist* between two sorts of

mimêsis: a *mimêsis eikastikê* [μίμησις εἰκαστική] and a *mimêsis phantastikê* [μίμησις φανταστική] (235d–236c). The first consists of reproducing the model by respecting its proportions and imbuing each part with the appropriate colors: an art of the accurate copy. The second, on the other hand, involving above all works of large dimensions (which thus need to be viewed at a distance), deforms the exact proportions and uses colors that do not correspond to those found in reality. This mimetic does not seek to reproduce the real as it is, but as it appears to the spectator given his point of view—"these artists give up the truth in their images (*tois eidôlois* [τοῖς εἰδώλοις]) and make only the proportions that appear to be beautiful, disregarding the real ones" (*ou tas ousas summetrias, alla tas doxousas einai kalas* [οὐ τὰς οὔσας συμμετρίας ἀλλὰ τὰς δοξούσας εἶναι καλάς]) (236a 4–6)—and it is there, of course, that we find lodged the art of sophistry, always considered "relativistic" (268c–d). It is a mimetics that does not reproduce being but appearance: a "phantastics," then, which is translated as the art of the "simulacrum" or of "illusion" (see PHANTASIA): it is, in keeping with good Platonic doctrine, to be condemned under the double heading of imprecision and deception, simultaneously because it is at a remove from truth and because it would have us believe its truth. Now there is "a great deal of this kind of thing in painting" (*pampolu . . . kata tên zôgraphian* [πάμπολυ . . . κατὰ τὴν ζωγραφίαν]) (236b 9). The quality of the *mimêsis* is to be gauged by the standard of its reference, evaluated in terms of accuracy and exactitude, that is, as a function of criteria that belong to the realm of knowledge and truth: in the arts of imitation, "it is first of all equality, whether of quality or quantity, that gives truth or rightness (*tên orthotêta* [τὴν ὀρθότητα])" (*Laws*, 2.667d 5–7).

This strictly referential conception of *mimêsis* nonetheless poses several problems with relation to the image—that is, as soon as one applies it to the type of imitation on which the Platonic theory of *mimêsis* is, in fact, based. The criteria of good *mimêsis* in the sense of likeness cannot be those of *mimêsis* in the sense of reproduction. An image that would reproduce the dimensions and all the characteristics of its model would no longer be an image but an identical duplicate of the original. One would no longer have Cratylus and the image of Cratylus, but two Cratyluses:

> Then you see, my friend, that we must find some other principle of truth in images ("*allên chrê eikonos orthotêta zêtein*" [ἄλλην χρὴ εἰκόνος ὀρθότητα ζητεῖν]), and also in names; and not insist that an image is no longer an image when something is added or subtracted. Do you not perceive that images are very far from having qualities which are the exact counterpart of the realities which they represent ("*hosou endeousin hai eikones ta auta echein ekeinois hôn eikones eisin*" [ὅσου ἐνδέουσιν αἱ εἰκόνες τὰ αὐτὰ ἔχειν ἐκείνοις ὧν εἰκόνες εἰσίν])?
>
> *Cratylus*, 432c 7–d 2

B. Resemblance or representation?

How is the resemblance of an image to be thought? How are we to think that other accuracy that presupposes the existence of a deviation between the product of the imitation and the object imitated? How are we to reconcile the

referential definition of *mimêsis* with the idea that the imitation can be accurate while being inadequate to its model? This properly conceptual difficulty, evidence of a tension between contradictory demands, is already inscribed in the language. As R. Dupont-Roc and J. Lallot observe in the notes accompanying their translation of Aristotle's *Poetics*, whatever the difference between Aristotelian and Platonic *mimêsis*, there is "a feature common to verbs of imitation in the two authors: the fundamental ambivalence of the accusative of an object—affected (= model) or effectuated (= copy)—constructed with those verbs." And it is precisely in order to *preserve* that ambivalence that they chose to translate *mimeîsthai* by *représenter* and not by *imiter*: "unless there be elements in the context allowing one to discriminate, 'to represent (*représenter*) a man' offers the same ambiguity as *mimeîsthai anthrôpon* [μιμεῖσθαι ἄνθρωπον], whereas the traditional translation by *imiter* (to imitate) abusively selects an interpretation of the accusative as it does that of the model." This grammatical ambiguity, which allows one to focus the verb on the imitation as well as on the object imitated, is in agreement with the dual descent, both philological and philosophical, of the concept of *mimêsis,* that is, with the fact that its meaning was constituted to a twofold reference—both theatrical and pictorial. Those two lines of descent determine two distinct ways of envisaging the object of *mimêsis*. The first, which opens onto a space of fiction, leads one to connect the mimetic activity with its product, the object that Dupont-Roc and Lallot call the "object effectuated," which is given to be seen and heard in its actual presence—as in a theatrical performance (*représentation*). The second, which opens onto a world of images, connects it, on the contrary, with its model, what they call the "object affected," an object whose presence is duplicated in paint on an illusory mode—as in a pictorial imitation. It is plainly that second sense that is dominant in Plato, but without annulling the effects of the other line of descent, which continues to affect the Platonic tradition. The tendency is in some sense reversed in Aristotle, who reinserts the meaning of *mimêsis* into the realm of poetics. As Ricoeur has written, in *mimêsis*, according to Aristotle, "one should not understand . . . a reduplication of presence, as might be understood of Platonic *mimêsis*, but the break which opens up the space of fiction" (*Temps et récit*).

■ See Box 1.

Just as the theatrical genealogy of *mimêsis* comes to disturb, in Plato, the coherence of a construction based on a visual paradigm, the Aristotelian analysis of poetic *mimêsis,* in a movement that is similar but reversed, is haunted by the question of the pictorial image, which draws the problematic of *mimêsis* in an entirely different direction. The comparison with painting invoked by Aristotle on innumerable occasions, and which attests to the underlying (but active) presence of the pictorial reference, is not made without raising several difficulties. Poetic *mimêsis*, as defined by Aristotle, is, as is known, a *mimêsis* of action: it concerns "the imitation [representation] of men in action (*prattontas* [πράττοντας])" (*Poetics*, 2.1448a 1). Representing action means representing a plot (*muthos* [μῦθος]): "the Plot is the imitation of the action—for by plot [*muthos*] I here mean the arrangement of the incidents" (6.1450a 2). This correlation between *mimêsis*

1

The translation of *mimêsis* as "representation" in Aristotle

One of the strongest aspects of R. Dupont-Roc and J. Lallot's translation into French of Aristotle's *Poetics* is indeed the way it takes into account the dual philological and philosophical natures of the questions raised by the translation of *mimêsis*. The reasons they give to justify their choice of translating *mimêsis* as representation are of course first and foremost philological: "We can now see why, against an entire tradition, we chose to translate *mimeîsthai* not as 'to imitate' but as 'to represent': the decision was thus made on the basis of the theatrical connotations of this verb, and above all the possibility, as is also the case with *mimeîsthai*, of having the complement be either the 'model' object or the produced object—whereas 'to imitate' excluded the latter, which is the most important." But this choice also reflects a properly philosophical concern to account for the specificity of the Aristotelian conception of *mimêsis* in relation to the Platonic one, that is, a concern to resolve the many confusions and misinterpretations produced by the translation of *mimêsis* in the two authors as "imitation." Their translation thus has the great advantage of clarifying a conceptual difference by inscribing it into a lexical distinction,

that is, of clarifying retrospectively the Greek text itself. But it also adds a further degree of complexity to a history that is already fairly complicated, and the meaning of "representation" nowadays is indeed no less equivocal than the meaning of "imitation" was then. If "imitation" pulls *mimêsis* towards "resemblance" by conceiving of it as part of a problematic that was based on the paradigm of the image, "representation" draws us on the other hand to a theory of the sign founded on a linguistic model. Its present-day meaning has largely been determined by a history that has its origins in the seventeenth century, notably with the logicians of Port-Royal, and that was extensively developed in the twentieth century in the field of discourse theory. If the theatrical connotation of representation is still there in the everyday usage of the term, it has to a large extent disappeared from theoretical usage, where its connotation is primarily semiotic, including the application of the word to the analysis of the pictorial image. The way in which the term is nowadays used pervasively in art criticism, where it tends to replace the term "image," is particularly interesting in this respect. To think the image as representation amounts to thinking the

image as sign, and thus to obliterating its specifically visual dimension, which is still present in the word "imitation." It is thus hardly surprising that the translation of *mimêsis* as "representation" is consonant with certain recent analyses that have been undertaken in the context of the philosophy of language, independently of any philological or historical concern. So Kendall Walton, for example, in the opening pages of his book *Mimêsis as Make Believe*, is careful to warn his reader that the word *mimêsis*, as he uses it, has to be understood in the sense of representation, that is, without reference to any theory of resemblance or imitation. He immediately goes on to say, however, that if the meaning of *mimêsis* corresponds for him to that of "representation," it is in the particular sense that he himself gives to the term "representation"! It was doubtless in order to avoid all of these ambiguities that Walton preferred to return to the Greek term, but without translating it.

---

and *muthos* by way of plot results in giving primacy to plot over characters in the definition of tragedy: "The plot (*ho muthos* [ὁ μῦθος]), then, is the first principle, and, as it were, the soul of a tragedy; Character (*ta êthê* [τὰ ἤθη]) holds the second place" (6.1450a 38–39). The comparison with painting, which intervenes immediately following this sentence, justifies that hierarchy by establishing a parallel between outline and plot, on the one hand, and color and character, on the other: "A similar fact is seen in painting. The most beautiful colors, laid on confusedly, will not give as much pleasure as the chalk outline of a portrait." But this comparison, which is in some sense structural and which establishes a hierarchical correspondence between the parts entering into the composition of a poem and those entering into the composition of a painting, agrees poorly with the one developed in chapter 2, again on the subject of character. It rests on an entirely different distinction that, in this case, calls into play the idea of resemblance or likeness:

> Since the objects of imitation are men in action, and these men must be either of a higher or a lower type . . ., it follows that we must represent men either as better than in real life, or as worse, or as they are. It is the same in painting. Polygnotus depicted men as nobler than they are, Pauson as less noble, Dionysius drew them true to life. Now it is evident that each of the modes

of imitation above mentioned will exhibit these differences, and become a distinct kind in imitating objects that are thus distinct.

2.1448a 1–9; trans. S. H. Butcher

If the definition of *mimêsis* as a *mimêsis* of plot or action links poetry to history—from which it is distinguished, moreover, since actions are represented on stage by characters who are themselves in action—*mimêsis* of character, on the contrary, leads one to a linkage with painting, and more precisely with a genre of painting that raises in the most pointed manner the question of likeness, namely, that of portraiture. This twofold reference—to history and portraiture—attests anew to the impossibility of giving an unequivocal definition of *mimêsis*. If the *mimêsis-muthos* link fully justifies the translation of *mimêsis* as "representation," the existence of that other link, between *mimêsis* and portraiture, attests to the permanence, in Aristotle, of an interpretation of *mimêsis* in terms of image and thus of likeness, which would justify an occasional return to translating *mimêsis* as "imitation." As is the case in chapter 4, in which Aristotle suspends the Platonic condemnation of artistic imitation by assigning from the outset a cognitive function to the pleasure procured by mimetic activity, a tendency said to be inscribed in human nature. This pleasure in recognition, which, for Aristotle, lies at the source of knowledge, is directly linked to the existence

of images, that is, to grasping a likeness or resemblance: "Thus the reason why men enjoy seeing a likeness *chairousi tas eikonas horôntes* [χαίρουσι τὰς εἰκόνας ὁρῶντες]) is that in contemplating it they find themselves learning or inferring, and saying perhaps, 'Ah, that is he' " (1448b 15).

C. Nature or history?

The definition of art in general and of painting in particular has often received legitimacy, notably in the sixteenth and seventeenth centuries, through the authority of Aristotle. Even at present, numerous interpreters see clear evidence of the influence of the Stagirite on the constitution of the theory of art. Yet although that theory does indeed borrow its elements from Aristotle, there is no basis for attributing to him such a determination of art. It conflates in a single idea definitions that, in Aristotle, belong to quite different registers. It associates with painting, and more generally with the arts in the modern, artistic sense of the term, that is, to activities that belonged, for Aristotle, to the realm of poetics, the definition that the philosopher gives for *techne* (τέχνη) in the *Physics*: "Generally speaking, art (*techne*) either executes what nature is impotent to effectuate or imitates it. . . . If, then, artificial things are produced with a view to a certain end, it is clear that this is equally the case for the things of nature; for in artificial as well as in natural things, antecedents and consequences have between them the same relation" (2.8.199a.15). Poetic *mimêsis* is referred by Aristotle not to nature but to history; it is an imitation of human actions (*mimêsis praxeôs* [μίμησις πράξεως]). Attributing to Aristotle the idea according to which art, in the artistic sense, is an imitation of nature thus implies a transfer of meaning from the realm of physics to that of poetics, from art in the sense of *techne* to art in the sense of *poiêsis* [ποίησις]. The translation of *techne* as *ars*, then as "art," the fact that Greek does not possess a term to designate what we call "art" in the sense of the fine arts, that is, the fact that it conflates in a single term two things that European languages, since the Renaissance, have strained to distinguish, namely, the art of the artist, the painter or sculptor, and the art of the artisan or worker (a distinction renewing one established in the Middle Ages between the liberal arts and the mechanical arts; see ART) are certainly not unrelated to this transfer. And that in itself would undoubtedly not have been possible if the meaning attributed by Aristotle to *mimêsis, mimeîsthai*, when those words refer to images and not plots, had not in some way included a space to welcome and incorporate it. The fusion, in a new conception of art, of *mimêsis* in the sense of an imitation of actions and *mimêsis* in the sense of an imitation of nature may have received its authority from the secondary sense that *mimêsis* has within the *Poetics* itself. We are dealing here with one of the multiple transformations that allowed the *Poetics,* starting with the Renaissance, to become a foundational text for the theory of painting. It effectively allowed one to reassign priority to the pictorial paradigm in the definition of *mimêsis*. And also to take advantage of the possibilities offered by the synthesis previously effected in the Middle Ages, by way of the word *ars*, between the definition of *techne* given in the *Physics*, where *techne* is opposed to *phusis* [φύσις], and the one found in the *Nicomachean Ethics*, where

techne is distinguished from *praxis,* those two terms then corresponding to two different modes of regulated and finalized activity: "the disposition to act accompanied by a rule [τῆς ποιητικῆς ἕξεως]" (6.4.1140a 3–5; see PRAXIS). The theory of imitation, as it was to develop in the Renaissance and the classical age, would give a new meaning to the link between the idea of art and that of rules by redefining the rule within an artistic realm that affirmed and was intent on defending its autonomy in relation to the domain of "mechanical" activities. The misinterpretation of the Aristotelian idea of *mimêsis* was thus not the cause, but in fact the effect of the labor of reinterpretation that the transformation of the artistic domain (and the new stakes with which art was charged) made necessary.

■ See Box 2.

II. From the Imitation of the Visible to the Expression of the Invisible: The Powers of the *Imago*

In chapter 1 of his book published in 1637, *De pictura veterum libri tres*, a veritable *summa* of humanist thinking about art, Franciscus Junius enumerates the different definitions of imitation. After citing chapter 4 of the *Poetics*, the preface to *Eikones*, and book 2 of the *Life of Apollonios* by Philostratus, he writes: "In any event, for grammarians, image (*imago*) means what proceeds from imitation (*imitago*)." This sentence bears witness to the transformation visited on the idea of imitation through the transition from *mimêsis* to *imitatio*, as a result of the connection established in Latin between *imitatio* and *imago.* In this sense, the history of *imitatio* becomes inseparable from that of *imago*.

Imago belongs to the same semantic field as *simulacrum, signum, effigies*, and even *exemplar* and *species.* Signifying the imitation of a portrait, the word *imago* was applied to the image of the deceased. It designated the mask made from the imprint of a face. Initially referring to ancestral cults, it also designated, in classical Latin, the image of the gods, associated with terms referring to the realm of the sacred. The transformation of the meaning of *imago* in the course of the Middle Ages by the theological problematic of the image would simultaneously modify the meaning of *imitatio* by inscribing it in a new network of signification articulated around the idea of likeness, but a likeness or resemblance that was also thought in new terms, as evidenced by the extraordinarily complex use of "similitude" and its offshoots. The meaning taken on by *imitatio* in the fourteenth century, for example, in the expression *imitatio Christi,* illustrates the amplitude and the nature of this transformation. The use of *imitatio* refers in this case to a problematic of resemblance that developed from a reinterpretation of *imago,* the relation of son to father and that of man to God, giving a radically new meaning to the term. The idea according to which man had been created in the image of God required one to no longer think of the resemblance of the *imago* solely in terms of a copy, but also in terms of an analogy.

Under the influence of Neoplatonic doctrines (Boethius, Scotus Erigenus, and above all the School of Chartres), analogical thinking would bring about a complete re-elaboration of the meaning of *imitatio* as applied to artistic activities. To a theorist of the Middle Ages, the artist seeks to imitate the

2

Alberti's window

The new definition of painting that was developed during the Renaissance would mean that these different and initially heterogeneous levels of meaning were able to coexist, and this coexistence would sometimes bring with it certain contradictions. Far from being a sign of logical inconsistency, these contradictions in fact attested to the difficulty that the first theoreticians of art had in combining the two senses of *mimêsis* in a fully unified theory. The definition of a painting as an "open window," which we find in book 1 of Alberti's *De pictura*, is in this respect exemplary, particularly in light of the endless misunderstandings to which it has given rise. For Alberti, this window frames a narrative representation; it does not open out onto nature but onto a story: "First of all about where I draw. I inscribe a quadrangle of right angles, as large as I wish, which is considered to be an open window through which I see the story (*historia*) I want to paint" (English translation, slightly modified; in the Italian translation of his treatise, Alberti uses the word *storia* which, like *historia*, corresponds to Aristotle's *muthos* [on the two versions of Alberti's treatise, see BEAUTY]). But this definition does not match the one we find elsewhere in the text, where pictorial representation is characterized by its function of showing, that is, its function as an image: "No one would deny that the painter has nothing to do with things that are not visible. The painter is concerned solely with representing (*repraesentare*) what can be seen." This explains how this analogy with the window could have been interpreted in a sense that was completely alien to Alberti's thought, as a window opening out onto the visible world, like those *vedute* one comes across in so many Renaissance paintings. We find the same ambivalence in Poussin a century later. In one of his last letters, he defined painting as "an imitation, made up of lines and colors on some surface, of whatever is visible under the sun" (letter to Fréart de Chambray, 2 March 1665). But elsewhere he writes that "painting is nothing but the imitation of human actions," this second definition of imitation conforming to the Aristotelian idea of poetic *mimêsis*, since it was in fact a translation of a sentence by Torquato Tasso, which Poussin contented himself with copying out by replacing the word "poetry" with the word "painting."

visible world created by God as the creative work of God, to create in the image of God by prolonging the activity of nature. The relations between human creation and divine creation are governed by a principle of concordance and similitude, resting on the application of the rules of harmony, proportion, symmetry, and clarity, which the artist discovers in himself as in nature, and which allow him to attain that beauty which is nothing other than the visible manifestation of the divine splendor. The artist imitates not only *natura naturata*, but also *natura naturans.* As Panofsky writes, "the thesis according to which art imitates nature as much as possible or rather imitates according to nature, means that a parallel (but not a relation) is being set up between art and nature: art (under which rubric one must naturally and perhaps principally understand as well the *artes* that are foreign to the three arts based on drawing) does not imitate what nature creates, but works in the manner in which nature creates, pursuing, through specific means, objectives that are themselves defined, by realizing determined forms in materials that are themselves determined" (*Idea*). The visible form achieved by the artist is the material expression of a form immanent to his mind or imagination (*fantasia*) that the artist discovers in his contemplation of the visible world. In imitating the visible, art expresses the invisible. Commenting on a sentence of Robert Grosseteste: "Forma est exemplar ad quod respicit artifex ut ad ejus imitationem et similitudinem formet suum artificium" (The form is the idea that the artist has in sight in order to produce the imitations and likenesses of his art)," Edgar De Bruyne writes as follows: "The material work does not necessarily and faithfully copy the visible form . . . but inevitably it expresses the representation of what the artist conceives in his soul. It is that spiritual model that the form imitates above all else" (*Etudes d'esthétique médiévale*). As Saint Bonaventure writes, with reference to the classical theories of rhetoric: "Dicitur imago quod alterum exprimit et imitator" (It is said that the image expresses something other than what it imitates) (quoted by De Bruyne). The transformation of *imitatio* in relation to that of *imago* adds to the horizontal definition of imitation as outer likeness a twofold dimension, both vertical and in depth, expressiveness being characterized as a movement from inner to outer and from low to high. The first consequence of this transformation is to allow theologians to resolve in a manner favorable to images the thorny question that had been raised by the iconoclasts and that would be endlessly renewed until the Council of Trent, namely, the question of the worship of images (see OIKONOMIA). The second is plainly to furnish a major argument for legitimating artistic activity. The theoretical labor of Scholastic thought consisted of giving substance, an ontological dimension, to concepts such as *imago* or *forma* and to confer on them a properly theological function.

III. From *Imitatio* to *Imitazione*: Renaissance Theories of Art

It was thus this rather complicated history, extending over several centuries, that the humanist thought of the Renaissance would inherit. It was on that basis that the Italian theoreticians returned to the Greek and Latin texts that they discovered in the original, those of Aristotle, Plato, Horace, and Cicero. They were related to the problematic of *mimêsis* through the mediation of a field in which the idea of *imitatio* was gradually inscribed.

A. Hesitations in vocabulary

The definition of art as imitation first developed in the domain of the visual arts, giving to *imitare, imitazione*, the meaning of likeness, an image faithful to visible reality. The idea

that art was to imitate nature appeared among painters and theoreticians of painting at the beginning of the fifteenth century. It is found in Alberti (*De pictura*, III, 1435), Ghiberti (*I commentarii*, 1436), and even in Leonardo, who stated that the painting most deserving of praise was that which was faithful to the thing imitated ("conformità co'la cosa imitata") (*Trattato della pittura*, fragment 411, in *Libro di pittura*). It was not until the second half of the sixteenth century and the dissemination of Aristotle's *Poetics* that the concept of imitation would be applied to the poetic arts, thus taking on a new meaning. (The first Latin translation of the *Poetics* from the original, by Lorenzo Valla, appeared in 1498; the Greek text was printed for the first time in 1503. In the second half of the sixteenth century, numerous translations in the vernacular appeared, accompanied by commentaries, along with poetics of Aristotelian inspiration.)

How is one to reconcile Aristotelian *mimêsis* with the idea of *imitatio* and above all with that of *imitazione* as it is expressed in the realm of painting? That conceptual difficulty first presented itself as a problem of translation. How was one to translate *mimêsis*? If *imitatio*, borrowed from classical Latin, finally prevailed in Renaissance Latin, certain translators nonetheless hesitated with regard to that term as an adequate rendering of the sense of *mimêsis*. It was thus that in 1481, the translator of Averroes opted for *assimilatio*, while Fracastoro, in the following century, anticipating the solution proposed by Depont-Roc and Lallot, thought that one could opt for either "imitation" or "representation": "sive imitari, sive representare dicamus" (*Naugerius*; *sive de Poetica dialogues*). The complete triumph of *imitatio* and its Italian derivative, *imitazione*, which would in turn give birth to the French and English variants of *imitation*, would not be sufficient to remove all those hesitations. The transition to the vernacular would be accompanied by numerous distinctions attesting to the permanence of the difficulties encountered. In his *Tratatto delle perfette proporzioni*, published in 1567, Vicenzo Danti, basing himself on the Aristotelian distinction between poetry and history, thus proposed to reserve *imitare* for art and to use *ritrarre* to designate an imitative likeness, one that reproduces things as one sees them. (*Ritrarre* from the Lat. *ritrahere*, "to pull backward"—as in Fr. *retirer* [withdraw] or *retrait*—initially had the general meaning of representing, describing, recounting; applied to painting, it took on the meaning of a representational likeness.) Already in Ceninni, one encounters the expressions *retrarre da natura* or *ritrarre naturale* (*Il libro del arte*). As for Castelvetro, the author of an Italian translation of Aristotle's *Poetics*, published in 1570, which would be strenuously challenged by the French during the following century, he chose to translate *mimêsis* as *rassomiglianze*, resemblance, and not as *imitazione*.

■ See Box 3.

B. Imitate nature or the idea?

These divergences found in the Italian translators, whether translating into Latin or the vernacular, illustrate the extreme diversity of conceptions competing (and doing so without cease) over a span of several centuries. The uncontested reign of the idea of imitation from the Renaissance to the end of the eighteenth century would never imply the existence of a systematic and unified theory of imitation.

As previously stated, the problem of imitation was first posited in the realm of painting before being taken up and formulated in very different terms by theoreticians of poetics. Was one to imitate nature or the idea, an external model or an inner model, the real or the beautiful? Ought the painter to seek to render visible reality as faithfully as possible, in

---

3
The resemblance of the portrait

The use of the word *ritratto*, derived from *ritrarre*, to refer to a portrait illustrates the richness of the identification between portrait and resemblance that made the portrait the paradigm of resemblance, and thus of painting as a lifelike image (just as the words *po(u)rtraire* and *po(u)rtraiture* were used in the seventeenth century to mean painting in general). But this identification also explained why the portrait came to be considered as an inferior genre in terms of the hierarchy of genres elaborated in the light of Aristotle's *Poetics*, and which implied the primacy of narrative painting. How could the status of the portrait as a genre be defended from the perspective of Aristotelian criteria? It was precisely in order to resolve this difficulty that an author such as Mancini proposed making a distinction between two types of portrait: *il rittrato simplice*, or simple portrait, conforming to the Platonic definition of *mimêsis eikastikê* [μίμησις εἰκαστική], which "expresses nothing more than the dimension, proportion, and resemblance of the thing it imitates (*similitudine della cosa que imita*)," and *il rittrato con azione et espressione d'affetto*, or portrait with action and passion, in which there is "besides resemblance (*similitudine*), action and passion, which is imitated (*imitandosi*) by representing (*rappresentar*) the mode of this passion (*il modo di quell'affetto*)" (Mancini, *Considerazione sulla pittura*). Of course, the variety of terms used by Mancini—*similitudine*, *imitare*, *rappresentar*—and the link between action and passion, which connects the problematic of action to that of the expression of emotions, attest to the changes that the Middle Ages and the Renaissance brought to bear on Aristotle's *mimêsis*, as well as Plato's. But this distinction between two genres of portrait, as foreign as it is to Aristotle's thought, was a response to the difficulty that originates with the double meaning Aristotle gives to *mimêsis*, depending on whether he relates the term to discourse or to the image. Roger de Piles would also invoke Aristotle in describing the portrait genre, yet used a different argument: "If painting is an imitation of nature, it is doubly so with respect to the portrait, which not only represents man in general, but such and such a man in particular" (*Cours de peinture par principes*).

its details and with its imperfections, or, on the contrary, to render visible that ideal image of beauty that exists only in the mind or the imagination, on the model of the perfect orator as described by Cicero in a passage of the *Orator* that all theoreticians of painting would refer to for centuries (see BEAUTY and DISEGNO)? However important it was, the influence of Neoplatonism and Ciceronianism on thinking about art during the Renaissance is insufficient to explain the existence, or even the meaning, of such a series of questions. Like all questions addressed to painting, they have their source, first of all, in the very history of that art. They refer to what might be called painting stories, in this case to those of two paintings of Zeuxis, recounted by Pliny. In one, Zeuxis had painted grapes that were so well imitated that birds swooped down on the canvas. In the other, he had the most beautiful virgins of Crotona pose for him. Unable to find perfect beauty in a single model, he had borrowed from each what she had that was most beautiful. These two tales would long assume paradigmatic value in reflections on the idea of imitation in the field of painting. The first legitimates a realist interpretation of imitation as likeness, and would be constantly invoked by all those who praised the illusionary powers of painting (the mirror and the monkey are two traditional emblems of painting). The second functions in favor of a more intellectualist conception of imitation, submitting *imitazione* to the *idea* and the *concetto*, and whose purpose is no longer to give an illusion of the real through a faithful likeness with things, but to attain perfection and beauty (see CONCETTO). Thus did Alberti, referring to the story of Zeuxis and the virgins of Crotona, recommend to the painter to imitate several models because it is impossible to find perfect beauty in a single body. Such was the method used by Raffaello, as he confessed in a letter to Castiglione on the subject of the difficulty he had in finding a model to paint his Galatea: "Since there is a penury of good judges and beautiful women, I make use of a certain idea (*certa idea*), which comes to my mind (*mente*)." It is that *certa idea* discussed by Raffaello that the artist imitates through his *disegno*. To defend "il primato del disegno" in painting, as the Florentines did, implies a Platonic (or rather Neoplatonic) conception of imitation as imitation of a mental representation to which the painter relates as to a model in his imitation of things. Reviving a theological problematic developed in the Middle Ages, Zuccaro would go so far as to make of the *disegno interno* an imprint of divinity, a *segno di dio*, and thus to define painting as an activity that consists not in imitating things but in acting in a way resembling God (*L'Idea de'pittori, scultori, et architetti*; see DISEGNO).

C. To imitate is not to lie: The problem of fiction

Adopted by theoreticians of poetics, the idea of imitation would undergo a certain number of transformations that would affect in turn the pictorial conception of imitation. First, because they often expressed themselves in Latin, and even while writing in Italian, they would think of *imitazione* as a translation of *mimêsis* and *imitatio*. Associated with the translation and interpretation of texts, consideration of the subject took on a more scholarly cast. Moreover, it was inevitable that the application of the principle of imitation to the language arts would inflect its meaning in a new direction. For a poet, imitating does not mean the same thing as

for a painter. He imitates with words, not images. His imitation, contrary to the painter's, cannot be conceived in terms of resemblance. The theory of *disegno* was in this respect characteristic of the reversal effected by *ut pictura poesis*, that is, by the comparison between painting and poetry (see COMPARISON); by referring image to *idea*, to *concetto,* it defined pictorial imitation on the model of poetic imitation.

This dissociation between imitation and likeness is at the origin of most of the problems posed by the idea of imitation in the field of poetics. How is one to reconcile the definition of poetry as imitation with the various licenses that are part of poetic invention? Does not the referential character of the idea of imitation contradict that right to be all-daring that Horace ascribes to the poet? Some did not hesitate to denounce the perils of a theory that imposed far too narrow limits on artistic activity. The poet, Patrizi would say, is not an *imitator* but a *facitor, facitor* being in this case a perfect equivalent for the Greek *poietes* (*Della poetica*). The opposition between *imitator* and *facitor* nonetheless raises a genuine problem. The poet does indeed fabricate fictions. Whereas the idea of imitation allows one to ascribe to art a function relating to knowledge and thus to truth, the idea of fiction implies one relating to mendacity and falsehood. In the Middle Ages, Isidore of Seville had labored to distinguish *falsum* from *fictum*, but his distinction had barely left a trace. In the Renaissance and the seventeenth century, a number of theoreticians of art would continue to speak of the beautiful lies—or even the innocent lies—of art, thus using for the benefit of art the very argument that had long served, and would continue to serve, to condemn it.

D. Imitating the masters: The problem of invention

The conception of imitation elaborated in the Renaissance on the basis of readings of Aristotle, Horace, and Cicero enabled a partial resolution of the opposition between imitation and fiction. Poetic invention can be legitimated by the authority of ancient authors. But that very authority brought to the fore a new difficulty that radically transformed the elements of the problem of *mimêsis* and formulated it in new terms. Imitation was no longer conceived solely with reference to nature but also in relation with the ancients, whose works were posited as models of the imitation of nature. The imitation became in a way an imitation to the second degree, the imitation of an imitation: art was to imitate art in order to imitate nature. This notion according to which art was to rest on an imitation of the masters constituted the true novelty of the theory of imitation as it developed in the framework of humanism. But it would also give rise to a number of reservations, particularly among artists and theorists invoking a Platonic conception of art, such as those of the Academy of Florence, who were rather hostile to the principle of imitation. Although they recognized a pedagogical value in the imitation of the ancients, they refused to regard the ancients as unsurpassable models to whom the artist was to submit. The debate provoked by the idea of a model in the realm of poetry was thus in all ways analogous to one previously evoked on the subject of painting, even if it was formulated in different terms. The story of Zeuxis took on paradigmatic value not only for the painter but also for the poet, on the condition that the beauties of art be substituted

for those of nature. No model was perfect enough for it to have sufficed for the artist to imitate it in order to achieve beauty. This is why it was necessary to imitate several models and above all to imitate them with discernment, as Pico wrote in the course of the polemic that pitted him against Bembo on the idea of imitation: "Imitandum inquam bonos omnes, non unum aliquem, nec omnibus etiam in rebus" (I say that one must imitate all good writers, not merely one, and not in everything). It is not in authors who wrote before him that the poet finds the source of his inspiration, he said, but in a "certain inner idea" (*idea quaedam*), which is not without evoking the *certa idea* of Raffaello. To the normative conception of imitation defended by Bembo, Pico thus opposed a critical relation to the tradition compatible with the freedom of the poet and his originality: "Inventio enim tum laudatur magis, cum genuine est magis, et libera" (Since the more an invention is free and original, the more is it worthy of praise). Conceived as *inventio*, imitation was transformed into true emulation, allowing the artist to surpass his models and to create works superior to those of the past. In authors writing in Latin, *imitatio*, moreover, was gradually cast aside to the benefit of *inventio*. That term, borrowed from rhetoric, did not have the modern sense of inventing. *Inventio* harmonized with the idea of imitation, as opposed to *creatio*, which belonged to the lexicon of theology.

IV. From *Imitazione* to *Imitation*: French Aristotelianism

A. The ends of imitation

The *Poetics* played a major role in the birth and development of the theory of art in France in the seventeenth century. Whether defining art in general or various forms of artistic representation, pondering the nature of tragedy or that of historical painting, establishing the rules governing the composition of a dramatic poem or those intervening in the composition of a painting, classical theorists for the most part sought inspiration in Aristotle and borrowed most of their categories from him. They did not, however, have at their disposal a French translation of the *Poetics* until 1671, the date on which Norville's version appeared, followed in 1692 by Dacier's. It was thus initially by way of Italian translations, whether in Latin or in the vernacular, that Aristotelian thinking on art penetrated into France, as well as by way of Italian (but also Dutch) exercises in poetics, such as those of Daniël Heinslus (*De tragediae constitutionae*, 1511) or Gerald Jan Vossius (*De artis poeticae*, 1647), which would have a great influence on French thought. Even when they read Greek, the French related to Aristotelian *mimêsis* by way of its re-elaboration via the idea of *imitatio* and *imitazione*.

Those translations were the object of a certain number of critiques whose stakes broadly exceeded the framework of a narrowly philological dispute. In contesting the interpretation of *mimêsis* given by the Italians, what was at stake was also affirming the originality of the French theory of artistic imitation, along with the superiority of French over Latin and Italian. The principal reproach addressed to the Italians was having obscured Aristotle's text as a result of not knowing anything about the art of the theater. Most interpreters, Corneille wrote, explained it only "from the

perspective of grammarians or philosophers. Since they had more experience of study and speculation than of the theater, reading them can make us more erudite, but will not shed much light on which we can depend for success in the theater" (*Discours de l'utilité du poème dramatique*). Corneille's refusal to dissociate theory from practice attests to a change in perspective that affected the entire range of reflection about art in the seventeenth century. Whether focused on theater or painting, aesthetic theory developed in France on the basis of art and was elaborated principally by artists. The redefinition of the idea of imitation was largely a function of this very specific feature of aesthetic theory in France. If imitation was always posited as a principle, it was above all conceived as a problem, or rather as a set of problems that it fell precisely to artists to solve. Now the nature of those problems (as of the solutions given them) was itself determined by the subordination of the principle of imitation to the pleasure principle, which displaced the idea of imitation by integrating it into a problematic that was no longer one of the causes of art, but rather of its effects. Painting is an imitation, Poussin would say, and "its end is delectation" (letter to Fréart de Chambray, 2 March 1665). For the French, if imitation did indeed define the nature of art, it was not its aim. The sole aim of art was to please, and it was always in terms of that aim that the principle of imitation was conceived. Its application was entirely subject to that finality. Defining artistic imitation thereupon consisted in determining the rules through which imitation could achieve that goal: "The principal rule is to delight and to stir the emotions," wrote Racine in his preface to *Bérenice*. "All the others have been forged only to satisfy that first one." Corneille, like many others, did not, moreover, hesitate to ascribe that notion to Aristotle at the beginning of his first *Discours* on dramatic poetry: "Even though the sole aim of dramatic poetry for Aristotle was to delight the audience."

- See Box 4.

This definition of imitation in terms of pleasure illustrates the influence exercised by thinking about rhetoric on artistic theory. It effectively has its source in the hierarchy established by Cicero between the finalities of the art of oratory: *docere* (to instruct), *delectare* (to delight), *movere* (to move), and which gives pride of place to *movere*. The application of the Ciceronian problematic to the realm of the poetic and visual arts would be accompanied in France by numerous debates attesting to the same difficulties as those already encountered by theoreticians of rhetoric in aligning the necessities of *docere* with the exigencies of *movere*. If some went so far as to call into question the pedagogical and moral purpose of art, all were in agreement in denying it priority and in affirming with Racine that the principal rule of art was to delight and to stir the emotions. Which does not at all mean that they refused to ascribe to art a value rooted in knowledge. On the contrary, since that value was attributed to pleasure itself, as in La Fontaine, whose art was undoubtedly the best example of that harmonious and perfectly balanced synthesis between the exigencies of pleasure and those of knowledge, which corresponded to the classical ideal of perfection.

4

Pleasure: From the cause to the aim

In his concern to restore the truth of Aristotle's text, Dacier would denounce what in his eyes was a completely erroneous interpretation of the idea of *mimêsis*, particularly in the commentary accompanying the famous passage from chapter 4, which he translated as follows: "There are two main causes, both quite natural, which seem to have produced poetry; the first is imitation, a quality innate to men, since they differ from the other animals in that they are all inclined toward imitation, it is by means of imitation that they learn the first elements of the sciences, and all imitations give them a singular pleasure." The commentary concerns the final point:

> The most learned commentators of Aristotle have made a very considerable error here in taking these words as an explanation of the second cause they

give for poetry, as if Aristotle said: And the second is that all imitations give them pleasure. Aristotle was incapable of saying something whose meaning was so mistaken, and of giving to one effect two causes that are only a single cause. It is as if one said that two causes make a plant cultivated by a gardener grow: the first is that he waters it, and the second is the pleasure he takes in watering it. There is no one to whom this does not appear absurd. This philosopher says, then, that the first cause of Poetry is imitation, to which men are naturally inclined, and since this inclination, however natural it is, would be useless if men took no pleasure in producing imitations, he adds: and in which they take a singular pleasure.

Dacier, *La Poétique d'Aristote*

If the mistake of learned commentators was in believing that pleasure was the second cause that Aristotle attributes to imitation (when it in fact is the tendency to rhythm and melody), Corneille's mistake was even greater since it consisted of turning this cause into an aim, and even of making it the sole aim of art. But this "mistake," which was the foundation of all classical aesthetics, was an extremely productive one in the field of art.

B. Imitating according to nature and the true

What is a good imitation? How to distinguish between imitation and likeness? What does it mean to imitate nature? What is the nature of the model to be imitated? Although the French raised the same questions, on the whole, as their Italian predecessors, they nonetheless posed them in a palpably different manner. That difference was not solely a function of the political and institutional conditions in which reflection on art developed in France, but also of the existence of a new theoretical, philosophical, and scientific context; it involved epistemological changes affecting the entirety of concepts around which the theory of artistic *mimêsis* had always been articulated. And, in the first place, that of the image. The idea of representation, as it was elaborated in France, resulted in calling into question the traditional definition of the image in terms of resemblance, thus necessitating a different manner of conceiving of images. It was indeed the new concept of representation that underlay the comparison frequently invoked by Descartes between idea and image. When he stated that ideas were "like images of things," or even "like pictures or paintings," that did not mean that ideas resembled things but that they were related to things in the same manner as images that imitated the appearance of things, that is, through representation. All of this presupposed a radically new conception of the image, based on the idea of the sign and no longer on resemblance. As Descartes writes in *La dioptrique*, an image does not need to resemble that which it is an image of in order to represent it, and often even "to be more perfect, insofar as they are images, and to better represent an object, they ought not to resemble it, like those engravings which, being composed of but a bit of ink scattered here and there on paper, represent to us forests, cities, men, and even battles and storms." This problematic of the sign and representation would be broadly developed by the logicians of Port-Royal, who would notably apply it to the problem of the Eucharist: the bread and wine represent the body of Christ but do not resemble it. But it was plainly in the realm of painting that its effects would be most conspicuous, giving a new orientation to the debates that had until then inspired the idea of imitation.

■ See Box 5.

The other transformation clearly concerns the concept of nature, which took on a new sense in the seventeenth century, both on the physical and the metaphysical levels. If the word "nature" continued to designate the visible world for painters, it became charged at the same time with numerous meanings that combined in a more or less confused or contradictory way in the language of artists. It was at times taken in an empirical sense, as a synonym of observable reality, at others in a rational sense, as a synonym of essence, rule, law, at still others in a normative sense, as a synonym of beauty and truth, and most of the time in all those senses simultaneously. It referred as much to the object of artistic imitation as to the effects which that imitation sought to produce. In all cases, it implied the idea of a model, whether the model to be imitated or as a model for imitation.

The re-elaboration of the idea of imitation on the basis of a problematic of representation, like the new significations attributed to the word "nature," explain the fact that the definition of art as an imitation of nature did not have the same meaning for the French as for the Italians. More Aristotelian than Platonist, the French were less interested in the powers of the idea than in the necessity for rules (of composition, construction, design, color, etc.). As Cartesians, they thought that even the most extravagant fictions originate in a "certain mix and composition" of parts that are not "imaginary, but true and existent," as Descartes puts it in his first *Meditation*, taking as his example precisely the

bizarre and extraordinary forms that painters invent in their works: "This art in general," Félibien wrote about painting, "extends to all manners of representing entities that are in nature. And although painters occasionally have formed some that are not natural, like the monsters and grotesques that they invent, which are nonetheless composed of parts known and taken from different animals, it cannot be said that they are pure effects of the imagination" ("Préface aux Conférences de 1667"). Just as they refused to oppose imitation and imagination, the French did not see a contradiction between a concern for exactitude in the observation of reality and the application of analytic criteria in the elaboration of representation. The opposition between realist imitation and ideal imitation was absorbed into a conception of imitation far less dogmatic than is commonly thought and that submitted imitation to criteria of selection and correction that were no longer ideal but rational. One must imitate nature through reasonable choice, as Le Brun would say. That reasonable choice meant that artistic imitation was to satisfy simultaneously the rules of art, the exigencies of truth (whence the importance given at the Academy to the study of anatomy, proportion, geometry, perspective) and those of verisimilitude and decorum.

■ See Box 6.

C. Representing action

If the definition of artistic imitation according to its modalities (nature and truth) was, as we have seen, rather flexible, that which defined it as a function of its object was far more normative. It consisted in defining art as a representation of human actions. Taking up the Aristotelian definition of poetic *mimêsis*, the French applied it to the full range of the arts, not only the poetic arts, but also sculpture, painting, and even ballet. For the French, as for Aristotle, imitating an action meant first of all representing the plot or what was called the *fable* (the term with which most translators of the *Poetics* rendered *muthos*). The first effect of that definition of art in the realm of painting would be the establishment of a hierarchy of genres dominated by historical painting, that is, by narrative painting. But imitation was not solely concerned with plot; as in Aristotle, it also took as its object character, the passions, sentiments, what the seventeenth century would call *mores* (a term utilized to translate the *êthos* [ἦθος] of the *Poetics*). It was thus that Claude François Ménétrier wrote:

> Ballet does not imitate solely actions; it also imitates, according to Aristotle, passions and customs, which is more difficult than the expression of actions. This imitation of the customs and affections of the soul is based on impressions that the soul makes naturally on the body, and on the judgments we make of the customs and inclinations of persons on those inner movements.

> *Des ballets anciens et modernes*

This text also illustrates the transformation to which the classical theoreticians subjected Aristotelian *mimêsis*. It will be noted that on the subject of actions Ménestrier employs the terms "imitation" and "expression" indiscriminately.

5

The resemblance of the portrait (bis)

It is hardly surprising that the effects of this new concept of representation should manifest themselves most clearly in relation to the portrait. If a good portrait is lifelike, what defines the lifelike resemblance of a portrait? Félibien gave a completely original answer to this question, which the Italians had already asked themselves, and which recalled Descartes's analysis. "How is it," Félibien asks, "that a mediocre painter is sometimes more successful in painting a lifelike portrait than an experienced and learned man? . . . Be aware that what often appears as a lifelike resemblance in these mediocre portraits is nothing but that. . . . From the moment, by some sign, an image is formed in our mind which is in some way related to a thing we know, we immediately believe that we find in it a great resemblance, even though, in looking at it more closely, it was often nothing more than a rather weak idea."

6

Decorum

"Decorum" has the same meaning as it does in Latin, that is, appropriateness. In the artistic field, decorum has, like *prepon* [πρέπον] in Greek rhetoric, a double meaning; it is determined both upstream and downstream, so to speak. The first determination is referential in nature: the rule of decorum requires that characters are represented in a way that is in keeping with their state, their situation, their nature: a king could not be expressed or be clothed in the same way as a peasant, each passion has to be represented in a manner that befits the state of the person, etc. The second is moral and social in nature. Representation has to be in keeping with the moral sentiments of the spectators, it must not shock them, and it has to respect the rules of propriety. Furetière only mentions this second meaning in his dictionary (RT: *Dictionnaire universel, contenant tous les mots français tant vieux que modernes, et les termes de toutes les sciences et des arts*): " Decorum: A Latin, then French word, which is expressed in this proverbial saying: to observe decorum, meaning to respect all the rules of polite society."

The use of the word "expression" as an equivalent of "imitation" conveys the new manner in which the action/passion relation was conceived in the seventeenth century.

■ See Box 7.

The problems raised by the representation of history were the object of numerous debates in the seventeenth century, in the domains of both theater and painting. Such discussions called into play the same distinction between likeness and representation that we have already encountered with regard to portraiture, but in a somewhat different manner. Does the fact of imitating history in accordance with nature and the truth, as required by the principle of imitation, demand of the artist that he faithfully respect historical truth, or can he deviate from it should it enter into conflict with the necessities of representation, that is, with the nature and truth of art? That question led to a rather lively exchange between Philippe de Champaigne and Le Brun on the subject of Poussin's painting, *Eliézer et Rébecca.* Whereas Champaigne reproached Poussin for not having "treated the subject of his painting with all the faithfulness of history, since he had eliminated from it any representation of the camels mentioned by history," Le Brun thought to the contrary that the painter was right to take that liberty with history, "that the camels had not been eliminated from the painting without solid consideration; that Monsieur Poussin, constantly seeking to refine and to unburden the subject of his works and to bring forth in an agreeable manner the principal action being treated, had rejected the bizarre objects that might debauch the eye of the spectator and amuse it with minutia" (Academic Lecture of 7 January 1668).

But it was surely in the realm of poetry that the representation of history raised the most difficulties. For poetry represents history by way of fiction. Faithfulness to history thus poses two problems of a rather different nature for the poet. The first involves the difference between resemblance and representation: as in painting, a faithfulness to history may enter into conflict with necessities imposed by the rules of art. The second no longer brings into play the autonomy of art, but rather that of the artist: a respect for history imposes constraints that may be incompatible with the freedom of the poet, that is, with his right to dare anything. This problem plainly concerned the powers of the artist in general, be he painter or poet. But in France, as previously in Italy, it was envisaged essentially with reference to the activity of the poet,

and that precisely because it was born of a reflection on the idea of fiction, and fiction fell under the rubric of poetry and not painting, which raised in turn the question of illusion—dramatic poetry presenting the particularity of bringing into play simultaneously the pictorial question of illusion and the poetic question of fiction.

Reconciling these various exigencies was not always possible, but the freedom of the poet also consisted in casting aside all contradictions, as may be seen in the case of Corneille, who, in his prefaces, did not hesitate to resort to the most disparate arguments, in keeping with the needs of the play in question. It was thus in the name of the rules of art, and consequently the necessities of representation, that he justified the liberties he had taken with history in *La Mort de Pompée*, where he opted to "reduce to two hours what had transpired over two years." One rediscovers here the Aristotelian distinction between poetry and history. This did not prevent Corneille elsewhere from invoking historical truth, and thus the necessities of resemblance, but on this occasion to justify freedoms taken with the rule of verisimilitude or plausibility ("the truth is not always plausible") and that of morality (i.e., of catharsis in the moral sense as understood in the seventeenth century), which demanded that criminals inspire horror and crime be always punished. That argument from resemblance, which is a pictorial argument, was developed at length in the dedication to *Médée*, precisely on the basis of a comparison between poetry and painting:

Poetry and painting have this in common, among many other things, that one often makes beautiful portraits of an ugly woman, and the other beautiful imitations of an action that should not be imitated. In portraiture, it is not a matter of wondering whether a face is beautiful but whether it bears a resemblance; and in painting, one should not consider whether behavior is virtuous but whether it is similar to that of the person being introduced; it consequently evokes for us good and bad actions indiscriminately, without offering us the latter as an example; and if it wishes to impose a measure of horror on us, it is not at all because of their punishment, which it does not affect to show us, but because of their ugliness, which it attempts to represent to us naturally.

However different they be, the justifications of *Pompée* and *Médée* are not at all incompatible. They both express the same

---

7

Expression

The word *expression* entered the French vocabulary of painting around 1650, and this new usage remained for a long time without an equivalent term in other languages (*espressione* was still absent from Baldinucci's *Vocabulario toscano dell arte del disegno* in 1681). *Expression* was used first of all in the general sense of the expression of the subject of a painting, that is, as a synonym for representation. But it quickly took on a second, more restricted meaning, referring to the representation of passions. Le Brun thus made a distinction between general expression, which "is a naïve and natural resemblance of the things one wishes to represent," and particular expression, "which indicates the movements of the heart, and makes visible the effects of passion" (*Conférences académiques* of 7 April and 5 May 1668 on *L'Expression des passions*). The first meaning would gradually disappear in favor of the second, making way for the distinction representation/expression.

refusal to subject art to extrinsic constraints, whether they be the constraints of historical truth or those that morality and society are intent on exercising over representation.

D. To imitate is not to copy:
From the idea of invention to that of originality

This will to autonomy explains the interest brought to the question of the imitation of masters, which had resulted in the polemic between Pico and Bembo. But here too the position of the French was less dogmatic than is often believed. They were unanimous in acknowledging that imitation of the masters played an essential role in the education of a painter, sculptor, or writer. It is in imitating art that one learns to imitate according to nature and truth, that is, that one becomes an artist oneself. But the imitation of art cannot be conflated with artistic imitation in the strict sense; it is its necessary but by no means sufficient condition. It was thus that Philippe de Champaigne lashed out at those he called "copyists of a manner," who "limit themselves servilely to copying the particular manner of an author, taken as their aim and as the sole model they need consult. They judge on the basis of that author alone the manner of all others and have no eyes to discern the beauties and various agreements that nature offers for our imitation" (Academic Lecture, 11 June 1672). In the image of Zeuxis, one must imitate several models and not one alone, and, as Pico already said, do so with discernment, which meant, for the French, by imposing on oneself nature and truth as a rule. But it was above all another motif that was taken up in the seventeenth century to characterize the artist's approach: that of the bee gathering from all flowers to produce a honey that is its alone. Like the bee, the artist was to borrow from different masters in order to become finally his own master, that is, in order to find a manner belonging to him alone. This is precisely the manner in which La Fontaine describes what may be called his poetic method. After acknowledging the extreme diversity of his sources of inspiration, he mocks the "foolish herd" of servile imitators who "follow like real sheep the shepherd of Mantua": "I make use of him in a different manner, and, letting myself be guided, often make bold to strike out on my own. I will always be seen to practice this custom; my imitation is in no way a form of slavery" (*Épître à Mr l'Évêque de Soissons*). This proclamation of independence and freedom is all the more important in the case of La Fontaine in that he was a partisan of the ancients.

The quarrel of the ancients and the moderns, which developed over the last decades of the seventeenth century, did in fact change the nature of the debates over the imitation of masters. The partisans of the moderns did not call into question the idea of imitation, but rather that of the masters, French artists of the century of Louis XIV being for them infinitely superior to those of the past, which included not only the Greeks and Romans, but also the Italians of the Renaissance. Whether partisans of the ancients or the moderns, everyone in the seventeenth century defined artistic imitation in the same way—with reference to nature and truth. They thus all made the same distinction between genuine artistic imitation and that of servile imitators content with merely imitating the manner of someone else. Those who defended the ancients did not present them as models to imitate, but as

models in imitating according to nature and truth. And it was precisely for the same reason that the partisans of the moderns refused to consider the ancients as models, because they did not imitate according to nature and the truth, contrary to the French, they claimed, whose success on this point was without example in the past. "Voiture did not model himself on anyone," wrote Charles Perrault; the art of La Fontaine, he said, "is of an entirely new species," and there is not a single one of his inventions "which has a model in the writings of the Ancients" (*Parallèle des anciens et des modernes*). The idea of invention, constantly associated since the Renaissance with that of imitation, no longer had the merely rhetorical sense of *inventio*; it also took on the meaning of novelty, which in turn gave a new meaning to the idea of imitation by inscribing it in a problematic that was no longer, as in Pico, one of emulation, but of originality: "Never has anyone," wrote Perrault about La Fontaine, "more deserved to be regarded as original and of the first of his kind" (*Les hommes illustres*).

E. From a regulating principle to a normative principle:
The idea of imitation in the eighteenth century

Although reflection on the idea of imitation was pursued in the eighteenth century, it no longer aroused the same passions as in the previous century. First, because such reflection now developed outside the sphere of practicing artists, among theoreticians of art approaching the idea of imitation from an exclusively theoretical angle and no longer as in the seventeenth century, under its twofold—theoretical and practical—aspect. Escaping from the artists, reflection about art became more systematic, as may be illustrated by the title of the abbé Batteux's work, published in 1746: *Les beaux-arts réduits à un seul principe* (The fine arts reduced to a single principle). The generalization of the principle of imitation to the full range of the fine arts was thus accompanied by a theoretical hardening that transformed what was a rather supple regulating principle, intervening in the training of artists, for the classics, into a simultaneously normative and explanatory universal principle, which claimed to account for all forms of art. In addition, the emergence of an aesthetic of sentiment and an aesthetic of nature (both linked to the rise of new forms of sensibility and to transformations in the idea of nature) resulted in giving pride of place to a definition of art as the imitation of nature to the detriment of all other definitions, and at the same time giving that definition a sense rather removed from the one it had in the seventeenth century. One no longer thought, as did Boileau, that "there were no longer serpents or odious monsters who, once imitated by art, were unable to please the eyes" (*Art poétique*). The preference now went to imitating the beauties of nature, in pleasing tones of verisimilitude and decorum. This new conception of the idea of imitating nature, accompanied by a disaffection regarding the great genres (tragedy, historical painting), plainly rendered most of the thinking of the previous century on the subject of the relations between nature and history out of date. In art as in philosophy, nature would henceforth be opposed to history. One would have to wait for David for the Aristotelian definition of art as the representation of human actions to regain a second wind in painting.

These various transformations affecting the idea of imitation did not prevent the authors of the eighteenth

century from voicing the same convictions on a number of scores as their predecessors. And specifically concerning the necessity of distinguishing the imitation of art from all other forms of imitation, resemblance, or reproduction. Developing thought on the nature of the senses and the role of sensations thus led theoreticians of art to radically pit artistic imitation against illusion. As Marmontel wrote in the article "Illusion" in the *Encyclopédie*, what is called theatrical illusion or pictorial illusion are but "demi-illusions," "the pleasure taken in art being a function of that tacit and inchoate reflection that warns us that it is but a feint." The specific nature of artistic imitation is expressed in the specific nature of the pleasure which that imitation procures for us. It was thus through another perspective—that of the analysis of sensations—that the theorists of the eighteenth century rediscovered the Aristotelian idea, which lay at the heart of classical doctrine, according to which the pleasure produced by *mimêsis* was a pleasure specific to *mimêsis*.

V. *Nachahmung*: The Calling into Question of *Mimêsis*

The use of the term *nachahmen* (to imitate) posed a problem in Germany already in the first half of the eighteenth century, and was the symptom of a lexical malaise that was fueled by the more general crisis of the Aristotelian principle of *mimêsis*. More and more authors, such as J. J. Winckelmann and J. G. Herder, attempted subtle differentiations in order to rescue the word from any confusion with its pejorative correlates, *nachmachen* and *kopieren* (to copy, to reproduce). But such subterfuges barely fooled anyone. At the end of the eighteenth century, it was no longer those correlates that were contested, but the word *nachahmen* itself. Over and again, Jean Paul and F. Schlegel associated *Nachahmung* (imitation) with mere copying, an evolution concluded by A. W. Schlegel with his peremptory refutation of the axiom *ars imitatur naturam*. Art was not obliged to imitate nature. The word *nachahmen*, in his view, would henceforth be supplanted by the terms *bilden* (to fashion, to give form to) and *darstellen* (to represent).

A. A latent lexical malaise (1700–1760)

It was only after 1700 that the principle of *mimêsis*, which had so broadly occupied Italy, England, and France since the Renaissance, began to be debated in Germany. But at the time the discussion began, the formula *ars imitatur naturam* could no longer be taken for granted since each of the terms in the axiom had been invested with multiple meanings. Imitation could be understood at times as strict reproduction, at others as an inventive recomposition of the real and nature, at times as *natura naturata*, and at others as *natura naturans*. As of the 1740s there was thus a deep linguistic malaise regarding the use of the word *nachahmen* (to imitate), with attempts alternately to save it at whatever cost or to burden it with negative virtualities. If, still in the middle of the century, recourse to the word *Nachahmung* seemed stripped of ambiguity and difficulty for J. C. Gottsched or J. E. Schlegel ("a poet is a skillful imitator of all things in nature" [ein geschickter Nachahmer aller natürlichen Dinge]; Gottsched, *Versuch einer kritischen Dichtkunst*), such was not the case for J. J. Bodmer, J. J. Breitinger, or G. E. Lessing. "The terms *faithful* and *beautified* [*getreu und verschönert*],

used with regard to imitation and nature as subject of imitation [*Nachahmung*], are subject to many misunderstandings," Lessing announced in 1768 in his *Hamburgische Dramaturgie*.

■ See Box 8.

At times invested with Aristotelian dignity, at others associated, on the contrary, with the minimally prestigious register of the copy (*nachmachen, kopieren*), the notion of *Nachahmung* issued in increasingly subtle lexical differentiations, which constitute a problem for the translator. In this regard Winckelmann's use of the term is eloquent. Whereas he had made of imitation the core and very title of his first essay, "Gedanken über die Nachahmung der griechischen Werke in der Malerei und Bildhauerkunst" (Reflections on the Imitation of Greek Works in Painting and in Sculpture) of 1755, Winckelmann would use it in his subsequent texts only with increasing embarrassment. In 1759, he undertook to distinguish genuine imitation (*nachahmen*) from mere copying (*nachmachen*):

> To personal thought, I oppose the copy (*das Nachmachen*), but not at all imitation (*die Nachahmung*): by the term *copy* I understand a slavish tracing (*knechtlische Folge*). In imitation, on the contrary, what is imitated, if handled with reason, may assume an other nature, as it were, and become one's own (*gleichsam eine andere Natur annehmen und etwas eigenes werden*).
>
> *Erinnerung über die Betrachtung der Werke der Kunst*

The lexical discomfort is evident. Following Winckelmann, Herder attempted a subtle distinction between *nachahmen* as a transitive verb, the synonym of slavish copying, and *nachahmen* as an intransitive verb, designating imitation proper. "*Einen nachahmen* signifies, in my view, to imitate the subject, the work of others; *einem nachahmen* signifies, on the contrary, to borrow from an other his manner of treating that subject, or a comparable subject" (Einen nachahnem heißt, wie ich glaube, den Gegenstand, das Werk des andern nachahmen; einem nachahmen aber, die Art und Weise von dem andern entlehnen, diesen oder einen ähnlichen Gegenstand zu behandeln) (quoted from J. and W. Grimm, RT: *Deutsches Wörterbuch*, vol. 13, s.v. "Nachahmen"). Restitution into French becomes complex: one would have to translate the transitive *nachahmen* as *copier, reproduire servilement* (slavish copying), and the intransitive *nachamen* as *s'inspirer, rivaliser avec* (to be inspired by, etc.). For Winckelmann and Herder, the strategy was the same: it was a matter of inventing a kind of negatively charged yet extremely close twin of *nachahmen*, such as *nachmachen* or *einen nachahmen*, in order to save the word *Nachahmung* from its disastrous possibilities. But the lexical ruse barely fooled anyone, and it was the term *Nachahmung* itself that ended up with the blemish of the slavish epigone.

B. *Nachahmen* and the decline of the principle of imitation around 1800

Later developments bear this out. In subsequent decades it was not only words of the same family (*kopieren, nachmachen, nachbilden*) that became suspect, but the semantic matrix

8

The critique of the idea of the imitation of nature in Lessing

The use that Lessing made of *Nachahmung* was consistent with his general methodology in art theory: he availed himself of the notion, but in order to point out its internal contradictions. As he said, if one applied literally the principle of imitation of nature that Breitinger and Batteux were so attached to, then the worst deformities would pass for art, and perfect harmony of proportions would be something very unusual:

> The example of nature which has to justify the connection between the most solemn seriousness and the most frivolous gaiety, could equally well be used to justify any dramatic monstrosity that would be unstructured, disconnected, and lack all common sense. The imitation of nature (*Die Nachahmung der Natur*) should absolutely not be the principle of art (*Grundsatz der Kunst*); or rather, if it had to remain so, art would thereby cease being art, or at least high art. . . . According to this way of thinking, the most artistic work would be the worst,

and the most mediocre would be the best.

> Lessing, *Hamburgische Dramaturgie*, §70, 1 January 1768 (1769)

Lessing was not attacking the principle of imitation as such, but the imitation of nature. If the imitation of nature is the essence of art, then one has to follow this to its logical conclusion. A perfect reflection of reality can only reflect back to us representations and images that are often ugly, even hideous. The strict application of the principle of the imitation of nature produces the opposite of what it is aiming for, namely, beauty, and thus loses all validity as an artistic principle. In his essay *Laocoön*, the word *Nachahmung* reappeared, but in relation to the modes of representation in painting: "Painting employs wholly different signs (*Zeichen*) or means (*Mittel*) of imitation (*Nachahmungen*) from poetry, —the one using forms and colors in space" (Lessing, *Laocoön*). Lessing retained the word *Nachahmung*, which seemed the most appropriate to express the quest for the ideality of the beautiful, and thus for the

essence of art itself. So *Nachahmung* was not rejected, but it did not really have the status of an artistic and aesthetic concept. When he discussed painting in *Laocoön*, he identified more with *Darstelling*, representation. The other, far vaguer meaning made allusion to the poetic and pictorial models of the ancients. *Nachahmung* was not yet explicitly opposed to *mimêsis*; without being actually empty in terms of content, the word expressed at best a concession to the worship of the classical ideal of beauty. In other words, it still had some legitimacy because of the authority of Winckelmann, but its theoretical validity had become so problematic that only the aesthetics that were taking shape in Germany could give it back its productive capacity.

itself: *nachahmen*. The attack came above all from the Romantic school and its surroundings.

■ See Box 9.

In his *Vorschule der Asthetik* (*Pre-School of Aesthetics*) (1804), Jean Paul adopted Herder's lexical distinction between a transitive and intransitive use of *nachahmen*, but brought it to an abrupt close:

> Does the expression *die Natur nachahmen* mean the same thing as *der Natur nachahmen,* and is repetition imitation? Verily, the principle that consists in faithfully following nature scarcely makes sense.

> (Aber ist denn einerlei, die oder der Natur nachzuahmen, und ist Wiederholen Nachahmen?—Eigentlich hat der Grundsatz, die Natur treu zu kopieren, kaum einen Sinn.)

> *Vorschule der Asthetik*, §3

In 1785, in order the better to disqualify imitation, Jean Paul made of *nachahmen* a synonym pure and simple of *kopieren:* "The imitation of nature is not yet poetry since the copy cannot contain more than the original" (Die Nachahmung der Natur ist noch keine Dichtung, weil die Kopie nicht mehr enthalten kann als das Urbild) (*Uber natürliche Magie der Einbildungskraft* [On the Natural Magic of the Imagination]). More and more frequently associated with the terms *wiederholen, kopieren, nachäffen*, the word *nachahmen* has the French

reader hesitating between several translations: *répéter, copier, singer,* or *imiter*. Between F. Schlegel, who, on the subject of imitation, spoke of "artificial counterfeits" of Greek works (*künstliche Nachbildungen* in the first edition, changed to *Künstliche Nachahmungen* in later editions, *Uber des studium der griechischen Poesie* [On the Study of Greek Poetry]), and Novalis, who, in a letter to his brother Karl, probably dating from 1800, stated peremptorily that poetry was at the strict antipodes to imitation, the status of the word *Nachahmung* continued to be degraded and the span of translations to broaden. In 1801–2, A. W. Schlegel put a radical halt to the discussion. In his *Vorlesungen über schöne Literatur und Kunst* (Lectures on Literature and the Fine-Arts) delivered at the University of Berlin, he offered a systematic refutation of the Aristotelian principle of *mimêsis*:

> Aristotle had posited as an unchallengeable principle that the fine arts were imitative (*die schöne Künste seien nachahmend*). This was precisely the case on the condition that one meant by it a simple thing: they have something imitative (*es komme etwas Nachahmendes in ihnen vor*); but it was imprecise if it meant, in the sense in which Aristotle himself understood it, moreover, that imitation constituted their entire essence (*die Nachahmung mache ihr ganzes Wesen aus*).. . . Numerous moderns have subsequently transformed this principle into the following axiom: art must imitate nature (*die Kunst soll die Natur nachahmen*). The imprecision and ambiguity

9

Formative imitation in Karl Philipp Moritz

By the end of the eighteenth century, imitation no longer implied the idea of a rational order inherent in nature, or that was particular to a system of artistic rules. It was faced with a dual process: on the one hand, the increasing subjectivization of all aesthetic categories, and on the other, the development of a new concept of nature. Art was seen from that point on as having to produce works in accordance with a principle of autonomy analogous to the autonomy that was immanent to living organisms. So a work of art had to be accomplished as a dynamic, internal, and autonomous process. But for Moritz, this movement was not at all, as it was for Goethe, part of an investigation of nature as such. Or rather, art and nature were connected as part of a whole that was analogous to the cosmos of the Greeks and that closely conditioned them. Art should in effect aim to find the language of nature, either through imitation or through symbolism. The aesthetic orientation of Moritz was thus as far removed from the rationalism of Breitinger as it was from the exclusively artistic vision of Winckelmann or of Lessing. It was the enthusiasm and mysticism of the whole that inspired the thought of Moritz: the essential criterion of beauty could only be something that was perfectly finished or accomplished (*Vollendete*). But this beauty was itself only one moment of a movement tending toward the apprehension of the whole. According to him, if we do not possess the concept of what is right or good in an ethical sense, we cannot grasp in its fullness the idea of a formative imitation (*die bildende Nachahmung*), to the extent that this imitation is immanent to the creative faculty of the beautiful as it is manifest in a work of art:

Die eigentliche Nachahmung des Schönen unterscheidet sich also zuerst von des moralischen Nachahmung des Guten und Edlen dadurch, dass sie, ihrer Natur nach, streben muss, nicht, wie diese in sich hinein, sondern aus sich heraus zu bilden.

(So the imitation of what is properly speaking beautiful is first of all distinct from the moral imitation of the good and the noble in that it has to strive, according to its nature to form an image that is not, like this imitation, an image in itself, but to form its image out of itself.)

Moritz, Über die bildende Nachahmung des Schönen

The "aus sich heraus zu bilden" (to form its image out of itself) dissipates the ambiguity of the sentence. Formative imitation has nothing in common with imitation as Lessing, for example, understood it; it is a *poiesis*, inspired by a *Bildungskraft*, a formative power. *Nachahmung* is all the more untranslatable since Moritz uses the word by defining it as what it is not, that is, an activity of the creative imagination. The break with the artistic tradition of imitation was thus complete; Moritz envisaged an idealization of beauty involving as much a mystical experience as an aesthetic experience. It was, however, in function of this new and sometimes obscure meaning that the aesthetic orientation of German Romanticism would be determined.

---

of the terms "nature" and "imitate" have provoked the greatest misunderstandings and led to the most diverse contradictions.

For A. W. Schlegel, the symptoms of the inadequacy of the term *nachahmen* were numerous. In Batteux, for example, who postulates that art ought to imitate beautiful nature, or elsewhere that art ought to imitate it as more beautiful, the word "imitate" is incorrect "since one either imitates nature as it is, in which case it is possible that the result will not be beautiful, or one gives it a beautiful form (*man bildet sie schön*), and one is no longer dealing with imitation (*so ist es keine Nachahmung mehr*). Why not say straightaway: art should represent the beautiful (*Warum sagen sie nicht gleich: die Kunst soll das Schöne darstellen*)?" The word *nachahmen,* an incorrect term that translates in this case the incorrect notion of imitation in Batteux, ought simply to be eliminated. And Schlegel concludes: "A more accurate formulation of the principle would be: art ought to give a form to nature (*die Kunst muß Natur bilden*)." *Bilden* and *darstellen* would replace *nachahmen*. With enough untranslatability, the untranslatable is voided.

VI. Realism or Conventionalism: New Perspectives

The concepts of reference, correspondence, and resemblance, which were at the origin of various theories of imitation, have by now become quite problematical. The idea of imitation, as it functioned for centuries through numerous transformations, assumed that the object was given in experience and that the representation might adequately refer to reality. "To perceive similarities," wrote Aristotle, "is to give evidence of a sagacious mind" (*Rhetoric*, 3.11.5). That proposition, which defined resemblance as a condition of the possibility of representation, possessed the value of an axiom in theories of art until the nineteenth century. The naïve realism underlying conceptions of representation based on the idea of resemblance has largely been called into question by the epistemology and analyses developed in particular by various philosophies of language. Nelson Goodman radicalized a conventionalist position, ending up in a relativism. For him, what links A and B consists in a relation between elements that may be totally heterogeneous, and that relation brings about a symbolic productivity every bit as efficacious as traditional resemblance of an Aristotelian sort: "Almost any picture can represent anything" (*Languages of Art*). The principle according to which the representation of reality must rest on resemblance to the thing represented is thus based more on a belief than on logical arguments. This conception of representation was born of an aesthetic reflection on the functions of metaphor, but was extended to the whole gamut of symbolic creations of art by basing itself on a new theory of reference. Ernst Gombrich opposed what he called the "extreme conventionalism" of Nelson Goodman and defended the existence of "a real visual resemblance" with recourse to contemporary research in psychology, anthropology, and philosophy on the subject of perception. Without denying the importance of codes and what Goodman calls "inculcation" in the process

of recognizing visual representations, Gombrich rejects the idea that images representing nature would be no more than conventional signs in the same way as linguistic signs. There exist for him relations of similarity between the visual space of the painting and the nature of the object represented (cf. "Image and Code: Scope and Limits of Conventionalism in Pictorial Representation," in *The Image and the Eye*). But such bonds of resemblance exclude all realist reference to the object since the most realistic representation already presupposes an extended apprenticeship and rigorously determined cultural and social frames of reference. One thus ends up, in most such inquiries, with a paradoxical situation, since the devaluation of imitation as the central concept of aesthetics has given rise to numerous theories on what was at the very foundation of that concept, that is, resemblance, reference, and representation. Contrary to reflection on art in the nineteenth century, contemporary aesthetics no longer rejects imitation in the name of creative freedom or a radical autonomy of artistic invention, but by virtue of a foundational conviction according to which every act of reference—by perception and above all by language—to reality eliminates any possible homology or isomorphism between discourse and reality. Determined in relation with logic, thus disposing of new epistemological and metacritical models, aesthetics sees itself as necessarily implicated in the debate over realism and anti-realism. The question of realism thus conditions the determination of values, the objective properties of a work, the beautiful, and colors as much as it does that of representation, reference, and resemblance, that is, a large part of the field of aesthetics. This does not at all mean that the concept of imitation has lost all validity and that it is presently stripped of all expressive value, including in the domains of pure copying and artistic forgery. It is through a more precise analysis of the functions of reference that the idea of imitation can conserve its meaning.

MIR [мир, мір] (RUSSIAN)

ENGLISH	world, peace, peasant commune
FRENCH	*monde, paix, commune paysanne*
GERMAN	*Welt, Friede*
GREEK	*kosmos* [κόσμος], *eirênê* [εἰρήνη]
LATIN	*mundus, pax*

➤ *PEACE*, *WORLD*, and CIVIL SOCIETY, OIKEIÔSIS, PRAVDA, SECULARIZATION, SOBORNOST', SVET, SVOBODA

The presence in Russian of two homonyms, *mir* [мир] (peace) and *mir* [мир] (world), raises an etymological problem: Was it a matter of two distinct terms at the outset? Need we imagine one of the two semantic veins as derived from the other, or should we imagine two derivations diverging from a common notion? Moreover, was that homonymy used by writers in order to bring to light or create an intersection between the "peace" field and the "world" field? Finally, how do we situate *mir* [мир], the name of an institution, the "peasant commune," in relation to "peace" and "world"?

I. *Mir* (World) and *Mir* (Peace): A Fertile Ambiguity

The Russian language inherited from Old Slavonic two masculine nouns *mir*—one signifying "peace" (and translating regularly the Greek *eirênê*), the other signifying "world" (and translating regularly the Greek *kosmos*). The two words are perfect homonyms. Insofar as spelling is concerned, the custom—in printed texts and in nineteenth-century cursive—was to distinguish them through use of a normal Cyrillic *i* for *mir* [мир] (peace) and a "dotted" *i* (theoretically reserved for the notation of an *i* before a vowel) for *mir* [мір] (world). That distinction did not survive the spelling reform of 1917, which eliminated a certain number of letters from the Russian alphabet, including the dotted *i*: the two versions of *mir* have since been spelled identically, as they had been written in Old Russian texts until the eighteenth century. It happens that Vladimir Mayakovsky published in 1916, just prior to the reform, his great poem against the war that was then ravaging Europe, "Vojna i mir": the spelling of *mir* (with a dotted *i*) indicated that the title was to be understood as "War and the Universe" (which is how Claude Frioux translates it into French), even though the expression echoes the title of Tolstoy's novel, *War and Peace*. And in fact, in Mayakovsky's poem, it is not a matter of contrasting war and peace but of describing the suffering inflicted by war on the world. In editions published during the Soviet era, after the spelling reform, the two titles cannot be distinguished in print.

As a rule, context allows one to distinguish between the two *mir*s: the two homonyms are indeed two different words, and it is entirely appropriate for dictionaries to treat them in two separate entries. The autonomy of each of the terms is notable in their offshoots: only *mir* (peace) gives rise to a verb, *mirit'* [мирить] (to reconcile), whence comes *smirit'* [смирить] (to appease, tame). And although it is true that the adjective *mirovoj* [мировой], which most often means "worldwide," can also have the meaning of "relative to peace" (in the expression *mirovoj sud'ja* [мировой судья], "justice of the peace"), and it is also true that the Old Slavonic *mrinu* and the Old Russian *mirni* translates *tou kosmou* [τοῦ κόσμου], *kosmikos* [κοσμικός], and *mundi*, as well as *tês eirênês* [τῆς εἰρήνης] and *pacis*, at least the modern Russian form of that adjective, *mirnyj* [мирный], no longer means anything other than "peaceful."

It is precisely because the two *mir* nouns can no longer be confused that one can play on their homophony to produce poetic or rhetorical effects, as in the saying *V mire žit', s mirom žit'* [В мире жить, с миром жить] ([If one wants] to live in the world, [one must] live in [observing the peace]) (RT: *Tolkovyĭ slovar' zhivogo velikorusskogo iazyka*, s.v. *mir* 1); or in the poet Yesinin's line, *k miru vsego mira* [к миру всего мира] (for the peace of the whole universe), an appeal dating from 1917 (see Pascal, *Civilisation paysanne en Russie*); or even in the Soviet slogan *mir miru!* [мир миру!] (peace to the world!), which merely takes up the prayer from the Menologion of Novgorod (twelfth century): *mir vsemu miru podazd'* [мир всему миру подаздь] (give peace to the entire world) (RT: *Materialy dlia slovaria drevnerusskogo iazyka*, s.v. *mir*); or even in the translation of the Gospel according to John (14:27):

Mir ostavljaju vam, mir moj daju vam, ne tak kak mir daёt ja daju vam.

[Мир оставляю вам, мир мой даю вам, не так как мир даёт я даю вам.]

[Εἰρήνην ἀφίημι ὑμῖν, εἰρήνην τὴν ἐμὴν δίδωμι ὑμῖν· οὐ καθὼς ὁ κόσμος δίδωσιν ἐγὼ δίδωμι ὑμῖν.]

(I leave you peace; I grant you my peace; I give it to you, not as the world gives it.)

The situation of *mir*, on the linguistic level, is thus entirely different from the one encountered with *volja* [воля], for example, which at times means "will" and at others "freedom" (as can be seen in the names of two political groups of the late nineteenth century, *Zemlja i volja* [Земля и воля], "Land and Freedom," and *Volja naroda* [Воля народа], "the Will of the People"). In the case of *volja*, we are not dealing with two homonyms, but with a single word, whose semantic range includes notions that, in other languages, are rendered by two distinct signifiers. Moreover, the "freedom" denoted by *volja* is to be understood as the free exercise or unimpeded deployment of the will. It is distinguished from freedom as personal autonomy, which is denoted by *svoboda* [свобода]; *volja* translates *thelêma* [θέλημα], but *svoboda* translates *eleutheria* [ἐλευθερία] (RT: *Materialy dlia slovaria drevnerusskogo iazyka*). See SVOBODA.

■ See Box 1.

II. The Idea of "Bond": *Mir* and *Sobornost'*

On the linguistic level, however, what requires reflection is not the differentiation of the semantic status of *mir* (world), but the relation between *mir* (peace) and *mir* (world). Although it is true that in the history of Russian (and even in Old Slavonic) we are dealing with two distinct terms, one cannot but wonder whether the two *mir*s are linked by a common etymology. It is generally believed that in the prehistory of common Slavonic there must have existed a

1

War and Peace: The duality of *mir* and the polysemy of "world"

If, in the case of the two versions of *mir*, the translator-interpreter needed only to decide between "peace" and "world," his or her task, for the most part, would be easy. There are, however, ambiguous situations. Circumstances and context allow listeners to choose the interpretation best suited to their mood, without it necessarily being that of the speaker. One example (studied by Bočarov in 1980) is offered by Tolstoy in *War and Peace* (vol. 3, pt. 1, chap. 18). It is the summer of 1812. Napoleon's armies are invading Russia. Natasha is at services and hears the great *ekten'ja* [ектенья] (responsive prayer) of the liturgy of Saint John Chrysostom. Here is the translation of the passage in the Pléiade edition:

Le diacre s'avança sur l'ambon . . . et . . . entonna d'une voix haute et solennelle la prière: — Prions en paix le Seigneur — Oui, songea Natacha, prions tous ensemble, sans distinction de classes, sans inimitié, unis dans un amour fraternel! — Prions le Seigneur pour la paix d'en haut et le salut de nos âmes. Pour le monde des anges et de tous les esprits incorporels qui vivent au-dessus de nous, comprenait Natacha.

The deacon came out to the ambo . . . and, . . . began loudly and solemnly to read the words of the prayer:
    "In peace let us pray to the Lord."
    "As one world—all together, without distinction of rank, without enmity, but united in brotherly love—let us pray," thought Natasha.

    "For the peace from above and for the salvation of our souls!"
    "For the world of the angels and the souls of all the bodiless beings who dwell above us," Natasha prayed.

The situation is more complex than is implied by Uspenskij's analysis (to which Bočarov refers) and the French translation. In the Russian editions published during Tolstoy's lifetime and, more generally, before the spelling reform, all occurrences of *mir* are written мір (world). If the French and English translators thus render the deacon's first exclamation, "мiром господу помолимся [мiром господу помолимся]," as "let us pray in peace," it is because they seek in a way to correct Tolstoy so as to make him conform to the Greek text, which says: "en eirênê tou kuriou deêthômen [ἐν εἰρήνη τοῦ χύριου δεηθῶμεν]," thus: "in peace [*eirênê*], let us pray to the Lord." But, to judge by the spelling, *mirom*, an adverbial form of *mir*, is to be understood as "together, so as to form a world." The deacon (according to Uspenskij, to whom Bočarov refers) is addressing the praying community insofar as it is a unanimous totality or world. Natasha, for her part, does not transpose "peace" into "world," as the translations would lead us to believe, but draws out of "world" the idea of love, which orients us toward "peace." The deacon's second exclamation ("o svysnem mire l o spasenij dus našix [о свысiнем мiре и о спасений дус наших]") is faithful to the Greek—despite the spelling—only if one interprets it as a prayer for peace from on high (*anôthen* [ἄνωθεν]). But Natasha imagines praying for the spirits who are in the world above. Between the deacon and Natasha, there is not exactly a misunderstanding; one cannot say that she has mistaken the sense of his words, or of the Greek. The homonymy creates an ambiguity here that legitimizes both translations simultaneously, and that consequently can be reconciled. Such a situation is possible only because the semantic fields of the two versions of *mir*, even though the terms are lexically distinct, intersect, or even because each projects onto the other an aura of connotations. Thinkers on the subject of *sobornost'* [соборность] have insisted on this, as we shall see below: the world is not truly a *mir* unless it is a gathering of unanimous human beings, united by a feeling of mutual belonging, of forming a coherent and harmonious whole based on an agreement between its parts and that whole, as well as on the inner peace of each of its individuals. So strong is the hold of the group, thus constituted, on its members that they have no other horizon than the group itself: the entire world can be nothing other than the projection of the group. A desire for peace inspires agreement, which is both the structure of the world and the necessary condition for its achievement.

Such at least is the ideal of the world. But *mir* in the sense of "world" has taken on, in Russian (as it had even in Old Slavonic), all the values that have become those of Greek *kosmos*, Latin *mundus*, French *monde*, Spanish and Italian *mundo*, and German *Welt*. The world is also what is "mundane," the domain of the secular, profane, and here-below, in

opposition to the spiritual world, the world above. (Thus Pleberio, in Fernando di Rojas's 1499 *Tragedia de Calixto y Melibea (La Celestina)*: "¡Oh vida de congojas llena, de miserias acompañada! ¡Oh mundo, mundo!" [Oh life, filled with pains, accompanied by miseries! Oh world, world!].) *Obmirščenie* [обмирщение] is the fact of entering into agreement with the powers of this "world": old-believers reproach the church for accepting the reforms advocated by the state in the seventeenth century, and for "yielding to the world" (on the attitude of the church toward the "mundane" world, see Bulgakov, *Pravoslavie*).

Here too, Tolstoy's novel offers an example of the paradoxical advantage a writer can draw on, not only from the homonymic relation of the two versions of *mir*, but from the polysemous nature of *mir* as "world." To go back to Bočarov's analyses: before the invasion of Napoleon's armies and the ensuing war, certain of the principal characters led a worldly life (*mirskaja žizn'* [мірская жизнь]) in society that seemed to them painful and artificial. Pierre Bezukhov gets mired down and sullies himself "in the world," reproaching himself for being a "man of the world" (*mirskoj čelovek* [мірской человек]). Similarly, Nikolai

Rostov finds peace only after distancing himself from "worldly life" (in this case, his civilian existence) and rejoining his regiment, which seems a monastery to him, the image of a pure world. What prompts dissatisfaction and discomfort with the mundane world of secular life is that it embodies dispersion, disorder, and incoherence. The social and secular (*mirskoj* [мірской]) world is opposed to the cosmic (*mirovoj*) world, whose heroes are open, in moments of total solitude suited to mystical perception, to an intuition—of the unity of the universe. The world as cosmos is opposed to the world of profane society as heaven is opposed to earth, but also as the harmony of the totality is opposed to fragmentation and chaos. In other words, the world is a cosmos to the extent that it is agreement. The remarkable fact—for the structure of the novel *War and Peace*—is that this world of harmony, based on friendship and thus on peace between the elements that constitute it, is revealed to the characters of the novel when there is war: in order to confront the ordeals of war, society rejects dissension, pettiness, and various forms of selfishness or secular social existence in order to form here below a spiritual community in the image of the

cosmic world, one in which individuals come to feel that they belong directly to the cosmic totality; their worldly existence, their social determinations, are abolished. It will be seen how, in the title *Vojna i mir* (*War and Peace*), *mir* does not only mean "peace," but refers as well to the "world" and the contrasts between the profane or secular world and a cosmic world identified with the spiritual world.

mir signifying "peace" that would have split into two terms, one conserving the original sense, the other taking on the sense of "world." According to Antoine Meillet (RT: *Le slave commun*), the model for this transition from "peace" to "world" was furnished by the administrative Latin of the Roman Empire: *pax romana* became an expression designating all the territory ruled by Roman peace. Similarly, Old Slavonic translated the Greek *kosmos* by (*visi*) *miru,* "(all) the peace," the entire domain of peace, and thus the world. The term *mir* would have been borrowed from *mihr* in an Iranian language, perhaps Scythian, a form deriving from ancient Iranian *mithra, represented in Avestan by *miqra*. The Sanskrit Vedic *mitra* regularly corresponds to the latter term. We are thus confronted with an Indo-Iranian etymon *mitra* (RT: *Ėtimologicheskiĭ slovar' russkogo iazyka*, s.v. *mir*). In Avestan as in Vedic, the noun can be neutral or masculine. In Vedic Sanskrit, *mitra*, neuter, signifies "friendship," "alliance" (and also, curiously, "friend"). Mitra is also the name of a major divinity in the Vedic pantheon, the god of friendship, friendship personified. In Avestan, *miqra* means "contract" and, as a proper noun, designates the god who reigns over all that partakes of the good, of order and light. Meillet (RT: *Etudes sur l'étymologie et le vocabulaire du vieux slave*) and, following him, Benveniste (RT: *Le vocabulaire des institutions indo-européennes*) and Dumézil, maintain that the original meaning of Indo-Iranian *mitra is "agreement, friendship resulting from a contract." From a morphological point of view, *mitra is the instrument or agent through which the *mi- operation is achieved. The meaning of that verbal root

may thus be a subject of speculation. It may be a matter of the Indo-European root *mi- (to change) and (to exchange), represented notably by the Sanskrit *mi- (to alter) and *mith*- (alternate) and the Latin *muto* (to change), *mutuus* (reciprocal): the contract on which the friendship denoted by *mitra- is based is itself the formalization of an exchange of benefits. But the existence of other Indo-European *mi- roots—allowing one to trace other semantic lines of transmission for *mitra- (and thus for *mir*)—have been posited: a *mi- (to attach) would allow us to understand *mitra- as a "bond," originally a material bond, and secondarily a bond understood as the constitutive obligation inherent in a contract. The Greek *mitra* [μίτρα] (belt) would be a borrowing from an Iranian form that would have retained that concrete sense (RT: *Dictionnaire étymologique de la langue grecque*, s.v. "Frisk"). Certain etymologists acknowledge as well a root in *mi- that would be at the origin of the Sanskrit *mayas* (sweetness), and the Old Slavonic *milu* (likable) (RT: *Etudes sur l'étymologie et le vocabulaire du vieux-slave*). That last etymology would make the Indo-European *mitra a far more affective form of friendship than one resulting from either a binding obligation or exchanges regulated contractually. (Jan Gonda rejects the notion that *mitra*- is a term for "contract.")

These speculations on the ultimate etymology of *mitra* are not unrelated to the more or less explicit (or more or less refined) analyses of the terms *mir* (peace) and *mir* (world) conducted by Russian authors. Florensky (*The Pillar and Ground of the Truth*) states outright that the two versions

of *mir* cannot be dissociated, in the sense that "the idea of *mir*, of the world, is based on the notion of a concordance of parts, harmony, and unity. The world is a coherent whole; it is the *mir* of the beings, things, and phenomena it contains." In other words, with peace and agreement being the condition of the world, and the world being the space constituted by peace, it is the sense of "peace" (order, harmony, coherence) that is primary. This idea underlies the doctrines positing that *sobornost'* (solidarity) is the foundation of the human world, and that *sobornost'* is an expression of love as the realization of an inner principle that is supernatural and prevails over empirical nature: it is the principle of divine truth. And inversely:

> . . . the principle of truth [*pravda* (правда)], which is the foundation of society as community [*obščestva* (общества)], the principle of the submission of human passions and natural tendencies to the will and force of God, is necessarily achieved as love [*ljubov'* (любовь)], total inner unity of the human being, a unity without which the union and coordination that empirically determine the nature of the community are impossible.

<div align="right">(Frank, The Spiritual Foundations of Society)</div>

For Frank, as is known, this genuine community, "this spiritual organism is what is understood—in the deepest and most general sense—by the word 'church' (*tserkov'* [церковь]). Thereby, we arrive at the affirmation that at the foundation of all community, as the means and creative principle of that community, there is necessarily the Church." Thus, the "world is to melt without residue into the Church. . . . The entire world is to become without residue the world in God, but God cannot take his place without residue in the world" (ibid.). He continues:

> Social life is constituted by a constant struggle between the principle of solidarity and the principle of individual freedom, between the power [*vlast'* (власть)] that protects the interests of the whole and anarchical tendencies, between centripetal and centrifugal forces. . . . It is only when those two principles find support in a third principle . . . , the service of God, the service of absolute truth, that they achieve agreement and are lastingly reconciled.

The social world becomes a community, the *mir* of the secular world becomes a church only when that reconciliation, which is a pacification (*primirenie* [примирение]), has completed its work. It may be noted, in taking up the question of the original meaning of *mir* anew, that if the harmony of the whole is a form and consequence of the love that the constitutive parts of that whole bring to God, then that social bond cannot be interpreted as a system of exchanges regulated by contract.

Thus the ideologues of *sobornost'* adopt as their own, and with considerable insistence, Tönnies's opposition between *Gemeinschaft* and *Gesellschaft* (see CIVIL SOCIETY, Box 1). It is clearly in society as *Gesellschaft* that the parts are reciprocally adjusted through the effect of laws or forces that are imposed on them and remain, in a sense, external in relation to them. In *Gemeinschaft*, on the contrary, the unity is internal,

and the solidarity organic. But in point of fact, Frank further notes, in the case of a human society, even beneath the external modifications appropriate to *Gesellschaft*, one detects the presence of an internal solidarity characteristic of *Gemeinschaft*. Adapting the teaching of Khomyakov on the nature of the unity of the church, Frank, in *The Spiritual Foundations of Society*, affirms that *sobornost'* is based on a relation of love. If the ideal is to act so that the human world might melt into the Church, through the effects of pacification, it must also be recognized that the principle of love or organic solidarity is indispensable, even if it is invisible, for every society.

III. *Mir,* Peasant Commune and Utopia—Slavophiles and Socialists

The theme of *sobornost'*, which implies a reflection on the "peace" component and the "world" component in the unitary notion of *mir*, also includes considerations about a third sense of the word: *mir* as the name of a specific institution, the peasant commune, also called *obščina* [община]. The real institution that corresponded to *mir* taken in this sense was the object, between 1840 and 1930, of various intellectual battles bearing directly on the characteristics (and thus on the fate) of Russian society, and that ultimately involved the nature of the social bond and the very status of the political. Before indicating briefly the stakes of those debates, we may note that in all dictionaries, *mir* as "peasant commune" is presented as an aspect of *mir* as "world," a circumstance confirmed by the spelling of the word prior to the reform: each "peasant commune" is a world in itself, a whole whose cohesion is ensured by extremely powerful customs of solidarity. It was this *mir* as "peasant commune" that Toporov had in view in his remarks (in "Iz nabljudenij nad etimologiej slov mifologiceskogo xaraktera") on the etymology of the term: "The god Mitra is the one who gathers men in a social structure, a *mir*, it might be said, borrowing a term from Russian social tradition." This way of defining the group wanted by Mitra takes into account, Toporov says, the "natural [or etymological] bond" between the Indo-Iranian *mitra and the Russian *mir*.

What sort of totality-collectivity are we dealing with in the peasant *mir*? Intellectuals became truly aware of the importance of this kind of social organization only after the German traveler August von Haxthausen published the results of his investigation of the Russian agrarian regime. The Slavophiles opted to see in the *mir* described by Haxthausen the *mir* mentioned in the juridical texts of Kievian Russia (notably the *Russkaja pravda* of the thirteenth century). By 1856, the Russian political philosopher Boris Chicherin had shown that this was an error: in Kievian Russia, the peasants of a commune (in the sense of a territorial circumscription) formed a *mir*, that is, they met periodically to designate their magistrates, who were responsible for the police and relations between the commune and the outer world, the prince and the lords of the manor (see Eck, *Le Moyen Âge russe*). Although the Kievian *mir* also had to administer lands not yet assigned, the peasant was free to dispose of the lands he worked as he wished. In contrast, the *mir* Haxthausen observed was the true holder (if not the owner), administrator, and assigner of the land worked by the peasants (Eck, ibid.). According to Klyuchevsky, the characteristic features of this

mir-obscina—obligatory equalization of the lots assigned to each household, complete power of the commune over the peasant, the commune's vouching (out of solidarity) for the payment of taxes—were not explicitly established until the seventeenth century (*Socineniya*, vol. 2).

■ See Box 2.

The peasant *mir* was an extraordinarily persistent and fertile ideological (if not philosophical) theme in Russian thought of the second half of the nineteenth century. The defense and illustration of the *mir* was one of the principal motifs of the Slavophile trend.

Thus I. Kireevskij saw in the *mir* a society whose cohesion was ensured by a fundamentally moral bond. The Russia of times past, "authentic" Russia, unaltered by reforms imitated from the West, was united by that moral bond "into a single vast *mir*, a nation in which faith, land, and custom were shared by all" (quoted in Walicki, *Slavophile Controversy*). The *mir* was a unity grounded in the intimate adhesion of individuals and the integrating force of religion and of shared moral convictions. As opposed to this, organization imposed by an external law, where social relations result from rational contracts combined with legal guarantees, was, for C. S. Aksakov, artificial and bad. An autonomous sphere of the juridical and the political existed: it was entirely in the hands of the monarch and the state. It was external to the life of the people as

organized, in accordance with its inner truth, in the community of the *mir*; the freedom to be defended was not the power for the people to intervene in political affairs, but the right to be free from politics (Walicki, *History of Russian Thought*). The *mir* was, like the church whose counterpart it was within society, a form of common life that combined unity and freedom and whose law was love (Walicki, *Slavophile Controversy*, quoting Khomyakov).

The Slavophiles were not alone in exalting the *mir*. In the camp of the adversaries of autocracy, those who dreamed of a democratic Russia and were inspired in large measure by the revolutionary doctrines and movements of Western Europe, Alexander Herzen, in 1846, was also discovering first the importance, then the positive value of the *mir*. The *mir* was not just a remnant from a precapitalist order. It was also the germ and the model of a socialist organization for the whole of Russia. The hope of Herzen and his "populist" disciples that socialism might come to Russia without necessarily passing through a capitalist phase was based on the existence of the *mir*. Herzen, like the Slavophiles, was horrified by the disasters that the Industrial Revolution, and more generally capitalism, had inflicted on entire populations, but, unlike the Slavophiles, his aim was not to preserve or restore old structures, but to "preserve the commune and render the individual free." That combination defined his ideal of "Russian socialism" (see Malia, *Alexander Herzen and the*

2

History of the *mir*

Whatever its antiquity, and whatever the variations and obscurities of the agrarian codes before and after the abolition of serfdom in 1861, the commune appears as the natural form of peasant life. This is a kind of proverb among peasants of the Russian plain: "the land is with the *mir*" (*zemlja mirskaja* [земля мирская]) (see Lewin, *Making of the Soviet System*; and ibid., for an analysis of juridical debates concerning the *mir*).

The principal function of the *mir* is the periodic redistribution of land among households, in accordance with the manpower provided by each household or the number of mouths to be fed. A scrupulous concern for egalitarian justice brought the *mir*, in its allocation of plots of land, to take into account quality of soil, configuration of terrain, and distance from the village. In addition, one had to yield to all the constraints inherent in the practice of triennial crop rotation, applied to all the lands in the commune. Each household thus received a lot composed of narrow strips of land, which were dispersed and frequently impractical to till with a harnessed plow, but the resultant distribution was rigorously and minutely egalitarian. The lands associated with each household did not form a single block, but consisted of

parcels surrounded by other parcels belonging to other households. Labor was necessarily and at all times collective. The division of lots resulted from decisions, which were always unanimous, taken after tumultuous discussions by family heads convened in general assemblies (*sxod* [сход]). The *mir* system was further reinforced after the 1861 reform: it was to the *mir* that the responsibility fell for buying and administering the lands that large landholders were obliged to cede to the peasants once they were liberated. In the eyes of many economists, however, the *mir* was an insurmountable impediment to agricultural development and thus to the capitalist modernization of Russia. The Stolypin reforms, after the failure of the revolution of 1905, aimed to break the framework of the commune and to favor the emergence of a class of land-owning peasants, intent, in order to get rich, on taking initiatives, working hard, and employing a salaried workforce. These reforms were largely successful: on the eve of the 1917 revolution, almost half the peasant families of European Russia had left their *mir*, and the peasants had become individual farmers. But the upheavals of civil war and the changes triggered by the reform of 1918 ("land to the peasants!") resulted in the *mir*

being reconstituted, and a good number of peasants who had left their communes returned. For more than a decade, the Soviet government allowed the *mir* to subsist, even as it sought to invigorate the class struggle in the villages and to favor soviets of poor peasants. It was only with generalized collectivization (elimination of the kulaks, establishment of *kolkhozes* and *sovkhozes*) at the beginning of the 1930s that the *mir* disappeared. (Concerning the vitality of the *mir* during the first years of the Soviet regime, see Pascal, *Civilisation paysanne en russe*; Lewin, *Paysannerie et le pouvoir soviétique*.)

Birth of Russian Socialism; Walicki, *History of Russian Thought*). It stemmed from a critique, not only of capitalism, but also of the idea that only capitalist society, by engendering the forces that would destroy it, could give birth to socialism and, additionally, that what would follow capitalism would necessarily be socialism. For Herzen, the paths of history were not traced in advance (see Berlin, *Russian Thinkers*).

Among the adversaries of the *mir* one finds, principally, as of 1861, all the partisans of the transformation of Russia into a modern country: functionaries, economists, entrepreneurs. For them, the *mir* was one of the principal causes of the economic, social, cultural, and—in a certain sense, moral—backwardness of the Russian peasantry (see Besançon, *Être russe au XIXe siècle*). But the "populist" or (later) "socialist-revolutionary" vision of the *mir* (which would be criticized as late as the 1920s by the economist Cajanov, the partisan of a society founded on familial peasant property, see Kremnev, *Puteshestvie moego brata Aleksei*) was above all attacked by the Marxists. They rejected the utopia of a socialism carried forward by the peasant masses and constructed on the model of the *mir*; for them, the mission of leading the revolution that would achieve the transition to socialism fell to the industrial proletariat, the product of capitalism. It should be remembered, however, that as of the 1860s, Marx, and then Engels, when questioned by the Russian populists (notably by Danielson, the translator of *Capital*), on several occasions offered answers less categorical than, and more distant from, what was in the process of becoming Marxist orthodoxy. In their preface to a Russian edition of the *Communist Manifesto* in 1882, they wrote: "If the Russian revolution becomes the signal for a workers' revolution in the West, so that the two revolutions complement each other, the current model of Russian common property can become the starting point for a communist revolution" (quoted in Rubel, *Marx, critique du marxisme*). In sum, according to Marx, the enclosed, ahistorical, and specifically Russian "world" that was the Russian peasant *mir* could be saved and could preserve Russia from capitalism only if it were caught up in the history of a properly "worldwide" revolution.

MITMENSCH (GERMAN)

ENGLISH	fellow human
FRENCH	*autrui*

➤ *AUTRUI*, and ACTOR, I/ME/MYSELF, MENSCHHEIT, NEIGHBOR, PARDON, SUBJECT, WELT, *WORLD*

Of recent use in philosophy, the *Mitmensch* (literally, the man-with-me), who is not simply "the other," but not really "others" per se, is situated at the heart of a complex configuration, where it is caught between an undifferentiated alter ego—an other (*alius*) who is indeed someone, but not just anyone (that is, the *thou* or *you* of the dialogical relation)—and the "neighbor," in the sense conferred on the term by the Decalogue. The distinct orientations taken by those using the term, and the theological or religious impregnation of the word, have contributed to the difficulty of translation—a difficulty all the more remarkable in that reflection on the *Mitmensch* has found an echo in France in various debates that oppose diverse conceptions of the functions of *autrui* (others).

Although the term attested to by Adelung in 1777 (RT: *Versuch eines vollständigen grammatisch-kritischen Wörterbuches der hochdeutschen Mundart*) is immediately understandable in common parlance, where it designates simply "any person sharing with me the human condition"—"Meine Glückseligkeit kann ohne Liebe meiner Mitmenschen nicht bestehen" (My happiness cannot exist without the love of those with whom I share existence), wrote Schiller, and similarly

Voss: "du Frei muß werden sobald zu Vernunft er gelangte der Mitmensch!" (any other man, as soon as he gains access to Reason, must be free!)—it appears in philosophy from the outset as a concept. The two initial orientations given to the word (by Hermann Cohen in 1919, then, ten years later, by Karl Löwith) are different, but it is not their difference that makes for the difficulty of finding an equivalent for the term; the translation of *Mitmensch* in French as *autrui*, which is undoubtedly the only reasonable and suitable rendering, in no way allows the term to be shorn of its ambiguities. In addition, there exists, in the historical context in which the concept was formed, a dimension that was from the outset theological, in which the word subsumed simultaneously a "neutral" sense—*Mitmensch* does indeed signify any other person who shares the same condition as me—and a plainly religious sense. Bultmann, throughout his long career, also employed the word to designate not exactly *der Nächste*, but the other human being whom my practical behavior must consider not as a *Nebenmensch* (literally, the man alongside [me]), but, precisely, as a *Mitmensch*, in such manner that I can as a consequence understand the meaning of the commandment that will make of the *Mitmensch* (which everyone has the right to be for me) a fellow human. Conversely, Jesus, the eminent fellow human, is in reality, under the figure of Christ, the paradigm of the *Mitmensch.*

Two general axes can be described from a historical, as well as a thematic, point of view: on the one hand, the phenomenological lineage initiated by Löwith, a student of Husserl and then of Heidegger, which leads to the French phenomenology of Sartre and Merleau-Ponty, and which is continued by Deleuze; on the other, the ethico-religious orientation of Cohen, adapted by Buber to an extent, which emerged in the idea of the "other" in Lévinas. Nevertheless, Deleuze's critique of the Sartrean alter ego (see "Michel Tournier et le monde sans autrui") was executed against a backdrop of phenomenology, just as Lévinas's "other" was similarly rooted in a renewal of phenomenology (see "La trace de l'autre"). Thus it is that the notion of *autrui*, "others," in French, which confirms, without in any way resolving this foundational semantic duality, can give but an approximate equivalent of *Mitmensch*, and its principal virtue lies precisely in the ambiguity that is retained in French, even though it remains altogether mute, at least on first hearing, in relation to the religious dimension, which was the initial breeding ground of the notion.

I. From *Nebenmensch* (the Man beside Me) to *Mitwelt* (a Shared World): A Place for the *Mitmensch* (Hermann Cohen, Karl Löwith)

The systematic origin of the concept comes from an inflection implemented by Cohen toward the end of his life, when he returned to the arguments he originally put forth in *Ethik des reinen Willens* (1904) in order to show its limits and to acknowledge the specificity of religion, which, until then, had not received an independent status. Cohen had shown that there could be no pure morality without the second person, the *Nebenmensch*. But the *Nebenmensch*, if it remains captive to the limits of the concept of plurality, does not satisfy the exigencies of the concept of the nonself, "for which reason one prefers to it the more precise

concept of the other. The other is not an other; on the contrary, in his precise correlation, he is in a relation of continuity with the *I*. The other, the alter ego, is the origin of the ego" (*Ethik des reinen Willens*, chap. 4). This moral conception would undergo a substantial deepening and transformation when Cohen, in 1918, wrote *Die Religion der Vernunft aus den Quellen des Judentums* (published in 1919). The initial problem he posed turns on the limits of morality, and it is a matter of showing that there exists, beyond the "it" or "he" that constitutes the exclusive horizon envisaged by the realm of the practical, a "thou" whose singularity escapes the notion of the alter ego. Because it lifts humanity out of all that is empirical and available to the senses, ethics is constrained to look past concrete individuality in order to objectivize the ego at the higher level of abstract humanity. Religion finds the basis of its legitimacy from a systematic point of view, and the basis of its specificity with regard to reason, as soon as it brings to the fore the irreducible singularity of a "thou" that is no longer an alter ego, the *Nebenmensch*, but rather the *Mitmensch*. The suffering of others, in its singularity, confronts the "I" with its responsibility for the suffering that it inflicts by sinning, and the particular objectivization of the inflicted harm that is manifested in the suffering of the other is what constitutes self-consciousness—and the source of religion. Moreover, the correlation between man and a God whose uniqueness Cohen emphasizes cannot be sustained logically if that "man" is not understood in his own radical uniqueness—but a uniqueness that is not identical with the absolute unity of the divine. It is thus solely a matter of the individual considered in his or her extreme singularity, that is, of the other (*autrui*), which is at once like oneself and altogether other: the *Mitmensch* henceforth opposed to the *Nebenmensch*. It is thus not by chance that the central chapter of *Die Religion der Vernunft aus den Quellen des Judentums* (*Religion of Reason out of the Sources of Judaism*) is devoted to the subject of forgiving, the act that exceeds—par excellence—the limits of morality (a sphere that knows genuine reparation only in the law) and that reveals the singularity of the relation between "I" and "thou" that operates below the relations between *Nebenmenschen* and that only functions between *Mitmenschen* as between "I" and God: "The hypothesis that the alter ego and the other (*autrui*) might be identical is precisely the prejudice of contemporary thought. . . . The alter ego is not at all the *other*. It is experience itself that rejects that identification."

For Löwith, in his doctoral thesis "Das Individuum in der Rolle des Mitmenschen" (The individual in the role of *Mitmensch*), the notion of *Mitmensch* intervenes in the analysis of the structure of being-together (*Miteinandersein*), which implies that one makes a distinction between a world, an environment (*Umwelt*), and a shared world (*Mitwelt*). "Others do not encounter each other originally as suspended objects whose characteristics would partake of the person, but in a relation of man to the world, thus an 'intramundane' relation, a world considered as a 'shared world,' in the perspective of the surrounding world" (*Sämtliche Schriften*, vol. 1, chap. 2, in which the reference to §24 of Heidegger's *Being and Time* is explicit). It is because humans are so essentially

a part of the world that they profoundly determine its nature, and this world that is accessible to me is not only humanly structured in the sense of a world shared by others, it is also my world, and it is first of all with regard to myself that it can be characterized as a world shared, which in turn is oriented as a function of a self for whom other people are others. Thus the shared world, if it is encapsulated in a specific other person, becomes for me a "thou." Löwith, who examined in particular Feuerbach's *Principles for a Philosophy of the Future*, thus sought to account for the equivalence posited by that author: "the world or thou." And the "thou" does not represent only the shared world, but the entire world. In the conclusion of his thesis, in which Löwith cites Stirner, he reinforces the idea of the uniqueness of every "I" living at the center of its world with its "property," that is, with what is proper or belonging to it. But he emphasizes still more forcefully that one's own world is always also a world shared, and that every radical individuality is also, by dint thereof, a personality (in the Latin sense of *persona*), that is, a "role" for others. It is that role that is also defined by the term *Mitmensch*. The condition of possibility of that duality between the individual and the other that coexists in every human being rests on the modality of being human: he or she is independently an other because he or she is independent of his or her own nature. From one's being, no specific obligation to be can be deduced other than the obligation to be a *Mitmensch*, that is, a personality that results from the relation between each individual and the others, a relation from which one can in no way escape. This necessity of the *Mitwelt* determines that of the *Mitmensch*, and what results from this phenomenology of being-together is an individual-person duality that is considered as ultimate, but that remains primarily oriented as a function of the ego.

II. Other People between Structure and Transcendence: Legacy of the *Mitmensch* in France (from Sartre to Ricœur)

A deepening of this perspective occurred in Merleau-Ponty (as in Deleuze by way of a critique of the Sartrean theory of the alter ego developed in *L'être et le néant*), one that develops an abstract mode of the notion of *others* that no longer designates a particular modality of the other individual and becomes rather a structure of the field of perception. In a working note of November 1959 (*Le visible et l'invisible*), Merleau-Ponty writes: The self-other relation to be conceived . . . as complementary roles of which neither can be held without the other being held as well: masculinity implies femininity, etc. Fundamental polymorphism in relation to which it is not mine to constitute the other *in the face of* the Ego: it is already there, and the Ego is conquered from it." Exactly a year later, one finds—in a note titled "autrui" (others)—these sentences, which seem to be returning to Löwith's thesis (which Merleau-Ponty had not yet read, although he had promised himself to do so): "*Autrui* is not so much a freedom seen *from without* as destiny or fate, a subject competing with a subject, but it is caught in a circuit that binds it to the world, as ourselves, and thereby also into a circuit that binds it to us—And that world is *common* to us, is an interworld—And there is transitivism through generality" (*Le visible et l'invisible*). The

critique of Sartre is quite present in what lies behind these reflections (ibid.):

> If access to *autrui* has entered into a constellation of others . . . it is difficult to argue that the other is nothing other than the absolute negation of myself, for when it comes to absolute negation, there is only one, which absorbs into itself all rival negations. Even if we have a *principal other* . . . the mere fact that it is not a unique other obliges us to understand it not as absolute negation, but as modalized negation, i.e., ultimately, not as what contests my life, but as what gives it form. . . . [T]he problem of others [is not to be posed] as that of access to a different mode of negativization but as that of initiation to a symbolic and typology of others whose *being for itself* and *being for others* are reflexive variants, and not essential forms.

Thus *autrui* would be less related to the Sartrean alter ego, "the gaze of the other that robs me of the world," and more to a structure.

Similarly, Deleuze granted to Sartre—but in order to immediately strip him of it—the merit of having wanted to make of *autrui* a structure irreducible to subject or object: ". . . but since he defined that structure by the gaze, he lapsed into the categories of object and subject, by making of *autrui* he who constitutes me as an object when he looks at me." *Autrui* is defined from the outset as a "structure of the field of perception" such that "it is not myself, but *autrui* as a structure that renders perception possible." And that structure is not one among others since *autrui* conditions the whole of the field. The fundamental effect of the presence of others "is the distinction of my consciousness and its object," a distinction that occurs simultaneously in space and in time (all quotations from "Michel Tournier et le monde sans autrui"). More generally, Deleuze (ibid.) contests the manner in which philosophical dualism correctly articulates the categories of the functioning of the field of perception and the variations of objects within that field and the subjective syntheses exercised on perceptual matter:

> The true dualism is entirely elsewhere: between the effects of the "structure of *autrui*" in the perceptual field, and the effects of its absence. . . . In defining *autrui* . . . as the expression of a possible world, we make of it . . . the *a priori* principle of the organization of the entire field of perception according to categories; we make of it the structure that permits the functioning as well as the "categorization" of that field.

In 1967, in the re-edition of his *En découvrant l'existence avec Husserl et Heidegger*, Lévinas included an unpublished text, "Langage et proximité," which took its place among a series of texts titled "Raccourcis" [Shortcuts], taking up the essential aspects of the theses developed in his *Totalité et infini*. One finds in that previously unpublished text the famous passage about the caress, which tends to bring to the fore the gaps in our intentional understanding by distinguishing cognitive understanding from the ethical relation to the real:

> Perception is a proximity with being which intentional analysis does not account for. The sensible is

superficial only in its role being cognition. In the ethical relationship with the real, that is, in the relationship of proximity which the sensible establishes, the essential is committed. Life is there. . . . The poetry of the world is inseparable from proximity par excellence, or the proximity of a neighbor par excellence. And it is as though by reference to their origin in the other [*Autrui*], a reference that would obtain as an a priori structure of the sensible, that certain cold and "mineral" contacts are only privately congealed into pure information or pure reports.

Another one of the *raccourcis*, "Enigme et phénomène" (1965), quite plainly refers to the legacy of Hermann Cohen, where *autrui*—understood in terms of the infinite as what refers us to an originary anteriority, which never becomes a presence or is incarnate—"solicits by way of a face, the term of my generosity and my sacrifice. A Thou is inserted between the I and the absolute He." It will be understood that *autrui* is what regulates an essential asymmetry between oneself and the other, who is always closer to God than oneself is. Lévinas thus represents a radical attempt to bring into coexistence, in the notion of *autrui*, a profoundly revised version of the phenomenological tradition and the initial ethico-religious dimension. Paul Ricœur, in showing the limits of that perspective, which grants a radical exteriority to *autrui*, recalls that:

> . . . the theme of exteriority reaches the end of its trajectory, namely, the awakening of a responsible response to the beckoning of the other, only by presupposing a capacity to receive, discriminate, and acknowledge. . . . In order to mediate the openness of the Same to the Other and the internalization of the voice of the other in the same, must not language contribute its resources of communication, and thus of reciprocity, as is attested to by the exchange of personal pronouns . . . which reflects a more radical exchange, that of the question and the answer, in which the roles are endlessly reversed?
>
> (*Soi-même comme un autre*)

Autrui, then, again becomes the other, and there is an end of hypostasizing, on the basis of the category of alterity, at times as a radical and infinite singularity, at others as a general, originary, and abstract structure of the field of perception. The *Mitmensch* becomes anew *das Andere*.

MOMENT, MOMENTUM, INSTANT

DANISH	*øjeblik*
FRENCH	*moment, instant, occasion*
GERMAN	*der Moment, das Moment, Augenblick*
GREEK	*kairos* [καιρός], *rhopê* [ῥοπή]
ITALIAN, SPANISH	*momento*
LATIN	*momentum*

➤ AIÔN, AUFHEBEN, DASEIN, *DESTINY*, FORCE, HISTORY, JETZTZEIT, PRESENT, *TIME, WITTICISM*

"Moment" has two meanings that are derived from one another: a technical (mechanical) meaning and a temporal meaning. The mechanical meaning is the Latin *momentum*, and refers concretely, via Archimedes, to the small quantity that tips the scales. The temporal meaning is a movement that determines a before and an after that are irreducible the one to the other. This sudden bursting through of time into space is a key to understanding the Greek *kairos* [καιρός], which is translated, among other things, as "moment."

Modern languages are characterized by their tendency to forget the technical meaning in everyday usage, which focuses on the temporal determination of a small lapse of time (cf. the article "Moment" in Diderot and d'Alembert's *Encyclopédie* [RT: *Encyclopédie ou Dictionnaire raisonné des sciences, des arts et des métiers*]: "A moment does not last long: an instant is even shorter"). They specify the technical meaning differently and in parallel with the temporal meaning.

German has, in addition, differentiated the technical meaning from the temporal meaning by gender: Hegel makes the technical meaning a speculative usage that requires a reorganization of its distinction from the temporal meaning. The philosophical lexicon of the other languages adapts the Hegelian usage ("moment" as instance, or level of reality) through translation.

I. *Momentum* (Lat.), *Rhopê* (Gr.), and Their Translations

The technical meaning of the Latin word *momentum* is prior to the meaning of a small interval of time. *Momentum* refers

then to a particular magnitude linked to movement. The redefinition of the category of movement by Galileo and Newton led to a linguistic distinction being established in modern languages, different from one language to the next, between a dynamic meaning and a static meaning, which are merged together in Latin.

Even in its technical sense, *momentum*, which is derived from *movimentum* (from *movere*, "to move"), does not have an univocal meaning. This polysemy reflects a difficulty encountered from the thirteenth century onward in translating the Greek term *rhopê* [ῥοπή], a term used in Book 4 of Aristotle's *Physics* (216a13–20) and in the *Commentary* written by Eutocius (sixth century) from the book of Archimedes known in English as *On the Equilibrium of Planes* (cf. *Archimedis opera omnia cum commentariis Eutoccii*, 264, 13–14).

In Aristotle and in Eutocius, *rhopê* designates the tendency that a body naturally has to move at a speed proportional to its weight (or its lightness in Aristotle). But in the work of Archimedes cited, *rhopê* has the meaning, when considering a set of scales, of a weight that can tip the scales one way rather than the other. It is still a tendency, but it results then from the combination of the weight and the distance between the fulcrum and the beam of the scales. Some translators who use *momentum* in order to designate the first meaning of *rhopê* have to then use another term (for example, *pondus*) when they want to signify the second meaning. Yet this usage is far from being a general one, since Vitruvius, in Book X of *De architectura* (1486), describes *momentum* as the combined effect of the weight and of the distance traveled. What is more, *momentum* is also used in the Middle Ages to translate the Greek term *to kinêma* [τὸ κίνημα], which is found in Book VI of Aristotle's *Physics* (I.232a9–10, and 241a4) and which there designates the indivisible quantum of a movement that has already occurred.

At the end of the sixteenth century, the technical meaning of *momentum* is thus threefold: (a) a natural tendency toward movement as an effect of gravity (dynamic meaning); (b) the product of weight times distance (what we might call the term's *statistical* meaning); (c) a small quantity of movement. These three senses make only an implicit reference to the movement of the fulcrum of a set of scales when it tips: *momentum* contains the contradictory idea of a (static) equilibrium and its (dynamic) rupture as an effect of an infinitesimal cause.

These three meanings can be found, mixed and distributed (according to the particular distortions of each language), in the technical usage that many modern European languages make of the derivations of the Latin word *momentum*, namely the following: *moment* in French, "momentum" and "moment" in English, *momento* in Spanish and Italian, and *das Moment* in German.

In modern French, *moment* refers to the result of a precise mathematical operation, which consists of constructing the vectorial product of the vector position of a material point by a vector having this point as its origin: one calls this the moment of the vector (in relation to the origin chosen in order to identify the position). Since force as Newton defines it is a vector applied to the material point on which it acts, one can define through this operation the *moment* of a force. Meaning (b) is privileged here, as well as a mathematical

conception of mechanical quantities, emphasizing their construction. By analogy, the quantity called in French *moment cinétique* (kinetic moment), constructed in the same way with the slight difference that the force is replaced by the quantity of movement (defined as the product of mass and velocity, a vectorial quantity), *should* be called the "moment of the quantity of movement." This is not the case, however, though the adjective *cinétique* added to *moment* is intended to remind one of this link with the velocity of the moving body, and to make the notion of *moment* a kinetic, even dynamic, one.

In English, there are two words derived from the technical meaning of the Latin *momentum*: "momentum," which is imported directly, and "moment," which is a translation of the Latin term. "Momentum" in English refers to what in French is called the "quantity of movement." This usage comes after Newton, who discusses what he calls the "quantity of motion" and, in Latin, *quantitatis motus*. The English "moment," as in French, refers to the vectorial product of the vector position by another vector. So one finds in English the expression "moment of a force"; in the literature of the time, the expression "moment of momentum" designates what in French is called "kinetic moment."

The importation of *momentum* into English comes in response to a conceptual concern to underscore the dynamic connotation that Newton's second law confers on the "quantity of motion." This law is still called the "fundamental principle of dynamics," and states that the variation of the quantity of motion of a moving body is equal to the force applied to this body. The English "momentum" thus denotes an impulse and retains in part meaning (a) of its Latin homonym, while modifying it, since the English "momentum" is a result of applying an external force and is not inherent in the body (because of its gravity). What is more, the English term introduces a type (c) nuance, in that Newton's law is a differential law and thus deals with infinitely small quantities.

French then makes a distinction between two concepts, one dynamic and the other static, using two clearly different words (*quantité de mouvement* and *moment*), and thereby emphasizing the mode of construction of the physical quantities concerned, whereas English, which uses two phonetically adjacent terms, retains some trace of the Latin polysemy. We are dealing not only with two conceptions of the relationship between mathematics and physics, but more profoundly with two different intuitive representations of movement: it is not insignificant that movement is a quantum in French, and an impulse in English. The difficulty this distinction had in becoming established will be confirmed by the fact that in classical French (notably in the aforementioned RT: *Encyclopédie*), *moment* sometimes designates the "quantity of movement." The *Encyclopédie* article "Mechanics" even reproduces a strange line of argument that attempts to justify, with regard to the set of scales, the use of a single term for two different notions.

The German *das Moment* is used more or less identically to *moment* in French. The moment of a force is *das Kraftmoment*. Since the term for quantity of moment, however, is *Impuls* (previously *Bewegungsgrösse*, "quantity of movement"), the kinetic moment is, more logically than in French, called *Impulsmoment*. Yet *das Moment* has a more dynamic connotation than *moment*

in French, as can be seen in the expression *Drehmoment*, literally "moment of rotation," to refer to the kinetic moment.

The present-day usage of the term *momento* in Italian is closely related to the usage of *moment* in present-day French. We should, though, note one meaning of *momento* that is of fundamental historical importance: the meaning Galileo gives to it between 1593 and 1598 when he establishes a link—which had been unthinkable before then, and that no other language borrowed—between meanings (a) and (b) above. This convergence of meanings corresponds to an abortive attempt by Galileo to derive the dynamic from the static without the intermediary of the kinematic, based on a parallel between a set of scales and an inclined plane:

> Momento e la propensione di andare al basso, cagionata non tanto dalla gravità del mobile, quanto dalla disposizione che abbinno tra di loro i diversi corpi gravi.

> (Moment is the propensity to go downwards, caused not so much by gravity as by the disposition that the heavy bodies have between them.)

> (*Mechanics*, 2nd definition, cited in K. Lasswitz, *Geschichte der Atomistik vom Mittelalter bis Newton*)

II. *Kairos*

The Greek word *kairos* [καιρός], which can correspond to the French *moment*, in the sense of *bon moment* (right moment), *moment opportun* (appropriate moment), *occasion* (opportune moment) (cf. the title of the novel by Crébillon fils, *The Night and the Moment*), refers to a nonmathematizable singularity. Latin rhetoric (Quintilian, *Institutio Oratoria* III.6.26; V.10.43) thus distinguishes between *tempus generale* or *chronos* [χρόνος], a time linked to history and likely to be dated, and *tempus speciale* or *kairos*, a distinct time that is either periodically repeated (a favorable season in a natural cycle, or

an auspicious moment that is favorable for a certain kind of action in people's lives), or that occurs unpredictably, and it is thus expressed as *tempus per opportunitatem* (*G. Fabii Laurentii Victorini explanationum in rhetoricam Ciceronis libri duo*, ed. Halm, I.21) or as *occasio* (ibid., I.27).

■ See Box 1.

The specificity of the Greek word, which accounts for the scope of its application, comes from its originally spatial meaning, referring to a crucial cutting or opening point, as in the adjective *kairios* [καίριος], found only in the *Iliad*, and which applies to the flaw in a breastplate, hinge, or fitting (IV.185; XI.439; VIII.326), and to the bony suture of a skull (VIII.84), all places where a blow to the body could be fatal and would decide one's fate. So Euripides speaks of a man "struck in the *kairos*" (*Andromache*, 1120). This may perhaps explain how in Latin the skull's "temple" (*tempus, -oris*), "time" (*tempus, -oris*), and the (architectural) "temple" (*templum*) are related to *temnô* [τέμνω], "to cut" (cf. *temenos* [τέμενος], "enclosure, sacred place, altar").

According to the hypothesis put forward by Onians, the usual word *kairos* ([καιρός], with an acute accent) and the technical term *kairos* ([καῖρος], with a circumflex) are one and the same, with the difference of accents used to mark, as it often does, a semantic specification. *Kairos* with the circumflex belongs to the vocabulary of weaving and refers to the braid that regulates and separates the threads of a warp, often paired with the mechanism that holds up the top part of the work: *kairos* determines the spacing between even and odd threads, which allows for the interweaving of warp and weft. In the same way, *kairos* in the usual sense of the term suggests the opening of something discontinuous in a continuum, the breach of time in space, or of temporal time in spatialized time. In medical vocabulary it is a moment of crisis, and the interlacing or combination of circumstances

1

Longue durée

The concept of *longue durée* was the centerpiece of Fernand Braudel's writing, and it is intimately linked to his vision of historical time. Precisely because it is a complex concept, it is usually not translated into other languages, including English.

Braudel uses *durée* to signify "temporalities," for his principal concern is to establish multiple temporalities in the analysis of social reality. He starts from the assumption that for the past 250 years, at least in history and the social sciences, there were really only two possible temporalities: one espoused by nomothetic social scientists who assert that there exist universal general laws about social behavior that hold true across all of time and space, and the other subscribed to by idiographic historians who reject the notion of universal general laws and insist on particular hermeneutic insights into social reality.

Braudel argues that both approaches are false and misleading. There exist in his view other temporalities—neither universal nor particular—that provide a better understanding of the past and the present. He names four of them: *structure* (or *longue durée*); *conjoncture* (or *moyenne durée*); *événement* (or *courte durée*); and *très longue durée*. For Braudel, *l'histoire événementielle* (eventual history) corresponds to the particularist time of idiographic historians and *très longue durée* designates the eternal time of the nomothetic social scientists. His own work takes place in the space of *longue durée*—long-lasting but not eternal realities—as well as in the time of *conjonctures* (cyclical process within *structures*).

All of these terms pose translation problems in English, whether as nouns or adjectives. While *événement* is easily rendered

as "event," there is no English equivalent of *événementiel*. I have recommended "episodic" as a term that captures the essential element, that of brief, observable phenomena. *Conjoncture* has cognate equivalents in all European languages, except English. The English term "conjuncture" is primarily used to signal a meeting-point of two phenomena and is close to an "event." The French (and other European-language) meaning of *conjoncture* is that of a medium-length curve going either up or down (an A-phase and a B-phase). "Cyclical" time might be the closest in equivalence. As for *très longue durée*, it is best left in French. After all, Braudel says of it, "If it exists, it must be the time of the wise men (*sages*)."

Immanuel Wallerstein

in politics and history. It expresses timeliness (thus the [appropriate] measure, brevity, tact, convenience) and opportunity (thus advantage, profit, danger), or any decisive moment that is there to be seized, normatively or aesthetically, as it passes by—and seized sometimes even by the hair, since *kairos* is often figured as a young man who is bald or has the back of his head shaved, but who has a long forelock in front. Thus, in Pindar, *kairos* is used to characterize words, both expertly fired and well woven, which hit their mark (*Nemean Odes*, 1.18; *Pythian Odes*, 1.81, 9.78).

The attention given to *kairos* defines a certain type of rhetoric, that of Alkidamas, or of Isocrates and the Sophists, and characterizes rhetorical improvisation (Greek *epi tôi kairôi* [ἐπὶ τῷ καιρῷ], Latin *ex tempore*), of which Gorgias was, according to Philostratus, the initiator (*Vitae Sophistarum*, I, 482–83).

III. *Der Moment / Das Moment*

German decouples the meanings that are simultaneously present in the Latin *momentum*, and redistributes them not onto two different words, but onto two genders of the same word, one of which is adapted by the vocabulary of speculative philosophy. *Der Moment*, in the masculine, refers to a more or less long interval of time, and *das Moment*, in the neuter, originally has the physical meaning of *momentum*. The German philosophical lexicon from Kant onward produced an additional meaning based on *das Moment*, that of cause, or factor, or component of a whole, considered or not in terms of its temporal succession. From there, it became a technical term of speculative philosophy, adopted as such by other languages, including French. This term, created and coined by philosophical language, leads to two questions. The first is the question of the relationship between the mechanical and the speculative meanings of *das Moment*.

■ See Box 2.

This process itself, to refer here only to language and mechanics, is still never thought independently of time (cf. the verbs used by Hegel: "to put an end to" and "to preserve," as described in Box 2). This is what Marx shows, by contrast, in his attempt after the *Grundrisse* to no longer think in terms of the "moments" of economic processes that should instead be freed from a surreptitious eschatology, and from the correspondence between temporal succession and the movement of the concept as postulated by Hegel.

2

Moment (Ger.) in *The Science of Logic*

The most apposite text here is the commentary on *aufheben* that concludes the first chapter of *The Science of Logic*, in other words, the text par excellence in which the generality of a statement feeds on the particularity of an idiom. Its generality is linked first of all to its immediate environment, since this passage concludes the stage of the logic where the most abstract notions intervened, that is to say, *being*, *nothingness*, and *becoming*, and it appears at the moment when *becoming* both ends and is preserved in its being-there (*Dasein*). Hegel then proceeds to his own objective, analyzing the phenomenon that has just occurred, the *Aufheben*, saying his intention is to discuss "one of the most important concepts in philosophy," of which the movement from *becoming* to being-there is only an example (see AUFHEBEN). Hegel here offers a sort of note on the terminology, focusing on the verb *aufheben* (rather than the noun *Aufhebung*) in its accepted senses and different usages. If *aufheben* holds our attention, it is because of the "delightful" phenomenon that "speculative thought" observes in a particular language, German: the same verb offers the two opposite meanings of "stop, bring to an end" and "preserve, maintain." Nevertheless, to be able to think other than "from the lexical point of view," it is necessary to show how "a language has come to use one and the same word for two opposite determinations," by examining what happens in the thing itself in question. It to this end that Hegel introduces the term *Moment*:

> Etwas ist nur insofern aufgehoben, als es in die Einheit mit seinem Entgegengesetzten getreten ist: in dieser näheren Bestimmung als ein Reflektiertes kann es passend Moment genannt werden. Gewicht und Entfernung von einem Punkt heißen beim Hebel dessen mechanische Momente, um der Dieselbigkeit ihrer Wirkung willen bei aller sonstigen Verschiedenheit eines Reellen, wie das ein Gewicht ist, und eines Ideellen, der bloßen räumlichen Bestimmung, der Linie.
>
> (Something is sublated only insofar as it has entered into unity with its opposite; in this closer determination as something reflected, it may fittingly be called a "moment." In the case of the lever, "weight" and "distance from a point" are called its mechanical "moments" because of the sameness of their effect, in spite of the difference between something real like weight, and something idealized, such as the merely spatial determination of "line.")

(*Wissenschaft der Logik*, 114; trans. G. di Giovanni, *The Science of Logic*, 82)

It is clearly a matter of comparing two distinct domains: the speculative domain, within which the *Aufheben* operates, and the mechanical domain, in which one calculates moments of force. *Moment* is presented here as a borrowing, a "Latin expression" used by "technical philosophical language." In the *Aufheben* of speculation, as in the *Moment* of mechanics, the opposites—elimination and preservation, the real and the ideal—work together.

So Hegel uses a Latin word *momentum*, Germanized simply as *Moment*, to explain to German readers how a German word works, and what is more, an everyday German word. This is a rather curious operation. The equivalence proposed at the beginning of his commentary between *das Aufgehobene* (the substantivized past participle of *aufheben*) and *das Ideelle*, mentioned in the passage cited, ought to suggest the existence of a stronger link between the *Aufheben* and the *Momente*—the very one that the conclusion establishes when it mentions "the meaning and the more precise expression that being and nothingness acquire when they are moments." At this point, *Momente* can be defined as what the process of *Aufheben* is composed of.

BIBLIOGRAPHY

Hegel, Georg Wilhelm Friedrich. *Wissenschaft der Logik*. Frankfurt: Suhrkamp, 1831. Translation by George di Giovanni: *The Science of Logic*. Edited by di Giovanni. Cambridge: Cambridge University Press, 2010.

In philosophical discussion, *das Moment* thus goes back to the configuration of the Latin *momentum* and its multiple mechanical and temporal meanings. The problem then is not so much that *das Moment* has a temporal meaning. (In French translation one hears this temporal aspect necessarily in *moment*, even though the translation proves rather awkward in certain contexts in which the speculative meaning prevails, as we can see in this passage from Jaspers: "*Der Augenblick hat in sich zum Beispiel ein* [neuter] *Moment der Angst* [the instant contains for example the moment of anxiety]" (116). The problem is rather one of knowing how to translate *der Moment* differentially, now that a good part of the temporal meaning is contained within *das Moment*.

The second question thus has to do with the translation into French or other languages of *der Moment* and of the system of nouns that are used in German to express the lapse of time in its unequal durations. Whereas French has only the pair *instant/moment*, German has three terms to work with: *der Moment*, *das Moment* with its temporal connotations, and *der Augenblick*. The "opposition" (*Gegensatz*) between *Zeitmoment* and *Augenblick* (Jaspers, *Psychologie der Weltanschauungen*, 114) follows a completely different logic than the opposition *moment/instant*. *Augenblick* alone has the sense of "lived instant," whereas *der [Zeit]moment* can in some instances refer not to a moment but to an instant as an objective division, a unit of measurement of time (ibid., 111: *der objektive Zeitmoment* [the objective moment of time]; *ein beliebiger,*

willkürlich gewählter Moment [any moment, chosen at random]). So the particular translation difficulties of *der/das Moment* end up revealing the autonomy of the reflection on *Augenblick*.

■ See Box 3.

IV. *Augenblick/Instant*

German represents an instant not as an immobile point on a line (*in-stans*) but as an organic movement, the blink of an eye. The German *Augen-blick* suggests both the quickness of a glance and the light that this look retains (cf. the poem by Schiller, "Die Gunst des Augenblicks" [The favor of the moment]). The word literally means both a "look" and a "closing of the eyes"; it is the blinking of an eye staring at its object, then by extension the "short duration" of this closing, which is generally agreed to be "indivisible" (RT: *Versuch eines vollständigen grammatisch-kritischen Wörterbuches der hochdeutschen Mundart*, 1792 edition, in the article "Augenblick," 1:col. 561).

This particular metaphor does not necessarily entail any difference in usage with respect to the French: the pair *Moment/Augenblick* works much like the French pair *moment/instant*, with the second term in each being reserved for the description of a lapse of time so brief that it eludes measurement. However, while French usage requires the addition of an epithet when instant refers to anything other than an objective division of time (see, for example, G. Bachelard, *L'Intuition de l'instant* [Intuition of the instant], 36: "*un instant*

3

An English Hegelianism? "Moment" in John Stuart Mill

It is curious to note that John Stuart Mill, in his *System of Logic* (published in 1843, or about ten years after the text by Hegel cited earlier, *The Science of Logic*) problematizes the notion of "moment" in more or less the same way that Hegel does. In a chapter discussing the "Conditions of a Philosophical Language," Mill first of all recalls the dynamic meaning of "moment." Then, emphasizing the truth it contains and which concerns the conservation of something unknown (since the product of the velocity of a body and its mass does not refer to anything experientially real), he assigns it a role that assumes its full importance in the use of fictions, as he conceives it in Book V. This notion, which Mill begins by critiquing, is now reoriented so that it can be accepted on other conditions than those stipulated previously. The whole play of the theory of fictions used by utilitarians lies in the awareness that a term only apparently intends something in experience, but that it should not be rejected for this reason, provided one is no longer deluded about its

illusory transcendence, because it retains an indirect power to determine things.

It was already a received doctrine that, when two objects impinge upon one another, the momentum lost by the one is equal to that gained by the other. This proposition it was deemed necessary to preserve, not from the motive (which operates in many other cases) that it was firmly fixed in popular belief; for the proposition in question had never been heard of by any but the scientifically instructed. But it was felt to contain a truth; even a superficial observation of the phenomena left no doubt that in the propagation of motion from one body to another, there was something of which the one body gained precisely what the other lost; and the word momentum had been invented to express this unknown something. The settlement, therefore, of the definition of momentum, involved the determination of the question, What is

that of which a body, when it sets another body in motion, loses exactly as much as it communicates? And when experiment had shown that this *something* was the product of the velocity of the body by its mass, or quantity of matter, this became the definition of momentum.

(*A System of Logic*, vol. 2)

Given its logical and philosophical context, this analysis, rooted in physics and part of a theory of fictions, obviously calls to mind the equivalent of the *Moment* of the *Aufheben* in Hegel's *Logic*. What is strange about this analogy is that it probably occurs without Mill's being aware of it himself, despite his interest—a mixture of acerbic critique and restrained admiration—in German philosophy.

Øjeblik in Kierkegaard

➤ ANXIETY

The instant, which is in Søren Kierkegaard the object of a series of original developments in the register of existentiality, cannot be assimilated to any of the points of *chronos*: past, present, future. Of the two terms in Danish, *moment* and *øjeblik*, the first can refer, outside of speculative philosophy, to all of the moments of a whole or of a natural or historic process. It is important, though, to mention one not-insignificant usage, since body and soul are said to be two "moments" of a synthesis, with the mind being the third term. The question of the third, posed when the two "moments" are the temporal and the eternal (*Kierkegaard's Writings*, 7:185), leads precisely to the concept of *øjeblik*, which is usually preferred to *moment* in order to connote the existential dimension. After Kierkegaard's great works in which the instant is a cornerstone of the analysis of the aesthetic and ethical stages, the concept is elaborated philosophically in two books published in 1844: *Philosophical Fragments* and *The Concept of Anxiety*, notably in chapter 3.

Without the instant, which comes from God himself in time, "everything would have remained Socratic" (*Kierkegaard's Writings*, 7:53), and the paradox whereby time and eternity touch one another would have been missed. Or to put it another way, everything would have remained in the hands of "negation, transition, mediation, these three masked, suspect and secret agents which [in Hegel's *Logic*] set everything in motion" (ibid., 7:181). The Christian impulse of reflection leads Kierkegaard to base himself, to the contrary, on a number of solid philosophical pillars (Socrates, the Platonic *exaiphnês* [ἐξαίφνης], the idealist philosophy of religion) to develop the concept of an instant to its fullest extent, at the risk of "a productive misunderstanding" (W. Beierwaltes, "Exaiphnês oder," 282).

The "instant" is a term that produces an image—"Atom and blink of an eye" (*Kierkegaard's Writings*, 7:187; 1 Cor. 15:52)—and refers to the end of time while expressing eternity. How should we interpret this "first attempt to suspend time"? For the Greeks, eternity is the past, to which we can only accede by moving backward. For Judaism, history and the future become decisive. But it is Christianity, Kierkegaard maintains, that first introduces both an absolute qualitative difference, and a contact, between time and eternity. The future, far from being conceived as a result of the past, is "a whole of which the past is a part" (cf. Merleau-Ponty, *Phénoménologie de la perception*, 471). But for this

to obtain, the instant has to be posited concretely, so that an "ambiguity" can appear: the ambiguity "in which time intercepts [tears: *af-skaere*] eternity, and eternity penetrates time" (*Kierkegaard's Writings*, 7:188). The instant, as the "fullness of time" (Gal. 4:4, cited in 7:18, 189), the "making eternal of the historical, and the making historical of the eternal" (7:58), means that the eternal is "the future which returns like the past" (*Kierkegaard's Writings*, 7:58, 15:92).

Just as Leucippus did for space, Plato posed the question of movement in time. His achievement is to have thereby discovered *exaiphnês* (RT: LSJ: "on a sudden," "the moment that") and its suddenness. However, his "metaphysical" approach can make it only a "mute atomic abstraction" (*Kierkegaard's Writings*, 7:183). While doing justice to the Greeks (5:20), Kierkegaard continues, we should define more precisely this "strange [*atopon* (ἄτοπον)] thing" that has no place, this pure in-betweenness (*mellem*), or interval between motion and repose, this *kat' exochên* [κατ᾽ ἐξοχήν] transition, "which is in no time." It could be a matter of "what is happening behind the back of consciousness" (*Lectures philosophiques de Søren Kierkegaard*, ed. and trans. H.-B. Vergote, 304, 321). Taken out of its physical and metaphysical context, and transferred to the field of existentiality on the basis of what is "dogmatically" given, this transition falls into the realm of possibility (ibid., 300). It conditions the play of categories of leap, decision, repetition, and contemporaneity, where the concept that is being worked is the instant as opposed to reminiscence, disjunction as opposed to mediation.

Understood in this way, *øjeblik* is, in opposing ways, at the center of the analyses of faith and anxiety, where it appears that the primacy of the future and the vertigo of freedom give the dimension of the possible, of pure in-betweenness as power, its full scope. As "the One which both is and is not," the instant of "the anguishing possibility of power . . . a higher form of non-knowledge . . . in a higher sense, is and is not" (*Kierkegaard's Writings*, 7:146, 183). The instant is both temporal (a transition) and "outside of time."

Since the conception of time is decisive in the determination of the stages of existence (aesthetic, ethical, religious), the concept of an instant will become the object of three original variations, marked by a rhythm of increasing potentiality.

The aesthetic instant, the beautiful "poetic" moment, is "the eternal instant of joy"

(*Kierkegaard's Writings*, 2:272). It is eternal because, once all concern about external contingencies is eliminated, "it is everything" (3:401; 10:278). But since it is unable to instigate a history, aesthetic passion "runs aground on time" (10:234 ff.).

"The aesthetic is in man that by which he is immediately what he is; ethics is that by which he becomes what he becomes" (*Kierkegaard's Writings*, 4:162). The models of this becoming are conjugal love and social action, which involve duration, continuity, and history. It is through the instant of resolute choice of the self that ethical individuality "uses time for its own ends" (10:235).

Different from aesthetic and ethical eternity, as well as from the abstract eternity of the Hegelian *Logic*, the eternity in question in the Christian religious sphere determines the third application of the concept of *øjeblik*. If the master is greater than the occasion, it is because the "absolute Fact" (*Kierkegaard's Writings*, 7:93) has happened, through which is given, in time, the condition that allows the paradoxical instant to be confronted, when thought is summoned to discover "what it cannot think" (7:35).

Because the ethics of autonomy is only a "transient sphere" (*Kierkegaard's Writings*, 9:438), the paradoxical instant, compared to the immediacy of the aesthetic instant, this "parody of eternity" (7:186), represents a new immediacy. But these two instants share a passion for eternity which, however different they may be from one another, are not the eternity of "the human in general," of unconditional duty and of the suspended power of the absolute choice of self. When Kierkegaard entitles his last polemical writings against established Christianity *The Instant*, he is evoking this "category of great importance in that it opposes pagan philosophy, and an equally pagan speculation in Christianity" (7:183ff.).

fécond" [a fertile moment]), it is the other way round in German, where *Augenblick* alone refers immediately to a lived instant. Jaspers underlines the fact that "the word *Augenblick* describes something completely heterogeneous in what remains identical in the formal concepts of time, namely the full and the empty [*das Erfüllte und Leere*]." This leads to the following terminological distinction: "The atom of time [*Zeitatom*] is of course nothing, but the instant [*Augenblick*] is everything" (*Psychologie der Weltanschauungen*, 108–17). In this phrase Jaspers summarizes the entire process by which *Augenblick* has come to be endowed with a powerful poetic and aesthetic force. Poetry in particular develops the theme of the small bit of eternity contained within an instant (cf. Goethe, *Faust*, I.V.73), while for Lessing *Augenblick* becomes an original aesthetic concept, a timely moment that is distinct from *kairos* in that it crystallizes a temporal sequence, including the future, instead of disrupting it: "Painting, in its compositions in which several times coexist, can make use of only one single moment [*Augenblick*], and because of this must choose the fullest one, from which what precedes and what follows will be most easily understood" (G. E. Lessing, *Laokoon*, in *Werke*, 2:89).

The difficulty comes into sharper focus when a claim is made, so to speak, on all of the particular elements that have been mentioned. In Heidegger's *Sein und Zeit*, the term first appears in two key paragraphs marking the transition to originary temporality (§65 and §68). *Augenblick* is then used to determine the characteristics of the "authentic present" insofar as it is maintained in the future and the having-been.

> In der Entschossenheit . . . wird [die Gegenwart] in der Zukunft und Gewesenheit gehalten. . . . Die in der eigentlichen Zeitlickheit gehaltene, mithin eigentliche Gegenwart nennen wir den Augenblick.

> (In the decision . . . the present is maintained within the future and the having-been. This present maintained within authentic temporality, thus the authentic present, we name the instant.)

> (*Being and Time*, §69, 338)

In this respect, *Augenblick* is explicitly distinguished from the *Jetzt*, the *now* of derived temporality that understands time as a receptacle, a *milieu* within which one instant follows another in succession. *Instant*, by the sheer weight of its etymology, thus appears as an uneasy translation for *Augenblick*, which indicates a present that is not itself within time, and a present in which nothing happens, since

it alone is what can enable *Dasein* to open itself to a being "in a time."

We come back, then, to the problem of the metaphoricity proper to *Augenblick*. The adverbial expression "in the blink of an eye" offers a valid equivalent, but it cannot in any case systematically replace a noun. The meaning of Adelung's comment that *Augenblick* should be understood figuratively even though it is never, or hardly ever, used literally, can now be fully appreciated: "instant," unlike *Augenblick*, does not translate the metaphor, and designates a different conception of time, while "blink of an eye" translates the metaphor, but does not express time.

MOMENTE (GERMAN)

➤ MOMENT, STIMMUNG, *TIME*

We say of a musical work that it corresponds to a form made up of *Momente*, according to the German expression in use since the nineteenth century, whenever the sequence is itself conceived as an accumulation of *Momente*. This becomes, then, the standard term for a musical unit of time. Stockhausen gave a complex compositional meaning to the term, which has had a determining influence on contemporary music and musical terminology.

For the Germans, particularly Schubert, musical *Momente* referred to those parts (*Stücke*) that are not composed with the aim of developing a form extended across several different times but that, on the contrary, indicate a brevity that itself constitutes an autonomous unit of time. The notion of *Momente* in the compositional sense of the term appeared between 1958 and 1960 in the work of Karlheinz Stockhausen. In the first case, *Momente* is translated as "moments," and the temporal division of the work into moments refers to a distinct musical genre. In the second case, the term *Momente* is retained as a proper name that is used to conceptualize a unique experience that simultaneously affects melodic structure, timbre, and duration (*Momente* in Stockhausen are "individual passages of a work . . . regarded as experiential units"; Sadie, *New Grove Dictionary*).

In his work entitled *Momente* (finished on 21 May 1962 in Köln) for soprano, four choral groups, and thirteen instrumentalists and based on the Song of Solomon and songs by Blake and Bauermeister, Stockhausen explains that this notion of *Momente* slows him to "form"

> something in music which is as unique, as strong, as immediate and present as possible. Or I experience something. And then I can decide, as a composer or as the person who has this experience, how quickly and with how great a degree of change the next moment is going to occur.
>
> (*Karlheinz Stockhausen on Music*)

Stockhausen refers to three clearly distinct types of *Momente* that, as the work takes form, end up acting upon each other. First of all, in terms of the melody, the *Moment* has to do with the work on heterophonia, the play that is internal to the arrangement of the pitch of each note. Here, the spoken voice, articulated and not sung, takes precedence. The *Moment* increases the already equivocal meaning of the voice. Then, in terms of timbre, this reaches its high point in the treatment of the men's choir and percussion sections so as to produce consonants, hisses, and loud noises; this less discursive *Moment* is intended to introduce an entropic sequence within a more articulate extension or duration. Finally, there is the *Moment* that refers to duration as an alternation between polyphonic sequences and silences; the sense of a new *Moment* is a result of a deliberate break in the musical flow created by the female voices.

> I would thus understand by Moment any formal unit that has, in a given composition, a personal and strictly assignable characteristic. I could also say: any autonomous thought. The concept is thus qualitatively determined, taking into account a given context (as I said, in a given composition), and the duration of a moment is one of the properties among others of its mode of being.
>
> (Stockhausen, "Momentform")

This explains the importance of the plural, *Momente*, which emphasizes the large number of operations and, at the same time, their singularity and function. It is worth noting that this conception of articulated composition in *Momente* brings forth variables, permutable elements—in short, what the composer calls a polyvalent form. These are variables of dynamics, statistical divisions of sounds in a global duration: the collective form of the *Moment*. The procedures are there to reveal the mutable functions of the *Momente* in all their power as inserts. Three other works by Stockhausen take up the question of *Moment* and of the *Momentform*: *Kontakte* (1958), *Carré* (1959–60), and *Gruppen* (1958). *Momente* in the sense in which Stockhausen uses the term would from that point on become part of contemporary musical terminology.

MORAL SENSE

FRENCH   *sens moral*
GERMAN   *sittliches Bewusstsein*

➤ MORALS, SENSE, and COMMON SENSE, CONSCIOUSNESS, ENGLISH, PERCEPTION, PRAXIS, RIGHT/JUST/GOOD, *VIRTUE*

We can date the invention and philosophical usage of the term "moral sense" to Shaftesbury, and more particularly to Hutcheson. The tradition of a philosophy of moral sense is more generally constituted within the Anglo-Scottish philosophy of the eighteenth century. Moral sense associates the understanding of morality with a moral sensibility. It consists of a set of innate dispositions. It is also a look of approval or disapproval of a given action. However, the recourse to the term "sense" allows us to envisage practical reason playing some role, a moral activity that is far more than the faculty of perceiving good or evil.

The expression "moral sense" is a relatively recent invention. As a term in the lexicon of philosophical discourse, it is generally attributed to Shaftesbury's *An Enquiry Concerning Virtue* (1699). A hotly disputed notion in the eighteenth century, the moral sense is invoked less often in debates on moral philosophy of the times than in everyday language. We say of someone with very firm principles of good and evil that he is "a man with a developed moral sense."

If the philosophical and ordinary meanings of moral sense always suggest a certain presence of morality within a man, they refer more to a set of moral questions than to a simple doctrinal position.

"Moral sense" was established as a term primarily in order to take the side of naturalism in morals; "moral sense" refers to a set of dispositions that are innate to morality, a capacity that preexists all conventions. This relation to the discernment of good and evil takes the form of an ability to perceive the moral quality of actions, a sense. According to Thomas Burnet, man has a natural awareness of good and evil, which can be understood as a moral sense: "I understand by natural conscience a natural sagacity to distinguish moral good and evil, or a different perception and sense of them" (*Remarks on Locke*).

The existence of a natural sensibility in morality is in many ways reinforced in the definition Hutcheson gives of "moral sense." Moral sense is not used to perform a good deed but rather to be sensitive to the moral qualities of an action and to approve of them. Hutcheson proposes a morality of the spectator and not of the agent: moral sense for him designates a perception that becomes an approval or disapproval of an action: "A Determination of our minds to receive the simple Ideas of Approbation or Condemnation, from Actions observ'd" (*An Enquiry Concerning Virtue*).

It nonetheless remains the case that from these perspectives, moral sense is above all linked to a receptiveness of the human mind in practical matters. Does this expression not also hold out the possibility that one may exercise one's moral reason by intervening in one's own actions? Thus, in Shaftesbury, moral sense refers to an ability to form adequate representations of good. Sense is not reduced to the faculty of perceiving; it is to be understood as a "reflected sense" (*Characteristics*), an instance of the control and examination of moral representations. "Moral sense" and, more often, "sense of right and wrong" constitute a second-order affection, or even the mind's disposition to examine sensations, actions, or received passions. Man "is capable of having a Sense of Right or Wrong; a Sentiment or Judgment of what is done through just, equal, and good Affection" (*Characteristics*). Moral sense is reason based on the perceptive naturalness of actions and passions.

In our time, Charles Taylor's critique of moral naturalism barely mentions the place of moral sense. It is directed, rather, toward the role of naturalist epistemology, whose model incites us to seek "criteria" for morality. In contrast to this approach, Taylor asserts the need to have recourse to moral intuitions, to what motivates us morally, without appealing to moral sense, which is instead a means of apprehending morals independently of science ("Explanation and Practical Reason").

MORALS / ETHICS

FRENCH   *morale, éthique*
GERMAN   *Sitten, Sittlichkeit, Moralität*
GREEK   *ethos* [ἔθος], *êthos* [ἦθος]
LATIN   *mores, moralitas*

➤ BERUF, DUTY, LAW, *LIBERTY*, MENSCHHEIT, MORAL SENSE, *RELIGION*, VIRTUE, WERT

"Morals" (from the Latin *mores*, "customs") and "ethics" (from the Greek *êthos* [ἦθος], "character"), like their equivalents in the other modern languages, generally refer to the rules that make up the norms of human behavior. They are distinguished, both within one language and from one language to another, in terms of two types of problem. The first is the problem of the subject and its conduct, whether as an individual or as a community. The second concerns the nature of what "morals" designate: as a simple description, the designation "morals" refers to nature and to history; as a prescription, it dictates laws, and establishes values, whether good or bad. How these four dimensions (individual and collective, descriptive and prescriptive) are linked constitutes the arena in which the differences between languages are played out.

One might think that "morals," of Latin etymology, is the exact equivalent of "ethics," of Greek etymology, and that these twin terms coexist with the same meaning in the main modern European languages, including English, even if the Greek term is, as usual, more erudite and more technical (like "corporeal" and "somatic," for example). This is wrong on two counts: on the one hand, however unstable and confused these differences are, "morals" and "ethics" do not nowadays share the same field of application, and their distinction is sometimes even a doctrinal topos; on the other hand (and this is a paradoxical chiasmus that is often not recognized as such), it is often ethics that are invoked with reference to *mores*, as a reflection on social norms and conduct, whereas "morals" refers primarily to the individual—if not to his "character" (*êthos*), then at the very least to the question of his freedom of choice.

We can find in the organization of the Greek terminology as it was first established by Aristotle, as well as in the way in which Cicero justified his choices of translation, two causes that may to some extent account for the paradox of the modern usage.

I. *Ethos* [ἔθος] as "Habit" and *Êthos* [ἦθος] as "Character": What Are Ethics?

Two competing nouns developed in Greek from *eiôtha* [εἴωθα], "I am in the habit of" (Sanskrit *svada-*, "character, penchant, habit"; cf. Latin *suesco*, with probably the same root **swedh-* as *ethnos*, a "people"): *ethos* [ἔθος] and *êthos* [ἦθος]. Both have the same original meaning, "custom," but they evolved in different ways.

Ethos came to mean "habit, custom, usage" and refers, for example, to "the custom of the city [*ethos tês poleôs* (ἔθος τῆς πόλεως)]" (Thucydides 2.64); *ethei* [ἔθει] is thus opposed to *phusei* [φύσει], "by nature" (so Aristotle, in the *Nicomachean Ethics* 10.9, 1179b20ff., contrasts the doctrines of those who think we are good "by nature, by habit, by teaching," cf. 1154a33).

Êthos, with an *eta* [η], refers first in the plural to the places where animals and men habitually stay ("The familiar places and the horses' pasture [ἤθεα καὶ νομόν]," *Iliad* 6.511), and in the singular, to one's habitual way of being, or disposition, or nature. The word falls within the category of what we might

therefore call "psychology" (one is, for example, "sweet-natured [*praios to êthos* (πρᾷος τὸ ἦθος)]," Plato, *Phaedrus* 243c3–4; or, like Pandora, "of a deceptive character [*epiklopon êthos* (ἐπίκλοπον ἦθος)]," Hesiod, *Works and Days* 67, 78).

■ See Box 1.

In Aristotle, *êthos* becomes part of the terminological language of poetics: the "characters" (*êthê*), which allow us to describe the characters in action, are one of the six elements of tragedy, along with the story, *muthos* [μῦθος]; expression, *lexis* [λέξις]; thought, *dianoia* [διάνοια]; spectacle, *opsis* [ὄψις]; and song, *melopoia* [μελοποΐα] (*Poetics* 6.1450a5–10). It is above all part of the terminology of rhetoric: the "character" (*ethos*) of the orator, along with the passion (*pathos* [πάθος]) of the listener and the *logos* [λόγος] itself in its persuasiveness, constitute the three "technical proofs," that is, those which depend on art itself, unlike those, like testimonial accounts, which have an external origin (*Rhetoric* 1.2, 1356a): the good orator indeed not only should study characters (*theôrêsai ta êthê* [θεωρῆσαι τὰ ἤθη], 1356a22) as part of his training, as Plato's *Phaedrus* had already suggested, so as to adapt his speech to his audience, but also should himself display a character that has been appropriately adapted, and that corresponds to the particular character of the political regime in which he is speaking ("We should ourselves possess the character particular to each constitution [*ta êthê tôn politeiôn hekastês* (τὰ ἤθη τῶν πολιτειῶν ἑκάστης)]," *Rhetoric* 1366a12), so as to inspire confidence (*pistis* [πίστις]) and to induce persuasion (*pistis*, again). This explains, then, the connection between rhetoric and "ethics" (proofs—still *pistis*—come, says Aristotle, "by means of speech that is not only demonstrative, but 'ethical' [*di' êthikou* (δι' ἠθικοῦ)]," *Rhetoric* 1366a9ff.), as well as the fact that political science, which determines what constitutes the properly human good, can be an architectonic for both rhetoric and ethics (*Nicomachean Ethics* 1.1, 1094a26–b7).

Where Aristotle is particularly innovative, however, as the title of his *Ethics* (*en tois Êthikois* [ἐν τοῖς Ἠθικοῖς], *Politics* 4.1295a36ff.) by itself indicates, is in using the adjective *êthikon* [ἠθικόν] to mark out an entirely separate area of philosophy. This partition, which has become an accepted part of philosophy programs, was institutionalized in the Stoic description of the parts of philosophy (see Diogenes Laertius, *Proemium* 18). As a way of defining it, Aristotle chose to reinterpret the two terms, and to make *êthos* (character) a consequence of *ethos* (habit):

Ethical virtue [*hê êthikê* (ἡ ἠθικὴ), sc. *aretê* (ἀρετὴ), literally, excellence of character] for its part [that is, as distinct from *aretê dianoêtikê*, excellence of thought, intellectual virtue] arises as an effect of habit [*periginetai* (περιγίνεται): is born or comes "around and following from"], which is how its name is formed, as a slight variation of *ethos*. It is plain from this that none of our ethical virtues arises [*egginetai* (ἐγγίνεται): is born or comes "within"] within us by nature.

(*Nicomachean Ethics* 2.1, 1103a17–19; cf. *Eudemian Ethics* 1220a39–b3)

The stakes here are very high: for Aristotle, it is question of determining as accurately as possible the place of nature in ethics: "Neither by nature, then, nor contrary to nature do virtues arise in us; rather we are adapted by nature to receive them, and are made perfect by habit" (*Nicomachean Ethics* 2.1, 1103a23–26). The interplay between *êthos* and *ethos* anchors virtue in practice, both through the political habits that are contracted because of a good constitution, and through individual exercise of virtue; in other words, virtue is a *technê* [τέχνη], a "know-how":

The virtues we get by first exercising them, as also happens in the case of the other arts [*technai*]. For the things we have to learn before we can do them, we learn

---

1

Heraclitus, *êthos anthrôpôi daimôn* [ἦθος ἀνθρώπῳ δαίμων]

➤ DAIMÔN, *DESTINY*

The wide range of interpretations proposed for fragment B119 of Heraclitus, *êthos antrôpôi daimôn* (variously rendered in English as "The character of man in his guardian spirit" [W. S. Graham], "Character for man is destiny" [Kathleen Freeman], "A man's character is his fate" [Jonathan Barnes]), allows us to understand how strange *êthos* can seem to us, and *daimôn* [δαίμων] no less so. It is generally understood that man's fate is engraved in his personality (*sein Eigenart*, as Diels-Kranz translates it in German), whether this is seen as reflecting his destiny (Antigone is born Antigone), or indicating his responsibility (the only fate we have is the one we

make for ourselves). Jean Bollack, basing his analysis on the twin terms *ethos-êthos*, "habit"-"character," notes that these two interpretations rely on an anachronistic representation of "character," of the kind one would find in the thirteenth century, whereas the Greek does not make "character" something virtual that can be dissociated from a way of being (and he ultimately draws a different conclusion from this, *Héraclite*, 382ff.). Martin Heidegger, in his *Letter on Humanism* (trans. Capuzzi, 256), places so much emphasis on the common etymon that he proposes to read it as:

Man dwells in the nearness of god.

by doing them, for example, men become builders by building and lyre-players by playing the lyre.

(Ibid., 1103a31–34)

This text is often compared to the one in Plato's *Laws*: his Athenian, in making his program of education, already joins together *êthos* and *ethos*, character and habit, but in stipulating that it is during infancy, and even in the mother's womb, that "more than at any other time the character is engrained by habit [*emphuetai . . . to pan êthos dia ethos* (ἐμφύεται . . . τὸ πᾶν ἦθος διὰ ἔθος)]" (*Laws* 7.792e; cf., for example, *Nicomachean Ethics*, trans. Tricot, 87 n. 3). This overlooks the fact that what is at stake is deliberately reversed: where Plato comforts the naturalist by arguing that habit is innate, Aristotle neutralizes what is given to us naturally by arguing for a responsible practice.

Most of the difficulties and even confusions between customs and morals, between morals and ethics, stem from this initial chiasmus, which anchors ethics in habit more than in character, in culture and practice more than in nature. The proof of this is that most philosophers who have attempted to define the terms in their own languages, like Cicero or G.W.F. Hegel, have tried to find a set of problematics equivalent to the Greek, thus placing the task of translation at the heart of their reflection.

II. *Mores*

If the reflection on "ethics" in the Greek language is focused on the close link between *êthos* and *ethos*, in Latin the problem of the basis of "morals" is exacerbated by the fact that the same term refers in the singular (*mos*) to habit, and in the plural (*mores*) to character. These two domains are all the more closely interrelated because Latin authors would themselves continually question the relationship between *mores* and *mos*. So it would be helpful to begin by clarifying the different meanings of the term, both in the singular and in the plural, and to underline how culturally specific the linguistic usage is in our theoretical reflection.

Mos (in the singular) refers in its most widely accepted sense to one's usual manner, to habit insofar as it characterizes the agent of the action, whether this agent is singular (thus Chrysippus proceeds, in one work, "in his usual manner," *more suo*: Cicero, *De republica* 3.12), plural (thus Numa respected "the old way in which Greek kings did things [*mos vetus Graeciae regum*]" in legal matters: Cicero, *De republica* 5.3), or even an anonymous collectivity (thus Cicero's grandfather's house was small, "in the ancient manner [*antiquo more*]," *Laws* 2.3). The latter two examples cited themselves suggest the slippage in meaning from a characteristic habit to that particular form of habit that "tradition" represents, a meaning frequently conveyed when the term is in the singular, but also in the plural. An example of this would be *mos*, which tolerates the sort of deception that is proscribed by the law of nature, according to Cicero (*De officiis* 3.69); likewise, what Cicero in *Laws* (2.23) calls "our traditions," *nostri mores*, constitutes, along with Numa's laws, the frame of reference when he elaborates his code of law in religious matters. "Ancestral tradition" thus constitutes the *mos* par excellence, and the most complete manifestation of habit elevated to a system of reference.

The term as it applies to the characterization of an individual denotes first in the plural all of the habits that define a behavior, what we call someone's "character," insofar as it is what this individual's "morals" are based on. So Latin does not separate exteriority—behavior as objective action—from interiority—the set of dispositions that constitute the motivation for the behavior. This is not to say, however, that Latin authors were unaware of any such distinction. When it is needed, this clarification is generally made by connecting the term *mores* to other terms that circumscribe the extension of the concept. We might highlight two types of such paired expressions: either *mores* are considered in terms of the exteriority of the action, and are then associated with terms like *vita* (life, way of life; cf. Cicero, *De republica* 1.10, 16; 2.21), *instituta* (the principles of life; cf. Cicero, *De officiis* 1.120), or *consuetudo* (habit; cf. Cicero, *De republica* 3.17); or "character" is prioritized in the way one understands *mores*, and in this case the associated terms are *ingenium*, *indolis*, and *natura*, three terms denoting temperament as a natural disposition (cf. Cicero, *De officiis* 1.107ff., 3.16; Seneca, *De ira* 1.6.1, 2.15.1). So the Latin reflection on *mores* constantly brings into play two realms: on the one hand, the realm of habit perceived in terms of its formality, or almost its arbitrariness; on the other, a naturalistic realm prior to any formalization, compared by Seneca (*De ira* 2.15.1–2) to a land out of which the moral dispositions of a human being emerge.

In a philosophical context, such a dual approach tends to overlap with the classical Greek dichotomy of law and nature (*nomos*/*phusis*). Two examples of analysis we come across in Cicero will show how the reflection on *mores* might be structured around these poles. In book 3 of *De republica*, the character Philus returns to an argument first made by the neoacademician Carnedes asserting that justice does not, in nature, have its foundation in a social instinct. Philus emphasizes in particular that the "morals" of men can in fact be reduced to habits (*consuetudines*) and to instituted forms of behavior (*instituta*) that are based on nothing more than the arbitrariness of a custom passing itself off as a law, as is demonstrated by the multiplication of habits and behaviors into an infinite number of forms depending on the number of different peoples, as well as their variability over time. Conversely, the character Lelius in *De amicitia* (the very same person who in *De republica* responds to Philus's speech, and who comes to the defense of justice) continually draws *mores* and *natura* closer together, with the primary aim of countering the utilitarian theory of friendship that the Epicureans propose: for Lelius, it is the accord between good natures, manifested by harmony of *mores*, that founds and sustains the feeling of affection (*caritas*) from which authentic *amicitia* develops.

The confrontation of these two texts highlights a profound ambiguity in the Latin conception of *mores*, which is divided between a descriptive approach toward the "morals" noted, and a prescriptive approach aimed at sanctioning "good morals." The linguistic usage can help us to understand how this division works: one tendency is toward using such terms as *consuetudo*, *usus* (usage), and *instituta*, whenever it is a matter of seeing *mores* in terms of their objectivity and their potential variability, whereas the term *mores* itself is more often than not used on its own whenever it is a matter of

defining a moral norm, or of seeing how one measures up to the proposed norm. Because of this tendency, the polemical use of the term *mores* in Philus's speech is intended precisely to disqualify the idea that these "morals" are anything more than *instituta*. Looking at it from the opposite perspective, the term *mores* is almost always used from a moral point of view to stigmatize any transgression of an ethical rule: the *mores* that are thereby denounced are thus not perceived in neutral terms, from a descriptive point of view, but as the opposite or negative of what "good morals" should be. The use of the term thus illustrates the imperative of the norm in the very statement of its negation, as in the speech on the tyrant, presented as a figure who is antithetical to all human and civic values—for example, in book 2 of Cicero's *De republica*, or again in Seneca's *De clementia*.

Mores thus pose a problem for the principle of "morals," which results on the one hand from a confusion of the perspectives of (external) morals and (internal) character, and on the other from the description of what is given, and the prescription of a norm. This confusion can be explained in large part by an ancient conception of the person, the complete philosophical expression of which we find in Cicero (*De officiis* 1.107–21). This exposition is substantially indebted to the Stoic philosopher Panaetius, but, beyond the particularities of doctrine, reflects an approach to the person that is characteristic of the dominant aristocratic milieux in the Greco-Roman world (see Gill, "Personhood and Personality," 169–99). The person is thus defined as a synthesis of two pairs of "roles" (the term *persona* refers to a mask, and later by extension to a theatrical role: it translates *prosôpon* [πρόσωπον] in Greek): the first pair comprises the "common" *persona* of a rational being and the "singular" *persona* made up of our individual temperament and sensibility; the second pair joins the *persona* that is imposed on us by fate or birth and the circumstances of our life, with the *persona* given by the deliberate choice of a career. This schema therefore combines on the one hand, without explicitly analyzing their potential conflict, the objective determinations of a given character and the rational imperatives that prescribe a universal morality, and on the other hand, the internal motives related to the *natura* of each person, and the external behaviors conditioned by institutions and social functions (see *PERSON*).

The relationship to *mos* as "tradition" provides a key, though, to understanding the Latin conception of *mores*, as can be judged by looking at three accounts: the political philosophy of Cicero (*De republica*, *Laws*), the historiography of Titus Livius (books 1 to 5, from the founding of Rome by Romulus to its symbolic refounding by Camillus), and the practical morals of Seneca (*De ira*, *De clementia*). In all three cases, individual or collective *mores* (the *mores* of a people or of a social group) are conceived with reference to a Roman tradition that provides an evaluative norm through concrete models that embody a mind governed by virtue. *Mores*, in the plural, are thus intended both to exemplify and to consolidate a singular *mos*, a historic and cultural reality that has gradually been elaborated and unified through the accumulation of acts of behavior, and of examples of character in the course of historical time. For Roman man, there is no real place for any conflict between fact and norm, outside

and inside, singular and collective, and the purpose of the *mores* is to reproduce within the plurality of experiences the essence of a *mos* that brings together these opposites. Any conflict is precisely the sign of moral monstrosity embodied by perverse, seditious, or tyrannical figures (for example, Tarquin the Elder, Spurius Maelius, Appius Claudius the decimvir, the emperor Caligula), whose singular "character" has the effect of dissolving the cohesion of the social body by their private or political "morals," which go against the *mos*.

III. *Mœurs*, Morals, Ethics: Between Descriptions of Individual or Collective Rules of Behavior, and Prescriptions of Norms

In the French language, the division between *les mœurs* and *la morale* seems to become accentuated, and to make a hard and fast separation between the descriptive and the normative. *Les mœurs* are the rules of behavior of a people or of an individual, and a critical judgment is needed to know whether they are good or bad, accepted or prohibited, since they could equally well be both. *La morale*, on the other hand, only includes rules of good behavior. They determine and codify, more or less systematically, what is good and what is acceptable (so for this reason one does not speak of *mauvaise morale*, but of *mauvaises mœurs* [bad moral conduct]). This being the case, the difference between the terms is also part of a broader discursive division, or even a conflict, between disciplines. *Mœurs* and *morale* do not only each designate a different content (whether descriptive or prescriptive), but also are opposed to each other as two different approaches to human behavior (anthropological and sociological or theological and confessional): so the choice of the first term could imply the refusal of any theoretical or normative approach, whereas preference given to the second term could be the sign of a claim to universality.

The growing fortunes of the notion of ethics need to be understood in the context of this dilemma. This notion seems to be reserved for a normative approach toward human behavior that aims to go beyond its description, and is at the same time not based on any official dogma (particularly religious dogma), or any moral catechism. The different composite terms derived from ethics, what are known as applied ethics (bioethics, environmental ethics, professional ethics), attempt to lend a rational legitimacy to the production of criteria of decisions and rules of conduct in each particular domain.

A. *Les mœurs*: From psychological analysis to anthropological investigation and sociological study

The description of *mœurs* is presented initially as a resistance to moral prescription and prediction. However, in the transition from the language of the moralists to the essays of the Enlightenment, the object itself of this description changes, and the meaning of the term modulates.

1. The knowledge of *mœurs* still plays a part, in the *Réflexions ou sentences et maximes morales* (1765) of La Rochefoucauld, in drawing a "portrait of man's heart" (preface to the 1765 edition, in Lafond, *Moralistes du XVIIe siècle*, 232). Already with La Bruyère's *Les caractères ou les mœurs de ce siècle* (1688), however, this knowledge becomes the

object of an investigation intended to describe differ-
ent human types. The more this investigation extends
to include the diversity of social classes, and then of
peoples, the less possible it becomes to think of this
as a prescriptive project. Moral rules and principles
are abandoned in favor of the freedom of the reader,
who himself draws the lessons from the portrait, the
investigation, or the history that are proposed to him.
Whereas La Rochefoucauld, in spite of his visible re-
treat from any Christian moral prediction, presents his
maxims as "the summary of a moral code conforming
to the thinking of several Church Fathers" (in Lafond,
Moralistes du XVIIe siècle, 232), La Bruyère emphasizes:
"These are moreover not maxims that I wished to write:
they are like moral laws [*comme des lois dans la morale*]
and I confess that I have neither the authority nor the
genius to be a legislator. . . . Those who write maxims
ultimately want to be believed: I am willing to accept,
on the contrary, that people say of me that sometimes
I have not observed well, provided that as a result people
observe better" (preface to *Les caractères*, in Lafond, *Mor-
alistes du XVIIe siècle*, 695). So the proliferation of points
of view on human behavior, and the recognition of so-
cial and geographical diversity, are not just a question
of knowledge. Replacing *la morale* with *les mœurs* gives
the subject back the liberty to constitute himself as a
moral subject, allowing him to move freely between de-
scription and prescription. For the philosophers of the
Enlightenment, this freedom will become an even more
important juncture in their approach to the question of
human behavior. One of the principles of the Enlighten-
ment was to relate the constitution of a moral subject to
its environment (geography); this philosophical prin-
ciple thus authorized the transition from psychology
to anthropology—even if this meant searching for the
signs of humanity's moral unity within the diversity of
morals. As Rousseau put it in *Émile*:

Cast your eyes on all the nations of the world, go
through all the histories. Among so many inhuman
and bizarre cults, among this prodigious diversity of
morals and characters [*cette prodigieuse diversité de
mœurs et de caractère*], you will find everywhere the
same ideas of justice and decency, everywhere the
same notions of good and bad.

(Rousseau, *Émile*, 4:597, trans. Bloom, 288)

2. This search for unity does not preclude, however, un-
derstanding morals in their historical context; in fact,
quite the opposite. This leads to the second funda-
mental change that came about as a result of the phi-
losophy of the Enlightenment: moral prescriptions are
also derived from a philosophy of history. This is what
the link between Voltaire's *Essai sur les mœurs et l'esprit
des nations* (Essay on the morals and customs [or *intel-
ligence*] of nations) and his epistemological reflections
on history amply demonstrates (see, for example, the
article "History" in RT: Diderot and d'Alembert, *Ency-
clopédie ou Dictionnaire raisonné des sciences, des arts et des
métiers*).

3. This does not mean, though, that all constraint disap-
pears. In moving from *la morale* to *les mœurs*, what is also
transformed is the relationship of politics to human
behavior. Examining one's moral conscience and con-
trolling the conformity of practices to the rules that
determine beliefs are replaced by a policing of morals
that is not content to discipline the bodies of individu-
als, to organize and pacify society, but goes further and
seeks to control and orient the way in which popula-
tions evolve. This policing of *mœurs* accompanies the
diversification of those forms of knowledge that par-
ticipate actively in the normalization of these regulated
behaviors.

■ See Box 2.

B. *La morale*: Between rational foundation, Christian apologetics, and positivist sociology

Confronted with the domination of *les mœurs*, of the forms
of knowledge to which this domination gives rise, and of the
controls that discipline them, the idea of *morale* can only ap-
pear as a resistance to the diversity and the shifting historic-
ity of the rules of behavior. This resistance is likely to assume
two opposing forms.

The first form of opposition is that of a rational founda-
tion. We find a conclusive sign of this opposition in the fate
that befalls each of these two terms (*mœurs* and *morale*) in
Descartes's *Discourse on Method*. Whereas *mœurs* (as well as
voyages) are eliminated because of the uncertain nature of
the knowledge associated with them, *la morale* is presented
as a set of necessary rules by which one should lead one's
life. In principle, these rules should be obtained following a
deductive process that does not draw in any way on experi-
ence, but in the absence of an immediate rational founda-
tion, a *morale par provision* is established, a provisional *morale*
whose essential characteristic is precisely that, far from
being reduced to a conformity to *les mœurs*, it has to include
other rules.

The second form of opposition makes *la morale* the object
of an apologetic discourse. It links the defense of *la morale*
to the existence of a dogma. This is why it refuses to come
down on the side of either the rational foundation of *la mo-
rale*, or the acceptance of the diversity of *les mœurs*. Pascal
thus makes the relativity of *les mœurs* an argument against
nature as much as against reason: "The corruption of reason
is shown by the existence of so many different and extrava-
gant customs [*mœurs*]. It was necessary that truth should
come, in order that man should no longer dwell within him-
self" (ed. Lafuma, no. 600, p. 584, trans. Trotter). There is in
consequence no legitimate *morale* beyond one inspired by re-
ligion: "It is right that a God so pure should only reveal Him-
self to those whose hearts are purified. Hence this religion
is lovable to me, and I find it now sufficiently justified by so
Divine a morality [*une si divine morale*]. But I find more in it"
(ibid., no. 793, p. 600, trans. Trotter). This duality is of major
importance, since it means that *la morale* is always suspected
of having the shadow of a Christian God cast over it.

This leads to the temptation to lend the term an unprec-
edented residual and positivist definition, turning *la mo-
rale* simultaneously into a set of social facts, comparable to

2

Biopolitics and the policing of *mœurs*

Replacing moral prescription with the description of *mœurs* is a prominent feature in the emergence of what Michel Foucault called a "society of normalization." The biopolitics that organizes this society by controlling hygiene, health, the family, and sexuality is made possible by the fact that it is based less on a system of preestablished rules and moral precepts, or on theological dogma, than on a series of forms of knowledge and of controls that not only regulate the lives of individuals, but also conflate themselves in a global subject: the population. The notion of *mœurs*—which becomes the object of an actual science (cf. Lévy-Bruhl, *La morale et la science des mœurs* [Ethics and moral science], 1903)—thus ensures the articulation between the disciplining of the body (the singular) and the normalization or regularization of this population (the collective). It is also what allows a part of this population to be designated and identified as outsiders, and to apply a politics of exclusion to them. So the description or caricature of the different moral codes of behavior (*mœurs*) of a given population is a systematic component of racist discourses.

This is all the more true in that the naturalization of *mœurs*—unlike *la morale*, which is used, on the contrary, as a criterion to distinguish man from animals—allows for a blurring of the borders between humanity and animality. As soon as one can refer to the *mœurs* of animals, and describe a population in terms of its *mœurs* as differing, or deviating, from the norm, the comparison with such and such an animal species is easily made. Thus Voltaire writes about albinos in his *Essai sur les mœurs et l'esprit des nations*: "The only human thing about them is their stature, and their faculty of speech and of thought is far removed from our own."

religious facts, legal facts, and so on; the science of these facts; and the application of this science. This is what Lucien Lévy-Bruhl proposes in a key passage in *Ethics and Moral Science* (1903):

> Even if we leave aside the old conception of "theoretical *morale*," the word *morale* still has three senses between which we must carefully distinguish.
>
> 1. The term *morale* is applied to conceptions, judgments, sentiments, usages as a whole, which relate to the respective laws and duties of men among themselves, recognized and generally respected at a given period and in a given civilization. It is in that sense that we speak of a Chinese *morale*, or a contemporary European *morale*. The word designates a series of social facts analogous to other series of facts of the same kind, religious, juridical, linguistic, etc.
> 2. The science dealing with those facts is called "ethics" [*morale*], just as the science dealing with phenomena of nature is called "physics." In that way, ethical science is opposed to natural science. But while "physical" is used exclusively to designate the science of which the object is called "nature," the word *morale* is used to designate both the science and the object of the science.
> 3. The applications of the science may be called "ethics" [*morale*]. By "progress of ethics" [*progrès de la morale*], a progress of the art of social practice is understood: for instance, a fuller justice realized by men in their relations with each other, more humanity in the relations between the different classes of society, or in those between nations. This third meaning is plainly separated from the two preceding, which differ equally between themselves. Hence there are inextricable confusions, and particularly the result that moral philosophy [*la philosophie morale*] today, similar in that point to the natural philosophy of the ancients, discusses purely verbal problems, and overlooks real problems.

(Lévy-Bruhl, *Ethics and Moral Science*, trans. Lee, 81)

What this two-pronged attack (religious on the one hand, positivist on the other) renders problematic is the prospect of a rational foundation of practical norms. So it traces the path of a third term, which appears later and which, without restricting the discourse on behavior to a moral catechism or an anthropological and sociological investigation (and thus subsuming the normative within the descriptive), does not reject the rational determination of norms for conduct.

C. Ethics

The appearance of the term "ethics," at first more technical than the terms formed on *mors*, emphasizes this division between knowledge of nature (even if it is the second nature of habits) and the systematization of duties, without collapsing the second into the dogmas of religion. What is significant in this respect is the fact that "ethics" was only used initially to refer to (to translate) the philosophical works of antiquity, as opposed to moral catechisms (thus La Bruyère, for example, in the *Discours sur Théophraste*, refers to Aristotle's *Ethics*). But the growing (and recent) fortunes of the term come above all from the impossibility of using the notions of *morale* and *mœurs* to designate the imposition of practical norms in domains that one does not imagine to be governed solely by economic or technical imperatives: the environment, business, enterprise. To speak about bioethics, environmental ethics, or business ethics is thus, in theory, to take into account the need to have available determinate norms by which decisions can be taken in circumscribed domains and in precise circumstances. In theory, this normative register should be based neither on an anthropological

or sociological description of the rules of behavior specific to a given domain, nor on an external catechism. The difficulty comes from the fact that such independence is never clearly demonstrable. Applied ethics cannot easily prove that they do not ratify the morals and interests of a given milieu (professional or otherwise), or that they do not introduce, in a disguised form, some (religious or political) catechism. We can thus legitimately ask whether "ethics," used so as to avoid saying *mœurs* or *morale*, does not in reality say the same thing as one or the other of the two terms. But "ethics" can also refer to the combination of the two, independent of any religious dogma: the universal and abstract dimension of a moral concern that cannot be easily defined, and the diversity of its fields of application.

▪ See Box 3.

IV. *Sitte, Sittlichkeit, Moralität*

The German language distinguishes between the descriptive (nature) and the prescriptive (law), but also between the individual and the communitarian, which are the principles from which philosophy establishes its terms. Thus Kant rigorously separates morals (*die Sitten*) from morality (*Moralität*). This disjunction consecrates and completes the one that rationalism and Enlightenment philosophy had established in the French language, and does not essentially displace its opposition, except to clarify under what absolute conditions the prescriptive is freed from the descriptive, and morality from anthropology. It is for this reason that it does not pose any major problem of translation.

The same cannot be said of the more radical attempt to rejoin what the different languages had so well taken apart, namely in Hegel's accomplished efforts to think through the conjunction of nature, history, and the law. In the *Philosophy of Right*, he sets the notion of *Sittlichkeit* in opposition to *Moralität*. *Moralität* is effectively defined first of all by its failures. The term refers less to the set of rules of conduct that an individual gives himself, and in which he realizes his freedom abstractly, than to the very interiorization of these rules, their possession by a free will. *Moralität* is thus wholly on the side of the law that the autonomous subject gives himself, and it says nothing of the effective laws of conduct shared by a community of men. In the process, *Moralität* involves two kinds of forgetting: (1) the necessarily collective or communitarian dimension of the rules of conduct (the subject of *Moralität* can only be an abstract individual); and (2) what these rules owe to shared habits whose repeated exercise becomes second nature.

The notion of *Sittlichkeit* reintroduces these two dimensions. *Sittlichkeit* of course implies morals (*die Sitten*), insofar as they come from habit and constitute a second nature, though Hegel makes it clear that, contrary to the usage the French moralists might have made of it in the seventeenth century, it cannot be a matter of rules of conduct or of individual virtues. So *Sittlichkeit* has nothing in common with the naturalization of character invoked in the discourse on *mœurs* of these moralists. But the division of *mœurs* is part of *Sittlichkeit* precisely, and only, to the extent that within it, one can realize a concrete freedom, and in that respect it brings together what until then had been separate: *Sitten* and *Moralität*.

▪ See Box 4.

It is this forced conjunction (a conceptual and semantic tour de force) that Nietzsche would attack, denouncing in the *Sittlichkeit der Sitte* the illusion that consists of attributing a new dignity to manners and customs, and of forgetting that at the source of *Sitte*, one finds in reality nothing other than the sacrifice of the individual for the benefit of the collective whole, and a calculation: the preference for a durable advantage over an ephemeral advantage. So Nietzsche writes in §9 of *The Dawn of Day*, entitled, precisely, *Begriff der Sittlichkeit der Sitte* (Conception of the morality of customs): "Morality is nothing else (and, above all, nothing more) than obedience to customs, of whatsoever nature they

La valse des éthiques (The dance of ethics)

La valse des éthiques is the title Alain Etchegoyen chose for a work in which he analyzed and lamented the contemporary excess of applied ethics: business ethics, whose aim is to propose to employees a system of values that can help boost performance; and bioethics, and its various offshoots. His book is symptomatic of an interplay between ethics and morals, and in effect expresses a nostalgia for a prescriptive and universal morality, Kantian in nature (*die Moralität*), that motivates his critique of these different local ethics:

> *La morale* [morality] is a categorical imperative: ethics is a hypothetical imperative. This distinction is a telling one.

Either the action is determined by an unconditional imperative that is imposed categorically: conscience in this case acts out of duty. This should be considered *morale*. Or the action is determined by a hypothesis that imposes a behavior on it, which we might also term an imperative of prudence. In this instance we are dealing with ethics.

(*La valse des éthiques*, 78)

What "ethics" designates, then, according to Etchegoyen, is a vague moral concern that has trouble masking a whole series of compromises with the interests of the moment. We might wonder, then, how far the criticism

he levels at ethics reproduces, almost as a caricature, the opposition between *Moralität* and *Sittlichkeit*—especially given, as Jean-Pierre Lefebvre writes in the glossary accompanying his French translation of Hegel's *Phenomenology of the Mind*, that "this term [ethics] is currently undergoing an evolution in French that collapses the traditional meaning of ethics and that of *Sittlichkeit*."

Sittlichkeit, das Sittliche: Translating Hegel

It should come as no surprise that the translation into French of *Sittlichkeit* has proved problematic for all who have attempted it, nor that translators have found so many words to convey its absolute singularity. Thus Derathé translates *Sittlichkeit* as *vie éthique* (ethical life: Hegel, *Principes de la philosophie du droit*). Labarrière and Jarczyck (in *Le syllogisme du pouvoir*), like Kervergan (in his translation of *Principes de la philosophie du droit*), use the neologism *éthicité* (ethicity). Fleischmann speaks (in *La philosophie politique de Hegel*) about *morale réalisée* (realized morality). Symptomatically, Lefebvre (translator of *Phénoménologie de l'esprit*) constructs an entire circumlocution to account for the untranslatability of the term, "*souci des bonnes mœurs et de la coutume* [concern for good morals and for customs]," while he translates the adjective *sittlich* as *éthique* (ethical).

This awkwardness in translation immediately brings to mind the chiasmus between ethics and morals described earlier. The choice of *éthicité* or of *vie éthique* is intended to make us hear the *ethos* (habit) in *Sittlichkeit* that morality, in the Kantian sense of the term, had bracketed off. In the translation of §151 of the *Philosophy of Right*, which explains the meaning not of *Sittlichkeit*, but of the ethical element (*das Sittliche*), with reference to the sharing of these same *Sitten* (manners and customs), the French translators Pierre Jean Labarrière and Gwendoline Jarczyck put *Sitte* in quotation marks, and refer it to the Greek *ethos*. The ethical element of the habit then becomes "*une seconde nature qui est posée à la place de la volonté première simplement naturelle et est l'âme, la signification et l'effectivité pénétrant son être-là, l'esprit vivant et présent là—comme un monde dont la substance n'est qu'ainsi comme esprit*" (a second nature that is put in place of first, simply natural will, and is the soul, the meaning, and the effectiveness penetrating its being-there, the spirit that is living and present there—like a world whose substance is only as it is insofar as its spirit: Hegel, *Principes de la philosophie du droit*). With this second nature, we are well and truly in an Aristotelian register, but with the important difference that the conformity to customs, to manners, to *Sitten*, is also an entirely conscious act of freedom: it is in terms of this free consciousness that the term *Sittlichkeit* should be understood.

The choice of *vie éthique* or *éthicité* to translate *Sittlichkeit* is thus understandable, even if it is not certain whether these terms are indeed the most appropriate to make us hear the Greek *ethos*, or whether the Aristotelian meaning is not lost in the adventures and misuses of the term *éthique*. One would have to pass over and above French and Latin in order to grasp, within the French language, the Greek origin of the term. One would also have to forget about the original confusion between *ethos* and *êthos* initiated by Aristotle. It is true that Hegel himself plays around with Aristotle's categories and gets lost in them, when he translates, in the notes in the margin of his copy of *Philosophy of Right*—another sign of a complex legacy and of an impossible translation—*êthos* as *Sitte* (*mœurs*), and *ethos* as *Gewohnheit* (habit).

may be. But customs are simply the traditional way of acting, and valuing. Where there is no tradition there is no morality; and the less life is governed by tradition, the narrower the circle of morality. The free man is immoral, because it is his will to depend upon himself and not upon tradition" (*Dawn of Day*, trans. Kennedy, 14). It is more than likely that Nietzsche's text is very closely working away at the Hegelian construction, and he in fact rejects precisely what, for the author of the *Philosophy of Right*, was the specificity of *Sittlichkeit*, namely freedom.

V. *Ethik*

The notion of *Sittlichkeit* does not allow us, however, to account for the conflicts that can appear in the formation of habits and character (in the sense of *ethos*), between theological principles or prescriptions concerning action, and practical social or professional imperatives. Thus the need, for Max Weber, for another term: *Ethik*, which he uses throughout his work to account for the precepts that result from this conflict and that determine this particular *ethos*, and which he uses as well in the title of his book, *Die protestantische Ethik und der "Geist" des Kapitalismus* (*The Protestant Ethic and the "Spirit" of Capitalism*). In this work, the notions of "ethics" and *ethos* are clearly articulated in relation to one another. "Ethics" is the set of prescriptive rules that, precisely, lend to the conduct of Protestant capitalists the character of an *ethos*. This articulation enables Weber to analyze in these terms the idea that it is everyone's duty to increase their capital:

> Truly what is here preached is not simply a means of making one's way in the world, but a particular ethic. The infraction of its rules is treated not as foolishness but as forgetfulness of duty. That is the essence of the matter. It is not mere business astuteness, that thing is common enough, it is an ethos. *This* is the quality which interests us.
>
> (Weber, *The Protestant Ethic and the "Spirit" of Capitalism*, trans. Parsons, 51)

So what Max Weber understands by Protestant ethics cannot be reduced to a deduction of pure reason, in the sense of *Moralität*, nor to the rationality of the State, in the sense of *Sittlichkeit*. Taken in these terms, *Ethik* only exists as the systematic reconstruction of an ideal type. It is in this sense that there can be a capitalist ethics, a politico-social ethics,

or a "rational ethics of the profession" (see BERUF). It is in this sense, too, that we can refer to a bourgeois *ethos*, or an "*ethos* of the rational bourgeois enterprise."

To speak of *Ethik* is nevertheless ipso facto, and more generally, to go beyond the descriptive stage and to adopt a purely reflective, even systematic point of view. This is particularly true of Cohen's *Ethik des reinen Willens* (Ethics of pure will), in which *Ethik* designates the systematization of *Sittlichkeit*.

Cohen's *Ethics of Pure Will*

In his *Ethik der reinen Willens* (Ethics of pure will, 1904), Hermann Cohen explicitly critiques Kant's division between morality (*Moralität*) and legality (*Gesetzlichkeit*): on the one hand, Kant makes law the center of gravity of ethics, but on the other, he makes a distinction between morality and legality. Kant also separated the philosophy of right from ethics:

> Mann könnte denken wenn die Legalität des Gesetzes so gleichbedeutend wird mit dem Zwange des Rechtes, dass dadurch der Sinn des Gesetzes für die Ethik ausser Zweifel gestellt würde; dass es als das schlechthin allgemeine Gesetz von der Maxime als dem subjektiven Bestimmungsgrunde, unterschieden werde. Indessen wenn sonach das Sittengesetz als das Gesetz der Gemeinschaft und der Menschheit, aller Isoliertheit des Individuums engegentritt, worin unterscheidet es sich alsdann von dem Gesetze des Rechts, bei welchem es sich doch auch um Jedermann handelt? Es entsteht bei dieser Unterscheidung zwischen Recht und Sittlichkeit der schwere Zweifel, dass die reine Sittlichkeit vielmehr leer sei; und dass sie, von der Lehrart abgesehen, in der Hauptsache doch nichts Anderes als die Religion besage und bedeute.

> We might think that, if the legality of the law becomes synonymous with the constraint exerted by right, the meaning of the law for ethics would thus be guaranteed.... However, if the moral law [*Sittengesetz*], as a law of the community and of humanity, is opposed to any particularity of the individual, how would it be distinct from the law of right, whose competence extends to each and every one of us? Establishing a difference in this way between right and morality [*Sittlichkeit*] sows a seed of serious doubt: pure morality would then seem to be empty and, in essence . . . , it would be and would mean nothing other than religion.

(Cohen, *Ethik der reinen Willens*, 254)

The only other passage in which Cohen uses the *Fremdwort* (foreign word) *Moralität* emphasizes the fact that he does not consider legality in opposition to morality, but that morality has to be "recognized as being an immanent force of legality," and that if this link were removed, ethics would remain deprived of what would be, by analogy, the *factum* of science; the consequence of such a failure would be that ethics would fall either within the domain of psychology, or into the hands of religious exclusivity.

For Cohen, the distinction is thus between ethics and morality (*Sittlichkeit*), without it being a matter of a fundamental conceptual opposition; rather, it is first and foremost a problem of the logic of the system. Within the system, precedence is given to reason (*Vernunft*), and thus to logic, since it alone is able to determine the purity needed to clear the principles of thought of all representation, and consequently of ensuring that thought is truly autonomous when dealing with intuition and the data it carries. At the highest level of the system, one could establish an equivalence between reason and rational interest; understanding, which attempts to draw out the rational principles of the natural sciences (the lower level being the experience of nature), corresponds to reason, and ethics, from which right (the analogon of mathematics) and the law (the analogon of experience) are derived, corresponds to the interest of reason. In addition, ethics is the logic of the sciences of the mind (or the moral sciences), since the problems that come under its competence are the individual, totality, the will, and action.

This is why Cohen is also opposed to Hegel: because his logic would also encompass ethics. Whereas Hegel does consider as distinct the idea of *Sollen* (should be), he establishes an equivalence between the concept and the being. So, for him, the idea would be the development of the concept, and would remain a prisoner of being, which would also then encompass that which should be. Cohen opposes to this form of pantheism an equivalence between ideas (ideas are the prescriptions of the practical use of reason) and what should be.

Ethics is the science of pure will: the fact that the term comes from the Greek *ethos* [ἔθος] simply means that this science has not broken free from one of its problems, that of customs and manners (*Sitten*). But these customs are not the content of morality (that is, *Sittlichkeit*, as the content of the will, in the same way that nature is the content of thought), and were this not the case, this morality would seem to have as its basis the nature of the subject—something that Cohen rejects. Morality, rather, has right and justice as its objectives. From the point of view of its relationship with religion, ethics requires that religion be demythologized, since it is simply the historical form through which ethics has gradually found its way into general culture. The level of customs (*mœurs*) thus remains that of particularity and plurality, that is, the level of society; whereas the level of totality—that of the State (that which enables morality to be realized), and, further down the line, that of the confederation of States—is only affected by morality under a particular aspect. This aspect is morality, inasmuch as it is assimilated into an ethics whose ultimate horizon, the level of the unity of humanity, that is, the ideal, can only be thought from the perspective of the "pure" interpretation that ethics gives of Hebraic messianism. Cohen indeed refuses to grant religion any autonomy, as he does thought, will, and feeling (the feeling of the aesthetic): at most, religion has a "specificity" within the system (Marc de Launay).

➤ GOD, *NEGATION, NOTHING*

NAROD [народ] (RUSSIAN)

ENGLISH	people
FRENCH	*peuple*
ITALIAN	*popolo*
LATIN	*gens*

➤ PEOPLE, and *CULTURE*, *GENRE*, MIR, PRAVDA, RUSSIAN, SOBORNOST´, SVOBODA

The Russian noun *narod* [народ] is derived from *rod* [род], "family line, species, genus." *Narod*, exactly like "people," signifies both the population of a country and "the lower classes, the common people." For Slavophiles, *narod* has the elevated sense of the "spiritual unity" of the nation, and a large part of the Russian intelligentsia idealizes it as a natural and organic element, the "authentic life" of the people. Although it was a cliché in both czarist Russia and the Soviet Union, *narod* took on a less ideological meaning in the work of Bakhtin, who related it to the notion of *narodnaja kul'tura* [народная культура], popular culture.

I. *Narod* and *Gens*

The root *rod* [род], which in Slavic languages has supplanted the Indo-European radical **gen*, essentially signifies "birth." In modern Russian the term has the different senses of "clan, tribe, parents"; "family, line, generation"; "species, genus" (or "gender" in the grammatical sense) (RT: *Slovar' russkogo iazyka* [Dictionary of the Russian language]). All these meanings refer to entities (things or individuals) that have been created or put into the world together. In the derived term *narod* [народ] (people), the prefix *na-* still connotes more the totality of the individuals (put into the world together or unified).

In *The Russian Religious Mind*, Georgi Fedotov highlights the importance of the continuing veneration of the *rod*—a veneration that goes back to paganism and more particularly to the "cult of the dead as the ancestors of an eternal kinship community." "The Latin people and the Celtic clan," Fedotov writes, "are only pale images of social realities that were once alive. In Russian language and life, the *rod* is full of vitality and vigor." A typical linguistic manifestation of this vitality is the use of family names as polite forms of address: "The terms 'father,' 'grandfather,' 'uncle,' and 'brother,' as well as the corresponding feminine terms, are used in the language of Russian peasants to address both known and unknown individuals." In this way "all moral relationships between individuals are raised to the level of blood kinship." In Russian, family relationship is rendered by *rodstvo* [родство], an abstract nominalization of *rod*.

This linguistic habit of extending kinship relations to everyone sheds a particular light on the roots of Russian communalism and explains the importance of notions like *mir* [мир] (village community), *sobornost'* [соборность] (conciliarity), *obščestvo* [общество] (community), etc.: for Slavophiles, the archaic cult of the *rod*, to which *narod* clearly refers, is one of the characteristics of Russian civilization.

II. *Natsija*, *Narod*, and *Narodnitčestvo*

Observers of nineteenth-century Russian society repeatedly emphasized that the nobles (*dvorjane* [дворяне]) and the people (*narod*) often seemed to be two separate nations: their clothes, their manners, even their language—everything was different. The Russian word *natsija* [нация] (nation), which comes from the Polish *nacja* (RT: *Ètimologičeskij slovar' russkogo jazyka* [Etymological dictionary of the Russian language], vol. 3), was created during the time of Peter the Great, whose reforms produced a sharp division within Russian society between cultivated people and the *narod*. In its contemporary acceptation *natsija* signifies "a community of people unified by a language, territory, economy, and a common mentality, developed historically" (RT: *Slovar' russkogo iazyka*, vol. 2). As for *narod*, it means "the population of a state" but also "the lower classes, the common people" (RT: *Tolkovyĭ slovar' zhivogo velikorusskogo iazyka* [Explanatory dictionary of the living language of Great Russia], vol. 2).

For Slavophiles, *narod* has an elevated sense, whereas *natsija* is neutral in value. Slavophilism is essentially an ideological reaction to the modernization of Russia and particularly to the gap between the nobles and the *narod*. Slavophiles have concentrated on the Russian way of organizing life in the village community (*mir*) and on the interpretation of the law as truth and justice (*pravda* [правда]). This way of living was contrasted with Western standards of formal law (cf. Kireevski, *Polnoe Sobranie Sočinenii* [Complete works], 1: 115–16). The patriarchal Russian village was considered the true origin of the nation's life and strength, the incarnation of traditional national virtues. Slavophiles regarded themselves as full participants in this patriarchal life and did not want to detach themselves from the *narod*, which for them expressed the spiritual unity of all Russians.

The idealization of peasants is connected with guilt feelings on the part of the intelligentsia, whose privileges depended chiefly on the maintenance of serfdom; the term itself (*intelligentsija* [интеллигенция]) appeared around 1860 in the work of Piotr Boborykin and passed from Russian into other European languages (RT: *Great Soviet Encyclopedia*, vol. 10). The idea that intellectuals have a duty to the people found its practical development in the *narodničestvo* [народничество] movement. *Narodničestvo* is usually rendered in French, very inexactly, as *populisme*, and in English by "populism." An English translator of Berdyayev explains *narodničestvo* as "the movement that in 19th-century Russia was based on the feeling of an obligatory devotion to the general interests of the common folk" (Berdyayev, *Slavery and Freedom*). A *narodnik* [народник] is someone who "believes in the *narodničestvo* and practices it" (ibid.). During the 1860s and 1870s many *narodniks* "went to the people." They took up residence in the countryside in order to devote themselves

to bringing civilization to the people and improving their lives, seeking to overcome the gap between the intelligentsia and the *narod*. The ideals of *narodničestvo* inspired a few generations of passionate advocates who became physicians and schoolmasters in the villages.

Narodničestvo found expression in Russian literature of the second half of the nineteenth century, notably in the work of Tolstoy and Dostoyevsky. For Tolstoy, the simple, everyday life of the common people was endowed with a high moral and religious value: only in the common people was there true life, the life that allows the individual to arrive at salvation and "Resurrection" (*voskresenie* [воскресение]), to borrow the title of one of his well-known novels. Similarly, Dostoyevsky, exploring the nature of the "Russian character" (*russkij xarakter* [русский характер]), believed, in an almost religious way, in the Russian *narod* as the ultimate moral value.

III. Berdyayev, *Narod*, and *Ličnost'*

Berdyayev, on the contrary, adopts a personalist point of view and disapproves of the excessive cult of the *narod*, which he considers an obstacle to the development of subjectivity and individuality. *Narodničestvo*, he writes, "does not exist in the West, it is a specifically Russian phenomenon. Only in Russia can one find this perpetual opposition between the intelligentsia and the people [*narod*], this idealization of the people that becomes almost a religion, this quest for truth and God in the people" (Berdyayev, *Mirosozertsanie Dostoevskogo*). According to Berdyayev, *narodničestvo* reveals a weakness rather than a strength among the cultivated Russian elite:

> [T]he intelligentsia's tendency to seek its integrity solely in the "organic life" of the *narod* shows its lack of spiritual autonomy. Russian *kollektivizm* [коллективизм] and *sobornost'* have been considered a great advantage of the Russian people (*russkogo naroda* [русского народа]), the one that has raised it above European nations (*nad narodami Evropy* [над народами Европы]. But in reality this means that the person (*ličnost'* [личность]) and the personal spirit have not yet been awakened in the Russian people (*v russkom narode* [в русском народе]), and that the person is still too immersed in the natural element of the life of the people.

IV. *Narod*, Carnival, Laughter: The Notion of *Narodnaja Kul'tura* in Bakhtin

It is not surprising that *narod* plays the role of a major ideological cliché. In Soviet ideology *narod* was the general term that served to designate the workers, kolkhozians (workers on collective farms), and the "working intelligentsia" (*trudovaja intelligensija* [трудовая интеллигенция]). Its abstract nominalization, *narodnost'* [народность], was inscribed in the two famous trinities of Russian cultural history: along with autocracy (*samoderžavie* [самодержавие]) and orthodoxy (*pravoslavie* [православие]), it composed the formula of official nationalism in Russia at the end of the nineteenth century, and along with ideological conviction (*partijnost'* [партийность]), it constituted the dogmatic definition of "socialist realism" as an artistic genre. The cliché "socialist realism" was created in the USSR in the 1930s to define in an official way the method of Soviet literature.

Socialist realism is "an aesthetic expression of the socialist conception of the world and of man" (RT: *Great Soviet Encyclopedia*, vol. 24/1).

In Mikhail Bakhtin we find a counterideological use of the term *narod*. Bakhtin introduces the notion of "popular culture" (*narodnaja kul'tura* [народная культура]) or "comic popular culture" (*narodnaja smexovaja kul'tura* [народная смеховая культура]). Popular culture gives people a specific view of the world that is opposed to official or serious culture. For Bakhtin the twofold, serious/comic view of the world is an intrinsic characteristic of human civilization. The paradigmatic event of popular culture is the popular festival, the carnival. Carnival is a universal event, democratic and egalitarian. During the festival "life is subject only to [carnival's] laws, that is, the laws of its own freedom [*zakony svobody* (законы свободы)]" (Bakhtin, *Rabelais and His World*). Carnival "does not acknowledge any distinction between actors and spectators," Bakhtin writes, "because its very idea embraces all the people [*on vsenaroden* (он всенароден)]" (ibid.). The adjective *vsenarodnyj* [всенародный] poses a real problem of translation: it has been rendered in French by the expression "*fait pour l'ensemble du peuple*," and also by "*qui est le bien de l'ensemble du peuple*" (*L'Œuvre de François Rabelais*). In a sense, both translations are correct; *vsenarodnyj*, formed on the basis of *narod* and the prefix *vse-* (omni-), which expresses universality, means literally "omni-popular, shared by all." We must understand this term by putting it on the same level as Solovyov's *sobornost'* (uni-totality) and *vseedinstvo* [всеединство] (omni-unity = uni-totality).

However, Bakhtin turns the Slavophile vocabulary away from its ideological aim. As an actor in the carnival, the *narod* is a natural element, no longer a "mysterious, foreign, and seductive" force, as it is in Berdyayev (*Mirosozertsanie Dostoevskogo*, 169). It is gay and joyous. It is a spontaneous element in which the individuality and subjectivity of the modern period have not yet been separated from each other. It involves neither a person opposed to society nor a difficult shaping of personality that requires a return to the *narod*, as is the case in the *narodničestvo* of the nineteenth century. The person is unified with the *narod* in an organic manner: Bakhtin speaks of the "body of the *rod* [*rodovoe telo* (родовое тело)]" in Rabelais (Bakhtin, *Tvorčestvo Fransua Rable*). The expression *rodovoe telo*, in which the adjective *rodovoe* is derived from *rod*, is in fact another untranslatable expression: the French translator renders it as "corps procréateur" (Bakhtin, *L'Œuvre de François Rabelais*) and the English translator as "ancestral body" (*Rabelais and His World*, 19, 322–24). In fact, Bakhtin writes that in Rabelais's work, Pantagruel is the image of the "people's body [*vsenarodnoe telo* (всенародное тело)]" (*Tvorčestvo Fransua Rable*, 359, *Rabelais and His World*, 341). Carnivalesque culture is a spontaneous element that undoes all seriousness, including official ideology.

> As opposed to the official feast, one might say that the carnival celebrated temporary liberation from the prevailing truth and from the established order; it marked the suspension of all hierarchical rank, privileges, norms, and prohibitions.

> (*Rabelais and His World*, 10)

Bakhtin underscores the indissoluble and essential connection between the extra-official laughter of the popular feast and freedom (*svoboda*) (*Rabelais and His World*, 71–73). Thus, under the Stalinist regime humanism took the form of an anti-autocratic *narodničestvo*:

> Growth and renewal are the dominant motifs in the figure of the people (*narod*). The people (*narod*) is the newborn child fed on milk, the newly planted tree, the convalescent and regenerated organism.

<div align="right">(Ibid., chap. 6)</div>

If we now return to the twofold meaning of "people" (see PEOPLE), both the body of citizens and the mass of the excluded, we see that it is more the second term of this opposition on which thinking about the *narod* is based. The history of the intelligentsia connects the word with the diverse strategies deployed for getting closer to or distinguishing oneself from the *narod* (insofar as it has neither the same education nor the same culture)—unless it is, as in Bakhtin, to foil the ideological instrumentalization that these strategies themselves imply.

NATURE

GERMAN	*Natur, Aufgang*
GREEK	*phusis* [φύσις]
LATIN	*natura*
RUSSIAN	*priroda* [природа], *natura* [натура]
SPANISH	*naturaleza*

➤ ART, *CULTURE*, ERSCHEINUNG, ESSENCE, ESTI, FORCE, LIGHT, MIMÊSIS, *TO BE*

The Latin translation of the Greek *phusis* [φύσις] by the Latin *natura*, from which are derived most of the words designating "nature" in European languages, can be considered an inconsequential event in Western history—or, on the contrary, a major event—with great historical import. Heidegger never ceased to problematize this translation as it had never been problematized before, though

that led him to render the Greek *phusis* as *Aufgang*, "opening up," "emergence," rather than by *Natur*, "nature." To gauge the significance of Heidegger's gesture we must, however, move beyond the pseudo-opposition between a supposedly Greek nature-growth and a supposedly Roman nature-birth. Setting himself the task of determining *phusis* as the movement of a thing's coming to be by itself (whence physics), Aristotle turns first to etymology to make this term signify in its original sense:

> "Nature" [*phusis*] means (1) the genesis [*genesis* (γένεσις)] of growing things [*tôn phuomenôn* (τῶν φυομένων)]— the meaning that would be suggested if one were to pronounce the *u* in *phusis* long.

<div align="right">(*Metaphysics*, 5.4. 1014b 17–19)</div>

Aristotle explicitly connects *phusis* with *phuô* [φύω], *phuesthai* [φύεσθαι], "to grow, raise, cause to be born, to develop," the verb coming from the Indo-European root **bhu-*, from which also come the Latin *fui*, the French *fus*, the English "[to] be," and the German *bin*, *bist*, in the conjugation of the verb *sein* in the present indicative, which until the fourteenth century included forms that have now disappeared, *<wir> birn*, *<ihr> birt*, replaced respectively by *sind* and *seid*, which, like the Latin *sum*, come from a different Indo-European root.

This connection of *phusis* with the idea of "growth" may nonetheless seem as insufficient as it is incontestable, for we must still ask how "growth" is understood. Heidegger proposes to move back from the idea of "grow" to the allegedly more originary idea of "flowering" (Ger. *das Aufgehen*), which can itself be traced back phenomenologically to an "appearance":

> The other Indo-European radical is *bhu*, *bheu*. To it belong the Greek *phuô* [φύω], to emerge [*aufgehen*], to be powerful [*walten*], of itself to come to stand and remain standing. Up until now this *bhu* has been interpreted according to the usual superficial view of *physis* [φύσις] and *phuô* [φύω] as nature and "to grow" [*wachsen*]. A more fundamental exegesis, stemming from preoccupation with the beginning of Greek philosophy, shows the "growing" to be an "emerging," which in turn is defined by presence [*Anwesen*] and appearance [*Erscheinen*]. Recently the root *phy-* [φυ] has been connected with *pha-* [φα], *phainesthai* [φαίνεσθαι]. *Physis* [φύσις] would then be that which emerges into the light [*das ins Licht Aufgehende*], *phyein* [φύειν] would mean to shine, to give light therefore to appear. (Cf. *Zeitschrift für vergl. Sprachforschung*, vol. 59.)

<div align="right">(Heidegger, *Introduction to Metaphysics*, 59)</div>

Heidegger problematizes, in an unprecedented way, the age-old translation of Greek *phusis* by Latin *natura* and its different derivatives in European languages, in contrast, for example, to Husserl, who declared at the beginning of his Vienna lecture that in Greek antiquity nature is "what the ancient Greeks considered nature [*was den alten Griechen als Natur galt*]." Nonetheless, the Slavic languages constitute a notable exception: while Russian uses *natura* [натура] in the sense of "the essence of a being," *natura rerum*, natural phenomena taken as a whole are designated instead by the term *priroda* [природа], from *rod* [род], which is close to the meaning of German *Geschlecht*: "generation, line, race, species" (see GESCHLECHT).

Breaking with a long tradition, or rather a long obstruction, Heidegger proposes, then, to reinterpret *phusis* not as "nature" (from Latin *nasci*, "to be born"), but as *Aufgang*, an "opening-up" or "emergence." But contrary to a commonly held view, Heidegger does not oppose a *natura*-"birth" to a *phusis*-"growth" that he considers more originary; rather, the line of demarcation runs between *phusis* on one hand, and *natura* as birth and growth combined on the other. While nature designates a sector of the existent (in pairs of oppositions in which the other term may be culture—nature/culture—history, art, super-nature [grace], etc.), *phusis* names instead the "how" (desinence-sis: *phu-sis*) in accord with which everything appears. It is a name for Being, not for the existent. In short: "nature" is ontically oriented, and *phusis* is ontological. Reinterpreted in its original acceptation, the term *phusis* seems to Heidegger to be "*das Grundwort des anfänglichen Denkens* (the basic word of beginning thought)" (*Heraklit*, 101).

■ See Box 1.

Rather than Homer, it is Heraclitus who constitutes the source on which Heidegger constantly drew for the meaning of *phusis*, and notably fragment 123: *phusis kruptesthai philei* [φύσις κρύπτεσθαι φιλεῖ]. This fragment has often been translated as "Nature likes to hide itself." Heidegger renders it this way: "Das Aufgehen dem Sichverbergen schenkt's die Gunst," or "Das Aufgehen schenkt die Gunst dem Sichverbergen" (*Heraklit*, 110)—"It is to withdrawal [to the movement of withdrawing] that unclosing grants its favor." Or, in Jean Beaufret's French translation of the German translating the Greek: "Rien n'est plus propre à l'éclosion que le retrait" (*Dialogue*, 1, 18). Here it is no longer a matter of "nature" but of an internal tension, an "unapparent harmony," in the Heraclitean sense, between veiling and unveiling, occultation and disocculation, or between sheltering and unsheltering. That is probably why Heidegger notes that the term *phusis* is "perhaps untranslatable" (*vielleicht unübersetzbar*), following this passage:

> We still leave untranslated the fundamental word: *phusis.* We do not say *natura* and *Nature*, because these names are too equivocal and loaded—and, in short, because they acquire their nominative force only from a very special and very slanted interpretation of *phusis.* We have in fact no word for conceiving in a single expression the mode of deployment of *phusis* as it has been clarified up to this point. (We try to say *Aufgang*—the rise of what rises by opening—but we remain powerless to give to this word, without intermediary, the plenitude and determination it needs.)

> (Heidegger, *Wegmarken*, 259; *Questions II*, 208–9)

Homer, *phusis* and *pharmakon*

➤ LOGOS

The first known occurrence of *phusis* is found in Homer. The word, a hapax, is uttered by Hermes in an enigmatic passage that deals especially with the *pharmakon* [φάρμακον] and the language of the gods:

> So spoke Argeïphontes, and he gave me the medicine (*pharmakon*), which he picked out of the ground, and he explained the nature of it to me (*kai moi phusin autou edeixe* [καὶ μοι φύσιν αὐτοῦ ἔδειξε]). It was black at the root (*rhizêi* [ῥίζῃ]), but with a milky flower (*anthos* [ἄνθος]). The gods call it *moly*. It is hard for mortal men to dig up, but the gods have power to do all things.

> (*Odyssey*, 10. 302–306)

The word *pharmakon* (from **pharma*, which it is tempting to connect with *pherô* [φέρω], "plant that grows in the earth," RT: *Dictionnaire étymologique de la langue grecque*, s.v.) means both "remedy" and "poison" ("medicinal herb, drug, treatment, philter, potion, spell, dye, color, cleaning agent, reagent, tanner," etc.; the *pharmakos* [φαρμακός, accent on the omicron] is a scapegoat, an expiatory victim, whereas the *pharmakos* [φάρμακος, accent on the alpha] is a poisoner, a magician). This ambivalence allows the word to designate in a perfectly appropriate way the *logos* [λόγος] that causes pain or enchants, produces terror or courage (Gorgias, *Eulogy of Helen*, 82B 11 DK, §14), and also writing, as a remedy/poison for memory (Plato, *Phaedrus*, 274e; see Derrida). But in Homer, Hermes's *pharmakon* is a *pharmakon esthlon* [φάρμακον ἐσθλόν] (v. 286, 292, a "plant of life," says Bérard, "good," "courageous," like a Homeric hero), capable of saving Odysseus from Circé's *pharmakon*, which transforms men into swine—but brings Odysseus into her bed. Among the gods this good *pharmakon* is called *môlu* [μῶλυ], which sounds like a "loan-word of unknown origin," but later designates a kind of garlic (RT: *Dictionnaire étymologique de la langue grecque*). It is this *pharmakon* whose *phusis* Hermes explains to Odysseus. By translating *kai moi phusin autou edeixe* as "*il m'apprit à connaître*" ("he taught me to know"), Victor Bérard skillfully uses an elision to avoid the difficulty, whereas Homer says "and he explained the *phusin* of it to me." Wolfgang Schadewaldt, on the other hand, renders *phusis* in this passage by *Wuchs*, a word from the same family as the verb *wachsen*, "to grow," and thus goes back to the idea of growth (*Die Odyssee*, 176: "*und wies mir seinen Wuchs*"). In any case, *phusis* is, like the idea of *pharmakon* itself, contradictory or ambivalent: the root is black, the flower white. Language of the gods, language of humans, difficult to understand for mortals, but easy for the all-powerful; black but white; remedy and poison: the textual terrain of *phusis* requires careful attention.

Supernatural

➤ *GRACE*, SVET (Box 1)

At the beginning of his commentary on Book II of Aristotle's *Physics* (in *Questions II*), Heidegger mentions, among the antithetical oppositions in which "nature" is one of the terms, "nature/grace," adding between parentheses: "*Über-natur*" (super-nature). Although the adjective *surnaturel* has become common parlance in French, the same is not true of the substantive *surnature*, and the least one can say is that it is hardly used outside the vocabulary of theologians, so that we are more inclined to nominalize the adjective and speak of the "supernatural," at the price of an abusive confusion, in ordinary usage, with the "paranormal." A mystery remains to be explained: why is there this strange absence? To understand it, we have to examine the history of the "supernatural." This history has been written, from the point of view of the history of dogma, by Henri de Lubac, in his classic study *Surnaturel—Études historiques*, which forms a trilogy with two other works: *Augustinisme et théologie moderne* and *Le Mystère du surnaturel.* According to *Augustinisme et théologie moderne* (315n2), it was Scheeben who introduced the word *Übernatur* ("super-nature") in a technical sense, distinguishing it from the supernatural, but de Lubac adds: "Although this distinction does not appear to have been widely adopted, one cannot, in our view, make Scheeben entirely responsible for the currently widespread usage that incorrectly replaces *surnaturel* by *surnature.*" The appearance of the term *Übernatur* seems to go back, in the German language, to Rhineland mysticism: "Suso once speaks of an '*übernatur*' (*Das Büchlein der ewigen Weisheit* [*A Little Book of Eternal Wisdom*], Part 2, chap. 24), but it does not seem that this word came into widespread use" in German (*Surnaturel*, 405). It appears to have been in the ninth century, in "the Carolingian translations of Pseudo-Dionysius by Hilduin and John Scotus Erigena, that *supernaturalis* made its true entrance into theology," an entrance that was to be followed by a long eclipse: "Its use, which remained rare until the middle of the thirteenth century, became widespread only after St. Thomas Aquinas" (ibid., 327). The word seems to have been shaped by the Greek *huperousios* [ὑπερούσιος] (Didymus the Blind, Pseudo-Dionysius), and thus has a very distant origin in the equation *phusis* = *ousia* [οὐσία] mentioned by Aristotle (*Metaphysics* 5.4, 1015a 12–15).

| NEGATION

The word "negation"—like the Latin *negatio*, from *nego*, *negare* ("to say no" and "affirm that [. . .] not [. . .]," "deny," "reject")—designates both the term, particle, or negative operator ("not," "no," "nothing," "no one") and an utterance or proposition that is opposed to assertion, or to a given assertion, and whose truth value is thus the inverse of that of affirmation.

I. Negative Words and How to Designate What Is Not the Case

1. See *NOTHING* (ESTI) for the formation and meaning of negative terms in various languages See also *PERSON, II.4.*
2. On the relationship to being, see OMNITUDO REALITATIS, REALITY; cf. *TO BE* (ESTI).
3. On the relationship to the Other, see NEIGHBOR; cf. TO TRANSLATE, Box 1.
4. On the experience of negation and the relationship to nonbeing, see ANXIETY; cf. DASEIN, *MALAISE.*

II. The Operations of Negation

1. On the logical procedure that makes possible the construction of an assertion or a negation, and on their truth value, see PROPOSITION and TRUTH; see also NONSENSE, PRINCIPLE (in particular PRINCIPLE, I.C on the principle of noncontradiction) and SENSE; cf. *FALSE,* IMPLICATION, *LIE,* SPEECH ACT. Concerning the fact that

two negations are not necessarily equivalent to an assertion, see PORTUGUESE and ESTI I, IV.

2. On the procedure of extenuation and the passage to the negative, especially in theology, see ABSTRACTION, Box 1.

3. On the dialectical force of the negative and of negativity, see AUFHEBEN; cf. ATTUALITÀ, PLASTICITY, PRAXIS.

4. On the procedure of denial, in which negation leads to an awareness of a content, see VERNEINUNG; cf. DRIVE, ENTSTELLUNG, and more generally ES, UNCONSCIOUS, WUNSCH.

5. On erasure and oblivion, see MEMORY; cf. AIÔN, ERZÄHLEN, HISTORY.

➤ *AUTRUI*, and ACTOR, I/ME/MYSELF, MENSCHHEIT, MITMENSCH, PARDON, SUBJECT, WELT, *WORLD*

The English word "neighbor," based on the prefix "nigh-" (denoting proximity in time or space) and the suffix "boor" (a dweller or place of dwelling, as in "bower" or "abode"), brings three distinct but overlapping conceptual clusters into philosophy and critical theory. First, and most important, is the religioethical register of the Neighbor, which derives from the biblical injunction to "love your neighbor as yourself" (originally found in Lv 19:18, and quoted and referred to elsewhere, e.g., Mt 22:39, Mk 12:31, Lk 10:27, Jas 2:8, Rom 13:9). This Neighbor connotes an unspecified category of fellow human beings (and sometimes animals) whom we are obligated to "love," usually understood as implying responsibility or care. Islam too refers to "the neighbor" (*al-jar*) as a figure of special obligation and ambiguous determination (see Qur'an, Surah Al-Nisah 4:36, and the Maariful commentary by Mufti Muhammad Shafi); the Arabic *jar* [جار] is closely related to the Hebrew *gar* (to dwell) and thus to *ger* (a proselyte, resident Gentile, or stranger). The religious figure of the Neighbor passes readily into secular culture and ethics, where it is often presented as the emblem of a universal ideal, and sometimes as equivalent to the "other" of the so-called Golden Rule: "do unto others as you would have them do unto you." This is a weak parallel, however, since the Levitical injunction does not necessarily imply reciprocity, and some interpreters (such as Kierkegaard and Levinas) have insisted on its asymmetry. The figure of the Neighbor as a privileged object remains very active in philosophy and psychoanalysis, as well as in vernacular ethics.

Second, we can distinguish a more general sociopolitical concept of *neighbors*, based on propinquity, spatiotemporal proximity, or contiguity. If the Neighbor is the embodiment of a religioethical ideal, neighbors are transient figures who contingently occupy that position. The modern discussion of sociopolitical neighbors and the neighborhood begins with Weber, Tönnies, Durkheim, and Simmel and continues in contemporary sociology, political theory, public policy, and urban planning. In his first inaugural address in 1933, Franklin D. Roosevelt announced his administration's Good Neighbor Policy, which was intended to improve relations with Latin America in the reflexive logic of the Levitical commandment. For Roosevelt, the good neighbor "resolutely respects himself and, because he does so, respects the rights of others." Robert Frost's famous line, "Good fences make good neighbors," with its problematics of the border, could serve as the sociopolitical neighbor's motto. If the "good neighbor" at minimum is one who observes boundaries and respects obligations, neighbors may also provide mutual assistance or share conviviality—but unlike the religioethical Neighbor, the value of reciprocity here remains paramount. Positive, negative, and ambivalent representations of neighbors can occasionally be found in modern literature (e.g., Rilke, Kafka, Thomas Berger), whereas in popular culture, from Donald Duck to David Lynch, the figure of the "bad neighbor" (whether merely annoying or downright threatening) is much more common. The sociopolitical idea of neighbors implies the existence of a *neighborhood*, usually a territorial vicinity or social grouping based on shared resources, interests, or problems; the neighborhood is an informal mode of association situated between the intimacy of the family and the public concerns of the polis. A neighborhood may involve no more than a vaguely defined geographical area, or it can organize itself as a quasi-political entity, a "neighborhood association," for the sake of common issues or goals. Moreover, the rise of the Internet has allowed for the easy development (and even easier dissolution) of virtual "neighborhoods" that fulfill neighborly functions such as the exchange of information, opinions, and phatic gestures.

Third, we can identify a mathematical set of meanings of *neighboring*, which is often associated with the derivative terms "neighborhood" and "nearest neighbor" and is current in topology, set theory, graph theory, systems theory, cellular automata theory, game theory, and various branches of information technology. The mathematical concept of the neighborhood was introduced by David Hilbert in his definition of planes in *Foundations of Geometry* (app. 4) and developed by Felix Hausdorff in his foundational work on set theoretical topology. Generally speaking, the neighborhood of a given point is defined as a collection of elements or points with certain specific properties in relation to that point, depending on the particular axiomatization. The mathematical notion of the neighborhood describes modes of place and proximity but is not limited to classical Euclidean, or "metric," models of space. The neighborhood of a point in metric space involves those points that are less than a certain distance from it, whereas in topological space, a neighborhood can be specified without such metrics, allowing for concepts such as "being near" and "infinitesimal closeness" and producing a much more general theory

of abstract spaces. If distance is a key idea in the theory of metric space, the neighborhood has an analogous function in topological space, which can be deformed without altering the structure of its neighborhoods. Several branches of social and biological sciences make use of theories of neighborhoods in their models, including social network analysis, mathematical sociology, and a branch of molecular embryology known as topobiology. And several philosophers, including Alain Badiou, Gilles Deleuze, Felix Guattari, and Manuel DeLanda, have used mathematical neighboring for political, social, and other conceptual functions.

In all three of these contexts, the Neighbor and "neighboring" involve a degree of ambiguity or indeterminacy. The question of who is included in the category of the Neighbor is vigorously argued in Judaism, Christianity, and Islam. In social theory and political discourse, neighbors constitute a zone of indistinction between friends and enemies, the familiar and the strange, where alliances are contingent and hospitality easily slips into hostility. In popular culture, such neighbors are often represented as social irritants or comic foils, symptomatic of the permeability of private and public space, of real and virtual neighborhoods. Religioethical and sociopolitical concepts of the neighbor tend to be nonsystematic and informal in their fundamental concepts, and this is one reason why the neighbor has occasioned such complex and controversial histories of hermeneutical, ethical, and philosophical speculation. Mathematical accounts of neighboring, on the other hand, strive to formalize concepts such as adjacency, connectedness, and approximation by means of such fundamental set theoretical distinctions as that between parts or regions of a set, on the one hand, and groups of particular elements or members of a set, on the other.

These three meanings fused (some would say confused) in the English word "neighbor" are distinguished by two or more terms in other European languages. The religioethical Neighbor of the Hebrew Bible and the New Testament is usually translated as *prochain* in French—"Tu aimeras ton prochain comme toi-même" (Ostervald, *Traduction de la Bible*, 1724) and *Nächste* in German—"Du sollst deinen Nächsten lieben wie dich selbst" (Luther, *Biblia, das ist, Die gantze Heilige Schrifft, Deudsch*, 1545). *Prochain* derives from *proche*, meaning "close" or "nearby," from the vulgar Latin *propeanus* and the classical *prope*. In the New Vulgate translation, the neighbor of Leviticus 19:18 is *proximum*, the "closest" (although in earlier Latin editions *amicum*, "friend," was used). The Greek term used already in the Septuagint is *plêsion* [πλησιον], also signifying nearness. The German *Nächste* is the substantive of the adverb *nächstens*, meaning "soon" or "near," again implying physical proximity or temporal imminence. In German, *der Nächste* means generally "the next one" (as in *Du bist der Nächste*, "You're next"), and specifically the neighbor to whom one is obligated, but it is not used to refer to the sociopolitical neighbor. This next-door neighbor is *der Nachbar* (masc.) and *die Nachbarn* (fem.), terms very close to the English "neighbor." The French equivalents are *le voisin* (masc.) and *la voisine* (fem.), which come from the Latin *vicinus*, meaning "near" and derive from *vicus*, meaning "a quarter or district of a town." The mathematical concept of neighboring often borrows the language of sociopolitical usages, so

in French the word for a topological neighborhood is *voisinage* (in German, however, a distinct word is used, *Umgebung*, meaning "surroundings" or "environment"). In comparison with French and German, the English word "neighbor" may appear promiscuous in its condensation of three distinct semantic fields; but it also suggests the possibility of productive conceptual interimplications among the three ideas.

The original formulation "love your neighbor as yourself" (*v'ahavtah le're'akha kamokha* [וְאָהַבְתָּ לְרֵעֲךָ כָּמוֹךָ]) in the Hebrew Bible (Lv 19:18) has led to a complicated history of interpretations and a polemic between Judaism and Christianity. The verse is lexically and grammatically ambiguous: Who is referred to as "neighbor" (*re'a*)? What is meant by "love" (*ahav*)? And what is implied by the reflexive term "as yourself" (*kamokha*)? The use of the preposition ל here, indicating "love to" rather than "love of" or "for" the neighbor, is unusual; and the particle ו that connects this line to the previous verse can imply equally conjunction (and) or disjunction (or), each involving distinct, even opposed, interpretive consequences. The word *re'a* [רֵעַ]—usually but not invariably translated in this context as "neighbor"—derives from the primitive root *ra'ah*, which means to "pasture," "tend," "graze," or "feed," without the connotations of proximity that emerge in European languages. *Re'a* is used in a variety of senses in the Torah, and its reference in Leviticus 19:18 is unclear—does it apply exclusively to fellow Jews, or are other people included? The dominant strand of Jewish interpretation of the commandment, from Onkelos (second century CE) through Maimonides (twelfth century) up to the Emancipation (1848), has argued that *re'a* is limited here to other Jews; and indeed, in some of its other biblical appearances, the word seems to refer exclusively to fellow Israelites. But at still other points *re'a* is not confined in this way: in Exodus 11:2, for example, *re'a* refers to the Jews' Egyptian neighbors; elsewhere it seems to figure idolaters or even idols (Jer 3:1), and in Psalm 139 it seems to signify "thought" or "will." Modern Jewish commentators (cf. Simon) have argued for a broader understanding of Leviticus 19:18, often citing the thirteenth-century French rabbi Menachem Ha-Meiri as evidence of a universalist ethics of the neighbor in Judaism, but this may in part be due to pressure from competition with Christianity.

It is not surprising that Christianity, in its Pauline mission to the Gentiles, presents an expansive interpretation of the Neighbor. Already in the parable of the good Samaritan in Luke (10:25–37), the question, who is my neighbor? (*kai tis estin mou plêsion* [και τις εστιν μου πλησιον]) seems controversial: in contrast with the Kohen and the Levite, who pass by without helping a "half dead" man in the road (perhaps due to religious prohibitions against priestly contact with a corpse?), the Samaritan—an Abrahamic sect with heterodox beliefs and practices, hence similar to Christianity—assists the injured man with unlimited generosity, instituting an almost saintly paradigm of the good neighbor, one that is implicitly opposed to Jewish legalism and tribalism. Beyond its polemical function, the parable has significant philosophical implications: first, it poses the neighbor as a *question*—that is, as a topic for debate, a problem, or idea—moreover, one with political implications, in the suggested politico-theological opposition of Judaism and Christianity as particularist and

universalist communities. Second, the neighbor here is now a *subjective* position, which is expressed as the imperative of becoming a neighbor rather than treating others as neighbors—a dialectical inversion of earlier biblical references, where the neighbor was invariably presented as a grammatical and ethical object. If the question at the beginning of the parable is, who is the neighbor (whom I should love)? by the conclusion, the question is implicitly reframed as, who am I (who should love my neighbor)?

While Christianity tends to expand the inclusiveness of the category of neighbor, it also limits or focuses the sense of "love" in the Levitical verse by translating it into Greek as *agape* (*caritas* in Latin; both words are often translated into English as "charity"), which does not have the sexual implications of *eros* or the philosophical sense, beginning with Aristotle, of *philia*. The Hebrew word that appears in the injunction, *ahav* [אָהַב], is used for all kinds of love, from erotic to spiritual, from the most illicit to the most hallowed. The rabbinic tradition has been especially elaborate in its accounts of the vast number of particular duties implied by "love" in Leviticus 19:18, including acts intended to alleviate the suffering of others, to increase other people's enjoyment, and to minimize the friction of everyday social relations. It is worth noting, too, the unexpected uses made of the commandment as a proof text in a number of Talmudic contexts, including discussions of sexual relations and capital punishment. In Tractate *Niddah*, for example, it is argued: "A man is forbidden to perform his marital duty in the day-time, for it is said, *But thou shalt love thy neighbor as thyself*. But what is the proof? . . . He might observe something repulsive in her and she would thereby become loathsome to him" (17a). And the imperative of establishing the least painful methods of execution is asserted in Tractate *Kethuboth* and elsewhere by citing the commandment: "Scripture said, But thou shalt love thy neighbour as thyself—choose for him an easy death" (37b). Although these references to Leviticus 19:18 are not presented as interpretations of the commandment, they suggest that the neighbor can accommodate both the most intimate and the most public interpretations and that ambivalence and even death are by no means foreign to its account of neighbor love.

In the Gospels, the injunction to love the neighbor is always paired with that to love God (from Dt 6:5), and the two commandments are frequently linked in later Christian accounts of neighbor-love, as well as in numerous Jewish sources, as the supreme religioethical principle. Saint Augustine argues that the naturally occurring love of self must be transformed or corrected by love of God, and only then can we love our neighbor appropriately. Hannah Arendt points out that for Augustine it is only from the perspective of a self-love that has passed through self-denial that authentic neighbor-love is possible: "It is not really the neighbor who is loved in this love of the neighbor—it is love itself" (*Love and Saint Augustine*). Arendt argues that for Augustine, neighbor-love does not establish the natural community of a neighborhood but instead *isolates* both the neighbor and the self, who are alone together with God.

For philosophy the most important Christian account of neighbor-love, however, is Saint Paul's: "Owe no one anything, except to love one another; for the one who loves

another has fulfilled the law. The commandments . . . are summed up [*anakephalaioutai* (ανακεφαλαιουται)] in this word, 'Love your neighbor as yourself.' Love does no wrong to a neighbor; therefore, love is the fulfilling [*plêrôma* (πληρωμα,)] of the law" (Rom 13:8–10). In calling neighbor-love the "summation," or literally, "recapitulation" of the law, Paul is repeating the rabbinic commonplace, associated as well with Jesus, that it represents the moral essence of Judaism, as it will in Christianity. But when Paul calls neighbor-love the "fulfilling" of the law, he is saying something much more radical. This notion of *plêrôma* has often been taken as a key statement of Christian supersessionism, the assertion that Jewish "law" (and Judaism as such) is *replaced* by Christian "love," as the conclusion of an earlier moment and the imminence of a new one. According to Giorgio Agamben, Paul's account of neighbor-love as *plêrôma* is a process that leads not to epochal transformation but rather to the fulfillment of the law in each moment, "a *messianic* recapitulation, something inseparable from the messianic fulfillment of times." Alain Badiou argues that Paul reduces the multiplicity of the law to the single injunction to love the neighbor insofar as it avoids the law's dialectics of prohibition and transgression in its pure positivity and because "it will require faith in order to be understood . . . because *prior to the Resurrection, the subject, having been given up to death, has no good reason to love himself.*" For Badiou, self-love, in its fidelity to the event of the resurrection, *instantiates* a subject; to love the neighbor "as yourself" thus is the work of a faithful subject whose love enacts the "*force* of salvation." In his 1987 lectures on Paul, Jacob Taubes emphasized Paul's disconnection of the commandments to love God and the neighbor in this passage; Paul's exclusion of love of God, Taubes argues, must be understood as an "absolutely revolutionary act," the critique of the function of God the Father, anticipating both Nietzsche and Freud and opening a new political theology of the neighbor.

From the eighteenth century, philosophy has taken up the biblical tradition of the Neighbor, often as an emblem of ethical reason as such. In *The Groundwork of the Metaphysics of Morals* (1785; in *Practical Philosophy*), Kant presents neighbor-love as a paradigm of practical reason based on the will, rather than mere inclination. In the *Critique of Practical Reason* (1788), he claims that neighbor-love is not only a particular "law of love" but also the "kernel of all laws," the expression of the asymptotic goal of "the moral disposition in its complete perfection"—the "love for the law" (5:83–84). And in the *Metaphysics of Morals* (1797), echoing the common complaint that love cannot be commanded, Kant argues that neighbor-love must be understood as a practice of "*benevolence* (practical love)," not an affective state. Nevertheless, Kant grants the injunction to love the neighbor the status of a metaethical principle and calls it one of the fundamental "subjective conditions" of the concept of duty (6:399). As "the duty to make others' *ends* my own (provided only that these are not immoral)," neighbor-love for Kant expresses the duty of Duty itself, beyond any particular religious conviction or ethical objective (6:450)—indeed, Kant barely mentions the neighbor in his *Religion within the Limits of Reason Alone* (1793), as if the topic rightfully belongs to philosophy.

For Hegel, however, Kant's account of ethics and neighbor-love, remains, we might say, "too Jewish." In *The Spirit of Christianity and Its Fate* (1799; in *On Christianity*), Hegel criticizes "Kant's profound reduction of what he calls a 'command' (love God first of all and thy neighbor as thyself) to his moral imperative." For Jesus, Hegel argues, neighbor-love is "a command in a sense quite different from that of the 'shalt' of a moral imperative." Kant's imperative, like the notion of a commandment in Judaism, implies a split between an "is" and an "ought" (as well as "reason" and "inclination"); neighbor-love, however, is purely an *is* (*ein* Sein), or what Hegel calls, in a remarkable phrase, "a modification of life" (*eine Modifikation des Lebens*), and is formulated as a commandment only because life requires form in order to be expressed. In the subsection on "Observing Reason" in *Phenomenology of Spirit* (1807), Hegel returns to neighbor-love as an example of reason's claims for "immediate ethical certainty" (parallel with his earlier discussion of consciousness's "sense-certainty"): "Another celebrated commandment is 'Love thy neighbor as thyself.' It is directed to the individual in his relationship with other individuals and asserts the commandment as a relationship between two individuals, or as a relationship of feeling [*Empfindung*]." But this "feeling" must involve an *act*, and this act must be reasoned, in the service of my neighbor's well-being [*Wohl*]: "I must love him *intelligently*" (*ich muß ihn mit* Verstand *lieben*). The immediacy and necessity claimed for the commandment are imperiled by the impossibility of knowing the conditions of my neighbor's well-being with any certainty; indeed, Hegel argues, only the state can determine the nature of "intelligent, substantial beneficence" (*verständige wesentliche Wohltun*), and the individual's act of neighbor-love is both trivial in comparison with the state's and always potentially in conflict with it. Hence, as a commandment, neighbor-love is merely an empty, formal universality; any content given to it is contingent and uncertain. But while the commandment cannot claim concrete universality, Hegel insists that "in its simple absoluteness, it represents *immediate ethical being* [*unmittelbares sittliches Sein*]," prior to and in excess of the empty oppositions between subject and object, content and form, as well as individual and state.

This tension between formal universality and immediate ethical being is played out in the nineteenth century and later. Of special note is Kierkegaard's lengthy discussion in *Works of Love* (1847), which is organized into three inflections of the commandment: "You *shall* love," "You shall love *the neighbor*," and "*You* shall love the neighbor." For Kierkegaard, neighbor-love is the only form of love that is essentially free, paradoxically, *because* it is commanded. Whereas erotic love and friendship are bound to the compulsions of desire and the vicissitudes of affection, the imperative to love the neighbor liberates the subject, who must make a radical and existential decision, *either* "preferential love" *or* neighbor-love. This choice, moreover, is the condition of possibility of any authentic form of love, including "self-love," which is limited by neighbor-love rather than by its foundation. In its uncanny proximity, the neighbor questions the self-identity of both subject and object. The neighbor, Kierkegaard writes, "in itself is a multiplicity," unlike the necessary individuality of the friend or the lover; the neighbor, moreover, is *generic*, without the particularity that characterizes the object of preferential love. Hence some commentators (including Adorno) have accused Kierkegaard of eliminating the neighbor as a living person altogether, leaving only the abstract idea of "the human"; indeed, Kierkegaard argues that the most unselfish and freest love is for the *dead*, who have none of the distracting traits of living individuals. In an essay from 1940, Adorno argues that the "impotent mercifulness," "severed from social insight," of Kierkegaard's doctrine of neighbor-love reflects the failure of social relations in modernity, "the deadlock which the concept of the neighbor necessarily meets today. The neighbor no longer exists."

In later modernity, we find increasing suspicion of the injunction to love the neighbor—that it is an ideological ruse, the very motto of bad faith. For Nietzsche, neighbor-love is symptomatic of the failure of *self*-love: "Your love of the neighbor is your bad love of yourselves," both narcissistic and self-loathing. Rather than love of the neighbor, Nietzsche follows philosophical tradition by urging love of the friend—not, however, because the friend is "closer" to the subject than the neighbor—indeed, if anything the neighbor is too close: "Do I recommend love of the neighbor to you? I prefer instead to recommend flight from the neighbor [*Nächsten-Flucht*] and love of the farthest [*Fernsten-Liebe*]. . . . I wish you were unable to stand all these neighbors and their neighbors [*allerlei Nächsten und deren Nachbarn*] . . . [T]hose farther away pay for your love of your neighbor; and even when you are together five at a time, always a sixth one must die" (*Thus Spoke Zarathustra*). Nietzsche argues that neighbor-love is unjust: to love *this* neighbor is always to sacrifice some other neighbor who happens to be farther away; but even more, neighbor-love gives up on "the farthest"—the possibility of encountering the new, the unknown, the yet to come. As if reformulating the Levitical injunction, Nietzsche writes, "Let the future and the farthest be for you the cause of your today: in your friend you shall love the overman as your cause" (*in deinem Freunde sollst du den Übermenschen als deine Ursache lieben*). In its distance, the friend is the locus of the coming "overman," who is not an idealization of the specular "self" but rather the "cause" of what the subject may become.

If for Nietzsche the neighbor is too close, for Freud, the neighbor is too distant, not near enough to one and one's interests, and thus undeserving of love. In his impassioned critique of neighbor-love in *Civilization and Its Discontents*, he writes, "My love is something valuable to me which I ought not to throw away without reflection. . . . If I love someone, he must deserve it in some way. . . . He deserves it if he is so like me in important ways that I can love myself in him; and he deserves it if he is so much more perfect than myself that I can love my ideal of my own self in him" (*Standard Edition*, 21:109). Love *is* narcissistic for Freud, hence one both can and must love only those with whom one can identify, insofar as there is a limited economy of love and to squander it recklessly would be irresponsible and at the expense of those with a rightful claim to it. Moreover, the call to neighbor-love conceals the truth of civilization's "discontents," the aggressivity in excess of any self-interest or economy: "The element of truth behind all this, which people are so ready to disavow, is that . . . their neighbor is for them not only a potential helper or sexual object, but also someone who tempts

them to satisfy their aggressiveness on him, to exploit his capacity for work without compensation, to use him sexually without his consent, to seize his possessions, to humiliate him, to cause him pain, to torture and kill him" (*Standard Edition*, 21:111).

For Freud and Nietzsche, the injunction to neighbor-love emblematizes the ethical and social contradictions that fret the project of Enlightenment and hence requires ironic unmasking as ideology. But the intensity of their critical attention and the striking degree of animus that fuels it suggests that the neighbor is not merely one more moral cliché among many but instead a special source of anxiety and trauma, to be returned to as a resource for thinking. For a series of philosophers and psychoanalysts in later modernity, including Rosenzweig, Levinas, and Lacan, this disturbing element in the neighbor and the injunction to neighbor-love exceeds the dialectics of religion and secular reason precisely as the residue of those logics and as something caught up in them but not fully explainable in the terms of either.

In his seminar of 1959–60, *The Ethics of Psychoanalysis*, Lacan suggests that Freud's critique of neighbor-love reveals a fundamental truth about *jouissance*, the traumatic enjoyment that the subject both repudiates and secretly treasures. Lacan connects Freud's discussion of the Neighbor in *Civilization and Its Discontents* with his account of the *Nebenmensch*—literally the "next person," the first other encountered by the subject—in his early *Project for a Scientific Psychology* (*Standard Edition*, vol. 1). At the heart of the *Nebenmensch* is what Freud calls *das Ding*, the unsymbolizable "thing" that constitutes the kernel of exteriority, the other's *jouissance*, at the heart of subjectivity. Lacan argues that Freud repudiates the commandment to love the neighbor not merely as naïve or impractical but also as a manifestation of the "obscene" demands of the superego for excessive enjoyment. It is this account of the neighbor that allows Lacan to formulate an ethics of psychoanalysis that avoids the problematic (discovered by Saint Paul) that the moral law itself *produces* desire and transgression in its very attempt to limit them. In this ethics, to love the neighbor's *jouissance* as one's own would be to encounter the strangeness of one's desire. More recently, Lacan's account of the neighbor has been a recurrent topic in the work of Slavoj Žižek, Eric Santner, and Kenneth Reinhard. Žižek's numerous essays, talks, and chapters on the topic express his ambivalence: "Smashing the Neighbor's Face"; "Love Thy Neighbor? No Thanks!"; "Fear Thy Neighbor as Thyself"; and "The Only Good Neighbor is a Dead Neighbor!" For Žižek, as well as for Santner and Reinhard, however, the neighbor persists as a key locus of political theological insight even after its disenchantment and death in modernity.

In this work on the political theology of the neighbor, Lacan is supplemented by that of the German Jewish philosopher Franz Rosenzweig. The figure of the neighbor is an exemplary locus for what Rosenzweig calls "the new thinking," which is in excess of the dialectic of faith and reason. In *The Star of Redemption* (1919), Rosenzweig sees neighbor-love as the purely human means of enacting redemption according to the two paths represented by Judaism and Christianity. The "Jewish" mode of neighbor-love involves the instantaneous transformation of love of self into love of the neighbor, which thereby immediately realizes eternity; the "Christian" mode is the world-historical expression of redemption through the progressive expansion of local congregations into universal empire. In each case, the neighbor is the "anyone" whose proximity is coordinate with the imminence of redemption, which is always "not yet" and ever unfolding "from one neighbor to the next neighbor." Rosenzweig's ideas on the neighbor respond to those of his teacher, Hermann Cohen, one of the founders of the Marburg School of neo-Kantianism. In *Religion of Reason* (1919), Cohen tried to reconcile Jewish legalism with Kantian ethics. Cohen had already vigorously defended the universalism of the Jewish account of the neighbor in 1888, when he testified in a defamation suit against an anti-Semitic school teacher who had claimed that Judaism authorizes discrimination against Gentiles; this testimony along with three other essays of Cohen's on the neighbor were collected and published by Martin Buber after Cohen's death.

Buber's own reflections on the neighbor and the "I–Thou" relationship were in turn influential in Emmanuel Levinas's work on the neighbor (although Levinas was critical of the reciprocity of Buber's model). The neighbor is a crucial topic in both Levinas's "Jewish" and "philosophical" writings, including his major work, *Otherwise Than Being* (1974), in which it represents an originary proximity that determines the subject as responsible and fundamentally indebted to the other: "Proximity is thus *anarchically* a relationship with a singularity without the mediation of any principle, any ideality. What concretely corresponds to this description is my relationship with my neighbor. . . . [I]t is an assignation of me by another, a responsibility with regard to men we do not even know." For Levinas, the neighbor figures the pre-ontologically ethical constitution of the subject in its nonreciprocal relationship to the other. According to Levinas, the obligation to love the neighbor is a debt that can never be amortized and for which I am unjustly persecuted: no person can take my place and assume my ethical burden, but I am called to assume the place of all other neighbors. For Levinas, the radical asymmetry of the relationship to the religioethical Neighbor must be distinguished from the equality and interchangeability that define sociopolitical neighbors; in this sense, the injunction to love the neighbor is both *descriptive* and *prescriptive*—it is both the condition of subjectivity as such and an imperative to sociopolitical action.

Levinas's account of the neighbor can be understood as a critique of Heidegger's notion in *Being and Time* of *Mitsein*, or "being-with," which, many critics have argued, is not for Heidegger a social or ethical relation but rather the originary structure of *Dasein*. In his later work, the proximity of *Mitsein* develops into a discourse of nearness, the neighbor, and the neighborhood—concepts that do not readily correspond to the ideas of the neighbor we have described so far but which we might call ontological neighboring. As Derrida points out, whereas in *Being and Time* the "nearness" of *Dasein* to being is *ontic*, in Heidegger's later writings proximity is *ontological*: "Whence, in Heidegger's discourse, the dominance of an entire metaphorics of proximity . . . a metaphorics associating the proximity of Being with the values of neighboring, shelter, house, service, guard, voice, and listening" ("The Ends of Man"). In the "Letter on Humanism" (1946), for example, Heidegger writes that "man is the neighbor of being" (*Der Mensch ist der Nachbar des Seins*;

Basic Writings), and in "The Nature of Language" (1957), he writes that "Thinking . . . goes its ways in the neighborhood of poetry. It is well, therefore, to give thought to the neighbor, to him who dwells in the same neighborhood" (*On the Way to Language*). Derrida criticizes Heidegger's account of *Dasein*'s proximity as merely one more version of humanism, the "proper" of man, and asks, "Is not this security of the near what is trembling today?" The theme of the neighbor persists in Derrida's writings, including his posthumous *The Animal That Therefore I Am* (2006), where he criticizes the tradition, from Aristotle to Heidegger, of regarding animals as "*all the living things* that man does not recognize as his fellows, his neighbors, or his brothers." Derrida suggests that animals epitomize the uncanny otherness of the neighbor: "[N]othing will have ever given me more food for thinking through this absolute alterity of the neighbor or of the next (-door) than these moments when I see myself seen naked under the gaze of a cat."

The mathematical concept of the neighborhood is central to a series of key oppositions that run through the work of Deleuze and Guattari, including that between "striated" (or metric) and "smooth" (or nonmetric) spaces in *A Thousand Plateaus* (*Mille plateaus*, 1980). These oppositions derive in part from Pierre Rosenstiehl and Jean Petitot's distinction between hierarchical "arborescent" societies (which they describe via the so-called friendship theorem, where, for any group of "friends," there is exactly one "dictator" who coordinates the system and is everyone's "friend") and "acentered," or nonmetric "rhizomatic" systems based on *neighbors*, "in which," according to Deleuze and Guattari, "communication runs from any neighbor to any other, the stems or channels do not preexist, and all individuals are interchangeable, defined only by their state at a given moment." Unlike the static system of "friends" (which Deleuze and Guattari associate with the classical "*philo*-sopher"), a neighborhood is a *becoming*, "a zone of proximity [*zone de voisinage*] and indiscernibility, a no-man's-land, a nonlocalizable relation sweeping up the two distant or contiguous points, carrying one into the proximity [*le voisinage*] of the other—and the border-proximity [*voisinage-frontière*] is indifferent to both contiguity and to distance." In *What Is Philosophy?* (1991), Deleuze and Guattari propose a "geophilosophy" of neighbors: if the Greek philosophical society of "friends" leads to the capitalist society of "brothers," geophilosophy organizes itself in terms of *neighbors*: "a concept is a heterogenesis—that is to say, an ordering of its components by zones of neighborhood."

If for Deleuze and Guattari a concept as such is a "neighborhood," a loose assemblage of valences and vectors, for Badiou the neighborhood is a particular *concept*, with precise mathematical and political implications. In *Theory of the Subject*, Badiou develops the mathematical idea of the neighborhood into a dialectical materialism through the distinction between algebra and topology (1982; from seminars delivered in 1975–79). For Badiou, materialism involves two types of dialecticity drawn from mathematics: the algebraic disposition, based on identity, belonging, and reflection; and the topological disposition, based on the asymptote, adherence, and the remainder. Algebra, which is a "combinatory materialism," studies the relations between the elements of a set according to laws of "composition"

(such as association or commutativity) in terms of the belonging or *membership* of elements. Topology, according to Badiou, arises from the need to grasp movement and place in order to specify concepts such as location, approximation, continuum, and differential. Rather than individual elements, topology examines *parts* or subsets; it aims at "what happens when one investigates the site of a term, its surrounding, that which is more or less 'near' to it. . . . If the master concept of algebra is that of the law (of composition), topology is based on the notion of neighborhood." Whereas algebra is a science of identifying and naming a particular element, topology involves *dis-identification* or de-particularization: what applies to one point in a topology *must also apply to other neighboring points.* Topology does not describe individual elements but rather *collectives*; in a "neighborhood," Badiou writes, "the element is the point of flight for a series of collectives. The individual has no other name than its multiple adherences" (*Theory of the Subject*). The notion of locating elements in overlapping clusters as "neighborhoods" tends toward the "expansion of the local" as more and more elements are potentially each other's "neighbor." Badiou makes the political implications of this model explicit: "the working class may be the first neighborhood—already very vast—of a factory revolt. You will thus obtain . . . wider neighborhoods. . . . The intersection of these two neighborhoods is nothing less than the form of internationalism immanent to the term 'revolt'" (*Theory of the Subject*). The topological concept of a neighborhood thus suggests a principle of political collectivization other than citizenship (whose models are paternal and fraternal and based on genealogy and friendship): the neighbor is not a "member" of a state defined by socioeconomic coordinates but is, instead, a *part* of a loosely aggregated neighborhood.

Badiou's account of the potentially infinite expansion of the neighborhood involves Paul Cohen's concept of a "generic" set produced by the technique known as "forcing" (ideas that are central in Badiou's *Being and Event.*) By "forcing" a "generic extension" of a set, a new set is produced that is nonconstructable, that is without external unifying predicates—thus not a proper set at all under Gödel's criterion of constructability. As its name suggests, a generic set is only *minimally* described: "[T]he generic essentially resembles the topological, which . . . disindentifies the element in favor of its neighborhoods" (*Theory of the Subject*). In political terms, Badiou associates such a "forced" generic neighborhood with the possibility of the proletariat itself. If a generic set is a neighborhood in which individual elements are indiscernible and the limit function is approximate, the authentically political neighborhood is essentially *generic*, an open collective whose parts are always in excess of its members. In the final chapter of *Theory of the Subject*, "Topologies of Ethics," Badiou proposes an ethics of exposure, of openness, where "justice" and "courage" are presented as functions of the neighborhood: justice relativizes the law—it arises from the "topologization of algebra," in which "the neighborhood subordinates the elementary to itself. Justice is the *blurring of places*, the opposite, therefore, of the right place." Courage, on the other hand, interrupts the relativized law for the sake of the excess, the remainder, "thus dividing the prescription of the place by *completely* investing its neighborhoods. All courage amounts

to passing through there where previously it was not visible that anyone could find a passage." Finally, Badiou's topological concept of the virtues of the neighborhood provides a precise model for the political idea called *communism*: the neighbor is the subject of communism, subtracted from the state—the common or generic subject, whose adherences are minimally specified and infinitely expansive.

NEUZEIT / MODERNE (GERMAN)

ENGLISH   modern times, modern age, modernity
FRENCH   *temps modernes, âge moderne, modernité*

➤ BAROQUE, BILDUNG, CLASSIC, HISTORY, PRESENT, ROMANTIC, SECULARIZATION, STATO, *TIME*

In contrast to the *antiqui/moderni* pair, the German *Neuzeit* is part of an idea of historical periodization that divides history into three ages: antiquity, Middle Ages, and *Neuzeit*. Since the nineteenth century the term has designated the period that follows the Middle Ages, a period that is fundamentally open to the present and whose temporal limits seem ill defined. Unlike *die Moderne* (which French and English translate, as they do *Neuzeit*, by *modernité*, "modernity"), which generally refers to the nineteenth century and more

particularly to its aesthetics, *Neuzeit*, which was coined at the same time, indicates first of all the feeling of a profound change in all domains of life such as might have been experienced by the humanists of the "Renaissance" who were made the pioneers of this "modernity" (Burckhardt). The chronological extension of the term ranges, with many variations, from the Italian Renaissance to the century of industrialization, and indeed down to our own time.

Since Ranke proposed the historiographic practice and theory known as *Historismus*, the notion of *Neuzeit* has undergone additional differentiations (into subperiods such as *Frühe Neuzeit, jüngere Neuzeit, neueste Neuzeit*); on the other hand, *Neuzeit* correspondingly has lost its initial connotations and has become simply a term of historical periodization. It is in that form that the notion of *Neuzeit* was definitively established (in the middle of the twentieth century) in history, sociology, and the history of philosophy. It is also increasingly argued that this historical period should be closed by assigning it an end. Here, however, the debate becomes philosophical, and German then prefers to use the term *Moderne*, which usually shifts the discussion to the value of modernity. French has no way to render this shift in emphasis.

The first use of *Neuzeit* is found in the Grimm brothers' dictionary (1884), where it is opposed to the *Vorzeit* (literally, "the earlier period") and illustrated by a verse written by the young revolutionary Freiligrath in 1870, in which he describes himself as "a feverish and impassioned child of the *Neuzeit* who still longs a little for the older [time] (*die alte* [*Zeit*])." Here the word expresses a feeling of renewal (*Neu-zeit*, literally, "new time"), an upheaval affecting all life and all people, contemporaries' excitements and fears; it is applied to the present time, but it also situates the individual in the dynamics of history that carries everyone along with its forward thrust, that is, in general progress. In French this is rendered by the expression *les temps modernes* rather better than by the word *modernité*.

I. *Neuzeit*: The Historiographical Determinants

A series of events traditionally marks the beginning of the *Neuzeit*: the discovery of America in 1492, that is, the opening up of a closed world to a potentially infinite universe; Luther's proclamation of his ninety-nine theses and the beginning of the Reformation in 1517; and the invention of the printing press. The interpretation of some of these events has given rise to intense debates, particularly in the case of the Reformation, in which Nietzsche saw a regressive protest against the Italian Renaissance (*The Antichrist*, §61), and on which Troeltsch offered a more qualified judgment balancing the Reformation's traditional (that is, for him, Lutheran) elements against the innovative (Calvinist) ones (*Die Bedeutung des Protestantismus für die Entstehung der modernen Welt*, 1911).

However, a consensus among historians has emerged, defining the *Neuzeit* on the basis of a certain number of dominant traits inchoately emerging well before 1500, that enables us to discern a long-term historical configuration (*longue dureé*). Among these traits is the invention of printing and the consequent opening up of a "public space" (*Öffentlichkeit*): the communication media that were developed starting in the sixteenth century are described in German as *neuzeitlich* and not *modern*, the latter word being reserved for the technical innovations of industrialization in the nineteenth and twentieth centuries. To this is usually added the transition from feudalism to a capitalist economic model, the development of a new social class—the bourgeoisie—and the formation of modern states. Various concepts have been tried out, associated, and opposed to provide a more complete explanation of this process of turning societies into states: in addition to the well-known processes of absolutism and "disciplinarization" (*Zivilisationsprozess*, with the different nuances introduced into it by Michel Foucault and Norbert Elias), the pair formed by the concepts of secularization and confessionalization (*Säkularisierung, Konfessionalisierung*) (see SECULARIZATION) characterizes the whole of historical writing about the Germanic Holy Roman Empire and establishes itself as one of the most remarkable components of thinking about the *Frühe Neuzeit*.

II. *Frühe Neuzeit, Neuere Zeit, Neueste Zeit*: Problems of Periodization

Economic and political historians differentiate *Neuzeit* into three or four phases. The first, that of the *Frühe Neuzeit*, goes from about the time of the first Italian city-states to the end of the Thirty Years' War, and led to a new order in Europe (1350–1650). The second phase is described as *neuere Zeit* or *jüngere Neuzeit* and is marked by the formation of a modern subject and the ideals of the Enlightenment. It is generally said to extend as far as the French Revolution, emphasizing the advent of the bourgeoisie as a historical actor. Industrialization and its effects constitute the essential trait of the third period, designated as *neueste Zeit*. This tautological redundancy (*neu, Neuzeit, neueste Zeit*, etc.) shows that the notion of *Neuzeit* always implies an awareness of the historical relativity of every period (R. Vierhaus, "Vom Nutzen," 14). Of these expressions only *Frühe Neuzeit*, which designates the period between about 1450 and 1650 and is sometimes extended as far as 1800, has been unanimously adopted.

The problems of defining and delimiting a *Neuzeit* period have led to extensive historiographical reflection. Thus, this concept has been connected with the notion of crisis (Aston, *Crisis in Europe*) and with the suggestion, made by Hans Blumenberg and others, that well-defined historical periods are separated by transitional periods. The idea of a "threshhold between periods" (*Aspekte der Epochenschwelle*) or even of a "threshold century" (*Vierhaus*, ibid., 21), allows us to abandon the search for the exact limits of the *Neuzeit* and conceive it instead as a set of diverse changes and as a plural, open process (ibid., 23). The same can be said of Reinhard Koselleck (in Brunner, Conze, and Koselleck, *Geschichtliche Grundbegriffe*, 1: xiv–xv); introducing the idea of a time when modernity was "getting into the saddle" (*Vorsattelzeit*), in which the "process of translating" "classical topoi" into "modern [*neuzeitlich*] conceptuality" took place, he makes a differentiation that other historians have adopted in their periodizations of German history) (cf. H. Schilling, *Aufbruch und Krise*).

III. *Neuzeit*, Nature, and the Divine

The historiography of the *Neuzeit* accords a large place to the transformations of science. For Romano Guardini, the change in the notion of nature and the philosophy of nature

is the essential characteristic of the *Neuzeit* (*Das Ende*, 35ff.). Drawing on Goethe, he considers modern man a stranger in the midst of nature, which no longer is, of course, in any way divine. Ernst Cassirer went so far as to make central to his thinking about the *Neuzeit* the idea of a modern individual who has to resituate himself in relation to this unknown universe (*Individuum und Kosmos*). For Cassirer, the *Neuzeit* begins somewhere between Nicolas of Cusa's theory of knowledge and ignorance and Giordano Bruno's materialism. Bruno is also one of the main figures of the *Neuzeit* for Hans Blumenberg (*Die Legitimität*), even though Blumenberg chooses the name of Copernicus to mark the turning point of modern times and the "pathos" of this revolution (*Die kopernikanische Wende* and *Kopernikus im Selbstverständnis der Neuzeit*, 343). Man is no longer at the center of the world; his "ex-centricity" entails his cosmological and theological deracination (*Entwurzelung*), compensated by a theoretical "curiosity" (*curiositas, theoretische Neugier*) that constitutes, as it were, the signature of the *Neuzeit*. The notion of *Neuzeit* is thus paired with that of secularization, which Blumenberg, in opposition to Carl Schmitt, seeks to liberate from a long tradition of interpretation that makes of it a "category of historical illegitimacy" (*Kategorie geschichtlichen Unrechts*).

■ See Box 1.

IV. *Neuzeit, Moderne*

Although in German the adjective *modern* is replacing *Neuzeit* with increasing frequency, the substantive *Moderne* remains uniquely applicable to the historical period that begins around the middle of the nineteenth century. In addition, the concept of the *Moderne* appears along with the art and literature of this period, and its theorizations are always aesthetic in nature—from Friedrich Vischer, who sees in it "the union of the ancient and the romantic" (*Aesthetik oder Wissenschaft*, §467), to Theodor Adorno, who describes modernity as "the art of the most advanced consciousness" (*Ästhetische Theorie*, 57; on Baudelaire's "*beau moderne*" and the philosophical interpretation of modernity, see Vincent Descombes, *Philosophie,* and Jürgen Habermas, *Der philosophische Diskurs* [1988]). On the other hand, after World War II the word *Neuzeit* seems to have lost its optimistic connotations and has been reduced to a neutral historical term, whereas the word "modern" still reflects the idea of a positive progress. In the debate over postmodernity and neo-structuralism that flourished in Franco-German philosophical dialogue during the 1980s, it was the term *Moderne* that was used. The *Moderne*, setting aside the notions that are associated with it (subjectivity, autonomy, self-foundation) and the criticism that has been directed at them, is conceived fundamentally as a project, and this introduces into it a component of reflexivity that is absent in the notion of *Neuzeit*, at least in its current usage (cf. Habermas, "Die Moderne," 1980); this might be the philosophical specificity of *Moderne* in relation to *Neuzeit*. At a time when the project of modernity is being challenged, the fate of the notion of *Neuzeit* thus seems to have dwindled in philosophy and to retain its pertinence only in historiographical debates about the periodization of modernity. However, given the richness of these debates, it could be that the speculative power of the concept of *Neuzeit* will remain. Moreover, the originality of Blumenberg's philosophical project can also be gauged by the maintenance of the term *Neuzeit*, which signals a different periodization of modernity by taking as its starting point the Renaissance rather than the Enlightenment and the Industrial Revolution, unlike thinkers concerned with the *Moderne*. The difference between Blumenberg and Habermas thus begins with their choice of words. The problem of French *modernité* would then be that it cannot account for this bifurcation.

1

Vor tid, nutiden (Danish)

These terms, which are rendered as "our time," "the present time," "the epoch," and other analogous expressions, appear in almost all the works in which Kierkegaard characterizes his period. The latter is subjected to criticism for having lost the sense of the individual man's (*Enkelte*) concrete possibilities because it has not undertaken the task of the "subjective existent thinker." The "epoch" is dominated philosophically by speculation and socially by mass culture (the press). This also affects Christianity, Denmark's official religion. Being aware of one's times to the point of denouncing their vices is to confront the incomprehension of the present generation and abandon all hope of being admired.

The tactic to be adopted consists in deceiving one's surrounding world ("*Mundus vult decipi, decipiatur ergo*": 2: 229, 9: 313, 16: 33), making them hear the voice of the isolated man who stigmatizes the failings of the epoch. Kierkegaard might have said, like Hamlet, "The time is out of joint." But he would have done so without believing that he was called upon to "set it right." For his "time," he wants to be only a "corrective" (*correctiv*) (17: 276, 19: 43). Whether it is a matter of thought, literary mores, or religion, the task of the subjective thinker is simply to describe the stages of existence, their specific temporality, in order to make the reader "attentive" (14: 79, 86) to the dangers of "leveling" (*Nivellering*) (5: 153) and of jealousy that levels (8: 184, 202, 225). This is not unrelated to Heidegger's analysis of mediocrity (*Durchschnittlichkeit*) or of "one" (*man*) and leveling (*Einebnung*) (*Sein und Zeit*, §27).

NONSENSE

FRENCH	*non-sens, absurdité*
GERMAN	*Unsinn, Sinnlosigkeit*
SPANISH	*disparate, sinsentido*

➤ *ABSURD*, and ENGLISH, INGENIUM, *NEGATION*, PRINCIPLE, PROPOSITION, *SENS COMMUN* [COMMON SENSE, SENSUS COMMUNIS], SENSE, SIGN, SIGNIFIER/SIGNIFIED, SPEECH ACT, TRUTH, *WITTICISM*

Why is it generally difficult to translate "nonsense" as the French expression *non-sens*? Why has it not been possible, until recently, to bring the "positive" dimension of "nonsense" into French or German? To answer these questions we have to examine the development of the expression, particularly in contemporary English, and the gradual explication and even philosophical rehabilitation of nonsense: to determine, so to speak, the different senses of non-sense. For the analytical tradition, it is particularly important to distinguish radical nonsense or the absurd (cf. the German adjective *unsinnig*) from a nonsense that is the absence of meaning or emptiness (cf. Ger. *sinnlos*) and which accordingly raises the question of a (normative) definition of the meaningful. But we can also try to move beyond this distinction, as did, in various ways, Wittgenstein's grammatical philosophy.

I. Natural Conception / Philosophical Conception of "Nonsense"

We can distinguish, following Cora Diamond in her essay "What Nonsense Might Be," two conceptions of nonsense. They are defined superficially by what "nonsense" is opposed to: "good sense" and "sense." The English word "sense" has precisely these two uses (cf. Jane Austen's title, *Sense and Sensibility*, which is rendered in French by *Raison et Sentiments*, but which refers to both sense and the sensible; also recall the adjective "no-nonsense," which means "solidly reasonable"). "Sense" is thus the exact opposite of "nonsense," and the identification of these two conceptions of nonsense in a single expression is no doubt characteristic of English.

Among the British empiricists, notably Hume, nonsense is opposed first of all to reason (in the sense of "good sense," "common sense"); it is associated with the absurd and the ridiculous and sometimes simply with an absence of seriousness. Hume is fond of the expression "talking nonsense," which he occasionally uses in a critical way:

> Does a man of sense run after every silly tale of witches or hobgoblins or fairies, and canvass particularly the evidence? I never knew any one that examined and deliberated about nonsense.

(*Letters of David Hume*, vol. 1, no. 188)

Or again, in a letter to Strahan:

> Since Nonsense flies with greater Celerity, and makes greater Impression than Reason; though indeed no particular Species of Nonsense is so durable. But the several Forms of Nonsense never cease succeeding one another; and Men are always under the Dominion of some one or other, though nothing was ever equal in Absurdity and Wickedness to our present Patriotism.

(Ibid., vol. 2, no. 455)

The "natural" sense of nonsense is thus at first sight something like "absurd" or "contradictory." In *Leviathan*, Hobbes identifies absurdity and nonsense: man has not only the privilege of reason, he writes, but also "the privilege of absurdity, to which no living creature is subject, but men only. And of men, those are of all most subject to it that profess philosophy" (chap. 5). But Hobbes also develops an initial, quite elaborate linguistic theory of nonsense. He distinguishes between two types of nonsense in expressions:

> One, when they are new, and yet their meaning not explained by definition; whereof there have been abundance coined by Schoolmen and puzzled philosophers. Another, when men make a name of two names, whose significations are contradictory and inconsistent. . . . For whensoever any affirmation is false, the two names of which it is composed, put together and made one, signifie nothing at all.

(*Leviathan*, chap. 4, §21–24)

For example, the expressions "round quadrangle" or "incorporeal substance" are meaningless, "meere sound"; here we are dealing with radical nonsense, since Hobbes does not limit himself to saying that the expression refers to no object, that it has no meaning (it is a "senselesse and insignificant word"); it is empty, it signifies nothing.

Here we have a first glimpse of the transition from the natural conception (nonsense = absurdity) to a philosophical or linguistic conception of nonsense, the two conceptions remaining closely linked:

> And therefore if a man should talk to me of a round quadrangle . . . or of free-Will, I should not say he were in an Errour ; but that his words were without meaning; that is to say, Absurd.

(Ibid., chap. 5, §22)

For Hobbes, nonsense is a capacity of the human species ("the privilege of Absurdity") that is as distinctive as the capacity for laughter (cf. *Leviathan*, chap. 6); we will see that the two are not unrelated.

II. Philosophers and the Natural Conception of Nonsense

The natural conception is developed in Annette Baier's article "Nonsense," which presents six categories:

1. what is obviously false, and "flies in the face of the facts";
2. semantic nonsense, that is, the case in which one doesn't know what one is talking about, in which the utterance is "wildly inapposite";
3. phrases that imply category mistakes; e.g.: "This stone is thinking about Vienna," or this passage from Lewis Carroll: "He thought he saw a Garden-Door / That opened with a key; / he looked again, and found it was / A Double Rule of Three";
4. word sequences that are composed of familiar terms but have an "oddball and unclear syntactical structure." Thus the expression Carnap cites in the classification of nonsense he offers in his famous essay "The Elimination of Metaphysics through Logical Analysis of Language": "Caesar is and";
5. statements that are produced by taking a "respectable" statement and replacing one or more of its words (but not too many) with meaningless words that cannot be translated into the familiar vocabulary, while at the same time retaining a recognizable structure. An example proposed by G. E. Moore: "Scott kept a runcible at Abbotsford"; another, by Carnap, in his *Logical Syntax of Language*: "Piroten karulieren elatisch"; and by Frege, in his *Über die Grundlagen der Geometrie*: "Jedes Anej bazet wenigstens zwei Ellah." We see that these examples of nonsense arouse a certain creativity among philosophers, even those who are the least imaginative. The literary examples of this kind of nonsense are countless: obviously Lewis Carroll, or, in German, Christian Morgenstern (what commentators call "nonsense lyrics" inspired by Mauthner; see Jacques Bouveresse, *Dire et ne rien dire*);
6. "Mere gibberish."

Obviously it is conception 5, which was broadly exploited by Lewis Carroll, that is the most fascinating one from the translator's point of view. The translations of Carroll's "Jabberwocky" no doubt vary more than those of "normal" sentences, but they can be made without difficulty and in accord with well-defined rules, as is shown by the following example:

> All mimsy were the borogoves.
> (Tout flivoreux vaguaient les borogoves.)

(Parisot)

> (Enmîmés sont les gougebosqueux.)

(Warrin, in *The Annotated Alice*)

In reality, this category of nonsense illustrates the independence of meaning from syntax, as is shown by Chomsky's

ultrafamous example, "Colorless green ideas sleep furiously," which, though nonsensical, can still be translated.

But category 4 is equally central for contemporary philosophical reflection: it is used in the philosophy of language to distinguish two types of nonsense, one radical (category 6), and the other, a syntactical or categorical nonsense, which consists in putting together words that do not go together.

III. The Battle over Philosophical Nonsense

A. The substantial conception of nonsense

Philosophical nonsense is inseparable from the idea of linguistic rules that determine the limits of meaning, of what can be said. Many interpreters think they find such an idea in Wittgenstein's *Tractatus logico-philosophicus.* But this is instead a later conception that can be found, for example, in the work of Rudolf Carnap and Bertrand Russell, and it is radically different from the natural conception. It assumes that we have to mark off nonsense, that is, pseudo-propositions (*Scheinsätze*), from meaning, from what can be said.

In "The Elimination of Metaphysics," Carnap distinguishes two kinds of meaningless pseudo-propositions:

i. those that contain one or more words without meaning;
ii. those that contain only words that have meaning but are arranged in such a way that no meaning emerges from them.

According to Carnap, metaphysical nonsense can sometimes be reduced to nonsense of type (i). But usually a metaphysician knows perfectly well what he means by each of his words, and the critique of metaphysics bears on nonsense of type (ii). Type (i) is pure nonsense; it is literally unintelligible. Type (ii) nonsense is substantial nonsense: we know what each part of the proposition means—the problem is the composite that they form.

> In saying that the so-called statements [*Sätze*] of metaphysics are *meaningless* [*unsinnig*], we intend the word in its strictest sense . . . a sequence of words is meaningless if it does not, within a specified language, constitute a statement. It may happen that such a sequence of words looks like a statement at first glance; in that case, we call it a pseudo-statement.
>
> ("Elimination of Metaphysics")

For Carnap, logical syntax specifies which combinations of words are acceptable and which are not. The syntax of natural language allows the formation of nonsense (ii), in which there is a "violation of logical syntax." Here we see the emergence of a specific, philosophical conception of nonsense:

> Let us take as examples the following combinations of words:
>
> 1. "Caesar is and"
> 2. "Caesar is a prime number."
>
> Since (2) looks like a statement yet is not a statement, does not assert anything, expresses neither a true nor a false proposition, we call this word sequence a "pseudo-statement." . . . This example has been so chosen that the nonsense is easily detectable. Many

so-called statements of metaphysics are not so easily recognized to be pseudo-statements. The fact that natural languages allow the formation of meaningless sequences of words without violating the rules of grammar, indicates that grammatical syntax is, from a logical point of view, inadequate.

> (Ibid.)

The nonsense thus obtained is not due to one or another word's lack of meaning but rather to the meanings themselves that these words have and that fail to combine to "make sense." The rules of ordinary language are different from the rules of logical or philosophical syntax. Thus for Carnap there are "varieties" of nonsense—not only the absurd or radical nonsense but also the logically impossible.

This so-called substantial conception of nonsense, apparently inspired by Wittgenstein and his idea of the "limits of meaning," is in reality profoundly opposed to his conception of nonsense as sense.

B. *Sinnlos/unsinnig*

Frege and Wittgenstein have a conception much closer to the natural one and recognize only one kind of nonsense. This is what is called the austere conception of nonsense, and it can be opposed to Carnap's substantial conception. Wittgenstein's conception, particularly in the evolution from his earlier to his later philosophy, provides interesting perspectives.

The question of nonsense, including the question of the different kinds into which nonsense may be divided, becomes central in the philosophy of language starting with Wittgenstein's *Tractatus* and his use of Frege's definition of sense (see SENSE, V). Nonsense understood as an absence of meaning is at the center of the contemporary conception of logic. Frege identifies sense and thought (*Gedanke*), a thought being a special kind of sense, a propositional sense. The important point for Frege is not to conceive the sense/nonsense distinction on the model of the true/false distinction. There are true or false statements and thoughts: a statement is true (or false) when it expresses a true (or false) thought; but there is no thought without meaning nor a statement that is meaningless because it is supposed to express a meaningless thought. For Frege, there are no logically faulty thoughts: they are not thoughts at all. This idea is picked up by Wittgenstein in the *Tractatus*, where it plays a central role in the definition of nonsense and the illogical: "Thought can never be of anything illogical [*wir können nichts Unlogisches denken*], since, if it were, we should have to think illogically [*unlogisch denken*]" (3.03, trans. Pears and McGuinness).

Let us recall that the *Tractatus*'s goal is to determine the limits of language by the limits of nonsense:

> Die Grenze wird also nur in der Sprache gezogen werden können und was jenseits der Grenze liegt, wird einfach Unsinn sein.
>
> (It will therefore only be in language that the limit can be drawn, and what lies on the other side of the limit will simply be nonsense.)
>
> (*Tractatus,* preface, trans. Pears and McGuinness)

Scientific propositions alone are meaningful (*sinnvoll*). Tautologies and contradictions are meaningless (*sinnlos*) because they do not represent a given state of affairs, but they are not nonsense (*Unsinn*) because they are part of language and symbolism.

> Tautologie und Kontradiktion sind sinnlos.
>
> (Tautologies and contradictions lack sense.)
>
> (*Tractatus*, 4.461, trans. Pears and McGuinness)

> Tautologie und Kontradiktion sind aber nicht unsinnig.
>
> (Tautologies and contradictions are not, however, nonsensical.)
>
> (Ibid., 4.4611)

Metaphysical propositions, however, are radically nonsensical (*unsinnig*):

> Die meisten Sätze und Fragen, welche über philosophische Dinge geschrieben worden sind, sind nicht falsch, sondern unsinnig. Wir können daher Fragen dieser Art überhaupt nicht beantworten, sonder nur ihre Unsinnigkeit feststellen.
>
> (Most propositions and questions, that have been written about philosophical matters, are not false, but senseless. We cannot, therefore, answer questions of this kind at all, but only state their senselessness.)
>
> (*Tractatus*, 4.003, trans. Ogden and Ramsey)

As is shown by the enigmatic passage that (almost) concludes the *Tractatus*, it is of the utmost importance to understand that these propositions are not nonsensical, which does not mean that we must understand them: precisely, it is radically impossible to understand them. This is Wittgenstein's text:

> Meine Sätze erläutern dadurch, dass sie der, welcher mich versteht, am Ende als unsinnig erkennt, wenn er durch sie—auf ihnen—über sie hinausgestiegen ist. (Er muss sozusagen die Leiter wegwerfen, nachdem er auf ihr hinaufgestiegen ist.)
>
> Er muss diese Sätze überwinden, dann sieht er die Welt richtig.
>
> (Ibid., 6.54)

Here is the Ogden and Ramsey translation into English:

> My propositions are elucidatory in this way: he who understands me finally recognizes them as senseless [*unsinnig*], when he has climbed out through them, on them, over them. (He must so to speak throw away the ladder, after he has climbed on it.)
>
> He must surmount these propositions; then he sees the world rightly.

Compare Pears and McGuinness:

> My propositions serve as elucidations in the following way: anyone who understands me eventually recognizes them as nonsensical, when he has used them—as

steps—to climb up beyond them. (He must, so to speak, throw away the ladder after he has climbed up it.)

> He must transcend these propositions, then he will see the world aright.

For Wittgenstein, then, surmounting these propositions means recognizing them to be metaphysical and without meaning (*unsinnig*). Whence the temptation that long guided the reading of Wittgenstein's work: it was thought that there was a kind of understanding of nonsense that showed itself instead of saying itself and that metaphysics had its paradoxical place in this "showing." We cannot ignore the deliberately Kantian side of the *Tractatus*'s project. The goal is to set a limit (*Grenze*) to thought, in a project similar to that of a critique of pure reason: a resumption of the Kantian project (drawing a line of demarcation between science and non-science), expressed here in terms of nonsense: setting the limits of sense (see Strawson's book on Kant's first critique, *The Bounds of Sense*) by delimiting the domain of what can be said. But such an approach falls far short of Wittgenstein's project and his conception of nonsense, as the preface to the *Tractatus* shows:

> [T]he aim of the book is to draw a limit to thought, or rather—not to thought, but to the expression of thought: for in order to be able to draw a limit to thought, we should have to find both sides of the limit thinkable (i.e. we should have to be able to think what cannot be thought).
>
> It will therefore only be in language that the limit can be drawn, and what lies on the other side of the limit will simply be nonsense.
>
> (Trans. Pears and McGuinness)

One cannot set a limit to thinking because in order to do so, one would have to specify what cannot be thought, nonsense, and thus grasp it in some way in thought. But there can be no statements regarding what one cannot speak about, not even meaningless statements that might mean something if they had sense. Hence the limit will be set "within" language (that this can be done is what the book is going to show). Once this limit has been set, what remains beyond directly intelligible statements (beyond scientific propositions) will be pure nonsense. This means that Wittgenstein excludes precisely the idea that certain statements are nonsense but might nonetheless indicate something that cannot be said. There is therefore only one kind of *unsinnig* nonsense: it is the "austere" conception of nonsense.

What is the source of nonsense? Wittgenstein warns us against "the most fundamental confusions of which the whole of philosophy is full" (3.324). The philosopher often allows himself to be hypnotized by the existence of a single sign (*Zeichen*) for two objects. But the fact of sharing a sign cannot be considered characteristic of the objects themselves (3.322). What matters is not the sign itself, but rather that of which the sign is the perceptible side (3.32), namely, the "symbol" (*Symbol*), which determines the meaning of the proposition (3.31). Then how can the possibility of access to the symbol be conceived? Wittgenstein's response is very important and constitutes the connection

between his earlier and his later philosophies: "In order to recognize the symbol in the [*am*] sign we must consider the significant use [*sinvoller Gebrauch*]" (3.326).

This "significant use" is the only experience we have of meaning, and it is the criterion of what is and what is not nonsense. Thus, as early as the *Tractatus*, the borderline between sense and nonsense is determined by neither the "empirical content" of logical positivism nor a kind of transcendent authority that is supposed to set the limit of thought: it is determined by usage. In reality, the theory of usage that characterizes all of Wittgenstein's later philosophy is already present in the theory of nonsense in the *Tractatus*. An expression without meaning is an expression to which I, myself, do not give meaning.

Thus Wittgenstein explains "the correct method in philosophy":

> The correct method in philosophy would really be the following: to say nothing except what can be said, i.e. propositions of natural science—i.e. something that has nothing to do with philosophy—and then, whenever someone else wanted to say something metaphysical, to demonstrate to him that he had failed to give a meaning to certain signs in his propositions.

> (*Tractatus*, 6.53, trans. Pears and McGuinness)

A statement without meaning is not a particular kind of statement: it is a symbol that has the general form of a proposition and that has no meaning because we have not given it one. This reduces the distinctions between *sinnlos/bedeutungslos/unsinnig*—which is nonetheless philosophically central. Here is Wittgenstein again: "Wird ein Zeichen *nicht gebraucht*, so ist es bedeutungslos. Das ist der Sinn der Devise Occams" (3.328). The standard French translation of this proposition, by Pierre Klossowski, renders *nicht gebraucht* as *ne pas utilisé* (not used). Etienne Balibar's unpublished, much more careful translation has instead: "Un signe dont on n'a *pas l'usage*, n'a pas de signification non plus" (A sign whose usage one does not have or know, also has no meaning). Ogden and Ramsey translate Wittgenstein's proposition this way: "If a sign is *not necessary* then it is meaningless. That is the meaning of Occam's razor." And Pears and McGuinness: "If a sign is useless, it is meaningless. That is the point of Occam's maxim." In translation, the range of senses covered by "Wird ein Zeichen nicht gebraucht," extraordinarily, runs from "not used" to "use not known" to "not necessary" to "useless."

We come back once again—both in Wittgenstein's argument, and in our understanding of the different ways in which the *Tractatus* has been translated—to meaningful use (*sinnvoller Gebrauch*). But usage is not prescribed by anything other than usage itself. "We cannot give a sign the wrong sense" (5.4732, trans. Pears and McGuinness).

No sense can be illegitimate (*unrecht*) once it is given, that is, as soon as we give sense to this or that sign. As for metaphysical nonsense, when the sign ceases to be used in conformity with its habitual usage, that does not mean that what has been said has defined a new use for it. It is in this absence of definition, not in the sense of a formal definition but in the sense of a factual absence of giving meaning, that nonsense arises.

That, as we have seen, is what *Tractatus* 6.53 (trans. Ogden and Ramsey) underscores: "[W]hen someone else wished to say something metaphysical, to demonstrate to him that he has given no meaning to certain signs in his propositions."

Nonsense as such then produces an elucidation: the person who understands the author of the *Tractatus* understands that his propositions are nonsense, and it is in understanding this that he is illuminated.

> Meine Sätze erläutern dadurch, dass sie der, welcher mich versteht, am Ende als unsinnig erkennt. . . . Er muss diese Sätze überwinden.

> (My propositions are elucidatory in this way: he who understands me finally recognizes them as senseless. . . . He must surmount these propositions.)

> (Ibid., 6.54)

We must note here a slight strangeness in expression: we always think we remember this conclusion of Wittgenstein's as "the person who understands these propositions understands that they are nonsense." But what Wittgenstein wrote in a last-minute evasion is "he who understands *me*" (*welcher mich versteht*) (our emphasis). He thus chooses to draw attention to the difference between understanding someone and understanding what he says. It is a matter not only of understanding that Wittgenstein's propositions are nonsense, but also of abandoning the idea of understanding them "*qua* nonsense." The elucidation provided by this nonsense is the comprehension of their author—Wittgenstein.

C. Nonsense and language games

In the *Philosophical Investigations*, Wittgenstein develops his conception of nonsense by concerning himself with another kind of nonsense that is connected with the fitting (*treffend*) character of an utterance in its context. It is important to situate this conception, as Diamond does, in relation to the earlier one. Wittgenstein's later philosophy seeks to define "nonsense" by the absence of a "language game" (*Sprachspiel*) in which the expression can be used. "Nonsense" is thus defined once again but in a new sense, by usage.

> When a statement is called senseless [*ein Satz . . . sinnlos*], it is not as it were its sense that is senseless [*so ist nicht sein Sinn sinnlos*]. But a combination of words is being excluded from the language, withdrawn from circulation.

> (*Philosophical Investigations*, §500)

Or in a 1935 lecture (in English):

> Though it is nonsense to say "I feel his pain," this is different from inserting into an English sentence a meaningless word, say "abracadabra," and from saying a string of nonsense words.

> (*Wittgenstein's Lectures*)

And thus we are tempted to see an evolution in Wittgenstein toward a more pragmatic conception of nonsense, defined no longer by rules of logic, but by rules of usage. In reality—and that is what is shown by the predominance and

centrality of the idea of nonsense in his later philosophy as well—an expression that is misused, and hence is excluded from language, is nonsense; it is not a sense used in a way that is wrong, absurd, or inadequate. That is what some commentators (like Charles Travis in *The Uses of Sense*) define in the later Wittgenstein as sensitivity to significance in usage (S-use sensitivity): the meaning of a word is also defined by its later and possible uses. For Wittgenstein, whether in his early or his later philosophy, there is no intermediary between sense and nonsense, even if there are diverse kinds of nonsense, just as there are diverse kinds of meanings or ways of meaning.

IV. "Nonsense," *Witz*, Philosophical Grammar, and Ordinary Language

Up to this point, we have examined nonsense in its "logical" and grammatical sense; it remains to consider poetic and comic nonsense, which we have already touched upon in relation to Lewis Carroll. How can we define the comic quality of nonsense? Specialists in nonsense as a literary genre generally resist the tendency to identify nonsense with an absence of sense: nonsense is instead the absence of a certain sense, for example, common sense or reason, that is subverted in nonsense.

In this context we can distinguish, following Wittgenstein, three uses of the notion of sense: (1) the primary notion of sense; (2) the notion of a secondary sense, proposed by Wittgenstein in §11 of the second part of the *Philosophical Investigations* (e.g., the use of "fat" or "yellow" in the statements "Wednesday is fat" and "the vowel 'e' is yellow") and derived from the primary sense; (3) the complex of *Sinnerlebnisse* or *Bedeutungserlebnisse* (experiences of meaning, which are central in the later Wittgenstein) that accompany use and that, despite their name, are seen as nonlinguistic experiences. However, *Bedeutungserlebnisse* do not play a major role in the definition of poetic or comic nonsense. Thus we can define poetic or comic nonsense in the framework of a sensitivity to meaning and of a lived experience of meaning ("*das Erleben der Bedeutung*," that must be distinguished from *Bedeutungserlebnisse*) (see ERLEBEN)—which Wittgenstein has in mind in speaking of someone who is "meaning-blind," incapable of feeling (appreciating) the humor of jokes. "If you didn't *experience* the meaning of words, then how could you laugh at puns [*Wortwitze*]?" (*Letzte Schriften*, vol. 1, §711).

The meaning-blind person (*Bedeutungsblind*; cf. *Remarks* [*Bemerkungen*], vol. 1, §202) is indeed blind to nonsense—in any case to the specific type of nonsense that we find in poetry and humor and that thus has more to do with meaning than is commonly thought.

Wittgenstein remarks that "even a nonsense-poem [*ein Unsinn-Gedicht*] is not nonsense in the same way as the babbling of a child" (*Philosophical Investigations*, §282; Klossowski translates *Unsinn-Gedicht* into French as "un poème de 'non-sens'").

Wittgenstein compares three statements—"a newborn child has no teeth," "a goose has no teeth," and "a rose has no teeth"—and notes that even if the last seems truer or more certain that the other two, it seems less meaningful. However, there is always a way to give it meaning by imagining adequate conditions of use (*Philosophical Investigations*). In Wittgenstein's later philosophy, there are no inherently meaningless expressions or ones to which we cannot give meaning, only expressions to which we do not want to give meaning: we can give them one, someday, and include them in a language game. Every combination of words can, if we wish, be "put into circulation." From this point of view, Wittgenstein's later philosophy no longer has anything to do with a normativism of meaning and opens the way toward a positivity of nonsense.

The new attention Wittgenstein gives to the ordinary facts of grammar and language makes him particularly sensitive to nonsense, to *Witz* and wordplay, and to their meaning. He notes: "Aptitude for philosophy resides in the ability to receive a strong and lasting impression from a fact of grammar" (*Big Typescript*).

This aptitude also determines the capacity for humor, and more particularly for wit, because it draws our attention to curious properties of language. Wittgenstein cites Lichtenberg in this connection and takes an interest in how we understand Lewis Carroll's poems.

> Let us consider the witty meaning [*witzige Bedeutung*] that we give to Carroll's grammatical games. I could ask: why do I think a grammatical word-play [*Witz*] is profound in a certain sense? (And this is naturally philosophical profundity.)
>
> (*Wiener Ausgabe*, vol. 3, quoted in Bouveresse, *Dire et ne rien dire*)

Wittgenstein discerns the proximity between *Witz* and philosophy in their common ability to appreciate, as it were, the salt of language. He is supposed to have once said that one could imagine a philosophical work consisting entirely of jokes (without, for all that, being facetious). The *Witz* is another, more amusing way of "knocking one's head against the barrier of language"—a task that defines philosophy. This is how Jacques Bouveresse puts it:

> A philosophical proposition and a grammatical *Witz* both have a direct relation to the question of the limits of meaning, and seem to be opposed to each other a little as the pleasure of nonsense is to what might be called by contrast the pain, impotence, and frustration of nonsense. It has been said that the witticism, as analyzed by Freud, could be considered a successful lapsus. Wittgenstein sometimes seems to suggest that a philosophical proposition might resemble an involuntary witticism.

How can *Witz* draw our attention to language and yet have a profundity of the same kind as that of grammar itself? It is because it is characterized precisely by the impossibility of determining what constitutes the comic—the container or the content, thought or language:

> We receive from joking remarks a total impression in which we are unable to separate the share taken by the thought-content from the share taken by the joke-work. . . . We do not know what pleases us and what we are laughing about.
>
> (Freud, *Jokes*, 8:94)

The Freudian theory of wit maintains that the joke, which begins as simple play, is rapidly put into the service of the inclinations and drives of psychic life that have to overcome obstacles and inhibitions to express themselves. It is clear that this has something in common with philosophy, particularly when it becomes grammatical and shows the inseparability of thought and language. This transition to grammar is inseparable from a certain nonsense or even buffoonery: we find with pleasure in Wittgenstein efforts to transgress the rules of the grammar of language in the broad sense (of its usages), which draw our attention precisely to these rules. "Why can't a dog simulate pain? Is he too honest?" (*Philosophical Investigations*, §250). Another example Wittgenstein gives is that of someone who writes at the top of an official document: "Place: here. Date: now." Here again this attention to nonsense and the equivocal may remind us of Freud. Freud observes that "Jokes do not, like dreams, create compromises; they do not evade the inhibition, but they insist on maintaining play with words or with nonsense unaltered," presenting it as meaningful. "Nothing," he continues,

> distinguishes jokes more clearly from all other psychical structures than this double-sidedness and this duplicity in speech. From this point of view at least the authorities come closest to an understanding of the nature of jokes when they lay stress on "sense in nonsense [*Sinn im Unsinn*]."
>
> (Freud, *Jokes*)

For Freud the "joke-work" (*Witzwerk*) consists precisely in finding sense in nonsense and thus in giving a meaning, not discovering it. Freud defines *Witz* as "sense in nonsense" (see SIGNIFIER/SIGNIFIED and INGENIUM, Box 3). Superficial nonsense is used in the *Witz* to express a thought that is important but that one does not necessarily want to, or cannot, approach. The *Witz* is thus never radical nonsense (*Unsinn* as defined above). An explicit contradiction or obvious falsity cannot constitute a witticism: "The scandal begins when the police put an end to it" (Kraus); or, to take a recent example, "In the interest of our relationship, let's not have one" (*Ally McBeal*). In taking an interest in the traps set by language, and also in its profoundly and naturally ordinary character, Wittgenstein's philosophy (and later Austin's, which is fertile in wit and nonsense) specified an essential relationship that *Witz* maintains with philosophical grammar: that is, their ability to express both a problem and its solution as already present before our eyes: we simply hadn't looked or listened carefully enough to recognize them.

| NOSTALGIA

A certain number of terms that serve to designate uneasiness or malaise, experienced as characteristic of a culture or a national genius, find an equivalent in the word "nostalgia": *nostalgie* (Fr.), *saudade* (Port.), *dor* (Rom.), and *Sehnsucht* (Ger.). The component of quest and exile, including existential exile outside oneself, displacement in all senses of the word, is in fact predominant in the term "nostalgia," whether it is linked to solitude (*saudade*), to the suffering connected with an impossible desire (*dor*), or to an aspiration to something entirely different (*Sehnsucht*). See DOR, SAUDADE, SEHNSUCHT, and, more broadly, *MALAISE* (ACEDIA, ANXIETY, MELANCHOLY).

On the Greek model of nostalgia as "suffering of, or for, the return," see SEHNSUCHT, Box 1.

| NOTHING, NOTHINGNESS

The expressions designating what does not exist are constructed in different ways, both within a single language and from one language to another. French, for example, immediately sets in competition a positive term and a negative term. The positive term, *rien*, derives from Latin *rem*, the accusative of *res, rei*, which originally designated a good, property, or personal effect (see RES and *THING*). The negative term, *néant*, also derives from Latin, but it is composed of a negative particle (*nec, ne*) applied, depending on the hypothesis, to the positive *entem* (the accusative of *ens*, "not a being") or to the positive *gentem* (the accusative of *gens*, "not a living being").

I. Positive Nouns / Negative Nouns

1. The main positive nouns designating what does not exist are, in addition to the Iberian *nada*—derived from Latin (*res*) *nata*, the past participle of *nasci*, meaning "to be born" (see PORTUGUESE and cf. SPANISH)—the French words *rien* and *personne*. The positive use of the feminine noun *une rien* has been gradually replaced by the nominalization of the pronoun and the adverb that commonly serve as negative auxiliaries, *rien*, *un rien*: "The word offers a short version of the evolution of the etymological meaning of *chose* inverted as *néant* (c. 1530)" (RT: *DHLF*), which did not fail to have a philosophical impact: see RES; cf. REALITY, *TO BE,* VORHANDEN. In an analogous way, *personne*, formed on the basis of the positive *persona*, or the actor's mask (which is certainly not an anodyne entity), designates any given human being a "person," and, in correlation with *ne*, acquires the negative value of "no one": see PERSON. Consult MÊTIS, Box 1, "Odysseus: My name is No-One," for an example of a pun on *personne* that implies both the difference, which is fundamental in Greek, between negation and privation (*ou/mê*), and the connection in French between the expression of negation and the so-called *ne explétif*; on the latter, see ESTI, Box 4.
2. The majority of the terms designating what does not exist are composed of a negation bearing on a positive term that does not, moreover, designate the same thing, depending on the languages concerned (Gr. *ouden/mêden*, Lat. *nihil*, Fr. *néant*, Ger. *Nichts*, Eng. "nothing"; cf. Gr. *outis/mêtis*, "not someone," Lat. *nemo*, "not a man," Eng. "nobody," and so forth). Thus in Greek it is *hen*, "one," that is negated (see MÊTIS, Box 1); in Latin it is supposed to be the *hilum*, a minuscule black dot at the end of a broad bean (*ni-hil*; RT: *Dictionnaire étymologique de la langue latine* citing Festus); in German, it may be a *Wiht* (little demon), unless it is *Wicht*, from *Wesen* (essence) (cf. ESSENCE); in English, it is "thing."
3. Further reflection takes into consideration the degree of freedom in certain languages that construct, by means of an erroneous division, a new positive on the basis of the negative compound: that is what happens in Democritus's Greek (68 B 56 DK [see RT: DK]), which proposes *den* (a false division of *ouden*, which is normally divided into *oude-hen*, "not even one"), an amalgam of the last letter of the negative particle and the negated positive. German can render Democritus's *den* in a similar way, reactivating a term used by the Rheinland mystics, *das Ichts* ("Das Ichts existiert um nicht mehr als das Nichts," RT: DK translation of Democritus's fragment whose French equivalent would be "Le *éant* n'existe pas plus que le néant"). See ESTI, IV.B.

II. Derivations and the Combinatory System

We find here and there a certain number of remarkable disparities that give rise to major translation problems.

1. In some languages and in some cases, a term (noun, adjective, or verb) may be negated in several ways that stipulate different modes of nonexistence and refer to different paraphrases: this is the case in particular for the difference between negation and privation, which is fundamental in Greek, for example (*ouden*, *mêden*; see ESTI, II, IV.A, and MÊTIS, Box 1), and the different ways of indicating presence and the possession implied by privation (absence of something, through lack ["a-logical"], defect ["il-logical"], exteriority ["de-mentia"], extenuation, and so forth). On the way in which a negative or privative term is formed by means of a particle or a prefix, see—in addition to ESTI, and COMBINATION AND CONCEPTUALIZATION—GERMAN and the study of the *Lust-Unlust* pair under PLEASURE, II.C). See also TRUTH (particularly for the Greek *alêtheia*, which Heidegger renders by *Unverborgenheit*), UNCONSCIOUS, and cf. MADNESS.
2. The rules of derivation, combination, and syntax related to negative terms produce texts that are characteristic of certain languages and particularly difficult to translate into other languages; this is the case, for example, of the German derivation that moves from the adverb *nicht* to the substantive *Nichts*. Regarding this set of problems, particularly illuminating examples will be found under ESTI. See also PORTUGUESE, and cf. ANXIETY, AUFHEBUNG, PRINCIPLE.

See also *NEGATION* and, in particular, VERNEINUNG.

OBJECT, OBJECTIVE BEING

FRENCH *objet, être objectif*
GERMAN *Objekt*
GREEK *antikeimenon* [ἀντικείμενον]
LATIN *obiici, obiectum; esse obiective*

➤ ERSCHEINUNG, ES GIBT, GEGENSTAND, INTENTION, PERCEPTION, *PHÉNOMÈNE*, REALITY, REPRÉSENTATION, SEIN, SUBJECT, TATSACHE, *THING*, *TO BE*, TRUTH, VORHANDEN

The word "object," like the concept to which it refers, has not always existed. But we constantly project it into texts to which it is alien.

I. The *Antikeimenon,* or Thought without Object

Must it not be admitted that even if the word is lacking, the concept of object is as old as philosophy itself? In reality, Plato and Aristotle did not fail to analyze the faculties' relationship to their terminus, but they did not have an independent word for doing so. Whereas it is absent in the original Greek, translators introduce it—projecting onto ancient authors, through a retrospective illusion, our Latin vocabulary inherited from medieval philosophy.

When Plato speaks of the faculties and of "that to which they are related," he always uses a clumsy paraphrase. Of course, he mentions the relationship between a capacity for knowledge or desiring and the order of the things that this capacity knows or desires. But he describes them only by manipulating syntax: thirst will never be the desire for "anything other than that of which it is its nature to be, mere drink" (*Republic* 4.437e, trans. Shorey; Chambry renders this in French as "elle ne saurait être le désir d'autre chose que de son *objet* naturel" [emphasis supplied]).

Plato (or rather Socrates's interlocutor Glaucon) goes on: "Each desire in itself is of that thing only of which it is its nature to be [the desire]" (ibid.; Chambry renders this as "chaque désir pris en lui-même ne convoite que son *objet* naturel pris en lui-même" [emphasis supplied]). Similarly, "Science, which is just that, is of knowledge which is just that, or is of whatsoever we must assume the correlate of science to be" (ibid., 4.438c; Chambry translates this as "ou de l'objet, quel qu'il soit, qu'il faut assigner à la science" [emphasis supplied]). To distinguish a faculty, Socrates says, "I look to one thing only—that to which it is related [*eph' hôi*] and what it effects" (5.477d; Chambry: "je ne considère que son objet et ses effets"). Here we see how flexible the Platonic connection is, limiting itself to a relative pronoun, and how plodding and awkward a literal translation seems; how much clearer and necessary appears the projection of the term "object" so as to explain the sense of Plato's text. It remains that this kind of translation introduces into Plato a concept that has no semantic foundation. On the contrary, for Plato, the corresponding terms always come "in pairs of twins" (*Theatetus*

156b1). The powers of the soul and that of which they are the powers are correlative; but in this correlation, what Plato calls a "power" (*dunamis* [δύναμις]) has no terminological correlate in the order of things. What our translations call the "object"—anachronistically, but in accord with an interpretation almost inevitable for a modern mind—remains anonymous in Plato. Aristotle, who was more inclined to classify, regroups the powers and what they take as their themes in a larger category, that of opposites. The powers (*dunameis*) are distinguished according to their specific activities, and the activities, in turn, according to their opposites (*antikeimena*): "And by opposites, I mean food, what is perceptible, or the intelligible" (*De anima* 2.4, 415a20). Although the operations are primary, "we might inquire whether the search for their opposites [*antikeimena*] ought not to precede them, for example, the sensible before the sensitive faculty, and the intelligible before the intellect" (ibid., 1.1, 402b15; the 1982 edition of Tricot's French translation adds a note: "The word *antikeimena* thus signifies here the objects of sensation and intelligence"). *Antikeimenon* is given first a local meaning, that of "opposite," as is shown in Aristotle's *De caelo*, where it designates the lowest place and the highest place, situated at the two extremes of an imaginary axis connecting them: "Fire and earth move not to infinity but to opposite points [*antikeimena*]" (*De caelo* 1.8, 277a23; cf. 2.2, 284b22; see Bonitz's remarks in his *Index Aristotelicus* of 1870, 64a18). Each faculty is distinguished from another by its particular operations, since the activity precedes the power and constitutes its specificity: "The activity of the sensible object and that of the percipient sense is one and the same activity" (*De anima* 3.2, 425b25). But beforehand, each activity is determined by its reference to its opposite, that is, by the type of specificity that affects each of the faculties of the mind: they are *opposita*, as James of Venice correctly rendered the term (ca. 1130).

Shall we say, then, that Aristotle has found a name for what remains unnamed in Plato? Should we interpret *antikeimenon* as signifying the opposition of the object with regard to the power? Here there is a retrospective illusion to which we could easily succumb. But Aristotle's thought does not prefigure the medieval and modern concept of the object, as if the generality of his language held the rest of history in its secret folds and paved the way for later distinctions, or as if later interpreters succeeded in arriving at the truth of a meaning that was latent but already secretly present, and of which they are the heirs.

In the first place, Aristotle does not absorb the Platonic expression into a more precise vocabulary; he limits himself to situating the relationship of correlation observed by Plato in a still more general classificatory concept. The *antikeimenon* is a very broad class of correlates that are only a particular case: "The term 'opposite' is applied to contradictories, and to contraries, and to relative terms, and to privation

and possession, and to the extremes from which and into which generation and dissolution take place" (*Metaphysics* Δ.10, 1018a20–21). And the correlate is itself a genus whose species include the relation of "the measurable to the measure, and the knowable to knowledge, and the perceptible to perception" (ibid., Δ.15, 1020b31–32). Far from containing in embryonic form the distinctions with which the concept of *obiectum* is charged, the Aristotelian notion of *antikeimenon* merely allows a regrouping: it places the cognitive correlation in a hierarchy of more general terms.

Moreover, a correlative relation is symmetrical: it can be reversed, and knowledge can thus become in turn the opposite of the knowable (*Categories* 10.11b29–30; cf. 7.6b34–36). The medieval and modern concept of object is asymmetrical: one would never say that knowledge is "the object of the known." The sense of "opposite" is thus far broader than that of the later term "object": opposition signifies a general, reciprocal relationship that is larger than the particular case of the powers of the mind and of their theme; it therefore does not define the status of the term in question by the faculty. What a power knows is first of all the thing itself, not an object defined by its pure correspondence with the faculty. The faculty is determined by the being, and it is not the object that defines the faculty (*Metaphysics* Δ.15, 1021a26–b3; I.6, 1057a7–12).

II. *Obiectum,* or the Obstacle before the Eyes

The word "object" designates the act of something presenting itself as opposite or standing over against, the Latin *obiici*. Here again, should we say that the word that designates it, and thus the concept that accompanies it, is already present in Latin antiquity?

Classical Latin already has the past participle of *obiicio*, "to throw or place before, to be opposite, to set against"; and Tacitus, in *Germania*, refers to women in combat "using their breasts as shields [*obiectu pectorum*]" (8.1). Latin also uses the masculine substantive *obiectus*, which is derived from *obiicio*, to refer to "what is set before" or what "stands before" (an *obstant*), an "obstacle," a "spectacle," and more precisely, an "apparition," a "phenomenon." But the invention of the neuter noun *obiectum* corresponds to a new conceptual requirement.

This requirement proceeds first of all from the theory of perception, when it implies an activity of the powers of the mind. For Augustine, who adopts the Platonic theory of vision, the latter is engendered by the encounter between the look, which emanates from our eyes, and color, which emanates from the thing. Our eye emits a ray "by which we touch everything that we see. . . . If you want to see further, and some body interposes itself [*interponatur*], the ray collides with the body set in front of it [*corpus obiectum*] and it cannot pass beyond it toward what you want to see. . . . You want to see a column, a man stands in the middle of your field of view, your look is blocked" (Augustine, *Sermo* 267, 10.10; RT: *PL* 38, col. 1262). Here the *obiectus* is the *obstant*, the body interposed between the eye and the thing to be seen, the obstacle that puts the terminus of my movement, the theme pursued by my operation, out of reach. The *obiectus* hinders the activity of sight; it is not the latter's objective. The past participle *obiectum* does not designate the thing looked at,

but that which, thrown before the eyes, breaks the axis of the look, violates the transparency of its seeing.

By a paradoxical consequence of this active theory of vision, however, its terminus is always an obstacle that limits by its shadow the ray of pure light emitted by the eye; and reciprocally, the obstacle is an *obiectum*. Thus Pseudo-Grosseteste, commenting on this passage in Augustine around 1230, substantializes the past participle: "The mental ray that comes out of the eye is not affected by the external object [*non immutatur ab obiecto extra*]" (Baur, *Die Philosophischen Werke des Robert Grosseteste*, 255.15–19). Here it is no longer an adjective designating a quality but very probably a neuter and a subsistent term. Contraposition is no longer an accident of perception, its inevitable reverse; instead, it indicates a positive property of the visible.

The concept of object is constructed when the term *obiectum* combines two determinations: the older meaning of interposition, and the new one, in conformity with the Aristotelian problematics, of the terminus to which a power is relative. The use of the term is solidified and determined in Pseudo-Grosseteste:

> But it is further added that, whether for natural appetite, or for the deliberative faculty, there exist different objects and different motors. Thus there also exist different acts and different powers.
>
> (Pseudo-Grosseteste, in Baur, ibid., 264.42–44)

Even if Pseudo-Grosseteste is the only writer to produce the concept of object in its nascent state, in presenting his sources (Augustinian and Aristotelian), we cannot exclude the possibility that it is a tool that was forged in the Faculty of Arts and anonymously spread by it (several attestations between 1225 and 1230 allow us to suggest this: e.g., the *Summa duacensis* [ed. Glorieux, 43 and 49] and the *De anima et de potenciis eius* [ed. Gauthier, 223, 232, 244, and 250]). It appears for the first time in the title of the anonymous *De potenciis animae et obiectis* (between 1220 and 1230; ed. Callus, 147–48).

It is in Philip the Chancellor's *Quaestiones de anima* that the concepts of subject and object are related to each other for the first time:

> Una [potentia] enim simpliciter est quae est una in subiecto et obiecto, duplex quae est una in subiecto, duplicata in obiecto.
>
> (For [a power] that is absolutely unique is [the power] that is in the subject and the object, and it reduplicates that which is one in the subject but reduplicated in the object.)
>
> (Philip the Chancellor, *Quaestiones de anima*, ed. Keeler)

The object not only is the interposed obstacle, but also is clearly recognized as the theme specific to the act of knowing; it even serves to distinguish the diverse faculties, because it is anterior to them. Thus Grosseteste thinks he is allowed, when citing the text of Aristotle's *De anima*, to translate *antikeimena* not by *opposita*, as James of Venice had, but by *obiecta*. This is the translation that became standard in

the second half of the thirteenth century, and was adopted in William of Moerbeke's version of *De anima*.

With the fusion of Aristotle's psychology and the Augustinian theory of vision, a decisive turning point is reached: the faculties of the mind are no longer open to the driving and multiform manifestation of the being with which they are identified in the act of knowing, but are determined by the prior nature of their specific object. What is known is no longer the face of the thing itself, but the obstacle with which the look collides, that deprives its activity of its own transparency. Knowledge is no longer a simple reception of an actual being by the power moved, but rather the ricochet of a ray emitted by the intellect that is reflected back to it after having bounced off its terminus. It is no longer the direct confrontation of the thing known and the knowing intellect, bound together by a common act, but the reverberation of sight on the "objectness" that has clothed the thing with a characteristic stratum. The thing known emerges as an object; the problem of knowledge is gradually detached from the being of the thing. Truth is henceforth transformed into an adequation between the powers of the mind and the corresponding objects:

> Some *habitus* are in the mind qua *habitus*, and thus they are by themselves in the mind or in man; there are others that are there as objects [*in ratione obiectorum*], and such is truth and falsity, because they are thrown before [*obiiciuntur*] the understanding.
>
> (Bacon, *Questiones supra libros prime philosophie Aristoteles*)

III. *Esse Objective,* or the Ontology of Objects in General

The concept of *esse obiective* (objective being) lexicalizes this development: what is present to pure thought is not imprinted there as a perception passively received through the senses, but as the terminus of an act of seeing: it is present as the object of our representation: "Once this thing is known as it is in nature, it shines objectively within, in the understanding itself" (Henry of Ghent, *Quodlibet* 5, quest. 26, f. 205 N ; cf. 5, quest. 14, f. 175). Objective being refers to the being of the thing as it is targeted by our representation, thus both as immanent (represented) and transcendent (representing). The understanding agent, when it encounters the external thing, produces the object in the understanding as a real accident in the mind. It thus gives it the status of a universal: the form "man" can be attributed to all men. The object is not a being received, but is constituted in the intellect and by the intellect: "For our act of intellection, we have an internal object, even if to feel we need an external object" (*Quodlibet* 13, art. 2, §[20] 60, ed. Alluntis, 470). And Duns Scotus emphasizes that the being of the thing remains the same, whether its object exists or not: the objective being of Caesar is identical whether he is absent or existent. Objective being is universal, abstract, immanent to the spirit.

Thus Duns Scotus constructed the main characteristics of the modern theory of objective being, or of objective reality, as it is developed down to Suárez, Descartes, and Kant: "What is objective is that which constitutes an idea, a representation of the mind, and not a subsistent and independent reality" (RT: *Vocabulaire technique et critique de la philosophie*, s.v. *Être objectif*).

The invention of the term "object" and its compounds shows how illusory it would be to assume that concepts are eternal, how dangerous and yet stubbornly persistent is the retrospective illusion of interpreters and translators who slip the new concept into ancient texts, and how much the fundamental concepts of metaphysics are connected with the evolution of the vocabulary that makes it possible to name them.

Quine and qualia

➤ TO TI ÊN EINAI

Philosophical debates about qualia cluster around two broad positions: the acknowledgment of irreducible, phenomenal properties of subjective experience on the one hand, and the characterization of such properties as eliminable or epiphenomenal on the other. Of the many problems at issue in these debates, one concerns the accessibility of such private, introspective experiences to public, intersubjective linguistic reports. Because qualia are often treated as nonextensional and nonrepresentational, they trouble both (traditionally analytic) philosophies of language that correlate linguistic meaning with empirical content, and (traditionally continental) philosophies of language that emphasize the irreducibility of discourse.

The philosophy of W.V.O. Quine (1908–2000) can be daunting in its many guises, here resembling Rudolf Carnap's logical positivism, there anticipating Jacques Derrida's deconstruction, and always recalling a pragmatic tradition running from Charles Sanders Peirce to John Dewey. Strictly speaking, there is no Quine on qualia. His most influential writings largely predate now conventional discussions of inverted color spectra or brilliant neurophysiologists in black-and-white rooms, reflecting instead mid-century behaviorist approaches to psychological considerations and resembling, in this regard, the later Ludwig Wittgenstein's private language argument. For Quine, behaviorism constitutes a methodological necessity in the study of language: "In psychology one may or may not be a behaviorist, but in linguistics one has no choice" (Quine, *Pursuit of Truth*, 37–38). Quine's thought thus appears to resemble more closely the latter of the two positions referred to above, tending more toward the reduction or elimination of phenomenal properties than toward their recognition or affirmation.

Given its explicitly extensionalist, physicalist, and behaviorist commitments, it is not surprising that Quine's philosophy would largely ignore qualia, or at least remain implicitly agnostic regarding the existence of phenomenal properties not subject to linguistic representation or empirical

(continued)

(continued)

verification; yet even as Quine's philosophy of language presents a challenge to the purported ontology of qualia, it preserves the challenge that qualia present to the philosophy of language, although in displaced form. Consider a classic example in expositions of qualia. Seeing a turquoise patch feels a certain way to me that it may not feel to you. This property of "what it is like," for me, to see turquoise exemplifies the qualitative aspect of a subjective experience. Now, although you and I may undergo different experiences while seeing turquoise, we will likely both be able to produce the word "turquoise" upon being asked the name of the color that we see—likewise for drinking coffee, having a headache, and so on. While on a private, phenomenal level, we might experience very different things, on a public, linguistic level, our behavior coincides. By these lights, verbal behavior is too crude an instrument to detect more subtle differences in subjective properties. However, Quine shows, most notably through his "principle of indeterminacy of translation," how the language of physical objects itself faces equally significant difficulties (*Word and Object*, 27). Quine imagines a linguist attempting to produce a handbook for translating a hitherto unknown language. A rabbit appears, and a native speaker utters "Gavagai." Our field linguist writes "rabbit" in his notebook as the translation of "Gavagai." Yet in thus correlating what Quine calls "stimulus meaning" with "occasion sentences," and in accordingly translating "Gavagai" as "rabbit" by virtue of a perceived sameness of stimulus meaning, our linguist assumes the native speaker's language is similar enough to our own that there is cognitive synonymy between his conception of rabbit and ours. As Quine points out, however, there is no way of knowing, based on observed linguistic behaviors alone, whether the speaker means "rabbit" or "rabbithood" or "stages of rabbits" or even "the rabbit fusion."

This indeterminacy characterizes for Quine all acts of translation, and it applies not only to our translations between languages but also to our simplest referential correlations between words and things: the indeterminacy of translation leads to the inscrutability of reference. Thus the threat that qualia represent for behaviorist, materialist, or functionalist philosophies of language—as when diverging experiences of a color fail to register in the common verbal behavior that those same experiences prompt—remains present in Quine's work, which relocates the vagaries of mental properties in the world of physical objects. The threat thus emerges from within physicalist discourse itself rather than arriving from the other side of an explanatory gap in the form of phenomenal discourse. If physicalist discourse can be seen as necessarily insufficient for representing phenomenal properties, Quine extends this line of reasoning, demonstrating the indeterminacy of physicalist discourse even in representing physical objects. Radical translation, he notes, "begins at home" ("Ontological Relativity," 46).

For Quine, translational indeterminacy and referential inscrutability necessitate philosophical holism, which stresses the underdetermination of language by reality, or of science by experience. Quine rejects reductionism as an unexamined dogma of empiricism: "Our statements about the external world face the tribunal of sense experience not individually but only as a corporate body. . . . The unit of empirical significance is the whole of science" (Quine, "Two Dogmas," 41–42). Inasmuch as one can translate his statements about the external world into positions on mental properties, one might say that Quine would be skeptical of qualia not because they can be reduced or eliminated, but because they represent in themselves an atomistic, reductionist approach to complex phenomena.

Quine's holism prompts his pragmatism. He describes phenomenal and physicalist conceptual schemes as mutually constitutive and mutually irreducible: for each, the other plays the role of "a convenient myth" (Quine, "On What There Is," 18). Quine does not seek to eliminate phenomenal properties, but neither does he go so far as to grant them an autonomous existence independent of physicalist conceptions. In choosing which ontological framework to adopt under what circumstances, Quine advocates "tolerance and an experimental spirit," one that bears in mind "our various interests and purposes" (ibid., 19). Such a spirit allows that science admits, and must admit, of certain conceptual or theoretical posits that are at once irreducible and mythic, and in fact are irreducible because they are mythic: "Physical objects are conceptually imported into the situation as convenient intermediaries—not by definition in terms of experience, but simply as irreducible posits comparable, epistemologically, to the gods of Homer" (Quine, "Two Dogmas," 44). This line of reasoning extends not simply to physical objects and Homeric gods, but also to forces, irrational numbers, and classes of classes. And, one imagines, to qualia. Quine does not evade the challenge that putatively intrinsic properties of phenomenal experience pose to physicalist discourse about external objects. His is not a naive physicalism. Instead, he advocates a holist, pragmatist approach to the difference between physicalist and phenomenal ontological commitments and conceptual frameworks. To "quine qualia," in this regard, amounts less to materialist elimination than to pragmatic tolerance (cf. Dennett, "Quining Qualia," 42–77).

OBLIGATION

"Obligation"—from Latin *obligo*, "to attach" (*ligo*) "to" or "against" (*ob*)—has, like the Latin word *obligatio*, a strong meaning that is juridical (a commitment made by the parties, a guarantee or security deposit) and moral (mental commitment, responsibility, moral bond, constraint).

I. Obligation and Legal Bond

The legal, social, and religious system connecting obligation, norm, and law is explored in the entries for LEX and PIETAS (the disposition to perform one's office, or the feeling of duty) and RELIGIO (which "ties together" men and gods), so far as Latin is concerned; for Greek, see THEMIS, Boxes 1, 2 (see also KÊR and the complex vocabulary of destiny, which includes *anagkê* [ἀνάγκη], "necessity, constraint"). The other side of the tradition, the Arab and Hebrew one, is explored in the entries for TORAH (see also Hebrew BERĪT, "covenant"). The German *Pflicht* (from *pflegen*, "to care for") translates *obligatio* and *officium*: see SOLLEN and cf. BERUF. For English, see FAIR, LAW, and RIGHT/JUST/GOOD. Finally, the Russian SOBORNOST', which is translated by "conciliarity," designates the kind of gathering-together that connects people, beyond "catholicity," in Russian culture (cf. OIKONOMIA, PRAVDA).

See *DROIT*; cf. *DESTINY*.

II. Obligation and Moral Duty

The expression of moral obligation is connected with that of duty. Thus it is joined with the expression of debt, and thereby with fault and possibility: see DUTY and cf. PARDON; see also ASPECT and *PROBABILITY*.

The connection between having a duty to be and having a duty to do is explored on the basis of German; see SOLLEN. The terminological network thus rejoins that of will: see WILLKÜR and WILL; and that of value: see WERT and cf. *VALUE*.

On the relationship to the act as a moral act, see MORALS, POSTUPOK; cf. *ACT*, *GOOD/EVIL*, and *PRUDENCE*.

OIKEIÔSIS [οἰκείωσις] (GREEK)

ENGLISH   appropriation
FRENCH   *appropriation*
GERMAN   *Zueignung*
ITALIAN   *attrazione*
LATIN   *conciliatio, commendatio*

➤ *APPROPRIATION*, and HEIMAT, I/ME/MYSELF, LOVE, OIKONOMIA, PROPERTY, TRUTH

"Appropriation" is the literal translation, which has become inevitable, of the Stoic term *oikeiôsis*, derived from the verb *oikeioô* [οἰκειόω], "to make familiar" and later "to make specific to, to appropriate"; "to appropriate to oneself" in the reflexive sense, "related to the family, to the estate; belonging to the family," whence "proper to." *Oikeiôsis* is opposed to *allotriôsis* [ἀλλοτρίωσις], "alienation," and designates what nature has originally "appropriated or attached to us or conciliated with" us. The term also has an affective dimension that is very poorly rendered by "appropriation."

Providing the transition from the physical to the ethical, the notion of *oikeiôsis* [οἰκείωσις] is used by the Stoics in two different arguments, which makes understanding and translation even more difficult. This notion suggests that living beings do not seek primarily pleasure, but instead what is "appropriate" to each of them, starting with the preservation of their own constitutions. This entails a certain form of self-esteem and implies that in accordance with this tendency or primary impulsion (*prôtê hormê* [πρώτη ὁρμή]), we can posit for rational beings this double equation: living in accord with nature = living in accord with reason = living in accord with virtue. But *oikeiôsis* also has the purpose of founding relationships of justice between human beings by ensuring that self-esteem founds love for one's relatives, a love that must be understood as love for their own good, and which is destined to broaden to encompass all rational beings, thus founding in nature the social bond, or even the cosmopolitanism cherished by the Stoics, whether this is merely a cosmopolitanism of the wise, as in the older Stoicism, or that of all human beings, as in Panetius and later writers.

It is informative to compare the most recent French translation of the canonical statement of the thesis, as it is given by Diogenes Laertius, with the presentation offered by Cicero:

The living being's primary impulse is, they say, to preserve itself, because from the outset nature appropriates it [to itself], as Chrysippus says in the first book of his treatise *On Ends*, when he says that for every living being the chief object that is proper to him is his own constitution and the consciousness he has of it.

(L'impulsion première [τὴν πρώτην ὁρμήν] que possède l'être vivant vise, disent-ils, à se conserver soi-même [τὸ τηρεῖν ἑαυτό], du fait que la nature dès l'origine l'approprie (à soi-même) [οἰκειούσης αὐτὸ τῆς φύσεως ἀπ' ἀρχῆς], comme le dit Chrysippe au premier livre de son traité *Sur les fins*, quand il dit que pour tout être vivant l'objet premier qui lui est propre [πρῶτον οἰκεῖον] est sa propre constitution [σύστασιν] et la conscience [συνείδησιν] qu'il a de celle-ci.)

(*Lives of Eminent Philosophers*)

When an animal is born, it is spontaneously appropriated to itself [*ipsum sibi conciliari*], . . . interested in preserving itself [*commendari ad se conservandum*], and loving its own constitution, as well as everything that is likely to preserve this constitution [*et ad suum statum eaque quae conservantia sunt eius status diligenda*].

(Dès que l'animal est né, il est spontanément approprié à lui-même [*ipsum sibi conciliari*], . . . intéressé à se conserver soi-même [*commendari ad se conservandum*] et à aimer sa propre constitution ainsi que tout ce qui est propre à conserver cette constitution [*et ad suum statum eaque quae conservantia sunt eius status diligenda*].)

(*De finibus*)

Leaving aside the way in which this argument is presented in our two authors—a priori proof in Chrysippus, proof by effects in Cicero—we can observe that contrary to his usual practice, Cicero does not give the Greek term *oikeiôsis*, or even its Latin equivalent, but instead leaves it to his interpreters to give priority to *conciliatio* (literally, "association," "union") or *commendatio* (literally, "recommendation"). Cicero's exposition regarding the other aspect of this notion, that of justice, underscores what in Christianity would be called "love for one's neighbor," and uses only the term *commendatio* (*De finibus*, 3.62–63). We can now understand why, perhaps deviating somewhat from the literal meaning of the Greek, French translators have preferred, as did É. Bréhier in his edition of the Stoics for the Bibliothèque de la Pléiade, to use the verbs *attacher* and *adapter* in rendering Diogenes Laertius's canonical statement, whereas R. D. Hicks, the English translator of the Loeb Classical Library edition, opted for "endear," because he translated *oikeion* by "dear." That also explains why M. Pohlenz's translation of *Oikeiôsis* by *Zueignung* was rendered in Italian by *attrazione* (trans. O. De Gregorio).

These variations obviously show that, to cite two of the most recent and most authoritative editors and translators of Hellenistic literature, A. Long and D. Sedley, "any translation [loses] something of the original."

➤ ECONOMY, *IMAGE* [BILD, EIDÔLON], MIMÊSIS, MOMENT, OIKEIÔSIS, SECULARIZATION, SOBORNOST', SVET, *WORLD*

The term *oikonomia* [οἰκονομία] is a nodal concept in Christian thinking about the image (*eikôn* [εἰκών]). To understand it, we have to analyze its semantic history over the nine centuries that preceded its triumph. The Apostle Paul, who inherited the classical notion of *oikonomia* (Xenophon, Aristotle), chose the term to designate in his Epistles the totality of the level of the Incarnation. Its apparent polysemy is the origin of the disparity in its translations. Thus the profound unity of a regulative concept was veiled, legitimizing any relationship between the spiritual world and the temporal world. Intended to justify the adaptations of the Law to everyday and historical reality, the patristic economy supported all the modalities of management and administration in the visible world. The doctrine of the image sealed this pragmatic unity with an astonishing modernity.

I. From Xenophon and Aristotle to Paul

Patristic literature owes the introduction of the term "economy" to Paul's Epistles, in which we find *oikonomia* [οἰκονομία] used to designate the economy of the Pleroma, or the divinity taken in the plenitude of its perfection (Eph 1:10), the economy of grace (3:2), and the economy of mystery (3:9). In the Epistle to the Colossians (1:25), Paul speaks of the economy of God (*oikonomia theou* [οἰκονομία θεοῦ]). In modern French translations, the word is never rendered literally; instead we sometimes find *accomplissement*, sometimes *plan*, *dessein*, or *réalisation* (RT: *Traduction oecuménique de la Bible*). The person entrusted with this accomplishment is the *diakonos* [διάκονος] or *oikonomos* [οἰκονόμος], translated by *intendant* or *ministre*, the Vulgate having opted for *actor*. For Paul, it is a matter of borrowing from the Greek language a term that up to that point designated the management and administration of goods and services in domestic life and of importing the model of the private economy into the public economy, into the life of the city. That is in fact the sense in which both Xenophon and Aristotle use the word *oikonomia*.

Before them, Hesiod dealt in his *Works and Days* with the familial economy in a rather poetic way. In the *Republic* (4 and 5) and in the *Laws* (4 and 8), Plato used *oikonomia* to construct philosophically a figure of administration in the ideal city. The Platonic economy is the science of the

management of goods and persons in a state led by a sage endowed with temperance (*sôphrosunê* [σωφροσύνη]) and justice (*dikaiosunê* [δικαιοσύνη]). Access to these cardinal virtues passes through education and requires the exercise of dialectic conceived as the art of dialogue that leads to knowledge. The legislating faculty is nothing other than the *logos* [λόγος], that is, discursive rationality.

The objective of Xenophon and Aristotle is entirely different. Both of them deal with practical problems connected with the everyday reality of the family and the city and do not venture into literary or utopian terrain. As a result, in both thinkers *oikonomia* becomes a crucial notion in the sense that it determines the site of a confrontation between political realism and justice. In *The Economist*, Xenophon analyzes all the elements of the management of wealth and goods in the context of the family farm.

> SOCRATES: Tell me, Kritoboulos, is economy [οἰκονομία] the name of a certain kind of knowledge [ἐπιστήμης], like medicine, the art of forging or carpentry . . . ? Could we say, then, that it is a task [ἔργον] of economy?
>
> KRITOBOULOS: It seems to me that it is the task of a good economist [οἰκονόμου] to administer his household well.
>
> SOCRATES: And someone else's household, if it is entrusted to him—couldn't he administer it as he does his own? A competent carpenter [τέκτων] could work for another person as he does for himself. Thus someone who is familiar with economics [οἰκονομικός] will have the same ability. . . . Hence a person who knows this art [τὴν ταύτην τέχνην ἐπισταμένῳ], even if he has no property of his own, can earn a salary by administering another person's household [οἰκονομοῦντα] as he would by building it.

> (Xenophon, *The Economist*, 1.1–4)

As Leo Strauss puts it, "the administrator of an estate may be good or bad at management. But the economist (*oikonomikos*), that is, a person who has mastered the art of administering his estate, is ipso facto a good manager" (*Xenophon's Socratic Discourse*). In the debate between Socrates and Kritoboulos in Xenophon's work, the concept of *oikonomia* is in fact inhabited by the inevitable tension between the calculus of optimization and ethical requirements, an art of acquisition without war coupled with a providential conception of nature. In the rest of the debate, Socrates discusses further the management of wealth and the correct measures to take in order to ensure the prosperity of households and of the city.

In Aristotle's *Economica* (*Oikonomikos*), things become clearer: neither providence nor utopia is at issue, but rather a detailed consideration of actual practices and their results. In the private domain, Aristotle remains quite close to Xenophon, but when he moves to the public domain, economic concern is inseparable from political concern. *Oikonomikos* no longer designates a person but rather a mode of rationalized relations of the real that is closer to a judgment of (dialectical) probability than to a metaphysical concern. The function of judgment is entrusted to the proper usage of the *doxa* [δόξα]. The analysis of tricks thus finds its place here. Economics is a practice, both strategic and tactical, in the service of power and the accumulation of wealth. Its means are judged by their results.

■ See Box 1.

All this was inherited by the church fathers after Paul's suggestion that the Incarnation be assimilated to a plan for managing and administering humanity's secular reality by the divinity. Translations give a very confused picture of the term's polysemy since the word *oikonomia* sometimes disappears, and sometimes, put between quotation marks, is the subject of an awkward commentary on an accidental homonymy. However, the systematic unity of the term is essential for anyone who wants to understand the operative efficacy of *oikonomia*. The disparate translations show the uneasiness felt by Christians when faced with a Christological operator of opportunism. It is true that *oikonomia* changes meaning every time its use requires an inflection, but what constitutes the founding unity of polysemy itself is precisely its militant resistance to any kind of rigor (*akribeia* [ἀκρίβεια]) or univocalness in interpretation.

II. Patristic Polysemy: Economy and Incarnation

The polysemy of *oikonomia* does not reflect a semantic evolution since all the term's meanings have coexisted and operated simultaneously since the first centuries of the Christian era. In the eighth century, a crucial turning point linked economy with the debate on the legitimacy of the icon in patristic literature. It was in connection with the crisis provoked by the iconoclastic emperors (724) that the defenders of the image ("iconophiles") constructed the conceptual unity of the economy. In this way the definition of an operator that provides for uninterrupted management of heaven's interests and earthly goods is revealed and completed in all its philosophical and political breadth.

■ See Box 2.

A. Divine economy and ecclesiastical institution

The term *oikonomia* is used in patristic literature in its classical sense of the management and administration of goods and people or to designate responsibilities and offices within the ecclesiastical institution. The Incarnation, that is, the divine will to resort to the visible and historical, becomes the model for human management and administration of the secular space by those who are considered its stewards (*oikonomoi*). Paul is the founder of the system of incarnational economy. The *oikonomia* opens up the operative space of the new law which, in the image of Christ, is composed of infractions and transgressions that Paul was the first to declare (Rom 2:29; 2 Cor 3:6) to be the realization of the spirit of the law in opposition to its letter (Eusebius, *Histoire ecclésiastique*, RT: *PG*, vol. 20, col. 308C; Dio Chrysostom, *De sacerdotio*, 6.7.40). Consequently, the word *oikonomia* designated the person of Christ as well as the whole narrative of his life, passion, resurrection, and beyond, as far as the future completion of the providential plan of redemption (Athanasius, RT: *PG*, vol. 25, col. 461B, and vol. 26, col. 169A; Justinian, RT: *PG*, vol. 6, col. 753B; Irenaeus, RT: *PG*, vol. 7, col. 504B; Gregory of Nazianzus, RT: *PG*, vol. 36, col. 97C; Gregory of Nyssa, RT: *PG*, vol. 45, col. 137B).

1

Chrematistics and economy

The first question is whether the art of getting wealth [*chrêmatistikê* (χρηματιστική)] is the same as the art of managing a household [*oikonomikê* (οἰκονομική)] or a part of it, or instrumental to it. . . . Now it is easy to see that the art of household management is not identical with the art of getting wealth, for the one uses [*porisasthai* (πορίσασθαι)] the material which the other provides [*chrêsasthai* (χρήσασθαι)]. For the art which uses household stores can be no other than the art of household management.

(Aristotle, *Politics*, 1.8.1256a3–13)

Of the art of acquisition [*eidos ktêtikês* (εἶδος κτητικῆς)] then, there is one kind which by nature [*kata phusin* (κατὰ φύσιν), sc. war and hunting] is a part of the management of a household, insofar as the art of household management must either find ready to hand, or itself provide, such things necessary to life, and useful for the community of the family or state, as can be stored. . . . And so we see that there is a natural art of acquisition which is practiced by managers of households [*oikonomois*] and by statesmen [*politikois* (πολιτικοῖς)], and what is the reason of this.

(1257b27–38)

And thus we have found the answer to our original question, whether the art of getting wealth is the business of the manager of a household and of the statesman or not their business?—viz. that wealth is presupposed by them. For as political science does not make men, but takes them from nature and uses them, so too nature provides them with earth or sea or the like as a source of food. At this stage begins the duty of the manager of the household [*oikonomos*], who has to order the things which nature supplies.

(1258a19–25)

In book 1 of the *Politics*, Aristotle distinguishes two economic systems: one that remains closely connected with nature and undertakes to store up, manage, and make profitable the products necessary to life (economy); the other, unlimited, which seeks only the acquisition of wealth (chrematistics) and requires ethical vigilance because of the substitution of money for goods themselves (commerce). These two systems concern both domestic economy and political economy. The *Economics*, an Aristotelian treatise, adopts this distinction but chooses to accord its specifically political place to the acquisition and

growth of power by appropriation and growth of goods. In the *Economics*, chrematistics is no more than a set of financial techniques and strategies. We should note that in the *Politics* (1258b), on the chrematistic side of economy, the profitability of investments produces an interest called *tokos* [τόκος], which provides Aristotle with an opportunity to condemn usury as an activity opposed to nature (*para phusin* [παρὰ φύσιν]). This may seem surprising, since he observes that this productivity is homonymic with the procreation of children (*homoia gar ta tiktomena tois gennôsin auta estin* [ὅμοια γὰρ τὰ τικτόμενα τοῖς γεννῶσιν αὐτὰ ἐστιν]). Christianity was, on the contrary, to exploit this homonymy positively in an ecclesial economy that takes as its model engenderment and filiation on the basis of the fecund womb of the mother of God, named *Theotokos* [Θεοτόκος]. In classical thought, reflection on economy was often inseparable from an agricultural model, and the fundamental concern always remains that of a rational harmony between *oikonomia* and *phusis* [φύσις], between economy and nature. The Christian construction of economy breaks with any natural model in order to define a symbolic system of theologico-political power.

2

The crisis of the image: The iconoclastic period (724–843)

For almost a century, the Byzantine Empire was shaken by a theologico-political conflict in which what was at stake was the legitimacy of the image and the monopoly that institutions could have over it. The iconoclastic emperor Leo III decreed (724) the destruction of all religious images, which were to be replaced by imperial figurations and the decorations of

profane art. The church entered this conflict in which the foundation of its temporal power was involved, and triumphed in 843, with the "solemn restoration." It was on the occasion of this historical convulsion that Christian theologians and philosophers produced the first doctrine of the image. This remarkable philosophical innovation, in a world that was

heir to Judaism and Greek thought, which were not very favorable to visible things (out of fidelity to the rigor of ontological questioning), was carried out in the name of Economy. It was through the renewal of the uses of this term and through the play of its polysemy that the first Western thinking about the image began, the first iconology.

From the moment that the Incarnation becomes a long-term design that necessarily includes the most radical test of reality, namely, mortality, *oikonomia* becomes the model of every adaptation of human management to the providential level, the operating concept that relates spiritual requirements to the exercise of temporal power. In other words, it is the concept of the adaptation of means to ends in virtue of which the "occasion" (*kairos* [καιρός]; see MOMENT) is judged in terms of utility or efficacy. It is not a matter of

either jurisprudence or casuistry, because its foundation remains unshakably Christological; in fact, the person of Christ cannot be considered as a particular case treated as an exemplum. It is thus a kind of eschatologically founded pragmatism. This finalized adaptation is based on organic analogies of which the most foundational is again of Pauline origin: the identification of the body of Christ with the body of the church (1 Cor 12:31). Henceforth, the ecclesiastical institution becomes the *oikonomos* of the accomplishment

and all the means it uses to lead the *oikoumenê* [οἰκουμένη], that is, all inhabited lands, to the triumph of Christianity are justified by the divinity of the ends and the harmony of a natural order. The church has thus made a transition from the domestic *oikos* [οἶκος] to the cosmological *oikos* in order to extend to the whole universe the science of management and administration of the divine patrimony, creation. The divine economy is the natural model of all exchange and all consumption.

B. *Dispositio* and *dispensatio*

In light of the tensions in classical thought, we can understand why the church soon found itself facing the following question: how far can the adaptation of means to ends be taken? How far can trickery and the temporary abandonment of evangelical principles lead us to agree that the ends are more important than the requirement of justice and love? Debates on this subject were frequent, whether it was a question of the strategies to be used for conversion, pedagogical tricks, or pious lies.

To better delimit the semantic space of *oikonomia*, we have to start over from its Christological foundation as it derives from Paul's use of the word. The *Oikonomia* of God is Christ, the filial incarnation. From this follows a Trinitarian use (Hippolytus, RT: *PG*, vol. 10, col. 808A, 816B, 821A), which is rendered in Latin sometimes by *dispositio*, and sometimes by *dispensatio*, depending whether the emphasis falls on the system as the structure of divinity (Tertullian) or on its dynamics as productive of meaning and history. Tertullian adds to the Latin terms the transliteration of the Greek (in the form of *oeconomia*) to designate the Trinitarian dimension of the filial mystery (RT: *PL*, vol. 2, col. 158A). *Dispositio* makes it possible to shed light on the naturalistic dimension of *oikonomia*, which covers the whole of creation, and thus simultaneously *phusis* [φύσις], *kosmos* [κόσμος], and *sustasis* [σύστασις]—that is, nature, the universe, and the organic system (Clement of Alexandria, RT: *PG*, vol. 8, col. 1033A–B). The body is included in this providential, ordered structure of the world, and *oikonomia* thus inherits the Stoic conception of the cosmos. *Dispositio* is a structural concept, whereas *dispensatio* is a functional concept. *Dispensatio*, a dispensation and a development in the visible, covers the historical effects of the divine will and action in the world and the adaptation of its investments to its creature. The concept of accounting for expenditures, profits, and losses finds here its theological foundation.

> We shall say immediately what the goods are that are dispensed [*chorêgia tôn agathôn* (χορηγία τῶν ἀγαθῶν)] that come to us from the Father through the Son: in order to continue in existence, every nature in creation, whether it belongs to the visible world or the intelligible world, needs divine solicitude [*epimeleias* (ἐπιμελείας)]. That is why the demiurge Word, the only begotten God, grants his help in proportion to each one's needs [*hekastou chreias* (ἑκάστου χρείας)]. In addition, he provides resources [*epimetrei tas chorêgias* (ἐπιμετρεῖ τὰς χορηγίας)], varied and of all kinds, according to the diversity of his debtors, distributing them proportionately to each one [*summetrous hekastôi* (συμμέτρους ἑκάστῳ)] in accord

with the necessity of his needs [*kata ton tês chreias anagkaion* (κατὰ τὸν τῆς χρείας ἀναγναῖον)].

> (Basil of Caesarea, *Traité du Saint-Esprit*)

This dispensation raises, for ecclesiastical management, the question of profitability and balanced accounts in the distribution of benefits and in the distribution of rewards and punishments (cf. Kotsonis, *Problèmes de l'économie ecclésiastique*).

The translation given priority in the Vulgate is *dispensatio*, which covers both *phusis* and *pronoia* [πρόνοια], that is, nature and providence. Thus it is used by Clement (RT: *PG*, vol. 8, col. 809B), Origen (RT: *PG*, vol. 11, col. 277A), Gregory of Nyssa (RT: *PG*, vol. 45, col. 126C) and Maximus the Abbot (RT: *PG*, vol. 90, col. 801B). The harmony of the world is open to all ways of adapting means to ends in order to obtain consensus (*homologia* [ὁμολογία]). Thus the term "economy" designates prudence (*phronêsis* [φρόνησις]), as in Origen and Athanasius (RT: *PG*, vol. 25, col. 488B) or Theodore of Studion (RT: *PG*, vol. 99, col. 1661C); pedagogical strategy and the manipulation of minds, as in Origen (RT: *PG*, vol. 13, col. 496B); trickery and all stratagems that make possible the adjustment of silence and rhetorical procedures, as in Gregory Nazianzus (RT: *PG*, vol. 36, col. 473C) or Basil (RT: *PG*, vol. 32, col. 669A); and finally lies (*apatê* [ἀπάτη], *kalê apatê* [καλὴ ἀπάτη]), as in John Chrysostom (RT: *PG*, vol. 48, col. 630ff.).

C. "Economize the truth"

Letter 58 from Gregory Nazianzus to Basil of Caesarea perfectly illustrates the question of the pastoral economy in its management of opportunity. Basil, confronting heretics, cleverly dissimulates, for strategic reasons, the rigor of the Trinitarian dogma in order to avoid a conflict that would threaten the unity of the church in the provinces affected by heresy. Not being in a strong position, Basil keeps partially silent. Accused of cowardice by the more rigorous, he receives this letter of support from his friend.

> It is better to economize the truth [οἰκονομηθῆναι τὴν ἀλήθειαν] by yielding a little to the circumstances, as one does to a cloud [ὥσπερ νέφει τινὶ τῷ καιρῷ], rather than compromise it by making a public declaration that reveals everything. . . .
>
> The audience did not accept this economy. They cried that it was the result of the managers of cowardice [οἰκονομούντων δειλίαν] and not of discourse. As for you, divine and holy friend, teach us how far we must go in the Theology of the Spirit, what terms we must use, how far we must be economical [μέχρι τίνος οἰκονομητέον] to maintain these truths when confronted by our contradictors.

> (Gregory of Nazianzus, *Lettres*)

The difficulties raised by putting a theological concept in the service of politics mobilized the church fathers and theologians when Christian charity had to be reconciled with the desire for hegemony and conversion. It was entirely possible to make economy the foundation of an active conception of tolerance. But this did not happen, and strategic accommodation won out, to the point of accepting a certain Machiavellianism.

Pontifical management of human affairs yielded historical examples in which the respect for the Gospels no longer inspired the hierarchy's decisions. The penitential economy then came to the rescue for sinners.

The wealth and ambiguity of the term's polysemy provide an adequate explanation for the prudent silence of the church, which never produced an overall thematic work on this dangerously ambivalent term. That God and his creature meet on the "economic" terrain of a mutual accommodation clearly emerges from the texts without ever being the object of a conceptual mobilization. The sole testimony to a thematic definition occurs in a lost work of Eulogios that we know through Photius's review of it. Eulogios seems to have taken into account only the semantic field of accommodation and opportunity.

■ See Box 3.

III. The Iconic Economy

Starting in the eighth century, in connection with the crisis of images unleashed by the iconoclastic emperors, the defense of the icon was entirely constructed on the economic interpretation of the Incarnation. The management and administration of visible things became the cornerstone of ecclesiastical politics. An enemy of the icon can be called an *iconomachos* as well as an *economachos*, because in Greek the two words are pronounced in the same way, *ikonomachos.* Thus the enemy of the icon is a tormentor of Christ, the enemy of the church and the universal plan of redemption. The iconic *oikonomia* thus gathers together the entire semantic field of *oikonomia* in a unifying doctrine that supports all the productions of images. In fact, the icon celebrates the Incarnation and institutes the production of visible things as *mimêsis* [μίμησις] of all God's providential operations. The strategic, pedagogical, and political adaptation of means to ends practiced by the institution is part of the divine adaptation to the system of visibility.

To elaborate the iconic specificity of the *oikonomia*, the church fathers opposed it to *theologia* [θεολογία], that is, to the Jews' literal fidelity to the Mosaic Law. Economy is the mark of the new law, the end of biblical prohibitions and of subjection to the letter (Theodore of Studion, RT: *PG*, vol. 99, col. 353D). There followed moments of crisis within the church when the *oikonomia* became, to the indignation of the most rigorous minds, the justification for lies, abuses, and crimes committed in the name of legitimate ends. Economy conflicts with *akribeia*, that is, with the literal respect for the Law. The "holy economy" inevitably began to feed the polemic directed against the Jews. Enemies of the Incarnation and the image, they are at the same time accused of practicing a diabolical management of goods and profits. Their relationship to money bears the signs of their damnation.

We can now understand in a different way the difficulty faced by Christian translators who chose to give priority to the disparate with the entirely economical goal of concealing the "ideological" unity of a term that threatened the spiritual purity of practices. Translating the word *oikonomia* as "economy" every time it occurred might reveal only too clearly the political goals of a temporal power that no longer felt it was faithful to the ethical requirements of the Gospels. This explains the countless footnotes warning the reader against the deviations of what is presented as an accidental homonymy that could give rise to serious misunderstandings. The anxiety is well founded: it is exactly the same thing at issue in the secular and religious senses of *oikonomia*, namely, of legitimating all the means necessary for the management and administration of the visible world with a view to salvation while respecting the indestructible unity of an institution. *Oikonomia* is not a homonym, but a unified concept in the service of unification.

3

Eulogius's distinctions

The lost treatise by Eulogius was probably contemporary with the debates about the Monophysite and Nestorian heresy (fifth century), that is, with an era in which the rigorous defense of dogmatic truths endangered the unity of the church. Therefore, it was necessary constantly to seek the best possible "compromises" between spiritual fidelity and political aims. This "compromise" is "economy" and requires a pragmatic adaptation within a vigilance that remained theoretical. This treatise is the only Byzantine work that seems to have attempted a synthesis of "economic" operations.

Eulogius draws a triple distinction within the notion of economy as it is recognized by the church, and he shows that it is only by not aligning themselves with none of the three that they [the heretics] have arrived at a formless mixture of impiety through the alliance they have made between the excesses of their heresies. To begin with, Eulogius says that the principle of economy does not recognize just anyone as a judge and arbiter of its realization, but instead chooses them among the servants of Christ, among the dispensers [*oikonomous*] of the divine mystery and among those who legislate from episcopal sees. In addition, it is a proper principle that exercises the economy when the dogmas of the faith are not subjected to any attack by it.

Often a circumstantial economy [*proskairos oikonomia* (πρόσκαιρος οἰκονομία)] is established for a limited time by admitting and retaining a few givens that were not supposed to be in order to allow the true faith to recover its durable power and tranquility. . . . The second economy concerns words. Thus when the church's dogmas are well established and expressed in different terms, we agree in order to say nothing about certain words, especially if they are not serious reasons for scandal for those whose intention is sufficiently upright. . . .

A third mode of economy concerns the frequent case in which people do not take into account a decree that has been promulgated, and promulgated precisely against them, without the authority of the true dogmas being thereby lessened.

Nikephoros: The iconophile synthesis

It was probably through the crisis of the image that the operational unity of the concept of *oikonomia* was constituted. Explicitly bringing together under a single term the Incarnation, political management of goods and persons, and the stakes involved in iconic figuration made *oikonomia* the key element in a symbolic construct. Economy synthesizes doctrinally the evangelical message and the life of the institution. Patriarch Nikephoros was a vehement and exemplary spokesman for this view in the ninth century:

> Even before taking up the question of icons, through the view that he [the iconoclast] expresses publicly, he allows his plan to be divined without waiting to turn it in the famous way that we know. Now see the logical consequence that is maintained between his conception and everything that precedes. In fact, he has first discussed the two natures and hypostases, and then, suddenly carried away by arrogance and passion, he jumps abruptly and without order to icons and prototypes. He could offer no better proof that the whole discussion that he has carried on has had, from start to finish, no goal other than to do violence both to the sacred symbols of our faith and to the whole Economy of our Savior Jesus Christ, and he has merely thrown himself still further into revolt against Christ.

(Nikephoros the Patriarch, *Discours contre les iconoclastes*, [*Antirrhétiques* 1, 224C–225A])

Nikephoros's *Antirrhetici* are the most important of the iconophile works, and they were written in the ninth century. In them, the term "economy" is used thirty-nine times to identify very closely the defense of the Incarnation with that of the image. These polemical treatises responded to the iconoclastic interpretation of economy, which claimed that after the Resurrection, respect for the evangelical message was the only legitimate responsibility of the church's theology and its hierarchy, whereas the temporal economy fell to the secular political power of the emperor. The interpretation of *oikonomia* thus became a political stake in which the separation of powers was central. The church triumphed by bringing together under a single term the secular issues of the visible, power, and wealth.

ʿŌLĀM [עוֹלָם]   (HEBREW)

ENGLISH   world
FRENCH   *monde*

➤ *WORLD* [WELT], and AIÔN, *HUMANITY*, *LIFE*, PRESENT

Among the words that designate the world, some emphasize the order of things, like the Greek *kosmos* [κόσμος] and the Latin *mundus*. Others accentuate the presence of the subject, his being-in-life. The world is what one comes into at birth, and what one leaves at death. That is the case for English "world," German *Welt*, and Dutch *vereld*, in which the etymology is easier to discern: the length of life (cf. Eng. "old") of a man (Lat. *vir*; Ger. *wer-* in *Werwolf*, "wolfman," "werewolf"). The Hebrew word for "world" is currently ʿ*ōlām* [עוֹלָם]. It is present in the Bible, but probably not in this sense, even in a late text like Kohelet (Ecclesiastes) 3:11. There is another, temporal sense, that of indefinite duration, usually in fixed expressions such as ʿ*ōlām* [עוֹלָם], "to have an indeterminate future," whence "for all time," or *me*-ʿ*ōlām* [מֵעוֹלָם], "for a time whose beginning is unknown," "since a moment which is not known," whence "forever."

The substantive, used in a constructed state as a quasi-adjective, designates the most remote antiquity (Dt 32:7, etc.). Indetermination is the principle that is supposed to explain the word's probable etymology through a root meaning "to hide": the distant past and future lie outside our knowledge.

The meaning "period, era, eon" evolves from the idea of an eschatological change that will distinguish an era still to come (*hā-ʿōlām ha-bā'* [הָעוֹלָם הַבָּא]) from the present era (*hā-ʿōlām ha-zèh* [הָעוֹלָם הַזֶּה]). Since in this future era, "everything" will have to be changed, the word designating the period takes on the meaning of its content: that of "world," a meaning that it retained in the later history of the language, and that passed, through the intermediary of Aramaic, into the Arabic (ʿ*ālam* [عالم]).

In the first century CE, the formula "come into the world" is found, with the sense, for humans, of "to be born," or for things, "to appear." This is the case in the Greek Old Testament (Wis 2:24; 14:14), the New Testament (Jn 1:9; 13:1; 16:33), and the Talmud, where the expression "those who come into the world [בָּאֵי עוֹלָם]" designates all humans

(e.g., Rosh Hashanah, 16a; the targum of Kohelet 1:4). It is also the case in pagan authors (Dio Chrysostom, 12.33); *On the Sublime*, 35.22). Biblical Greek renders this meaning either by *kosmos* [κόσμος] or by *aiôn* [αἰών]. This word has the twofold advantage of a certain phonetic proximity and a clear semantic relationship, the Greek word having designated, quite early in its evolution, the span of a life, and the Hebrew word being capable of signifying, for its part, "in perpetuity," in the sense of "for the whole of life" (Dt 15, 17, etc.).

OMNITUDO REALITATIS

ENGLISH   the whole of reality
FRENCH   *le tout de la réalité, le tout inclusif de la réalité*
GERMAN   *der Inbegriff aller Realität, die Allheit aller möglichen Pradikäte*

➤ REALITY, *WHOLE*, and DASEIN, ESSENCE, GERMAN, GOD, *NEGATION*, RES, SEIN, *TO BE*, TO TI ÊN EINAI, VORHANDEN

Omnitudo realitatis, the Kantian formula that defines the ideal of pure reason—the idea of a being that includes within itself the whole of reality, without its being necessary to make a decision regarding "the existence of a being of such an eminent superiority"—is no doubt the best proof of the differentiated sense of the term "reality" in Kant's critical work. Here, *Realität* is a simple calque of the Latin *realitas*, in the sense of the real content (*Sachheit*), of positive and exhaustive determinability ("total possibility"), against the background of which the determination of each existing thing stands out. The formula finds its meaning only in reference to Christian Wolff and Scholastic uses of the tem *realitas*, the very ones that were to make possible the first thematic opposition of existence understood as *Wirklichkeit* (actuality) to reality (*Realität*). This opposition is the core of Kant's critique of the ontological argument, insofar as the concept of God as *ens originarium, ens summum, ens entium*, although it is truly—but only within the bounds of reason—the "concept of supreme reality" that contains within itself "the whole of reality" does not for all that imply existence (*Dasein*). For Kant, *Dasein*, like being (*Sein*) or "positing," is not a "real" predicate, that is, one that can be "understood" in the set of "realities" through which the *ens realissimum* (see REALITY, and the distinction *Realität/Wirklichkeit*) are wholly defined.

Through this strange locution (*omnitudo realitatis*) we see in miniature, as it were, the extent to which Kant's breakthrough still had to struggle with the late Scholastic terminology of German academic metaphysics. The same can be said about many classic philosophical texts in Latin that require a kind of retroversion to Greek. In translating "German classical philosophy" we must not ignore this historical density of the concepts, even though they are elaborated by contraposition to *Fremdwörter*.

I. The Classical Meaning of the Kantian Formula: The Supremely Real Being

Kant introduces, in the framework of the Transcendental Dialectic, and as an ideal of pure reason, the idea of a total reality (*omnitudo realitatis*, *Allheit der Realität*), which corresponds to the principle of complete determinability: "*alles Existierende ist durchgängig bestimmt*" (everything which exists is completely determined). "In accordance with this principle, each and every thing is therefore related to a common correlate, the sum [*Inbegriff*] of all possibilities," that is, "to the *totality* (*universitas*) or sum of all possible predicates" (*Critique of Pure Reason*, A 573/B 601). Thus, to such a complete determination corresponds a concept we can never represent (*darstellen*) *in concreto* and whose proper place is pure reason itself. The latter, through its demand in principle for the complete determination of every thing (*Ding*), a demand that is itself based on the idea of the "sum-total of all possibility" (*Inbegriff aller Möglichkeit*), forms the concept of an individual object (*einzelner Gegenstand*) that is completely determined through the mere idea and must therefore be entitled an *ideal* of pure reason (ibid., A 574/B 602), which is also the idea of an *omnitudo realitatis* or an *ens realissimum*: the unique "thing" (*Ding*), completely determined by itself, which must be represented as an "individual" (ibid.). The possibility of that which thus contains within itself "all reality" (*alle Realität*) is to be considered "originary" in relation to the derived character of the "possibility of things" (*Möglichkeit der Dinge*), whose diversity is directly connected with the specific manner in which they "limit" the supreme reality (*höchste Realität*) that forms, as it were, its "substrate" (ibid., A 576/B 604). This supreme reality may also bear the more traditional names of *ens originarium, ens summum, ens entium* (originary being, supreme being, being of beings). Naturally, this is only an Idea—Kant even calls it a "fiction" (*Erdichtung*) (ibid., A 580/B 608)—that cannot be hypostatized in the concept of a Supreme Being.

II. "Reality," "Possibility," and "Quiddity" in the Work of Christian Wolff

In the Kantian vocabulary the formula *omnitudo realitatis* goes back beyond Wolff and Leibniz to the Scholastic use of the term. In his *Philosophia prima sive ontologia* (1730), Christian Wolff defined the "thing" and its "reality" in these terms:

Quicquid est vel esse posse concipitur, dicitur res, quatenus est aliquid; ut adeo res definiri possit per id, quod est aliquid. Unde et realitas et quidditas apud scholasticos synonyma sunt.

(Everything that is or that we can conceive being is called a thing, insofar as it is something; thus the thing could be defined by the fact that it is something. That is why, among the Scholastics, reality and quiddity are synonymous terms.)

(Wolff, *Philosophia prima*, §243)

Wolff had already posited, in his 1729 "German Metaphysics" (*Deutsche Metaphysik*), that "*Alles was seyn kann, es mag würklich seyn oder nicht, nennen wir ein Ding*" (Everything that can be, whether it is actually real or not, we call "thing") (§16). In Wolff's work, the distinction between *realitas* and *existentia*—the one that characterizes the tradition that Duns Scotus inaugurated—is also confirmed by this addition to §243: "*E.g., arbor et ens dicitur et res. Ens scil. si existentiam respicis; res vero, si quidditatem*" (Of a tree we say, for example, that it is an existent and a thing. An existent if we consider

its existence; a thing, if we consider its quiddity). However, we must note another, broader use of the term *realitas* to designate, as in the *Theologia naturalis* (1736–37), everything that can be understood as truly inherent in any existent whatever ("*quicquid enti alicui vere inesse intelligitur*," 2: 5). In conformity with this new meaning, *existentia* (whether necessary or contingent) can then be itself considered a *realitas*. But if, as an inherent reality (*inesse alicui*), existence can be attributed as one property among others, it is nonetheless not identified with actuality or effectivity.

III. Existence as a Complement of Possibility, *Existentia* as *Actualitas*

In his "German Metaphysics" of 1719, Wolff discussed existence (understood as a complement or "fulfilling" of possibility) in terms of actuality (*Würklichkeit*):

Es muß also außer der Möglichkeit noch was mehrers dazu kommen, wenn etwas seyn soll, wodurch das Mögliche seine Erfüllung erhält. Und diese Erfüllung des Möglichen ist eben dasjenige, was wir Würklichkeit nennen.

(However, something additional must still be added, if something is supposed to be, whereby the possible receives its fulfillment. And this fulfillment of the possible is precisely what we call actual reality. [That is, actuality or existence.])

(Wolff, *Deutsche Metaphysik*, §14)

Used adverbially, the term *wirklich* (*würklich*) determines the mode of being present (being-there) or existent (*vorhanden*):

Weil die Welt nicht würklich da ist . . . die Welt ist würklich außer unserer Seele vorhanden.

(Because the world is not "really" present . . . the world really exists outside our minds [that is, it is actually present in front of us].)

(Wolff, *Vernünftige Gedanken*, §942–43)

This use of the term *Wirklichkeit* is in fact merely a translation of the Latin *actualitas*, understood as a determination of existence. Rudolf Goclenius, in his famous *Lexicon philosophicum*, observed, in the article "Actualitas": "*Actualitas prima, qua res existit, dicitur Esse; Paul. Scal. ita loquitur cum Barbaris, quorum haec est distinctio*" (We call being the primary actuality through which a thing exists; that was what Paul Scaliger called it, repeating this barbarous Scholastic distinction). Wolff says more precisely: "*Esse ens dicitur, quatenus est possibile: existere autem, quatenus actu datur*" (The existent is called being, insofar as it is possible; but we say that it exists insofar as it is given in the act or "actually given") (*Philosophia prima sive ontologia*, §874n). In this primary actuality, we can easily recognize the Aristotelian *energeia* [ἐνέργεια] (see PRAXIS), which is distinct from the essence or the formality that defines this or that being.

IV. *Realitas,* Realities, and Negations

Alexander G. Baumgarten and Georg Friedrich Meier, who on this point are quite closely dependent on Wolff, use the term

realitas in the same sense. *Realitas* is used in the context of the general analysis of "determinations" (*notae et praedicata*) and combines all the positive conceptual characteristics that can be attributed to a thing through opposition to negative determinations (*negationes*) (Baumgarten, *Metaphysica*, §§34, 36; Meier, *Metaphysik*, §46). *Negationes* are thus directly opposed to *realitates* (Baumgarten, *Metaphysica*, §135), and the existent as such, or at least the existent that is conceived as *ens perfectum, positivum, reale*, is defined by the set of *realitates* that compose it, among which may figure existence or actuality (*actualitas*), understood as *complementum possibilitatis*:

Cum in omni ente sit realitatum numerus, omne ens habet certum realitatis gradum.

(As there are a certain number of realities in every existent, every existent contains a certain degree of reality.)

(Baumgarten, *Metaphysica*, §248)

Of course, for Baumgarten as for the Wolff of the *Theologia naturalis*, existence is to be counted among realities, since it contributes to complete determination (*complementum*) of what is (*Philosophia prima*, §172–73) :

Existentia non repugnat essentiae, sed est realitas cum ea compossibilis.

(Existence does not reject essence, but is instead a reality that is compossible with it.)

(Baumgarten, *Metaphysica*, §66)

Existentia est realitas cum essentia et reliquis realitatibus compossibilis.

(Existence is a reality compossible with essence and with all other realities.)

(Ibid., §810.)

But existence, thus understood as a "reality," opens another dimension, that of actuality or *Wirklichkeit* (we have already seen how the latter term imposed itself on Wolff). Thus, Baumgarten can now write: "*Omne actuale est interne possibile, seu posita existentia ponitur interna possibilitas*" (everything that is actual is intrinsically possible, which means that existence being posited, internal possibility is as well) (ibid., §8), which Hegel was to "translate" very naturally as "*Was wirklich ist, ist möglich*" (what is actually real is possible) (*Wissenschaft der Logik*, ed. G. Lasson, 2: 381).

Thus *realitates* considered as positive determinations, which are themselves susceptible of degrees, constitute so many *entia realia*, and in principle they can all be applied to a concrete thing (the *ens reale* in the strict sense) in which they are inherent; then we understand that all realities, as perfections raised to the highest degree (*plurimae maximae realitates*), may coincide in one and the same being which, containing within itself the *omnitudo realitatis*, will be the *ens realissimum*:

Omnes realitates sunt vere positivae, nec ulla negatio est realitas. Ergo si vel maxime conjugantur in ente omnes, numquam ex iis orietur contradictio. Ergo omnes

realitates sunt in ente compossibiles. Ergo enti perfectissimo convenit omnitudo realitatum, earumque, quae ullo in ente esse possunt, maximarum.

(All realities are truly positive, and no negation is a reality. Thus if all realities are combined to the highest degree in the existent, no contradiction will ever result. All realities are therefore compossible in the existent. Hence the complete totality of realities—and the maximal ones that may be in a given existent—is appropriate for the most perfect existent.)

(Baumgarten, *Metaphysica*, §807)

V. The Kantian Thesis: Being as Positing

We see clearly all that is at stake in the thesis that makes existence a "reality." It is the most economical formulation and, as it were, the core of the ontological argument: we can affirm the existence of God as soon as existence has been established as a real predicate, for otherwise, as Baumgarten once again emphasizes:

Deus non actualis esset ens omnibus realitatibus gaudens, cui quaedam tamen deesset.

(God would not be the actual [or effective] existent enjoying all realities, since he would lack one of them.)

(Baumgarten, *Metaphysica*, §807)

Here we find once again the ancient ontological argument, set forth this time in Wolffian concepts, the very conceptual system that Kant was to criticize as early as 1763, refusing both to make existence and being-there (*Dasein*) a real predicate or to count it among the realities that belong to a thing or constitute it, and to make God the concept including all realities. Saying that being (*Sein*) is not a real predicate (*reales Prädikat*) or that it adds no "reality" to the concept of a thing leads Kant to define it as "positing": "*Es ist bloß die Position eines Dinges, oder gewisser Bestimmungen an sich selbst*" (It is merely the positing of a thing, or of certain determinations, in themselves) (*Critique of Pure Reason*, A 598/B 626). Thus the propositions "God is omnipotent" and "God exists" can no longer be analyzed in terms of predication, as if it sufficed to distinguish (as in Meister Eckhart) between propositions of the third and second adjacents. There is no proposition of the second adjacent, or rather, when we say "God exists," "we attach no new predicate to the concept of God, but only posit the subject in itself with all its predicates" (*Critique of Pure Reason*). Existence or actuality adds nothing ("*Das Wirkliche enthält nichts mehr als das Mögliche*" [The real contains no

more than the possible], ibid.). What is entirely lacking here is a common measure or additivity.

The remaining, irreducible heterogeneity of being and reality governs Kant's thesis of being as *Position* (positing). It is certainly permissible to see in this, as Heidegger does, the distant echo of a Scholastic doctrine transmitted by Suárez: "It suffices to consider this word 'existence' to see in the *sistere* [*ex-sistere*], in placing, the connection with *ponere* and positing: *existentia* is the *actus quo res sistitur, ponitur extra statum possibilitatis*" ("La thèse de Kant sur l'être," *Questions II*, 110; *Nietzsche*, 2: 417ff.; Heidegger, "Kant's Thesis about Being"). But we can also focus our attention, not on this uniformly continuous history ("From Anaximander to Nietzsche"), but on the Kantian rupture with the Scotist tradition.

PARDON / FORGIVE

FRENCH   *pardon*
GERMAN   *vergeben*
GREEK   *suggignôskein* [συγγιγνώσκειν]
LATIN   *ignoscere, remittere*
SPANISH   *perdonar*

➤ DUTY, *FALSE,* MEMORY, THEMIS

In most European languages, the verb "to pardon," or "to forgive," is a compound of "give" with an intensive preverb and is modeled on late Latin *perdonare*: thus *vergeben* (Ger.), *pardonner* (Fr.), *perdonar* (Sp.). The pardon, as a supplement to giving, is a way of escaping the rigorous calculus of crime and punishment. However, antiquity expresses "pardon" in terms of knowledge: the Greek *suggignôskein* [συγγιγνώσκειν] and Latin *ignoscere* are compounds of verbs meaning "become acquainted with" (*gignôskein* [γιγνώσκειν], *noscere*); yet the two paradigms are antithetical: the Greek understands the pardon as shared knowledge (*sun,* "with"), whereas in Latin "pardon" belongs to the register of ignorance and the refusal to know (*in-*, no doubt privative). The moral and political implications of these two attitudes differ considerably.

I. Donation and Pardon

In most modern languages, both Romance and Germanic, "to pardon" is a transposition of Late Latin *perdonare*, which is, moreover, attested only once (in Romulus's *Aesop*, around the fourth century). The verb is not a direct compound of the Latin *dare* (give) but derives, through the noun *donum*, from *donare* ("to donate," and in particular, "to absolve," "to favor"). A pardon, as the intensive preverb indicates, has the structure of a completion or an excess, of a surplus of donation. It makes an exception in the accountability of debt and justice, which apportions punishment to the crime in accord with a strict retribution derived from the *lex talionis*.

By itself, "giving" or "donating" already implies a movement beyond equality and reciprocity: according to the definition in *Le nouveau petit Robert*, the French word *donner* means *abandonner*, to give something to someone "without receiving anything in return." Similarly, the archaic economy of the potlatch, brought to light by Marcel Mauss, implies a "gift/counter-gift" circulation that goes beyond commercial exchange: "in the things exchanged in the potlatch, there is a virtue that forces the gifts to circulate, to be given and given back" (*Essai sur le don*). The munificence of the counter-gift constantly begins a new debt that perpetuates the process of "expense," to adopt Georges Bataille's expression. This excess constitutive of the gift and its systematics is, however, not of the same order as that involved in the pardon. Instead of initiating an infinite chain, the pardon is instead a cutting off, or "de-cision," like a decision handed down by a court. But pardoning is not, like punishing, a matter of

balancing accounts; it is on the contrary a matter of agreeing to clear an account even if it is in deficit, even if it is not clear. A fault is remitted (*remittere veniam*) just as the International Monetary Fund remits a debt or a judge remits a sentence, to "clear the account." This is shown in the Lord's Prayer, in which the verse "Forgive us our trespasses as we forgive those who trespass against us" translates the accountant's Latin: *dimitte nobis debita nostra* (forgive us our debts), which is itself modeled literally on the Greek: *aphes hêmin ta opheilêmata hêmôn* [ἄφες ἡμῖν τὰ ὀφειλήματα ἡμῶν] (lit. "remit, release our debts"; see Matt 6:12–15).

There is, however, an alternative way to proceed. We might consider that with forgiveness, the final reckoning is, in the end, simply extended. New, initially extrinsic elements do come into play here: the request for forgiveness ("Forgiveness? Have they ever asked us for forgiveness?" Jankélévitch, *L'imprescriptible*), repentance ("If [your brother] sins against you seven times in the day, and turns to you seven times and says, 'I repent,' you must forgive him," Luke 17:3). All this evidence of good will, in fact, generates a new but no less exact accounting: one that balances the request for and the granting of forgiveness, which we could describe as "Abrahamic" and which functions even in the great public representations of repentance (Ricœur, *La mémoire*).

What significance should then be assigned to completion, to the surplus constitutive of the "par-don"? Can we still say that forgiveness clears an account in deficit? Yes, and in at least two modes of excess. First, because the Gospel's hyperbole in commanding us to love our enemies or to turn the other cheek produces an offer of "absolute," or "mad," forgiveness that always goes beyond the request and may merge with a structure of renewal analogous to that of the potlatch (this would in any case be worth thinking about). Also, as Jacques Derrida stressed, because there is something "unpardonable" and "imprescriptible": a pardon is really a pardon—the perfection of the gift—only when it pardons the unpardonable, remits the imprescriptible (the Shoah, which we no longer dare introduce with "for example"); only the impossible pardon is truly nonaccountable and in conformity with its concept.

II. Forgiveness and Grace: Theological-Political Verticality

To account for the inadequation of every model of exchange, even if it is noncommercial, Paul Ricœur chooses to emphasize the "vertical disparity between the profundity of the offense and the loftiness of the forgiveness" (*La mémoire*). This vertical disparity, which for him constitutes the authentic singularity of forgiveness, has to do with the possibility of "detaching the agent from his act": "you are better than your acts," says this "liberating word" (see Matt 18:18, "Whatever you bind [*alligaveritis*] on earth shall be bound [*ligata*] in heaven, and whatever you loose [*solveritis*] on earth shall be

loosed [*soluta*] in heaven," where *solvere*, "to unbind," "to dissolve," "to absolve," translates the Greek *luein* [λύειν].

This strong conception is without any doubt theological-political. There is the one who pardons, on high, who possesses the sublime ability to originate anew, to re-create, and there is the one who is pardoned, down below, because he has offended and fallen (although the etymology of *culpa* is unknown, *fallere*, from which "fault" and "false" are derived, is generally connected with the Greek *sphallô* [σφάλλω], "to cause to fall," or with Old High German *fallan*, "to fall," and *peccare*'s first meaning is "to stumble," "to make an error"). Clearing every account is a gracious remission. Only grace can in fact settle the account in deficit: first of all, the efficacious grace of God, however it is transmitted (although the state of innocence was lost with Adam, "baptismal grace" is substituted for it, and in the case of mortal sin, "penitential grace"); then, modeled on it or legitimated by it, the ruler's clemency (from the Latin *clemens*, "gently sloping"), which is never more than the human transposition of God's grace. This condescension of grace, which is sometimes unbearable, is in any case exercised in the disparity of a dual relationship.

III. To Forgive: Not to Know or to Understand?

This vertical disparity is in perfect conformity with the conception of the pardon that is expressed in classical Latin. On the other hand, it is not compatible with the Greek pardon.

The verb "to pardon" corresponds to the Latin *ignoscere*—a verb for which *venia* (indulgence, favor, grace) serves as a substantive (*veniam dare, petere*, "to grant," "to request pardon," whence our "venial" sin). Latin grammarians saw in *ignoscere* a compound with a privative prefix, derived from *noscere*, "become acquainted with," "recognize" (perfect *novi-*, "know"), as is shown for example by the gloss *ignoscere: non noscere* (Loewe, *Prodromus*, quoted by RT: *Dictionnaire étymologique de la langue latine*); but there is also a verb *ignorare*, which means "not to know," "to be ignorant of." There is thus a complex interplay among ignorance, denial, and pardon, as is shown for example by this remark of Seneca's regarding a slap received by Cato: "He did not get angry, he did not take revenge for the insult, he did not even forgive it [*ne remisit quidem*], but he denied the fact—there was more magnanimity in not recognizing than in pardoning [*majore animo non agnovit quam ignovisset*, with the play on the two compounds *ad-nosco*, 'recognize,' 'admit' and *ignosco*]" ("On Constancy," 14.3). In any case, it is clear that the kind of ignorance involved in the Latin pardon is connected with the sovereign decision not to remember, to forget, to "grant amnesty"; the anecdote reported in "On Anger" (2.32.2) concludes with these words of Cato's: "I do not recall that I have ever been struck" (*non memini . . . me percussum*). There is magnanimity and high-mindedness in the wise man who haughtily pardons, and this condescendence is entirely founded on a denial of knowledge.

The Greek *suggignôskein* [συγγιγνώσκειν] takes us into a completely different world: instead of being connected with ignorance or forgetting, forgiveness has to do with shared knowledge. *Suggignôsken* means literally "become acquainted with" and thus generally "to share knowledge" (knowledge that may be a mistake [Thucydides, *History of the Peloponnesian War*, 8.24.6] or the secret of a conspiracy [Appian, *Civil Wars*, 2.6]); and, in the middle voice, when one shares knowledge with oneself, "to be conscious of " (Lysias, *Discourses*, 9.11); whence: "to be of the same opinion," "to consent" (when making a transaction or a treaty), "to recognize," "to confess" (thus Sophocles's Antigone says: "Once I suffer I will know that I was wrong"; *Antigone*, v. 1018); and finally, "to have a fellow feeling with another" (RT: LSJ), "pardon": this is the most common meaning among the Greek tragedians (e.g., Sophocles, *Electra*, 257; Euripides, *Helen*, 1105). Moreover, the noun *suggnôme* [συγγνώμη] always has this sense of "pardon," "forgiveness," "indulgence." It is by understanding together, that is, by entering into the other person's reasons, by intellectual action and not by compassion, that a Greek pardons or forgives.

■ See Box 1.

The prefix *sun-* (with) in the Greek *suggignôskein* invalidates the essential characteristic of the modern pardon, as well as that of Latin ignorance: it cannot imply any vertical disparity. On the contrary, pardon/comprehension takes place in the horizontality of a "with" that belongs, not to the theological-political domain, but to the political alone. The relationship is no longer dual but plural, implying a "we," or even a city, that the pardon redefines. Furthermore, the offense is not seen as a fall, but rather as a failure, *hamartia* [ἁμαρτία], *hamartêma* [ἁμάρτημα] (from *hamartanein* [ἁμαρτάνειν], "miss the target"; thus both "make a mistake" and "commit an offense"). Aristotle underlines this with regard to this definition of virtue as mean:

> [I]t is possible to fail [*hamartanein*] many ways . . . while to succeed [*katorthoun* (κατορθοῦν)] is possible only in one way . . . —to miss the mark [*apotuchein tou skopou* (ἀποτυχεῖν τοῦ σκοποῦ)] is easy, to hit it [*epituchein* (ἐπιτυχεῖν)] is difficult.

> (*Nicomachean Ethics*, 2.6.1106b28–33).

Thus we are faced with two heterogeneous models clearly reflected in the Latin and Greek words: an exemption when confronted by a failure, which uses the superior's refusal to recognize to clear an account in deficit and start over from zero; and an intellectual sharing that redefines the space of a "we."

Aristotle: *Suggnômê* as understanding and broad-mindedness

In the *Nicomachean Ethics* (6.11), Aristotle counts *suggnômê* ("judging with," "compassion," "remorse," "sympathy") among what are called the "intellectual virtues" (*dianoêtikas* [διανοητικάς]), in contrast to the "moral virtues," which have to do with character, *êthikas* [ἠθικάς] (on this distinction, see ibid., 1.13). It is connected with *sunesis* [σύνεσις], "junction" (from the verb *suniêmi* [συνίημι], "bring or send together," "approach," "understand," with the same preverb *sun-* as in *suggnômê*), which is translated by "intelligence"; and it is defined in relation to *gnômê* [γνώμη], the faculty of knowing (this is obviously *gnômê* as in *suggnômê*), which is rendered by "judgment," "resolution," and covers "good sense" and "common sense" (the common sense expressed in proverbs, *gnômai* [γνῶμαι]) as well as "intention" and "verdict." *Gnômê* and *suggnômê* both refer not to the just man (*to dikaion* [τὸ δίκαιον], who distributes in accord with equality or corrects and equalizes proportionally), but rather to equity (*hê epieikeia* [ἡ ἐπιείκεια]), which, being at the heart of justice, corrects the just man according to the law by taking into account singularities and cases (ibid., 5.14). One quotation will suffice

to explain how "pardon" is anchored in comprehension, discernment, and broad-mindedness and why it proves difficult to translate into French as well as English.

What is called judgment [*sens* in J. Voilquin's French translation; *bon sens* in Gauthier–Jolif's], in virtue of which men are said to "be sympathetic judges" [some manuscripts read *eugnômonas* (εὐγνώμονας); *qu'ils ont un bon jugement*, in J. Tricot's French translation] and to "have judgment, [*echein . . . gnômên* (ἔχειν . . . γνώμην)]," is the right discrimination of the equitable [*hê tou epieikous . . . krisis orthê* (ἡ τοῦ ἐπιεικοῦς . . . κρίσις ὀρθή)]. This is shown by the fact that we say that the equitable man is above all others a man of sympathetic judgment [*suggnômonikon* (συγγνωμονικόν), "understanding"; *favorablement disposé pour autri* in J. Tricot's French translation; *l'homme qui, entrant dans le sense des autres, est porté à leur pardonner* in J. Barthélémy Saint-Hilaire's translation], and identify equity with sympathetic

judgment about certain facts [*to echein . . . suggnômên* (τὸ ἔχειν . . . συγγνώμην); *de montrer de la largeur d'esprit* in J. Tricot's translation]. And sympathetic judgment is judgment which discriminates what is equitable [ἡ δὲ συγγνώμη γνώμη ἐστὶ κριτικὴ τοῦ ἐπιεικοῦς ὀρθή] and does so correctly; and correct judgment is that which judges what is true.

PARONYM, DERIVATIVELY NAMED, COGNATE WORD

FRENCH	*paronyme*
GERMAN	*Paronym, nachbenannt*
GREEK	*parônumos* [παρώνυμος]
ITALIAN	*denominativo*
LATIN	*denominativum*

➤ ANALOGY, CONNOTATION, ESSENCE, HOMONYM, PRÉDICABLE, PREDICATION, SENSE, SUPPOSITION, WORD

"Paronym" is the usual translation of the Greek *parônuma* [παρώνυμα], used by Aristotle in the first chapter of the *Categories* (1a12–15): "Things are said to be named 'derivatively' which derive

their name from some other name, but differ from it in termination (*ptôsis* [πτῶσις]). Thus the grammarian derives his name from the word 'grammar,' and the courageous man from the word 'courage'" (trans. E. M. Edghill in *Basic Works of Aristotle*). The differing translations of the substantive or adjective term in various European languages bear witness to a difficulty that is not merely linguistic. The problem raised by *parônumos* [παρώνυμος] for the translator/interpreter has to do with the fact that while the term does not initially play a metaphysical role in Aristotelian discourse, it acquires a preponderant role in the tradition of interpreting Aristotle, which makes it a kind of hidden source of the history of metaphysics.

I. The Status of Paronyms, between Words, Things, and Concepts

Boethius translated *Categories* 1a12–15 this way:

> Denominativa vero dicuntur quaecumque ab aliquo, solo differentia casu, secundum nomen habent appellationem, ut a grammatica grammaticus et a fortitudine forti.

> (Finally, we call denominatives all those which, differing from another thing solely by the "case," receive their appellation in accord with [its] name: thus from grammar grammarian, and from courage, courageous.)

(*Aristoteles Latinus*, 5, 15–17)

Denominativa seems to mark a clear difference from *sumpta* (derived names)—and rightly, because for Aristotle, *parônuma* [παρώνυμα] are, like homonyms and synonyms, things, and not terms. The difficulty arises from this parallelism: in modern,

non-Aristotelian usage, synonymy and homonymy concern linguistic units. Ultimately, this displacement, which began in the Middle Ages, cannot fail to spill over onto the perception of the status of paronymy, its function, and the stakes that it involves within the Aristotelian horizon. Another difficulty has to do with the fact that in classical Latin, *appellatio*, *appellare*, and *appellatum* refer to both "the named" (a man named "Peter") and to the "calling" or naming ("who is called Peter"), that is to say, to two different facts: the fact of naming (calling someone "Peter") and the fact of bearing the name "Peter." Hence the dimension of the derivation of the name (the de-nominative) raised in the determination of the Aristotelian paronym—a thing that takes its name from another thing through a kind of double derivation (real, where the courageous is a declination of courage, and verbal, where the word "courageous" is an inflection, bending, shifting, of "courage")—is either illegible or redundant in Boethius's translation (and its French revision by Jules Tricot).

■ See Box 1.

Paronyms being adjectives, and, in logic, concrete accidental terms, the question of the meaning of paronymic terms was the object of lively controversies from the Middle Ages to the seventeenth century. Two main positions opposed each other: that of Avicenna and that of Averroës. Avicenna's thesis (*Logica* I, 1508, folio 9va) was summarized and rejected by Averroës in his *Long Commentary on the Metaphysics* (text 5, comm. 14): "He [Avicenna] says that 'white' in 'Socrates is white' signifies primarily the subject and secondarily the accident, but quite the contrary is the case: 'white' signifies primarily the accident and secondarily the subject. In fact, it is of the essence of the accident to exist in a subject." Averroës's thesis was adopted by most thirteenth-century philosophers: the common opinion was that "white" signifies whiteness *in recto* and the subject *in obliquo* (cf., e.g., Dietrich of Freiburg, *De accidentibus*, chap. 13, p. 72). Avicenna's doctrine, conveyed through the theory of connotation, established itself thanks to Ockham, with a few lexical differences. Thus Marsilius of Inghen, a follower of Buridan, uses the term "material signified" to refer to the subject (for which alone the term substitutes) and "formal signified" to refer to what the term "connotes" or "signifies connotatively," whereas Buridan himself used the term *appellatio* in preference to *connotatio*. In the seventeenth century, Averroës's theory became dominant, combined this time with a distinction between "distinct" signification and "vague" signification. Its paradigm is the discussion of "connotation" in the *Port-Royal Grammar*, which adopts, in this context, the medieval distinction between "direct" (*in recto*) signification and "oblique" (*in obliquo*) signification:

I have said that adjectives have two significations: one distinct, which is that of the form; and the other vague, which is that of the subject. But it must not be concluded therefrom that they signify more directly the form than the subject, as if the most distinct signification were also the most direct. For on the contrary it is certain that they signify the subject directly, and as grammarians say, *in recto*, though more vaguely, and they signify the form only indirectly, and grammarians again say, *in*

1

Modern translations

Modern translations of Aristotle's *Categories* generally adopt the Boethian interpretation. A few English versions use "derivatively named" (H. P. Cooke, trans., *Aristotle, The Categories, On Interpretation*; E. M. Edghill, trans., *The Works of Aristotle, I: Categoriae and De interpretatione*). In French, the same goes for R. Bodéüs (*Catégories* [2001], 3): "In addition, we call 'derived' [*dérivées*] all things that are distinguished from each other by inflection and have the appellation corresponding to their name. Thus from the knowledge of letters derives the literate and from courage the courageous"; others (including K. Oehler, German trans.; J. L. Ackrill, English trans.; and D. Pesce, Italian trans.) prefer, like J. Tricot, to stick to the "Greek" term, as does E. Rolfes, who uses the formula "Paronym (*nachbenannt*)" (in *Aristoteles, Kategorien*). However, they all clearly imply that what is "denominated" (*nach-benannt*) after another thing is indeed a thing, and not a word. Owens justifies the calque of the Greek (*The Doctrine of Being in the Aristotelian Metaphysics*, 330). For him, the distinction made in English between

"denominative" and "derivative" is not pertinent, because both apply to words. The best translation of *parônuma* is thus "*paronyms*," according to Owens: "Derivative in this application would refer only to the word, not the thing. Denominative likewise applies only to the words. . . . There is in English no term for this notion." Modern translations do not interpret the calque of Latin *denominativa* in the same way. For us, this means that the philosophical ambiguity of the Aristotelian notion of "paronymy," which is connected with its position intermediary between "homonymy" and "synonymy" (which was to produce its effects at the beginning of the invention of the analogy of being; see ANALOGY), is doubled, indeed covered over, by the ambiguity of the French *dénominatif* or English "denominative," which are torn, but in a different way than the Aristotelian paronym, between words and things.

olbliquo, though more distinctly. Thus white, *candidus*, signifies directly something having whiteness; *habens candorem*; but in a very vague way, not indicating in particular any of the things that can have whiteness; and it signifies whiteness only indirectly; but in a way just as distinct as the word whiteness, *candor*, itself.

(*Grammaire de Port-Royal*, 3rd ed., II.2 / A. Arnauld, *Grammaire générale et raisonnée*)

The metaphysical issue is first of all the relationship between Plato and Aristotle. Expressing in language (that of "de-nomination") and in a quasi-Platonic way the relation of a concrete thing to a form that is, so to speak, declined in it, Aristotelian paronymy is also the hollow place marked out within a mechanism—the distinction of homonyms, synonyms, and paronyms—linking words and things, crossing their respective properties. Neither words, nor things, nor concepts, but in a sense all three at once, the entities (*parônuma*) that, in the Aristotelian tradition, are involved in the definition of paronyms—this grammarian and this grammar, connected by a desinence that does not really pertain to things, but that is not simply an aspect of words—thus appear as the sign of an originary indecision in the Aristotelian system of categories, between a Platonism that is residual but confined to language, and an inchoate Aristotelianism that has not yet found its level of action. The interpretation of the term *parônumos* requires elucidating the status of the *ptôsis* [πτῶσις] (case, desinence, inflection) both in Aristotle, and in his commentators taking into account the complex role *ptôsis* was to play, in late antiquity and the Middle Ages, in the constitution of a so-called Aristotelian metaphysics that gradually came to center on the notion of an "analogy of being."

"Paronymy," the structure to which the term *parônumos* refers in the *Categories*, is described this way by C. H. Kahn (*The Verb "Be" in Ancient Greek*): "Paronymy is a four-term relation between two things, A and B, and two corresponding words, 'A' and 'B' (the 'names' of these things), such that 'A' differs from 'B' by a minor morphological deviation." We see that a single term can thus cover simultaneously two relations, A/B and 'A'/'B,' as well as their own relation to each other, A/B ≡ 'A'/'B.' The reader of Aristotle's ancient and medieval interpreters cannot fail to wonder what, in the texts he has before his eyes, founds A/B ≡ 'A'/'B,' and if it is founded, whether this "foundation" is truly "Aristotelian." From this point of view we must keep in mind that for Aristotle, not every term morphologically derived from another term refers to a "paronymy": "human" or "the human" is not a paronym of "man" or of "humanity." As is clearly shown by *Categories* 8, 10a27–b11, "paronymy" does not concern just any concrete term relative to the corresponding abstract or just any adjective relative to a substantive: paronymy has to do only (1) with concrete accidental terms considered from the point of view of the property that they signify and of the substance that possesses them; and, by that very fact, (2) with the relationship of ontological dependency connecting an accident with a substance. From this point of view, "paronymy" thus cannot be understood independently of the diverse medieval interpretations of *Metaphysics* z 1, 1028a10–20 (the accident

is not *ens*—an existent—but *entis*, something of an existent), representing the accident (according to Aristotle) as an "inflection of substance."

■ See Box 2.

II. Paronymy between Analogy and Emanation

This interpretation of the accident as an "inflection" must also be kept in mind when stressing the central role played by "paronymy" in the late antique interpretation of Aristotle's *Metaphysics*. "Paronymy" is involved in the genesis of the theory called "the analogy of being" (*analogia entis*). The phenomenon can be described as the establishment of the homonyms *aph' henos* (ἀφ' ἑνός] (coming from something unitary, "unity of provenance" [Lat. *ab uno*]) and the homonyms *pros hen* [πρὸς ἕν] (in view of something of one, "focal unit" [*ad unum*]), or more simply *pros hen legomena* [πρὸς ἕν λεγόμενα], placed by Greek commentators on Aristotle in a median position between homonyms and pure synonyms, in the very place concurrently occupied, but for other reasons, by Aristotle's *parônuma*.

■ See Box 3.

The appearance of what is called the "theory of analogy" assumes that at a given moment, the "intermediaries" *aph' henos* and *pros hen* (or some of their properties) were collected under the rubric "homonyms by analogy," and that this occurred either by displacing paronyms or by absorbing them or certain of their properties. Whoever its author, this act—which by its very violence caused to merge or be superimposed in a single place phenomena as different as the focal meaning, paronymy in the strict sense, and the ontological derivation—has had two distinct posterities. The most famous and most studied is the theory of the analogy as being characteristic of the Arabo-Latin age (which began with Avicenna's and Averroës's translations of the so-called Arabic Aristotle). Within this horizon, *denominatio* is gradually marginalized by the notion of *analogia* or absorbed by it in increasingly complex formulations. But despite all this, we must not purely and simply identify "analogy" and "paronymy," as some contemporary interpreters have done (cf. Hirschberger, "Paronymie und Analogie bei Aristoteles"). In the Greco-Latin age of metaphysics, when the problem of the unification of the multiple meanings of being does not play a leading role, the notion of *denominatio* (= "paronymy") intervenes in an entirely different context. Boethius uses it to resolve a specific problem formulated in the *De hebdomadibus*: "Quomodo substantiae in eo quod sint bonae sint cum non sint substantialia bona"—that is, to determine "how, assuming that they are good (since they tend toward the good and are thus like it in some way), things that exist—substances—are good in their very being without however being substantially good." This question is in no way Aristotelian. In fact, in both his problem and his solution, Boethius inaugurates, through "paronymy," a radical displacement of Aristotelian ontology: he introduces, through his mediation, the Christian-Platonic idea of a stream, a flow (*fluxus, defluere*) of existing things, "secondary goods" proceeding from the will of the first Good. Boethius's thesis was that existing things are good neither in their essence nor through participation, but by

2

Ptôsis

The noun *ptôsis* is not attested in Greek before Plato. A noun of action based on the radical of *piptô* [πίπτω], "to fall," *ptôsis* means literally "a fall": the fall of a die (Plato, *Republic*, X.604c), or of lightning (Aristotle, *Meteorology*, 339a3). Alongside this basic value (and derived metaphorical values: "decadence," "death," and so forth), in Aristotle the word receives a linguistic specification that was to have great influence: retained even in modern Greek [*ptôsê* (πτώση)], its Latin translation by *casus* allowed it to designate grammatical "case" in most modern European languages. In fact, however, when it first appears in Aristotle, the term does not initially designate the noun's case inflection. In the *Peri hermeneias* (chaps. 2 and 3), it qualifies the modifications, both semantic and formal (casual variation) of the verb and those of the noun: "[he] was well," "[he] will be well," in relation to "[he] is well"; "about Philo," "to Philo," in relation to "Philo." As a modification of the noun—that is, in Aristotle, of its basic form, the nominative—the case (*ptôsis*) differs from the noun insofar as, associated with "is," "was," or "will be," it does not permit the formation of a true or false statement. As a modification of the verb, describing the grammatical tense, it is distinguished from the verb that oversignifies the present: the case of the verb oversignifies the time that surrounds the present. From this we must conclude that to the meaning of a given verb (e.g., "walk") the case of the verb adds the meaning [*prossêmainei* (προσσημαίνει)] of its temporal modality ("he will walk"). Thus the primacy of the present over the past and the future is affirmed, since the present of the verb has no case.

But the Aristotelian "case" is a still broader, vaguer, and more elastic notion: presented as part of expression in chapter 20 of the *Poetics*, it qualifies variation in number and modality. It further qualifies the modifications of the noun, depending on the gender (chap. 21 of the *Poetics*; *Topics*) as well as adverbs derived from a substantive or an adjective, like "justly," which is derived from "just." The notion of case is thus essential for the characterization of paronyms.

Aristotle did not yet have specialized names for the different cases of nominal inflection. When he needs to designate them, he does so in a conventional manner, usually by resorting to the inflected form of a pronoun—*toutou* [τούτου], "of this," for the genitive, *toutôi* [τούτῳ], "to this," for the dative, and so on—and sometimes to that of a substantive or adjective.

In the *Prior Analytics*, Aristotle insists on distinguishing between the terms (*horoi* [ὅροι]) that "ought always to be stated in the nominative [*klêseis* (κλήσεις)], e.g. man,

good, contraries, but the premises ought to be understood with reference to the cases of each term—either the dative, e.g. 'equal to this' [*toutôi*, dative], or the genitive, e.g. 'double of this' [*toutou*, genitive], or the accusative, e.g. 'that which strikes or sees this' [*touto* (τοῦτο), accusative], or the nominative, e.g. 'man is an animal' [*houtos* (οὗτος), nominative], or in whatever other way the word falls [*piptei* (πίπτει)] in the premiss" (trans. A. J. Jenkinson, *Analytica posteriora*, I.36, 48b, 41). In the latter expression, we may find the origin of the metaphor of the "fall"—which remains controversial. Some commentators relate the distinction between what is "direct" and what is "oblique" [as pertains to grammatical cases, which may be direct (*orthê ptôsis*) or oblique (*plagiai ptôseis*), but also to the grand metaphoric and conceptual register that stands on this distinction] to *falling* in the game of jacks, it being possible that the jack could fall either on a stable side and stand there—the "direct" case—or on three unstable sides—the oblique cases. In an unpublished dissertation on the principles of Stoic grammar, Hans Erich Müller proposes to relate the Stoic theory of cases to the theory of causality, by trying to associate the different cases with the different types of causality. They would thus correspond in the utterance to the different causal postures of the body in the physical field. For the Stoics, predication is a matter not of identifying an essence (*ousia* [οὐσία]) and its attributes in conformity with the Aristotelian categories, but of reproducing in the utterance the causal relations of action and passion that bodies entertain among themselves. It was in fact with the Stoics that cases were reduced to noun cases—in Dionysius Thrax (TG, 13), the verb is a "word without cases" (*lexis aptôton*), and although *egklisis* means "mode," it sometimes means "inflection," and then it covers the variations of the verb, both temporal and modal. If Diogenes Laertius (VII.192) is to be believed, Chrysippus wrote a work *On the Five Cases*. It must have included, as Diogenes (VII.65) tells us, a distinction between the direct case (*orthê ptôsis*)—the case which, constructed with a predicate, gives rise to a proposition (*axiôma*, VII.64)—and oblique cases (*plagiai ptseis*), which now are given names, in this order: genitive (*genikê*), dative (*dôtikê*), and accusative (*aitiatikê*). A classification of predicates is reported by Porphyry, cited in Ammonius (*Commentaire du "De Interpretatione" d'Aristote*, 44, 19f.).

Ammonius (ibid., 42, 30f.) reports a polemic between Aristotle and the Peripatetics, on the one hand, and the Stoics and grammarians associated with them, on the other.

For the former, the nominative is not a case, it is the noun itself from which the cases are declined; for the latter, the nominative is a full-fledged case: it is the direct case, and if it is a case, that is because it "falls" from the concept, and if it is direct, that is because it falls directly, just as the stylus can, after falling, remain stable and straight.

Although *ptôsis* is part of the definition of the predicate—the predicate is what allows, when associated with a direct case, the composition of a proposition—and figures in the part of dialectic devoted to signifieds, it is neither defined nor determined as a constituent of the utterance alongside the predicate.

In Stoicism, *ptôsis* seems to signify more than grammatical case alone. Secondary in relation to the predicate that it completes, it is a philosophical concept that refers to the manner in which the Stoics seem to have criticized the Aristotelian notion of substrate [*hupokeimenon* (ὑποκείμενον)] as well as the distinction between substance and accidents. *Ptôsis* is the way in which the body or bodies that our representation [*phantasia* (φαντασία)] presents to us in a determined manner appear in the utterance, issuing not directly from perception, but indirectly, through the mediation of the concept that makes it possible to name it/them in the form of an appellative (a generic concept, man, horse) or a name (a singular concept, Socrates). Cases thus represent the diverse ways in which the concept of the body "falls" in the utterance (though Stoic nominalism does not admit the existence of this concept—just as here there is no Aristotelian category outside the different enumerated categorial rubrics, there is no body outside a case position). However, caring little for these subtleties, the scholiasts of *Technê* seem to confirm this idea in their own context when they describe the *ptôsis* as the fall of the incorporeal and the generic into the specific [*ek tou genikou eis to eidikon* (ἔκ τοῦ γενικοῦ εἰς τὸ εἰδικόν)].

In the work of the grammarians, case is reduced to the grammatical case, that is, to the morphological variation of nouns, pronouns, articles, and participles, which, among the parts of speech, accordingly constitute the subclass of *casuels, a "parts of speech subject to case-based inflection"* [*ptôtika* (πτωτικά)]. The canonical list of cases places the vocative [*klêtikê* (κλητική)] last, after the direct [*eutheia* (εὐθεῖα)] case and the three oblique cases, in their "Stoic" order: genitive, dative, accusative. This order of the oblique cases gives rise, in some commentators eager to rationalize (Scholia to the *Technê*, 549, 22), to a speculation inspired by "localism": the case of the

place from which one comes (in Greek, the genitive) is supposed "naturally" to precede that of the place where one is (the dative), which itself "naturally" precedes that of the place where one is going (the accusative). Apollonius's reflection on syntax is more insightful; in his *Syntax* (III.158–88) he presents, in this order, the accusative, the genitive, and the dative as expressing three degrees of verbal transitivity: conceived as the distribution of activity and passivity between the prime actant (A in the direct case) and the second actant (B in one of the three oblique cases) in the process expressed by a biactantial verb, the transitivity of the accusative corresponds to the division "A all active—B all passive" (A strikes B); the transitivity of the genitive corresponds to the division "A primarily active/passive to a small degree—B primarily passive/active to a small degree" (A listens to B); and the transitivity of the dative, to the division "A and B equally active-passive" (A fights with B). The direct case, at the head of the list, owes its prmacy to the fact that it is the case of nomination: names are given in the direct case. The verbs of existence and nomination are constructed solely with the direct case, without the function of the attribute being thematized as such. Although Chrysippus wrote about *five* cases, the fifth case, the vocative, seems to have escaped the division into direct and oblique cases. Literally appelative [*prosêgorikon* (προσηγορικόν)], it could

refer not only to utterances of address but also more generally to utterances of nomination. In the grammarians, the vocative occupies a marginal place; whereas every sentence necessarily includes a noun and a verb, the vocative constitutes a complete sentence by itself.

The commentators' arbitrage

The transfer of "intermediary" homonyms to the problem of the unification of the multiplicity of the meanings of being, probably begun as early as Alexander of Aphrodisias, was well documented by sixth-century commentators writing in Greek (against Porphyry who, in the *Isagoge*, declared in favor of a strict homonymy of being). Among these commentators, we may mention especially Elias, who explicitly rejects Aristotle's and Porphyry's thesis regarding being (strict homonymy), and clearly

declares in favor of the unity of origin and the unity of end:

> [T]he existent is divided neither into a homonymous vocal sound (as Aristotle says in the *Categories* and Porphyry says in the *Isagoge*), nor as a genus into species (as Plato says), but according to the origin and the end.
>
> [διαιρεῖται τοίνυν τὸ ὂν οὐχ ὡς ὁμώνυμος φωνή (ὥσπερ ἐν Κατηγορίαις ' Ἀριστοτέλης καὶ νῦν ὁ Πορφύριος εἴρηκεν), οὐδὲ ὡς γένος

εἰς εἴδη (ὥσπερ ὁ Πλάτων εἶπεν), ἀλλ' ὡς τὰ ἀφ' ἑνὸς καὶ πρὸς ἕν].
>
> (Élias, *In Porphyrii Isagogen*, in *Commentaria in Aristotelem Graeca*, 18.1:70, 18–21)

their very origin, because their being has been willed by the Creator and "emanates" or "flows" from his will; it was left for the theologians of the Greco-Latin age to give his thesis a definitive form by drawing more explicitly on the Neoplatonic harmonics of the structure of *denominatio.* This act was clearly accomplished by Boethius's commentator Gilbert of Poitiers, when he reformulated the thesis of *De*

hebdomadibus by positing that since they emanate from the will of the *primum Bonum*, secondary goods can be called good (*bona*) "according to a denomination" (*denominative*).

The formula is anything but banal. In fact, "to be said denominatively" does not signify here the derivation of the name from a thing qualified on the basis of the corresponding quality—as "white is derived from whiteness,

grammarian from grammar, or just from justice"—any more than the simple formation of a (concrete) noun on the basis of another (abstract) noun. This Boethian real predication expresses a causal relationship close to what Plato called "eponymy." The first medieval attempt to carry out a metaphysical reorganization of the system formed by *Categories* 1, 2, 5, and 8, the Porretan theory of *denominatio*, provided the overall physiognomy of the first age of medieval metaphysics before the arrival of the metaphysics of analogy based on the corpus of writings on nature by Aristotle and his Arab interpreters.

According to Gilbert of Poitiers, "denomination" concerns a precise aspect of reality: the dimension of being-caused. That is why most of the examples used to illustrate it are technical. The being concerned is an *opus*, the result of an action, a *factum*. Although, as we have pointed out, Aristotelian paronymy did not apply to terms such as "human" or "the human" relative to "man" and "humanity" (but rather to concrete accidental terms like "white") the Porretan notion of *denominatio* is, in contrast, illustrated in an exemplary way by the term *humanum*. For Gilbert and the Porretan logicians the term *humanum* can indeed be attributed formally to a living being, as in *animal humanum*, but it is attributed denominatively to a fabricated product, as in *opus humanum*, because—and here we come back to the notion of *denominatio* understood as causal emanation—it emanates or has emanated (*fluxit*) from an agent whose being is human. As we see, what is said to be "according to a *denomination*" is here opposed above all to what is attributed "formally." The same distinction is found in all the medieval texts that, in the Arab-Latin age of metaphysics, oppose, as does Avicenna (*Logica*, Venice, 1508, fol. 3 vb), univocal predication and denominative predication (see PRÉDICABLE, PREDICATION).

III. Paronymy and *Suppositio*

Paronymy, as an instrument for two distinct metaphysical theories, the Boethian theory of "emanation" and the Arab-Latin theory of "analogy," is also crucially involved in the origin of the logical theory of signification and reference, as one of the places where the theory of *suppositio* developed. The opposition between the noun "man" and the noun "grammarian" has an important place in Anselm of Canterbury's *De grammatico*, in which it illustrates the distinction between, on one hand, nouns that, like *homo*, are both principally (*principaliter*)—that is, first—significative and principally appellative of a substance; and on the other hand, nouns like *grammaticus*, which present a different semantic structure. For Anselm (De *grammatico*, in *Opera omnia*, 1:156), what distinguishes "man" from "grammarian" is that in the first case the substance is both signified and named *principaliter*, that is, directly (per se), whereas in the second case, the case of the "grammarian," the substance is named but not properly (*proprie*) signified, that is, per se, and that the quality signified properly is not named (we note that the explanation provided here would be more difficult to give in German, where the same term, *Benennung*, opposed to *Bezeichnung*, "signification," is used to designate appellation in the Aristotelian sense of "denomination" and appelation in the sense of nomination, that is, of "reference" [= Frege's *Bedeutung*]). In other words, the noun "grammarian" names the substance

that it signifies *per aliud* and signifies per se an accident that it does not name.

Anselm's theory was developed by the grammarians and logicians of the twelfth century, who substituted for Anselm's pair *per se-per aliud* the pair *principaliter-secundario* (principally–secondarily) (cf. *Promisimus*, ed. L. M. de Rijk, 2:258; Abelard, *Dialectica*, ed. L. M. de Rijk, 113 and 596). These authors say that the denominative "signifies principally" the quality or form from which it is derived (*sumptum*) and only secondarily the subject that it "names" (*nominat*). This formulation's goal is to resolve the traditional question arising from the patent disagreement of the two main authorities of the high Middle Ages in matters of semantics: Priscian, for whom every noun "signifies a substance and a quality," and Aristotle, for whom "a noun like whiteness signifies only the quality." The Ockhamist theory of the synonymy of abstract and concrete nouns (*Summa logicae*, I.6) is part of the same horizon. Going back to Avicenna's distinction between univocal predication and denominative predication, Ockham posits that the synonymy of the concrete and the abstract is valid principally in the category of substance, because in the case of substances there is no real distinction between the subject itself and what makes it what it is (the sole difference residing "in the manner in which nouns signify" [*in modo significandi*]). On the other hand, this synonym is not valid in the case of denominatives like "white" and "whiteness," because these terms cannot have the same *suppositio*, the former necessarily "supposing for" (substituting for, taking the place of) the subject of the accident, and the latter for the accident itself (*Summa logicae*, I.5).

| PASSION

"Passion"—which is derived via the Latin *passio* from the verb *patior* (*pati, passus sum*), "to suffer, endure, resign oneself to, allow"—is one of the possible translations of the Greek *pathos* [πάθος], from *paschein* [πάσχειν], "to receive an impression or sensation, to undergo treatment, to be punished." It emphasizes the passivity of the mind or the subject, which undergoes what comes to it from outside, whereas other translations, such as Latin *perturbatio* or French *émotion*, stress mobility and agitation. In the entry PATHOS the systems and stakes connected with this initial difference in emphasis between the passive and the kinetic are discussed.

I. Passion and Action

We customarily oppose the logical, grammatical, and ontological categories of acting and undergoing, of active and passive, of subject and object. But the vocabulary of philosophy constantly challenges, from one language and period to another, the distinctions it makes: see in particular AGENCY, DRIVE, INTENTION, *LIBERTY,* NATURE, OBJECT, PERCEPTION, SENSE, I.A, SUBJECT, WILL; cf. *ACT,* ACTOR.

II. Passion and Suffering

1. Passion designates first of all the passions of the soul, the perturbations, or even illnesses that affect, as Descartes said, "the union of the soul and the body" and constitute, as it were, the irrational substance of human life: see DRIVE, FEELING, GEFÜHL, GEMÜT, MADNESS, STIMMUNG; cf. *DISPOSITION,* ES, *MALAISE, REASON, TO SENSE,* UNCONSCIOUS.

2. Passion refers to love, on the one hand, and to suffering, on the other: see LOVE, PLEASURE. The Russian word STRADANIE brings into play the relationship between activity and passion along with the redemptive value of suffering (cf. Ger. *Leidenschaft* [passion], from *leiden* [suffer]: *Die Leiden des jungen Werthers* are the sufferings/passions of the sensitive young man); see also WORK, and cf. BERUF.

    On the "Passion" of Christ, which is connected with the Incarnation, see also BOGOČELOVEČESTVO, GOD, OIKONOMIA.

3. On the relationship between wisdom and passion, the use and regulation of the passions, the idea of an ability to resist, of a constancy or courage of the soul, see GLÜCK (particularly GLÜCK, Box 1), MORALS, PHRONÊSIS, PIETAS, VIRTÙ, *WISDOM.*

PATHOS [πάθος] (GREEK) / PERTURBATIO (LATIN)

Psychic life is movement. The mind moves. Psychic life is passion. The mind is, in fact, moved. The vocabulary of feeling in European languages is organized around these two poles: on one hand, the idea of a turbulence, a becoming, an instability—something starts moving and transforms itself; there is a psychic activity; on the other hand, such an activity is the effect of an external cause to which the mind finds itself exposed, which it undergoes, passively. Something happens to it and transforms it. Agitation is the form that passivity takes. Thus in Greek, we have *thumos* [θυμός], *epithumia* [ἐπιθυμία], *orexis* [ὄρεξις], but also *pathos* [πάθος], *pathêma* [πάθημα]. In Latin, *emotio, perturbatio*, on the one hand; *morbus, passio, affectus*, on the other hand. In French, *sentiment* and *passion* and *émotion*. In English, "feeling," "passion," "emotion." What is at stake theoretically here—the choice between a kinetic or passionate conception of feeling—can be understood in the context of a history of decisions regarding the way to translate the ancient words into modern languages. Discussions of the concepts often take the form of linguistic commentaries; for example, when Cicero translates the Greek *pathos* by the Latin *perturbatio* instead of *morbus*, or when Augustine criticizes this translation. This tension still determines our contemporary problematics, including that of psychoanalysis.

I. From *Epithumia* to *Pathêma*

Affective life is an excess of movement, a movement that is simultaneously spontaneous and reflexive: an impulsive response, a reaction, whose active and imperious aspect is

emphasized. The metaphorical figure of such an activity is the horse, which, in Plato, represents the desiring soul: a spirited animal sensitive to the beauty of bodies and things that can be possessed and which, in their presence, displays an extraordinary energy that is difficult to contain. Rage and courage are also a horse full of spirit and energy. This characterization in terms of movement is inseparable from the idea that sense experience is in general an experience of change, of becoming, of the impermanent. As sensations— and just like other sensations/perceptions—pleasure and pain belong to the domain of what moves and never stops. Plato uses *pathos* [πάθος] and *pathêma* [πάθημα] only when he wants to emphasize the sick, morbid, incurable nature of the affects, their pathological side. His dominant lexicon is that of motivity.

The Aristotelian vocabulary shifts the accent to the "pathetic" aspect of affects. Ethics and rhetoric are based on the possibility of acting on the mind, one's own or those of others, in order to produce effects that are called, therefore, *pathêmata*. Instead of the Platonic obsession with turbulence and anxiety, in Aristotle we find an entire technique of influence or manipulation. Rage, love, hatred, shame, indignation are all responses that are both reasonable and irrational. They are reasonable because they are motivated by a thought, irrational because the thought is accompanied by a bodily change like cold, heat, tears, trembling. Each passion corresponds to a precise idea that is pertinent in a certain situation and includes a physical sensation: the idea of having suffered an inopportune offense, coupled with the desire for revenge, triggers what is called "rage" (*orgê* [ὀργή]). The anticipation of a danger is manifested in what is called "fear" (*phobos* [φόβος]). The cognitive and intellectual nature of the emotion justifies the recentering of affective vitality around the concept of passivity: passion is what I am made to think, thus to feel. Passion is the echo of the world's contingency in my understanding and my body. Passion is my way of interacting with what surrounds me and happens to me. What happens around me touches me, what is done to me affects me, what is said to me moves me. My passivity is my vulnerability with regard to what is external to me, to the milieu in which I live. Inevitable, passion is thus not pathological: on the contrary, suffering is healthy, it is cathartic.

The word *pathos* was definitively established with the Stoics. In a theory that reinforces, on one hand, the cognitive conception of feeling and that proposes, on the other, a model of wisdom and happiness defined by impassiveness, passion becomes, still more clearly than for Aristotle, the subject's reaction to the world. A cognitive operation effects the mediation between me and what happens to me: consent (*sugkatathesis* [συγκατάθεσις]). I always have to say yes or no to my representations, perceptions, thoughts. Thus I am carried away by fury only if I say yes to the thought of an offense received and the anticipation of my vengeance. I am seized by panic only if I ratify the overestimation of a danger. I get angry and tremble only if I approve the beliefs of which rage and fear are the somatic effects. I am therefore responsible for my passions: what I feel, I want to feel with my assent. Such a theory makes voluntary the movements by which the mind allows itself to be carried away; accepts, in fact, to allow itself to be carried away. Nothing is more voluntary than passivity that is consented to and complicit with passion.

II. From *Pathos* to *Perturbatio*

It is on this point that the translation from Greek into Latin becomes a significant decision. In the *Tusculan Disputations*, Cicero asks how best to translate into Latin the concept that the Greek Stoics express by *pathos*. *Pathos* should be rendered by *morbus* if one wants a literal translation. *Morbus*, "illness," would convey the meaning of what befalls you and puts you in an unhealthy state of suffering. To *morbus*, however, Cicero prefers another word, *perturbatio*: "Quae Graeci [πάθη] vocant, nobis perturbationes appellari magis placet quam morbos" (These movements that the Greeks call *pathê*, we prefer to call perturbations rather than illnesses), he writes (*Tusculan Disputations*, 4.4.10; cf. *De finibus*, 3.35). He defines *perturbationes* as swirling, jerky movements of the mind, contrary to reason. *Perturbationes* are the worst enemies of the mind and of a tranquil life (*Tusculan Disputations*, 4.15.34).

Why does Cicero prefer—*nobis magis placet*—to call "perturbations" what the Greeks call illnesses or passions? For a series of reasons. The first is respect for Latin usage, *consuetudo*. Cicero notes that in the common language, Latins call *perturbationes* all the states that the Greeks call *morbi* (ibid., 3.4.7). But does that mean that we must take ordinary language as our guide, without reflection? No, because the choice of *perturbatio* is the correct one: "Nos autem hos eosdem motus concitati animi recte, ut opinor, perturbationes dixerimus" (We, I think, are right in calling the same motions of a disturbed soul perturbations; ibid.). (As is often the case, here Latin is a more accurate, more appropriate language than Greek—thus Cicero.) Consequently, it is preferable not to render the Greek word for word: *verbum a verbo* (ibid.). It is better—*magis placet*—to replace *morbus*, which would be the literal translation, by *perturbatio*. But substituting *perturbatio* for *morbus* means substituting *perturbatio* for *pathos*, and thus, in a way, correcting the Greek, reinventing the pertinence of the philosophical vocabulary and making it more reasonable.

In a commentary that shows the complexity of the translation decisions he makes, Cicero justifies choices that are linguistic and philosophical. Another argument against a literal translation of *pathos* by *morbus* is that *morbus* is synonymous with *aegritudo*, which means "suffering," "sorrow," "distemper." With an acute sense of exactitude, the Romans reserve *aegritudo* for pain, by analogy with bodily illness, whereas the Greeks call *pathê* all the movements of the soul, including those that are agreeable, such as desire and sensual pleasure. Thus translation offers an opportunity for a criticism of the source language, whose lexicon is presented as generic and contradictory. Pleasure and desire are not illnesses, Cicero observes, because one does not suffer from them. The translation of *pathos* by *morbus* is adequate for a specific perturbation, the one that is rightly called *aegritudo*, "distemper" (ibid., 3.10.22).

The more he enters into probing explanations of the vocabulary of the passions, which he tries to transform into emotion, the more Cicero unveils an ambitious strategy: reforming a metaphorical field. The language of ancient

psychology and ethics seems to him to be dominated by the paradigm of the body, of medicine, and hence of illness. But although this model works well as regards the perturbation that concerns him most, pain, it does not lend itself to the expression of the concept of affectivity in general. *Morbus* is not a good term because *pathos* is not a good idea—philosophically speaking. Why? Because for Cicero the history of the mind goes back to Plato and even further, to Pythagoras. First Pythagoras and then Plato had analyzed the structure of the *psuchê* [ψυχή] into two parts, one the basis of a distinctive characteristic, movement. Whereas one part is tranquil and constant, calm and placid, the other part is full of *motus turbidi*, movements and maelstroms, such as rage or desire (ibid., 4.4.10). It was this very precise concept of mobility, unrest, and inconstancy that was to resurface in the Latin word. Cicero took advantage of his role as a creative translator, as a fabricator of neologisms and importer of Greek notions, to refresh the philosophical memory that had faded in the Greek vocabulary. In Latin, a new language, we find on the surface of the word the originary signified that theory had always identified as essential in affective life: the idea of perturbation. In the Latin language, a work in progress that translators were shaping by the choices they made, words were to be, in sum, more appropriate, more adequate to notions. If it is a question of naming a *motus turbidus*, because that is the pertinent definition, then it must be called *perturbatio*.

Through the decisions it requires, the act of translating offers an opportunity to find the correct word, to improve the fit between word and concept. Reformulating in another language makes it possible to bring out a forgotten or underestimated meaning and thus to amend an incoherent usage. Cicero seems to reproach the Greeks, from Pythagoras to Zeno, for not having preferred to *pathos* a word like *tarachê* [ταραχή] (alarm; see *Lysias* 6.35), for example, just as he has chosen *perturbatio* rather than *morbus*. It seems to him, in fact, that ancient ethics always thought "emotion" when it used the word "passion." In the commentaries accompanying his lexical choices, we can discern his criticism of Stoicism: whereas he rejects the obsessional nosography of the classification of the *pathê*, he notes their tumultuous nature. However—and translation comes in here—the kinetic metaphor should have priority over the medical metaphor. Cicero observes that all the Stoics, and notably Chrysippus, tried very hard to compare the illnesses of the mind with those of the body. Let us instead examine more closely what the thing itself contains (*ea quae rem continent pertractemus*), he suggests. What has to be understood is the fact that perturbation is always in movement: *intellegatur igitur perturbationem . . . in motu esse semper* (ibid., 4.10.24). Perpetual movement is thus the "thing" (*res*) whose essence the word *perturbatio* expresses. Moreover, Zeno had already defined a perturbation as a "commotion" (*commotio*) contrary to reason (ibid., 4.6.1). In doing so, he situated himself in the Pythagorean and Platonic tradition that identifies wisdom with peace of mind (ibid., 4.4.10). However, the Greeks, including Zeno, called this *perturbatio*—which they defined (wrongly) as a *commotio*—a *pathos.*

A worn-out language failed to render adequately an essential idea. Another language was now able to rediscover such a semantic characteristic. The word *perturbatio* echoes what is in fact a *perturbatio*, echoes the thing that the word *pathos* obscures. In this particular case, the translation is an interpretation. It is a retrospective lesson in pertinence. It is also a reshaping of the history of philosophy. The preference for the metaphor of movement rather than for that of illness is part of a historiographical strategy. The Stoics, Cicero maintains, were right to center affectivity on movement. They understood that this was the essential point: a direct line could be traced to Pythagoras and Plato. On the other hand, the Aristotelians forgot it, and their ethic of moderate passions is dangerously tolerant. Saying that the affects are emotions makes it possible to see them as leaps into the void and as slippery slopes, that is, as movements that it becomes impossible to stop and that thus have to be prevented, rather than assisting them with moderation. The fact that *perturbatio* is a *commotio*, a turbulence, an excitation—a metaphoric leap, a plunge, a collapse—has consequences for the way in which the remedy is conceived. Although some illnesses are incurable, medical language is, by definition, a language of healing. In physics, on the other hand, what falls cannot stop midway; what slips will not come back up the slope; a person who drifts out to sea will no longer be able to swim back. We treat an illness when it is not an incurable plague, but we *avoid* falling off a cliff, because such a movement cannot be controlled. We avoid diving into a current that will carry us out to sea, where we lose our footing. We avoid starting down a slippery slope (ibid., 4.18.41). In short, it is imperative to block emotions from the outset, before they are born, for they force their way forward by themselves (*ipsae se impellunt*). It is they that move, that make you move, that move you.

Cicero adduces Stoic arguments against Aristotelian arguments, taking the precautions that a good skeptic requires. These are efficacious, ad hominem arguments. Nonetheless, he does not conceal his approbation, even if it is critical, for the "virility" of Stoic morality and his scorn for the softness of Aristotle's language and thought. Peripatetic *ratio* and *oratio* lack vigor (they are *enervatae*); for Cicero, the Stoic discourse wholly centered on prevention is necessary. On one condition, however: it has to adopt a more rigorous tone, strengthen still further the insistence on the irresistible, ineluctable, incurable aspect of the *motus turbidus.* To do so, and especially in order to deepen the contrast with Aristotle and his moderation, the Stoic *oratio* has to be reconciled with its contents, its *ratio* has to become intolerant: it has to be inflected toward the mechanics of movement. The vocabulary of physics is a vocabulary of the irreversible. The Latin translation of *pathos* by *perturbatio* reestablishes the pertinence of this vocabulary for ethics. In the words of a new language, philosophy and the philosophical vocabulary are once again in accord.

III. From *Perturbatio* to *Affectus*

Cicero reorganizes the vocabulary of the passions around their motivity and their tumult, in contrast with the immobility of reason. He does this through a translation and the commentaries that accompany it. This translation is discussed at length in Saint Augustine's *The City of God*. Reflection on the best way to interpret Greek *pathos* and to

render it in Latin leads to the Christian turning point in the psychology of the affective. Between Cicero and Augustine, we therefore remain in the continuity of a single language, Latin, but we put back in question the pertinence of the Stoic vocabulary and the lexical transfer from the Greek.

The passions that the Greeks call *pathê*, Cicero called *perturbationes*, Augustine writes, but most people call them *passiones* (*City of God*, 14.8.1). Thus we should avoid adopting Cicero's term *pertubatio* without precautions; it is an idiosyncratic translation, a single author's translation. It is better to adopt the general use of *passio*, or still better, to use the term *affectus*, because the latter allows us to speak of the emotions without applying to them a systematically and exclusively negative connotation. Since *per-turbatio* echoes, so to speak, the definition of *motus turbidus*, it is a term saturated with philosophical scorn. It is the right word in a theory of virtue that turns on *apatheia* [ἀπάθεια], "impassiveness"; and in an ethics in which "good" is only a synonym of "reasonable" and in which every form of affectivity is disqualified. Augustine, however, rejects the Stoic ideal of the imperturbable sage who is supposed not to be disconcerted, irritated, or moved by anything. For him, persons who never enjoyed themselves, never wished for anything, never suffered, and were afraid of nothing would be, ultimately, insensitive to good and evil. Christian morality requires us to love God, to desire good and hate evil. Contrition for sins committed and the fear of punishment are indispensable. How can we believe without fervor, how can we repent without tears? What would charity be without compassion, or fear without trembling? The Christian is a being of flesh and blood, a being who would lose his humanity if he pretended to a rigor that is nothing more than arrogance and vanity (ibid., 14.9.6). The Christian knows that after the Fall he was condemned to sin and that therefore he must feel and suffer. He knows that passions are the result of original sin, a memory of the lost Eden. The affects are only the perversion of a will that was once absolutely good but has now become good or bad. The relationship with good and evil is entirely affective: the emotions make us sin, but they are also our sole path to salvation. It is not reason that will save us.

Rejecting the identification of the good with *a-patheia* means rejecting the idea that every movement is troubling, that every emotion is a *motus turbidus.* Consequently, this amounts to rejecting *per-turbatio*, a term that in Cicero's language preserves the hard core of Stoic ethics. Augustine chooses *affectus* because it is neutral: we are affected by upright feelings if we lead an upright life; we have perverted feelings if our lives are perverted (ibid., 9.6). It is only the city of the impious, that is, unbelievers, that is shaken (*quatitur*) by bad (*pravi*) affects, which are illnesses and perturbations (*tamquam morbis ac perturbationibus*). Passion perturbs when there is no faith, for a perturbation is an affect, but in its negativity (ibid., 14.10. 26–27, 14.12.31).

By preferring *affectus*, Augustine returns to the use of *pathos.* On the one hand, he criticizes the Stoic intransigence of which Cicero had made himself a spokesman. On the other hand, he places passivity, rather than movement, back at the heart of feeling. By endorsing another Stoic idea, namely that we voluntarily consent to our representations, he insists on the exteriority of what touches us,

excites us, terrifies us. We are affected by a cause, in the sense that we are invested by it, that it can put us in this or that disposition (*afficere*). Therein consists the failure of our will, of that perfect mastery, of that total freedom of choice that Adam and Eve perverted long ago. Now our will has gone off track (*perversa voluntas*). By allowing ourselves to be invaded by a pleasure or a pain, we are saying yes to something that we should reject. But we say yes because our will is now split, divided, and can take the wrong turn. Passion—that is, the finitude that makes us human—resides in this possibility of error, of this inflection of the will that allows itself to be influenced, carried away, convinced.

IV. Modern Transpositions: "Endeavor," *Trieb*

European languages transparently translate the words whose Greek and Latin history we have sketched. The texts we have chosen, namely those by Aristotle, the Stoics, and Augustine, are constantly referred to in the conceptual and linguistic debates that punctuate the later history of the philosophy of the passions. In this long history, the work of Thomas Hobbes marks a critical moment that is of particular interest and can be compared with that in which Cicero found himself .

■ See Box 1.

Like Cicero, Hobbes is aware of the importance of choosing the right word when he transposes into his language concepts that come from texts written in another language. And as was the case for Cicero, for Hobbes the problem arises in an acute form when he discusses the vocabulary of the passions:

> These small beginnings of motion, within the body of man, before they appear in walking, speaking, striking and other visible actions, are commonly called endeavours.

> (*Leviathan*, 1.6)

"Endeavor" is thus the generic term for this initial movement that is the condition of all desire and all repulsion. Appetite (desire) and aversion form a pair of contraries on which depend the passions, all of which can be analyzed and classified in one of these two categories (ibid):

> These words, appetite and aversion, we have from the Latins; and they both of them signify the motions one of approaching, the other of retiring. So also do the Greek words for the same, which are *hormê* and *aphormê.*

"Appetite" and "aversion" are English translations of *appetitio* and *aversio*, which render, in turn, *hormê* [ὁρμή] and *aphormê* [ἀφορμή]. As a reader of Cicero, Hobbes adopts a vocabulary of the passions that we find in its Stoic version in the *Academica* (*Lucullus*, 8.24; cf. *De fato*, 17) and at the very heart of the Epicurean vocabulary in *De finibus*. For Hobbes, the human being's cognitive, affective, and moral functioning is thus explained by two movements: a movement that impels us toward the object that causes it and a movement that repels us from such an object. These are the two endeavors—appetite and aversion—of which all the passions are only particular modifications. The requirement of clarity is fulfilled and the ease of translating from Greek and Latin into English is accompanied by a serene reference to the past. In these ancient languages, truth advances naturally, and the

Hobbes and translation

➤ TO TRANSLATE

Hobbes regards translation as a test of philosophical clarity and validity. Faced with a Scholastic tradition that in the middle of the seventeenth century continued to use Latin, he had the greatest scorn for this disfigured and worn-out Language, which no longer even corresponded to the great Roman models:

> The writings of School divines are nothing else, for the most part, but insignificant trains of strange and barbarous words, or words otherwise used than in the common sense of the Latin tongue; such as would pose Cicero, and Varro, and all the grammarians of ancient Rome.

> (*Leviathan*, 4.46)

This usage cut off from common sense and grammar produced an esoteric, foreign language that no longer meant anything. To this barbarous language, which was neither authentically ancient nor truly modern, the author of the *Leviathan* issued a challenge (ibid.): just try to translate it!

> Which if any man would see proved, let him (as I have said once before) see whether he can translate any School divine into any of the modern tongues, as French, English, or any other copious language.

That would be the only way to see if these "insignificant trains of strange and barbarous words" actually meant anything. If the translation of them was intelligible, it would have been proved that they were already meaningful in Latin. If not, it would have been proved that they were meaningless (ibid.):

> Which insignificancy of language, though I cannot note it for false philosophy, yet it hath a quality, not only to hide the truth, but also to make men think they have it, and desist from further search.

Thus translatability becomes a criterion of truth. Precisely at the point where philosophical practice becomes a dissection of arguments to test their coherence and validity, the fact of translating acquires the status of an experimental method. It is an operation, an action on a text, whose result proves a hypothesis or replies to a question. In this work, considered foundational for the British tradition, philosophy becomes analytic thanks to translation. The requirement of clarity and intelligibility entails a linguistic commitment: it is not so much a matter of writing in modern languages—Hobbes himself wrote in both English and Latin—as of *being able* to translate.

modern languages have only to take hold of these clear and distinct ideas. "For nature itself does often press upon men those truths, which afterwards, when they look for something beyond nature, they stumble at" (*Leviathan*, 1.6). The "trains of words" (see Box 1) pass from one language to another: this proves the lucidity of true philosophy. Hence they have passed the test of modernity.

Hobbes thus carries out a task different from Cicero's, but he shares with his Roman mediator a concern to establish links. Philosophy must not remain confined to a foreign idiom. The latter has to be either appropriated or rejected. To translate is to understand and make understood. To translate is to clarify. It is therefore not surprising to see translation become a crucial enterprise for the Enlightenment.

Among the last contemporary avatars of the tension between external passivity and internal agitation, we may mention the way in which psychoanalysis conceptualizes this same oxymoron (see DRIVE and I/ME/MYSELF). Psychoanalysis makes a radical break with philosophy. The unconscious and especially the phenomenon of repression shift the problem of activity and passivity to another, more complex level. However, the same tension is at work. Here, there is a triple passivity of which the ego must become aware: first, the one that puts it at the mercy of the drives (*Triebe*), that is, the quantities of energy in movement and tending toward discharge; second, the one that it undergoes with regard to the super-ego, to the law that has been internalized and become unconscious; and finally, the impotence that the ego experiences in the symptom. The drive is a stimulus, but it acts chiefly through a phantasmatic resurgence. It is life, activity, desire to be, but also repetition, compulsion, reflex. The language of physics allows Freud to express the oxymoron of an activity that is all the more active because it is governed by a neurotic constraint, a necessity all the more imperious because its manifestations are *patho*logical, led on by the *pathos* of the repressed that is returning. The desire that formerly underwent repression, the desire whose realization in an act or in a movement has been inhibited, becomes, through this inhibition itself, infinitely powerful, insistent, "active." Hyperactive now, because it was formerly passive.

| PEOPLE

FRENCH   *le peuple, les gens*

➤ PEOPLE/RACE/NATION, *PERSON,* and AGENCY, BEHAVIOR, COMMON SENSE [*SENS COMMUN,* SENSUS COMMUNIS], ENGLISH, LIBERAL, NAROD, POLITICS, WHIG

The ambiguity of the English word "people"—which refers to both an indivisible unity and a plurality or federation of individuals, to the point that the term is dissolved in an impersonal plurality ("people say") or even turned into a pronoun ("they say")—is particularly interesting, the two senses being used alternatively and even coexisting in English philosophical and political language. The passage to American English is even more significant than in other cases, because the twofold use of the word and the transformation of its meaning played a central role in the definition of political power at the time of the American Revolution.

I. "People," Singular and Plural

"People" was originally synonymous with "folk" (a word associated with "race," "nation," "tribe"; cf. Ger. *Volk*), and initially referred to a unit. The development of the term's usage is marked on the grammatical level by the passage to the plural in the conjugation of the verb of which "people" is the subject ("people say," "people want"). This is a possibility specific to English, in which "people" can be both singular and plural. In seventeenth-century English, and especially in the field of political philosophy (Hobbes, for example), the people constitute a unity ("All the duties of sovereigns are implicit in this one phrase: *the safety of the people* is the supreme Law"; *On the Citizen*, ch. 13), the body of citizens, which can be divided into parts. But the term coexists with the common and very loose use of "people" in the plural ("people are to be taught"; *Leviathan*, ch. 2). We also sometimes find a plural "peoples" ("the common-peoples minds"; ibid.), which clearly shows the indeterminacy of the word. These linguistic facts make particularly complex the definition of the relationship between individual and people, the word "people" referring both to a unit and to a plural conglomerate.

To this is added another, nonspecific meaning (see PEOPLE/RACE/NATION) of the people as a class that is oppressed or in a relationship of inferiority, a meaning that has the same dimensions (both protesting and despising) as the French word *peuple*. We may note that a new and odd sense has appeared in English that radically inverts this one: "people" in the sense of celebrities, as in the case of the magazine *People*.

II. "People" and the American Innovation

This ambiguity between the singular and the plural is related to the assertion that the people is simultaneously one and multiple, as is clearly indicated in the expression "We the people." Thus we read at the beginning of the 1787 U.S. Constitution: "WE, THE PEOPLE of the United States, in order to form a more perfect Union … do ordain and establish this CONSTITUTION." For Hamilton and Madison (see *Federalist Papers* nos. 39 and 46), the "people" is "the great body of the people," and it is in it that resides the sole source of sovereignty: "The fabric of American empire ought to rest on the solid basis of THE CONSENT OF THE PEOPLE" (Hamilton, *Federalist Papers*, no. 22). "The ultimate authority resides in the people alone" (Madison, *Federalist Papers*, no. 46). The question of this consent is basic to the whole of American thought specific to democracy: how to conceive the consent of the people, that is, of each individual, to society? This problem is connected with the ambiguity of the word "people," which the Federalists were paradoxically to resolve by proposing a twofold definition: the people can be either a group of "individuals composing a single English nation" or a group of individuals "forming distinct and independent English states." The political organization is defined as a "compound" divided into a federal and a national power, the people remaining the supreme authority that delegates its power.

Madison (ibid.) particularly insisted on this absolute sovereignty of the people, which is the "common superior" of the federal and state governments, and thus "the ultimate authority." Thus is affirmed the great principle of the original right to power vested in the people. James Wilson argued that the people of the United States disposed of and exercised its primitive rights, and it alone *delegates* (Hamilton, *Federalist Papers*, no. 23) its powers. According to the Federalists, all power resides in the people, and not in the government of the states. The now vaunted basis of federalism, the "mixed character" (Madison, *Federalist Papers*, no. 39) of political power, is thus inseparable from the idea of the delegation of power by the people, which has the authority to delegate power to its agents and to form a government that the majority believes will contribute to its happiness, the transcendent power of the people being competent to form the kind of government the people considers likely to produce its happiness. The redefinition of power reveals itself here to be connected with a redefinition of what a constitution consists in: it is not the definitive organization of a power, because at any time the people can rescind—without resorting to revolution—its delegation of power to a defective government and can subject its constitution to renewed debate. The constitution is thus based on the "assent and ratification of the people of America," but the people are conceived "not as individuals composing one entire nation, but as composing the distinct and independent states to which they respectively belong": "It is to be the assent and ratification of the several States, derived from the supreme authority in each State—the authority of the people themselves" (Madison, *Federalist Papers*, no. 39).

Thus the essential duality of "people" implicit in the definitive passage from the singular to the plural (cf. "themselves") is carried out in the Federalist project. The multiplicity of interests (of the individuals) that compose the people become compatible with the common interest through the multiplication of the centers of power. It is this phenomenon of the fragmentation of power that Gordon Wood has defined as the "disembodiment" of power (*Creation of the American Republic*). The paradox is that the people exercises its sovereignty in and through this very disembodiment. According to Wood, this is clearly related to a radical transformation of the meaning of the word "people" and of the relationship to politics in general following the overthrow of the old Whig concepts. When the American Revolution began, the people were considered a homogeneous entity in rebellion against the rulers. But under the pressure of reality, the idea gradually emerged of a non-homogeneous people without any genuine unified interest. Thus Americans transformed the people in the same way that the British had transformed rulers a century earlier: they broke the relationship of interest among individuals (Wood, ibid.).

In conclusion, the political stake involved in the redefinition of "people" becomes clear. Politics could no longer be defined, Wood says, as a battle between rulers and the people: "In the future, political struggles would be internal to the people, they would oppose the diverse groups and diverse individuals that sought to create inequality on the basis of their equality" (ibid.).

We see that this new sense of "people" sums up the American innovation in politics (even if much could be said about its possible perversions; cf. Wood's concluding chapter, which seems to deplore a disconnection of the social and the political and perhaps a lasting impoverishment of political thought in America), in its desire to truly implement the classical idea of popular sovereignty. Thus in the United States, the people as a source of power—which we find in the use of the term in the sense of "electorate" or, in the judicial field, in the expression "the People vs. X")—was to coexist with the "people" having divergent community interests (black people, my people) or simply "people" in an indeterminate, pronominal way (people say), and even, in more casual language, "he's good people."

PEOPLE / RACE / NATION

FRENCH	*peuple, race, nation*
GERMAN	*Volk, Rasse, Nation*
GREEK	*dêmos* [δῆμος], *genos* [γένος], *ethnos* [ἔθνος], *laos* [λαός], *ochlos* [ὄχλος], *plêthos* [πλῆθος], *hoi polloi* [οἱ πολλοί]
LATIN	*populus, gens, natio, plebs*

➤ CIVIL SOCIETY, *DROIT, GENRE,* GESCHLECHT, LAW, NAROD, OIKONOMIA, PEOPLE, POLIS, POLITICS, *STATE*

What the terms "people," "race," and "nation" have in common is that they designate types of geographical and historical, cultural, social and/or strictly political community. The difficulty of translating them has to do with the fact that from one language to another, and within each language from one period to another, they do not necessarily refer to the same types of membership, or distinguish, intersect, or share them in the same way. Hence by translating *dêmos* [δῆμος] or *populus* as "people," *ethnos* [ἔθνος], *natio*, or the plural *gentes* by "nation(s)," *genos* [γένος] or *genus* by "race," we fall victim to a retrospective illusion that projects onto Greek or Latin notions, ambiguities, and problematics that do not belong to them.

Thus *dêmos*, like *populus*, designates both citizens as a group and the least wealthy (and sometimes the most numerous), least educated, and least noble part of that group, but never a natural and/or historical component of human diversity. But this is often the case for the notion of "people," and still more for that of *Volk* (*Völker*), the uses of which give priority, on the contrary, to a community of birth or a shared history. Inversely, *ethnos*, *natio*, or *gentes* never had a political meaning (they do not imply any kind of citizenship), whereas the history of the term "nation" is understood as a history of its gradual articulation with the notion of the state, although its ethnic sense does not disappear.

Finally, the idea of race, although fluctuating (as a component of human diversity, as a social category), remains inseparable from various theories that make the war of the races the motive force in history—something the terms *genos* or *genus* never connoted.

I. People, Race, Nation

A. "People"

The Chevalier de Jaucourt's article on "People" (*Peuple*) in the RT: *Encyclopédie ou Dictionnaire raisonné des sciences, des arts et des métiers* testifies to the fact that the word is dauntingly polysemous: "People: a collective noun that is difficult to define because different ideas about it are formed in diverse places, in diverse times, and depending on the nature of events." In reality, efforts to define the word "people" turn on a twofold ambivalence: that between a political creation and a natural or historical given, and that between citizens and the masses positively or negatively valued. The modern definition of "the people" as a political creation and in this case, a contractual institution—a definition that stems from Rousseau—thus collided from the outset with a double resistance: "the people" is also a factual reality anterior to the contract; moreover, the word sometimes designates the part of the population that, because of its poverty or lack of education, is excluded from the exercise of sovereignty.

1. The act through which a people is a people

Determining the meaning of "people" involves first of all the question of its origin or foundation, as is shown by Rousseau's polemical attack on Grotius: "A people, says Grotius, can give itself to a king. So that according to Grotius, a people is a people before giving itself to a king. That very gift is a civil act, it presupposes a public deliberation. Hence before examining the act through which a people elects a king, it would be well to examine the act by which a people is a people" (*The Social Contract*, I.5; trans. J. T. Scott in *The Major Political Writings of Jean-Jacques Rousseau*). But the fact that the people has no political existence and therefore cannot deliberate before being instituted as such by the contract does not mean that it did not previously exist. On the contrary, the institution of the people as a political body is conceived all the more strongly when gauged by the distance between a point of departure and a point of arrival, a first form of community (a first "people") and the form that gives this first people sovereignty. This is shown with particular clarity by the three chapters that deal with the people in *The Social Contract* (II.8–10):

> What people, then, is suited for legislation? One that, while finding itself already bound by some union of origin, interest, or convention, has not yet borne the true yoke of laws. One that has neither deeply rooted customs nor supersitions; . . . finally, one that combines the stability of an *ancient people* with the docility of a *new people*.

> (trans. J. T. Scott, *Major Political Writings*; emphasis added)

Thus the foundation of the people as a political body does not erase its natural or historical origin. On the contrary, it is based on the first bonds that define it. Although there is in the polysemic unity of "people" a persistent ambiguity that is difficult to eliminate, a glance back at Greek and Latin makes it easy to understand: the unity of "people" asserts, in a monothetic way, the transition, and even the consubstantiality, between the natural (geographical and historical) reality of the people as *ethnos* [ἔθνος], or even as *genos* [γένος], and the political reality of the people as *dêmos* [δῆμος]. The phrase "first people," or "original people," has in fact, none of the meanings that covered by *dêmos* or *populus* (see *infra*). It corresponds far more to what the Greek terms *ethnos* and *genos* suggest. As a result, if one had to give impossible Greek or Latin equivalents for the terms of Rousseau's formula summing up the problematics of sovereignty, we would probably arrive at the following definition of the contract: the act by which a people (*ethnos*, *natio*) is a people (*dêmos*, *populus*).

This confusion, which has major consequences, is still more manifest as soon as the notion is made plural. Then it is almost impossible to make a distinction between peoples and nations—understood as the anthropological components of human diversity. In *The Social Contract,* as in the *Discourse on the Origin and Basis of Inequality among Men*, Rousseau uses both terms in the plural in an undifferentiated way, sometimes in the same sentence. Thus in the famous note 10 in the latter work: "there are whole peoples that have tails like four-footed animals." No doubt some writers, like Buffon or Voltaire, tried to distinguish between peoples and nations on the basis of the degree of political organization, but the distinctions vary and are reversed from one author to another.

2. The people: A body of citizens or a mass of outcasts?

For the philosophers of the Enlightenment, "the people" was also that part of the population that was in fact deprived of political rights and thus totally dominated. The second ambivalence thus is located not at the level of the foundation, as a problem of political philosophy, but in ordinary language. Depending on whether it is evaluated positively or negatively, it testifies to the force of social prejudices or to the insufficiency, and even the hypocrisy, of the contractualist definiton of "the people," so long as too numerous and too massive inequalities continue to exist within the body politic. The whole question is who belongs to the people and who, on the contrary, claims the right to except himself from it. Thus Abbé Coyer could deplore (in his *Dissertations pour être lues*, 1755; the first of these "dissertations" is on the old word *patrie*, the second on the nature of the people) the fact that the people saw itself constantly shrinking: "The people used to be the general estate [*l'état général*] of the nation, simply opposed to the great and the nobles. It included farmers, workers, artisans, merchants, financiers, men of letters and men of law." In fact, that is what Vauvenargues might have had in mind when he wrote, "The people and the nobility do not have the same virtues, or the same vices." But in the eighteenth century, "the people" was no longer defined by opposition to the nobility, but by opposition to the Third Estate. The bourgeosie's increasing power, and its desire not to be confounded with the mass of the people, led to an increasingly narrow perception and definition of "the people." It seems that everyone wanted to distinguish himself, and first of all Rousseau, who did not escape the rule when he wrote in his *Confessions*: "Born into a family superior in its manners to the common people, I had learnt only wisdom from my relations, who had shown me honourable examples, one and all" (II.66, trans. J. M. Cohen). The meaning of "people" is here quite close to the one that *le public* acquired in French at about the same time, understood as the formless, restless mass that included neither the nobles nor the members of the *parlements* nor yet even the merchants; a mass that was characterized not only by its lack of education and its potential violence but also by its association with labor. However, taken in this sense, the people was also lauded and even glorified in revolutionary literature: thus Jean-Paul Marat praised it when he asked whether the people or the bourgeoisie was the defender of the Revolution: "In the state of war in which we find ourselves, there is only the people, the common people so despised and so little despicable, that can inspire respect in the enemies of the revolution" (*Textes choisis*, 217).

Going back to the Greek and Latin shows that this ambivalence is found in *dêmos* and *populus*, whose use tends sometimes toward *plêthos* [πλῆθος] and *plebs*, but here as well the evaluation can be either positive or negative. However, it is worth noting that no political construction, even the most democratic, succeeds in completely and permanently reducing this opposition between the body of citizens and de facto outcasts. That is why, on the fringes of the thought that institutes the people, a discourse that makes it an object of compassion permanently subsists.

■ See Box 1.

1

People, the masses, and collective man in Gramsci

The question whether "people" refers to a body of citizens or to a group of outcasts still influences the problematic nature of the relationship between the philosopher and the people. Whereas in the first case the intellectual is not distinguished from the people (or at least does not ask whether he is), in the second case he is forced to reflect on the conditions under which he can address the people. This is particularly clear in Gramsci's thought. In his work, the Italian word *popolo* appears to be linked to two complementary problems, that of philosophy, and that of revolution. The conceptual and terminological elaboration differs, opening in one case on the equivalence between people, the masses, and the uneducated, and in the other on the idea of a collective man. In his reflection on philosophy, Gramsci uses indifferently *popolo* (people), *massa*, (masses), and *i semplici* (the uneducated). Among the factors that explain the persistence of a philosophical trend is its adoption by the people's common sense (*senso comune*). If there is a popular conception of philosophy, it is not unconnected with "specialists' philosophies," despite the gap between the intellectual elite and the masses. The relation between the two groups centers on the idea of the conscious direction of action. Described by Gramsci as the "healthy core of common sense," it can be developed into a "unitary and coherent whole" and it is in this very development that resides "so-called scientific philosophy" (*Gramsci dans le texte*, 137). But the common meaning is itself only "a chaotic aggregate of disparate conceptions in which one can find whatever one wants" (307). Thus, popular philosophy must not be confused with philosophy as conceptual criticism. The relationship is mediated, and must be elaborated all the more because, in Gramsci's view, philosophy undergoes a metamorphosis when it is diffused among the masses: it can be experienced by them only as a faith (158).

Moreover, the people's point of view is the yardstick by which philosophies should be evaluated. Thus some philosophies prove to be hostile with regard to the people. They help keep the people ignorant and do not offer it the means to acquire conscious direction of its action. This is the case of idealism, whose distance with respect to the people is manifested in the rejection of "cultural movements that want to 'go to the peoples'; or again of "Jesuitized Christianity, transformed into a pure narcotic for the popular masses [*le masse popolari*]" (140, 155). In addition, the people's point of view is made the criterion of

a true "philosophy of *praxis*" (an expression that Gramsci uses to refer to communism in a veiled way, in order to keep his texts from being censored), so that it does not suffer from the weakness of "philosophies of immanence." The latter, for example in the work of Benedetto Croce and Giovanni Gentile, were not able to "create an ideological unity between the low and the high, between the 'uneducated' and the intellectuals [*i 'semplice' e gli intelletuale*]" (140). To establish the conditions for this unity between the low and the high, Gramsci seems at first to resort to a simple tactic: considering that all philosophy tends to become the common sense of a given milieu, no matter how restricted it might be, he recommends investing in a thought that is already that of common sense, in order to endow it with the "coherence" and "sinew of individual philosophies." However, this investment is itself conditioned by the "'felt' demand for contact with the 'uneducated'" (142). Thus, this is not a simple tactic, because in this "felt demand" we can clearly discern the political dimension of this philosophy of *praxis*: it depends on a commitment to "fight modern ideologies in their most refined form in order to be able to constitute one's own group of independent intellectuals and to educate the popular masses, whose culture was medieval" (255–56).

This commitment shifts us toward political questions that open up a new view of the people that involves analyzing the conditions for revolution. The success of the latter depends, according to Gramsci, on the consensus of the masses and their participation. The notions of the masses and the uneducated, which serve to describe from a cultural point of view the internal division of the people, are reinterpreted and put in the service of a unified vision that opposes the people as a whole to a minority of intellectuals and specialists. In an essay written in 1926, "Some Aspects of the Southern Question," Gramsci notes the fracture lines separating peasants and workers, cities and rural areas, proletariat and intellectuals. He defines the revolutionary project on the basis of these fractures: given the divisions and the necessity of not making a "passive revolution," a revolution without the people, the political ambition must at first be limited to the project of a revolution on the national scale. To carry out a successful revolution, it is thus necessary to achieve a "cultural-social unity [*unità cultural-social*] that causes a large number of scattered wills, whose goals are heterogeneous, to be welded together to attain the same

end, on the basis of a single, common conception of the world" (*Gramsci dans le texte*, 173). In the first of the notebooks devoted to the topic of "The Modern Prince," Gramsci takes up the figure of Machiavelli, who conceived, according to Gramsci, the movement of a people and the process of forming a collective will:

> Throughout the book, Machiavelli discusses what the Prince must be like if he is to lead a people to found a new State; the argument is developed with rigorous logic, and with scientific detachment. In the conclusion, Machiavelli merges with the people, becomes the people; not, however, some "generic" people [*si fa popolo, si confonde col popolo, ma non con un popolo "genericamente" inteso*], but the people whom he, Machiavelli, has convinced by the preceding argument— the people whose consciousness and whose expression he becomes and feels himself to be, with whom he feels identified.
>
> (trans. Q. Hoare and G. N. Smith, *Selections from the Prison Notebooks*)

A new notion emerges from this reflection. It expresses what the people must become in the revolution: the "collective man [*uomo collettivo*]" (*Gramsci dans le texte*, 173). It appears as the key formula for revolutionary thought and action, but it also takes us back to Gramsci's thinking about the philosophy of *praxis*. The task of this philosophy, of its intellectuals, is to create the social-cultural unity of a people. In this sense, the "people" can be conceived as the key concept in Gramsci for connecting thinking about philosophy with thinking about revolution.

B. "Nation": The body of the king and the body of citizens

The polysemy of "people" is further aggravated by the fact that its different senses are recuperated by "nation" as the latter term, through a whole series of mutations, acquires a rigorous political meaning; and all the more so because the meaning of "nation" becomes a historical and political issue. Under an absolute monarchy, the nation is initially summed up in the body of the king—the whole of his subjects insofar as they are his subjects. Thus the glory of the nation, so often invoked, is nothing other than the power of the king. That is what Rousseau points out in the *Jugement sur le projet de paix perpétuelle* (Judgment of the program for perpetual peace): "Every occupation of kings or of those to whom they entrust their functions is intended to realize two goals: to extend their domination abroad and to make it more absolute within. Any other design is either related to one of these or merely serves as a pretext for them. Such are the public good, the happiness of his subjects, the glory of the nation" (*Œuvres complètes*, 2:592).

The politicization of the idea of the nation can be understood, then, as a series of efforts to break it away from its identification with the person of the absolute monarch. At first, the monarchical definition is opposed by an attempt to restore to the nation the sense of a historical community of customs and culture, and to turn against the king's power the rights that his origin gives him. That is what is involved in the various theses like the one defended by Henri de Boulainvilliers in *Essais sur la noblesse de France* (1732), which undertake to distinguish two nations on the basis of their origins: the descendents of the Gauls conquered by the Romans, and the nobility descended from the Franks. Taken in this sense, the nation can no longer define all the subjects of a monarch, connected physically and legally with the king's body, but that does not imply the unity of a territory either. As a nation, the nobility transcends state boundaries. Thus the nobles of all countries can claim to belong to an original community (of birth) in order to proclaim the rights of the nation that they constitute in opposition to other nations.

The nobility's historical appropriation of the term "nation" met with resistance on the part of the Third Estate, which was to turn the meaning and the use of the term in another direction. Against the nobility's speculations, the Third Estate at first sought to regain control of the term "nation" by identifying it with the unity of a territory bounded by frontiers and subject to a common set of laws and government. That is, for example, what the article "Nation" in the RT: *Encyclopédie* does. Then the goal is to make the nation the source of sovereignty and the owner of the crown, the government, and public authority: "In a word, the crown, the government, and public authority are goods of which the body of the nation is the owner and of which the rulers have the usufruct," Diderot wrote in the article "Autorité public." And, reversing the terms of the monarchical definition, he adds in his *Observations sur le Nakaz*: "There is no true sovereign other than the nation." But it was especially with the Abbé Sieyès's pamphlet *Qu'est-ce que le tiers-état?* ("What is the Third Estate?") that "nation" took on an essentially political and legal meaning. For Sieyès, a nation is defined both by its political ability to subsist—which requires particular works

(exploitable and exploited resources) and public functions (the army, the judiciary, the administration, the church)—and by its juridical existence: "a body of associates living under a common law and represented by the same legislature." To the extent to which the Third Estate itself is capable of providing this subsistence, of performing these functions, and constituting such a body, it forms "a complete nation" (*Qu'est-ce que le tiers-état?*, 31). The nobility, on the contrary, imprisoned in its privileges and its idleness, is outside the common order, the common law. It forms, Sieyès wrote, "a separate people in the great nation." Thus the semantic relationship between "people" and "nation" was shattered: the political dimension was no longer reserved for the former and history for the latter, but the other way around. This idea of a "complete nation" led first to the articulation of the idea of the nation with that of the state. Saying that the Third Estate is a complete nation does not mean that the nobility is excluded from the nation, but only that the Third Estate is capable by itself of assuming all the functions of the state that give the nation its unity.

C. "Race": A biological given or a social class?

It remains that the political sense of "nation" does not put an end to the other meanings that the term has been able to acquire, starting with the meaning of a community of customs and language constituting, independently of any political unity, a part of human diversity—a subject of study for anthropology and history. That is why in translations that sometimes involve the retrospective illusion, *ethnos* or *genos* (see below) is occasionally rendered, especially in the nineteenth century but still today, by "nation." Some discourses and some theories even explicitly oppose this relative "denaturalization" and "dehistoricization" of the notion, preserving its dimension of a natural and/or historical community. But then it is confused with "race." It is particularly in the works of historians who make race the engine of history at the same time that they construct the idea of national history, such as Augustin Thierry's *Lettres sur l'histoire de France* (1820, 1827), that we find this ambiguity between a strictly political and legal meaning of "nation" and its identification with a natural community. But "race" is also polysemous, and its use to designate the human communities of antiquity (through historical description or translation) is subject to just as much confusion. The philosophical use of the notion of race was initially linked, in the seventeenth century, with the broadening of anthropology (previously limited to humany anatomy and psychology) to describe the varieties of the human species—as in Buffon's *Histoire naturelle de l'homme* or Voltaire's *Essai sur l'histoire générale et sur les moeurs et l'esprit des nations*. The notion of race was then used in a double register, descriptive and explanatory, which gave rise to numerous polemics, like the one between the polygenists and the monogenists. Ostensibly, the question is whether the differences for which this notion is supposed to account (differences that are primarily morphologial, such as skin color or the shape of the face) are original or derived—whether several races of human beings appeared simultaneously on Earth or at least independently of one another, or on the contrary they derive from a common source that contained

them all in embryonic form. In reality, the goal is almost always to show the superiority of one race over the others.

But the word "race" has still another meaning, and the difference it designates is not always and exclusively ethnic. In the nineteenth century, two meanings existed alongside one another: the first is the broad, open one that is implied by the theme of the war of the races that recurs in the discourse of historians. Races are not necessarily ethnically determined components but may also be social or cultural groups. In fact, Marx praised Augustin Thierry—the theoretician of the war of races as the engine of history (*Sur l'antipathie de race qui divise la nation française*)—as the "father of class struggle in French historiography" (letter to Engels, 27 July 1854). Here, "race" referred to distinct groups that, although they inhabited (or had inhabited) the same territory, had not been able to mix, for reasons that were not only ethnic but also cultural or social in nature. In the second sense, races are natural, biologically determined components of human diversity. Then we see how ambiguous it is to translate *genos* or *genus* by "race." The translation is, of course, legitimate when "race" is situated in the tradition of natural history, to which *genos* in part belongs. But "race" also implies divisions that are too historically and ideologically determined to be transposable, and it suggests, at the price of a real retrospective illusion, that they have always been conceived that way.

■ See Box 2.

II. *VOLK*, "NATION"

A. *Volk*

Volk, unlike "people," and also unlike *dêmos* and *populus*, has the pejorative sense of "rabble" only in exceptional cases. This is connected with another of its characteristic traits: the word designates only marginally, in an exclusively political and juridical way, a body of citizens, and it refers to the natural basis of the political body rather than to this body itself. This basis may both be presented as an obstacle to the rational and political constitution of this body and exhibited, indeed sacralized, as the main reason for opposing it.

1. *Volk*: An obstacle to the Commonwealth

That is so shown first of all by the complexity and complementarity of the definitions of *Volk* given by Kant in his

Metaphysical First Principles of the Doctrine of Right (the first part of his *Metaphysics of Morals*) and his *Anthropology from a Pragmatic Point of View*. Significantly, it is in the latter and not the former that we find a rigorous definition of *Volk*:

> By the word *people* [*Volk*] (*populus*) is meant a *multitude* of human beings united in a region [*die in einem Landstrich vereinigte Menge Menschen*], in so far as they constitute a *whole*. This multitude, or even the part of it that recognizes itself as united into a civil whole [*einem bürgerlichen Ganzen*] through common ancestry [*gemeinschaftliche Abstammung*], is called a *nation* [*Nation*] (*gens*). The part that exempts itself from these laws (the unruly crowd within this people [*die wilde Menge in diesem Volk*]) is called a *rabble* [*Pôbel*] (*vulgus*).
>
> (trans. R. B. Louden, *Anthropology from a Pragmatic Point of View*, 213)

Kant connects *Volk* with *populus*, but gives it a sense that is both narrower and vaguer than that of the Latin term. It designates, as it were, the first degree of union, before any recognition of a common origin, and a fortiori of a common fate. To indicate a meaning similar to that of Cicero's *populus*—that is, a political meaning—Kant thus had to introduce other terms, this time in the *Doctrine of Right*:

> This condition of the individuals within a people [*dieser Zustand der Einzelnen im Volke*] in relation to one another is called a *civil* condition [*bürgerlicher Zustand*] (*status civilis*), and the whole of individuals in a rightful condition, in relation to its own members, is called a *state* [*Staat*] (*civitas*). Because of its form, by which all are united through their common interest in being in a rightful condition [*im rechtlichen Zustande*], a state is called a commonwealth [*das gemeine Wesen*] (*res publica latius sic dicta*).
>
> (trans. M. J. Gregor, *Metaphysics of Morals*, §43, 89)

But it is above all Kant's definition of the contract that manifests most clearly how much he reserves *Volk* to designate the natural element of the body politic. Unlike Rousseau, he does not say that the contract is "the act by which a people is a people," but rather "the act by which

---

2

The malaises of ordinary language

In French, an ambivalence persists in the different uses of the term *race* in ordinary language.

1. To say of someone that *il a de la race* or *il est racé* is first of all to reproduce a class judgment. Moreover, the expression has no meaning other than the one that attributes "class" to some person or other. But it is also to claim that there is a natural foundation for social distinctions;

it is to seek in the *genos* a justification for inequality.

2. Inversely, the interdiction that weighs on the word *race*, taken in its ethnological sense, testifies to its basis in natural history. To avoid *race* is to refuse to reduce human diversity to a given of natural history. The races, it will be said, are good for animal species (in the sense of breeding), not for humans. And it is true that the history of the term is partly linked with the blurring

of these boundaries and with the lifting of the moral interdictions that are attached to them. Speaking of human *races* as we speak of *races animales* used to be a way of justifying the fact that relationships between these different species of men (in this case, colonizers and colonized) could be as violent as those that organized the animal realm. Thus we will prefer to use the term *ethnie* (ethnicity), which preserves or restores the division between humanity and animality.

a people forms itself into a state is the *original contract*. Properly speaking, the original contract is only the idea of this act" (ibid., §47, 91–92). The definition of the contract makes it possible to distinguish the "people conceived as subject" (the mass of individuals) from the "people unified itself" (the people considered as a state). However, it will be noted that as soon as *Volk* no longer has the natural meaning given it by anthropology, a paraphrase is necessary, as well as a resort to Latin, as if Kant did not have confidence in the German language's ability to express these matters of public law.

As a final sign of Kant's reluctance to give *Volk* a juridical meaning, we must mention the doubts he expresses regarding the legitimacy of using the expression *Völkerrecht* to designate the right of nations, in other words, his refusal to make peoples (*Völker*) the subject of international law. What is involved in this law are the relations not among peoples but among states:

> The right of *states* in relation to one another (which in German is called, not quite correctly, the right of nations, but should instead be called the right of states, *jus publicum civitatem*) is what we have to consider under the title *Völkerrecht*.

> (Ibid., §53.114)

2. *Volk*: Nature and history versus reason and law

What appears in Kant as a semantic reluctance (he finds the term *Volk* unsuitable) becomes in other writers a way of resisting any rational and juridical conception of the body politic. The naturalness and historicity of the *Volk* were opposed in principle to any attempt to reduce the people to relationships of law. Thus Herder defends the people against the state

in his *Ideen zur Philosophie der Geschichte der Menschheit* [Ideas for the philosophy of the history of humanity] (1784/91;):

> Nature raises families; the most natural state is therefore also *one* people, with one national character [*ein Volk, mit einem Nationalcharakter*]. . . . [A] people is as much a plant of nature as a family, only with more branches.

> (*Ideen* in *Johann Gottfried Herder Sämtliche Werke*, ed. B. Suphan et al., 13:384)

The people (*Volk*) is thus conceived as a natural organism whose divisions can result only from a politics of violence. And government has no legitimacy except insofar as it belongs to this organism. But this strong naturalization of the notion of the people is also a historicization of it. It is, in fact, for the people to cultivate its specificity in the course of a history that, far from implying any attachment to its original nature (Kant), on the contrary preserves it. It is in this perspective that we should understand the development of several notions derived from *Volk* that put the unity of the people under the sign of its historicity, even its antiquity, or under that of its naturalness.

▪ See Box 3.

3. The erasure of social inequalities

This mutually exclusive naturalization and historicization of the *Volk* erases the tension between the juridical body of the citizens and individuals or groups whose social and political situation excludes them from that body. As a result, the object of compassion is shifted: it is no longer the most wretched part (the uneducated and impoverished people) that arouses pity, but rather the people as a whole (*das Volk*),

---

3

The ideology of *Volk* and *Volkstum*

On the basis of *Volk* have been created *Urvolk* (aboriginal people), *Volksgeist* (spirit of the people), *Volkslied* (folksong), and *Volkstum* (people-ness), which never refer to either a legal determination of the people or to the people as the group composed of the wretched and excluded. That is why the expressions "folksong" or "popular element" are not suitable translations of these German words. Of all these words, *Volkstum* is the most untranslatable. Coined by Ludwig Jahn in 1810 (in a work entitled precisely *Deutsches Volkstum*), it designates the strength given a people by its organic unity and makes the latter the source of its sovereignty. *Volkstum* is in fact in tension with *Königtum* (royalty). Let us add that this substance (or element) of each people is also the principle of its opposition to all others, and that its greater or lesser importance determines its ability to dominate others;

"What is it that makes England and France the leading world powers? Nothing other than the *Volkstum* that is constantly reborn in the midst of the greatest upheavals" (cf. *La langue source de la nation*, ed. P. Caussat et al., 134). But *Volkstum* is only one example among others of the different terms that can be forged by a nationalist ideology on the basis of the word *Volk*—as was shown by Victor Klemperer analyzing, day by day, the rhetoric of *Volk* and its derivatives in the discourse of the Nazis.

whether this compassion has to do with the people's insufficiently recognized language, spoken and written, its insufficiently developed culture, the absence of international recognition, or the actual existence of a cultural or political domination. The register of the people's self-pity certainly constitutes an element in the rise of nationalism that cannot be ignored.

Nietzsche notes that such a perspective constitutes a genuine break with a whole tradition inherited from antiquity:

To differentiate between government and people, as if two separate spheres of power, one stronger and higher, the other weaker and lower, were negotiating and coming to agreement, is a bit of inherited political sensibility that still accords exactly with the historical establishment of the power relationship in *most states.* When, for example, Bismarck describes the constitutional form as a compromise between government and people, he is speaking according to a principle that has its reason in history (which is, of course, also the source for that portion of unreason, without which nothing human can exist). By contrast, we are now supposed to learn (according to a principle that has sprung from the *head* alone, and is supposed to *make* history) that government is nothing but an organ of the people, and not a provident, honorable "Above" in relationship to a habitually humble "Below."

<div align="right">(trans. M. Faber and S. Lehmann, <i>Human,
All Too Human</i>, 215)</div>

Nietzsche challenges the unitary definition of "people" and in connection with his repeated criticisms of democracy as the weak's revenge and domination, *Volk* usually has the meaning of *vulgus* or *plebs* in their pejorative sense.

B. "Nation"

Nonetheless, in German *Volk* does not cover by itself the whole of the naturalness of the body politic. Although it designates a group gathered in a single territory, another term is necessary to designate a community of birth. The latter is, as we have seen, the precise meaning that Kant gives to the term *Nation* in his *Anthropologie in pragmatischer Hinsicht* (*Anthropology from a Pragmatic Point of View*). Except for when in *The Doctrine of Right* he wants to refer in a more political sense to the community of birth, the bond of kinship implied by the Latin terms *gens* or *natio*, Kant uses a lengthy paraphrase to avoid using *Nation*:

As natives of a country, those who constitute a people [*Volk*] can be looked upon analogously to descendants [*nach der Analogie der Erzeugung*] of the same ancestors [*von einem gemeinschaftlichen Elternstamm*] (*congeniti*) even though they are not. Yet in an intellectual sense and from the perspective of rights, since they are born of the same mother (the republic) [*von einer gemeinschaftlichen Mutter (die Republik)*], they constitute as it were one family (*gens, natio*), whose members (citizens of the state) are of equally high birth.

<div align="right">(trans. M. J. Gregor, <i>Metaphysics of Morals</i>, I, §53, 114;
translation modified)</div>

Once again, Kant resorts to Latin to designate the political character of the bond of birth, as if he could not count on the German term to do so.

In reality, *Nation* was at that time already being used as part of a strategy to which Kant could not subscribe. For authors like Herder, the nation is a community of birth, to be sure, but it is much more than that. It is an organic whole, a unity both natural and historical, and its customs, traditions, language, and religion, as well as its feelings and imagination, are all subject to the same process of development. In this regard it is the object of a veritable sacralization that has nothing to do with attachment to common legal norms. Nations constitute a division of humanity foreseen by divine Providence: "The Creator alone is the only one who conceives the full unity of any one and of all nations [*die ganze Einheit einer, aller Nationen*], in all their great diversity without thereby losing sight of their unity" (*Auch eine Philosophie der Geschichte zur Bildung der Menschheit* [1774]; trans. I. D. Evrigenis and D. Pellerin, *Another Philosophy of History for the Education of Mankind*, 26).

Thus we can see in what a complex system of illusions we find ourselves entangled when Herder uses this same term, *Nation*, in referring to the Roman Empire's violent treatment of the communities it conquered: "The walls that separated the nation from other nations were broken down, the first step taken to destroy the national characters of them all, to throw everyone into one mold called 'the Roman people'" (ibid., 23). Herder gave the form *Nation* an atemporal dimension that perpetuated it.

III. *Dêmos, Ethnos, Genos,* and Their Translations

In Anatole Bailly's Greek-French dictionary (RT: *Dictionnaire grec-français*) we find the same sequence, *race-peuple-nation* (as well as *tribu*, and also *classe, caste, sexe*, along with strange compounds such as *race de peuples* and *famille de peuples*) to render both *ethnos* and *genos*; and in any case *peuple* is one of the translations proposed for each of the three terms *dêmos, ethnos,* and *genos*. Thus the tripartite *race, peuple, nation* division as such does not constitute a significant system of differences in Greek: the Greek words in question evoke quite different series that distinguish them from one another or complicate them in different ways.

A. *Genos*: From the biological to the political (*genos* and *polis,* "race" and "city") and the logical (*genos* and *eidos,* "genus" and "species")

Genos, from *gignesthai* [γίγνεσθαι] ("to be born," and then "to become, to occur") had first of all the biological meaning of "birth, origin, descent." It signifies "race, stock," that of the gods (Hesiod's *Theogony*) and that of mules, and within the human "genus" (*genos anthrôpôn* [γένος ἀνθρώπων]), it takes on the narrower sense of "ancestry, kinship." In Homer, a person introduces himself in terms of his *genos* ("My *genos* is Ithaca and my father is Odysseus," says Telemachos, *Odyssey* XV.267), and Greek tragedies focus on the *genos*—the "family" of the Atreids, for instance. Thus *genos* functions as an equivalent of the two Latin words *genus* and *gens* (Greek *gennaios* [γενναῖος]: "noble, high-born"). It therefore connects the biological with two types of series, (1) sociopolitical and (2) logico-ontological.

1. The first series shows that birth is basic to social organization. Émile Benveniste describes how the "three concentric divisions of ancient Greece" (*Origines de la formation des noms en indo-européen*, 1:257, cf. 1:316), *genos, phratria* [φρατρία], and *phulê* [φυλή], which are analogous to Latin *gens, curia,* and *tribus*—along with the quantification stipulated in Solon's Athenian constitution, that thirty "clans" make a "phratry," and three phratries make a "tribe"—broaden the fraternity of blood to a military solidarity (Homer, *Iliad*, II.362 f.) and then an institutional one. Genealogical divisions are then rearranged into a "nomenclature of territorial divisions" (É. Benveniste, *Le vocabulaire des institutions indo-européennes*, 1:310) and embedded in sequences such as *oikos* [οἶκος], *kômê* [κώμη], *polis* [πόλις] (household, village, city-state).

For a long time, the essential question was as follows: what is the place of the genealogical and the "genic" in politics? One answer—which Plato attributed, not without irony, to Aspasia, a courtesan who was loved by Pericles and who is supposed to have influenced his famous funeral oration—makes the *genos* the foundation of the *polis*: the excellence of Athens comes from the Athenians' *eugeneia*, represented by the myth of their "autochthony" (their ancestors, they say, were born from the soil itself of their "motherland"): "This good birth [*eugeneia* (εὐγένεια)] has as its first foundation the origin [*genesis* (γένεσις)] of their ancestors [*progonôn* (προγόνων)], who, instead of being immigrants and engendering their descendants [*ekgonous* (ἐκγόνους)] metics . . . were autochthons" (*Menexenus*, 237b; cf. 245d); it is the *isogonia* [ἰσογονία], the "equality of birth" of all these "brothers" that provides a natural basis for the *isonomia* [ἰσονομία], the "equality before the law" established by law among Athenian citizens (239a).

Aristotle's answer consists, on the contrary, in distinguishing among orders. The *genos*, the line of biological descent, takes in politics the form of the *oikos* (the home) and of the *oikia* [οἰκία] (the family or household: man, wife, children, animals, servants). The *polis* is conceived as the outcome of successive local regroupings, several households forming a village (the "village" or *kômê* is a "colony," *apoikia* [ἀποικία], an extension-externalization of the family, *oikia*), and several villages forming a city (*Politics*, I.2,

particularly 1252b16f.): the geographical land is substituted for the patriotic myth. At the same time, the "political" establishes from the outset an order radically distinct from the "domestic" or "economic" order, whose goal is no longer to "live" but to "live well" (*eu zên* [εὖ ζῆν]) (1252b30): it is neither the unity of place (*topos* [τόπος]) nor the *genos* of the inhabitants, their common origin, that can guarantee the identity of a *polis*, but only the *politeia* [πολιτεία], the "political constitution" itself (III.3).

■ See Box 4.

2. The *genos*, thus relieved of its mythical, epic, and tragic freight, opens out onto another kind of series that is properly philosophical, and makes the transition from genealogy to logic and ontology. The terminology elaborated in terms of natural history (the "class" of animals) lends itself to categorial uses. Established by Aristotle by means of the distinction *genos/eidê* [εἴδη] genus/species, it is reexamined by Plotinus and Porphyry, who try to elaborate on this transition.

■ See Box 5.

B. *Ethnos* and *dêmos*: Geography and politics

Ethnos designates a more or less stable group of individuals, soldiers, or animals that is characterized by a common *ethos* [ἔθος] ("habits," "customs," from the same root **swedh-*) and that is distinguished from the *genos* as "foreign" (*othneios* [ὀθνεῖος])—thus in Rome, *ta ethnê* [τὰ ἔθνη] referred to the peoples of the provinces, and in the New Testament, it refers to the Gentiles as opposed to the Hebrews. *Dêmos*, which is generally related to *daiomai* [δαίομαι] (to divide up), signifies in Homer "country, territory" (for example, *Iliad* V.710: "The Boeotians who lived on a very fertile land [*dêmon* (δῆμον)]"); in Athens, the *demes* (divisions of tribes) were part of the administrative topography, and then the inhabitants of this country ("to the misfortune of your father, your city, and all your people [*dêmôi* (δήμῳ)]") (ibid., III.50); finally, perhaps because they lived in the countryside, it refers to the "common people," as opposed to the powerful (when Odysseus sees a "king or notable hero" [ibid., II.188]; "when he sees a man of the people [*dêmou andra* (δήμου ἄνδρα)]") (ibid., II.198). While *genos* implies a

[Γένος] and *genos*: The caution of contemporary historians

"So that there might be no ambiguity in the use of terms, we shall write the word *génos* [or *genos*] in French when it is a matter of the notion of *génos*, a social reality as it is conceived by modern historians" (F. Bourriot, *Recherches sur la nature du Genos*, 1:204). By means of this precaution, a contemporary historian tries to indicate that the Greek term γένος (*genos*) has in no case the meaning that nineteenth-century historians tried to give it, that it is a matter of a "clan" in the English sense (Grote, Morgan) or a "family line"

(*Geschlecht*) in the German sense (Meyer). The opinion that has been common since Fustel de Coulanges and Glotz, namely that ancient history can be reduced to a confrontation between two powers, the *genê* [γένη] and the state, thus deserves serious reexamination: "In the nineteenth century, an omnipotent structure, the *génos*, was created in all domains. . . . It is this mythical protagonist that has to be driven off the stage" (Bourriot, 232). In Athens, in the middle of the fourth century, to be part of the γένος (*en genei*

einai [ἐν γένει εἶναι]) was, without any possible ambiguity, to be part not of the *gens* or clan, but of the three generations issuing from a single ancestor.

The genera of being: Genealogy or logic: Porphyry and his translation

➤ ANALOGY, HOMONYM, PRÉDICABLE, PRINCIPLE, *TO BE*

The basic problem that determines the whole doctrine of the analogy of being can be formulated in terms of the semantics of the *genos*: how important a role is played by the Platonic and Neoplatonic genealogical meaning in the logical meaning that Aristotle established in the *Organon*? In Aristotelian theory, each science is the science of a single genus of being, but being is not genus, so that the recurrent problem arising from Aristotelianism can be formulated as follows: are the categories genera of being or are they multiple meanings indicating heterogeneous domains?

It is in Porphyry's *Isagoge* that the semantic stake is clearest. Porphyry opposes Plotinus, who, in the sixth book of the *Enneads*, "genealogized" Aristotle's categories the better to Platonize them. Porphyry re-Aristotelianizes them: Porphyry's genealogical tree does not have a single summit— there is no supreme genus like the Stoics' *ti*, nor are there any lowly rootlets to feed the superb tree. There is no process of engenderment, no hierarchical procession that allows us to pass logically to the individual, even if the tree is often designed to lead from the *genus generalissimum* to the *species specialissima* (A. de Libera, *La querelle des universaux*, 46). However, Porphyry takes into account the influence of the genealogical meaning when he distinguishes the meanings of *genos*: "genus is thus expressed in three ways, and it is the third with which philosophers are concerned." The three ways are (a) "the multiplicity of those who draw their origin from a single principle" (example: "the genus of the Heraclids" designates those who have Heracles as an ancestor); (b) "the principle

of each individual's birth," whether this concerns the father (Heracles for Hyllos) or the homeland (Athens for Plato); (c) "'genus' is also used in another way: it is that beneath which the species is ranked, perhaps named in this way in imitation of the preceding meanings; in fact, the genus of which we are speaking is a sort of principle [*archê* (ἀρχή)] for what is beneath it, and seems to embrace all the multiplicity [*plêthos*] that is under it." Meaning (c) goes back to the literal definition given in Aristotle's *Topics*: "genus is what is predicable [*katêgoroumenon* (κατηγορούμενον)] relative to the question 'what is?' [*en tôi ti esti* (ἐν τῷ τί ἔστι)]" (*Isagoge*, I.5), or "A 'genus' is what is predicated in the category of essence of a number of things exhibiting differences in kind." (*Topics*, I, 5, 102a31 f.; trans. W. A. Pickard-Cambridge), with the example of the "animal" (or the "living being," *zôion* [ζῷον]) as the genus for "man." We will emphasize Alain de Libera's notes: "Here there is an unavoidable translation difficulty in French: since Porphyry claims to illustrate the various meanings of 'genus,' we are forced to use the term, even if the words *race* or *lignée* would probably be preferable" (*Isagôgê*, 38, n. 11) for meanings (a) and (b). And especially, the relation to the "properly philosophical" meaning: "Here it is as if Porphyry were stressing the resemblance between . . . the properly Aristotelian philosophical acceptation—the relation of genus to species—[and] the 'ordinary,' or at least nontechnical meanings of the term in order to overcome the opposition Aristotle himself makes between the genealogical meaning and the genus-species relation" (ibid., 39, n. 19).

In opposition to Plotinus's refutation, Porphyry thus outlines a Plotinization of Aristotle by regenealogizing the meaning of *genos*. But he does so the better to carry out the final movement, which is that of disjunction: by opting for the radical homonymy of being (*Isagôgê*, II, 10), Porphyry refuses to "suture the Aristotelian doctrine of categories by means of a genealogical notion of genus, understood as an 'analogical' unity, *aph' henos* [ἀφ' ἑνός]" (ibid., 39). The disjunction of the meanings of *genos* and the homonymy of being are connected; to promote the genealogical meaning is to support the analogical procession that engenders on the basis of a unique principle, against the logical and categorial sense necessary for the homonymic disjunction. In a certain way, the difficulties of translating Porphyry into French are what corroborate the power of the homonymy for us today.

community of origin, *ethnos* implies a community of mores and *dêmos* implies a community of territory that culminates in a political structure.

In Aristotle's *Politics* we find, repeated over and over, the most rigorous expression of the difference between *ethnos* and *dêmos*. *Ethnos* is first contrasted, in virtually all its occurrences, with *polis* (city, state). In the technical sense, the *ethnê* designate the "peoples" (*peuples*; cf. J. Aubonnet's translation) or "tribes" (*peuplades*; cf. P. Pellegrin's translation) or "nations" (*nations*; cf. J. Tricot's translation) that have not yet reached the stage of the accomplished city, provisionally or definitively. This question, heavy with ideology, is subject to debate, depending precisely on one's interpretation of the natural historicity of the city and whether one gives priority to the break or the continuity with the family and the village:

"The cities were first governed by kings, as the *ethnê* still are today" (Aristotle, *Politics*, 1252b19f.).

That is why the term is used above all to designate barbarian groups, all of which are characterized by a lack of differentiation and can be despotically hierarchized, and which do not know this form of political equality by reciprocity (being alternately governors and governed)—the only one that can preserve differences from being erased by uniformity:

It is not like a military alliance [*summachia* (συμμαχία)]. The usefulness of the latter depends on its quantity even where there is no difference in quality [*to auto tôi eidei* (τὸ αὐτὸ τῷ εἴδει)] (for mutual protection is the end aimed at), just as a greater weight of anything is more useful than a less (in like manner, a state differs from a nation [*ethnos*], when

the nation has not its population [*to plêthos* (τὸ πλῆθος)] organized in villages, but lives an Arcadian sort of life); but the elements out of which a unity is to be formed differ in kind. Wherefore the principle of compensation [*to ison to antipeponthos* (τὸ ἴσον τὸ ἀντιπεπονθός)], as I have already remarked in the *Ethics*, is the salvation of states.

<div align="right">(Ibid., II.1261a24–31; trans. B. Jowett in *Basic Works of Aristotle*, 1147)</div>

Ethnos, a geographical and not a political term, has to do in particular with a theory of climates. It is the word used by Hippocrates when he examines, in his treatise on *Airs, Waters, and Places*, the effects of climate on the temperament and customs of all species of human beings: "I want to explain now how Asia and Europe differ from each other in every respect, and in particular with regard to the physical appearance of their peoples [*peri tôn ethneôn tês morphês* (περὶ τῶν ἔθνεων τῆς μορφῆς)], in which they are distinct and do not at all resemble each other" (XII, 1). This was, of course, the term Aristotle adopted (*Politics*, VII.7) to distinguish the *ethnê* of cold regions such as Europe, who are full of courage (*thumos* [θυμός]) but lacking in intelligence (*dianoia* [διάνοια]) and skill (*technê* [τέχνη]), and are thus free but not organized into cities (*apoliteuta* [ἀπολίτευτα], 1327b26), from those of Asia, who are inversely endowed (with *dianoia* and *technê*, but not *thumos*), and are consequently subjected or enslaved, with, in the middle, the *genos* of the Greeks, "the race of Hellenes," which is endowed with both courage and intelligence, and lives freely and politically. But this *genos* consists of *ethnê* that are more or less balanced and more or less politically virtuous—Pierre Pellegrin, when dealing with the Greeks, shifts, unaccountably, from *peuplades* to *peuples* (1327b34), and entitles his study "Le caractère national: Qualités des peuples selon le climat"—though once again the rigor of the terms can only be etymological or conventional. However that may be, *ethnos* designates the geographical and very precisely ethological component of human diversity, in contrast to both the community of origin (*genos*) and the political structure (*polis, politeia*).

■ See Box 6.

Dêmos, unlike the words that serve to translate it (*populus, peuple,* people, *Volk*), is one of the three terms that from earliest classical antiquity belonged exclusively to the vocabulary of politics. Sometimes it designates the body of citizens who make up the *polis* (and from which are excluded by definition those who have no political rights, and in particular women, children, and slaves, whatever the system), and sometimes, exactly like "the people" and unlike the *Volk*, the most "deprived" among them (*aporoi* [ἄποροι]), who are also always, as if by accident, the most numerous. In this latter sense, other words bearing more negative connotations are sometimes substituted for *dêmos*: *plêthos* (from *pimplêmi* [πίμπλημι], "to fill," like *polus* [πολύς], "numerous"), "the multitude, the crowd," or even "the rabble" that Xenophon contrasts with the *dêmos* (*Constitution of Athens*, 2, 18), and in the plural *ta plêthê* [τὰ πλήθη], "the masses," those whom, according to Plato, a demogogic Sophist would never fail to persuade (*Gorgias*, 452e); or again *ochlos* [ὄχλος] (*ochleô* [ὀχλέω] means both "to move" and "to disturb, harass," probably from *wegh-*, like "vehicle" and "wave"), the masses in disorder, the tumult of the crowd (*Gorgias* again, where Plato makes the meanings circulate among "popular assemblies," for instance the tribunals [454b] and the ignorant crowd [458–59]). Similarly, Latin writers played on *plebs* and *turba*.

This double polarity of *dêmos* is clearly connected with the polemics regarding democracy: the least bad of all possible governments, the government of all for all, or else a degenerate system that inevitably leads to power being seized by the most vile (*phauloi* [φαῦλοι]), the common people, as opposed to the good people (*spoudaioi* [σπουδαῖοι] from *spoudê* [σπουδή], "zeal"). Aristotle writes the history of democracy, drawing on the Sophists to rehabilitate the *dêmos* as *plêthos*, the people as multitude.

■ See Box 7.

IV. *Populus, Plebs, Gens*

The former genealogical names lose their institutional and social meaning and become a nomenclature for territorial divisions. Each language proceeds to rearrange its terminology. The way in which this transformation takes place in the different languages is extremely informative, because languages do not have the same way of being Indo-European.

Latin is Indo-European in its fidelity to earlier usage, to the vocabulary of institutions, even when this vocabulary covers new realities; Greek is Indo-European in an inverse way, through the persistence of the primitive model organizing a new series of designations.

<div align="right">(É. Benveniste, *Le vocabulaire des institutions indo-européennes*, 1:310sq.)</div>

6

Dêmos / laos: "People" / "people"

Many Greek words that are not related to each other are translated by "people," which tells us something about the vagueness of the modern term. For example, *phulon* [φῦλον] ("tribe," "race," from *phuô* [φύω], "push"), alongside *genos* or *ethnos*. Above all, as Émile Benveniste has noted (*Le vocabulaire des institutions indo-européennes*, 2:90), we translate without distinction two words that have absolutely different meanings and refer, as early as the Homeric poems, to historically distinct realities: *dêmos* and *laos* [λαός]. *Laos*, frequently used in the plural, without any corresponding term outside Greek, can be traced back to the Achaean period; it designates the people insofar as it bears arms (thus neither old men nor children) and implies the personal relation of a group to a leader whom it follows: thus Menelaos is a "shepherd of peoples." *Dêmos*, which goes back to the Dorian invasion, and thus to a more recent date, implies on the contrary, as we have seen, a fixed relationship to a territory, and designates not a military community but the stability of a politicizable or political body.

7

Dêmos and *plêthos*: Democracy and the plurality of citizens

➤ POLIS

To frame the problem, let us sketch a table of the different kinds of government or constitutions (*politeiai* [πολιτεῖαι]), that is, of the different types of governments (*politeumata* [πολιτεύματα]) set forth by Aristotle in Book 3 of the *Politics*. The "true" forms of government, listed according to the number and quality of the governors, may, as in Plato, undergo deviations regarding the goals that make them move from concern for the *koinon* [κοινόν] (public good, common interest,) to the selfishness of the *idion* [ἴδιον] (specific or private interest): then they change their names.

Government	True government (public good, *to koinon sumpheron* [Gr.])	Deviation (*parekbasis*) (private good, *to idion* [Gr.])
By one	Monarchy	Tyranny
By a few	Aristocracy	Oligarchy
By many	*Politeia*	Democracy *hoi polloi* [οἱ πολλοί] *to plêthos* [τὸ πλῆθος]

The central enigma, which is well known, has to do with the fact that the true form of government by the many does not really have its own name: it is called just *politeia*. Democracy, government by the people, is of this kind and is only the deviated form of it; it is defined as the government "that seeks the advantage of the poor (*pros to sumpheron to tôn aporôn* [πρὸς τὸ συμφέρον τὸ τῶν ἀπόρων]*)" (*Politics*, III.1279a9). Whence the prudence of Solon, the legislator par excellence: "Solon, himself, appears to have given the Athenians only that power of electing to offices and calling to account the magistrates which was absolutely necessary; for without it they would have been in a state of slavery and enmity to the government. All the magistrates he appointed from the notables and men of wealth" (II.12.1274a15–19, and III.11.1281b31f.; trans. B. Jowett in *Basic Works of Aristotle*). However, the *dêmos*, precisely because it is *plêthos* (mass, number), has thereby an intrinsic quality capable of conferring on democracy an unparalleled virtue and of making government by the many the government par excellence. This promotion is based on the very definition of the city, which for Aristotle, contrary to Plato, is not initially unified and hierarchized like the body or the mind, but multiple and synthetic like a chorus or a symphony, so that "in the virtue of each the virtue of all is involved" (VII.13.1332a38):

But a state is a composite [*tôn sugkeimenôn* (τῶν συγκειμένων)], like any other whole made up of many parts [*sunestôtôn d' ek pollôn moriôn* (συνεστώτων δ' ἐκ πολλῶν μορίων)]; these are the citizens, who compose it [*hê gar polis politôn ti plêthos estin* (ἡ γὰρ πόλις πολίτων τι πλῆθός ἐστὶν)]. It is evident, therefore, that we must begin by asking, Who is the citizen, and what is the meaning of the term?

(*Politics*, III.1.1274b38–41; trans. B. Jowett in *Basic Works of Aristotle*)

Quantity thus becomes a quality and justifies giving this *plêthos* the sovereign power:

For the many [*tous pollous* (τοὺς πολλούς)] , of whom each individual is but an ordinary person, when they meet together [*sunelthontas* (συνελθόντας)] may very likely be better than the few good, if regarded not individually but collectively [*ouch' hôs hekaston*, *all' hôs sumpantas* (οὐχ᾽ ὡς ἕκαστον, ἀλλ᾽ ὡς σύμπαντας)], just as a feast to which many contribute is better than a dinner provided out of a single purse. For each individual among the many [*pollôn gar ontôn* (πολλῶν γὰρ ὄντων)] has a share of virtue and prudence, and exactly like a crowd [*to plêthos*], when they meet together, they become in a manner one man, who has many feet, and hands, and senses; that is a figure of their mind and disposition (*ta êthê kai tên dianoian* [τὰ ἤθη καὶ τὴν διάνοιαν]). Hence the many [*hoi polloi*] are better judges than a single man of music and poetry; for some understand one part, and some another, and among them they understand the whole.

(Ibid., 1281a42–b10; translation by B. Jowett modified)

Thus is justified the fact that "the mass of citizens" (*to plêthos tôn politôn* [τὸ πλῆθος τῶν πολιτῶν]), that is, "all those who have neither wealth nor title to virtue," participate in the deliberative and judicial powers:

When they meet together their perceptions are quite good enough, and combined with the better class they are useful to the state (just as impure food when mixed with what is pure sometimes makes the entire mass more wholesome than a small quantity of the pure would be), but each individual, left to himself, forms an imperfect judgment.

(Ibid., 1281b34–38, trans. B. Jowett)

Probably no one has ever praised the democratic deviation more subtly.

BIBLIOGRAPHY

A. *Populus*

Whether we connect the word *populus* with the Indo-European root **pel-/ple-* (Greek *plêthos*, Latin *plenus*) or with an Etruscan origin, it is recognized that it initially had a military meaning: *populus* designated the mass of infantrymen, and other words have retained a trace of this meaning, such as the Latin deponent verb *populari*, which means "to sack or devastate." With the reorganization of the military and the *comitiae*, the term *populus* lost this meaning and came to apply to the citizenry as a whole, gathered together in the centuriate assembly. *Civitas* was later added to *populus*, reinforcing the idea of collectivity. But in Cicero's philosophical works these two notions are articulated in a more complex way.

A people [*populus*] is not just any assembly of individuals brought together in just any way [*non omnis hominum coestus quoquo modo congregatus*], but the gathering of a multitude, carried out by virtue of an agreement regarding the law and a community of interests [*coetus multitudinis juris consensu et utilitati communione sociatus*].

(*De republica*, I.25, 39)

Originally, then, there were no isolated individuals, but a human group. Then, according to Cicero, it was the agreement regarding law (*consensu juris*)—and not individual interests or historical affinities—that "informed" the association, whereas the application of this agreement realized "the common interest." Far from amounting to a collection of individual wills, and even independently of them, the *populus* thus appears as a collectivity structured by these two objective, specific bonds. Such a definition, which allows us to move beyond the moral-political dualism, emphasizes the natural foundation of the social bond; it also establishes an abstract idea of the public good; and finally it gives the *populus* a very strong juridical value as an independent organism that the Greek *dêmos* never had, a value that we find again in another definition of the *populus* as a *corpus ex distantibus*, "a body formed of disparate elements" bound together by the bond of law alone (Seneca, *Letters to Lucilius*, 102, 6).

■ See Box 8.

For Cicero, the *populus* precedes conceptually the *civitas*, its institutional form, and the *res publica*, its patrimonial dimension (Peppe, "La nozione di *populus*," 318): "Omnis populus qui est talis coetus, omnis civitas quae est constitutio populi, omnis res publica quae populi res est" (Every people, that is, the assembly I have described, a city that is the political organization of a people, a state that is the commonwealth; Cicero, *De republica* I.26, 40). Whereas all citizens participate in the commonwealth insofar as they form a group, as *cives*—that is, as individuals having citizenship and thus forming a part (*pars*) of the people—they share unequally in the government. It is for the mixed constitution, the historically determined *constitutio populi*, to set the rules for the attribution of power within the *res publica*. Thus inequalities emerge at the level of the *civitas*—where *populus* designates, in a narrower way, the whole of the citizens grouped together.

Far from being merely theoretical, this latter sense of the word *populus* reflects the state of Roman society from the third century BCE onward, a society that recognized the legal equality of all citizens, patricians, and plebeians, but that, on fiscal principles, made the people a constitutional actor with limited power and managed by "good people," that is, the Senate (and the magistrates)—as is suggested by the city's signature: *Senatus populusque romanus*. In this context one can probably speak of popular sovereignty. But apart from the appearance in the second century BCE of a democratic trend, it cannot be denied that a large part of Roman society tended to make the popular assembly the sole subject of power, which was, as it were, delegated to the magistrates (Cicero, *De officiis*, I.34, 124). Moreover, it was to be one of the ideological foundations of the Principate, and Seneca defined the monarch as a person "invested with the powers of the people in order to exercise them on the people" (*potestas populi in populum data*) (*Letters to Lucilius*, 14, 7).

The political definition of the people takes into account only adult male citizens. Does that mean the women and children, who were nonetheless citizens, were excluded from it? In reality, *populus* sometimes also designates the whole of the citizenry. What difference is there, Julian wonders, between the laws, received after the people's judgment (*judicio populi*), and "what the people has approved without any text [*ea quae sine ullo scripto populus probavit*]?" (*Digest*, I.3.32.1). This equivalence between *leges* and *mores*, which reflects the ambivalence of the word *populus*, characterizes the whole of the production of Roman law (F. Gallo, "Produzione del diritto e sovranità popolare nel pensiero di Giuliano").

B. *Populus, plebs*

These three definitions (an organism bound together by law, an assembly of citizens, the totality of the citizenry) clearly distinguish *populus* from *plebs*. From a legal point of view, the term *plebs* groups together the *proletarii*, initially those who are outside the *populus*—that is to say, outside the legions—whence the archaic formula *populus plebsque* (the *populus* and the *plebs*). Later on, the *plebs* was gradually integrated into the *populus*, but the term *plebs* retained its exclusive meaning of a group outside the patrician families (Gaius, *Institutiones*, I.3; Aulus Gellius, *Attic Nights*, X.20, 5). Under the Republic, the word designated more generally all those who did not belong for tax purposes to the upper orders (senators and knights in Rome, decurions in the provinces). Thus *plebs* ended up designating "the popular masses," "the common people," and was sometimes synonymous with

---

8

Cicero and Saint Augustine

Cicero's definition was criticized at length by Saint Augustine (*De civitate Dei*, II.17–19; XIX.21–24). "When man does not serve God, what justice can there be in man? There is therefore not that common acknowledgment of right [*jus*] that makes a multitude of men a people." And further on, "What can be the true interest [*utilitas*] of those who live in impiety, as anyone lives who betrays the service of God for that of demons?" Augustine is thus led to propose a new definition: "Populus est coetus multitudinis rationalis rerum quas diligit concordi communione sociatus" (a people is an assemblage of reasonable beings bound together by a common agreement as to the objects of their love) (*City of God*, XIX.24; trans. M. Dods, 706). Thus conceived, the *populus* is not a legal but a cultural unit; it is defined, not by a legal form, but by an ethical content, love for the same values and for God. No doubt Augustine recognized that historical peoples and even pagans had the right to bear this name: that is the case of the people of Rome in times of peace. But from his point of view, the Christian community is the authentic people and the spiritual city the true city. However, for Augustine, Cicero's presupposition is that the people is an organized community, not a juxtaposition of individuals, and the connection with *civitas* remains fundamental.

BIBLIOGRAPHY

Augustine. *City of God*. Translated by M. Dods. New York: Modern Library, 1950.

"the poor" (Cicero, *De republica* II.39; *De legibus*, II.50). In this sense, the word had numerous equivalents: *multitudo*, *turba*, and also *vulgus*, which refers to the lowest part of the *plebs*. These terms, accompanied by a depreciative adjective, often took on a moral connotation: *multitudo indocta, vulgus imperitorum, plebs et infima multitudo* (uneducated masses, ignorant multitude, plebeians and common people) (Cicero, *Pro Murena*, 38 and 70; *Pro Milone*, 95). With this twofold moral and sociological connotation, *plebs* comes closer to the Greek *plêthos*, while *populus* renders *dêmos*.

However, exceptions to this distinction emerged toward the end of the Republic, especially in the political vocabulary, where *populus* was often used to refer to the *plebs* (for example in Sallust or Livy). Under the Empire, the confusion increased because of the collapse of the *populus*'s powers. This confusion is also found in Greek texts of the period, where *dêmos* ends up expressing the idea of the crowd or "rabble" (Cassius Dio, 74, 13).

■ See Box 9.

C. *Populi, nationes, gentes*

Referring to a group of citizens, *populus* also had an international dimension. The jurist Gaius (*Institutiones*, I.1) defined the *jus gentium* as the natural law that governs "all the peoples" of the earth (*omnes populi*). Through this meaning, *populi* approaches *gentes* or *nationes*, but these notions in fact diverge on an essential level.

Gens designates neither a political group nor the work of a legislator, but rather an assembly of men—"a *multitudo* that has issued from the same origin or was constituted after having separated itself from another nation [*natio*]," according to Isidore of Seville (*Etymologiae*, IX.2.1). Although its members often bear the same name (Cicero, *Topics*, 29), the group is not genetically homogeneous (*Grand Dictionnaire Encyclopédique Larousse*, s.v. "Nomen," 443), whether it is a Patrician clan (Greek *genê*) whose ancestor is often mythical, or one of the various peoples who compose the human race. As for *natio*, from *nascor*, "to be born," it suggests more the idea of a natural origin or a common territory: "It is a group of men who have not come from elsewhere, but were born in the same place" (RT: *De verborum significatu quae supersunt*, s.v. "Natio"). In any case, *natio*, like *gens*, is outside the civic sphere. From these nonpolitical groups that usually lived under the direction of a chief, the Romans clearly distinguished the *populus* and its institutional form, the *civitas*, in which man manifested his liberty. "All peoples [*nationes*] can endure servitude,

but not our city [*civitas*]," wrote Cicero (*Philippics*, X.10, 20). And for him, the *populi* are those who are organized into *civitates*; it is in this sense that they have their own law, a *jus civile* (*De officiis*, I.23) distinct from the *jus gentium*. Pointing out the different degrees (*gradus*) in Roman society (*De officiis*, I.53; III.69), Cicero lists the whole of the human species; then the noncivic groups, those that have in common a name (*gentes*), birth or place (*nationes*), language (*linguae*); and finally the *civitas*. In doing so, he situates the city less in a genealogical conception than in a universe constructed legally and alien to ethnic or geographical determinations.

Christians used *nationes* (Greek *ta ethnê*) to designate pagans. In this they were simply imitating the Roman model: just as, for the law of the Empire, the *nationes* are outside a *civitas* and foreign to the *populus romanus* (Gaius, *Insitutiones*, I.79), so in the Christian vocabulary the term designates those who are outside the *civitas christiana*, the *populus Dei*.

At the end of this itinerary, we can better understand what risk is involved in superimposing "race" and *genos*, "nation" and *ethnos*, and with them all the terms that designate human communities in various languages. It is the danger of the retrospective illusion. Beyond careless translations, an implicit philosophy of history is at stake. Thus the systematic use of "nation" to translate this or that Greek or Latin term organizes nothing less than the "nationalization" of all the communities of antiquity, that is, the construction of this particular form of community as an object of universal history, just as the use of "race" or *Rasse* extracts this notion from the historical and ideological contexts in which it emerged, in order to confer on it an ahistorical validity.

Populus and *popularis*

Contrary to French, in Latin it is difficult to discern an absolute reciprocity between "people" and "popular." Nonetheless, in the conflictual context of the late Republic, a development begins: the *populares*, the leaders of the democratic party, define themselves as the representatives of the *populus* as a whole and as sovereign, whereas their adversaries depreciate them as demagogues who are seeking the favor of the *plebs* and the slaves. This debate clearly seems to prefigure the way *populus* and *plebs* approached one another under the Empire, whereby *populus* reconnects with its derivative, *popularis*.

PERCEPTION / APPERCEPTION

FRENCH   *perception, aperception*
GERMAN   *Empfindung, Wahrnehmung, Apperzeption*
GREEK   *katalêpsis* [κατάληψις]
LATIN   *perceptio, comprehensio, aperceptio*

➤ BEGRIFF, CONSCIOUSNESS, EPISTEMOLOGY, ERSCHEINUNG, GEFÜHL, I/ME/MYSELF, LEIB, OBJECT, PATHOS, *SENS COMMUN,* SENSE, TRUTH, UNCONSCIOUS

The noun "perception" had difficulty establishing itself in modern philosophical French. In Descartes, it retains the meaning of its antecedent, the Latin *perceptio*, which makes it a kind of intellectual operation, but a certain awkwardness is discernible in its usage, which explains why the more common verb *apercevoir* is frequently preferred to it. A tension between the noun and the verb was rapidly established because of the ambiguity of the latter, which can designate any act of knowing, the current meaning of sense perception being only one possibility among others. For Descartes, the common root of all these meanings is situated in consciousness's reflexivity, which is supposed to be present in all these operations: it is this presupposition that was attacked by Leibniz on the grounds that every perception is not necessarily conscious. Leibniz's critique of

Descartes gave rise in French to a new pair of opposites, *perception* and *aperception* (perception accompanied by consciousness). This linguistic innovation and its transposition into German was the origin in Kant of a new economy of representation (*Vorstellung*) involving *Wahrnehmung*, *Empfindung*, and *Apperzeption*.

I. Perception as an Operation of the Understanding: "Apperception" and "Perceive," from the Noun to the Verb

The Latin verb *percipere*, which originally meant, in the literal sense, "to take," "to gather," "to receive," and then, by transposition, "to feel," "to experience," "to learn," "to know," gave rise to the noun *perceptio* translating the Greek term *katalêpsis* [κατάληψις], which derived from the vocabulary of Stoic philosophy and designated a comprehensive grasping of the reality of the thing given in its representation (see Cicero, *De finibus bonorum et malorum*, 5.76, and *Academica*, 2.107: *perceptio* is a synonym of *cogitatio*, "thought," and *comprehensio*, "comprehension" or "a gathering together in thought of what truly is"; see BEGRIFF, Box 1).

Thus *perceptio* could be used in medieval philosophy to designate a philosophically formed concept, conferring in return on the verb *percipere* the correlative meaning of "receive into knowledge."

In modern philosophy, perception acquired the status of the fundamental relation between the knowing subject and what becomes an object for the subject. Descartes designates by perception all the cogitations of which the mind is the subject:

> Sunt deinde alii actus quos vocamus cogitativos, ut intelligere, velle, imaginari, sentire, etc., qui omnes sub ratione communi cogitationis, sive perceptionis, sive conscientiae conveniunt.

> (There are other acts, which we call "cogitative" [such as understanding, willing, imagining, sensing, etc.], all of which have in common the one feature of thought or perception or consciousness.)

(*Meditationes de prima philosophia*)

However, in a narrower sense, Descartes excludes the will from the field of perception, which is identified solely with the operation of the understanding, including when it implies imagination or sensibility:

> Omnes modi cogitandi . . . ad duos generales referri possunt: quorum unus est perceptio, sive operatio intellectus; alius vero volitio, sive operatio voluntatis. Nam sentire, imaginari, et pure intelligere, sunt tantum diversi modi percipiendi.

> (All the modes of thinking that we observed in ourselves may be related to two general modes, the one of which consists in perception, or in the operation of the understanding, and the other in volition, or the operation of the will. Thus sense-perception, imagining, and conceiving things that are purely intelligible, are just different methods of perceiving.)

(*Principia philosophiae*, pt. 1, principle 32)

The detours taken by the French translator of the *Meditationes* show that at that time "perception" was not easily or directly acceptable in French. Its more familiar substitutes

were abandoned in favor of the new, technical term only in the two contexts of the *Meditationes*, where *perceptio* is thematized as such. In addition, this thematization introduces the duality of a perception considered sometimes as an intellectual operation or purely mental in nature and sometimes as an operation mediated by the senses and involving the body.

■ See Box 1.

In the same way, Abbé Picot, the French translator of the *Principia philosophiae*, hesitated to use *perception* every time he encountered the Latin *perceptio*. In part 1, principle 32, he uses *perception* in the title, but in the body of the article he uses the verb instead of the noun, writing: "*l'une [de nos façons de penser] consiste à apercevoir par l'entendement*" (one [of our ways of thinking] consists in perceiving through the understanding). Similarly, in principle 45, he accepts *perception* in the title, but in the text he prefers to substitute *connaissance* (knowledge) (as in principles 46 and 48). In principle 35, *intellectus perceptio* is simply reduced to *l'entendement* (the understanding).

Perception is absent from Descartes's first writings in French: *Le Monde*, the *Dioptrique*, and the *Discours de la Méthode* (but *apercevoir* is frequent in *Le Monde* and is also used in the *Dioptrique*, in a sense for which French would now use *percevoir*: "*les corps que nous apercevons autour de nous*" [the bodies that we apperceive around us; *Œuvres*, 6:87]; "*les qualités que nous apercevons dans les objets de la vue*" [the qualities that we apperceive in the objects of vision; *Œuvres*, 16:130]; "*apercevoir la distance*" [apperceive distance; *Œuvres*, 6:137], etc.). Not until the *Passions of the Soul* (1649) did Descartes use the word *perception* as a philosophical term legitimated by its usage (see art. 17 and 19–25). Applied to the mind, the opposition between action and passion coincides with that between the will and the "*perceptions ou connaissances*" that the mind "*reçoit des choses qui sont représentées par elle*" (receives

from things that are represented by it). Perception derives from this a twofold character: (1) it is a reception, which implies a passivity of the mind, even when it is the mind itself that is the cause of its own perceptions: "Bien qu'au regard de notre âme, ce soit une action de vouloir quelque chose, on peut dire que c'est aussi en elle une passion d'apercevoir qu'elle veut" (Although in regard to our soul it is an action to desire something, we may say that it is also one of its passions to perceive that it desires); (2) perception represents something that is of the mind itself, or of the body, or of external things. Thus it always has a referential function, through which "we relate" our perceptions to objects outside us, or to our body, or to our mind (titles of arts. 23, 24, 25).

Nonetheless, and this was the conclusion of the Second Meditation's analysis of the lump of wax, every perception includes the mind's perception of itself. The previously mentioned equivalence between thought, perception, and consciousness has an entirely general import: in the Cartesian sense, every perception is conscious and thus so is the perception that the perceiving subject has of himself. That is why Descartes, like his translators, makes perception the equivalent of the act that is expressed by the reflexive verb *s'apercevoir*: the operation through which the subject perceives (*s'aperçoit de*) something is always also the operation through which the subject perceives him- or herself.

II. Leibniz: The Opposition "Perception"/"Apperception"

It was precisely in order to contest this equivalence that Leibniz was led to introduce a terminological and conceptual distinction between perception and apperception:

> The passing condition, which involves and represents a multiplicity in the unit [*unité*] or in the simple substance, is nothing but what is called Perception, which is to be distinguished from Apperception or

---

1

From Latin to French: "Perception" in the translation of Descartes's *Meditations*

A difficulty arose in translating the Latin vocabulary transmitted by Scholasticism into a French acceptable to Descartes's contemporaries. *Perception* was established only gradually, being justified at first on the basis of the more obvious and familiar meaning of the verb *s'apercevoir*, in the sense of "recognize," "become aware of." In the original Latin version of the *Meditations* (*Meditationes de prima philosophia*, 1641), *perceptio* occurs twenty-one times. To translate these, the Duke of Luynes's French translation (published in 1644) uses *perception* only six times. Elsewhere, the translator uses *connaissance* (six times), *notion* (three times, once in the phrase *connaissance ou notion), sentiment* (two times, once in the phrase *perception ou sentiment*), and finally *intelligence, conception, idée* (once each); we also find the

verbal transposition *connaître et concevoir*, and even, for *recta rerum perceptio* (lit., "the correct perception of things"), the periphrase *le droit chemin qui peut conduire à la connaissance de la vérité*.

The verb *percipere* is preponderantly translated by *concevoir* (thirty-one times) and, more rarely, by *connaître* and *apercevoir* (five occurrences each), and even by *comprendre* (four instances). We occasionally find *recevoir* ("in the mind," or "through the senses"), *sentir, ressentir, penser, entendre*, and also the periphrase *avoir la notion de*. . . . The translator uses *perception* nine times, of which seven occur, remarkably, in two precisely localized contexts. First, three times, in the Second Meditation, in the famous passage in which the analysis of the perception of a bit of wax is supposed to yield the conclusion that the

human mind is always involved in any perception or knowledge of a body and that it is in this regard "easier to know," or "more notable," than the body. In the first occurrence, the translator is careful to justify his use of an unusual word, offering a definitional explanation: "its perception [of the bit of wax], or else the action through which it is perceived [*par laquelle on l'aperçoit*]," an action that turns out to be nothing other than an intellectual operation or a "mental inspection" (*inspectio mentis*).

The four other occurrences come in the Sixth Meditation, but this time in order to provide the equivalent of *sentiment*, which is taken to refer to knowledge derived from the senses. Finally, this last meaning occurs two more times, as a rendering not of *perceptio* but of *comprehensio sensuum* and *sensus*.

Consciousness. . . . In this matter the Cartesian view is extremely defective, for it treats as non-existent those perceptions of which we are not consciously aware.

(*Monadology*)

To make room for these perceptions that we do not perceive and that can be described as unconscious, Leibniz characterizes perception ontologically in its universality as a form of the relationship of the multiple to the true unity, which is that of the simple substance or monad: "It suffices that there be a variety in unity in order for there to be a perception. . . . Perception is for me the representation of the multiple in the simple" (Letters to Bourguet, *Die philosophischen Schriften*, 3:581, 574). According to this description, perception designates the mutual relation that connects the world with each simple substance that represents it from a singular point of view and with a varying degree of clearness and distinctness: every perception includes the infinite in such a way that the hierarchy of beings is ordered in accord with the explicitation that they are capable of recognizing in the internal multiplicity of their representation. Thus "natural perception" can be distinguished, then "perception accompanied by memory," and finally "perception accompanied by consciousness," or the perceiving subject's reflection on himself. In this regard, the different levels of perception are part of a much more general notion of which they constitute the species, which is that of expression, and which Leibniz sought to distinguish from knowledge:

One thing expresses another, in my usage, when there is a constant and regular relationship between what can be said about one and about the other. It is in this way that a projection in perspective expresses a geometrical figure. Expression is common to all the forms and is a genus of which natural perception, animal feeling, and intellectual knowledge are species. In natural perception [*perception naturelle*] and feeling it suffices that what is divisible and material and is found dispersed among several beings should be expressed or represented in a single indivisible being or in a substance which is endowed with true unity. The possibility of such a representation of several things cannot be doubted, since our soul provides us with an example of it. But in the reasonable soul

this representation is accompanied by consciousness, and it is then that it is called thought. Now this expression takes place everywhere, because every substance sympathizes with all the others and receives a proportional change corresponding to the slightest change which occurs in the whole world, although this change will be more or less noticeable as other bodies or their actions have more or less relation with ours.

(Letter to Arnauld, 9 October 1687, in *Philosophical Papers and Letters*)

Although the Leibnizian vocabulary establishes with great clarity the distinction between perception in the general sense and apperception understood as conscious, reflective perception, the transposition of this lexicon into another language cannot be made without difficulty.

■ See Box 2.

Although the German verb *wahrnehmen* is translated in French by *s'apercevoir*, *Wahrnehmung* can ultimately render *perception* only at the price of abandoning the formal universality of Leibniz's definition and returning to a construction in which all perception implies consciousness of the reference to its object. But this does not amount to a return to Descartes's position, because the perceived object can only be the object of sensation, and the notion of a purely intellectual perception fades away. Kant's vocabulary testifies to the completion of this transformation.

III. Kant's Vocabulary: *Vorstellung, Wahrnehmung, Empfindung, Apperzeption*

Kant situates perception (*Wahrnehmung*) in a generic domain of which "representation" (*Vorstellung*) constitutes the first, indefinable term: as a "state of mind" (*blosse Bestimmung des Gemüts*), the representation includes a subjective aspect (what Descartes called a mode or way of thinking, *modus cogitandi*) and at the same time it has an objective reference to what it is for the subject, the presentation of what is in front of (*vor*) him. Perception is a representation accompanied by consciousness (see also *Logik* [*Logic*], introduction, §8, in RT: Ak., 9:64): to perceive (Ger. *wahrnehmen*, Lat. *percipere*) is "to represent something to oneself consciously" (*sich mit Bewusstsein etwas vorstellen*); if it is related to the subject as a "modification of his

---

2

From French to German: The case of Leibniz's *Monadology*

Heinrich Köhler, the German translator of Leibniz's *Monadologie* (1720; originally published in French in 1714), must have constantly associated the Franco-Latin term *perception* with the equivalent that he gave for it, *Empfindung*, which implicitly emphasizes its receptive or felt character: "*ce qu'on appelle la* perception, *qu'on doit distinguer de l'aperception ou de la conscience*" (art. 14) becomes "*welches man die* Empfindung *oder* Perception *nennet die man von der*

Apperception oder von dem Bewusst sein *wohl unterscheiden muss.*" On the other hand, to translate the verb *s'apercevoir* Köhler used *wahrnehmen*, which later yielded the substantive *Wahrnehmung*, which in turn became the accepted translation of *perception*. Thus "*les perceptions dont on ne s'aperçoit pas*" is rendered as "*die* Perceptiones *oder* Empfindungen *deren man sich nicht bewusst ist, und welche man nicht wahrnimmt.*" In article 23, "*on s'aperçoit de ses perceptions*"

is rendered as "*seine* Empfindungen *und* Perceptionen *wiederum wahrnimmet.*"

state," it is sensation (Lat. *sensatio*, Ger. *Empfindung*), and if it is related to the object, it is knowledge (Lat. *cognitio*, Ger. *Erkenntnis*) (*Kritik der reinen Vernunft*, A [1781] 320 / B [1787] S 376, in RT: Ak.). As such, perception thus implies three terms: a consciousness, the sensation that determines this consciousness, and the object appearing in the sensation, which is also called a phenomenon (see ERSCHEINUNG). If the latter is taken as the starting point, it can be said that "when combined with consciousness, it is called perception" (*Erscheinung, welche, wenn sie mit Bewusstsein verbunden ist, Wahrnehmung heisst*; ibid., A 120); but if instead consciousness is taken as the starting point, then "[p]erception is empirical consciousness, that is, a consciousness in which sensation is to be found" (*Wahrnehmung ist das empirische Bewußtsein, d.i. ein solches, in welchem zugleich Empfindung ist*; ibid., B 207), which can also be put this way: "The consciousness of an empirical representation is called a perception" (*Prolegomena to Any Future Metaphysics*, §10). Sensation as such, which is henceforth termed *Empfindung*, is the state of the subject whose sense receptivity is affected by the object, which thereby presents itself as a phenomenon (*Kritik der reinen Vernunft*, A 19 / B 33, in RT: Ak.). But perception requires, in addition to consciousness, a way of synthesizing the diversity that it contains (the internal diversity of the matter of sensation present in each perception and the diversity of the "dispersed and isolated" perceptions themselves; A 120); this synthesis is first of all the work of the imagination, which "constitutes a necessary ingredient of perception itself" (ibid.), but the unity that makes it possible is none other than the unity of self-consciousness, for which Kant adopts the Leibnizian term "apperception" (*Apperzeption*).

The terminological equivalence between "self-consciousness" (*das Bewusstsein seiner selbst*) and apperception makes the latter "the simple representation of the 'I'" (*die einfache Vorstellung des Ich*) (ibid., B 68). But this completely general acceptation is valuable because it enables us to differentiate two levels of self-consciousness and apperception. On the one hand, self-consciousness as a determination of the changing state of the subject in the flux of internal phenomena will be called "empirical apperception." On the other, the unchanging consciousness of an identical "I think," one and invariant ("It must be possible for the 'I think' to accompany all my representations") and the necessary and a priori condition of all consciousness, will be called "pure apperception" (*reine Apperzeption*) (ibid., B 131–32). The former is a self-consciousness that is simply subjective (a consciousness of the empirically determined internal state of the subject), whereas the latter expresses an objective self-consciousness (a unity necessary for the foundation of any concept of the object and of any judgment expressing the universal validity of phenomena in an experience).

IV. The End of Theories of Apperception: Perception and the Body

"The consciousness of myself as original apperception" (ibid., A 117) is also "an act of spontaneity" (ibid., B 132): it is in this sense that Fichte rehabilitates, in opposition to Kant's terminology, the authentic meaning of "intellectual intuition" (*intellektuelle Anschauung*) as an immediate, non-sensible representation of the activity of the "I" (second introduction to *Grundlage der gesamten*). In the *Phenomenology of Mind*, Hegel constructed an alternative theory of *Wahrnehmung* that differs from others in that it is based on the etymology of the term, "take for true" (*Wahr-nehmen*, "per-ceive," *per-cipio*).

■ See Box 3.

Herbart's criticism of Fichte and Kant, which reduces apperception to the observation of perceptions that have already been formed in the mind and makes it the representation of "I," a result and no longer an origin of the synthesis of representations in consciousness, marked the end of the philosophical use of the term "apperception" (*Psychologie als Wissenschaft*). On the other hand, perception became a major theme in the philosophy of knowledge and psychology throughout the nineteenth century before becoming central to the interests of phenomenology in Husserl's work and in its later developments. The most widespread contemporary view is then that, as Merleau-Ponty put it, "to perceive is to make something present to oneself with the help of the body" (*Le primat de la perception*). In this sense, "perception" retains some trace of the meaning it had in the work of seventeenth-century philosophers—inasmuch as "perception" leans on representation, here reinterpreted as "presence"—but the corporeal basis of access to the world prevents it from being assimilated to a pure "mental inspection."

Wahrnehmung: Hegel's lexical play

➤ TRUTH

For a reader accustomed to Leibnizian and Kantian distinctions, the beginning of Hegel's *Phenomenology of Mind* is puzzling because it simply ignores the *Empfindung/Wahrnehmung* pair, that is, the coexistence of sensation and perception in the act of knowing. In Hegel, what precedes *Wahrnehmung* is called *sinnliche Gewissheit* (sense-certainty). It is no longer a question of the relation between sensation and perception—understood as a return to the principle, a movement from the compound (the manifold of sensation) to the simple (the synthesis of the manifold in consciousness, and then the unity of the "I")—but rather of a two-stage process that implements diverse ways of registering truth in consciousness. Each of these two stages produces its own figure of truth, "its truth" (in the case of perception, the thing: the thing is the truth of perception), but they have in common the same aspiration to *capture* truth. The first sentence of the chapter "Perception," which sums up what has been said about sense-certainty, should also be read as a play on the verb *nehmen*, "to grasp or take":

> Die unmittelbare Gewissheit nimmt sich nicht das Wahre, denn ihre Wahrheit ist das Allgemeine; sie aber will das Diese nehmen. Die Wahrnehmung nimmt hingegen das, was ihr das Seiende ist, als Allgemeines.

> (Immediate certainty does not make the truth its own [does not *seize* the truth], for its truth is something universal, whereas certainty wants to deal with [to *seize*] the *This*. Perception, on the other hand, takes [*seizes*] what exists for it to be a universal.)

> (*Phenomenology of Mind*, emphasis added)

Sense-certainty concerns a singularity, a "this," but its own dialectic reveals that the latter is a universal, insofar as "here" is always a "set of other 'heres'"; perception, on the contrary, immediately takes the thing for a universal and corresponds to good sense (ibid., p. 160), for which the world is a world of things. French translators of *Phenomenology* have all rendered the insistent repetition of the verb *nehmen* here (cf. the translations by J.-P. Lefebvre, p. 103, and J. Hyppolite, p. 93; Hyppolite accentuates this even more by rendering the initial *nimmt sich* as *prendre possession*). But in Hegel, *nehmen* can be used in different ways that mark the advance from sense-certainty to perception. Whereas *sinnliche Gewissheit* seeks "to take," "to capture without mediation," *Wahrnehmung* is a "taking for" (*nimmt . . . als*), and more precisely, a "taking-for-true" (*Wahrnehmen*). It therefore explicitly presupposes an activity, or reflection, of consciousness; and, because perception is a "taking for," the perceiving consciousness also raises the possibility of illusion (*Täuschung*), understood as the particular form of non-truth that it invents and opposes to the truth of the thing and its properties (*Eigenschaften*), of the One and the universal, of taking and reflection, everything that Hegel calls the *Sophisterei* (sophistry) of perception and that finds a provisional solution in the "sphere of understanding" (ibid., p. 175).

The difficulty faced by the French translator is lexical: he cannot render Hegel's play on the decomposition of the verb *wahrnehmen*. To render the inversion *sein Nehmen des Wahren*, referring to consciousness (consciousness's *seizure* or capture of truth), Lefebvre offers what is probably the closest approximation: "*sa captation du vrai*" (p. 110), *captation* bringing out the *capere* in *percipere* (Hyppolite, p. 102, translated this as "*sa préhension du vrai*"); but the two nouns, put back in the correct order, do not coalesce to form a verb, as they do in German (*das Nehmen des Wahren* is an inversion of *wahrnehmen*). In French, *perception* is not necessarily the *véri-captation* that Hegel makes us hear in *wahr-nehmen*:

no more is the English "perception" anything lexically like "truth-capturing" or "truth-seizure."

But for all that, Hegel's play on the verb *nehmen* is, on the whole, translatable into French; on the other hand, what remains to be clarified is the internal coherence of the itinerary leading from Leibniz to Hegel. The history of theories of perception in Germany is a Franco-German history, as is clearly shown by the neologism *aperception*, a French term forged by the German Leibniz and acclimated in Kant's language. Hegel's initiative, which involves stressing for the first time the etymology of *Wahrnehmung*, constitutes a direct response to this tradition. It seeks to exclude from the word every trace of a partly French past, and operates at the very moment that Hegel opposes a paradigm of truth and certainty to an analysis of the different instances or organs of knowledge. In this sense, the substitution of the *Gewissheit/Wahrnehmung* pair for the old *Empfindung/Wahrnehmung* pair provides a good illustration of the methods of language and thought that Hegel deployed to move from a theory of knowledge (see EPISTEMOLOGY) to a doctrine of science.

PERFECTIBILITY

FRENCH   *perfectibilité*
GERMAN   *Perfektibilität, Vervollkommenheit*
LATIN   *perfectibilitas*

➤ BERUF, BILDUNG, GLÜCK, GOD, HISTORIA UNIVERSALIS, *HUMANITY*, I/ME/MYSELF, *LIBERTY*, OIKONOMIA, *RÉVOLUTION*, VIRTUE

Although the adjective *perfectibilis* appeared in 1612, it was only in 1755 that Rousseau and Grimm brought the noun *perfectibilité* into French. The term spread throughout Europe in the second half of the eighteenth century, and was the object of multiple refractions that often interpreted it, contrary to Rousseau, as a necessary tendency toward perfection—so that it tended to be identified with improvement ("perfection," *Vervollkommnung*). In the 1790s it became established with the sense of "indefinite perfectibility," that is, as a major concept in the philosophies of history that were attracting the most attention; then people spoke, without further specification, of "the system of perfectibility." This success nonetheless seems to have been ephemeral. On the one hand, "Progress" having become an objectively obvious fact, it was pointless to assert its objective necessary condition; on the other hand, in order to be conceived rationally, it could not be entirely "indefinite," that is, absolutely indefinable, or dangerously utopian.

I. From the Faculty of Self-Improvement to Indefinite Improvement

Initially, perfectibility appears as a "faculty of self-improvement," that is, as a kind of metafaculty on which the development of all the other faculties depends (Rousseau, *Discours sur l'origine de l'inégalité des hommes*). Its main characteristics are the following: (1) it is peculiar to human beings—to the individual and to the species; (2) its actualization is fortuitous—it depends on "circumstances"; (3) it is ambivalent insofar as it makes possible both insights and errors, both virtues and vices—the actualization of perfectibility therefore does not mean improvement because it signifies that one can "either come closer to the perfection inherent in his species, or move farther from it to the point of degeneration," and, in fact, our first steps have always "led far beyond nature" (Melchior and Grimm, *Correspondance littéraire*); (4), finally, it is "almost unlimited" (Rousseau, *Discours sur l'origine de l'inégalité des hommes*). In France, during the subsequent thirty years, the concept was subjected to an extreme overdetermination.

Helvétius changed the status of the concept and then its definition. In 1758, he related this metafaculty to a principle of which it is only the consequence, namely, "the kind of concern that the absence of impression produces in the mind,"

that is, the fear of boredom (*De l'esprit*, III, chap. 5). In 1773, in the summary of *De l'homme*, he reverses the reflexive mode of the formulation: the reactive faculty of self-improvement becomes basically the passive faculty of "being improved": "As a result, the human mind is susceptible of perfectibility, and in men who are commonly well-organized, the inequality of talents can only be a pure effect of the difference in their education" (*De l'homme*, summary IV; cf. II, chap. 23). People are thus perfectible in the sense that they are "educable," passively subject to the actions of their enlightened rulers, in conformity with a certain materialism.

But the concept could also be appropriated by challenging one or another of its secondary characterizations. For example, it is possible to deny that perfectibility is peculiar to humans, and to make it a property of every living being. Then it becomes a cosmological concept, and that is just how Bonnet understands it in his *Palingénésie philosophique*: "Would a philosopher deny that an animal is a perfectible being, and perfectible in a limited degree?" Why then should we not think that oysters might one day attain knowledge of their creator? But it is just as possible to deny that this perfectibility is ambivalent and unlimited. In this sense, in 1765 Voltaire expressly declared, in opposition to Rousseau: "He [man] is perfectible; and from this it has been concluded that he has perverted himself. But why not conclude that he has perfected himself to the point where nature has marked the limits of his perfection?"

Here, perfectibility no longer has much to do with a subjective faculty; it is absorbed into the historical fact of human progress, of multiple and reversible advances. It was for Condorcet, in the 1780s, to homogenize the latter in a single, irreversible process destined to be achieved in the cumulative and endless succession of generations: thus appears in France the "indefinite perfectibility" that is the vector of the *Esquisse d'un tableau historique des progrès de l'esprit humain* (1795), and which Condorcet retrospectively attributed to the Turgot of 1750 (*Œuvres*). When Auguste Comte carefully distinguished the adequate concept of *perfectionnement* (improvement) from "the chimerical conception of an unlimited perfectibility" (*Cours de philosophie positive*, XLVIIIe), he was trying to eliminate a concept that was both useless and perilous: improvement without perfectibility is progress in order.

II. On *Perfektibilität* as a Tendency to Perfection

In Germany, things took a quite different, much more theological form; here, we have to recall Matthew 5:48: "You, therefore, must be perfect, as your heavenly Father is perfect."

In 1756, Moses Mendelssohn translated Rousseau's *Second Discourse*; he rejected the neologism *Perfektibilität* and stuck to "Vermögen, sich vollkommener zu machen" (the ability to make oneself more perfect) (Rousseau, *Abhandlung von dem Ursprunge*). He justifies this choice in the long letter he sent the same year to Lessing, in which *Vermögen* becomes *Bemühung*, *Bestreben*, that is, an effort, an aspiration to come as close as possible to the "model of divine perfection" (das Muster der göttlichen Volkommenheit). *Perfectibilité* thus translated turns against Rousseau: far

from being satisfied to be a savage as long as circumstances allow him to do so, the human being always already aspires to the perfection of which God is the paradigm. This view was to be decisive.

On 21 January 1756, Lessing replied to Mendelssohn, rejecting his translation and substituting for it *Perfektibilität*, by which he meant "the property by virtue of which a thing can become more perfect, a property that characterizes all things in the world and that is absolutely necessary for their perseverance" (die Beschaffenheit eines Dinges darunter, vermöge welcher es vollkommener werden kann, eine Beschaffenheit, welche alle Dinge in der Welt haben, und die zu ihrer Fortdauer unumgänglich nötig war). (*Sämtliche Schriften*). This was probably an attempt to substitute a Spinozist translation of *perfectibilité*, understood at that time as a thing's pure power of persevering in its being, for the Leibnizian translation that Mendelssohn proposed as the internal principle of a continuous and necessary aspiration to perfection, that is, to a constant and harmonious improvement of one's natural powers (*Kräfte*).

But it was Mendelssohn who won out. Perfectibility, which had been a reactive faculty, now became a spontaneous tendency, a sort of eminently positive instinct that was henceforth constantly opposed to Rousseau. In 1764, in *Über die Geschichte der Menschheit* (On the history of humanity), it was certainly in opposition to Rousseau that Isaac Iselin translated *perfectibilité* by *der Trieb zur Vollkommenheit* (the impulse to perfection) in order to make it the basis for a veritable theodicy of history in which the latter tends to be identified with progress itself (*Fortschritt, Fortgang*): naturally inclined to perfection, the human race is destined to have a natural development in which Oriental sensibility, Mediterranean imagination, and finally Nordic reason succeed each other. In 1722, in his *Versuch über das erste Prinzipium der Moral*, J.M.R. Lenz sought to base morals on two major principles: "the impulse to perfection and the impulse to happiness" (der Trieb nach Vollkommenheit und der Trieb nach Glückseligkeit). For Lenz as well, Rousseau contradicted himself when he asserted that the human being, by essence perfectible, finds happiness in the tranquility of the state of nature. In reality, happiness is the state most in conformity with perfection, that is, with the optimal development of the strengths and faculties with which humans, like any living being, are naturally endowed. And in 1777, in the eleventh of his *Philosophische Versuche über die menschliche Natur und ihre Entwicklung* (Philosophical essays on human nature and its development), J. N. Tetens explains perfectibility anthropologically: Rousseau's *Vervollkommnung* is far too indeterminate and it has to be connected with something other than itself, namely, with the spontaneity that characterizes every living being. "Perfectible spontaneity" (*perfektible Selbsttätigkeit*) characterizes humans to the highest point in the sense that they are destined to become autonomous with regard to their environment, more slowly, but also more fully, than the animal individual. Moreover, it is significant that Tetens understands this process as an "impulse to development" (*Trieb zur Entwicklung*): once again, perfection finalizes perfectibility.

Thus it is still the same schema that is found invested in multiple fields—historical, moral, anthropological. But we see that is also still ambiguous, for if perfectibility thus becomes the mute impulse that leads humans to perfection, it is still a task, a vocation (*Beruf*), and that is why it is so important to become adequately aware of it. We must therefore draw attention to the reflexive form of the verb: perfectibility is the duty that a person has, as a subject, to *perfect oneself*, and progress is thus nothing other than the accomplishment of that tendency (obligation) extended to the species as a whole. But when in the following century Hegel, in an act comparable to Comte's, challenges *Perfektibilität* as "something just as deprived of determination as change in general," essentially "without purpose or goal" (ohne Zweck und Ziel) (*Die Vernunft in der Geschichte* [*Reason in History*]), he does not do so because he opposes progress, but because he refuses to leave it to an indeterminacy similar to that of the old concept of Providence (*Grundlinien der Philosophie des Rechts* [Elements of the Philosophy of Right], §343).

III. From "Perfectibility" to the Withering Away of Government

The first English translation of Rousseau's *Second Discourse* appeared in London in 1761 (DOI, 1755). From the outset, it adopted "perfectibility" to designate what becomes a faculty of improvement, and the translation published by Becket in London in 1767 followed suit. However, pending a more detailed study, it seems that the term did not really "take" until the 1790s.

Scottish thinkers clearly avoided it because they were trying to conceive a typical history of civil institutions which, far from setting aside the facts, resulted on the contrary from their inductive superimposition: the natural history of humanity is an abstraction from national histories. The violent criticism of the *Second Discourse* with which A. Ferguson's *Essay on the History of Civil Society* (1767) opens is, in this respect, just as significant as the solemn homage paid to Montesquieu further on (I, 10). To avoid the neologism "perfectibility," he said that "man is susceptible of improvement and has in himself a principle of progression, and a desire of perfection" (I, 1), on the condition that this be interpreted to mean that the fortuitous pressure of circumstances is indispensable to the actualization of this principle. Here we see the appearance of the major concept of improvement, whose least bad translation into French would probably be *perfectionnement*, (in contrast to German *Vollkommenheit/Vervollkommnung*, English does not construct an analogous noun on the basis of "perfection"). And in the Scottish "improvement," we can probably also hear the verb "to prove" (in the sense of testing or trying out) because it is in fact a basically empirical process that is carried out through successive adjustments and readjustments to the previously mentioned circumstances.

Instead, it is to the English Protestant dissidents that we must turn to find something comparable to what the Germans were working out at this time. In 1767 Richard Price attributed a natural "improvableness" to humans (*Four Dissertations*; cf. Laboucheix, *Richard Price, théoricien de la*

révolution américaine), and the following year Joseph Priestley averred that the human species was "capable of an unbounded improvement" (*Essay on the First Principles of Government*). In this context, "improvement" refers to an absolutely endogenous process that as such requires only an absence of obstacles in order to actualize itself: "It is a universal maxim, that the more liberty is given to every thing which is in a state of growth, the more perfect it will become." The point is now not to discern the typical course of nations, but to affirm that human progress is the immanent work of society as opposed to government: the latter has no task other than to provide the conditions by ensuring a maximum liberty of discussion in the millenarian perspective of a fulfillment of all things in which truth will finally shine forth in vivo for those who have been able to prepare themselves for it. Humans are "perfectible" in the sense that by themselves, politically authorized and morally obliged to freely examine ideas, they move from truth to truth toward the heavenly Jerusalem.

Thus, as in Germany, perfectibility becomes a spontaneous tendency to improvement of which progress is the irresistible manifestation. And again as in Germany, this tendency is a duty of which one must become aware. The difference arises from the fact that, on the one hand, the temporality in which it is expressed is clearly that of an eschatology, and on the other hand, and especially, it justifies a devaluation of politics as such: because humans are perfectible, their improvement is up to them, not to government. When William Godwin chose to use the term "perfectibility" in his *Enquiry Concerning Political Justice* (1793), he sought to radicalize the latter orientation at the expense of the former: it is for humans to improve themselves infinitely until they can, in this world, do without any government at all.

In the first edition of his book, Godwin's use of the term remains allusive, and he limits himself to declaring that "there is no characteristic of man which seems, at least at present, to distinguish him so eminently, or to be of such great importance in all the branches of moral science, as perfectibility" (*Political and Philosophical Writings*). In the 1796 edition, he is more precise: "By perfectible, it is not meant that he [man] is capable of being brought to perfection. But the word seems sufficiently adapted to express the faculty of being continually made better and receiving perpetual improvement; and in this sense it is here to be understood."

Thus the human being, first as a rational animal, then as moral being, will gradually, constantly, and indefinitely improve him- or herself if existing institutions, chiefly government, do not prevent doing so. It is necessary and sufficient to allow the tendency toward truth that essentially characterizes humans to develop freely. But here it is no longer a question of a collective resurrection, but rather of an absolutely secular perfectibility that guarantees—in the long term, of course—that government will simply wither away: after all, if people are indefinitely perfectible, that is because when they are fully grown-up, they have to govern themselves, without any coercion being required. Thus once again perfectibility is supplanted by progress, and it is no accident that Godwin prefers the expression "progressive nature," though progress is then the promise of a happy anarchy. We can understand

why T. R. Malthus reacted so violently in the first edition of his *Essay on the Principle of Population.*

The history of the concept of perfectibility consists of two stages: Rousseau's concept of "perfectibility" was first transformed into a spontaneous tendency to seek perfection, and then set aside in the name of Progress, as a kind of useless and even embarrassing scaffolding. Thus perfectibility was not a preliminary version of progress, but on the contrary what had to be concealed in order to be able to conceive progress in entirely diverse modalities depending on the context. It is hardly surprising, therefore, that Rousseau's neologism now appears to us as an enigma to which we never tire of returning.

PERFORMANCE (FRENCH)

"Performance," a term borrowed from English (first recorded in English in the fifteenth century), is one of the French translations of the English word "happening," in which what happens is an oeuvre-event that involves an audience: cf. WORK, Box 2.

It is also one of the established translations of Greek *epideixis* [ἐπίδειξις], which designates a rhetorical performance, especially epideictic. The entry SPEECH ACT explores the vocabulary of performativity, which is especially dependent upon English linguistics (J. L. Austin), in different languages. See also LANGUAGE (particularly LANGUAGE I.A, on the distinction between "competence" and "performance" introduced by Chomsky); cf. LOGOS.

In any case, whether in logic or in aesthetics, a performance is an event (see *EVENT*) that is connected with a context and a moment in time (see MOMENT, II), and that refers to an act (see *ACT* [AGENCY, PRAXIS]).

➤ ART, *IL Y A*, PLASTICITY, *PERSON*

PERSON

I. Person and Persona

"Person" comes from the Latin *persona* (from *personare*, "resound"), which initially designated an actor's mask (Gr. *prosôpon* [πρόσωπον], "that which faces the eyes, the countenance"), the character played, and the actor himself (Gr. *hupokritês* [ὑποκριτής], "he who replies," or "he who interprets"; whence English "hypocrisy," which passes from the register of imitation to that of artifice):

see ACTOR and MIMÊSIS. From the outset, "person" inherited a twofold semantic extension in modern languages:

1. "Person" belongs to the register of grammar (the "persons" as subjects of the verb, "personal" pronouns): see ACTOR, Box 1, ES, and I/ME/MYSELF.
2. "Person" belongs to the domain of law, which opposes "things" and "persons": see *DROIT* [LEX], *THING* [RES, SACHVERHALT]; cf. CIVIL RIGHTS.

II. Person and Subject

1. To these two registers must be added the theological register, via the work on the question of the Trinity, and the difference between *hypostasis* and *huparxis* [ὕπαρξις]: see ESSENCE, GREEK, II.C, and SUBJECT, Box 5.
2. The articulation of these registers paves the way for the adoption of the term "person" to designate in a privileged way, starting in the seventeenth century, the individual subject of thought and action, and by extension, subjectivity in general: see CONSCIOUSNESS, *IDENTITY* [SAMOST', SELBST], SOUL, SUBJECT; cf. AGENCY.
3. In French, *personne* and *personnalité* draw from the registers of psychology and morality. *Personnalité* is a more abstract term that now commonly has, in addition to a juridical sense, a psychological sense (the primary character of an individual) and the moral sense of a free and autonomous individual: see on the one hand GENIUS, INGENIUM, *PASSION,* and on the other hand *AUTRUI* [DRUGOJ, MENSCHHEIT, NEIGHBOR], MORALS, WILLKÜR. On the ethics of the person and "personalism," see the study of Russian *ličnost'* [личность] in RUSSIAN, POSTUPOK (free act), SOBORNOST' (conciliarity).
4. Finally, on the negative sense of "person," *personne,* as a pronoun used in some Romance languages, see *NOTHING*; and, on the Greek wordplay *mêtis/outis* [μῆτις/οὖτις], used by Odysseus, see MÊTIS, Box 1; cf. ESTI, *NEGATION.*

PHANTASIA [φαντασία] (GREEK)

ENGLISH	imagination, fancy, appearing
FRENCH	*imagination, image, (re)présentation*
GERMAN	*Phantasie, Einbildungskraft*
LATIN	*visum, imago, imaginatio*

➤ *IMAGINATION* [FANCY], and *APPEARANCE,* CONCETTO, DOXA, ERSCHEINUNG, *IMAGE* [BILD, EIDÔLON], INGENIUM, LIGHT, MIMÊSIS, PERCEPTION, *PHÉNOMÈNE,* REPRÉSENTATION

The standard translation of the Greek *phantasia* [φαντασία] by "imagination" raises more problems than it solves, if only because it resorts to a calque of Imperial Latin *imaginatio*, which was unknown to Cicero, for whom an *imago* was still chiefly a portrait (*De finibus*, V.1.3). The modern translation of *phantasia* by "representation," which is increasingly accepted, is certainly preferable because it does not refer to a notion, the imagination, which for us designates something quite different from what the Greeks might have meant by *phantasia*, but it does not make room for what is at the heart of *phantasia*: appearing.

I. *Phantasia*, Apparition, and Representation

The translation difficulties reflect the no less great difficulties involved in determining what the Greeks might have meant by *phantasia*: they have to do both with the polysemy of the Greek term, which is connected with the development of the Greek language itself, and with the complex and varied usage that Greek philosophers made of it. Let us explain at the outset that if *phantasia* must be related to *phainô* [φαίνω], "to make appear in the light" (*phôs* [φῶς]—and still more, to the middle-voice verb *phainomai* [φαίνομαι], "to come into the light, to appear"—it is also related to *phantazomai* [φαντάζομαι], "to become visible, to appear, show itself" (*phantazô* [φαντάζω], "to make visible, present to the eye or to the mind" it does not exist in the active mood before the Hellenistic period and does not acquire the sense of "to imagine" until the first or second century CE, when, for example, it appears in the author of the *Treatise on the Sublime* [Pseudo-Longinus] and in Alexander of Aphrodisias. We see immediately that the term originally had very little to do with our modern "imagination," whether reproductive or creative, and probably still less with Malebranche's *folle du logis* (madwoman in the house) or with Pascal's *maîtresse d'erreur et de fausseté* (mistress of error and falsity). Moreover, didn't Herodotus use the verb *phantazomai* to mean simply "show itself" (*Histories*, IV.124, where he says that the Persians no longer saw the Scyths because they had disappeared—*aphanisthentôn* [ἀφανισθέντων]—and no longer showed themselves—*ouk eti ephantazonto* [οὐκ ἔτι ἐφαντάζοντο])?

Thus we can understand Aristotle's famous statement: "As sight [ὄψις] is the most highly developed sense, the name *phantasia* has been formed from *phaos* [φάος], because it is not possible to see [ἰδεῖν] without light" (*De anima*, III.3.429a.2–4; trans. J. A. Smith in *Basic Works of Aristotle* 9). The Stoics, adopting the same etymology, added the following: "*phantasia* gets its name from the word 'light' [φῶς]," and in fact just as light allows us to see both itself and what it envelops, *phantasia* allows us to see both itself and what has produced it" (Aetius, IV.12–15; Sextus Empiricus, *M.*, VIII.162). The view peculiar to the Stoics (*phantasia* is *index sui*), and the fact that, according to Aristotle (*De anima*, III.7.431a.16–17; 8, 432a.9–10), "the soul never thinks without an image" (*phantasma* [φάντασμα])—Barbotin renders

this in French as *sans image*, Bodéüs better as *sans représentation*—are marks of *phantasia*'s reliability: therefore we can only be astonished by any interpretation tending to reduce *phantasia* to what governs internal visual images alone in the absence of any object, images (*phantasmata*) that are supposed, moreover, to be usually false (so that *phantasmata* is then rendered by "illusions," whence our modern "phantasm"). In any event, this interpretation absolutely contradicts the Aristotelian definition of *phantasia* as "a movement resulting from an actual exercise of a power of sense" [ὑπὸ τῆς αἰσθήσεως τῆς κατ' ἐνέργειαν] (*De anima*, III.3.429a.1–2). If we stress this etymology and the connection between *phantasia* and *phainesthai*, we are not directed first of all to visual, "pictorial" mental images but rather to what has to do with apparition, with becoming apparent, with the presentation of an external entity thus brought to light, indeed, with the simple presentation of real things—which may very well be things *heard* rather than *seen*.

■ See Box 1.

If Hobbes was very aware of the difficulties of moving from Greek to Latin, the Romans themselves had to experience them directly. Republican Latin, practiced by the author to whom we owe many of our translations of Greek notions, namely Cicero, had only three terms that could be used to render *phantasia*: (1) *imago*, which designated primarily a portrait, but could also refer to mental images, such as those used in mnemonic techniques; (2) *imitor*, which meant mainly to imitate in the attempt to reproduce an image, and which "translated" the Greek verb *eikazô* [εἰκάζω], which meant "to make a portrait, to represent by means of a drawing or painting," whence "to resemble"; (3) *imaginosus*, "subject to hallucinations."

We can now understand the difficulties Cicero encountered in translating the Greek word *phantasia*. On the one hand, probably to emphasize that the Stoics' *phantasia* referred to the representation that "is engraved, struck, and impressed on the basis of an existing object in conformity with that object in such a way that it would not be produced if the object did not exist" (*De legibus*, VII.50), he resorted to the Latin word *visum* (*Academica*, I.40), which is usually translated by "representation," but which signifies primarily "the thing seen." But on the other hand, he also used *visio* and *imago* to render the Epicureans' *eidôlon* (*De divinatione*, II.120;

1

Hobbes and the difficulties of moving from Latin to Greek

Thus we are a priori very far from any idea of a representation in the absence of an object and still further from any assimilation of *phantasia* to Hobbes's "decaying sense" (in the Latin version, *sensio deficiens, sive phantasma dilutum et evanidum*) (*Leviathan*, I.2). Whatever we moderns may owe to this conception and whatever we may think of this possible comparison, we have to note that

Hobbes saw clearly that *imaginatio* very imperfectly translated as *phantasia*:

For after the object is removed or the eye shut, we still retain an image [*imaginem*] of the thing seen, though more obscure than when we see it. And this is it the Latins call *imagination* [*imaginatio*] from the image made in seeing, and apply the

same, though improperly to all the other senses. But the Greeks call it *fancy* [*phantasia*], which signifies *appearance* and is as proper to one sense as to another. [The Latin words between brackets are those used by Hobbes himself in the Latin version of the book, *De Cive*, 1641.]

(*Leviathan*, I, 2)

De finibus, I.21), that is, the *simulacrum*, to borrow Lucretius's Latin (see IMAGE and SPECIES), which is the replica of the bodies emanating from themselves and producing in us an "image" (*phantasia*, which here takes on a strong sense close to *phantasma*, because this term, which presents a further difficulty, not only designates a faculty but can also designate what results from that faculty).

It is not until Imperial Latin, then, that we find *imaginor* and its derivatives, beginning with *imaginatio*. *Imaginor* and *imaginatio*, however, render the late meanings of *phantazô* and *phantasia*. This is shown by the following statement by Quintilian (first century CE), casually made in the course of a discussion of the ways of eliciting emotion:

> The Greeks call [phantasia] [φαντασία] (we could well call it *visio*) the faculty of representing to ourselves the images of absent things, to the point that we have the impression that we are seeing them with our own eyes and holding them in front of us [per quas imagines rerum absentium ita repraesantur animo ut eas cernere oculisac praesentes habere videamur].

> (*Institutio oratoria*, VI.2. 29)

Quintilian still proposes to translate *phantasia* by *visio*, but the definition he gives it is already far more "modern": it seems to be modeled, even in the appeal to emotion, on the definition given in the *Treatise on the Sublime* (XV), when Pseudo-Longinus emphasizes that in his age (probably the first century CE), the term *phantasia* is used regarding passages in which writers, orators, and poets, acting out of enthusiasm and passion, seem to have seen so vividly what they are describing that they succeed in bringing it before the eyes of their audiences. Thus *imaginatio*, which also does not at first refer to our modern conception of the imagination, can translate *phantasia*, but, strictly speaking, this translation is relevant only for a few late occurrences of *phantasia*. Later still, William of Moerbecke seems to have realized this in his *translatio vetus* of Aristotle's *De anima*, since he does not hesitate to decline *phantasia* and *phantasma* in Latin, as if they were untranslatables, a usage followed by Thomas Aquinas in his commentary, which nonetheless sometimes uses *imaginatio* as well (*In Aristotelis librum de anima*, 644–45, where we see the marvelous usage *phantasiantur* in the context of a discussion of the seeming prudence of ants and bees). However, a century earlier *phantasia* was essentially pejorative and designated something that was related to apparitions, phantoms—which could also be designated in Greek by *phantasma* because of its relationship to *phasma* [φάσμα], "vision, specter, phantom" (see, for example, Aeschylus, *Seven against Thebes*, v. 710, for *phantasma*; *Agamemnon*, v. 274, for *phasma*).

II. Appearing and Appearance

Although—or because, as it would probably be more correct to say—*phantasia* refers first of all to that which appears, it is nonetheless true that it can also refer to a mental image that is very likely to be false, or to pure appearance. It was Plato who gave this turn to the notion, to which it cannot, however, be reduced. Trying to understand thought, *dianoia* [διάνοια], as the mind's internal, silent dialogue with itself (*Theatetus*, 189e–190a; *Philebus*, 38b–40b), Plato distinguishes between the pure phenomenon of thought, which he characterizes as *doxa*, and thought that presents itself to the mind through the intermediary of sensation (*aisthêsis* [αἴσθησις]). It is this second form of thought, a mixture of opinion and sensation, that he chooses to call *phantasia* or to designate by *phainetai* (Diès translates it in French as *j'imagine*, but literally it means "it appears"), emphasizing that inevitably it will sometimes be false (*Sophist*, 2633e–246b).

■ See Box 2.

While it is true that in Plato and Aristotle what appears through *phantasia* may be subject to doubt, *phantasia* cannot be reduced to this aspect. This is evident in the Stoics, but it is also the case in Aristotle, for whom the spectrum of the *phantasmata* ranges from the true ones, which are necessary for thinking, to the false or illusory ones, such as appear in dreams, hallucinations, and all situations in which the conditions of perception are difficult, by way of the *phantasmata* at work in local movement, in which the role of *phantasia* is to make the object in question appear to be desirable so that one moves toward it. Ultimately, what radically separates Aristotle from Plato with regard to the reliability of *phantasia* is the former's express desire to distinguish it clearly from judgment: just because the sun appears (*phanetai* [φαίνεται]) to me to have a one-foot diameter does not mean that I will believe that it is smaller than the Earth we live on (*De anima*, III.3.428a–24b.10). Thus Aristotle regularly connects *phantasia* with the impersonal *phainetai*, "it appears," explaining that these terms have to be understood in their literal and not their derived ("metaphorical" in Aristotle's vocabulary) senses. *Phainetai* could in fact be used in Greek to signify anything that "appears," whether it appears by virtue of *phantasia* (the literal sense, according to Aristotle) or by virtue of something else, like sensation or thought (derived senses, according to Aristotle). In other words, just as we can say "it appears" to signify what emerges from an argument, or simply to mean "it seems," the same goes for Greek, with *phainetai* (and it is interesting that Aristotle himself does not fail to do so, as in *De anima*, III.10.433a.9, where *phanetai* introduces the conclusion of an argument that appeals precisely to *phantasia*). It is in this sense that we must understand this statement: "If then imagination [*phantasia*] is that in virtue of which an image [*phantasma*] arises for us, excluding metaphorical uses of the term" (*De anima*, III.3.428a.1–2), only what appears by virtue of *phantasia* deserves to be called *phantasma*, and not, as for Plato or in ordinary language, everything that appears or seems to be by virtue of sensation, opinion, or thought.

III. Appear to, Appear as

"Thus it appears" that if *phantasia* refers first of all to what appears, whether what appears is true or false (despite their redistribution of terms, the Stoics were hardly innovative from this point of view), we cannot identify it with our modern "imagination," a notion that has in addition the disadvantage of emphasizing an activity on the part of the subject, whereas in Greek it is rather a matter of receiving.

2

Plato's ambiguity, Aristotle's precision, and the Stoics' redefinitions

➤ SUBLIME

Three texts that echo each other allow us to gauge more accurately the oscillations in the philosophical use of a single family of words and the difficulty of translating them.

Plato writes the following:

SOCRATES: If a man sees objects that come into his view from a distance [πόρρωθεν] and indistinctly, would you agree that he commonly wants to decide [κρίνειν] about what he sees?
PROTARCHUS: I should.
SOCRATES: Then the next step will be that he puts a question to himself.
PROTARCHUS: What question?
SOCRATES: "What is that object which catches my eye [φανταζόμενον] there beside the rock under a tree?" Don't you think that is what he would say to himself, if he had caught sight of some appearance [φαντασθέντα] of the sort?
PROTARCHUS: Of course.
SOCRATES: And then he would answer his own question and say, if he got it right, "It is a man."

(*Philebus*, 38c–d; trans. R. Hackforth in *Collected Dialogues of Plato*)

Aristotle writes this:

[E]ven in ordinary speech, we do not, when sense functions precisely with regard to its object [οὐδὲ λέγομεν], say [ἐνεργῶμεν ἀκριβῶς περὶ τὸ αἰσθητόν] that we imagine it to be a man [ὅτι φαίνεται τοῦτο ἡμῖν ἄνθρωπος], but rather when there is some failure of accuracy in its exercise.

(*De anima*, 428a.10–12; trans. J. A. Smith in *Basic Works of Aristotle*)

Regarding Stoicism, we read,

[Chrysippus said that we have to distinguish *phantasia*, *phantaston*, *phantastikon*, and *phantasma*]. . . . The *phantaston* [usually translated by "object represented"] is what produces *phantasia* [the "representation"]. . . . The *phantastikon* [usually translated by "imagination" or "imaginary"] is an empty movement, an affection that occurs in the mind without any *phanataston* having given rise to it. . . . The *phantasma* ["imaginary object"] is that to which we are drawn in this empty movement of the *phantastikon*.

(Aetius, *Placita philosophorum*, IV.12.1–5)

The situation described by Plato clearly refers to what appears to *X* or *Y* as this or that, in the presence of the object. As a result, the conditions of perception govern the veracity or reliability of what appears to us, and it is therefore misleading, to say the least, to translate *phainetai* in French by *j'imagine*, as Diès did in his translation of the *Sophist*, 264a.

Similarly, when Aristotle, preparing to criticize Plato's definition of *phantasia* as a mixture of sensation and opinion, virtually quotes the *Philebus* in seeking to distinguish *phantasia* from sensation, the French translator Barbotin senses the necessity of rendering *phainetai* by *paraît* in his rendering of Aristotle's *De anima*, but he nonetheless thinks he has to add *l'image*, which spoils everything. The sentence put between quotation marks in Aristotle's text—an obvious allusion to the passage in the *Philebus* quoted earlier—should be rendered in French not as "cela nous paraît être l'image d'un homme," as Barbotin has it, but rather as something like "cela nous paraît être un homme," because it is the object itself that appears to be this or that, and the better the conditions of perception, the better the apparition will be.

Finally, the Stoics undertook a redistribution of terms by separating the *phantasma* from *phantasia* and making it responsible for everything that produces illusions. But by a strange reversal of the situation, we can nonetheless conclude that this act bore a new conception of the imagination as creative, to which Pseudo-Longinus and Philostratus testify: Orestes's visions, which the Stoics always associated with the *phantasmata* of the *phantastikon* (cf. Sextus Empiricus, *Adversus mathematicos*, VII.170, 244, 249; VIII.63, 67), were to become the very model of literary creation, Euripides having seen the Furies and succeeded in making us see what he had "imagined" [ἐφαντάσθη] (*On the Sublime*, XV.2).

"Representation" is better, but it has in turn the disadvantage of stressing what presents itself "again," which may, of course, be the case but is not necessarily the case. Whence the way of writing it in several languages: "(re)presentation." But this is hardly satisfying, since what it is most important to preserve is the connection with *phainomai* and *phantazomai*, while at the same time finding a family of terms from the same root to translate *phantasma*, *phantaston*, and *phantastikon*, and to refer both to mental images (pictorial or not) and to simple apparitions, to dream-images and hallucinations and other phantoms or shades—the least of the paradoxes certainly not being that a term derived from the word "light" can also signify "shade."

"Appear" is undoubtedly the key word that allows us to define more precisely what the Greeks understood by *phantasia* (provided, that is, that it is not identified with appearance taken in a pejorative sense, with mere semblance). In fact, though it is not necessary to appeal to Wittgenstein's "seeing as," since Plato already provided us with the means, we must understand *phantasia*, no matter which *phantasma* it should cause to appear, as a structure with a twofold complement governing the fact that something, whatever it is, appears to X or to Y *as* this or that.

3

The reappearance of "phantasm" on the basis of the vocabulary of psychoanalysis

As used by translators of Freud, "phantasm" is supposed to render the German *Phantasie*, that is, the idea of the products of the imagination through which the ego tries to escape the grasp of reality (such as daydreams) and that are often closely related to the unconscious. This term (along with its adjective *phantasmatic*), which reappeared in the vocabulary of psychoanalysis, is now widely used in ordinary language. Despite the fact that in medical French *fantasme* was occasionally used as early as 1836 in the sense of visual hallucination, and that in the 1906 edition of the *Nouveau Larousse illustré* it is soberly defined as a "chimera that is formed in the mind," in 1926 it is still absent from the eighth edition of the RT: *Dictionnaire général de la langue française*.

Resurfacing in French psychoanalytic literature over the course of the first third of the twentieth century, *fantasme* reconnected with the persistence in everyday popular speech of the Latin *phantasma*, a late transcription of the Greek word given the same spelling, which signified an image presented to the mind by an extraordinary phenomenon and that remained linked with *phantasia*, a term that initially designated the mental operation accompanying such an image, and only later "shade" or "phantom." *Phantasma* established itself in Imperial Latin in the form of *fantauma*, from the Ionian Greek *phantagma* and the Massalian Greek *phantôma*. This *fantauma* from what is now southern France is found again in the twelfth-century French *fantosme*, with the meaning of "vision of a person from the other world" or "phantom," and then "illusion" and "daydream." In Romance languages, the Italian and Spanish *fantasma* very clearly retains this twofold meaning, first of specter and then of mental image, whereas in French the two medieval terms *fantosme* and *fantasie* long continued to designate an extraordinary vision (*fantosme*) and the power of imagination (*fantasie*).

These last two terms are found in German in the form of *Phantom* (in English "phantom," and by extension, "deceptive image, illusion") and *Phantasie* (the word "imagination"). The pride of place that Freud gives to *Phantasie* led the first French psychoanalysts to translate the term by a word new to French, or newly rehabilitated in French usage: *fantasme*. However, *Phantasie* designates less the power of imagining (*Einbildungskraft*) than the imaginary world and the whole of its contents, the creative activity of dreams, images, and visions to which the mind lends itself and that are expressed by the verb *fantasieren* (substantialized in the form of *das Fantasieren*). So that as Laplanche and Pontalis note in their *Vocabulary of Psychoanalysis*, the French *fantasme* "does not correspond exactly to the German [*die Phantasie*], in that it has a more restricted extension; *fantasme* refers to a specific imaginary production, not to the world of fantasy or imaginative activity in general" (trans. D. Nicolson Smith). Nonetheless, although it was psychoanalysis that actually established the term *fantasme* in French—but by assigning it a more restricted meaning than German *Phantasie*—the corresponding concept has spread within the discipline to multiple levels or modalities (for instance: primal fantasy, *fantasme originaire*, *fantasme de séduction*, conscious and unconscious phantasm, the "family romance," and so forth)—whether they come from Freud, Jung, Lacan, or Melanie Klein. But today the use of *fantasme* has moved far beyond the field of psychoanalysis, in which it was born in the early twentieth century.

It remains that in French, and especially in English, "fantasm" or "fantasy" are sometimes written "phantasm" or "phantasy," the school of Melanie Klein seeing in this—inappropriately, it seems—a way of distinguishing the unconscious phantasm (*phantasy*) from the conscious phantasm (*fantasy*). Independently of this interpretation, the British publishers of the Standard Edition of Freud's complete works, who generally opted for *phantasy*, justified, in these somewhat awkward terms, the distinction between the two spellings:

Phantasy is adopted here on the basis of a discussion in the *Oxford English Dictionary*, which comes to this conclusion: "In modern usage, the terms *fantasy* and *phantasy*, despite their phonic identity and their etymology, tend to be apprehended as being distinct, the predominant sense of the former being "caprice, whim, fantastic behavior," whereas [the predominant sense of] the latter is "imagination or hallucinatory representation." Consequently, *phantasy* will be understood here with the technical meaning of a phenomenon concerning the psyche. But *fantasy* may also be used in certain appropriate occurrences.

(*Standard Edition*, 1:24)

Thus the difference from their French colleagues (for whom *phantasme* and *fantasme* have the same meaning), and also from their Italian colleagues (who use *fantasia* or *fantasma*) and Spanish colleagues (*fantasía* and *fantasma*), Anglo-Saxon psychoanalysts seem to insist on establishing a real distinction between *fantasy* and *phantasy*, the latter term being seen as closer, by its spelling, to the German *Phantasie* and indicating, in their view, a specific dependence, in relation to Freudian vocabulary, on the concept that is supposed to correspond to it.

PHÉNOMÈNE (FRENCH)

The word *phénomène* (in Greek, *phainomena* [φαινόμενα]) was introduced into French by Renaissance astronomers to designate the stars and constellations that shine so visibly to the eye. Today its philosophical usage lies at the intersection of the object and subject, between manifestation and consciousness.

I. PHAINOMENON, "PHENOMENON"

The English word "phenomenon," like its analogues in other languages, including French and German, is a calque of the Greek *phainomenon* [φαινόμενον], a participle of the middle voice verb *phainesthai* [φαίνεσθαι] meaning "to show, shine, appear, become visible, show itself as." We find the same Indo-European root **bh(e)ə₂*– (illumine, shine) in *phôs* [φῶς] (light), in *phantasia* [φαντασία] (imagination, representation), and also in *phêmi* [φημί] (to say). See LIGHT, Box 1, and PHANTASIA, cf. *IMAGINATION*.

Phainomenon retains a certain ambiguity. Sometimes the term designates that which "appears" or seems to appear as this or that, without really or truly being so (thus a *phainomenos sullogismos* [φαινόμενος συλλογισμός] is one that "merely seems to reason" [Aristotle, *Topics*, 1.100b25]); other times, it designates what we call, properly, "phenomena,"

that is, obvious and constraining events, such as natural phenomena, that are sometimes remarkable and for which we have to account (*apodounai ta phainomena* [ἀποδοῦναι τὰ φαινόμενα] [Aristotle, *Metaphysics* Λ 1073a36–37]). The well-founded phenomenon has to be distinguished from the imaginary phenomenon, and it is legitimate to speak of the "reality of phenomena" (Leibniz, *De modo distinguendi phaenomena ab imaginariis*). See *APPEARANCE, IMAGE*.

II. Phänomen/Erscheinung

Unlike German, French has only a single term; as a result, it is difficult to render in French the subtle difference that may exist between *Phänomen* and *Erscheinung*, unless we resort to the term *apparition* for the latter (Leibniz still writes *phaenomena sive apparitiones*) or create the improbable term *parence* (jargon used by a few translators of Heidegger). In Kant, for whom everything that is the object of a possible experience is a phenomenon, the latter is opposed to the *noumenon*, but also to the thing in itself (*Ding an sich*) and, like *Erscheinung*, to *Schein* (deceptive appearance, illusion). See ERSCHEINUNG, GEGENSTAND; cf. OBJECT, REALITY, RES, *THING*.

III. Phénomène, Conscience, Phénoménologie

In French, the technical term *phénomène* designates everything that appears to consciousness. In this sense, phenomena are to be described first, without seeking laws, causes, or hidden principles. It is in accord with this meaning of the term that Descartes wrote in the *Principles of Philosophy* (III.4), "I shall give a brief description of the phenomena whose causes I claim to seek." See CONSCIOUSNESS; cf. I/ME/MYSELF, REPRÉSENTATION, SUBJECT.

Phenomenology (Ger. *Phänomenologie*, introduced by Lambert; see LIGHT, Box 1), especially Husserlian phenomenology, constructs a lexicon that makes it possible to reconfigure the relationship between phenomenon and consciousness. See EPOCHÊ, ES GIBT, INTENTION; cf. ERLEBEN, PLASTICITY.

LATIN	*prudentia*
SPANISH	*prudencia*

➤ *PRUDENCE, VIRTUE,* and ARGUTEZZA, INGENIUM, MADNESS, MÊTIS, PRAXIS, PRUDENTIAL, SORGE, SOUL, VIRTÙ, *WISDOM*

The set of possible translations of the Greek term *phronêsis* [φρόνησις] shows the extension of its semantic field in ancient Greek, the development of this notion, and the redistributions to which it gave rise in Greek philosophy, as well as its advent in philosophies in European languages on the basis of its Latin translation by Cicero as *prudentia*. Originally designating thought, without emotion or desire being necessarily excluded, *phronêsis*, which was long not distinguished from *sophia* [σοφία], "wisdom,

knowledge, scientific knowledge," as Plato and even Aristotle often show, came to designate a virtue, an "excellence" (see VIRTÙ, Box 1), exercised in the practical domain. Traditionally included among the four "cardinal" virtues, along with courage, justice, and temperance (or moderation), *phronêsis* nonetheless has a special status. It is a "dianoietic" or "intellectual" virtue (Aristotle), and even a "science" (the Stoics); but it is also an attitude or behavior that is involved in both private and public affairs—in short, it is, as is usually said, a kind of "practical knowledge." Every smart manager is a "prudent" person (*phronimos* [φρόνιμος]); to be such a person "virtuously" or, better, to be one in a "virtuoso" manner, one also has to know how to anticipate the future and not limit oneself to a timid management style. From this point of view, the Greeks' "prudence" has almost nothing to do with the "prudence in business" to which Descartes alludes in his prefatory epistle to the French translation of the *Principles*, where he seeks to distinguish it from the wisdom with which philosophy must be conducted. We can take as an indication of this complexity the fact that Cicero himself, who normally translates *phronêsis* by *prudentia*, nonetheless sometimes renders this first of the four virtues by the phrase *sapientia et prudentia* (*De officiis* 1.15–16) when he wants to distinguish it from the three other cardinal virtues by its status as the intellectual virtue.

I. *Phronêsis* as Thought

The word *phronêsis* is derived from the verb *phroneô* [φρονέω], which, broadly speaking, means "to be intelligent, to think, to have feelings" (cf. RT: *Dictionnaire étymologique de la langue grecque*, s.v.). In Homer, "thought" (*phronêsis*) or "thinking" (*phronein* [φρονεῖν]) resides in the *thumos* [θυμός], the "breath," which is itself, according to Onians (see SOUL, Box 3), contained in the *phrenes* [φρένες], the "lungs." Onians (RT: *Origins of European Thought*) consequently notes that whereas in Homer, *phronein* may in fact designate the intellectual aspect of thought, as it does in later Greek (thus Agamemnon "thinking [*phroneonta* (φρονέοντα)] in his mind [*thumos*] things that were not to be realized," *Iliad* 2.36–37), this verb nevertheless has a broader sense that also includes the emotions and desire. This is shown again, later on, by the verse in Sophocles's *Philoctetes* (1078) in which Neoptolomos hopes that Philoctetes will change his *phronêsis* with regard to his companions: "Meanwhile, perhaps, he may come to a better mind [*phronêsin*] concerning us" (trans. Jebb, 208). Here we see that *phronêsis* does not refer to a purely intellectual act, but rather to the sense of the term "thought" that we still find in expressions such as "have a thought for," "our thoughts are with you," and so on.

Plato himself, who clearly emphasized the intellectual determination of *phronêsis*, is still dependent on this polysemy. Thus, after having strongly maintained that the body and the attachment to pleasure that may result from it hobble the development of *phronêsis*, "intelligence, thought," which, as seekers of the truth, we ought to cherish, because it alone is worth the effort and will make us truly virtuous (*Phaedo* 65a, 66a–e, 68a–b, 69a–c), Plato, in the same dialogue, nonetheless classifies it alongside sight, hearing, and analogous functions when the blessed are concerned (111a3–4). Similarly, in the *Theatetus* (161c), he says that Protagoras, whom some might consider the equal of the gods in wisdom and knowledge (*sophia*), in reality has no more *phronêsis* (judgment, intelligence) than a tadpole. However,

it remains that Plato, more than any earlier philosopher, clearly distinguishes what belongs to *phronêsis* from what belongs to the body and its "entrails." Thus in the *Timaeus* (71d–e), the "appetitive" part of the soul (*to epithumêtikon* [τὸ ἐπιθυμητικόν]), the one that is associated with hunger, thirst, and all bodily needs, is lodged under the *phrenes* so as to be kept as far as possible from the part that deliberates, thinks, and reflects, which is lodged in the head, itself separated from the rest of the body by the neck. Stressing the fact that this appetitive part of the soul participates neither in the *logos* [λόγος] nor in *phronêsis* (*Timaeus* 71d), Plato even maintains that our conceivers made the liver so that it might be impressed by "images" (*phantasmata* [φαντάσματα]), and this also makes dreams and divination possible. As force of mind, *phronêsis*, like thought and reflection, is thereby clearly opposed to *aphrosunê* [ἀφροσύνη], "dementia," and the proof is, Plato says, that no man in possession of his *nous* [νοῦς] (see UNDERSTANDING, Box 1), his (good) senses, is capable of divination. Only someone whose *phronêsis*, "capacity for reflection," is impaired in one way or another can succeed in divination (71e). The turn toward the intellectual aspect of the semantic field is thus very clear, and is also shown by the fact that in Plato, *phronêsis* and *sophia* are often used as synonyms: they belong to the domain of thought, intelligence, knowledge, wisdom. This is still sometimes the case in Aristotle as well, not only in his "early" writings, such as the *Protrepticus*, but also in the *Metaphysics* (Γ.5, 1009b13, 18, 32); M.4, 1078b15), notably when he reproaches the "ancients" for not having been able to distinguish between *phronêsis*, "thought," and sensation (cf. *De anima* 3.3, 427a17–22, where we find the same association as in Plato between the *noein* [νοεῖν], "thought," and *phronein*, "intelligence").

Nevertheless, as Aubenque has shown in his magisterial book *La prudence chez Aristote*, Plato's usage must not mask the "traditional" sense of the term *phronêsis*. In fact, although the word *phronêsis* commonly designated thought in a very general sense, it designated as well, and perhaps especially, thought or intelligence in a more specific sense, namely, to use a formula that Aristotle would not reject, "the understanding of human affairs." By this is meant both a certain kind of knowledge, the one that concerns precisely human affairs, which are changing and variable, and a certain kind of reasoning and behavior with regard to "life." This attitude, we might say, is rooted in a solid experience that makes the person who has it "wise": a person who is called a *phronimos*, a "prudent, intelligent, sagacious" person, will be able to gauge situations, anticipate them, and cope with them thanks to his experience and discernment. That explains why Aristotle sought to base himself on this "popular wisdom" in seeking, in opposition to Plato, to distinguish a person who is "wise" in the sense of having scientific knowledge, from a person who is wise in the sense of "prudent."

▪ See Box 1.

II. *Phronêsis* as a Virtue

When in the *Republic*, Plato adopts a four-part classification that was apparently already in use in his time, he hesitates, in designating what we usually translate as "wisdom," between

1

And Thales fell

Thales, who is supposed to have been the first of the Seven Sages of Greece to have borne the fine name of *sophos* [σοφός], is said to have fallen into a well while he was looking at the heavens, causing him, moreover, to be mocked by his servant. Plato reports the anecdote in the *Theatetus* (174a), where he uses it to poke fun at ignoramuses with slaves' souls who mock true sages, the philosophers who, even if they may in fact fall into a well and look silly, in reality possess true knowledge of the things of this world, namely, the knowledge that makes one truly free. It is also recounted by Montaigne, who gives it a quite different, juicier interpretation:

> I feel grateful to the Milesian wench who, seeing the philosopher Thales continually spending his time in contemplation of the heavenly vault and always keeping his eyes raised upward, put something in his way to make him stumble, to warn him that it would be time to amuse his thoughts with things in the clouds when he had seen to those at his feet.

> ("Apology for Raimond Sebond," in *The Complete Essays of Montaigne*, trans. Frame, 402)

(N.B.: Montaigne follows here the version of the anecdote given in Diogenes Laertius, *Lives of the Eminent Philosophers* 1.34, in which the servant deliberately leads Thales to a hole that she has previously dug.)

Unlike Plato, Montaigne thus adopts, and radicalizes, the point of view of the "popular opinion" that Aristotle mentions in order to convey the distinction he is trying to make between *sophia* and *phronêsis*: knowledge of things of a theoretical order is not of the same nature as knowledge of things of a practical order. The possession of the former in no way entails possession of the latter, as Thales's fall into the well clearly shows (*Nicomachean Ethics* 6.7, 1141bff.). That is why Thales can be considered a *sophos*, but not a *phronimos*.

Even when *sophia* wants to take revenge on the servant, and prove that she, *sophia*, is capable of practical applications, this does not guarantee her the status of *phronêsis*. *Sophia* can be practically effective without being ethically virtuous. That is the meaning of the anecdote reported

in the *Politics* (1.11, 1259a6–23). Thales performed an *epideixis* [ἐπίδειξις], a "demonstration," a display of *sophia* (a19; see SPEECH ACT): having predicted, thanks to his astronomical knowledge, that there would be an abundant olive harvest, he gave deposits for the use of all of the olive presses, and then rented them out again at the rate he wanted, thus inventing the monopoly and chrematistics, and proving that "philosophers can easily be rich if they like, but . . . their ambition is of another sort" (1259a16–18, trans. Jowett). *Phronêsis* is not the same thing as *sophia*, even when the latter is applied; and the Aristotelian sage, whether he is a *phronimos* or a *sophos*, knows it in a way quite different from the Platonic *sophos*.

sophia and *phronêsis* (see, for example, *Republic* 4.427e versus 433b). Furthermore, *phronêsis* can also designate both the understanding as an ability to reflect in a general way (4.432a) and the understanding as an intellectual ability distinct from bodily abilities (5.461a). In other words, the terminology is still far from being fixed, and no matter what turn Plato tried to give to this notion, it remains that in his work, *phronêsis* continues to have multiple meanings.

A. Aristotle's work

It is in the sixth book of Aristotle's *Nicomachean Ethics* that *phronêsis* is first clearly treated as a virtue or "excellence." It is not that Aristotle was the first to consider *phronêsis* a virtue, but that he gave this notion a special sense, basing himself on popular usage while at the same time radically reformulating things. Aristotle's contribution is characterized by at least three features:

a. a sharp break with Plato's intellectualist turn;
b. a clear distinction between the respective domains of *sophia* and *phronêsis*; and
c. a redistribution of the four virtues (which, since Saint Ambrose, it has been customary to call "the four cardinal virtues"), namely, prudence (*phronêsis/prudentia*), courage (*andreia* [ἀνδρεία] / *fortitudo*), justice (*dikaiosunê* [δικαιοσύνη] / *iustitia*), and temperance or moderation (*sôphrosunê* [σωφροσύνη] / *temperantia-moderatio*; Cicero

translates *sôphrosunê* by both *temperantia* and *moderatio*, and even by *modestia* or *frugalitas*; cf. *Tusculan Disputations* 3.16–18).

■ See Box 2.

1. The new classification of the virtues

In the *Nicomachean Ethics*, Aristotle adopts a distinction that was current in the Academy, but was also traditional, between the irrational part of the soul (which he limits for his current ethical inquiry to the desiring part of the soul, *to orektikon* [τὸ ὀρεκτικόν], sometimes simply called "the ethical part," *to êthikon* [τὸ ἠθικόν], *Nicomachean Ethics* 6.132, 1144b15) and its rational part, the *logos* being properly possessed by the latter, whereas the former (at most) listens to the *logos* and obeys it. Then he distinguishes first the "moral virtues"—or, to give them their true name, the "virtues of character" (*êthikai aretai* [ἠθικαὶ ἀρεταί]—which are those of the desiring part of the soul, from the "intellectual virtues" (*aretai dianoêtikai* [ἀρεταὶ διανοητικαί]), which are those of the part to which the *logos* is specific. Courage, justice, and temperance are thus ranked among these moral virtues or virtues of character that one acquires in early childhood, because character or temperament (*ethos* [ἦθος]) is shaped and strengthened through habit (*ethos* [ἔθος]: ibid., 2.1, 1103b17–19; the same play on words is already found in Plato, *Laws* 7.792e; see MORALS). On the other hand, *phronêsis* and *sophia* are ranked not only among

2

The four cardinal virtues

Plato, though he did not necessarily invent it, makes use of the four-part classification "wisdom (*sophia* or *phronêsis*), justice, courage, temperance." The Stoics call these four virtues "primary" (*tas prôtas* [τὰς πρώτας]: Diogenes Laertius, *Lives of the Eminent Philosophers*, 6.92; the term *phronêsis* was then adopted to designate the most important of them); but the expression "cardinal virtues" was not used by the Greek philosophers. Saint Ambrose uses this term to designate the civil virtues that every good Christian must possess in addition to the three theological virtues, namely, faith, hope, and charity. In fact, he usually calls them "principal" virtues (*principales*), and in this we can see a relic of Stoicism. However, Saint Ambrose enumerates seven "principal virtues": the Spirit of wisdom and intelligence, the Spirit of counsel and strength, the Spirit of knowledge and piety, and the Spirit of holy fear (*De sacramentis*, 3.2.8–10; *De mysteriis*, 7.42). Finally, defining *moderatio* as the virtue that tempers justice, Saint Ambrose considers it for that reason to be the most beautiful of all (*De paenitentia*, 1.1.1–2).

the intellectual virtues that are acquired through experience (*empeiria* [ἐμπειρία]) and are obviously indispensable so far as *phronêsis* is concerned, but also among those acquired through education (*didaskalia* [διδασκαλία]: *Nicomachean Ethics*, 2.1, 1103b14–17).

2. The distinction between *sophia* and *phronêsis*

When he takes up the study of the intellectual virtues (*Nicomachean Ethics* 6.2), Aristotle begins by subdividing the properly rational part into a "scientific" part (*to epistêmonikon* [τὸ ἐπιστημονικόν]) and a "calculative" part (*to logistikon* [τὸ λογιστικόν]), also called "opinionative" (*to doxastikon* [τὸ δοξαστικόν],1144b14; it is less a matter of calculating in the literal sense of the term than of making conjectures). The scientific part of the soul is the domain of theoretical things, that is, those that cannot be other than they are—in other words, necessary things, which are the only ones that can be made the object of truly scientific study, precisely because they are necessary. The excellence of this part is called *sophia*, or "wisdom," as it is usually translated. The calculative part of the soul, on the other hand, is the domain of things that can be other than they are, that is, contingent things—and, very specifically, within this domain it is the sphere of "human affairs" (*ta anthrôpina pragmata* [τὰ ἀνθρώπινα πράγματα]), "things to be done" (*ta prakta* [τὰ πρακτά]), that is the ambit of the calculative part of the soul. The excellence of this part is called *phronêsis*. Emphasizing the radical heterogeneity of these two domains, Aristotle thus breaks up what Plato had tried to unify: *sophia*, which understands nothing about the domain of things to be done, does not govern *phronêsis*; and *phronêsis*, insofar as man is not the most excellent thing in the world, does not govern *sophia*. The "conflict of faculties" is thus settled.

As a result, in contrast to the moral virtues, the "intellectual" virtues do not form a homogeneous whole. Let us not delude ourselves, therefore, regarding the intellectual character of Aristotelian *phronêsis*: *phronêsis* and the set of moral virtues form a whole, an autonomous domain, that of practical life (see PRAXIS), which cannot be reduced to scientific knowledge properly so called. The proof of this is that Aristotle already presupposes *phronêsis* in the famous definition of moral virtue as "a state of character concerned with choice [*hexis proairetikê* (ἕξις προαιρετική)], lying in a mean [*mesotês* (μεσότης)], i.e., the mean relative to us, this being determined by a rational principle" (*Nicomachean Ethics* 6.2, 1106b36–37,

trans. Ross). For this definition concludes this way: "And by that principle by which the man of practical wisdom [*phronimos*] would determine it." Thus Aristotle underscores the essential role of the prudent man in the very definition of moral virtue: it is the prudent man who determines the mean, the "happy medium." Incarnated in the *phronimos*, *phronêsis* thus intervenes long before it is defined as such within the study of the intellectual virtues (ibid., 6.5–9).

3. *Phronêsis* and its field of action

Aristotelian *phronêsis* thus occupies a rather special place that continues to be of great interest to modern thinkers (see PRAXIS, PRUDENTIAL). It is a virtue, but it is also a certain kind of knowledge, a certain kind of understanding: the understanding of practical things. Generally speaking, its domain is that of "doing." That is why Aristotle does not hesitate to classify it among the "productive sciences" (*poiêtika* [ποιητικά], *Eudemian Ethics* 1.5, 1216b18; he is using the term "science" [*epistêmê* (ἐπιστήμη)] in a broad sense), even though *phronêsis* is distinct from *poiêsis* [ποίησις] in the sense of *technê* [τέχνη], because it does not "produce" anything external to itself (*Nicomachean Ethics* 6.4; see PRAXIS). But *phronêsis* is indeed "productive," because contrary to the theoretical sciences, knowledge is not its only end. Only *phronêsis* governs action. If Aristotle bases himself on the fact that we recognize as "prudent" a person who manages his own affairs as well as possible, he immediately reworks this popular meaning by noting that "we think Pericles and those like him to be prudent men [*phronimous*] because they are capable of seeing [*dunantai theôrein* (δύνανται θεωρεῖν)] what is good for them and for men in general" (ibid., 6.5, 1140b7–10). This is a clear break with Plato, who did not hold statesmen in high esteem, and Aristotle further emphasizes it by observing that "political wisdom and practical wisdom are the same state of mind" (ibid., 6.8, 1141b23–24). Once it is established that *phronêsis* is the art of deliberating well concerning the means to an end, Aristotle explains that it is especially a knowledge of particular things and is thereby closer to sensation than to knowledge in the strict sense. That is why, he says in substance, a young man may very well be an excellent mathematician—mathematics never involves, after all, anything but "discourse"—but he cannot be a good politician, because that requires experience, and thus time (ibid., 6.9, 1142a11–20).

B. The new Stoic order

In proportion to their dogmatism or absolute rationalism—for them, the wise man's knowledge is an unshakeable knowledge that covers every domain, all of them closely interwoven with the others, and the great majority of men must be considered a bunch of good-for-nothings (*phauloi* [φαῦλοι])—the Stoics make *phronêsis* as a virtue the "knowledge [*epistêmê*] of bad things, of good things, and of what is neither good nor bad" (Diogenes Laertius, *Lives of the Eminent Philosophers* 7.92). The founder of the school, Zeno of Citium, who was still influenced by Socratic monism, went back beyond Aristotle to the Socratic conception of the unity of virtue-knowledge. Then *phronêsis*, whose name could be preserved, was merely one of the multiple versions of this virtue-knowledge, even if, by basing oneself on Plutarch, one could probably attribute a certain precedence to it: it was part of the definition of each virtue, which means that the *phronêsis* that enters into the definition of each of the virtues had to be distinguished from *phronêsis* "in the special sense." Thus, whereas courage is "prudence in domains requiring endurance, and moderation is prudence in domains requiring a choice, prudence in the strict sense [*tên d' idiôs legomenên phronêsin* (τὴν δ' ἰδίως λεγομένην φρόνησιν)] is prudence in domains concerning distribution" (Plutarch, "On Stoic Self-Contradiction" 1034a, in RT: *The Hellenistic Philosophers*).

Although this first conception did not persist among the Stoics, they did continue to reject Aristotle's sharp distinction among domains, which was itself founded on a monist psychology: "They suppose that the passionate and irrational part is not distinguished from the rational part by any distinction intrinsic to the nature of the soul, but that the same part of the soul, which they call thought and the directive part [*dianoian kai hêgemonikon* (διάνοιαν καὶ ἡγεμονικόν)], becomes a virtue or a vice insofar as it completely reverses itself and changes in the passions and alterations of its habitus or character, and that it contains nothing irrational in itself" (Plutarch, "On Moral Virtue" 441d, in RT: *The Hellenistic Philosophers*). Even if it continued to use the word *phronêsis* and to make it a virtue, Stoicism could not tolerate the existence of an autonomous and heterogeneous domain of science, as is found in Aristotle. That is why when Chrysippus, for example, seems to adopt the traditional classification of the four "cardinal" virtues, which the Stoics called "primary" virtues (see Box 2), he insists at the same time on their strong cohesion: "[The Stoics] say that the virtues are in a relationship of mutual implication [*antakolouthein allêlais* (ἀντακολουθεῖν ἀλλήλαις)], not only because anyone who has one of them has them all, but also because a person who accomplishes an action in accord with one of them accomplishes it in accord with them all" (Plutarch, "On Stoic Self-Contradiction" 1046e, in RT: *The Hellenistic Philosophers*). Similarly, Chrysippus continues to maintain that all virtue is knowledge, even if each virtue is a different kind of knowledge.

C. *Phronêsis* and *prudentia*

In choosing to translate *phronêsis* by *prudentia*, Cicero heard in the latter an echo of *providentia*, the art of foreseeing. *Prudentia* is in fact derived from *providentia* (*pro-video*, "to see ahead, foresee"; cf. RT: *Dictionnaire étymologique de la langue latine*). From this point of view, he was certainly not wrong, because we can read in Aristotle that "it is to that which observes well the various matters concerning itself that one ascribes practical wisdom [*phronimos*]. . . . This is why we say that some even of the lower animals have practical wisdom, viz., those which are found to have a power of foresight with regard to their own life" (*Nicomachean Ethics* 6.7, 1141a25–28, trans. Ross). But while Aristotle based himself on popular beliefs, Cicero relies on the strict Stoic definitions of *sophia* and *phronêsis* when he translates the latter by *prudentia*: "By *prudentia*, in Greek [*phronêsis* (φρόνησις)], we mean a virtue different from *sapientia*: prudence is the knowledge of what is to be desired and avoided; wisdom, which is, as I have said, the supreme virtue, is the knowledge [*scientia*] of things divine and human, which includes communal and social bonds between the gods and men" (*De officiis* 1.153). Thus even when Cicero, following in the footsteps of Panetius and middle Stoicism, maintains that *honestum*, "honorable conduct," which is the foundation of all morality, derives from one of the four virtues the Stoics considered primary, he nonetheless stresses that these four virtues are "interconnected and interwoven" (ibid., 1.15). Moreover, since it is in this passage that Cicero translates the first of these virtues by *sapientia et prudentia*, defining it as "the quest for and discovery of the true," we see that he clearly remains dependent on Stoic rationalism.

Given that this definition of *prudentia* became common in the world of Greco-Roman antiquity—it was retained by Augustine: "Prudence [*prudentia*] is the knowledge [*scientia*] of the things that must be desired and the things that must be avoided" (*On Free Will*, 1.13.27)—we might see in this a good reason not to resort to the translation by "prudence" when it is a matter of Aristotelian *phronêsis*. However, it must be noted that Thomas Aquinas, who discusses *prudentia* at length in his *Summa theologica* (IIa, IIae, qu. 46–56) from an Aristotelian point of view, did not bother with this difficulty and avoided the obstacle presented by the authority of Augustine—*prudentia* is a virtue, and knowledge is contrasted with virtue (qu. 47, art. 4)—by saying that the latter "understood knowledge in the broad sense of any act of right reason [*ibi large accipit scientiam pro qualibet recta ratione*]" (ibid.). Similarly, when he reaffirms, following Aristotle, that "prudence intimates action" (*Nicomachean Ethics* 6.11, 1143b8, where we read that *phronêsis* is "imperative," *epitaktikê* [ἐπιτακτική]), Aquinas once again gets around Augustine, who seems to limit *phronêsis* to "knowing how to be wary of the hazards that threaten action" (qu. 47, art. 8).

Today, of course, prudence is seldom defined in any but this Augustinian manner, as caution—for example, when driving a car. But the French translation of *phronêsis* by *sagesse*, "wisdom," is no better (French speakers will often say that a child is *sage*, and in France *comités de sages* are empanelled to give direction on matters of policy: is it not as if these *sages* could be expected to provide wise advice because they are not engaged in action?), and has, moreover, the great disadvantage that we then have to wonder how to render *sophia* and *sophos*. Translators who refuse to render Aristotle's *phronêsis* by "prudence" (*prudencia*,

prudenza, etc.), whether because of its "technical" translation in Cicero, the meaning this notion acquired in Kant (in whose work "prudence" is no more than "cleverness," *Klugheit*), or unfortunate modern meanings of the term, end up splitting "wisdom" into two: on the one hand, "wisdom" as such, to translate *sophia*, and on the other, "practical wisdom" or "practical reason" (*praktische Vernunft*, *ragione pratica*). There is no lack of resources; in French, the translation of *sophia* by *philosophie* and *phronêsis* by *sagesse* has even been proposed (Gauthier and Jolif, *Aristote*).

III. *Phronêsis, Sophia,* and *Sôphrosunê*

The translation problems that arise from the twofold Greek and Latin tradition, as well as the development of the terms "wisdom" and "prudence" in our languages, are obviously not simple issues. The difficulty has to do with what the "moderns" as well as the "ancients" call "wisdom" (*sagesse*). One symptom of this is the definition of the "Sage" that we find in Furetière's dictionary: "A philosopher who, through the study of nature and past events, has learned to know himself, and to conduct his actions well. Plutarch wrote a fine *Treatise on the Banquet of the Seven Sages.* The Sage has passions and moderates them. The Stoics, seeking to create a Sage, only made a statue of him" (RT: *Dictionnaire universel*). But since, for the notion of wisdom (*sagesse*), Furetière refers first of all to God's knowledge, and then to the knowledge that humans can acquire through the study of physics and morality, it is remarkable that through this very barb directed at the Stoics, it seems that one point in their doctrine is reaffirmed: wisdom is not only the superior art of living of a person who knows how to shelter himself from what torments other people—Montaigne's famous "soft pillow"—but primarily a knowledge of a theoretical order that, because it is theoretical, proves the basis for a self-knowledge that enables us to conduct our actions well. (It would, moreover, suffice to add dialectics to physics and morality to obtain the three inseparable parts of the Stoic system that constitute the Stoic Sage's virtues.)

A. *Phronêsis, aphrosunê, sôphrosunê*

This difficulty is illustrated by both Aristotle and the Stoics, to whom we owe our heritage with regard to *phronêsis*, a peculiar heritage in the sense that in antiquity, it was the Stoic heritage that prevailed and that ended up allowing the philosophy of modern times to reduce the Aristotelian heritage to almost nothing, whereas for our contemporaries, it is the Aristotelian heritage that seems to be the most interesting (cf. Pellegrin, "Prudence"). But that is to forget that in both cases, it is primarily a question of "virtue" and of what has to be called "wisdom" (*sagesse*). In this sense, if we recall that what Plato opposed to *phronêsis* as "wisdom" or "knowledge" was *aphrosunê*, "madness" (*Timaeus* 71e), it will not be without interest to note that when the Stoics oppose to the primary virtues the primary vices, which they define, consistently with their exposition, as "ignorances [*agnoias* (ἀγνοίας)] of things of which the virtues are the sciences [*epistêmai*]" (Diogenes Laertius, *Lives of the Eminent Philosophers* 7.93), it is again *aphrosunê* (*sottise* in the French translation of Diogenes Laertius, ed. and trans. Goulet-Cazé) that, as a "primary" vice, is the contrary of the "primary" virtue *phronêsis*. Of course, we do not speak Greek better than do the Greeks, but we might have expected *aphrosunê* to be opposed not to *phronêsis* but to *sôphrosunê*, that other "primary" virtue that since Cicero we have translated as "temperance" or "moderation," and whose task it is to regulate bodily pleasures, chiefly those of touch and taste, according to Aristotle (*Nicomachean Ethics* 3.13–15; the moderation of the ancients will be opposed to Christian "concupiscence," which has so much to do with vision).

Aphrosunê is not opposed to *sôphrosunê*, however, but characteristically to *phronêsis*, "wisdom," "virtue," or "knowledge." It was the term *akolasia* [ἀκολασία], a word that designates literally the character of that which has not been pruned and has grown all by itself, that the Greeks usually opposed to *sôphrosunê* (cf. Plato, *Republic* 4.431b; Aristotle, *Nicomachean Ethics* 3.15; Diogenes Laertius, *Lives of the Eminent Philosophers* 7.93). The whole question, as Plato and all his posterity said, is education, the crucial period being when the child is learning to control his body (*Republic* 2.377a–b). This explains Aristotle's strange play on words: "That is why we call temperance [*sôphrosunê*] by this name; we imply that it preserves one's practical wisdom [*hôs sôizousan tên phronêsin* (ὡς σῴζουσαν τὴν φρόνησιν)]" (*Nicomachean Ethics* 6.5, 1140b12): one may very well be dissolute and a good mathematician, be drunk and still know that two plus two equals four; but one cannot be both dissolute and prudent.

B. Understanding the Aristotelian circle and contemporary questions

For some of our contemporaries who are quick to seek in Aristotle the solution to the problems we face in dealing with G.W.F. Hegel's strong criticisms of Immanuel Kant and moral formalism, Aristotle is supposed to have developed a formidable circle between *phronêsis* and the three other main moral virtues: we cannot be morally virtuous without prudence, Aristotle says, or prudent without moral virtue (*Nicomachean Ethics* 6.13, 1144b30–32; 10.8, 1178a14–19). But this is to forget that in Aristotle, *phronêsis* is above all a virtue or "excellence," and not just any form of "practical reason," even if it is an "intellectual" virtue. The apparent paradox has to do with the fact that the person who ensures the choice of the happy medium defining moral virtues, namely the prudent person, cannot exist without first having moral virtue, and in particular the moral virtue Aristotle considers the most important of all, *sôphrosunê*, temperance or moderation. But this is a matter of education. The explanation is not at all paradoxical, even in appearance: although moderation is necessary to guarantee the correctness of practical judgments, no such guarantee is necessary to ensure the correctness of theoretical or mathematical judgments, for example. That is why, following in this respect Plato's adage, Aristotle puts such stress on the necessity of giving children a proper upbringing: the desiring part of the soul has to be accustomed to obeying the properly rational part, which will acquire all of its value when the time comes for reason to govern. The virtue of

prudence is thus established only in someone who is moderate; in return, moral values, including moderation, with time become authentic virtues and not simple habits, the results of previous training. Aristotle is not caught in a logical circle here; he uses this entailment to guarantee that *phronêsis* will be a virtue, and not mere smartness or terrible skill (*deinotês* [δεινότης], *Nicomachean Ethics* 6.13, 1144a26–34). For, understood as practical intelligence seeking to adjust means to ends, *phronêsis* can indeed be related to the form of wily, tricky intelligence that Détienne and Vernant have so well described in their famous book on the Greeks' *mêtis* [μῆτις] (*Les ruses de l'intelligence*; see MÊTIS). Odysseus's ruses, or those of the octopus, thus sketch the portrait of a certain type of *phronimos*, the "crafty devil." That is why, according to Aristotle, "practical reason" and "deliberative procedures" are in no way proofs of the morality of the person deliberating. Without moral virtues, and first of all moderation, *phronêsis* is no longer a virtue and retains of that characterization—of its status as a virtue—only the worst: the art of adjusting means to ends. In other words, "the end does not justify the means," but it is not for reason—or even for what some of our contemporaries would like to call "practical reason," meaning by that Aristotelian *phronêsis*, and not Kant's *praktische Vernunft*—to ensure the rectitude of the ends: that is a matter of desire—but of a "moderate" desire.

PIETAS (LATIN)

ENGLISH	piety, pity, filial piety
FRENCH	*piété, pitié, piété filiale*
GERMAN	*Frömmigkeit, Mitleid*
GREEK	*eusebeia* [εὐσέβεια]
ITALIAN	*pietà, pietà filiale*
SPANISH	*piedad*

➤ *PITY,* and DUTY, GOD, *JUSTICE*, LOVE, MENSCHHEIT, MORALS, PARDON, RELIGIO, *VIRTUE*

The Romance languages, and also English, have words such as *piété* (Fr.), *pietà* (Ital.), *piedad* (Sp.), and *piety* (Eng.) that seem to translate transparently the Latin *pietas* but do not take into account the meaning the Latin word had in the Roman world. That is because the semantic referent of "piety" has come to be limited exclusively to the religious domain as it has been marked out by Christianity. Today, the gap can be seen in the fact that in French the doublet *piété/pitié* has been constituted from a single etymon and that in the parallel doublet in English, "piety"/"pity," the forms thus related took on clearly distinct semantic values as early as the seventeenth century. However, the situation is different in Spanish and Italian, where the use of a single signifier for these two signifieds makes *piedad* and *pietà* more polysemous words. On the other hand, the German words *Frömmigkeit* and *Mitleid* are not derived from the same etymon, nor even from a single one, and thus they are not formally related in any way. *Frömmigkeit*, based on the adjective *fromm*, signifies "pious" in the sense in which one is "imbued with religious consciousness," "submissive to God's will," with which is connected the idea of profit, also found in the Middle High German *vrum*, *vrom*. *Mitleid*, which means "pity," is composed in the same way as "compassion" (from Lat. *compassio*, Gr. *sumpatheia* [συμπάθεια]) and refers to the fact of "suffering with," of "sharing others' suffering." The Latin *pietas* is based on the adjective *pius*, which relates it etymologically to the Italic languages and probably to *purus* (pure), the original sense of *pius* being perhaps "with a pure heart," in relation to the verb *pio* (to purify; cf. RT: *Dictionnaire étymologique de la langue latine*). But independently of etymological questions, we should restore to *pietas* its own semantic referent, which was first of all pagan and then gradually became Christian, before we consider the evolution of this notion in modern languages.

I. *Pietas*, a Roman Virtue

The Romans thought that they were distinguished from other peoples chiefly by the virtue of *pietas*: "[S]ed pietate ac religione atque hac una sapientia quod deorum numine omnia regi gubernarique perspeximus, omnis gentis nationesque superavimus" ([B]ut by the piety and religion and that unique wisdom through which we have understood that the world is directed and governed by the power of the gods, we have surpassed all other peoples and nations; Cicero, *De haruspicum responsis*, 9.19, in *Orations*). Thus *pietas* enters Cicero's politico-religious philosophy, and then the ideology of the Principate, whose beginnings saw the emergence of the figure of *pius Aeneas*, and as such, "[*pietas*] alone [being able] to indicate the good accord between gods and men because it signifies first of all the concord between the sons and the father, between citizens and the prince . . . , insofar as the destiny of Rome was, for five centuries, to merge with that of the emperor, [it] was to become the basic virtue of Roman history" (Meslin, *L'homme romain*, chap. 5).

Thus *pietas* can be defined as the "feeling of duty," or more exactly as the "disposition to fulfill one's duty toward that to which one owes it," that is, the three constituted entities that are the three spheres of origin and membership in society for the Roman: the family; the homeland (see Cicero, *De inventione* [*On Invention*], 2:66: "pietatem, quae erga patriam aut parentes aut alios sanguine conjunctos officium servare moveat" [piety, which forces us to fulfill our duty to our homeland, our family, and all those who are linked to us by blood]); and finally the gods (see Cicero, *De natura deorum* [*On the Nature of the Gods*], 1.41: "Est enim pietas justitia adversus deos" [Piety is justice toward the gods]). Republican *pietas* was replaced by the *pietas* that is due the emperor, notably in the imperial cult and that is itself relayed by the emperor's *pietas* toward the gods, his relatives, and the citizens of the empire (Ulrich, *Pietas*). The different forms of *pietas* are thus related to these three domains of application. Most often, it is the moral character of this notion that prevails in the different acceptations of the word, but its affective character is also perceptible in drama, for example, in the comedies of Plautus and Terence, and in the epistolary genre. There remained something in this term that attached to the notion of a code, a moral code, for instance; but that *pietas* was somehow "coded" does not necessarily mean that it was cold or rigidified by morality (such are the clichés often governing our image of the Romans), for here it is a matter of expressing love for a father, a mother, a daughter, a brother. . . .

The semantic field of *pietas* includes essentially the terms *honestas*, *dignitas*, and *conscientia*, as far as the subject's internal disposition (Fugier, *L'expression*), and also *officium* and *religio* as the subject's dispositions to a practice and as the exercise of that practice itself. Other terms help determine the meaning of *pietas*. Thus *fides*, as "dictorum conventorum constantia et veritas" (fidelity and sincerity in the words and commitments made; Cicero, *De officiis* [*On Duties*], 1.7), brings out the pertinence of the criterion of membership and origin in the notion of *pietas*. *Voluntas* (see Cicero, *Pro Plancio*, 80: "Quid est pietas nisi voluntas grata in parentes?" [What is piety if not a grateful disposition toward one's parents?]) shows that it is a question of an internal disposition (here, *grata*) relating to others. Finally, *justitia*—which is part of the definition of *pietas* (see Cicero, *De natura deorum*, 1.41, according to a formula that probably goes back to Posidonios), just as *dikaiosunê* [δικαιοσύνη] is part of that of *eusebeia* [εὐσέβεια] (see Plato, *Euthyphro*, 12e)—indicates that this virtue involves performing a duty.

The Greek term *eusebeia*, to which *pietas* corresponds, has a great similarity to the Latin term, since the exercise of this virtue does not apply solely to the gods, but also to family and homeland. However, a first difference between the two terms has to do with the fact that *pius* probably originally meant "with a pure heart," whereas *eusebês* [εὐσεβής], "who respects the gods and their laws," is based on *sebomai* [σέβομαι], "to feel a respectful fear" (RT: *Dictionnaire étymologique de la langue grecque*). A second difference arises especially from the fact that *pietas* is an object of reflection peculiar to Latin authors. For the Romans, the fact that Rome had extended its empire so universally, seeing it as an application of justice in the world of that time in which human realities (*res humanae*) and divine realities (*res divinae*) mutually determined each other, could be explained only by their unfailingly loyal, traditional,

ritual practice of all the forms of duties. Cicero's philosophy (see in particular *De republica*, 1.46.70 and 2.2.4; *De natura deorum*, 3.2.5; *De officiis*, 1.17.53–57) accounts in this way for the fact that in Rome the familial, civic, and religious domains merged in the representation of the sacred character of the Roman lineage. Taken together, the different entities to which *pietas* applied sketch out a continuum that a certain etymological play emphasizes. Thus, *pietas* is exercised toward one's *parentes* and relatives, then toward the homeland, *patria*, which has been received from these *parentes*, and goes back to that of the *patres* and beyond to that of the *majores*. The *parentes* include the *pater*, that is, the *paterfamilias*, one of the representatives of the sequence of generations through which the heritage is made. The word *patres* is also understood politically, the *patria* representing a Rome populated and defended by the heads of families, the *patres*. Finally, the *majores* are those who have given Rome its gods and its cults; thus they have a role in the "miracle" of the origin of Rome, which was later manifested in its conquest of the world, and they transmitted this *mos majorum* that the exercise of precisely this *pietas* from generation to generation is supposed to perpetuate. After Cicero, it was in the succession of the sovereigns of the empire, and of the lineages that "went back" to the heroes and gods (Mars and Venus, Apollo, Hercules, and Jupiter), that the miraculous and sacred character of the Roman lineage was then transmitted.

II. *Pietas, Piété,* and *Pitié*

Under Emperor Constantine, at the time of the official recognition of Christianity (313 CE), the Christian author Lactantius undertook a dialectical reflection against Cicero, whose remarks he discussed and deployed in order to combat his pagan contemporaries. Let us note first that he reconsiders the etymology of *religio* that Cicero had proposed and that he does so by referring to *pietas* in *Divinae institutiones* [*Divine Institutes*], 4.28 (RT: *PL*, vol. 6; see RELIGIO). But above all, in seeking to invalidate the pagan *pietas* by giving the term a new meaning, Lactantius makes reappear as in a photographic negative, so to speak, the conceptual unity peculiar to pagan *pietas*, a *pietas* that is simultaneously familial, sociopolitical, and religious. He defines *pietas*, in fact, in the chapter of his *Divinae institutiones* that is entitled "De justicia": "[S]i ergo pietas est cognoscere deum, cujus cognitionis haec summa est ut colas, ignorat utique justitiam qui religionem non tenet" ([P]iety consists in learning to know God, and if this knowledge is summed up in worshiping him, someone who does not observe the religious worship of God surely is ignorant of justice; ibid., 5.14.12). Lactantius, opposing the Roman religion inherited from the *majores*, defends the religion of the human family that has issued from the same God and Father (ibid., 3.9.19): "pietas autem nihil aliud quam Dei parentis agnitio" [piety is nothing other than the knowledge of God (qua) Father]; the creator of the first couple, who were the parents of a single lineage, of a universal genealogy ("Nam si ab uno homine quem deus finxit omnes origimur, certe consanguinei sumus" [If, in fact, we have been born from this unique man whom God has assuredly made, we are all of the same blood]; ibid., 6.10.4), and thus share a single, identical Christian *pietas* (see also ibid., 2.11.19, 5.6.12, 6.9.21, etc.). Lactantius thereby delimits new contours and

introduces new traits into the meaning of *pietas* that include *affectus, misericordia*, and *humanitas*.

A century after Lactantius, Augustine reconsidered the meaning of *pietas* and defined the meaning that was henceforth to prevail in Christianity. Having become a gift (the gift of the Spirit: Is 11:2; 1 Cor 12:1, as Tertullian notes, *Adversus Marcionem*, 3.17.3, and *Adversus Judaeos*, 9.26) and a virtue of the Christian religion, *pietas* also becomes the *vera pietas* that he seeks to define, permanently setting in history and the history of the language the mark of Christian dogma on this element of the Latin lexicon. Alongside the common uses of *pietas* applied by his contemporaries ("dicitur . . . more vulgi") to the accomplishment of duties toward parents or the needy, Augustine distinguishes *pietas* as designating "in the literal sense [*proprie*] the *cultus Dei*, the worship of God" (*Civitas Dei*, 10.1), which is based on the three theological virtues: "qui autem vera pietate in Deum, quem diligit, credit et sperat" (he who, with true piety, believes in God, hopes in him, and loves him; ibid., 5.20). It is this Christian definition of *pietas* that we repeatedly find in medieval literature (Bon and Guerreau-Jalabert, "*Pietas*"). For example, Saint Bernard writes: "[P]ietas est cultus Dei qui constat ex tribus: fide, spe et caritate" ([*Pietas*] is the worship due to God, consisting in three things: faith, hope, and charity; RT: *PL*, vol. 183, *Sententiae*, 3.21). Cicero's definitions were, of course, still frequently cited during the Middle Ages, but the overall logic of the notion of *pietas* and the meaning it had in the Latin of the pagans had, in fact, disappeared. On the other hand, Jerome's translation of the Bible shows that in the late fourth and early fifth centuries, efforts were being made to distinguish a *pietas*-worship that included the domain of Christian religion from another *pietas* which was seen as merely an *affectus* that was, in short, too human or too "pagan." This is the distinction that is the origin of the *piété/pitié* doublet in French and the "piety"/"pity" doublet in English, even if its semantic differentiation was established only in the seventeenth century, probably under the influence of the Latin of Christian theologians and of the Church.

In the eleventh century, Old French, as a vernacular language, had two words derived from *pietas*, namely *pitié* and, as a loan word, *piété*. But if this doublet existed formally, the meanings were not yet clearly distinguished: the two terms "appear as synonyms, and both have the meaning of the modern word *pitié*" (Bon and Guerreau-Jalabert, "*Pietas*"), and it was only in the middle of the sixteenth century that a semantic distinction between them appeared and was established in the following century. But at the same time that *piété* was defined as "affection and respect for God and holy things," the term was extended to mean "respectful affection for relatives and the dead" (RT: *Dictionnaire universel*), and the expression *piété filiale*, or "filial piety" (a Latinism, modern dictionaries note), came into use. Contemporary French—in which *piété* is understood primarily as "a fervent attachment to God: respect for religious beliefs and duties" or, like its avatar in the pagan, polytheistic domain, "a feeling of respect for the gods, for religious practices" (being distinguished from *pitié* as "a sympathy that arises from the sight of the sufferings of others and makes us wish them to be relieved")—is thus at least in part heir to this semantic structuring (Bon and Guerreau-Jalabert, "*Pietas*"), which is also found in the two German terms *Frömmigkeit* and *Mitleid*—a circumstance that makes the Latin *pietas* at times very difficult to translate into German today.

The Italian *pietà* in particular poses translation difficulties. In Curzio Malaparte's narrative entitled *La Pelle* (*The Skin*), *pietà*'s polysemy plays a significant role. This novel is imbued with the idea that the modern (*moderno*) Christianity of the American liberators of Italy (following the Second World War), which was full of solidarity but lacking in pity, contrasts with the Neapolitans' piety, into which enters their atavistic pity for other people and for themselves: it is a Christian pity (*pietà cristiana*). Thus the novel describes the "crazy pity" (*pazza pietà*), the "ferocious pity" (*feroce pietà*) of desperate men and women tearing themselves away from the wretched remains of dead bodies that "pity and love" (*pietà e affetto*) make them think they recognize but that becomes "piety and love" (*pietà e affetto*) when these men and women gather to practice the funerary rites over the dismembered cadavers. But there is a play on the double sense of *pietà* that can probably also be found in the French technical term in (Christian) art, *pietà*, borrowed from the Italian, which finally replaced, at the end of the nineteenth century, the synonymous designation *Vierge de pitié* or *Pitié*. And there remains in French, as in most Romance languages, a trace of the *pitié* that also used to mean *piété* in the old expression *mont-de-piété*, *Monte di Pietà* (It.), or *monte de piedad* (Sp.): pawnshop.

On the vocabulary of duty, see *OBLIGATION*; cf. in particular DUTY, MORALS, SOLLEN, *VALUE,* WILLKÜR.

➤ LOVE

| PLASTICITY

FRENCH   *plasticité*
GERMAN   *Plastizität*
GREEK   *plassein* [πλάσσειν]

➤ ART, AUFHEBEN, BEAUTY, *FICTION, FORM,* GERMAN, I/ME/MYSELF, SPEECH ACT, SUBJECT

It was around the turn of the nineteenth century that the neologism *plasticity* (*plasticité, Plastizität*) made its official appearance in European languages. It joined two already existing words formed on the same root (the Gr. *plassein* [πλάσσειν], "to model or shape"): first, the noun *plastics* (*la plastique*, *die Plastik*), designating the art of elaborating forms, and more particularly, sculptures; second, the adjective *plastic* (*plastique*, *plastisch*), which signifies on the one hand "capable of changing form" (like wax or clay), and on the other hand "capable of giving form" (like the plastic arts or plastic surgery; see ART, Box 2). Plasticity qualifies precisely the double aptitude for receiving and producing form.

Hegel was the first to note the frequent but indeterminate use his contemporaries made of this term, and undertook to give it a conceptual value. The two contradictory meanings of receiving and giving form allowed him to situate *Plastizität* in the register of speculative terms with two opposed meanings that were to have great influence on later thought, which found itself obliged, as it were, to invent referents for them. In the case of plasticity, this invention consists of an exportation. Hegel tears it away from its native domain, art, and assigns to it its true domain of validity, the development of subjectivity. Then the essential task of translating the subject is incumbent upon plasticity.

I. Between the Rise and Annihilation of Form: The Meanings of Plasticity

"Plasticity" articulates several meanings, and can thus be broken down into a series of equivalents that never retain more than one characteristic. "Malleability" and *Bildsamkeit* qualify the simple register of receptivity to form. "Formation," "information," *Einbildung*, and *Durchbildung* emphasize only the process of giving form. To be sure, one of the essential aspects of plasticity is indeed its receptiveness to impression: the word "plasticity" designates the ability to be shaped or modeled, including by culture or education (*la plasticité de l'enfant*), and also the ability to adapt or evolve (the plasticity of the brain, the *vertu plastique du vivant*). Nonetheless, while the adjective "plastic" is opposed to "rigid" or "fixed," it does not mean "polymorphous." Something that is plastic retains

form; for example, once shaped, marble cannot recover its initial form. This ability to preserve impressions is precisely what distinguishes plasticity from elasticity, and separates the malleable from the protean.

Thus we can understand why a certain synthetic material that appeared in the early twentieth century was called "plastic": it is capable of taking various forms and properties depending on the uses for which it is intended, but once it is molded, it nonetheless suspends the virtuality of its metamorphoses.

This fidelity to form, in which receptivity and activity are combined, enables us to understand two other recent and apparently contradictory meanings of the term "plastic," one in the realm of histology, the other in that of explosives. In histology, "plasticity" designates the ability of tissues to re-form themselves after having been injured (healing). "Plastic" also refers to a powerful explosive substance. It is as if plasticity put violence at the very heart of regeneration: the ability to receive a form, indeed to re-form tissue after a wound, via the necessity of enduring the explosion of an initial state: the formless, an inadequate or outdated form.

II. Hegel and the Plasticity of the Subject

Hegel sees in plasticity a means, both synthetic and disruptive, of qualifying in a perfectly adequate way the development of subjectivity, that is, the process of self-determination (*Selbstbestimmung*). In the preface to the *Phenomenology of Mind* he writes: "only that philosophical exposition can manage to become plastic in character which resolutely sets aside and has nothing to do with the ordinary way of relating the parts of a proposition." The "parts of a proposition" designate here the subject, the copula, and the predicate. If, according to Hegel, philosophy had up to that point lacked plasticity, that was because it had always considered the subject non-plastic, that is, purely and simply passive, receiving its accidents or predicates from outside, without producing them itself. Conversely, philosophy has conceived the act of predication as a pure and simple imposition of form, an arbitrary movement, a transition (*Übergehen*) between juxtaposed terms consisting in relating the predicate to a subject that remains fundamentally foreign to it. "Usually the subject is first set down as the fixed and objective self; from this fixed position the necessary process passes on to the multiplicity of determinations or predicates." That is why subjectivity, and consequently philosophy, have not yet found their true form.

Excluding this kind of ordinary relationship between the parts of a proposition requires us to break with an excessively narrow understanding of predication that misses the essential point, namely, the mutual determination of the terms themselves that make it possible. The philosophical proposition nonetheless makes this determination manifest insofar as in it subject, copula, and predicate appear as immediately identical. As an example, Hegel takes the proposition "God is Being" as paradigmatic of every philosophical assertion. What is the subject, what is the predicate? And how could one proceed in a linear way from one to the other? "Thinking," Hegel says, "instead of getting any farther with the transition from subject to predicate, in reality finds its activity checked [*gehemmt*] through the loss of the subject, and it is thrown back [*es erleidet . . . einen Gegenstoß*], on the

thought of the subject because it misses this subject." This has to do with the fact that the concept—or the speculative content of the proposition—immediately enters into contradiction with its own form insofar as it resists its predicative prolongation. It then deserts it to "return into itself."

For Hegel, this retreat is the real reason that philosophical texts are difficult. The difficulty is not due to the highly technical level of the discourse, but to the strange character of propositions that at first appear to be tautological (the terms of the proposition seem to be equivalent) and heterological (they seem to mean something different from what they say since their own content escapes them). However, this retreat of the concept into itself is an essential moment that prepares the passage from the simply predicative understanding of the proposition to its authentically speculative understanding.

At this point in regression, the subject loses its fixed form. In the first stage of its plasticity it becomes malleable to the point of not having any form. Nonetheless, Hegel says, this retrograde movement does not last: "it is necessary … that this return of the concept into itself be represented [*dargestellt*]." Having returned to the originary point where it rids itself of all forms, the subject is projected forward to give form—that is, to embody itself in a particular determination. In this way it affirms itself both as subject and as its own predicate: that is the meaning of self-determination. The plasticity of the subject characterizes its capacity to receive and to form its own content—in a word, to self-differentiate itself.

■ See Box 1.

The plastic operation constituted by self-determination thus presupposes that the subject is malleable: it has to be capable of ridding itself of its initial form. It also includes a moment of formation: the subject forms its accident by particularizing itself. The synthesis of these two instances, carried out precisely by plasticity, intervening between

the rise and annihilation of form, is both a virtuality of explosion (in his article on natural law, Hegel compares the process of mental self-determination to the action of a bomb) and a promise of reparation: meaning, injured by the initial conflict between the content and the form of the proposition, is restored, and the philosophical proposition is finally healed.

If "plasticity" had finally to be translated, if its power of translation had to be translated, we might turn to the word "tone" and its derivatives ("tonic," tonality). Etymologically and literally, "tone" (Gr. *tonos* [τόνος]) means "tension," and more precisely "good tension, midway between softness and hardness." Whence its double field of application, medical (in medicine, "tone" refers to the consistency of healthy tissue) and musical. Translated in tonic terms, plasticity appears to be a thing's power of transformation, as Hegel says in the *Science of Logic* (§189), "in its form itself," that is, its ability to sculpt its own becoming.

III. Nietzsche and the Ethical Value of Plasticity

Nietzsche unexpectedly continues along the line of speculative idealism by radicalizing the Hegelian definition of plasticity—the relationship of the subject to the accident, that is, to the event as well. In plasticity, Nietzsche sees the affirmation of becoming. In the second of his "untimely meditations" he declares:

There is a degree of sleeplessness, of rumination, of the historical sense, which is harmful and ultimately fatal to the living thing, whether this living thing be a man or a people or a culture.

To determine this degree, and therewith the boundary at which the past has to be forgotten if it is not to become the gravedigger of the present, one would have to know exactly how great the *plastic power* of a man, a people, or a culture is: I mean by plastic power the

---

1

"Plastic individualities"

Hegel's exportation of the concept of plasticity (see ART, Box 2) from aesthetics into philosophy requires a mediation, which is provided by the concept of Greek "plastic individualities" (*plastische Individuellen*). By this expression Hegel means great historical figures like "Pericles, Phidias, Plato, and especially Sophocles, but also Thucydides, Xenophon, Socrates" who attained in life what statues realize in matter itself: the incarnation of the spiritual. Living sculptures, these are "exemplary" or "substantial" figures. Like statues, "plastic individualities" give body to the mind while at the same time allowing it to be imbued by the Thing itself. Receiving and giving meaning, they are qualified as *selbstdeutende*, self-interpreting.

It is in referring to this auto-exegetical operation characterizing classical art and the Greek mode of being in general that Hegel comes to elaborate the concept of a specifically philosophical plasticity, the mode of being of subjectivity, and first of all the plasticity of the philosophizing subject. In the preface to the *Science of Logic* (1831), Hegel appeals directly to his reader's plasticity: "A plastic presentation [*plastischer Vortrag*] requires a plastic sense of reception and comprehension [*einen plastischen Sinn des Aufnehmens und Verstehens*]." This plastic sense of comprehension requires that the subject allow itself to be dispossessed of its initial form in order to become itself a formative power, that is, an

interpreter. Then the plasticity of the universal subject (*Selbst, Soi*), the specific imprint of subjectivity, which distinguishes it from every other kind of support, is in fact its ability to inform itself, that is, to hold the middle in the perpetual tension of a dialectical uneasiness, between evanescence and petrification.

capacity to develop out of oneself in one's own way; to transform and incorporate into oneself what is past and foreign, to heal wounds, to replace what has been lost, to recreate broken moulds.

Later on, plasticity, as life force and regeneration, as a midpoint between an excess of sensitivity and absolute indifference, even appears as an antidote to resentment:

Ressentiment itself, if it should appear in the noble man, consummates and exhausts itself in an immediate reaction, and therefore does not poison: on the other hand, it fails to appear at all on countless occasions on which it inevitably appears in the weak and impotent. To be incapable of taking one's enemies, one's accidents, even one's misdeeds seriously for very long—that is the sign of strong, full natures in whom there is an excess of the power to form, to mold, to recuperate and to forget. . . .

Genealogy of Morals, First Essay, Section 10

It is clear that plasticity constitutes for Nietzsche a fundamental storehouse of meaning for a new conception of subjectivity that would free it from the form—simultaneously too vague and too strict—of the *cogito* in order to reveal its explosive and creative aspect.

GERMAN	*Lust, Wohlgefallen, Vergnügen*
GREEK	*hêdonê* [ἡδονή], *chara* [χαρά], *chairein* [χαίρειν], *terpsis* [τέρψις], *euphrosunê* [εὐφροσύνη]
ITALIAN	*piacere, diletto, gusto, godimento*
LATIN	*suavitas, voluptas, delectatio, fruitio*
SPANISH	*goce, gozo, placer*

➤ BEAUTY, DRIVE, GLÜCK, GOÛT, LOVE, *MALAISE*, PATHOS, PHRONÊSIS, PRAXIS, SENSE, SUBLIME, *SUFFERING*, UTILITY

In the main European languages, the vocabulary of pleasure is determined by the heritage of Platonism. Archaic Greek distinguishes between the pleasure of existence (*chairein* [χαίρειν], "to feel joy"; *euphrainô* [εὐφραίνω], "to charm") and pleasure in the object (*terpein* [τέρπειν], "to sate, to enjoy"; *hêdesthai* [ἥδεσθαι], "to find pleasure in"; adj., *hêdus* [ἡδύς], "pleasant," "to qualify the object"). But philosophy chooses to combine all these terms under a generic term: *hêdonê* [ἡδονή]—which renders *voluptas*, pleasure (*plaisir, piacere*, etc.), *Lust*—determined as "the" pleasure in the object par excellence, the pleasure that the body takes in food or in love. Then all pleasure, enclosed in the two dominant systems, pleasure/pain and desire/lack, could be reduced to this yardstick in order to be devalued.

This reduction had several decisive effects on the use of these words in the history of philosophy. For one thing, it led to semantic inventions and refashionings. Sometimes, in fact, distinctions were made either to emphasize a pleasure that is noble or sublimated because of its subject (the Aristotelian god whose act is *hêdonê*; the Kantian soul capable of disinterested *Lust*, as opposed to the *Vergnügen* of the senses) or because of its object (the Spinozist series *titillatio, laetitia, gaudium*). At other times, lower pleasures are rehabilitated to change the relationships between desire and pleasure (*delectatio morosa*) and pleasure and pain (*Lust/Unlust*) and the distinctions between sensible and intelligible, body and soul (delight, joy). On the one hand, it produces a "moral" effect regarding the proper use of pleasures: this is the regime of the "metretic," of moderation, from Aristotle to Foucault.

I. From the Pleasure of Existence to Pleasure in the Object

A. The Greek system: *Charis, euphrosunê, terpsis/hêdonê*

In Homer, the pleasure par excellence is the pleasure of existence, the satisfaction taken in existing fully, which is expressed both as harmony with the outside (*chairein* [χαίρειν], *charis* [χάρις]) and as endogenous harmony (*euphrainô* [εὐφραίνω], *euphrosunê* [εὐφροσύνη]). For example, Odysseus, weeping at Alkinoos's feast, explains, in verses that can only be under- or overtranslated, what is "most beautiful" for him: "I say there is no goal more pleasurable [*telos chariesteron* (τέλος χαριέστερον)] than the good cheer [*euphrosunê*] that imbues a whole group" (*Odyssey*, 9.5–6). The French translator Bérard renders this as "Le plus cher objet de tous mes voeux, je te jure, est cette vie de tout un peuple en bon accord," while Jaccottet renders it as "Croyez-moi en effet, il n'est pas de meilleure vie que lorsque la gaieté règne dans tout le peuple." The verb *chairein* means "to be delighted," "to take pleasure" (in one's heart, in one's mind), and the noun that corresponds to it, *chara* [χαρά], which is frequent

in the tragedians, for example, signifies joy in the fullest sense. *Charis*, the deverbal of *charein*, has two main types of meanings. First, it is the life force in its plenitude and superabundance (what Hegel would call *Lebendigkeit*, "liveliness" or "vitality"): the "grace," in the sense of "charm," of a woman; the "virile splendor" of the warrior; the "majesty" and "glory" of kings—in short, the brilliance, whatever it might be, that makes a person radiant (thus, before Odysseus appears before Nausicaa or Penelope, "Athena gilded with grace his head and shoulders"; *Odyssey*, 6.235, 23.162, etc.); similarly, adolescence is "the most graceful time of young manhood" (*chariestatê hêbê* [χαριεστάτη ἥβη], ibid., 10.279). It is also "grace" in the sense of "favor" (including the "favors" granted by women: "The ancients called *charis* woman's spontaneous consent to the male"; Plutarch, "On Love," 751e) and "gratitude" that prevails in the feasting and presides over the exchange; the verb *charizesthai* [χαρίζεσθαι] means "to be pleasing to someone," "to gratify" (cf. the common prepositional turn of phrase genitive + *charin* [χάριν]: "for the pleasure of," e.g., *legein logou charin*, "to speak for the pleasure of speaking" [Aristotle, *Metaphysics*, 4.5, 1009a 21], and the Latin *gratia* + ablative [see RT: *Le vocabulaire des institutions indo-européennes*, 1:201]). Thus, in each occurrence of *charis*, it is a question of a pleasure that is attached to the person himself and not to objects or activities.

The myth tells us this in its own way: the "beautiful *Charis*" is the hospitable wife of Hephaistos (*Iliad*, 18.382), and the *Charites*, the three Graces born of Zeus and the daughter of Oceanus, live with the Muses on Olympus (Hesiod, *Theogony*, 64.907–11) and "accompany all the gods" (Homer, "To Aphrodite," v. 95). Their name indicates that they are divinities of beauty and seduction, of abundance, of the power of nature: Thalia (lit. "young shoot," "abundance," "feast"), Agleia (lit. "brilliant," "radiant"); as for the third, Euphrosune (from *eu* [εὖ], "good," and *phrên* [φρήν], "mind"), her name directly expresses the pleasure of existence and, par excellence, the merriment of feast and the banquet, the "good humor," well-being, and joie de vivre that, as we have seen, "imbues a whole group" when "the feasters up and down the houses are sitting in order / and listening to the singer, and beside them the tables are loaded / with bread and meats, and from the mixing bowl the wine steward / draws the wine and carries it about and fills the cups" (*Odyssey*, 9.7–10).

- See Box 1.

In the *euphrosunê* of the banquet, the pleasure of existence is already connected with enjoyment of the object. The verb *terpein* [τέρπειν] (more often used in the mediopassive *terpesthai* [τέρπεσθαι]) also designates the joy of the feast, pleasure that is simultaneously physical, social, and aesthetic and that is enjoyed with food, music, and song (e.g., *Odyssey*, 8.45). It expresses essentially the idea of full satisfaction ("to find full satisfaction of one's desire": Chantraine [RT: *Dictionnaire étymologique de la langue grecque*], following Latacz [*Zum Wortfed "Freude"*]; the Greek term can be related to Sanskrit *tarpayati*, "to be satisfied"), which explains the extent of its application—from sexual relations to knowledge. This idea of plenitude helps us understand why *terpesthai* expresses particularly well the pleasure taken in nonmaterial things and in activities that have to do with togetherness, that involve

play, and that produce harmony. Thus the Muses, by singing for Zeus, "rejoice his great spirit" (*humneusai terpousi megan noon* [ὑμνεῦσαι τέρπουσι μέγαν νόον]; Hesiod, *Theogony*, 37), and *terpsis* expresses the irresistible, lethal charm of the Sirens' singing (*Odyssey*, 12.52.186–8: "for no one else has ever sailed past this place in his black ship / until he has listened to the honey-sweet voice that issues / from our lips; then goes on, well pleased [*ho terpsamenos* (ὅ τερψάμενος)], knowing more than ever"). A formula of Democritus also reflects this particular sense of *terpein*: "tôn hedeôn ta spaniôtata ginomena malista terpei [τῶν ἡδέων τὰ σπανιώτατα γινόμενα μάλιστα τέρπει]" (among pleasing things, we enjoy most those that come most rarely; B 232, RT: DK). *Terpsis* is thus characterized as a pleasure taken in the exercise of one's faculties and in registering nonmaterial objects, without the constraint of need—more than a pleasure, a bliss.

The substantive *hêdonê* [ἡδονή] is not found in Homer, but the adjective *hêdus* [ἡδύς] (pleasant) is, regularly designating pleasant objects and primarily, once again, the pleasures of the table: eating and drinking. Etymologically, a *hedus* is someone who has good taste: Chantraine (RT: *Dictionnaire étymologique de la langue grecque*) relates *hêdomai* (= *domai*) to the Sanskrit *svadate*, "to take good taste" (whence the Latin *suavitas*), and Greek also has the verb *hêdunô* [ἡδύνω], which means "to season," whence "to charm." This pleasure, irreducible because it is initially linked with the satisfaction of natural needs, can also turn out to be harmful because of the negative counterparts of the object of pleasure (as for the Cyclops, who "was terribly / pleased with the wine he drank [*hêsato d'ainôs hêdu poton pinôn* (ἥσατο δ' αἰνῶς ἡδὺ ποτὸν πίνων)]"; *Odyssey*, 9.353–4, the only occurrence of the verb *hêdesthai* in Homer). On the whole, the archaic uses of *hêdesthai* and of *hêdus* refer to physical pleasure and involve contact, whether it is a matter of touching or of taste (cf. RT: LSJ, s.v. [ἡδονή] 2), connecting the feeling with an object that is its cause and is thus qualified as *hêdus*.

Prodicus, following Plato (*Protagoras*, 337c, 358a; cf. Aristotle, *Topics*, 2.112b 22–24), still makes a careful distinction between the *charis* and the *terpsis* of the *hêdonê*—too careful, because this lexical detail runs counter to the Platonic operation, which consists in merging all pleasures under the generic term *hêdonê* (which becomes established in the fourth century) the better to depreciate them ontologically. In the *Philebus* (*On Pleasure* [*Peri hêdonês*]), Plato deliberately puts *charein* or *chara*, *terpsis*, and *hêdonê* all on the same level (11b 4–5 and 19c 7), concluding with the depreciation of *chairein* ("all the oxen and horses and every other animal that exists tell us so by their pursuit of pleasure [*chairein*]"; 67b 1–2; Hackforth translation). The unification of pleasures under *hêdonê* is accompanied by an ontological hierarchization of true, pure pleasures on the one hand and impure pleasures on the other. In both cases, Plato analyzes *hêdonê* on the model of the satisfaction of physical needs: it is pleasure-repletion (*plêrosis* [πλήρωσις]; cf. *Gorgias*, 493d–494e), impure pleasure being a pleasure associated with pain, whereas pure pleasure, taken, for example, in things that are always beautiful in themselves, is presented as a sublimated pleasure, involving a fulfillment unaccompanied by need or suffering (*Philebus*, 50a 1–51b 7). Consequently, a happy life is no

1

Chaire, or how to greet

Comparing the two great traditional formulas of salutation, each of which connotes a different priority in the shared perception of the world, is very informative.

The Greek expression is *Chaire* [Χαῖρε], "Rejoice!" "Be glad (you're alive)!" That is, Lucian tells us, a formula that Homer always used, not only when people saw each other for the first time, but even when they separated and hated each other. In its classical sense, the term obviously refers to joy, and in particular to the joy of victory (*charma* [χάρμα] is the "desire for combat" and, with a concrete value, the word designates a "lance point" [Stesichorus, fr. 267 Page; cf. RT: *Dictionnaire étymologique de la langue grecque*]), and the first to use it is supposed to have been either Philippides, the messenger from Marathon, exhaling the word with his last breath, or Cleon, addressing the Athenian people after the Battle of Sphacteria (424 BCE). Pleasure and joy in life are certainly implied, as is shown by the criticism of the common epistolary formula found at the beginning of the *Third Letter* attributed to Plato: "[Plato] to Dionysius, Joy [*Chaire*]! Is it the best form of salutation to wish you 'joy' as I have, or would it be better if I were to follow my usual custom [*eu pratte* (εὖ πράττε)] and bid you 'Do well'?" ("act well," "succeed," which Bailly renders in French, emphasizing the "success" aspect, by *bonne chance*, and Brisson, more correctly and emphasizing the moral condition of happiness, by a play on words: "[com]porte-toi bien"; Diogenes Laertius, 3.61). "That is the salutation that I use when I write to my friends. You of course descended to flattery and addressed even the god at Delphi in these very terms . . . and wrote, they say, 'Joy to you [*Chaire*]. Keep ever the pleasant life of a tyrant'" (*Collected Dialogues*).

It is an inappropriate flattery, because, as the *Charmides* (164e) notes, the god at Delphi addresses humans with a "far superior salutation" when he says "Know thyself" instead of *Chaire*, in order to exhort them "not to rejoice, but to be wise" (or "moderate": *sôphrônein* [σωφρονεῖν]). Finally, Pythagoras, among others, is supposed to have chosen to say *Hugiaine* [Ὑγίανε], "Health," implying at the same time acting well and joy. This formula, generally reserved for saying farewell, is already very Roman.

In Latin, when one arrives, one says *aue* or *haue* (this may be an adaptation of a Punic word, according to Ernout and Meillet, RT: *Dictionnaire étymologique de la langue latine*, who report that "the formulas of salutation are often borrowed"), and when one leaves one says *vale* ("Be well," "Good health," from *valere* "to be strong," "to be powerful," physically, but also socially). We may compare this with the beautiful wish for peace that is daily expressed in Hebrew and in Arabic and with the most banal wish for a "good" period of time (*bonjour, bonsoir*, "good morning," *buenos días*, or even *bonne continuation*), which usually serves as a salutation—or a farewell— in our modern European languages.

longer linked with pleasure, with *hêdonê*, but with wisdom, with *phronêsis* [φρόνησις] (see PHRONÊSIS) (12b).

The major later conceptualizations attempt, each in its own way, to go beyond or to undo the framework thus sketched out by Plato; in doing so they nonetheless follow Plato, concerning whom it is right to emphasize that, as always, he goes beyond himself. In Aristotle and Epicurus, the term *hêdonê* prevails, but it is reinvested, at least in part, as pleasure in existence. Aristotle separates *hêdonê* from its bodily model (see Plato, *Republic*, 9.584c): pleasure, felt by the mind alone, even if the source of the affect is bodily (cf. *Nicomachean Ethics*, 10.2), is primarily connected with life (*zôê* [ζωή]) and with *energeia* [ἐνέργεια], the activity, or actuality, that defines it (10.4.1175a 12). It follows that no pleasure is movement or becoming, because pleasure is "perfect, complete in its form [*teleion to eidos* (τέλειον τὸ εἶδος)] at every moment" (10.4.1174b 5–6). *Hêdonê* completes the act as an end given over and above (it is added "as the bloom of life is added to those who are at the acme of their strength [hoion tois akmaiois hê hôra (οἷον τοῖς ἀκμαίοις ἡ ὥρα)]"; 10.4.1174b 10) and acquires its value from the act itself to which it is joined. That is why the happy life of wisdom is also the most pleasing (10.7.1177a 4: "pleasure has to be mixed with happiness"); the greatest pleasure is that of the act of thinking, and the prototype of this is the pleasure of the first mover, pure act ("its actuality is also pleasure"; *Metaphysics*, 50.7.1072b 15). But the most complete reversal is carried out by Epicurus, who proceeds to redifferentiate *hêdonê* positively, neither devaluing nor sublimating physical pleasure because he recognizes it, on the contrary, as the prime good ("the pleasure of the belly [*tês gastros hêdonê* (τῆς γαστρὸς ἡδονή)] is the principle and root of all good"; *Athenaea* 546F, RT: *The Hellenistic Philosophers*). The prime pleasure is the pleasure of movement (*kata kinêsin* [κατὰ κίνησιν]), which alleviates suffering. The result is a second type of pleasure, a stable pleasure (*katasthêmatikê* [καταστηματική]), which corresponds to the calming itself, the absence of pain in the body (*aponia* [ἀπονία]) and the absence of disturbance in the mind (*ataraxia* [ἀταραξία]). This stable pleasure is the true principle of happiness as state of pleasure, the pleasure of existing. The use (*chreia* [χρεία]) of pleasures must enable us to include the various kinds of pleasure in the stable unity of a life. The stability of the body thus makes possible the pure pleasures of the mind, consisting in an autonomous movement of the mind alone, which express themselves in the vocabulary of *chara* and *euphrosunê* and reinvest them. "Epicurus, in his treatise *On Choices*, puts it this way: 'The absence of [mental] disorder and the absence of pain are static pleasures, whereas joy and gaiety are perceived in the act in a movement [ἡ μὲν γὰρ ἀταραξία καὶ ἀπονία εἰσιν ἡδοναί· ἡ δὲ χαρὰ καὶ ἡ εὐφροσυνὴ κατὰ κίνησιν ἐνέργει βλέπονται]'" (Diogenes Laertius, *Lives*, 10.136).

B. *Voluptas*

In Latin, the adjective *hêdus* and the noun *hêdonê* are translated, in conformity with their etymology, by *suavis* and *suavitas*. But Cicero prefers the term *voluptas* (which, according

to RT: *Dictionnaire étymologique de la langue latine*, may derive from *volo*, with a broadening *p* from the Greek *elpomai*, which means "to hope," "to wait for something"), asserting that *voluptas* renders the Greek *hêdonê* in Latin more precisely than any other word (*De finibus*, 2.13).

In philosophical Latin, the vocabulary of pleasure is completely dominated by the role played by Epicureanism in Rome. Epicureanism was disseminated by Lucretius, whose *De rerum natura* begins by celebrating Venus as the mother of the nine Egyptian divinities, the Enneads, and as the pleasure of men and gods alike ("Aeneadum genetrix, horminum divomque voluptas"; *De rerum natura*, 1.1). The term *voluptas* is used in most occurrences as the exact equivalent of the Epicurean *hêdonê*, and the context is that of ethical doxography (see particularly Cicero, *De finibus* and *Tusculan Disputations*, and Seneca, *De vita beata* and *De beneficiis*).

Voluptas, as the principle and end of Epicurean doctrine, is opposed to *labor* and *dolor*; these are the choices open to *virtus*. The conventional images in which *voluptas*, "pale and painted," serves as a foil to a tanned and robust *virtus*, covered with dust and watching over institutions (Seneca, *De vita beata*, 8), are so many variations on Prodicus's apologue showing Hercules at the intersection of vice and virtue (Cicero, *De officiis*, 1.118). Here, the condemnation of Epicurean *voluptas* draws on elements that Roman civic morality borrowed from Cynicism and Stoicism and reduces the meaning of the term to physical pleasures. But neither Cicero nor Seneca limits himself to this meaning: they both know that the word *voluptas* can also express the pleasure of the search for truth or aesthetic pleasure; and when they use the word with these meanings, they do not differ from the Epicureans, for whom *voluptas* is both the most physical pleasure (that of the newborn child and the dissolute person) and the most moralized pleasure (that of the sage who makes the suffering of a mortal illness disappear by remembering with pleasure conversations with friends). Seneca assumes this ambiguity when he uses, to evoke the joys provided by making friends, the words *delectatio*, *jucunditas*, and *oblectamentum* (*Epistulae*, 9). He even goes so far as to reject the restrictive sense given *voluptas* by the Stoics, resorting instead to the common use (ibid.: the pleasure of reading a friend's letter). This use is already documented in Cicero, who mentions the peasant's *voluptas* in seeing the natural growth of plants and the *voluptas* of aging writers who contemplate their works (*De senectute*, 50). Similarly, the vocabulary of aesthetic pleasure used in the part of *De oratore* devoted to *movere* (i.e., how to move the audience; 2.18.121) makes the transition from the pleasure of the senses to the pleasure of judgment with the terms *venustas, suavitas*, and *lepos* (ibid., 3.46.181).

But Cicero's refutation of the doctrine of pleasure depends on a series of distinctions: first of all, it is important not to confuse a being's primary tendency to preserve itself with the "constitutive pleasure" that the Epicureans accorded to the infant and the sage. It is also necessary to distinguish a neutral state of the body, the absence of pain (*indolentia*), from the movements aroused by *voluptas* (whereas the Epicureans defined pleasure by the cessation of suffering). Finally, *voluptas* has to be characterized by a potential for excess, whereas the Epicureans postulated that the body set natural limits to pleasure. To forestall this

moralization of the body—and also to keep his fellow citizens from preferring the *voluptas* of contemplation to political work—Cicero tried to establish a linguistic distinction between the pleasures of the body and those of the mind, but it is not clear-cut. This attempted distinction—whose stakes are philosophical and political—involves a reorganization of the vocabulary of pleasure that claims to be based on the meanings of words documented by the founders of Latin literature. This is shown quite clearly by a passage in *De finibus* (2.13–14):

> What I mean by *voluptas* is exactly what he [Epicurus] means by *hêdonê*. . . . No Latin word can be found which captures a Greek word more exactly than *voluptas* does. Everyone in the world who knows Latin takes this word to convey two notions: elation in the mind [*laetitia in animo*], and a delightfully sweet arousal in the body [*commotionem suavem jucunditatis in corpore*]. This elation is described by one character in Trabea as "excessive mental pleasure" [*voluptatem animi nimiam*] and by another in Caecilius when he tells us he is "glad with every gladness" [*omnibus laetitiis laetum*]. But there is the following difference: the term "pleasure" [*voluptas*] is applicable to the body as well as the mind (in the latter case it is an example of vice according to the Stoics, who define it as "the irrational exulting of a mind that takes itself to be enjoying some great good"), whereas elation [*laetitia*] and joy [*gaudium*] are not applicable to the body. Every Latin speaker takes pleasure [*voluptas*] to consist in the perception of some delightful stimulation [*cum percipitur ea, quae sensum aliquem moveat jucunditas*]. The term "delight" [*jucunditas*] may, if you wish, also be applied to the mind, since "to delight" [*juvare*] can be used in either case, as can "delightful" [*jucundus*], which is derived from it. It must, however, be understood, that someone might say, "I am so elated [*tanta laetitia auctus sum*] that everything is in a whirl," and someone else might say, "Truly my mind is now in torment." The former is wildly delighted, the latter racked with pain, but there is room in the middle for neither joy nor anguish. Likewise, in the case of the body, between the enjoyment of the most sought after pleasure, and the agony of the most intense pains, there is the condition that is free of either.

Although the distinctions proposed by this text have been hardened by the requirements of polemics, they nonetheless helped influence all the uses of the vocabulary of pleasure in Cicero's readers, from Seneca to Augustine.

II. From Desire to Pleasure: *Delectatio*, "Delight," *Lust*

A. *Delectatio*, or the snares of interiorized pleasure

Plato had already conceived the so-called impure *hêdonê* on a physiological model as repletion or satisfaction of a lack that is in itself painful: the fact that suffering preceded or accompanied pleasure sufficed, in his view, to deprive it of any claim to constitute a good. But on the one hand, "pure" *hêdonê* persisted; on the other hand, the quest for moderation was still possible. If the pleasures of food or sex tended, in fact, to enslave desire (*epithumia* [ἐπιθυμία]), which they

aroused and disappointed in an endless spiral, temperance allowed one to escape the panic of pleasure-seeking desire. Thus *hêdonê* ceases to have a pejorative value here only when it is either repressed or transposed into the search for truth. But with Christianity, the status of pleasure with respect to desire changed in a significant way: far from seeing in it a pure *appetitus* that finds pleasure only when it has attained its object, moralists saw desire as being already imbued with pleasure. That is what is at stake in the medieval debates on the problem of *delectatio morosa*.

■ See Box 2.

The development of this problem also corresponds to an inflection of the concept of *delectatio* that also involves the etymology of the term. The Latin *delectatio*—from which the Old French *delit* (pleasure), modern French *délice*, and English "delight" derive—comes, in fact, from *lax* (*lacio*), which means "trap" or "snare"—whence *delicere*, "to catch someone in one's nets." These nets may remain sensible in nature, *delectatio* as such then being not at all suitable for the wise man. Nonetheless, *delectare vel conciliare* (to please or conciliate) is the second of the goals of ancient rhetoric, according to Cicero, the first being *docere* (to instruct), and the third *movere* (to move), or *flectere* (to persuade). Augustine distinguishes

two aspects in *delectatio*: first, the attraction an object exercises on the mind (he repeatedly bases this on a quotation from Virgil's *Bucolics* [2.65]: "Trahit sua quemque voluptas" [His (desire for) pleasure draws each one on]), and second, the joy the will takes in possessing the desired object. Augustine, who often plays, as do later Christian authors, on the alliteration between *dilectio* and *delectatio*, points out that the latter is precisely what the former seeks in its object and that therefore there can be no love without delight: "Non enim amatur nisi quod delectat" (*Sermon*, 159, RT: *PL* 38, col. 869). Regarding this alliteration, we can note that in modern Italian the same word, *diletto*, signifies "beloved" or "darling" when it is an epithet and "charm," "attraction," or "pleasure" when it is a noun: that is because it derives from *dilectus* in the first case and from *delectatio* in the second, whereas *dilettante* participates in both meanings and in this double etymology.

In addition, Augustine acknowledges an intellectual delight (*delectatio mentis*), holy and celestial, which he puts in opposition to earthly or physical delight (*delectatio carnis*), both being part of *appetitus*. Thus for Scholastic theologians, *appetitus* oscillates between two extreme types of pleasurable things: the *delectabile sensibile* (pleasurable sensation) and the *summum delectabile* (greatest pleasure). When, in

2

Delectatio morosa

In the field of moral philosophy, the close relationship between pleasure and desire has opened up a set of problems that Christian theologians have called *delectatio morosa* since the second half of the twelfth century. This expression, when translated into French as *délectation morose*, leads to a kind of misinterpretation. The epithet *morosa* refers here not to a complacent pleasure in some "morose" thought, but rather to the pleasure that the imagination savors deliciously as it is expectantly waiting (Lat. *moratur*) in the desire for an object that remains absent because it is inaccessible or prohibited.

The conception of such a *delectatio* inherent in desire itself represents an important turning point in relation to the conception of desire in late Greek antiquity. For Plato in particular, bodily appetites and sensuality are irremediably insatiable, whether they involve—according to the triad mentioned in the *Republic* (580e) and destined to become traditional—food, drink, or erotic pleasures, to which we must add money as a means of acquiring such pleasures. In relation to each of these objects, the desiring mind, like the Danaides with their pierced jar, sees what it is waiting for constantly escaping it: the more it seeks to fill itself up, the more it empties out. Desire, except in the case of someone whose object of desire is wisdom, is thus

condemned to be repeatedly reborn, always remaining unsatisfied and insatiable. But drawing on the Gospel according to which "everyone who looks lustfully at a woman has already committed adultery with her in his heart" (Mt 5:28), Christian authors problematized this relationship between pleasure and desire in an entirely different way. They wanted to consider—and denounce, since in their view it involved forbidden lusts—less the insatiability of desire than the presence of pleasure within it, as if the simple imaginary representation of the desired object procured an enjoyment analogous to that of actual possession. It was in the context of a debate on the degree of culpability that might burden the spontaneous movement of sensuality (*primus motus sensualitas*) before the will's explicit consent that the moralists developed, especially in the Middle Ages, the topos of *delectatio morosa* to produce a veritable psychology of the pleasure that is supposed to be provided by complacent savoring of the imaginary representation of a prohibited act.

But as we have said, the expression *delicatio morosa*, which by itself evoked the gloomy idea of culpability only for Christian morality (which was later to criticize this psychic attitude as "sinning through thought"), raises a translation problem in languages such as English and French, in which the epithet

"morose" generally serves to quality a morbid state imbued with sadness or despondent rumination. The Latin word *morosus*, in fact, has a double etymology: when written with the first syllable long, it derives from *mos, moris* (character trait, with a pejorative connotation of being difficult, somber, and acrimonious); when written with the first syllable short, it comes from the verb *moror, -aris* (to linger, to wait) and from the noun *mora* (delay, stop, pause). Since French and English have retained (except in the case of the contemporary use of *moratoire* and "moratorium," respectively) only the meaning corresponding to the first etymology, it is very difficult for them to understand the medieval epithet *morosa*, which refers to the second meaning and qualifies the joy that one can draw, in one's own heart, from desire itself. In Italian, on the other hand, where *morosità* means "delay" (particularly in acquitting oneself of a debt or an obligation), and where the French *morosité* or English "moroseness" is rendered by *malinconia* or *tristezza*, and in Spanish, where *morosidad* also means "delay" and *moroso* means "lazy" ("morose" being translatable by *taciturno*), the true meaning of the Scholastic *delectatio morosa* is more easily accessible, namely the meaning of a complacent pleasure that the mind takes in entertaining at length the fantasy of the desired object.

speaking of *delectatio morosa*, these authors draw attention to the snares connected with the stasis of desire that lingers (*moratur*) on the image of the object, we understand how *delectatio* came to be predestined, as it were, to qualify aesthetic delight: the delight one takes in the object with relative indifference to its existence or its possession. Thus in his definition of painting, Poussin declares that the goal of this art is delight (*délectation*), understood, following the critics of the late sixteenth century, as the delight of the mind and not that of the senses (*Lettres et propos sur l'art*).

B. "Delight" and the distancing of the reality of suffering

In the English term "delight," the idea of lingering is combined with that of the distancing in relation to pain that characterizes, according to Edmund Burke, the aesthetic and transaesthetic feeling of the sublime. Burke was probably the first to distinguish clearly, beyond indifference and the pure forms of pain or pleasure, a "relative displeasure" that arises from a distancing of pleasure and is called, depending on the case, "grief" or "disappointment," and a "relative pleasure" that accompanies the slow disappearance of suffering. Lacking an available word, Burke calls the latter "delight," explaining the intensity inherent in it by the underlying idea of a victory over pain. His contrast between delight and pleasure runs counter to common usage, and he sums it up this way:

> Whenever I have occasion to speak of this species of relative pleasure, I call it *Delight*; and I shall take the best care I can, to use that word in no other sense. I am satisfied that the word is not commonly used in this appropriated signification; but I thought it better to take up a word already known, and to limit its signification, than to introduce a new one which would not perhaps incorporate so well with the language. I should never have presumed the least alteration of our words, if the nature of the language, framed for the purposes of business rather than those of philosophy, and the nature of my subject that leads me out of the common track of discourse, did not in a manner necessitate me to it. I shall make use of this liberty with all possible caution. As I make use of the word *Delight* to express the sensation which accompanies the removal of pain or danger; so when I speak of positive pleasure, I shall for the most part call it simply *Pleasure*.
>
> (*A Philosophical Enquiry*)

C. *Lust* and the *Lust/Unlust* pair

The initial meaning of the German word *Lust* does not seem to have been "pleasure." Like the English "lust," it derives from the Indo-European *lutan, which means "to submit," "to bend," and is supposed to have originally designated only a more or less resistable inclination. But whereas English "lust" has retained the restricted meaning of "unbridled desire," "cupidity," or "craving," the semantic range of the German term extends from "appetite," "sexual desire" (*Ich habe Lust von dir* always means "I want you"), or "fantasy" to all the forms of satisfaction. In short, the semantic field of *Lust* extends beyond the sensible affect of pleasure to designate the desire that is *Lust*'s origin and effect.

In its philosophical usage, *Lust* is frequently followed by *Unlust*, without it being very clear whether *Lust* arises of its own accord or from the suppression of *Unlust*. *Unlust* poses a translation problem still more complex than *Lust*: Is the negation logical or real? Does it designate the absence of desire (indifference), reverse desire (repulsion), relative displeasure (grief), or positive displeasure (pain)? The register of *Unlust* is very broad.

1. *Lust* and *Unlust* in Kant

Kant makes *Lust* a genus within which he distinguishes two species, sensible and intellectual: the former divided into sensual and aesthetic, and the latter into theoretical and practical subspecies. Hence, there are several sources of ambiguity in translations. When we read in French versions of the *Critique of Judgment* that the feeling of respect for moral ideas "n'est pas un plaisir" (is not a pleasure), we have to realize that Kant does not use *Lust* here, but rather *Vergnügen*, a term that could be rendered in French by *contentement* to take into account the root of the adverb *genug*, which means "enough," "sufficiently." A purely physical pleasure constitutes the core of *Lust*. But as soon as we seek to connect it with concepts or Ideas, don't we lose sight of the aspect of organic comfort? How can the most individually subjective sensible affect be combined with a universal representation? Kant shifts the meaning of *Lust* in a decisive way by giving it a de jure universality in the domain of aesthetics. Refusing to see in it the cause or effect of the representation, he promotes it to the rank of a "predicate of a representation": the exclamation "It's beautiful!" can then be a judgment in the absence of any concept. Now we have to understand that alongside aesthetic *Lust*, we find what Kant calls teleological *Lust*. The first type of *Lust* is connected with the mode of the object's presentation; the second considers its end or its concept, which, without determining the object, nonetheless makes reflection on its content possible.

If in these two cases the translation by "pleasure" is insufficient, that is because of *Lust*'s tendency to maintain or reproduce the representative state that it provides. *Lust* is both pleasure and the desire for pleasure; the pleasure received is interwoven with the pleasure desired. That is not the case in the practical domain, where *Lust* is correctly translated by "pleasure," since the German term is connected with the realization of an intention and not with the desire for a subjective state. Let us stress, in this regard, the historical import of the linguistic division that leads Kant to choose desire-pleasure, *Lust*, to designate the faculty of aesthetic judgment, reserving *Begierde* (from *Gier*, "avidity") to signify desire-will, under the legislation of practical reason.

It will be noted that the *Lust/Unlust* opposition in the physiological register leads Kant, in a framework derived from Stahl, Hoffman, Haller, and Burke, to distinguish between the feeling of life being advanced and that of life being constrained: the latter is an essential preoccupation, since an uninterrupted joy might soon lead to death from overstimulation. In the aesthetic order, a tempered, direct, and positive pleasure is contrasted with a violent, indirect, and negative pleasure. The beautiful will then function to produce *Lust*, as a kind of favor, while the sublime will ensure the rise of *Lust* from *Unlust*, thus granting the witness of the

sublime a sort of coerced privilege (see SUBLIME). The subject finds himself forced to experience the intense pleasure of the sublime, whereas in his taste for the beautiful, he freely enjoys the harmony of the representative state and of the communicability of a feeling connected with a representation. We have to observe that, when the sublime is involved, the translation of *Lust* by "pleasure" becomes a particular source of misunderstanding: in English and French, the idea of pleasure is disconnected from that of desire, where the idea of pleasure remains linked with favor and does not tolerate well the presence of a constraint.

2. *Lust* and *Unlust* in Freud

Under the impact of Kant's speculations on sensual pleasure and aesthetic pleasure, *Lust* and *Unlust* henceforth tended to be associated with a pair of oppositions—no longer in order to stigmatize, in the Platonic manner, the impurity of their alliance, but rather that the effects of their rivalry might be recognized: *Lust* and *Unlust* are less final causes consciously determining action than efficient causes implementing mechanisms of appropriation or avoidance. Thus Freud recognizes in *Lust* and *Unlust* the principles of psychic life that mark the paths to be followed or avoided and regulate the psychic apparatus's functioning.

More than that, Freud, presupposing a form of continuity between the initial functions and the superior functions of the mind, considers judgment as the "appropriated evolution" of absorption into the ego and of expulsion from the ego. "Affirmation—as a substitute for union—belongs to Eros; negation—a result of rejection—belongs to the drive to destruction" ("Negation"). Instinctive repulsion already prefigures a concerted rejection, and although *Unlust* may risk slipping into the form of destructive misunderstanding from which repression springs, it nonetheless constitutes the germ of the symbol of negation. *Lust* and *Unlust* are thus two opposed sources of judgment: those of the judgment of attribution, which concerns the (good or bad) property attributed to a thing, and those of the judgment of existence, which posits the existence or nonexistence of a reality peculiar to my representation (see VERNEINUNG).

But since the affective process is forced to actualize itself more in repulsion than in assimilation, Freud tends to credit *Unlust* with a more important role than *Lust*. Conceiving negation in terms that are no longer solely dynamic but also economic, he seeks to grasp the stages of the transformation of desire and stresses the capacities of *Lust* and especially *Unlust* for metamorphosis and their "sublimating possibilities," noting especially the relation between preliminary pleasure and the activity of thinking. The problems Freud encounters in his theory of sublimation thus have a great affinity with those encountered with regard to the sublime: they have to do with the complex relationships that thought processes entertain with the flow of *Lüste* and *Unlüste*, which are constantly refashioned under the impact of various influences but may be endowed with an intensity to which the subject has no choice but to adapt.

While the motives of pleasure can be inventoried, repulsion and the desire for pleasure, inciting the psychic apparatus to movement, elude critical observation and force us to rethink the hidden coherence of actions and thoughts

under the category of destiny. Thus we could oppose *Lust* with *hêdonê* as a more or less evanescent affect, presupposing the implementation of complex and partially unconscious mechanisms, to the enjoyment of goods belonging to determinate hierarchies and leading to appropriative behaviors.

III. Pleasure, Enjoyment, Fruition

A. The juridical and affective senses of "enjoyment"

The French word *jouissance* appeared in the fifteenth century as a derivative from the verb *jouir*. At first, it had the juridical sense of drawing from a property all the benefit it was supposed to provide. In the seventeenth century, this initial meaning was applied to the notion of usufruct, the right to make use of a good belonging to someone else. But in the meantime, at the beginning of the sixteenth century, *jouissance* also acquired the meaning of intense sensual pleasure, especially sexual pleasure. In French, as in other Romance languages, the conjunction of these two meanings took place under the primacy of the lexical lineage *gaudium/gaudere*. Thus it may seem surprising that the word *jouissance* (like the Italian *godimento* or the Spanish *goce* and *gozo*) first came into use in its juridical sense and only later acquired its hedonistic sense: in reality, this linguistic fact marks a break with the Latin vocabulary, which separated quite sharply the register of *jouissance*-pleasure—with *voluptas, gaudium, suavitas, delectatio*, and *dulcedo*—from that of *jouissance*-law—with *possessio, usus*, and *fructus* (the latter term also having, however, the initial meaning).

German analogously makes use of two distinct lexical series to mark the difference between the enjoyment that provides pleasure (*Genuss, Behagen, Wohlgefühl, Lust, Freude*—and, more particularly, sensual enjoyment, *Sinnengenuss* and *Wollust*) on the one hand, and on the other hand, the enjoyment of one's own property, which is expressed notably by *Besitz* (possession), *Benutzungsrecht* (right to enjoy), or *Nutzung* (use, enjoyment). However, between these two registers there is a kind of hinge word: *Genuss*, which covers both meanings, as does *jouissance* in French. But it should be noted that it acquired only by extension, and with more difficulty, the sense of *jouissance*-pleasure, because, having the same etymology as *Nutzen* (utility, profit, fruit, benefit), it was originally marked by the juridical sense of "use" (like *Gebrauch*), "possession," and "usufruct."

In English, the distinction between the two meanings seems less clear than in German; "enjoyment" in the juridical sense is expressed by "use" or "possession," and also by "fruition" (which recalls the semantic duality of Lat. *fructus*), and finally, perhaps under foreign influence, by "enjoyment" (to enjoy certain rights), which thus takes us back to the lineage of *gaudere*.

In any event, whether in expressing legal enjoyment a language starts out from a term that originally belonged to the juridical vocabulary (like the Ger. *Genuss*) or from a term belonging to the vocabulary of affectivity (like the Fr. *jouissance*), it is a question of having or possessing something, insofar as that is opposed to feeling pleasure in something. Thus when the RT: *Diccionario de autoridades* of the Spanish Royal Academy attributes to the verb *gozar* the following meanings: "1. To have and possess something, like dignity, the right of

earlier birth, or an income; 2. To draw pleasure and joy from something; 3. To know a woman carnally; 4. To feel a strong pleasure, sweet and agreeable emotions," the objective sense of the first meaning is supposed to prevail over the subjective meanings of the second and fourth.

It thus appears that in the languages we have just mentioned, the same word ends up designating "enjoyment" in both its objective and subjective senses. There is enough proximity between them so that one can easily—and indifferently—pass from enjoyment as the right of possession situated beyond the principle of pleasure/displeasure to enjoyment as an experience from which one receives an intense pleasure in the thing possessed, in which one makes another person (or oneself) the object of one's own *fruitio*. However, the etymology of the word is not without importance, because here it is not just isolated nouns that are contrasted, but different semantic constellations. Thus *Genuss* refers directly to the vocabulary of use or possession (*Nutzung, Benutzung*, etc.), whereas *jouissance* spontaneously evokes pleasure and joy (*gaudium*) with the verb *jouir* (and especially the imperative: *Jouis!* which Lacan considers *surmoïque* [super-egoish]). In French, the verb *jouir*, taken in the intransitive sense, leads to the substantive *jouisseur*, which designates a person who seeks life's pleasures, especially sensual pleasures. German calls such a person a *Geniesser* (from *Genuss*) or a *Lebemann* ("playboy," always in the masculine!), whereas Italian calls him a *gaudente*, reserving *fruente* (*di*) for a person who enjoys a good. In English, a *jouisseur* is a "sensualist," and often the French term itself is used.

The relationship between enjoyment-pleasure and enjoyment-law has been refashioned in contemporary thought, particularly under the influence of Marxism and psychoanalysis, in a way that seeks to merge these two classic meanings in a notion of enjoyment endowed with an unprecedented extension making it thereby possible to rehabilitate the freedom of the inclination to enjoy and the right to have full use of oneself. In particular, this attempt constitutes the central motif of the "paradoxical economy" set forth by Georges Bataille in *La part maudite* (1949). For Bataille, "becoming aware of the crucial meaning of an instant in which growth (the acquisition of something) is resolved in an expense is precisely self-consciousness, that is, a consciousness that no longer has anything as its object" and man is given back the free enjoyment of himself. This is a thesis that seems to be a speculative repetition of an "ecstasy" that the author mentioned in *L'expérience intérieure* (1943): "At that moment, I thought that this dreamy pleasure would not cease belonging to me, that I would live from that moment on, endowed with the power to enjoy things in a melancholy way and to breathe in their delights" (*Inner Experience*).

Among the reworkings of the concept of enjoyment in which contemporary thinkers have engaged, we must give a special place to the one that Jacques Lacan introduced into the field of psychoanalysis, which poses a problem for any translator. It even seems that the French word *jouissance* was included in the 1988 edition of the *Shorter Oxford English Dictionary* simply because in this unusual sense, it seemed untranslatable in English. Not only does the Lacanian concept of *jouissance* break away completely from the register of pleasure, but in addition, although it was elaborated on

the basis of the juridical vocabulary, it detaches itself from all the conventionally accepted meanings in any domain whatever of language.

■ See Box 3.

B. Enjoyment and "fruition"

Understood in the subjective sense of full satisfaction, the French term *jouissance* is an exact translation of Saint Augustine's *fruitio*. Augustine borrows from Stoic eudaemonism the contrast between this register of *frui* (enjoy) or of the goal and that of the *uti* or means (make use of), and the idea that the only true enjoyment is that of the supreme good. For Jansen, simple *delectatio* represented a first-order *affectus*, especially when it accompanied love; but the true goal of this *affectus* is *fruitio*, which is congress with the beloved object for its own sake and which thus constitutes the final fruit (*fructus*) of love at the same time as its quiescence (*quies*); whence the interest of this notion for quietism and the mystics in general, who speak of "fruitful union." In this sense, in French the archaic term *fruition* is still sometimes found in the literary language: "Ô fruition paradisiaque de tout instant!" (A. Gide, *Journal*, quoted in the *Trésor de la langue française*, s.v. "Jouissance").

"Fruition" continues to be used in English, but in the sense of "realization," "concretization" related to "fruit" and "fruitful," which recall the proximity of the Latin *frui* to *fructus*. The Italian *fruire* and *fruizione* (enjoyment, especially of a right or a benefit) remain loyal to this etymology, but to designate an intense pleasure, Italian resorts to the verb *godere* and the substantive *godimento*, which have the same origin as the French *jouissance*, namely the Classical Latin verb *gaudere*, via the intermediary of Vulgar Latin *gaudire. Old French *joïr* (in Provençal, *jauzir*)—from which the noun *jouissance* emerged in the sixteenth century—had the meaning of "welcome warmly" and "gratify [someone] with one's love," and then, already in the twelfth century, in the indirect transitive form, that of "possessing a good" and "getting full satisfaction from any kind of possession." When the word *jouissance* appeared with its twofold meaning of "the possession of a good or a right" and "joy or intense pleasure," it corresponded through the latter meaning to *gaudere*, whereas the former meaning connected it, paradoxically, with the signified of *frui*. The same phenomenon that makes it possible to move seamlessly from the meaning "pleasure" or "amorous joy" (cf. the "joy" of the troubadours) to that of a right that one appropriates (another person being expropriated of it) and that one can claim—or vice versa—is found in several other European languages, notably in the Romance languages, such as Italian, with *godimento*, and Spanish, with *goce* and *gozo*.

IV. The Pleasures: Nomenclatures, Usages, Scales

A. The legacy of *placeo* and *placo*

While the German word *Lust* and, in a way, the English "pleasure," have a twofold meaning (pleasure/desire), we cannot say that the French *plaisir* is itself perfectly semantically. It, too, retains a sense that is close to "desire" and "will"; more precisely, "what it pleases someone to do or to command." This was the sense that established itself in

3

Jouissance according to Lacan

Although Freud himself mentioned *jouissance* (*Genuss*) with regard to both the satisfaction (*Befriedigung*) of vital needs and the fulfillment of a desire (*Wunscherfüllung*), it was Lacan who made this notion, constantly connected with either sexual pleasure or with the exercise of a right, a concept that is now considered important in the field of psychoanalysis. In an initial step, he distinguished it sharply from pleasure, placing *jouissance* at the foundation of his theory of perversion, understood no longer in the classic and pejorative sense of "sexual perversion," but instead as one of the three major components of psychic functioning alongside neurosis and psychosis. The perverse structure is characterized by the subject's obedience to the command of a law that he mocks while at the same time annihilating himself in this submission. In a second step, Lacan introduced the concept of *jouissance* into his theory of the difference of the sexes by distinguishing between phallic *jouissance* and feminine *jouissance* and by presupposing, on the one hand, that in humans desire is constituted by its relation to words, and on the other hand, that "there is no sexual relationship"; that is, that the subject, in the sex act, encounters neither the object of his desire that the other seems to him to represent nor the fulfillment that he expected to receive from such an experience. Thus the foreign translator who tries to find in his own lexicon of pleasure a term corresponding to *jouissance* as Lacan understands it finds that with Lacan one is always dealing with a very particular form of satisfaction, or at least with a satisfaction that is other than fully satisfactory. Everything seems to proceed from the exceptional *jouissance* experienced by the symbolic Father, the leader of the primal horde to whom the possession of all women is attributed and whose memory gives rise, in all other men, to the phantasm of an inaccessible, forbidden place of "absolute *jouissance*." These other men will experience no *jouissance* other than the "phallic *jouissance*" that is subjected to the flaw of castration and that is consequently irreducibly marked by lack, and not by the plenitude usually connoted by this term.

This masculine *jouissance* arouses the specter of "another *jouissance*" that is different from absolute *jouissance* and from phallic *jouissance*, and that Lacan suggests has been given to woman. The position of the latter in the field of sexuality consists in the fact that she is "not-all" (*pas-toute*) subject to the phallic logic of the castration complex, and that she exceeds, to that extent, such a determination. This excess, which is not simply complementary to masculine *jouissance*, constitutes a "supplement" with respect to the latter, but in woman it leads to a particular form of division (between "phallic *jouissance*" and the "other *jouissance*," "this *jouissance* that she is not all, that is, that makes her somewhat absent from herself, absent as subject"). Thus the gap between the sexes can be defined in the following way: "As such, [*jouissance*] is destined to these different forms of failure that constitute castration, for masculine *jouissance*, and division, so far as feminine *jouissance* is concerned" (*Le savoir du psychanalyste*, unpublished, 4 November 1971). But the supplementary *jouissance* peculiar to women (about which they cannot say anything and that is felt in particular by women who are mystical) is also experienced as *jouissance* of the Other, and, precisely, of the lack in the Other ("Dieu et la jouissance de la femme").

This diversity of the forms of *jouissance* and the two major traits that they have in common—namely, the relation each of them has with the impossible and their radical distinction from the vagaries of the register of pleasure (feelings, emotions, affects)—means that different languages encounter great difficulties in translating the Lacanian term *jouissance*. Italian generally resorts to *godimento*. Spanish oscillates between *goce* (delight) and *gozo* (pleasure), some translators preferring the latter word, which seems to them more restrictive than the former in relation to the imagined complete satisfaction. Other languages, such as English, limit themselves to putting the French word *jouissance* between quotation marks or in italics.

Lacan, Jacques. "Dieu et la jouissance de la femme." In *Le Séminaire*. Vol. 20, *Encore*. Translation by Bruce Fink, edited by Jacques-Alain Miller: *On Feminine Sexuality, the Limits of Love and Knowledge*. New York: W.W. Norton & Company, 1999.

Old French, especially in such locutions as *à son plaisir* ("at will," from the Latin *gratum*) and *bon plaisir* or *à plaisir* (as it pleases, as much as one wants), which have survived down to our own time and to which the German adjective *beliebig* corresponds. The latter, which means, both as an adjective or a pronoun, "any" and, as an adverb, "at will," "at discretion," "as much as one wants," comes from the verb *belieben* (to find good, to desire, to love) and from the substantive *Liebe*, words that derive from the Indo-European root that in Latin produced *libet* and then *libido.* This line of signification seems to be the very one that Freud follows when he considers the libido as the equivalent of hunger in the register of sexuality and defines it as the appetite for an object whose enjoyment satisfies the goal of the sex drive. Jung himself, even as he desexualized it, made the libido an appetite or an "interest" reaching forward (see DRIVE, Box 2).

The Latin verb *placere*, which probably began as an impersonal verb meaning "it seems good," "it pleases," "it has been decided" (*placitum est*), corresponded to the causative *placo* (I try to please), which is related to the French expression *j'apaise* (I calm, conciliate). Along that line, the noun *placitio* (the action of pleasing) was marked by the graphic and phonic proximity of *pax*, so that *placidus* ceased to have the meaning "pleasant" and took on that of "calmed" or "peaceful." This shift can already be seen with Saint Jerome. However, even in the thirteenth century, the old sense remained: thus Albert the Great translated the Augustinian notion of amorous knowledge (*notitia cum amore*) by the expression *notitia placida* (*Commentarii in I Sententiarum*, dist. 27, art. 8). This semantic movement associating the idea of pleasure with that of quiescence or satisfaction is found in the German word *Befriedigung*, which means "contentment," "satisfaction," and derives from *Friede* (archaic form of *Frieden*, "peace"). We can even see in it a lexicographic concordance with the fact that Freud conceives pleasure as the relief of a tension, that is, as a "negative pleasure," as opposed to pain.

In addition to the meaning of "pleasant feeling," the French word *plaisir* also has, by metonymic derivation—and

only since the fifteenth century—the concrete meaning of that which produces such an affective state. Thus we speak of the *usage des plaisirs* (the use of pleasures).

■ See Box 4.

However, as early as Greek antiquity, thinking about pleasures opens out, beyond their different categories or possible nomenclatures, onto the use that can or must be made of them and on their "moral problematization," as Michel Foucault has studied it in the second volume of his *History of Sexuality*. As he emphasizes, the place the subject gives to pleasures is essentially a matter of ethics, that is, of the relationship to oneself or of "concern with the self." Among the Greeks, the *aphrodisia* [ἀφροδίσια] are not acts listed in catalogues in which their legitimacy, or, on the contrary, their degree of deviation, of gravity and culpability, are evaluated, as Christian manuals of confession later tried to do. We can thus say that "what is at stake in the ethical system of the *aphrodisia* is the dynamic ensemble consisting of desire and pleasure associated with the act":

> What seems in fact to have formed the object of moral reflection for the Greeks in matters of sexual conduct was not exactly the act itself (considered in its different modalities), or desire (viewed from the standpoint of its origin or its aim), or even pleasure (evaluated according to the different objects or practices that can cause it); it was more the dynamics that joined all three in a circular fashion (the desire that leads to the act, the act that is linked to pleasure, and the pleasure that occasions desire).

It follows that the morality of the *aphrodisia* is a question of measure or moderation and of the supervision of sexual practices, of the desires that lead us to them, and of the pleasures that they provide us. Immorality in this area is excess, intemperance, disorder. But the objective is not to do away with pleasures and desires. On the contrary, we must use desire to maintain the sensation of pleasure and use need to revive desire (a little, as when Freud says that the affective bond of love is what, during the "intervals free of desire," enables this desire to arise again). Nonetheless, contrary to what Foucault seems to think, this connection between desire and pleasure was not entirely unknown to Christian moralists, who developed, notably in the Middle Ages, the topos of the *delectatio morosa*.

B. From *jucunditas* to "jubilation"

Although Latin terms such as *suavitas, voluptas, delectatio*, and *placere* have persisted almost as such in Romance languages, several other terms have been lost, especially in French. That is the case for *jucundus*, whose posterity concerns Italian in particular. This adjective—which was first and especially used by Cicero and Seneca, means "pleasant," "agreeable," and comes from *juvo* (to give pleasure to)—later yielded the noun *jucunditas* (joy). In Christian Latin, a popular etymology connected *jucunditas* with *jocus* (joke) and caused the word to be transformed into *jocunditas*. But the composite sense of "joke" and "joy" or "pleasure," which French could translate by *jeu* and *joie* or *plaisir*, is rendered much more clearly and without requiring a periphrasis by the Italian *giocondità*: the latter benefits, in this case, from the phonic relationship between *gioia* (joy) and *gioco* (joke, game). Nevertheless, contemporary Italian dictionaries generally give the sense of "gaiety"; that is, they emphasize play more than pleasure. However rich its past may have been, in contemporary languages the

Pleasure and pleasures (*aphrodisia* and *venerea*)

In French, grammar marks in a special way the transition from pleasure as an agreeable affective state to pleasure understood as something from which one draws satisfaction, usually sensual. This metonymic use of *plaisir* can be expressed by an adjectival phrase modifying a place (*un lieu de plaisir*), a time (*une soirée de plaisir*), or a person (*un homme de plaisir*). We also find it when the substantive is determined by a definite article and remains in the singular (e.g., *rechercher le plaisir*, or in the partitive, *se donner du plaisir*), but even more frequently when it is in the plural. Then it may retain a generic meaning or be constructed with a complement specifying a place or a time (*les plaisirs de Capoue*) or else a kind of pleasure (*les plaisirs de la chasse, du sport, de l'amour*).

Apropos of amorous pleasures, which are not limited to the sex act as such and which are described in Christian pastoral literature as "pleasures of the flesh" or "forbidden pleasures," we can note that French, no doubt like many other modern languages, is usually obliged to make use of periphrasis, whereas ancient languages such as Sanskrit, Greek, and Latin have a specific word for this purpose. Thus in Vedic literature, the word *kama* designates the pleasure of the senses or of sexual activity, even if it also covers, by extension, the whole semantic field of love. Still more clearly, in Greco-Roman antiquity there was a particular word to designate physical love: in Greek, the verb *aphrodisiazein* [ἀφροδισιάζειν] (to indulge in sexual pleasures, in the active voice in the case of a man, and in the passive voice in the case of a woman); in Latin, the neuter noun *venus, -eris* (sexual desire and pleasure), which has an exact counterpart in Sanskrit with *uanah* (desire). Each of these two Greek and Latin terms acquired that specific meaning because it had come to personify the divinity—Aphrodite or Venus—presiding over such pleasures (*ta aphrodisia* [τὰ ἀφροδίσια], among the Greeks; *venerea*, among the Romans).

Unlike these ancient languages, our contemporary ones do not have a specific, stable term to designate sexual pleasures, unless we resort to the language of triviality: in French, *la bagatelle, la gaudriole, la baise* (or more obscene, particularly because it designates the sex act itself—the verb *foutre* [from the Lat. *futuere*], which was especially favored by Sade). Italian resorts to the adjunction of a qualifier, for example, in *godimento venereo* ("sexual [literally, 'venereal'] pleasure"). As for the term *érotisme*, invented by Restif de la Bretonne in 1794, it designates a tendency, an interest, or a modality relating to physical love rather than to the pleasures themselves that are specific to the latter.

field of pleasure and joy is covered by a plurality of terms that are semantically quite close to each other. Thus in French, in addition to *plaisir* and *délectation*, we find *satisfaction, volupté, contentement, agrément, plaisance* (archaic), *complaisance, joie, allégresse*, and *jubilation.* In German, the most common words are *Lust, Vergnügen, Freude, Gefallen, Behagen*, and *Genuss.* To these Kant adds *Wohlgefallen* (*Critique of the Power of Judgment*, §3), which has the sense of "satisfaction," but he also uses *Vergnügen*, which the translators of the French Pléiade edition render by *plaisir* but which comes from *genug* (enough) and *Genügen* (sufficiency, satiety) and corresponds instead to *contentement*.

English has a very comparable distribution of terms, which Bentham takes into account when he distinguishes in "Table of the Springs of Action" fifty-four synonyms of "pleasure." Among them are "gratification," "enjoyment," "fruition," "joy," "delight," "delectation," "merriment," "mirth," "gaiety," "content," "comfort," and "satisfaction."

Some of these French, German, and English words are particularly related to the expression or manifestation of pleasure and joy. This is the case, for example, of "jubilation," a notion whose meanings can range from belligerent shouting or the sound of a battle trumpet to mystical ecstasy and narcissistic pleasure. Its Latin spelling, *jubilatio*, is borrowed from the Hebrew term that designates the ram's horn (*yôbhei*), the trumpet that is blown for great and solemn events and whose sound is translated, in the Septuagint, by the Greek *alalagmos* [ἀλαλαγμός] (from the verb *alalazein* [ἀλαλάζειν]), which means "war cry." In the Christian world, *jubilatio* came to designate an inner joy (close to "spiritual intoxication") that may be externalized in songs or cries (*jubilus* is the name given to singing exercises bearing on the last syllable of "alleluia" or on the whole of the word). Augustine saw in it the expression of an inexpressible spiritual delight, whereas Cassiodorus considered *jubilare* a synonym of *juvare* and *delectare*, emphasizing that this *copiosa mentis exultatio* (abundance of joy) is the outer manifestation of an ineffable mental pleasure. This term is found in the Romance languages and even in German, with *jubilieren*, which is, however, doubled by *frohlocken* (to rejoice).

C. Taxonomies within the semantic field of "pleasure"

We have already seen how Cicero tried to specify the meaning of the Latin word *voluptas* by means of other words that designate sensations or feeling concerning the body or the mind (*laetitia, gaudium, jucunditas*). However, the distinction between pleasure and joy, for example, remains rather poorly defined. Since this instability within a semantic field as extensive as that of pleasure concerns all languages, the translation of a term from one of them into another often raises problems. In the philosophical vocabulary, we can see this in particular in the rather fluctuating way in which the ternary hierarchy adopted by Spinoza is translated into French.

■ See Box 5.

The great diversity of pleasure's semantic field seems so universal that Bentham, seeking to determine it in English, ended up forging the concept of "fruitfulness" to designate a pleasure's ability to produce further pleasures: fruitfulness is enjoyment extended to the technical sense of a structural property of affectivity. This demonstrates the English language's specific ability to confer on fictive entities, beginning from real entities, a degree of supplementary reflexivity by giving them the suffix -*ness*. An entity is said to be real when, in a given case or in discourse, we intend to attribute existence to it, whereas a fictive entity is one to which we do not attribute a true existence. Thus for Bentham, pleasure and pain are real entities qua sensations that are not preceded by any other. However, pain takes precedence over pleasure in that it is usually felt more strongly. It follows that pleasure has a more "reflexive" character than pain and that the word "lust," for example, which is considered to refer to a real entity, can genera te "lustfulness," "luxury," "luxuriousness," etc.

Consequently, English's propensity to create substantives from verbs—gerunds such as "well-being"—also leads to the calculation of pleasures. To make verbs into substantives is to make it possible to classify them, as Bentham does when in "Table of the Springs of Action" he enumerates fifty-four

The register of pleasure and joy in Spinoza's translators

In the Latin text of Spinoza's *Ethics* (pt. 3, prop. 22.1, and prop. 18.2), we find the following descending gradation: *gaudium, laetitia*, and *titillatio*. The last term, which Spinoza associates with *hilaritas* (in the sense of "joyfulness"), corresponds in Descartes to the *chatouillement des sens* (the tickling of the senses), about which he says that it is "followed so closely by joy . . . that most people do not distinguish between them" (*Passions of the Soul*, §94). But German translators, for whom, according to Ritter's *Wörterbuch*, *die Lust* designates not the feeling of mere

pleasure, but that of joy, also use the word *Lust* to render Spinoza's *laetitia*, whereas they render the stronger word *gaudium* by *Freude*.

French translators generally render *laetitia* by the Cartesian term *joie* and *titillatio* by *plaisir*, and more precisely, by *plaisir local* or *chatouillement*. But then it is harder for them to render *gaudium*: C. Appuhn opts for *épanouissement* and R. Misrahi for *contentement*, as do R. Caillois and B. Pautrat, whereas P. Macherey, who sees *gaudium* as a *passion joyeuse*, prefers *satisfaction*. The

problem for German translators, who were able to render *laetitia/gaudium* satisfactorily by *Lust/Freude*, is then to translate the inferior term in the gradation as *titillatio*, whereas in French, if one considers *plaisir* correctly rendered by *titillatio* and *laetitia* by *joie*, resources seem to be lacking for *gaudium*.

synonyms of the term "pleasure," including a certain number of neologisms:

1. Gratification; 2. Enjoyment; 3. Fruition; 4. Indulgence; 5. Joy; 6. Delight; 7. Delectation; 8. Merriment; 9. Mirth; 10. Gaiety; 11. Airiness; 12. Comfort ; 13. Solace; 14. Content; 15. Satisfaction; 16. Rapture; 17. Transport; 18. Ecstasy; 19. Bliss; 20. Joyfulness; 21. Gladness; 22. Gladfulness; 23. Gladsomeness; 24. Cheerfulness; 25. Comfortableness; 26. Contentedness; 27. Happiness; 28. Blissfulness; 29. Felicity; 30. Wellbeing; 31. Prosperity; 32. Success; 33. Exultation; 34. Triumph; 35. Amusement; 36. Entertainment; 37. Diversion; 38. Festivity; 39. Pastime; 40. Sport; 41. Play; 42. Frolic; 43. Recreation; 44. Refreshment; 45. Ease; 46. Repose; 47. Rest; 48. Tranquillity; 49. Quiet; 50. Peace; 51. Relief; 52. Relaxation; 53. Alleviation; 54. Mitigation.

By means of a nomenclature of this kind (he draws up several others, notably for "desire"), Bentham does not seek to classify pleasures in order to hierarchize them for the purposes of action or politics, according to the degree of truth or value attributed to one or another of them. In his view, it is difficult to maintain that some pleasures are truer than others. Pleasure and, still more, pain, are only principles that have "authority" over our behavior, and play, within our actions, the role of motivating forces. They may be used as guides—fallible ones, in any case—to help us construct a world, either one of physical objects or one of interpersonal relations. They are thus fundamental to the whole of the "springs of action." Hence the "fictive" or "reflexive" character of pleasures does not prevent us from considering them as neither good nor false, neither true nor false. The principle of utility, which postulates the quest for the greatest happiness for the greatest number, leads us to put them in a logical and quantitative form, to subject them, by means of multiple rules, to a calculus (see UTILITY). Thus when they are treated as nouns, the diverse pleasures constituted as entities can have a quantity, an intensity, a duration, a probability, a distance or proximity, a fecundity, and a purity that make them quantifiable, "associable," capable of being subjected to laws and of entering into such calculations.

PLUDSELIGHED / DESULTORISK (DANISH)

ENGLISH	suddenness/desultory
FRENCH	*soudaineté / sans suite, décousu*
GERMAN	*Plötzlichkeit/desultorisch*

➤ *INSTANT* and CONTINUITET, DAIMÔN, DASEIN, DEVIL, *EVENT,* EVIGHED, I/ME/MYSELF, JETZTZEIT, MOMENT, *TIME*

The terms *Pludselighed* and *Desultorisk* occur in Kierkegaard along with *Evighed* and *Continuitet*. The absence of continuity (*Desultorisk*) takes on a special character when it occurs suddenly (*Pludselighed*), for example, when evil abruptly arises (*Œuvres complètes*, 4:37), as is suggested by the description of the demonic.

"If one reflects on its content, the demonic is determined as closing in on oneself; if it takes time into account, it is determined as the sudden" (ibid., 7:226). Lawless, foreign to the continuity of natural phenomena, the demonic is not of a somatic but rather of a psychic nature. It appears and disappears suddenly, in the rhythm of a suddenness (*Pludselighed*) that consists in the "abracadabra continuity of one who communicates only with himself" (ibid., 7:227). Like Mephistopheles it arises suddenly, being nothing other than itself, without content, like a shade that has died of boredom, given over to "continuity in nothingness" (ibid., 7:229).

The Kierkegaardian approach to time (like other categories instrumentalized in experience, such as the interval or the interstice in the sense of *inter-esse*) is marked by the restless oscillation between two movements or antagonistic terms, between humor and irony, tragedy and comedy, doubt and confidence, seriousness and joking. Regarding temporality, this "pendular movement" (*Pendulbevaegelse*) (*Journal*, 1:83) regulates the valorization and depreciation of the permanent and the sudden. As Kierkegaard writes, "Continuity in alternation governs the privilege of "the first time," of the semelfactivity of "what occurs only once," like "first love") or the Incarnation (*Œuvres complètes*, 10:76, and 4:36–38). This does not exclude the supremacy of "the second time" (*Journal*, 2:226, *Œuvres complètes*, 15:301–2; 17:171), which is not without analogy to Stendhal's second crystallization, but whose source is biblical: "Behold, I make all things new" (Rev. 21:5).

In its very ambiguity oscillation expresses the paradoxical aspect of discontinuity, as a fact, which gives time all its weight, its concrete continuity. In this we can see a kind of echo of the Platonic *atopon:* the nontemporal supremely active in time is the *exaiphnês* [ἐξαίφνης], the sudden, which interrupts mediation, not without having the value of *metaxu* [μεταξύ], of articulation or connection that, nonetheless, annihilates neither the tenor of the difference nor the violence of the collision.

In Kierkegaard, terms with a temporal resonance are frequently the origin of thematics that are deployed in very diverse registers. Thus the fact of being discontinuous is often denoted by the adjective *desultorisk* ("inconsistent, disjointed"). Thought's leaps are *desultorisk* (Hamann, *Œuvres complètes*, vol. 7): the incomprehensibility with regard to Abraham (vol. 3), the fragmentation of the post-humous writings (vol. 1), the seducer's moves (vol. 3), the

moments of aridity that, in the weary soul of the mystic, alternate with luminous moments (vol. 4), the irruption of evil (vol. 4). Continuity, on the contrary, is due to the ethical instant (vol. 2) of decision, to the recollection that maintains an eternal continuity (vol. 9). The aesthetician leads conquests, but since he is "incapable of possessing" (vol. 4), he can only "bend eternity in time in fantastic ways" (vol. 7). In continuity, the ethicist has the ardor of a conqueror, but also the humble patience to constantly acquire possession.

The sudden (*Plugselighed*) character of the *exaiphnês*, of the lightning bolt (*Blitz*) are found again in the brusque eruption of obscurity of madness, of death, of the shadows on Golgotha (vol. 15), of the demonic. Sudden also is the strange passage from the singular existent to the fantastic I of speculation. But suddenness provokes not only fear or astonishment. The emergence of a new quality (sin or grace, vol. 13), the light and gliding arrival of the favorable moment (*kairos* [ϰαίϱος], vol. 16) also occur with suddenness (see MOMENT).

POETRY

I. *Poiêsis* and *Praxis*

The English word "poetry" (archaic, "poesy") derives, via Latin, from the Greek *poiêsis* [ποίησις], from *poiein* [ποιεῖν] (to make, produce), referrring to the production of an object, as distinguished from *praxis* [πρᾶξις], from *prattein* [πράττειν] (to do, act) referring to an action that is its own end. On this fundamental difference between *poiêsis* and *praxis*, see PRAXIS; cf. *ACT* [AGENCY, ATTUALITÀ, SPEECH ACT], ACTOR, MORALS, WORK.

II. Poetry and Literature

1. In the entry for German DICHTUNG (from *dichten*, "to invent" and "to compose a poem"), which can be rendered by both "literature" and "poetry," the difference in the demarcations of the domains of discourse are examined. See also ERZÄHLEN, *FICTION,* HISTORY, LOGOS.
2. On the relationship between poetry and prose, and the connection with figures, see SUBLIME, and COMMONPLACE, COMPARISON, TROPE; cf. MIMÊSIS, *STYLE.*

➤ CATHARSIS

POLIS [πόλις], POLITEIA [πολιτεία] (GREEK)

ENGLISH   city-state, state, society, nation
FRENCH   *cité, État, société, nation*

➤ *STATE* [DEMOS/ETHNOS/LAOS, STATE/GOVERNMENT, STATO], and CIVIL RIGHTS, CIVIL SOCIETY, ECONOMY, *GOVERNMENT,* OIKEIŌSIS, OIKONOMIA, PEOPLE, POLITICS

The word *polis* [πόλις] is considered untranslatable: city-state, state, society, or nation? But is it the word that is untranslatable in our languages, or the reality that it designates, which has no equivalent in our civilization? *Polis* designates the "political community" peculiar to a stage in Greek civilization. But the fact that today we still cannot designate anthropological reality in general without appealing to the word *polis* shows that it is not easy to distinguish between translating words and establishing correspondences between things or deciding between Greek particularity and human universality.

Politeia [πολιτεία] seems to pose different problems: the *politês* [πολίτης] being a member of the *polis* (hence the citizen), *politeia* designates either, distributively, the citizens' participation in the city-state as a whole, and thus "citizenship," or collectively, the organization of citizens into a whole, and thus "constitution" or "regime." But there again, it is difficult to separate historical realities from the concepts philosophy bases on them since that is the title Plato gives to his main work on politics—the *Republic* (*Politeia*)—and the name that Aristotle gives to a particular *politeia* among all those that seem to him possible.

I. *Polis* and Political Philosophy

The *polis* [πόλις] is first of all a political entity peculiar to archaic and classical Greek civilization between (at least) the eighth and the fourth centuries BCE, connecting a human community and a determinate territory. Whereas other peoples lived in empires having an "ethnic" identity (e.g., the Persians), the originality of the Greeks in the classical period was that they lived in small, free communities (the Athenians, the Lacedaemonians, the Corinthians, et al.) having no unity other than political. Thus every city-state enjoyed territorial sovereignty, made its own laws (according to its *politeia* [πολιτεία]), and was protected by its own gods. Three governmental institutions were common to all the city-states: a large Assembly that brought together all or part of the *polites* [πολίτες] ("citizens," which was never synonymous with "residents," because minors, foreigners, "metics," women, and slaves were excluded); one or more smaller councils, generally entrusted with preparing and executing the decisions made by the Assembly; and a certain number of public offices (the *archai* [ἀρχαί], magistracies), exercised in alternation by certain people. The *politeia* specific to each *polis* defined the way these different bodies were recruited and their powers. Nonetheless, during the classical period, the *poleis* were distinguished from each other by whether they had adopted a democratic or an oligarchic *politeia.* In the former case, as in Athens, the Assembly brought together all the citizens and decisions were made by majority vote after a debate in the course of which everyone had an equal right to speak; in addition, everyone had an equal opportunity to take part in the councils and in most of the tribunals and magistracies (except the military and financial ones) through simple drawing of lots. In oligarchic city-states, only some of the members of the *polis* could take part in governmental organs and magistrates were chosen by election.

This singular historical reality constituted by the *polis* can be designated by the term "city-state" so long as the *polis* is not confused with the city (in Greek: *astu* [ἄστυ]), which was only a part of the city-state. But the problem is not only linguistic, it is philosophical from the outset because political philosophy was born in the *polis* as a "reflection" on the *polis* itself, both as the community of the Greeks and a way of life for men, and as a critical investigation into the *politeiai*, the different real or possible ways in which citizens could live together. It is from this interweaving of the singular and the universal, of the historical and the conceptual, of the real and the possible, that arise the difficulty of translating and the philosophical fertility of these notions of the *polis* and the *politeia*.

II. *Polis*: State, Society, Nation?

The difficulty of translating *polis* is less a matter of language than of history. No modern political entity is identical with the ancient *polis.* We usually live in states, each of which has legal sovereignty over a community of individuals, families, and classes called "society," and whose members feel themselves to be united by a similarity in language, culture, and history called "nation." However, although the Greek *polis* appeals to the three elements of legal system, social interdependence, and historical identity, it is nonetheless distinguished from what we call a "state," "society," or "nation."

Every Greek felt connected to his *polis* by an attachment so strong that he was often prepared to sacrifice his time for its administration and his life for its defense, and he feared the punishment of exile more than any other. Nonetheless, this feeling was not exactly national, if by "nation" we mean a community of language and culture (what the Greeks called *ethnos* [ἔθνος], and which they distinguished precisely from *polis*), not exactly patriotic, since it is less a relationship to a "native land," to a territory, than what the Greeks called *chôra* [χώρα], an awareness of belonging to a human community bound together by a shared past and a future to be constructed in common.

Each community was welded together by institutions that had a sovereign power over the whole of its members and its constituent groups. This relates the *polis* to the modern state, if we understand thereby the authority that "successfully claims a monopoly on the legitimate use of violence" (Weber, *Politik als Beruf*).However, a *polis* is not exactly a "state," the concept of which is correlative to that of the individual and "society." The state appears as an omnipotent, anonymous, and distant legal institution against which individual liberties must—always and again and again—be defended: the state is "they" against "us"—and "we" are individuals, or society. The same was not true in the *polis*: the pressure exercised by the *polis* is still exercised by "us," as such, by the community as a whole. To this extent, the freedom of the individual is gauged not by his independence with regard to the state but by the collectivity's dependence with regard to him, that is, to his participation in the *polis*.

The *polis* is thus first of all a community with a transgenerational permanence and a transfamilial identity, whose members feel a solidarity transcending all ties of blood.

In this sense, it is related to a "society." But it is not a "society" in the modern sense, for two complementary reasons. First of all, negatively, because for the Greeks, social and economic relations belonged to the sphere of the *oikos* [οἶκος] and not to that of the *polis*—that is, they were private, not public matters. Second, the *polis* is not a neutral context of exchange or of the circulation of goods, but rather the center of a historical experience, past and future, real or imaginary; in other words, the unity of this community did not arise from the interdependency of its members, but from action with a view to administering or defending it: it was a political unity.

The *polis* is thus neither a nation, nor a state, nor a society. It does not exist negatively, by inadequation, but positively, by definition. What constitutes the *polis* is the identity of the sphere of power (which for us concerns the "state") and the sphere of community (which for us is organized into "society"), and it is to this unity that each individual feels affectively bound (and not to the "nation"). Thus we can understand why the first political thinkers were able to take it as both their object and their model: while being aware of the singularity of the *polis*, they saw in it the concept of a "political community" in general. Thus according to Plato, Protagoras thought that men have to live in *poleis* because they lack other animals' biological qualities that fit them for the struggle for life, and thus have to unite by showing the virtues necessary for life in common (Plato, *Protagoras*, 320c–322d). Plato sees the *polis* as deriving from the necessity that humans cooperate and specialize (*Republic*, 2.369b–371e). Aristotle sees man as being by definition a "political animal" (*Politics*, 1.1253a 1–38), that is, "one who lives in a *polis*," and by that we must understand not only a "social animal," but also a being that can be happy only if he can freely decide, with his peers, what is right for their common life. It is as if the particularity of the *polis*, in which the sphere of the community merges with that of power, had made political thought as such possible. That is why the *polis* is neither the state nor society, but the "political community."

III. *Politeia*: Citizenship and Regime

This particularity also explains the dichotomy of the meanings of *politeia*. If the *politês* is a person who participates in the *polis*, the *politeia* may be either the subjective bond of the *politês* to the *polis*, that is, the way in which the *polis* as a community distributes among those whom it recognizes as its participants (the "citizenry"), or the objective organization of the functions of government and administration, that is, the way in which the power of the *polis* is collectively guaranteed (the "form of government" or the "constitution"). The first meaning is anterior and corresponds to the single use of the word in Herodotus (*Histories*, 9.34), who offers, moreover, without using the term *politeia*, the oldest classification of "forms of government" (3.80–83), depending on the number of those who govern: a single individual ("tyranny"), several ("oligarchy"), or all ("isonomy"). However, it is the second meaning that was to prevail in political thought, for example, with the *Poleitai of the Lacedaemonians* or the *Poleitai of Athens*, two texts transmitted in the corpus of Xenophon's works, or the "Collection of *Poleitai*" assembled by Aristotle, and of which only that of Athens is extant. Given that all these cases involve a kind of a posteriori codification, the term "constitution" seems to be the most appropriate translation of *poleitai*, on condition that it not be taken to imply any notion of a basic law written a priori. On the other hand, when Plato (*Republic*, 8) and then Aristotle (*Politics*, 3.6–7) classify and compare *poleitai*, they are concerned above all to discern in each case the fundamental principle on which the organization of power in the *polis* rests, and the term "form of government" seems more adequate.

However, neither of these translations is sufficient because one of Aristotle's *poleitai*, the one in which power is assumed by all citizens with a view to the common good, is called precisely *poleiteia* ("republic"? "constitutional regime"?), as if it incarnated, as it were, the essence of any *politeia*, by combining the two senses of the word: according to this *politeia*, in fact, all those who belong to the citizenry, and thus to the *politeia*, have the right to participate in the administration of the *politeia*.

> The words constitution (*politeia* [πολιτεία]) and government (*politeuma* [πολίτευμα]) have the same meaning, and the government, which is the supreme authority in states (*to kurion tôn poleôn* [τὸ κύριον τῶν πολέων]), must be in the hands of one, or of a few, of the many (*ê hena ê oligous ê tous pollous* [ἢ ἕνα ἢ ὀλίγους ἢ τοὺς πολλούς]). The true forms of government (*politeias* [πολιτείας]), therefore, are those in which the one, or the few, or the many, govern with a view to the common interest; but governments which rule with a view to the private interest (*to idion* [τὸ ἴδιον]), whether of the one, or of the few, or of the many, are perversions. For the members of a state (*politas* [πολίτας]), if they are truly citizens (*tous metechontas* [τοὺς μετέχοντας]), ought to participate in its advantages (*koinônein tous sumpherontas* [κοινωνεῖν τοῦς συμφέροντας]). Of forms of government in which one rules, we call that which regards the common interests, kingship or royalty; that in which more than one, but not many, rule, aristocracy; and it is so called, either because the rulers are the best men, or because they have at heart the best interests of the state (*polei* [πόλει]) and of the citizens (*tois koinônousin autês* [τοῖς κοινωνοῦσιν αὐτῆς]). But when the citizens at large administer the state for the common interest, the government is called by the generic name—a constitution [ὅταν δὲ τὸ πλῆθος πρὸς τὸ κοινὸν πολιτεύηται συμφέρον, καλεῖται τὸ κοινὸν ὄνομα πασῶν τῶν πολιτειῶν]. And there is a reason for this use of language.

> (*Aristotle, Politics,* 3.7.1279a 25–39)

But where translations of *politeia* by "constitution" or "form of government" are clearly inadequate is when the titles of the political works of numerous Greek thinkers, first of all Plato, have to be translated. These "Republics" do not limit themselves to presenting the functioning of a form of government, but found an overall project of common life, including programs of education, the organization of labor and leisure, moral rules, etc.: another proof, if one be needed, that the *polis* is indeed the unity of the community and power, two agencies that are for us divided between the state and society.

POLITICS, POLICY

➤ CIVIL SOCIETY, DEMOS/ETHNOS/LAOS, ECONOMY, GEISTESWISSENSCHAFTEN, *GOVERNMENT,* POLIS, *STATE,* STATE/GOVERNMENT

In French, the noun *politique* refers to two orders of reality that English designates as two different words, "policy" and "politics." In one sense, which is that of policy, we speak in French of *la politique* to designate "an individual's, a group's, or a government's conception, program of action, or the action itself" (Aron, *Democracy and Totalitarianism*): it is in this sense that we speak of *politiques* of health or education or of Richelieu's or Bismarck's *politiques* in foreign affairs. In another sense, which translates as the English word "politics," *la politique* designates everything that concerns public debate, competition for access to power, and thus the "domain in which various *politiques* [in the sense of "policy"] compete or oppose each other" (ibid.). This slight difference between French and English does not generally pose insurmountable problems, because the context usually suffices to indicate which meaning of *politique* should be understood, but in certain cases it is nonetheless difficult to render in French all the nuances conveyed by the English term, or, on the contrary, to avoid contamination between the two notions that English distinguishes so clearly. On the basis of an examination of the uses of the two words in political literature in English, we will hypothesize that their respective semantic fields are not unrelated to the way in which scholarly theories (and academic institutions) conceive what French calls *la politique*.

I. "Politics" and "Policy" in Philosophy

In contemporary academia, the domain of politics designates first of all an essential part of the field of "political science": the study of the forms of political competition, in accord with methods that arose from the analysis of pluralist regimes, but which can be transposed to the analysis of authoritarian regimes to shed light on conflicts among different opinion- or interest-groups that pursue opposed projects and distinct policies. Studies of electoral sociology (as well as analyses of other forms of political participation—demonstrations, petitions, activism, and so forth) belong to this domain, along with all kinds of studies on

political parties, the recruitment of governing elites, and, more generally, on the competitive and/or agonistic dimension of the regimes or political systems studied (see, for example, Campbell et al., *The American Voter*). But there also exist scientific approaches to policy that seek to bring out the conditions in which a particular policy can be implemented by a state, an administration, or, by extension, some kind of organization (a company may have a policy of investment, training, and so forth); significantly (insofar as it is a question of public organizations), this study of policy is generally called in French *analyse des politiques publiques*, in order to compensate for the indeterminacy of the word *politique* (for a general presentation, see Muller and Surel, *L'Analyse des politiques publiques*). As always in the social sciences, we find here a great diversity of approaches and theoretical oppositions to which we may give a political, even a partisan, meaning; but there is nonetheless a certain consensus in political science, at least in English-speaking countries, that has to do with the relations between scholarly discourse and common representations. The distinction between politics and policy is considered natural, even and especially when one inquires into the relations between them: the choice of a policy in a given sector obviously depends on politics, but that makes it only all the more useful to distinguish between the two notions. More deeply, most classical studies in political science have in common a combination of a certain confidence in the notions that have emerged from the common consciousness and an effort to critique and demystify the latter's most naïve or most widespread representations. With regard to the analysis of political life, sociology has constantly sought, with varying success, to shed light on the gap between classical democratic principles (popular sovereignty, the expression of the enlightened citizen) and the real functioning of representative regimes, which are in many respects oligarchical, and which very easily tolerate a certain political passivity; it could also be shown that many classical analyses, like that of "party identification" in *The American Voter*, draw their persuasive force from the fact that they tend to dissipate the democratic prejudices on which democratic regimes live. (If identification with a party is a crucial element in electoral choices, that is not because it increases political consciousness, but on the contrary because it makes political participation easier by relieving voters of having to form their own opinions on every question). The analysis of public policies, which has developed in the wake of decision studies, is primarily concerned with explaining the gaps between the intentions of decision-makers and the results of their actions, as well as the general opacity of decision-making processes themselves (Leca, in Grawitz and Leca, *Traité de science politique*, vol. 1). The dominant trends in political science are thus based on what might be called a non-Bachelardian epistemology that emphasizes the continuity between the common consciousness and scientific knowledge, and that probably reflects a more or less conscious adherence to the values of pluralistic democracy: that is no doubt what explains, *a contrario*, the reservations about this kind of political science expressed by French thinkers who reject this kind of naiveté and stress the discontinuity between science and common sense in order to bring out

more clearly the oligarchical dimension of pluralistic regimes (see, for example, Lacroix, "Ordre politique et ordre social," in *Traité de science politique*, vol. 1). Whatever one thinks of these debates, the existence of a political sphere in which conflict and public deliberation are the conditions of legitimate public action is not an eternal given of human life: it is in this sense that the great Hellenist Moses I. Finley could say, "Politics in our sense rank among the rarer activities in the pre-modern world. In effect, they were a Greek invention, more correctly perhaps, the separate inventions of the Greeks and of the Etruscans and/or Romans" (*Politics in the Ancient World*). The duality between policy and politics is also significant for political philosophy, insofar as the latter can hardly be understood without taking into account the distinction between the logic of command and the logic of deliberation. Most contemporary political philosophies, which implicitly accept the postulates of free-market economics (even if, as in the work of J. Habermas, to appeal to its ideals against its actual functioning), tend to privilege politics while at the same time including the policy dimension in the general framework of strategic action that often borrows from economic analysis. In other, more classical philosophies, politics may be conceived, in a rather Aristotelian way, with reference to its architectonic function, but also to the role played in it by public deliberation and the civic bond, which also assumes that its domain is irreducible to the particular goals that guide the policy of particular communities (see, for example, Oakeshott, *On Human Conduct*).

II. Politics and Policy

The oscillation of contemporary practical philosophy between the celebration of the civic ideals of liberated communication and the public sphere, on the one hand, and the general prestige of theories of rational choice, on the other, no doubt shows that the distinction English makes between the two dimensions of what French calls *la politique* involves more than a simple linguistic usage. However, this distinction does not suffice to exhaust the study of politics, which has led some authors to speak of the political as a concept that cannot be reduced to politics. In the work of Carl Schmitt, who introduced "the political" in his 1932 book *Der Begriff des Politischen* (*The Concept of the Political*), this distinction was framed as a polemic against liberalism, which tended, according to him, to reduce the specificity of "the political" to the advantage of the ethics-economy polarity, making "the political" the means of limiting ethical constraints to the benefit of individual freedoms. Schmitt's theses are indissolubly scientific and normative (even polemical); from the scientific point of view, the problem is to find the fundamental distinction in the political order equivalent to good and evil in the moral order, beautiful and ugly in the aesthetic order, and profitable and unprofitable in the economic order. But this quest is itself a way of discrediting liberal civilization, which underestimates the major role conflict plays in the constitution of political unities: "The specific distinction of the political, to which political acts and motives can be traced, is the discrimination between friend and enemy" (ibid.). The political is thus irreducible to culture, economics, or

ethics, because it truly appears only when crucial problems are involved whose resolution may require violent clashes. This conception, which reflects the author's hostility to the Treaty of Versailles and the ideology of the League of Nations, implied a radical criticism of the cosmopolitan and humanitarian ideals inherited from liberalism, and had dangerous aspects that Schmitt himself illustrated by supporting, for a time, the Nazi regime. But it would be unfair to see in this an appeal for a general subordination of human existence to the requirements of the political, itself reduced to violent conflict: the political is only one of the spheres of human action, in which, moreover, conflict is only one possibility that defines the limits of rationalization and not the ordinary forms of life. Strictly speaking, Schmitt's theory does not imply general war or conquest, even if in principle it excludes the achievement of perpetual peace—which would mark the end of all political existence *stricto sensu*, and which, in the real political world, is in fact the theme that makes it possible to criminalize some political actors, who are presented as enemies of peace and humanity (ibid.).

In itself, then, the idea of a distinction between the political and politics, which would enable us to conceive the political dimension of human life transhistorically, does not necessarily entail a complete or literal adoption of Schmitt's themes, but it does suggest that the political is endowed with a dignity superior to that of politics, either because it is distinguished from everyday politics, or because it is the specific object of philosophy and grand theory, whereas most of the social sciences can hardly rise above the level of the empirical study of political life. In this sense, the concept of the political is no doubt part of the common fund of contemporary philosophy. (For a line of inquiry fairly close to Schmitt's, see Freund, *L'Essence du politique*; for an approach faithful to the Aristotelian tradition, see Vullierme, *Le Concept de système politique*.)

PORTUGUESE

A Baroque Language

➤ BAROQUE, DASEIN, *DESTINY,* FICAR, HÁ, *MALAISE* [SAUDADE], MANIERA, *POETRY,* SPANISH

The Portuguese language, by virtue of its flexible syntax, the inversions of its punctuation, and its fondness for excess and rhetorical figures, is a baroque language. The characteristic traits of its philosophies—a penchant for aesthetic, metaphysical, existential, and "sensationist" questions—and the interweaving of its thought with literature derive from this original stamp. Although Portuguese literature has reached maturity, Portuguese philosophy, held back by the influence of Latin, has emerged only in recent centuries. Thus no one knows whether the baroque will persist or whether the philosophical language of the classics, which Portuguese is absorbing with the voracity of its "anthropophagic reason," will take it in new directions. With its very concrete expressions, its vitalism with regard to fundamental questions, and its aura of occultism, it is a language that overthrows the traditions of Western thought.

I. The Idea of the Baroque

"The finite sea may well be Greek or Roman, / Portuguese is the infinite ocean" (Pessoa, *Message*). The bonds connecting the Portuguese language with the idea of the baroque are circular and in some sense umbilical. "Baroque" comes from a word in the Portuguese goldsmith's art, *barroco*, which refers to irregular pearls, the rarest ones, whose obvious impurity gives them a high value, an additional mystery that cannot be grasped by reason and that invites us to go beyond it. Portuguese also uses *barroca* to refer to a cliff that overhangs an abyss, an escarpment produced by marine erosion that is unstable because it is made of clay, *barro*, a formless matter that has nonetheless retained the artisanal, biblical meaning of transcendence, like the lascivious flesh that can be brought to life by the divine breath. Before it spread to Italy and all of Europe during the Counter-Reformation of the seventeenth and eighteenth centuries, the baroque style was already emerging at the end of the fifteenth and sixteenth centuries in the symbols of the Manueline style, that last breath of the Gothic in Portugal. Its emblem is the armillary sphere, a globe containing brass rings representing the circles of the heavens and symbolizing the voyages that discovered new worlds in the East and West. With the ornamental exuberance of the maritime motifs in Lisbon's monasteries and palaces, which already overflow their Gothic skeletons and shed the melancholy greenish light of *saudade*, "Portugal offers us the archetype of the Baroque" (Ors, *Lo Barroco*), and along with it, the secret meaning of the spiritual history of Portugal. According to António Quadros (*O espírito da cultura portuguesa*), Portuguese writing "is viscerally baroque, expressing the sinuous, spiralling, spontaneous, dynamic, unpredictable, and creative practice of nature." This conception of natural writing—writing as nature creates—which contemplates the mystery of an insinuating and veiled order, is described this way by António Vieira, the "prince" of baroque prose:

What are these celestial expressions and words? The words are the stars, the expressions are their composition, their order, their harmony, and their course. Consider how the way of preaching in the heavens is in accord with the style that Christ taught on earth. In both cases, it is a matter of sowing: the earth sown with wheat, the sky sown with stars. One must preach as if one were sowing, not as if one were paving or tilling. Ordered, but like the stars: *Stellae manentes in ordine suo.* All the stars are in order, but it is an order that inspires, not a laborious order. God did not make the heavens in the form of a checkerboard of stars, as preachers make a sermon a checkerboard of words.

(*Sermão da sexagésima*)

Vieira's original baroque was opposed to the affected mannerism of some seventeenth-century Dominicans who tried to imitate Góngora or slavishly followed petrified rhetorical manuals. But first of all, it was opposed to the straight and antithetical order of which the checkerboard is the quintessential image and to the Cartesian linearity of classical reason. Therefore it is not surprising that in a culture as rationalistic and measured as the French, the term "baroque" was given so many pejorative connotations: "irrégulier, bizarre, inégal" (RT: *Dictionnaire de l'Académie Française*); "le superlatif du bizarre" (RT: *Encyclopédie méthodique*); "d'un bizarrerie choquante" (RT: *Dictionnaire de la langue française*); "qui est d'une irrégularité bizarre, inattendue" (RT: *Le nouveau petit Robert*). *Le nouveau petit Robert* confirms this bias by the synonyms it suggests: "biscornu, choquant, étrange, excentrique, irrégulier." Pellegrin outlines an explanation: this is a "defensive reflex" against "dangerous imperialism and the Counter-Reformation, the privileged vehicles of the baroque, of Roman and Jesuitical origin" ("Visages, virages, rivages du baroque").

The idea of the baroque defines thinking in the Portuguese language. We encounter this baroque question several times. First, in the interweaving of philosophy and art, since it is from art that we draw the idea of the baroque. Then in the intersection of the diachrony of language and so-called eternal philosophical problems: What does it mean to characterize a whole language by a privileged period, the baroque? Is there a crucial moment that henceforth determines in Portuguese a structure of writing and its philosophy? And this leads us to a final question, How do particular linguistic events peculiar to Portuguese provide access to a philosophical perspective, that is, to universal questions?

II. Between Art and Philosophy

A. A metaphysics of sensations

In Portuguese, thought inclines toward questions that have to do with art, aesthetics, and feelings. This also holds for Spanish and even Italian, whether we see in this the influence of the sea or that of the sun, Camus would say, on southern peoples. But thinking i n Portuguese inclines toward art and feelings even when it decides to speculate metaphysically. It produces "a metaphysics of sensations," to use an expression taken from Fernando Pessoa's *Sensationist Manifestos* and adopted by José Gil. This speculation is, moreover, often treated physiologically, as a special case of malaise: "Metaphysics is the result of an indisposition" (Pessoa, *Poesia de Álvaro de Campos*).

Metaphysics is usually approached from an existential point of view and deals with problems in philosophical anthropology, such as the feelings basic to nostalgia and melancholy (*saudade, fado*) or the moral ambiguity of sensual pleasure and of ecstasy.

■ See Box 1.

It is once again an existential perspective that marks the ontology of the difference between *ser* and *estar*; most languages have only the verb "to be." A question raised by some Iberian translators of Heidegger, who want to make him say in Spanish what German does not allow him to say; or by those who, like António Quadros, want to base the history of metaphysics on linguistic and cultural facts:

[T]he philosophy of existence, preceded, moreover, by the work of Kierkegaard and by that of the Iberian thinkers Unamuno and Leonardo Coimbra, emerges systematically in Germany with the thought of Heidegger and Karl Jaspers, as a reaction against the idealist absolutizing of a Being without qualities and blind to the concrete conditions of existence. These philosophers labored to distinguish between being in itself and being in the world, which the Portuguese language renders directly in the distinction between *ser* and *estar*.

(*O espírito da cultura portuguesa*)

The immediacy of the existential problematics conveyed by common usage, in Portuguese as in Spanish, is explored much further through the mediation of literature than through strictly philosophical speculation.

B. A philosophy inscribed in literature

"If a brilliant idea occurs to you, / it's better to write a song. / It has been proven that it is possible / to philosophize only in German" (Caetano Veloso, "Lingua," a song on his CD *Velô*). Portuguese thought, which is essentially baroque, often prefers to express itself by means of the art of the sermon, the novel, or poetry, as if the straightforward form of the philosophical treatise were unable to tame its overflowing vitality. Bernardo Soares, one of Fernando Pessoa's aliases, attributes this to the sonority of the language, and especially that of its vowels:

That hieratic movement of our clear majestic language, that expression of ideas in inevitable words, like water that flows because there's a slope, that vocalic marvel [*assombro vocálico*] in which sounds are ideal colours—all of this instinctively seized me like an overwhelming political emotion. And I cried. Remembering it today, I still cry. Not out of nostalgia for my childhood, which I don't miss, but because of nostalgia for the emotion of that moment, because of a heartfelt regret that I can no longer read for the first time that great symphonic certitude.

I have no social or political sentiments, and yet there is a way in which I am highly nationalistic. My nation is the Portuguese language.

(*The Book of Disquietude*)

An Italian noticed this as well: "There is no harmonic system comparable to the vocalic complexity of the Portuguese language which, including pure, nasal, and diphthongued vowels, has 43, forty-three voices—I say!"

1

Fado

➤ *DESTINY*

The word *faco*, from Latin *fatum*, refers first of all to fate or destiny, the irruption of time that thrusts the event into the midst of presence. This was undoubtedly understood as the result of the utterance (Lat. *fari, fabula*, Port. *fala*) of the gods decreeing directly what is and what will be without the symbolic intermediary of human language. For humans this is the irreversible condition in which they find themselves from birth on, the set of possibilities that cannot be transcended and that lead inexorably to death. Thus it is also the real power that marks human finitude. From this is derived a second meaning peculiar to Portuguese: *fado* is the melancholy feeling of the consciousness of this finitude and especially of its inexorability. Thus it is a feeling, or rather a disposition, that has its origin in a special metaphysical comprehension, probably drawn from some Stoic echo and from the Arab prophetic

tradition. We can find in it an analogy with the late Roman Empire: a spiritual maturity that was achieved at the moment of economic and political decline. For Portugal, it was the overseas empire that collapsed; the Portuguese language remains, pluralized in its idioms, over five continents.

Fado makes sensible an existential condition consisting in a feeling of weariness and aimless drifting. It is an often discreet melancholy by which one allows oneself to be borne along in places frequented specifically in order to experience it by listening to its expression: the most traditional kind of song in Portugal draws both its name and its inspiration from it. Fernando Pessoa describes it this way:

All poetry—and song is an assisted poetry—reflects what the soul lacks. Thus the songs of sad peoples are gay, and the songs of gay peoples are sad.

But *fado* is neither gay nor sad. It is an episode of interval. Before existing, the Portuguese soul conceived *fado* and desired everything without having the strength to desire it.

Strong minds attribute everything to Destiny; only weak ones trust personal will, because it does not exist.

Fado is the weariness of the strong soul, Portugal's scornful glance at the God it believed in and that immediately abandoned it.

In *fado*, the gods return, legitimate and distant.

("O fado e a alma Portuguesa")

Pessoa, Fernando. "O fado e a alma Portuguesa." *O Notícias Ilustrado*, 2nd series, no. 44, 14 April 1929.

(Vincenzo Spinelli, quoted in António Quadros, *O espírito da cultura portuguesa*). The number is correct, but he exaggerated the singularity: Greek, which moreover invented the vowels that the Phoenician alphabet lacked, has as many; Greek does not have the nasal diphthongs (*ão, ães, ões*), but Portuguese does not make the quantitative distinction between long and short vowels [ε/η, o/ω]. If we add to this all the tonic riches explored by the Greeks in meter and by the Portuguese in rhyme, we understand that their first philosophers were poets. In Portuguese, a rhyme can appear in the last and in the penultimate syllable of a word: *rime aguda* (acute) for words whose tonic syllable is the final, like *parangolé*; *rime grave* for words whose tonic syllable is the penultimate, divided into masculines like *fado* and feminines like *fada*; and *rime esdrúxula* (lit., bizarre), for words in which it is the antepenultimate, such as *âmago*. In French, on the contrary, rhymes are more mnemonic supports than musical notations, since they are borne essentially by the last phonetic syllable.

But this aesthetic penchant does not concern prosody alone. If a positivist philosopher like Euclides da Cunha, having decided to write an essay on the messianism of the man of the desert, ended up writing, despite his philosophical and scientific pretensions, an emblematic novel—*Os sertões*—that is because the theme, deploying antithetical ideas, along with the vocabulary and expressions of the language, carried him away.

Thus the most significant philosophers writing in Portuguese are to be found in its literature, as if the latter were the primary way of grasping knowledge and existence:

> The preponderance of the improvised over the functional, the predominance of verve over argumentation, the prevalence of partying over work, the precedence of ritual over planning, the prejudice of the taboo against efficiency, the choice of superstition in preference to rationality, of thought in preference to knowledge, are the priorities that challenge the rigid parameters of evaluation, resist the constant rules of order, and reject the general principles of progress.

> (Carneiro Leão, "Tiers Monde")

These great philosophers of Portuguese literature, or if one prefers, these literary writers of its philosophy, are found far more frequently than philosophers who present themselves as such.

This explains why António Vieira, for example, is sometimes reduced to being no more than a Jesuit preacher of the seventeenth century, and yet, as "a faithful mirror of the baroque mentality, Vieira is considered the greatest representative of classical Portuguese prose" (RT: *Le nouveau dictionnaire des auteurs*, 3:3319)—"classical" because he is a model of the baroque style, of course.

But the man who fought from the pulpit the expulsion of the Jews in the Old World and against the enslavement of blacks and Indians in the New, the man who knew that to make its way into people's stubborn understanding a good idea needs true rhetoric much more than good arguments is only rarely considered a philosopher:

> Não está a coisa no levantar, está no cair : Cecidit. Notai uma alegoria própria da nossa língua. O trigo do

semeador, ainda que caiu quatro vezes, só de três nasceu ; para o sermão vir nascendo, há-de ter três modos de cair. Há-de cair com queda, há-de cair com cadência, há-de cair com caso. A queda é para as coisas, a cadência para as palavras, o caso para a disposição. A queda é para as coisas, porque hão-de vir bem trazidas e em seu lugar; hão-de ter queda : a cadência é para as palavras, porque não hão-de ser escabrosas, nem dissonantes,hão de ter cadência : o caso é para a disposição, porque há-de ser tão natural e tão desafetada que pareça caso e não estudo : Cecidit, cecidit, cecidit.

> (It is not a matter of rising but of falling: *Cecidit.* Observe an allegory specific to our language. The sower's wheat, although having fallen four times, rises up only three times: in order that the sermon rise, it has to fall in three senses: it has to fall in the fall, it has to fall in the cadences, it has to fall in the coincidences. The fall is for subject matter, cadence for words, coincidence for arrangement. The fall is for the subjects discussed, because they have to be well prepared and in their proper place; they will have a "fall." Cadence is for the words, because they must be neither scabrous nor dissonant; they must have a "cadence." Coincidence is for arrangement, for it must be so natural, so free of affectation, that it resembles a "coincidence" rather than something studied: *Cecidit, cecidit, cecidit.*)

> (Vieira, "Sermão da sexagésima")

C. Rhetoric and concrete expressions in ordinary language

Repetition, excess, ostentation, play with mirrors, *mise en abyme*, and rhetorical figures are frequent, both in ordinary, everyday language and in more formal registers.

Negation, whose placement is relatively free, can be repeated for emphasis without reversing the polarity of the sentence. Two negations do not equal an affirmation. For example, *Não sei não* (I don't know at all) is a stronger form of *Não sei* or *Sei não* (I don't know).

In sentences with compound negations, a simple negation can also be added without changing the meaning: *Eu nunca disse nada a ninguém* (I've never said anything to anyone) is equivalent to *Eu não disse nunca nada a ninguém* and even to *Eu nunca não disse nada a ninguém*. The polarity is reversed only if the simple negation is placed immediately before the compound negation: *Eu não nunca disse . . .* (It is not true that I have never said . . .).

Syntactical inversions are frequent, and ambiguity is always felt to be closer to the real than the reasonable is, as in the expressions the realist writer Nelson Rodrigues likes to use that twist the common logic of meaning. He operates with an extremely flexible syntax that he bends in several different directions. The title of one of his tragedies, *Perdoa-me por me traíres*, (Pardon me for the fact that you are betraying me) reverses the expected *Perdoa-me por te trair* (Pardon me for betraying you) and loses in English (and in French) half the mirror-play and ambiguity of the original, which makes use, in order to carry out its twists, of the ellipsis of the subject and the personal infinitive conjugated in the second person singular.

■ See Box 2.

The nonfinite modes—the infinitive, the gerund, and the participles—which are usually the most abstract in modern languages, are more concrete in Portuguese. In addition to the infinitive, which may be conjugated according to grammatical persons, the participle is frequently used in several verbal expressions: with *estar*, "to be" (*estou cantando*, I am singing), *andar*, "to walk" (*ando comendo*, I've been eating), and *vir*, "to come" (*venho acreditando*, since I have believed). Like the continuous tenses in English, which is also a very concrete language, the participle determines the imperfective aspect of actions. Brazilian Portuguese, which is closer to Latin usage, often uses the participle in circumstantial complements such as *O garoto ouvia a história sorrindo* (The boy listened to the story smiling), whereas in Portugal people frequently prefer the more modern prepositional form of the infinitive: *A sorrir, o garoto ouvia a história*. Its use reminds us strikingly of the use of the participle in Greek, which is so important for worldly temporal relationships that Plato made it the name of this relationship: participation. Another passage from Vieira, chosen by Raymond Cantel, shows that "the personal infinitive makes a more concrete presentation possible," and, with the abundance of participles, makes us "feel better the cost and the difficulty" of the action:

[T]em o Holandês rebelde de se perturbar, vendo as nossas tropas de quatro Portugueses, e quatro negros marcharem tantas léguas de dificultosíssimos caminhos, sem camelos, nem elefantes, que lhes levem as bagagens, e andarem livres, e intrepidamente em suas campanhas, talando, e abrasando tudo apesar de seus presídios.

([T]he rebellious Dutchman has to be concerned to see our troops of four Portuguese and four blacks march [*marcharem*] so many leagues over such difficult roads, without camels or elephants to carry their baggage, and march [*andarem*] free and intrepid through their countrysides, razing and ravaging everything, despite their shackles.)

(Cantel, *Les sermons de Vieira*)

Portuguese occults words and even whole phrases by means of ellipses, the supreme figures of the baroque, often indicated by a series commas. It hides still more: sometimes, the whole conclusion of an idea is left up to the reader by the abundant use of ellipsis points. Skepticism? Insinuation? Esotericism? It is up to the reader to decide. Consider this bilingual title of André Coyné's bilingual book, *Portugal è um ente . . . De l'être du Portugal* (Portugal is an existent . . . On the being of Portugal), whose punctuation conceals and announces the subject's secrets.

Receptive to mysteries, sometimes mystical and messianic, Portuguese culture indulges madly in its numerous revivals of Sebastianism: the belief in the advent of a fifth universal empire (according to Daniel's interpretation of Nebuchadnezzar's dream), more spiritual and ideal, when there shall be an upheaval of the heavens and the earth, or the land and the sea, with the mythical return of the young king Sebastian of Portugal, who disappeared mysteriously at the Battle of Alcácer Quibir, in 1578, which was won by the Moors. Thus he became the "hidden king," an emblem of the mystical spiritual power, in prophecies (as in *The History of the Future*, which caused Vieira to be accused of making prophecies and for which he was imprisoned from 1665 to 1667) and in

2

The personal infinitive

The personal infinitive is a nominalizable verbal form, like any infinitive, and temporally indeterminate, but it is conjugated in all three persons of the singular and plural. It may or may not have a grammatical subject, but the real subject that underlies the verbal action is indicated by the verb ending. It is used when one wants to express this subject:

cantar (my singing, "my to sing")
cantares (your [fam.] singing, "your to sing")
cantar (his/her singing, "his/her to sing")
cantarmos (our singing, "our to sing")
cantardes (your singing, "your to sing")
cantarem (their singing, "their to sing")

To translate this into French, Italian, or Spanish, languages in which the infinitive usually takes on the function of a noun, the Portuguese expression may be attached to a grammatical person by adding a possessive adjective (*mon chanter*, *mi cantar*, etc.). Doing so is stylistically clumsy, but it avoids ambiguities. Consider this extract, in a truly untranslatable baroque style:

O quereres e o estares sempre a fim
do que em mim é de mim tão
desigual
faz-me querer-te bem,
querer-te mal
bem a ti, mal ao quereres assim
infinitivamente pessoal
e eu querendo querer-te
sem ter fim
. . .
(Your willing and desiring
what in me is
so different from me
makes me wish you well,
wish you ill,
well to you, ill to your
willing, so
infinitively personal
and I want to want you
infinitely
. . .)

(Caetano Veloso, "O Quereres")

numerous secret societies: the Templars, Rosicrucians, etc. (see SAUDADE).

D. The masks of philosophy

Although they did not speculate directly, writers, novelists, and poets nonetheless liked, in a manner somewhat resembling Plato or Diderot, to make their characters philosophize. The cynical philosopher Quincas Borba, a character created by the nineteenth-century writer Machado de Assis, resembles Voltaire's Pangloss with his system of humanitism, which describes all human action as part of a single vital organism:

> *Humanitas*, he said, the principle of all things, is nothing other than the same man, distributed over all men. . . . Thus, for example, the headsman who executes a condemned man can excite the vain clamor of poets; but substantially, it is *Humanitas* that corrects in *Humanitas* an infraction of the law of *Humanitas.*

> (*Posthumous Memoirs of Brás Cubas*)

This spurious organicism cuts across the heterogeneous philosophies maintained by Fernando Pessoa's aliases: personalities or characters, the personae of an author who enjoys describing writers when this author writes texts—art completely displacing the monist status of truth and exploding the idea of subjectivity's self-identity. In this same vein, Guimarães Rosa's Riobaldo speculates on the loftiest problems of metaphysics and morals in his language that is semi-illiterate but full of lived experience:

> At first, I did my damnedest, and didn't think about thinking, I had no time for that. I lived a hard life, like a live fish in the frying pan: someone who's wearing himself out doesn't get all worked up. But now, seeing that I've got time, and no little worries, I just lie about. And I've discovered this taste for speculating on ideas. Does the devil exist or not?

> (Guimarães Rosa, *Grande Sertão: Veredas*)

It is a fine gloss in popular language but uses a vocabulary drawn from the oldest Western traditions, and in particular from the Aristotelian thesis about the connection between leisure and theoretical activity.

III. The Structure and Diachrony of the Baroque in Portuguese

It is hard to decide whether the baroque is a style that structurally determines Portuguese or is simply a stage in its history—a very long stage, to be sure, since its effects have persisted more than four centuries. There are arguments on both sides. In any case, it was, is, or will turn out to have been a style or a period for the constitution of Portuguese, just as the Renaissance was for Italian, classicism for French, or Romanticism for German.

A. Portuguese among Romance languages

Portuguese is the youngest of the neo-Latin languages—according to the Brazilian poet Olavo Bilac (1865–1918): "Latium's last bloom, uncultivated and beautiful"—delayed in its constitution as the national language by the Arab occupation up to the twelfth century. Originally a dialect of the region around the city of Porto, it was recognized officially only in 1256, by King Denis. That is no doubt why it is one of the modern languages closest to Latin. And that is not without importance in philosophy. The study of Latin remained obligatory in Brazilian and Portuguese secondary schools until the 1970s; all authors writing in Portuguese, except the very youngest, know it quite well. Jesuit scholasticism as a whole benefits from it. Vieira, one of the first philosophical writers in Portuguese, quotes the Vulgate in his sermons, as we have seen, without any pedantry. It was only with the expulsion of the Jesuits by the enlightened despotism of Prime Minister Pombal, at the end of the eighteenth century, that Portuguese replaced Latin in the university and the academic world. Plombal's reforms did a great deal to impose the Portuguese language: from the prohibition on the use of other languages in the colonies (lanuages such as Tupi, still widely spoken in Brazil at that time) to the adoption of a program of educational reform inspired by the works of the philosopher and linguist Luis António Vernay, a follower, in his own way, of John Locke's theories of knowledge.

B. A structural effect

The historical proximity of Latin marks the Portuguese language structurally, not only in its vocabulary but also in its syntax, which remains halfway between the old, inflected language and modern languages without declinations. Except for personal pronouns, Portuguese no longer declines words, but their syntagmatic positions in the sentence are nonetheless not fixed. There is a great syntactical mobility, which leads to problems of ambiguity—which is either explored or resolved by an abundant use of commas. All these elements of position and coordination dispose the Portuguese language to the rhetorical figures of the baroque: inversions, ellipses, syllepses, chiasmas, reiterations, etc. If the period is the absolute king of the classical sentence, the comma—twisted, sinuous, doubtful, concessive, reversing—dominates baroque discourse as a whole. Cunha and Cintra's RT: *Nova gramática do português contemporâneo* (New grammar of contemporary Portuguese) lists about twenty different uses.

The punctuation of Portuguese depends on its general way of constructing sentences. The long sentence full of subordinate clauses is very frequently used. There are even novels consisting of a single sentence, such as Raduan Nassar's *Um copo de cólera* (A glass of choler/cholera), a monologue in which punctuation is eliminated and the pauses are determined by the reader's need to breathe. The same oral eloquence is found in Haroldo de Campos's *Galáxias* (Galaxies), a poem that, when read aloud, calls for the rhythm of the *repentistas*, performers who challenge each other verbally until the improvised inspiration of their verses (their life) is finished. But in most cases, the long sentence does not eliminate punctuation; on the contrary, it multiplies commas, semicolons, colons, dashes.

A single example will suffice—a sentence from Carneiro Leão's *Third World* and his own free translation of it into French ("Tiers Monde"), which forgoes the baroque figures of the Portuguese original:

Todo passo é uma aventura de originalidade: passeando pela essência do real, nossos passos caminham pela originariedade do caminho, caminhar e caminhada.

 (Every step is an adventure in novelty/originariness: strolling through the essence of the real, our steps walk upon the originality of the path, to walk walked.)

Car chaque pas est une aventure. En se promenant à travers l'essence de la réalité, nos pas cheminent dans l'originalité du chemin.

(Every step is an adventure. In strolling through the essence of reality, our steps walk in the novelty/originariness of the path.)

Originalidade and *originariedade* are both translated by *originalité*; *caminho, caminhar*, and *caminhada* become simply *chemin*; and the untranslatable paronymy *passo, passear* is lost. The sentence is divided into two.

C. A season of language

The fact that Portuguese is a young language may mean not that it owes it flexible syntax to a definitive structure but instead that it is still open to unexpected changes. Will these changes take place, freezing the language in a more rigid structure, or will it retain the characteristic traits of the baroque? Modern languages have generally gone through a process of maturation that involved the translation of classical Greek and Latin texts. During and after these great waves of translation, some of the most significant writers and philosophers in each language arose because they wanted to compete with the ancient models or detach themselves from them. The quarrel of the ancients and the moderns in France and the German Enlightenment and Romanticism are examples of this. Portuguese has not yet finished this task of translating the ancients; it is still at the beginning. Although some translations of Plato and the pre-Socratics have been published, the same cannot be said of translations of Aristotle, for example, which are often simply modeled on English or French translations.

Is the acquisition of the classics preparatory to the advent of a language that is itself more classical? Brazil is developing an "anthropophagic reason," propagated in literature by the concretist movement of Augusto de Campos, Haroldo de Campos, and Décio Pignatari, Brazilian semiologists and poets who have been exercising their neobaroque influence since the foundation in 1952 of a group called Noigandres (the flower that leads ennui astray). Oséki-Dépré offers this comment on Haroldo de Campos's work *De la raison anthropophagique. Dialogue et différence dans la culture brésilienne*:

. . . in total accord with Oswald de Andrade's "anthropophagic reason," which he conceives as "the thought of the critical devouring of the cultural and universal legacy elaborated not on the basis of the subjected and reconciled perspective of the 'noble savage,' but on that of the disabused point of view of the 'bad savage' who devours whites, the cannibal." Haroldo de Campos makes explicit and confirms the idea of the "anthologist" attitude of transcreation, a "translation that presents itself

as a radical operation," a translation of form, of the "mode of intentionality," of the "aim" of a work, to speak in Benjaminian terms. . . .

Whether it be through transcreation or through intertextuality, "anthropophagic reason" is realized in the same perspective: discovering and disseminating the new text, broadening the poetic range of the Portuguese language, expanding the literature, in a renovated language, through the virtual and organically new poetic information.

("Le concret baroque")

After all, nothing prevents a language thoroughly crisscrossed by the appropriation of the classics from producing pages that remain just as rampant, twisted, curvy, sensual, baroque.

Portuguese, perhaps by its existential and sentimental tendencies, or perhaps by its heterogeneous syntax, overthrows the abstract status of some universal philosophic notions. The important role played by the information of the aspectual details of verbs, which even multiplies copulative verbs (see FICAR and SPANISH) and which gives time a very humanized, lived, carnal character, undermines the rigid architecture of a very rectilinear reason. In this language, concepts are never columns of cold, white, eternal marble; instead, they are curves sensually shaped in soapstone, like those sculpted by Aleijadinho, which do not even try to conceal the ravages of time.

Portuguese express the passage of time and the presence of death, especially because they feel them and usually suffer from them. Sadness, nostalgia, and lassitude are the shifting and swampy ground on which they establish their foundations. If sensual pleasure arises, that is only the result of this awareness of the brevity of life. Therefore it is not surprising that philosophy written in Portuguese tends toward a metaphysics of sensations, more aestheticizing and existential, more inclined toward worldly, human problems, and that more logical or mathematical abstraction has little success. The recent impact of analytical philosophy, which is stronger in Brazil than in Portugal, might turn philosophy toward a simpler and more rigid syntax, although it is closely linked to English-language sources and limited to academia. So long as the spirit of the language remains under the spell of melancholy and the sensual pleasure of the times, universities and philosophical institutions seem to be permanently supplanted by the arts and by literature, which are more sensitive to human experience. Unless, through an inversion that draws thought from the sensations of existence, philosophical abstraction might be perceived as the product of an extreme nostalgia without an object. Then thought would recognize as its own this area that is guarded only by the muses and the Horae, the seasonal gods:

Vi que não há Natureza,
Que Natureza não existe,
Que há montes, vales, planícies,
Que há árvores, flores, ervas,
Que há rios e pedras,

Mas que não há um todo a que isso
   apparpertença,
Que um conjunto real e verdadeiro
É uma doença das nossas idéias.

(I've seen that there is no Nature,
That nature does not exist,
That there are hills, valleys, plains,
That there are trees, flowers, pastures,
That there are rivers and stones,
But that there is no whole to which all this belongs,
That a true and genuine whole
Is a disease of our ideas.)

(Pessoa, *Collected Poems of Alberto Caeiro*)

POSTUPOK [поступок] (RUSSIAN)

FRENCH   *action, acte libre, engagement*

➤ *ACT,* and DASEIN, DRUGOJ, DUTY, ISTINA, *LIBERTY, PERSON,* PRAVDA, PRAXIS, RUSSIAN, SAMOST', SVOBODA, *TO BE*

The Russian word *postupok* [поступок] has been rendered in French by *action* and by *acte*. However, *action* corresponds to the Russian *dejstvie* [действие], and *acte* corresponds to the Russian *akt* [акт]. Both translations are thus insufficient. *Postupok* designates a singular, personal action that presupposes responsibility, not necessarily a morally good act, but an "ethical act." According to Mikhail Bakhtin's philosophy of the act, *postupok* is carried out from the position specific to each individual—what Sartre was to call *engagement*.

I. Action: From *Dejstvie* to *Postupok*

The Russian term *dejstvie* [действие], "voluntary manifestation of an activity," is the equivalent of the French *action*. Unlike *dejstvie*, *akt* [акт] refers to an action that is more technical than voluntary and connotes the action's completion (RT: *Tolkovyĭ slovar' zhivogo velikorusskogo iazyka,* 1:9). *Dejstvie* is the modern neuter form of the old elevated word *dejanie* [деяние], derived from the verb *dejati* [деяти], "act" (see RUSSIAN, "L'opposition diglossique en russe"). *Dejanie* corresponds to the Greek *pragma* [πρᾶγμα], and to the Latin *actus, actio* (RT: *Materialy dlia slovaria drevnerusskogo iazyka*, 1:800). In Old Russian *dejati* also meant "touch" and "speak" (Sreznevskiĭ, *Materialy*, 1:800–802), but these meanings have now disappeared. Until the beginning of the twentieth century, the term *postupok* [поступок] was presented in dictionaries as equivalent to *dejanie* (RT: *Tolkovyĭ slovar'*, 3:348; RT: *Etymological Dictionary of the Russian Language*, 409).

The word *postupok* comes from the Old Russian noun *postup* [поступ], "movement, action, act" (Sreznevskiĭ, *Materialy*, 2:1270) and, finally, the verb *stupat* [ступать], "to walk, pace." Etymologically, *postupok* thus means "the step one has taken." In contemporary everyday language, the term means "intentional action," "an individual's behavior" (RT: *Slovar' russkogo iazyka*, 3:326). Thus, even in its prephilosophical usage, *postupok* refers to a singular, personal action; it is thus the best translation of Greek *praxis*, in the sense of an individual's act (e.g., in Aristotle).

II. Three Levels of *Postupok* in Bakhtin

The contemporary philosophical meaning of *postupok* has been influenced by Mikhail Bakhtin's ethical existentialism. In his unfinished work, *Toward a Philosophy of the Act*, he connects the crisis in contemporary philosophy (he was writing in the early 1920s) with its inability to move beyond the limits of the theoretical world. According to Bakhtin, only the philosophy of the ethical act (*postupok*) can constitute a first philosophy capable of surmounting the split between culture and life.

Bakhtin elaborates the concept of *postupok* on three levels.

1. The absolute level combines singularity (*edinstvennost'* [единственность]) and participation (*pričastnost'* [причастность]). Bakhtin's starting point is the fact expressed by the assertion "I am." This fact has two

aspects, the singularity of individual existence—it is I who am—and its participation—I am to be.

> *Et ego sum* (*I ja—esm'* [И я—есмь]), I too, exist actually (*dejstvitel'no* [действительно]) . . . I, too, participate in Being in a once-occurrent and never repeatable manner: I occupy a place in once-occurrent Being that is unique and never-repeatable, a place that cannot be taken by anyone else and is impenetrable for anyone else.
>
> (Bakhtin, *Toward a Philosophy*, 40)

One must therefore understand the singularity of a person as his non-coincidence with everything that is not himself.

The word *esm'* in the expression *ja esm'* ("I am") is the archaic Slavonic (and therefore elevated) form of the verb *est'* [есть], the infinitive of which, *byt'* [быть], is the root of the word *bytie* [бытие] ("to be"). Moreover, *bytie* is the elevated term in the opposition *bytie/suščestvovanie* [существование] ("existence") (see ISTINA). To stress the absolute character of the fact of the "singular participation" of a person in Being, Bakhtin introduces the metaphor of the "non-alibi in Being" (*ne-alibi v bytii* [не-алиби в бытии]). Man has no moral alibi: he can escape neither his own singularity nor his unique place. It is on this non-alibi in being that the duty to act is based:

> That which can be done by me can never be done by anyone else. The uniqueness and singularity of present-on-hand Being is compellently [*sic*] obligatory.
>
> (Ibid.)

2. The level of existential choice is situated between responsibility (*otvetstvennost'* [ответственность]) and duty (*dolženstvovanie* [долженствование]). However, duty is not absolute in character. One can in fact choose to assume responsibility for one's own existence or to ignore it and become an impostor (*samozvanets* [самозванец]). Only the acceptance of responsibility creates duty.

> Duty is possible only where there is a recognition of the existence [*bytie*] of a singular person within himself. . . . The responsible act [*postupok*] is an act [*postupok*] based on the recognition of one's constraining singularity.
>
> (Ibid., 113)

3. The ontological level concerns the act (*postupok*) and the event (*sobytie* [событие]). The singularity of a person is definitively realized only in a responsible act:

> The act [*postupok*] constitutes once and for all the actualization of the possible in the singular.
>
> (Ibid., 103)

However, according to Bakhtin, the being in which I participate cannot be reduced to the world of my act alone. The ultimate subject of moral philosophy is "the being-event" (*bytie-sobytie* [бытие-событие]), the world of the intersubjective event. The Russian prefix *so-*, the equivalent of Latin *co-*, designates a common characteristic of being. By its etymology *sobytie* is "common being, common existence, co-existence." Bakhtin metaphorically actualizes the term *bytie-sobytie*:

> The real being-event [*bytie-sobytie*] is determined not in and by itself, but precisely in relation to my own constraining singularity: If the "face" of an event is determined from the unique place of a participative self, then there are as many different "faces" as there are different . . . [individual poles of subjective responsibility.]
>
> (Ibid., 45)

The whole set of personal worlds creates a unique event.

The word *sobytie* comes from the verb *sbyvat'sja* ([сбываться], "to be realized"). Another meaning that is clearly present in *sobytie* is thus that of the realization of the singular existence of the Self (see SAMOST'). It is only in the world shared with others that this realization takes place: in *sobytie* the individual makes his singular place a responsible step (*postupok*) toward others (see SVOBODA and DRUGOJ).

Thus the *postupok* is the responsible act through which a person participates in being. From the point of view of values, the *postupok* cannot be subordinated to the goals, desires, or needs of which it is the realization. Unlike the act considered by analytical philosophy, the *postupok* is a value in itself, that is, an ultimate value: "The act [*postupok*] is a final accounting, an ultimate, deepened conclusion" (ibid., 103). That is why, according to Bakhtin, only the *postupok* unites the world of culture with that of life.

POWER, POSSIBILITY

"Power" derives from Latin *posse*, which itself goes back to the adjective *potis*, meaning "powerful, master of" (on the Indo-European root **poti-*, which designates the leader of a group, family, clan, or tribe; cf. Gr. *posis* [πόσις], "spouse," *despotês* [δεσπότης], "master of the house," *potnia* [πότνια], "mistress"). However, the Latin verb, and in particular the impersonal *potest*, from which derived in the time of Quintilian the learned adjectives *possibilis* and *impossibilis*, created to translate Greek *dunatos* [δυνατός] and *adnunatos* [ἀδύνατος] (from *dunamis* [δύναμις], "strength"; see *DYNAMIC*), expresses, like the impersonal Greek *dunatai* [δύναται], "possibility" (*fieri potest ut*, "it may happen that"). Thus *pouvoir* operates in the area between, on the one hand, possibility as a logical category modality (*possibilitas*) that is distinct from the impossible, the contingent, and the necessary, and that is connected with potentiality as an ontological category (*potentia*) determining the real or the actual, and, on the other hand, power (*potestas*) in the moral and political sense, to establish a relationship with duty and authority. The interferences between these two major meanings, logico-ontological and ethicopolitical, within the diverse linguistics systems, are particularly noticeable in the entries DUTY and WILLKÜR, I.C.

I. Power, Possibility, Potentiality

A. Logical modality

On the expression of possibility as a category of modality, in its relation to negation and time, see, for example, ASPECT, INTENTION, *NEGATION, NOTHING,* PRÉDICABLE, PRESENT, PRINCIPLE, VERNEINUNG, WUNSCH.

Cf. *PROBABILITY* [CHANCE], and *DESTINY.*

B. Ontological modality

The "possible" is taken first of all in the sense of what is "potential" as opposed to what is actual: see *ACT, I* (esp. PRAXIS and FORCE, on the matricial difference *dynamis/ energeia* [ἐνέργεια]). Something that is "physically" possible satisfies the general conditions of experience: see *EXPERIENCE, IL Y A,* NATURE, *PHÉNOMÈNE* [ERSCHEINUNG]; cf. EPISTEMOLOGY. In a certain ontological perspective, possibility merges with reality (*realitas*): see in particular ATTUALITÀ, REALITY, RES ; cf. ESSENCE, SPECIES.

II. Power and Political Power

Power is nothing other than the ability to act and, more precisely, to act in an effective way in pursuing goals: see *ACT, II* [PRAXIS].

Political power designates the ability to make others act in a specific way, even if this requires coercion; thus it differs from authority: see *AUTHORITY* and HERRSCHAFT.

On the relation between *potentia* and *potestas,* power and violence, see MACHT; cf. LEX, PIETAS, RELIGIO. Generally speaking, power is of considerable importance in modern moral and political philosophy, which stresses freedom more than virtues and the ability to coerce more than authority: see *LIBERTY* [ELEUTHERIA, POSTUPOK, SVOBODA], *OBLIGATION* [SOLLEN], *VIRTUE* [VIRTÙ], WILL, WILLKÜR; cf. *DROIT,* LAW, MORALS, *STATE.*

➤ GOD, SECULARIZATION

PRAVDA [правда] (RUSSIAN)

ENGLISH	righteousness, justice, truth
FRENCH	*justice, équité, vérité*
GREEK	*dikaiosunê* [δικαιοσύνη]
LATIN	*justitia*

➤ *JUSTICE,* THEMIS, TRUTH, and *DROIT,* ISTINA, LAW, MIR, POSTUPOK, PRAXIS, SOBORNOST', SVET

The word *pravda* [правда], despite the unambiguous nature of the equivalents used to translate it: "truth," *vérité, Wahrheit*—designates not only truth but also justice. The accent falls chiefly on the latter meaning when we examine words that have the same root: *pravo* [право] (law), *spravedlivost'* [справедливость] (justice, equity), *pravosudie* [правосудие] (justice, correct judgment). But *pravda* is not a homonym: its meaning resists a complete separation of the notions of *istina* [истина] (truth) and *spravedlivost'* (justice), of theory and practice. *Pravda* is never used to designate scientific truth. We can gauge the effects of untranslatability by the fact that *pravda* is usually rendered by "truth," neglecting its initial semantic field: justice, legitimacy, law, equity.

I. Slavic *Pravda* and Indo-European "Justice"

The Slavic word *pravda* [правда] corresponds to the Greek *dikaiosunê* [δικαιοσύνη] and the Latin *justitia.* It is formed on the Slavic root *prav,* "straight, just" (RT: *Ėtimologicheskiĭ slovar' russkogo iazyka* [Etymological dictionary of the Russian language], 352). The most plausible etymology traces *prav* back to Indo-European **pro-vos,* related to Latin *probus,* "good, honest" (*probhus*), Sanskrit *prabhús,* "exceptional, superior," and Anglo-Saxon *fram,* "strong, active, courageous." In Old Church Slavonic, Bulgarian, Ukrainian, and Russian, the first sense of *pravda* is "justice" and the second "truth"; in Serbo-Croatian, *prâvda* means "legal prosecution, trial"; in Slovene, *pravdâ* means "regulation, law, legal action"; *pravda* in Czech and Slovak and *prawda* in Polish have analogous connotations. In contemporary Russian the word *pravednik* [праведник], "just man," goes back to Old Church Slavonic and corresponds to Greek *dikaios* [δίκαιος] ("just"), *hagios* [ἅγιος] ("saint"), *martus Christou* [μάρτυς Χριστοῦ] ("martyr to Christ"). To the antonym *nepravda* [неправда] correspond *adikia* [ἀδικία], *anomia* [ἀνομία], "injustice."

Logically, the word *pravda* should occupy a central place in the philosophical dictionary of the language to which it belongs. But if we try to find the article "Pravda" in the five-volume philosophical encyclopedia published in the USSR, we have to acknowledge its absence. Why? This silence, which distances itself from the title of the periodical *Pravda,* the official voice of the authoritarian regime, leads far beyond ideological considerations and the circumstances of place, time, or censorship, and allows us to take another approach to classical theologico-political problems. The historian and philosopher George Fedotov, who emigrated to the United States after the Second World War, offers the following explanation: "The Russian word *pravda* has a particularly rich meaning: it can mean 'justice,' 'righteousness,' and even 'truth.' And we certainly encounter it through its contrary, *nepravda* (injustice) at every step of the way in the annals of relations between powers" (*Russian Religious Mind*, 2: 171).

Translations do not betray us when *pravda* renders the Greek *dikaiosunê* in the Septuagint or *dikê* [δίκη] in Heraclitus or Sophocles (Antigone's *dikê* is rendered as *pravda*). Classical expressions such as "the sun of *pravda*"—*sol justitiae*—reflect a traditional ethico-cosmological analogy whose essence is revealed by the principle according to which "the world holds together thanks to the just." The inverse is presupposed to be true: the just themselves depend on the analogy between the order of the world (*mir* [мир]) and the order of the city so long as this analogy lasts. Once this traditional bond was broken by modern physics, the semantic stability of *pravda* was affected, and first of all, its proverbial practical character. In the standard dictionary of V. I. Dal', *pravda* is defined as "truth in action, truth manifested, the good; justice done, equity." In the examples Dal' gives, the accent is clearly on active participation and the act as such: "Practice justice and *pravda,*" "fight for *pravda,*" "live in accord with *pravda*"; and *pravdivost'* [правдивость] (a substantive derived from *pravda,* signifying conformity with *pravda* and usually translated by "veracity, sincerity") is explained as "complete adequation between utterance and action." Many expressions of this kind remain alive in the Russian language today, going

back to expressions that bear witness to the lasting influence of the first translations into Slavic of the liturgy, the psalms, and the Scriptures made by Cyril and Methodius in the ninth century, hundreds of years before the Latin Vulgate passed into other vernacular languages. The main instrument of literacy was the Book of Psalms, and learning to read conveyed this analogy between the order of the created world and that of the city.

■ See Box 1.

II. *Pravda* and the Gap between "Legality" and "Legitimacy"

The semantic development of *pravda* did not undergo the systematic and direct influence of Roman law. The limits of the word were not determined within a system of codified notions, so that a series of obstacles to radical inquiry into its relationships with jurisprudence in the strict sense of the term did not arise. But history provides unquestionable proof that these relations had all their meaning from the outset: *pravda* is a key notion in vernacular law and gave its name to the oldest collection of laws set down in writing by the East Slavs, *The Russian Pravda* (eleventh century). Although the modernization of legal terminology changed the semantics of *pravda*, its legal sense was not erased but given a superior status. At the same time that he asked Leibniz to draw up a system of social classification for his empire, Peter the Great ordered Feofan Prokopovich to define the emperor's absolute legal power in a document entitled *The Pravda of the Monarch's Will* (1722; we see in this text the direct influence of Hobbes and Pufendorf). Can *pravda* in this title be rendered as "legitimacy"? This translation was to be contested more than once. In response to the absolutist version of a radical rationalization of law, there followed a no less radical reaction on the part of the Russian Jacobins led by Colonel Pestel (hanged 1825), who entitled his constitution *The Russian Pravda*. But can *pravda* be translated here by "constitution"? This historical question was answered in the negative by the unsuccessful attempts to limit the monarch's *pravda* constitutionally—until the revolution of 1905.

Questions of this kind do not reduce the philosophical and philological problems of translation to historical and political problems. By relativizing our representation of the immutable essence of the word *pravda*, we discover its now concealed semantic dimensions, which have remained at the stage of unrealized possibilities. Untranslatable today, they represented potentialities of translation in the network of European idioms; but the course of revolutions has led to their not being actualized. However that may be, confronted by this massive forgetfulness, it is important to emphasize that the original legal meaning of the word *pravda* has passed through all sorts of vicissitudes, including the 1917 revolution's systematic destruction and abolition of the Czarist regime's legal institutions and the traditional linguistic representations of justice.

III. The Bipolarity *Pravda/Istina*

Law and ethics designate practical philosophy as the domain for the positive application of the notion of *pravda*; the negative definition of the limit of this notion's use is provided by the theory of knowledge and the natural sciences: the latter operate with *istina* [истина] and not *pravda*.

Modern sciences sometimes reject the word *pravda* and sometimes eliminate its immediate semantic context, as in "promises, oaths, injunctions, commands, decrees, regulations, laws, contracts, judgments, witnesses" (Uspensky, *Jazykovaja situacija Kievskoj Rusi*). Ancient philosophy broadened the domains in which the word "law" (*nomos*, [νομός]) could be applied by transferring it by analogy from the *polis* [πόλις] to the *kosmos* [κόσμος], from the human world to the natural world. Starting in the seventeenth century, under the influence of advances in mechanics, the analogy was turned around: the concept of "physical" law, following the demonstration of its unprecedented effectiveness in describing material objects, began to determine the conception of justice and "social physics." Naturalism was erected into a social project. Of the different aspects of action—"who?" "where?" "when?" "how?"—naturalism absolutized the one most distant from humans and circumstances: "what (to do)?" The leveling of the dimensions constitutive of *pravda*—references to the person and the situation ("opportunity" [καιρός], see MOMENT, II; Aristotelian "equity" [ἐπιείκής], see THEMIS, IV)—made *pravda*

1

The Slavic liturgical language

In the twentieth century R. Jakobson and N. Trubetskoy demonstrated the fundamental linguistic and liturgical role played by Cyril and Methodius in constituting the lexicon of the principle Slavic notions. Their hermeneutics was explicitly developed in the course of the controversy in Venice in 867 regarding "the heresy of three languages," in which translation into the Slavic language was accused of infringing on the sacred character of the three "untranslatable" liturgical languages: Hebrew, Greek, and Latin. The innovation of Cyril and Methodius was taken over in Hussite translations (fourteenth century),

had repercussions on vernacular translations throughout Europe at the time of the Reformation, and finally led to the liturgical reform adopted by Rome in the twentieth century, as well as to the proclamation of Cyril and Methodius as patrons of united Europe (1980).

But what is paradoxical today is the situation of the Slavic language itself (in which an important role is assigned to the word *pravda*): just as in the case of Latin until recently, a discussion is going on concerning Slavic's untranslatable character (see RUSSIAN). In the precise case of the word *pravda*, its liturgical use has retained, in the language of

Dostoevsky and Pasternak, traditional semantic strata that disappear when it is translated by the "secular" words "justice" and "truth."

entirely dependent on an *istina* interpreted instrumentally. But that did not eliminate the bipolarity between *istina*, which corresponds to the question of "being," and *pravda*, which corresponds to the question of "ought to be." For instance, *istina* notes the "physiology" of a disease affecting an individual or a society; *pravda* moves to the question of what must be, in opposition to what must not be. The necessity of actively realizing *pravda* takes on a particularly menacing character when it is reduced to the practical application of an already known *istina*. Separating *pravda* from the concrete "who" (fundamentally inaccessible) and from the concrete "where" (which localizes knowledge), made it more abstract and manipulable. At the turn of the twentieth century, the "conflict of faculties" ended with the belligerent domination of the natural sciences and the Russian nihilists' notion that it was possible to apply to society schemas as rigid as Mendeleev's periodic table of elements. This model represses the semantic plurality of the term *pravda* illustrated by the proverb "to each his own *pravda*."

IV. The Short-Circuit between *Pravda* and Violence

The revenge of *pravda* in a space geometricalized by science takes on a moral and universal character. Tolstoy's protest against violence is not limited to a devastating criticism of the police state, war, and the military but is also directed against the judicial system, whose function of limiting violence cannot be performed without resorting to violence. What is required is the implementation of a radical separation between the *pravda*-pardon of the Gospels and the *pravda*-vengeance of the pagans. The petition that Solovyov and Tolstoy addressed to Alexander III in 1881 on behalf of regicide terrorists provides a historical example: "Using violence to render justice means admitting that *pravda* itself is powerless. Contemporary revolution shows by its acts that it acknowledges that *pravda* itself is powerless. But in reality *pravda* is strong, although the violence of contemporary revolution betrays its impotence" (Solovyov, *Smysl sovremennyx sobytij*, 38).

The abolition of slavery in America and in Europe (including Russia, in 1861) explains in part the elevated level of hopes for justice and goodwill during this period. Solovyov ironically sums up this irrational leap into naturalistic argumentation in the following syllogism: "Man is descended from the apes, therefore let us love one another." The fear that the "sources of the self" (to adopt Charles Taylor's title) might go bankrupt or become insolvent is connected with the gap that opens between the moral precept and the one who formulates it in a "sermon on the mount," on the one hand, and the space in which people try to put it into practice, on the other. The major factor of space—from the Baltic to the Pacific—has a considerable influence on the topos of *pravda*, subjecting it to a linear logic and the leveling that we find in the revolutionary *tabula rasa*. Geographers have calculated that the dimensions of Nicholas II's empire amounted to one-sixth of the earth's surface. The globalization of an egalitarian system of justice in this world without limits and borders sheds light on the implacable logic described in Dostoyevsky's *The Devils* and put into action by Bolshevism. The determination expressed by his characters, who set out to erase evil as such on the continent, does not

lead to the emergence of "the new man" but is transformed into vengeance taken on anything that resists them. On the way to revenge, justice deteriorates into mere vengeance. Twisted in this way, *pravda* does not cut the Gordian knot of violence but finds itself still more tightly bound by it, losing its natural ally, freedom.

All or nothing, thesaurus or *tabula rasa*, those are the two poles of the controversy between Solovyov and nihilism. The argument of Solovyov's work *Opravdanie dobra* (1896 [The justification of the good]) seeks to demonstrate the conjunction of civil liberty (law) and freedom of conscience (morality) in *pravda*. Opposing Tolstoy's juridical nihilism, Solovyov writes concerning *pravda*:

> Here we have a term which alone embodies the essential unity of the juridical and moral principles. . . . In all languages, moral and juridical notions are expressed either by the same terms or by terms derived from the same root . . . *dikê* and *dikaiosunê*, *jus* and *justitia*, as in Russian, *pravo* [право] (law) and *pravda*, in German *Recht* and *Gerechtigkeit*, in English *right* and *righteousness*. The two meanings are distinguished by suffixes. Cf. also the Hebrew ṣèdèq [צֶדֶק] and ṣedāqāh [צְדָקָה].

> (Solovyov, *Justification of the Good*, 317)

Solovyov defines *pravda* as "the right relation toward everything" (ibid., 136); it is the universal principle of his philosophical system.

For his book *L'Idée russe*, written in French, Solovyov quotes and translates the Slavophile Axakov's judgment regarding the transformation of the administrative structures of the church into a department of the state apparatus: "For the ideal of a truly spiritual government (*pravlenie* [правление], inner *pravda*) has been substituted by that of a purely formal and external order (*pravda*, *ordre*)" (191). Why did Solovyov translate *pravda* by the French word *ordre*? The translation difficulty arises in part from the noncorrespondence between two incongruent elements: on the one hand, external and internal *pravda* in Russian, and on the other hand, *justice-institution* and *justice-vertu* in French. In an article written in German, "The Russian Worldview" (1925), Siméon Frank, the greatest of Solovyov's disciples, emphasized that

> The Russian language has a very characteristic word that plays an extremely important role in the whole structure of Russian thought—from the popular way of thought to creative genius. This untranslatable word is *pravda*, which designates simultaneously the *istina* and moral and natural law, just as in German the word *richtig* designates something appropriate or adequate on both the theoretical and the practical levels.

The unity of *pravda* and *pravo*, broken and presented as archaic by the nihilist point of view, was reconstituted by Solovyov and Frank. In response to the charge of archaism, they undertook an archeology of *pravda*.

V. Projects Seeking to Move beyond the Theory/ Practice Opposition with the Help of *Pravda*

In the modern period the untranslatability of the word *pravda* is connected with the separation between the *vita*

activa and the *vita contemplativa* (Hannah Arendt). The invention of "technology" (of the concept and of the phenomenon, as is shown by the school of Alexandre Koyré) is determined by the fact that the paradigm of the divergence between *technê* [τέχνη] and *epistêmê* [ἐπιστήμη] in Plato and Aristotle is replaced by that of their convergence in Descartes and Bacon. The axiomatics of "practical philosophy" and of basic concepts is transformed by terminological "practicism" as the decisive criterion of scientific theories and ideological doctrines. Dependence on a technological invention like the printing press paves the way for a political instrumentalization of *pravda*.

After Kant's two *Critiques*, setting rigorous limits to "theoretical reason" and "practical reason," three paths leading toward their synthesis emerged in European philosophy: the aesthetic-anthropological (Schiller), the politico-speculative (Hegel), and the socio-historical (Marx).

a. The aesthetic synthesis of Schiller's Russian followers tended to unify practical good and theoretical *istina* within the concept of *pravda*: that is the specificity of the "message" of the Russian novel and the leitmotiv of literary and social criticism (beyond the cleavages between conservatives and revolutionaries). The way in which N. K. Mikhailovsky formulated this idea has gone down in the annals of the radical intelligentsia:

> Every time the word *pravda* occurs to me, I cannot help marveling at the extraordinary beauty it contains. This word exists, it seems, in no other European language. Only the Russian language, it appears, designates truth and justice by the same word, so that they seem to merge in a grandiose unity.
>
> (Mikhailovsky, *Écrits*)

b. The Slavic Hegelians' political synthesis tends to unify truth and justice in the concept of the state. But while in Germany the state is defined by the philosophy of right (*Recht*), in Russia it is defined by the philosophy of *pravda* (legitimacy-justice). The short-circuiting of the concepts of state and *pravda* characterizes the utopia of the right-wing Hegelians. Thus the ideologues of "Eurasianism" reconceptualized *pravda* in statist terms. In 1921 the Eurasianist historian M. Shakhmatov concluded his study "The Pravda State (Essay on the History of Statist Ideals in Russia)" (in *Evrazijskij Vremennik* [Eurasian annals], 4 (1925): 304) with the following diagnosis:

> Contemporary Europe has moved away from the "*Pravda* state." Some of its elements have been preserved only in England, where religion and law, law and ethics, have not yet been completely separated.

This kind of diagnosis conflates two orders of "untranslatability." The rationalization of the jurisprudence of various European traditions has not made the concepts *pravda/Recht/*"law" identical (whence the reference to a "traditional" England; see LAW). In addition, within the limits of the Russian language, one cannot formulate *pravda* in juridical terms, which in Europe are determined by the separation of religion, morality, and law, and especially of force and law.

c. "The unity of theory and practice" proclaimed by Marxism-Leninism is the main cause of the latter's success in Europe, which seeks in vain the aforementioned unity. Marx returned the Aristotelian concept of *praxis* to the center of philosophy, reorienting it toward a "technology of history." Marxism promised humanity that it would make political action intelligible in the present and historical theory intelligible in the past and the future, and it replaced the Bible in the libraries of the intelligentsia. But at the same time the biblical notion of *pravda*, which was full of forgotten eschatological promises, retained for the Russian intelligentsia its value as a symbol of a new synthesis. After the 1905 revolution it was subjected to criticism by thinkers who had broken with Marxism, such as N. Berdyaev, P. Struve, S. Bulgakov, S. Frank, et al. To the intelligentsia's *pravda,* Berdyaev opposed the "philosophical *istina*" and called for a search for a different synthesis, "a synthesis that responds to the intelligentsia's legitimate and positive need for an organic unification of theory and practice, of *pravda-istina* with *pravda-justice*) (Berdyayev, "Intelligentskaïa pravda," 29). But in accord with Lev Shestov's pessimistic analysis, *pravda* is helpless to resist the expansion of Utopia, that is, of a system of hypertheoretical responses to hyperpractical questions.

VI. The Difficulties of Retroversion: Justice-*Pravda*-Truth

Introduced by Saint-Simon and Fourier, the expression "social justice" is rendered in Russian by *pravda*. A century of the development of revolutionary ideas was also to confer on both the social idea and its lexical form a semantic freight absent in Western sources. In the nineteenth century, the word *pravda*, even without the adjective "social," was loaded with an explosive connotation. It was a challenge to the old semantic order. This connotation is easily discernible in what Dostoevsky wrote when he was a young follower of Fourier; it is modified substantially, though it has not entirely disappeared in his last works, where he warns against the revolutionary obsession. It is around the word *pravda* that the web of the (meta)juridical trials in *Crime and Punishment* and *The Brothers Karamazov* is woven. *Pravda* provides the axis of the "Pushkin speech" (1880), which is considered Dostoyevsky's intellectual testament (Heidegger's "European Nihilism," for example, opens with a quotation from this speech). If we take into account the major semantic enrichment of the notion, retranslating *pravda* into French by resorting to the initial concept of "social justice" would be reductive and unacceptable. But translating *pravda* into French by *vérité* is an example of "untranslatability" that deprives the reader of the references that intersect in the search for "justice" in France and in Russia (francophone Russian intellectuals cross French ideas with Old Church Slavonic). Dostoyevsky writes:

> Truth [*pravda*] is not outside yourself, but in yourself; find it in yourself, subject yourself to yourself, dominate yourself yourself, and you will see the truth [*pravda*]. It is not in things, this truth [*pravda*], it is not outside you or somewhere beyond the seas, it is above all in your own work on yourself. Overcome yourself, repress yourself—and you will be free as you have never dreamed

of being free, and you will undertake a great work, and make others free, and find happiness, for your life will be filled with joy and you will finally understand your people and its sacred truth [*pravda*].

(Dostoyevsky, *Diary of a Writer*, 1356)

VII. *Pravda*: A Word That Has the Force of Law and That Goes beyond the Law

As a universal laboratory always in search of *pravda*, literature has powerfully contributed to shaping the idea: the "word" (*slovo* [слово]) replaces the judge and the supreme law (note that *slovo* is an "untranslatable": it means both "word" and "discourse," "address," "saying," and refers back to *logos*).

"Starting with Gogol, Russian literature sets out in quest of *pravda*, and teaches us how to achieve it" (Berdyayev, *Origins of Russian Communism*). Vladimir Solovyov said that, before the defeat at Sevastopol, Gogol's *Dead Souls* was for Russia the "Last Judgment." The notion of *pravda* was then associated with the Inspector General (*Revizor*) in the old Czarist regime. *Pravda*, like the Inspector General, penetrates all the cells and affairs of the capital and the provinces of the empire, revealing his analytical power and imposing his fundamental criteria. *Pravda* and *Revizor* travel incognito. "One must not cheat with words"—this maxim of Gogol's was used by Solovyov as an epigraph to the article written toward the end of his life about the question of freedom of conscience in the Russian Empire. The imbroglio of lies that characterized the relations among the state, the church, society, the secret police, literature, censorship, the universities, and the educational system became particularly unbearable in light of the judgments made by Gogol, Dostoyevsky, Leskov, Saltykov-Shchedrin, Tolstoy, and Chekhov. The paralysis of the legal system and the imperial government's tendency to infringe the law at all levels of the administrative hierarchy much more radically than in other European cultures led to distrust of the judicial system, whereas confidence in verbal judgment increased. The word that does justice—*pravda*—is not presented as a commentary on or a complement to existing law, or even as its competitor, but as a tribunal in the absence of law, as the legislator of an alternative justice. Assigned this function, the word is endowed with new potentialities revealed by the challenges and ordeals of Russian and Soviet history; for the same reasons, it is less developed than it is in countries that have not experienced totalitarianism. This is a historical reason for the difficulty of translating *pravda* as the uprightness of verbal judgment, of the word invested with the power to make final, authoritative decisions.

Solovyov sought to examine from a philosophical point of view the theme of decision-making responsibility that constitutes the (non)correspondence of word and action in great empires. According to him, the Second Rome, the thousand-year-long Byzantine Empire, fell because of the contradiction between a pagan conception of the state inherited from the First Rome and the commands of Christ, affirmed in words but ignored in acts. It was this same contradiction that deprived Ivan the Terrible's "Third Rome" of legitimacy. According to Solovyov, Peter the Great's revolution destroyed less the organic unity of old Russia than

it unmasked the hypocrisy concealing the contradiction between pious words and impious actions. The concept of contra-diction (*protivo-rečie* [противоречие]) thus recovered its initial practical meaning (more concrete than in Hegelian logic). *Mutatis mutandis*, we can say that for *pravda* the "criterion of contradiction in practical philosophy" established by Solovyov is just as fundamental as the Aristotelian principle of non-contradiction is for *istina* in theoretical philosophy.

Solovyov reintroduced, above and beyond German idealism, the initiative of carrying out the mutation of European practical philosophy; according to him, this project went back to Patristics, from Origen to Saint Augustine and Maximus the Confessor—in numerous Slavonic translations of Pseudo-Dionysius, *Pravda-Dikaiosunê* is one of the names of God. Moreover, we must emphasize the radical difference between this project and those of Kierkegaard and Nietzsche, which are analogous to it in other respects, seeking the transformation of Western metaphysics. The point of departure for Solovyov and Dostoyevsky is not the isolated individual whose freedom breaks the bonds uniting people to each other and appears to be "irrational" with regard to universal reason but the verbal relationship between free beings, the verbal bond that counts on shared freedom and on a life open to the paradox of *pravda*.

VIII. *Nepravda*: Principle and Effect of "Newspeak"

Nepravda is the key word that allows us to characterize an ideological regime that systematically falsifies its discourse. In his novel *1984* George Orwell gave a precise description of the fundamental relation that links *nepravda*—lawlessness—to terror directed against traditional "untranslatabilities" and against formal logic (on the pediment of the "Ministry of Pravda," we can read the slogan "War is Peace"). The path that leads to social arbitrariness passes by way of a semantic mutation of the vocabulary. The cleavage between two words derived from the same root, *pravo* (law) and *pravda*, is the result of the implementation of Soviet newspeak. In the twentieth century remarks concerning the original meaning of *nepravda* ("crime, infraction of the law") disappeared from dictionaries. Dal''s dictionary (1881) has this to say about *nepravda*: "any illegitimate, violent action contrary to conscience; vexation, unjust judgment, iniquity. . . . Latin equivalents: *injuria, injustum, improbitas, inaequitas*." But Dal' explains the change in *nepravda* and *pravda*—which he regards as contemporary:

The meaning of these words has been deformed almost before our very eyes, because now they have become synonyms of "lie" (*lož* [ложь]) and "truth" (*istina*). . . . But originally *istina* referred solely to intellectual notions, while *pravda* referred to moral qualities, and that is why our first body of laws was called *The Russian Pravda*.

(Dal', *Tolkovyĭ slovar'*, 2: 529)

What is emphasized here is a specific historical stage in the rationalization of *pravda*, the breaking of its ties with the juridical and moral spheres; these ties have been significantly loosened but are still perceptible in the uses of its antonym. In the article "Criminal Act" in Brockhaus and

Efron's encyclopedic dictionary (RT: *Entciklopediceskij slovar'* [Encyclopedic dictionary], vol. 25), "crime" and *nepravda* are considered equivalents, specifying the forms of juridical *nepravda*: criminal *nepravda* and civil *nepravda*. Soviet dictionaries completely rejected the juridical sense of *nepravda* and reduced its moral content to a minimum. We might say that the extreme narrowing of the word's meaning corresponded to an extreme broadening of the reality of *nepravda* in a criminal state. In response to the Soviet dictionaries, George Fedotov wrote:

> The word *pravda* can reply to those who have not totally forgotten the meaning of this word. The *pravda* that is on the way to exile opposes participation in the general *nepravda*, in unjust proceedings, edification, work, or deeds at the bottom of which lies a fundamental *nepravda*.

> (*Tiažba o Rossii*, 200–201)

IX. Exile for *Pravda, Philo-dikaia, Philo-xenia*

The refusal to participate in a "collective *nepravda*" organized in a systematic fashion through the implication of everyone in a collective crime and responsibility is the initial act of George Fedotov's philosophy of exile. He adds a particular topological accent to the ancient and modern theme of the exit from the totalitarian "cave," that of "exile for *pravda*":

> It is easy to be exiled for *pravda*; but it is difficult to live for *pravda* in exile. *Pravda* is not like statues of the gods that one can take along when fleeing Troy in flames. It has to be permanently vivified, felt again and again in the heart and mind. Otherwise it withers, leaving only a shell of desiccated words.

> (Ibid., 203)

How can one reply when words like "freedom," "democracy," "equality," and "justice" were so discredited during the period between the two world wars? One response, a difficult one, is exile, as an act and as an object of reflection, as a historical phenomenon specific to the twentieth century, that of "displaced persons." Hannah Arendt expressed her high esteem for Fedotov's thought in her book *The Origins of Totalitarianism*, and his liberal philosophy and critique of Soviet pseudo-*pravda* were developed in America by M. Karpovitch and M. Malia. In the liberal tradition the reestablishment of the connection between freedom and *pravda* (after their divorce in Marxism-Leninism) takes on a decisive importance, even if its price is exile. Fedotov analyzes the historical relevance of the Gospels' encouragement of "those who are persecuted in the name of justice [*pravda*]." "Exiled" (*izgnannye* [изгнанные]) and "persecuted" (*gonimye* [гонимые]) are words that have the same root in Russian. The same goes for the two kinds of emigration, the one that moves "toward the outside" and the one that moves "toward the inside." The topology of exile manifested externally, visible to all, discovers and offers a chance to reveal to the world the vast, invisible archipelago of "internal exile." Its reality is denied by the ideologues of the new regime and written off by Western adversaries of communism. In both cases, the revolution's *tabula rasa* is simply accepted as a given recognized by everyone. Fedotov deconstructs this a priori assumption that serves as the basis for all debate about communism. Instead of discussing the claims made about this *tabula rasa* that was the USSR, covering about one-sixth of the planet's surface, Fedotov examines it as a palimpsest and deciphers the lines and meanings that have been effaced. Hegelians on both the right and the left (A. Kojève, G. Lukács) followed the course of the Absolute through history by reading the collective letters published in the newspaper *Pravda*; Fedotov, on the contrary, scrutinized the "effaced" and silent destiny of those who, despite the party's orders, did not sign these letters, who crossed their names off the lists of the historical *nomenklatura*, who deprived their families of any place in the sun of Humanity. The rigorous distinction between the concepts of the "sense of history" and *pravda* gave these people effaced by the winners' history a right to exile. "The *Pravda* of the Defeated" is the title of a programmatic article of 1933, in which Fedotov contrasts two opposed philosophies of history: the Hegelian and the Augustinian. The reexamination of the latter is guided by an axiom: the smallest movements toward good or evil are impossible to erase. Hospitality accorded to those who have no place in either the political system or the idealist system is situated in a hermeneutics of the palimpsest: "To bet on those who are today without power, who hide in 'the caves and burrows' of Soviet life, on those whose voices do not reach us, but of whom, in truth, neither Russia nor the 'the entire world are worthy,' let us dare to bet on these unknown people, in full awareness of the risk we are taking: that is Pascal's wager, the wager of faith, the wager without which no one's life is worth living" (*Tiažba o Rossii*, 313).

An internal emigré, Osip Mandelbaum established the link between exile in the name of *pravda* and the topological analysis of Dante's *Inferno*. The word *pravdo-ljubie* [правдолюбие] (*philo-dikaia*) refers us to a semantic matrix analogous to the one Émile Benveniste described in the combination of *philos* and *xenos* (see LOVE). The paradigmatic example of *philo-dikaia* was provided by the radical hospitality granted by the Glagolev family in 1941, in Kiev, to a Jewish family in danger of being shot by the Nazis. The Glagolevs gave their guests their house, their passports, and their name. An important document about this has been published: Father Alexis Glagolev, *In the Name of His Friends* (*Novy Mir*, no. 10, 1991). Here hospitality becomes synonymous with solidarity in exile. Paul Celan used Marina Tsvetayeva's formulation of *philo-dikaia* as an epigraph: "Poets are *youpins*." Here *philo-xenia* and *philo-dikaia* are one and the same thing. Such a topology of *pravda* is at the antipodes of the utopia of the "pravda-state."

X. The Paradox of *Pravda*

In the American translation of the *Great Soviet Encyclopedia* in thirty-five volumes—which is among the great dictionaries, being both a reference work and a unique testimony to the period of the cold war—the word *pravda* is translated as "truth." No reference is made to justice, right, or righteousness. This biased translation of a biased article devoted to the newspaper with the largest circulation on earth represents the tip of the iceberg: the British called this encyclopedia "lies in alphabetical order."

At the opposite of this pole of lexicographic falsification, we find the simple absence of an entry for *pravda* in the five-volume *Philosophical Encyclopedia.* The figure of the unsaid is an expressive one, the sign revealing the situation of the hostage concept in the post-Stalinist vocabulary. The void where the article on *pravda* should be in the *Philosophical Encyclopedia* can be understood not as a lacuna in a text invested with ideological authority but as a rip or tear and a manifestation of the palimpsest on *pravda* on which Fedotov, from his exile in Paris, made his Pascalian wager.

The catastrophe in Chernobyl in 1986 and the official lies about it revealed to millions of people the Achilles' heel of the Soviet system: "the fear of *pravda*," "pravdaphobia" (Struve, *Pravdobojazn'*, 101–3). Who is afraid of *pravda*?—that is the slogan of the liberating discourse of *glasnost'* [гласность] (another untranslatable term, made ordinary by the "public voice" or by "transparency"). We are witnessing the collapse of the experiment with the "artificial eclipse" of the sun of *pravda*. Justice-truth regarding communism not only brings out the fundamental contradiction between words and acts; more profoundly, there is the contradiction between the word and its double in "newspeak." The collapse of the word-idol leads to that of the word-usurper, which excludes verification by means of question and answer. Elaborated by the works of M. Bakhtin and S. Averintsev, the critique of monologic discourse—the rejection of the other—and the philosophy of dialogue enter into civic discourse.

The empires of the twentieth century have not erased once and for all dialogue and tension between the two constitutive poles of Europe: the *istina* of Athens and the *pravda* of Jerusalem. Socrates's ability to deliver a speech about truth (*istina*) during his trial presupposed a real legal framework that forbade his being interrupted by blows or by torture. In Jerusalem *istina* presupposes *pravda* in a significantly different sense. Like *pravda*, the Hebrew word *'Èmèt̲* combines the meaning of "truthfulness" (*istinnost'* [истинность]) with that of "accuracy" and "justice" (Averintsev, *Sophia-logos*, 396). The corresponding French terms, *justesse* and *justice*, show the lasting influence of the translation of the Psalms. French leaves open the possibility of this semantic identity, for example in the expression "*c'est juste*," meaning "it is true." But the contrast between this marginal performative in French and a fundamental notion in the Slavic languages shows what a great philosophical task is faced by the translator. The paradox of *pravda* is not limited to the declination of justice and truth in a single word. The meaning of *pravda* is anterior to the distinction between the practical and the theoretical. But the bipolarization that characterizes these notions today leads to the formation of a discourse incapable of including the translation of the word *pravda*. Its resistance to translation indicates that *pravda* is irreducible to concepts and refers us back to the philosophical tradition of *docta ignorantia*. In his work *The Unknowable*, Simeon Frank demonstrates the link uniting *pravda* with this tradition, which goes back to Nicholas of Cusa and the writings of Pseudo-Dionysius. *Pravda*'s apophatic horizon here encounters Socrates's awareness of his ignorance. The classic formula *inattingibile inattingibiliter attinguntur* (understanding through an awareness of the incomprehensible character of something) describes *pravda.* The criticism of the limits of translation is transformed into a way of understanding the untranslatable. Frank writes:

> We cannot speak of a superior *pravda*, express it as such with our concepts, because it speaks about itself, expresses and reveals itself silently; and we have neither the right nor the ability to express this self-revelation adequately by means of our thought; we must remain silent before the grandeur of *pravda* itself.

<div align="right">(Frank, Unknowable, 313)</div>

Hegel described the modern world as a way of life in which the newspaper had been substituted for the morning prayer; in the twentieth century the newspaper *Pravda* tried to put into practice the ultimate consequences of this substitution or "revolution in communication." To those who seek to interpret the postcommunist, atheistic world, the problem of the untranslatability of this key concept suggests the following strategy: not offering an overall interpretation of the "totalitarian system," not deducing the meaning of the word *pravda* from the concept of "totalitarianism," but reversing the point of view—questioning ideologies that claim to include theory and practice, past and present, *vita contemplativa* and *vita activa*, by opening up to the paradoxes of *pravda*.

PRAXIS [πρᾶξις] (GREEK)

ENGLISH   praxis, practice, action, agency
FRENCH   *praxis, pratique, action*
GERMAN   *Praxis*
ITALIAN   *prassi*

➤ *ACT* [ATTUALITÀ, TATSACHE], AGENCY, ART, *EXPERIENCE,* EXPERIMENT, I/ME/
MYSELF, LOGOS, PATHOS, PLEASURE, *POETRY* [DICHTUNG], *PRUDENCE,*
SUBJECT, *THING* [RES], VIRTÙ, VORHANDEN, WORK

The term *praxis* [πρᾶξις]—always seen in modern languages as imported from Greek, even though German and to a certain extent Italian have naturalized it (*die Praxis* [with a German plural, *die Praxen*], *la prassi*)—is central in contemporary philosophy, where it designates, depending on the case, an alternative to the points of view and values of being of *logos* [λόγος] or language, of theory or speculation, of form or structure, and so on. It refers, then, either to an Aristotelian version (*Nichomachean Ethics*) that opposes it to *poièsis* [ποίησις] and relates it to an ethics and a politics of "prudence" (*phronêsis* [φρόνησις]), or to a Marxist version (*Theses on Feuerbach*) that identifies it with the effort to transform the existing world rooted in labor and class struggle (*umwälzende* or *revolutionäre Praxis*). Between these two poles there is a Kantian version of the practical element of action (*das Praktische*) and the "primacy of practical reason," which, by assigning to philosophy an infinite task of moralizing human nature (a task called "pragmatic" [*pragmatisch*]), consummates the break with naturalism and prefigures the dilemmas of collective historical action. If all of these points of view continue to provide indispensable reference points for philosophy, that is because they correspond to ways of thought, to irreducible political and metaphysical choices that nonetheless constantly intersect and confront one another: in this way, an "ambiguity of *praxis*" has been constituted transhistorically and poses a problem for philosophy that is just as unavoidable as the "ambiguity of being."

Two key problems arise from *praxis* [πρᾶξις]. First, should it be translated? Second, to what language does it belong, Greek or German? These two problems are not really separable: they define an exemplary process of appropriation that essentially comes down to the Marxist transformation of the Aristotelian category, by way of a Kantian or post-Kantian problematics. Most of the connotations attached to the use of *praxis* now come not directly from the Greek source, but from German uses of the term, especially post-Marxist ones, that have been sufficiently naturalized to constitute an autonomous reference competing with the Greek or overdetermining its heritage to the point of sometimes making paradoxically difficult a "Hellenism" that might otherwise seem unproblematic, as in the case of Hannah Arendt.

We will examine first Aristotle's constitution of the *praxis-poièsis-epistêmê* [πρᾶξις-ποίησις-ἐπιστήμη] triad and its transformation into *praxis-poièsis-theôria* [πρᾶξις-ποίησις-θεωρία], in order to determine its anthropological meaning. Then we will show how the Marxist thesis—which argues that *Praxis* provides a criterion of truth or reality for both the idea and the social power of emancipation—condenses the tensions of a "philosophy of practice" developed by German idealism in the wake of Kant. We will also note indications of another classic way of connecting "theory" with "practice" that stretches from Francis Bacon to positivism (Auguste Comte), by way of the French Encyclopedists. Finally, we will compare a few

great twentieth-century returns to the problem of *praxis* (including projects for reconstituting a "philosophy of praxis") that either try to fulfill the promises of Marxism (Georg Lukács, Antonio Gramsci, Jean-Paul Sartre, and, by antithesis, Louis Althusser), or seek to propose an alternative to its political conception (Jürgen Habermas, Hannah Arendt), or to modify the term's semantic value in order to locate it, along with nature, morality, and history, in the element of institution and usage (Ludwig Wittgenstein).

I. The Aristotelian Conceptualization and Its Ambivalence

The Greek noun *praxis* is one of the nouns of action corresponding to the verb *prassô* [πράσσω] (to go all the way the end of, to cross; and then to complete, to accomplish; and, more generally, to do or to act), alongside *pragma* [πρᾶγμα], which is more concrete: *praxis* is usually rendered in English as "practice," "experience," "custom" (in French as *action* [action], in the sense of *exécution*, *entreprise*, *conduite* [execution, enterprise, conduct]), and *pragma* by pragmatics (in French, *chose*, *affaire* [thing, object], or, in the case of the plural, *ta pragmata*, as *les faits* [facts] but also *les affaires*, *les choses de la vie* [business, the things in life]). See in RES, Box 1.

All uses of the term *praxis* in philosophy (its translations and nontranslations) are determined by the powerful Aristotelian concept introduced in the *Nicomachean Ethics*, where it is one of the main themes. It is by virtue of the privileged position of *praxis* in Aristotle's thought that Aristotle's work ended up shaping the "practical philosophies" centered on an ethical concern with a teleology of the good (*telos* [τέλος]), (*agathon* [ἀγαθόν]) with all of the compounds with *eu* [εὖ], and with individual and collective "value" or "excellence" (*aretê*) [ἀρετή], traditionally translated as "virtue." At a certain point, "practical philosophy" was transformed into "the philosophy of practice": a shift made possible by the heft of the classical term *praxis*.

A. The system of Aristotelian *praxis*

Praxis is inseparable from the ramified uses of the verb *prattein* [πράττειν] and its qualifications as established in the first lines of the *Nicomachean Ethics*: "*ta prakta* [τὰ πρακτά]," actions (1.1, 1094a1); "*to d' eu zên kai to eu prattein* [τὸ δ' εὖ ζῆν καὶ τὸ εὖ πράττειν]," good living and good acting (1.1, 1095a19); "*hoi de charientes kai praktikoi* [οἱ δὲ χαρίεντες καὶ πρακτικοί]," men of culture and men of action—practically synonymous with political action: "*hoi politikoi* [οἱ πολιτικοί]" (1.3, 1095b22); "*to dikaiopragein* [τὸ δικαιοπραγεῖν]," acting in accord with justice (1.8, 1099a19); and so on.

These uses have two basic types of extension and intension. On the one hand, there is the "broad" type, which we would today call "formal," in which *praxis* connotes everything that has to do with action and operation (in contemporary philosophical English, the term "agency" is used) and that consequently is opposed to mere dispositions and to an "inactive" or speculative kind of life: "*epeidê to telos estin ou gnôsis alla praxis* [ἐπειδὴ τὸ τέλος ἐστὶν οὐ γνῶσις ἀλλὰ πρᾶξις]" (Since the goal is not knowledge, but action: *Nicomachean Ethics* 1.1, 1095a5–6). What all of these uses have in common is their emphasis on the form of the "exercise," the duration, repetition, and assiduity of which ensures the

improvement of results or of the agent's abilities. That is why, even when *praxis* is opposed to knowledge or discourse, it nonetheless connotes them, as soon as they require repeated exercise and a learning process (2.3). In many passages, *praxis* or *prattein* could not be better translated than by "application" or "exercise": "*haper ek tou pollakis prattein ta dikaia kai sôphrona periginetai* [ἅπερ ἐκ τοῦ πολλάκις πράττειν τὰ δίκαια καὶ σώφρονα περιγίνεται]*" (*A development that can come only from assiduous exercise of justice and wisdom:* 2.3, 1105b4–5).

On the other hand, the uses of *praxis* and the whole register of the "practical" are clearly connected—in a way we might call substantial—to a specified domain, which is that of approved behaviors. The latter, in turn, are organized around two poles: one that is specifically ethical and concerns the quality or value of individuals and their behavior, and another that is political (politics being, Aristotle tells us, the "organizing" or "fundamental" (*architektonikê*) discipline, and the object of the treatise on ethical virtues being "political in a way": "*politikê tis ousa,*" 1.1, 1094b11), that is, relative to the city, to the way in which people act there toward others and on each other. The two sides of the term thus merge in the idea of "making oneself" by acting for the common good in accord with the virtue of *phronêsis* [φρόνησις], "prudence" or "practical intelligence." This is the ideal of self-sufficiency or *autarkeia* that is suitable, not for a "solitary animal," but for man, who is "political by nature" (1.5, 1079b8–11)—an autarky that is, however, as we shall shortly see, likely to be quite differently reinvested.

■ See Box 1.

B. The tripartite classification of *praxis, poiêsis, and epistêmê/theôria*

Aristotle begins by distinguishing among *praxis, technê* as *poiêsis,* and *epistêmê* in order to valorize the field of *praxis* and the virtue or excellence that is peculiar to it (*phronêsis,* examined in book 6 of the *Nicomachean Ethics*). He then shifts the opposition by substituting *theôria* for *epistêmê,* which sublimates its meaning and reverses the corresponding evaluation. He situates *theôria* at the limits of the human, as is indicated by its contact with divinity—for example, in book 10, which is devoted to the question of pleasure. Later thinkers tended, on the one hand, to erase the difference in point of view between the two triads—that is, to make *theôria* (which gradually lost its theological connotations) a simple equivalent of *epistêmê*—and, on the other hand, to reduce—not without exceptions and resistances, even within great systems—the ternary point of view to a dualist one, a simple opposition between "theory" and "practice."

The first triad (*praxis-poiêsis-epistêmê*) is constructed in the first lines of the *Nicomachean Ethics* (1.1, 1094a1), "*pasa technê kai pasa methodos, homoiôs de praxis te kai proairesis* [πᾶσα τέχνη καὶ πᾶσα μέθοδος, ὁμοίως δὲ πρᾶξίς τε καὶ προαίρεσις]*" (Every art and every inquiry, and similarly every action and pursuit), and resumed a few lines later, "*praxeôn kai technôn kai epistêmôn* [πράξεων καὶ τεχνῶν καὶ ἐπιστημῶν]*" (Actions, arts, and sciences: 1094a7, where *technê* [τέχνη] is definitional for *poêsis*). In this triad, there are in reality two-times-two pairs. On the one hand, there are *poiêsis* and *praxis,* the faculty

---

1

The metaphysics of *praxis*

The relation of the concept of *praxis* to the doctrine of power and the act (whose principles are set forth in Book Theta of Aristotle's *Metaphysics*) is complex. Here we will note two important themes correlated with the terminology repeatedly used in the *Nicomachean Ethics*.

The first concerns the relation between *praxis* and *energeia* [ἐνέργεια], a term designating "being in actuality" or the full realization of an essence or form that has found its proper matter, which, in the *Nicomachean Ethics*, designates the being of man, of which *praxis* itself is a part. *Energeia* is in itself "practical" in its phenomenological relation to exercise, continuity (cf. *Nicomachean Ethics* 2.1, 1103a31–32: "The virtues we get by first exercising them, as also happens in the case of the arts as well [*tas d' aretas lambanomen energêsantes proteron, hôsper kai epi tôn allôn technôn* (τὰς δ' ἀρετὰς λαμβάνομεν ἐνεργήσαντες πρότερον, ὥσπερ καὶ ἐπὶ τῶν ἄλλων τεχνῶν)]," and

disposition (*hexis* [ἕξις]) that results from practical activity becomes in turn its condition of possibility, in accord with a "virtuous" circle (2.2, 1103b29–30): "We must examine the nature of actions, namely how we ought to do them; for these determine also the nature of the states of character that are produced [*anagkaion episkepsasthai ta peri tas praxeis, pôs prakteon autas; hautai gar eisi kuriai kai tou poias genesthai tas hexeis* (ἀναγκαῖον ἐπισκέψασθαι τὰ περὶ τὰς πράξεις, πῶς πρακτέον αὐτάς· αὗται γάρ εἰσι κύριαι καὶ τοῦ ποιὰς γενέσθαι τὰς ἕξεις)]."

It is "practical" also in its ontological relation to life (*zôê* [ζωή]), understood as a non-biological realization of the human, from which come the collusive formulations that combine *energeia* and *praxis* (1.6, 1098a12–14: "We state the function of man to be a certain kind of life, and this to be an activity or actions of the soul implying a rational principle [*anthrôpou de tithemen ergon zôên*

tina, tautên de psuchês energeian kai prazeis meta logou (ἀνθρώπου δὲ τίθεμεν ἔργον ζωήν τινα, ταύτην δὲ ψυχῆς ἐνέργειαν καὶ πράξεις μετὰ λόγου)]"; 10.6, 1176b5–7: "Those activities are desirable in themselves from which nothing is sought beyond the activity. And of this nature, virtuous actions are thought to be [*kath' hautas d' eisin hairetai aph' hôn mêden epizêteitai para tên energeian. toiautai d' einai dokousin hai kat' aretên praxeis* (καθ' αὐτὰς δ' εἰσὶν αἱρεταὶ ἀφ' ὧν μηδὲν ἐπιζητεῖται παρὰ τὴν ἐνέργειαν. τοιαῦται δ' εἶναι δοκοῦσιν αἱ κατ' ἀρετὴν πράξεις)]." Thus *energeia,* which is for Aristotle the supreme mode of being, is in a sense conceived on the model of practice (*praxis*) and its "virtue." But this proposition is very ambivalent, because it can also be understood as meaning that we must seek "beyond *praxis* proper," at a higher level of generality, the "active" perfection that the concept of *praxis* allows us simply to approach.

of making and the faculty of acting, both of which differ from *epistêmê* in that they belong to the domain of *genesis* [γένεσις] (becoming, engendering) and of contingency ("*ti tôn endechomenôn kai einai kai mê einai* [τι τῶν ἐνδεχομένων καὶ εἶναι καὶ μὴ εἶναι]," the essence of the things whose essence is to be "capable of being or not being." 6.4, 1140a12–13). The notions of contingency and becoming remain crucial even where *poiêsis* and *praxis* are used to underscore the "rational" (associated with a "reasoned state" [6.4, 1140a3–5] or "true course of reasoning" ["*hexis meta logou alêthous* (ἕξις μετὰ λόγου ἀληθοῦς)," 6.4, 1140a10, 20], one to produce and the other to act). Contingency, or proceeding case-by-case, distinguishes *poiêsis* and *praxis* from *epistêmê*, which deals with the necessary and the general.

But on the other hand, *praxis* is paired with *epistêmê* in contradistinction to *poiêsis*: in fact, it is only in making (*poien ti* [ποιεῖν τί], "making something") that there is a product (*ergon*) to be added, later and outside it, to *energeia*, to the implementation, to the activity itself, so that the product is more important than the activity: "Where there are ends apart from the actions, it is the nature of the products to be better than the activities" ("*beltiô pephuke tôn energeiôn ta erga* [βελτίω πέφυκε τῶν ἐνεργειῶν τὰ ἔργα]," 1.1, 1094a5–6). In other words, "While making has an end other than itself [*telos . . . heteron* (τέλος . . . ἕτερον)], action cannot; for good action [*eupraxia*] itself is its end [*telos*]" (6.5, 1140b6–7). (Tricot renders this in French as "*la bonne pratique étant elle-même sa propre fin*" [good practice being in itself its own end] to show that *eupraxia* involves both success [successfully completing the action] and a good action [acting well]). We have to grant that "action and making are different kinds of things" (6.4, 1140a2). *Praxis* involves the "shaping of man by man" (and for man); it is the whole set of activities guided by the virtue of "prudence" (*phronêsis*, 1140b1), through which human individuals construct the world of their social relations: "We consider that those can do this who [like Pericles] are good at managing households or states" ("*einai de toioutous hêgoumetha tous oikonomikous kai tous politikous* [εἶναι δὲ τοιούτους ἡγούμεθα τοὺς οἰκονομικοὺς καὶ τοὺς πολιτικούς]," 1140b10).

Insofar as it is essentially *energeia*, tending to nothing other than its own improvement, *praxis* approaches *epistêmê*; but through its orientation in relation to the singular, acting "case by case" depending on the *kairos* (see MOMENT), it differs from *epistêmê* and to some extent goes beyond it (1141b14–15: "Nor is practical wisdom [*phronêsis*] concerned with universals only—it must also recognize the particulars; for it is practical, and practice is concerned with particulars" ("*oud' estin hê phronêsis tôn katholou monon, alla dei kai ta kath' hekasta gnôrizein; praktikê gar, hê de praxis peri ta kath' hekasta* [οὐδ' ἐστὶν ἡ φρόνησις τῶν καθόλου μόνον, ἀλλὰ δεῖ καὶ τὰ καθ' ἕκαστα γνωρίζειν· πρακτικὴ γάρ, ἡ δὲ πρᾶξις περὶ τὰ καθ' ἕκαστα]"), and it is very precisely political in that regard ("Political wisdom and practical wisdom are the same state of mind," 1141b23). It is this political *praxis* that comes closest, at this stage, to the ideal of *autarkeia* [αὐτάρκεια]: "By self-sufficient [*autarkes* [αὔταρκες], we do not mean that which is sufficient for a man by himself, for one who

lives a solitary life, . . . since man is born for citizenship" (1.5, 1097b8–11).

C. From Practical-Political Autarky to Theoretical Autarky

Yet this presentation, which was to have immense influence (down to Machiavelli and the classical doctrines of *prudentia* and the art or skill peculiar to politics: *Staatsklugheit*, and even *raison d'État*, and so on), is questioned in book 10 of the *Nicomachean Ethics*, which discusses the relation between pleasure and activity (10.4, 1174b23: "*teleioi de tên energeian hê hêdonê* [τελειοῖ δὲ τὴν ἐνέργειαν ἡ ἡδονή]," pleasure completes—or "finalizes," as we might now say—the activity). Aristotle is then led to reconstruct the question of *autarkeia* so as to detach it from its political model ("living well" inseparable from "acting well") and to identify it with intellectual contemplation, with "the life of the mind": "the self-sufficiency that is spoken of must belong most to the contemplative activity" ["*legomenê autarkeia peri tên theôrêtikên [sc. diagôgên] malist' an eiê* [λεγομένη αὐτάρκεια περὶ τὴν θεωρητικὴν <sc. διαγωγὴν> μάλιστ' ἂν εἴη]," 10.7, 1177a27). Clearly, *praxis* is not subjected to the constraint of the matter on which the maker has to impose form, nor to the needs of the user who "orders" a product of technology, but it is still burdened with external dependencies: above all, social relations themselves, that is, the structure constitutive of the political sphere. In pursuing his ends, a politician depends on his fellow citizens (*politai* [πολίται]), his friends (*philoi* [φίλοι]), and his equals or peers (*homoioi* [ὅμοιοι]).

It is rather surprising to see Aristotle reversing his earlier judgments here: what appeared to be a completion becomes a lack; ethical-political *praxis* still depends on *poiêsis*, because it produces not objects, but effects external to it. As a result, *theôria* becomes a genuine *praxis*: "Nothing arises from it [theoretical excellence] apart from the contemplating, while from practical activities [or excellences, *aretai* [ἀρεταί], we gain more or less apart from [*peripoioumetha* (περιποιούμεθα), from *poiein*] the action" (10.7, 1177b1–4). Ultimately, it is by conforming to the paradigm of *praxis* that *theôria* comes to take its place.

But in reality, it is the definition of man himself that has changed. We are no longer in the immanence of the shaping of man by man, but in the break that relates the human (or rather, exceptional individuals) to the divine—which, according to a typically Aristotelian intellectualism, can only involve *theôria*; science as the contemplation of first principles and first causes, and the kind of life that corresponds to it, entirely devoted to thought and detached from any utility or efficacy. Obviously, in this perspective (or is this only a typically "modern" reaction?), the notion of *autarkeia* or self-sufficiency is associated in a contradictory way with a representation of the beyond on which human happiness is supposed to depend. But Aristotle's idea is that speculative activity brings the human individual into the divine world of complete self-sufficiency, which thus realizes a transcendence of activity beyond the opposition between acting and disposition, or action and passion (10.7, 1177b27–28: "It is not insofar as he is a man that he will live so, but insofar as something divine is present in him" ("*ou gar hêianthrôpos estin houtô biôsetai, all' hê theion ti en autôi huparchei*

[οὐ γὰρ ᾗ ἄνθρωπός ἐστιν οὕτω βιώσεται, ἀλλ᾽ ᾗ θεῖόν τι ἐν αὐτῷ ὑπάρχει]"). And yet this transcendence, or this aptitude for transcending the "purely human," is precisely the "specifically human" (1178a5–7): "That which is proper to each thing is by nature best and most pleasant for each thing; for man, therefore, the life according to reason is best and pleasantest, since reason more than anything else *is* man" ("*to gar oikeion hekastôi tei phusei kratiston kai hêdiston estin hekastôi; kai tôi anthrôpôi dê ho kata ton noun bios, eiper touto malista anthrôpos* [τὸ γὰρ οἰκεῖον ἑκάστῳ τῇ φύσει κράτιστον καὶ ἥδιστόν ἐστιν ἑκάστῳ· καὶ τῷ ἀνθρώπῳ δὴ ὁ κατὰ τὸν νοῦν βίος, εἴπερ τοῦτο μάλιστα ἄνθρωπος]"). *Theôria* is *energeia* par excellence, more free of passivity even than *praxis* itself because *praxis* remained a contradictory essence, involving a conflict between independence and dependency.

II. The Marxist Reversal: Preconditions, Alternatives, Irreversibility

Karl Marx's *Theses on Feuerbach* introduces the other concept of *praxis*, in which the Greek is transliterated and linked to an entirely different relationship between politics and metaphysics.

■ See Box 2.

It is certainly not impossible in this case to hear echoes of Aristotelian "practical philosophy" (as elaborated in the Nicomachean Ethics), which Marx read with admiration and commented on throughout his life. There is something here like an inversion of the doctrine of the excellence of *theôria*, (seen as "mystical" perhaps), and a return to the primacy of *praxis*, which is to be definitively situated in the political sphere of immanence (even at the cost of a transformation of the ideal of *autarkeia* or self-sufficiency into a principle of humanity's self-transformation through history or *Selbstveränderung*). But this very formulation, with its Hegelian and Kantian overtones, indicates that one or more intellectual revolutions have occurred that we must mention here.

Very schematically, there are four preconditions for the understanding of this formulation of *praxis*. The first, purely negative, is the fact that, in the course of the centuries intervening between the *translatio philosophiae* from Athens to Rome and the final establishment of European philosophies in vernacular languages, the Greek term *praxis* did not find any genuine Latin translation, with the result that the reactivation of this or that aspect of Aristotle's problematics was always accompanied by recourse to the Greek word or to a transcription of it (such as "practice" and, a fortiori, the Italian *prassi*). *Actio*, in particular, is not such a translation, but rather is a term that has its own field of application (especially in the physical and oratorical domains; see ACTOR). The same goes, of course, for "theory." The second precondition, viewed through the category of "idealism" to which Marx assigns the development of the "active side" of philosophy, involves the opposition, accorded crucial importance by Kantianism and post-Kantianism, between a practical point of view and a speculative point of view. This opposition will lead to a significant but paradoxical and evanescent use of the word *Praxis* (as a virtually German word). Here we see the mark of the "end of classical German philosophy" that Friedrich Engels identified with the Marxist revolution when the *Theses of Feuerbach* were published posthumously. The third precondition consists of the tendency to pose the theory/practice opposition in German idealism against the more or less concurrent one in the French tradition that culminated in positivism. We find traces of this opposition within Marxism itself, down to the present time. The fourth and last

---

2

Karl Marx, *Theses on Feuerbach*

The first thesis of Karl Marx's *Theses on Feuerbach* states:

The main defect of all hitherto-existing materialism . . . is that the Object, actuality, sensuousness, are conceived only in the form of the object, or of contemplation, but not as human sensuous activity [*sinnlich menschliche Tätigkeit*], practice [*Praxis*], not subjectively. Hence it happened that the active side [*die tätige Seite*], in opposition to materialism, was developed by idealism—but only abstractly, since, of course, idealism does not know real, sensuous activity as such [*die wirkliche, sinnliche Tätigkeit*] . . . [Feuerbach] therefore regards the theoretical attitude as the only genuinely human attitude, while practice is conceived and defined only in its dirty-Jewish form of appearance [*in ihrer schmutzig jüdischen*

Erscheinungsform]. Hence he does not grasp the significance of "revolutionary," of "practical-critical," activity [*der "praktisch-kritischen" Tätigkeit*].

The second thesis states:

The question of whether objective truth [*gegenständliche Wahrheit*] can be attributed to human thinking is not a question of theory but is a practical question [*eine praktische Frage*]. Man must prove the truth, i.e., the reality and power, the this-sidedness [*Wirklichkeit und Macht, Diesseitigkeit*] of his thinking, in practice [*in der Praxis*]. The dispute over the reality or nonreality of thinking that is isolated from practice is a purely scholastic question.

The third thesis states:

The coincidence of the changing of circumstances [*Ändern der Umstände*] and of

human activity or self-change [*der menschlichen Tätigkeit oder Selbstveränderung*] can be conceived and rationally understood only as revolutionary practice [*revolutionäre Praxis*].

The eighth thesis states:

All social life is essentially practical. All mysteries that lead theory to mysticism find their rational solution in human practice and in the comprehension of this practice [*in der menschlichen Praxis und in dem Begreifen dieser Praxis*].

Finally, the eleventh thesis states:

Philosophers have hitherto only interpreted the world in various ways [*verschieden interpretiert*]; the point is to change [*ändern*] it.

precondition lies in the coherence of the Marxist problematic of idealism's reversal, a product of the peculiarly "philosophical" moment to which the *Theses* belong. Idealism was never to be purely and simply recanted, but instead set aside in the process of constituting "historical materialism." It would subsequently re-emerge as a subject of debate in contemporary interpretations of Marx.

A. *Praxis* in German idealism

Praxis's central position in German idealism may be due to the conjunction of one of Kant's titles (that of an essay of 1793, "On the Common Saying: This May Be True in Theory but It Does Not Apply in Practice [*Praxis*]," often abridged as *Theory and Practice*) and the role he (and his successors) assigned to "practical philosophy" as a doctrine of the supreme (moral) goals of reason. But a paradox arises almost immediately. Although Kant makes systematic use of the adjective *praktisch* (in his terms "practical reason" or "pure practical reason"), his only use of *Praxis* as a substantive occurs in the essay mentioned above. As has been explained by translators and commentators on this text (Alexis Philonenko), it is in this essay that Kant sets forth his conception of the role of judgment in the moral and political domain. This was of course in response to the adversaries of the French Revolution who were inspired by Edmund Burke and who made institutional tradition the indispensable guide to political wisdom, *Staatsklugheit*. Kant, as the author of the three *Critiques*, adopted the word *Praxis* and the "commonplace" that is attached to it by the very writers he is criticizing (the "popular" philosophers and the jurists and theorists of government of the Enlightenment). Thus, he assumed an academic legacy of the eighteenth century, even if he did not invest it with his own intentions.

Kant nominalizes *praktisch* in the form of *das Praktische*, "the practical" or "the practical element." For him, it is a matter of showing that this element does not reside in prudence or skill (*Klugheit*, *phronêsis*), because the latter concerns the intelligent arrangement of means and ends, or a "technique" and the conditions of its effectiveness, whereas *das Praktische* resides solely in morality. It thus determines the "concept of freedom," and emerges as a "supra-sensible" principle inseparable from the categorical imperative. The practical element proper is thus not *technisch-praktisch*, but *moralisch-praktisch*. In a different context, Kant terms "pragmatic" the kind of anthropological research that studies the passage from the laws of practical reason to experience, so as to control the "pathological" element introduced by our sensible nature, and that thus controls disciplines such as pedagogy, applied morality, and politics, and in certain regards the philosophy of history as well (on all of this, see RT: Eisler, *Kant-Lexicon*, s.v. "Pratique," 829–30). Kant's philosophy thus forges a new concept of the practical, and accords it a central place in philosophy (a "primacy," as Kant calls it), in relation to a pragmatic "task" (see SOLLEN) of moralizing human relationships or of an imperative to transform the world (which we find again, literally, in Marx, even if he conceived its realization quite differently). Kant makes the human race both the (transcendental) "subject" and the (empirical) "object" of this self-transformation and makes it "responsible" (as in the essay *Was ist Aufklärung?*

humanity is made responsible for its own state of subjection). But within this very primacy, Kant guarantees the persistence of the deduction and the speculative principle identified with Reason.

What change was made by "post-Kantian" systems in this regard? Neither Johann Gottlieb Fichte nor G.W.F. Hegel thematized a theory/practice opposition or made conceptual use of the term *Praxis*. They did, however, help enrich it after the fact by emphasizing both the dimension of the act and activity (*Tat*, *Tätigkeit*, *Handlung*, *Tathandlung*; see TATSACHE), and that of efficacy and reality (*Wirkung*, *Wirklichkeit*; see REALITY). Though act-activity and efficacy-reality both belong to what Marx called "idealism" itself bound up with the problematic of the will, they pull it in diametrically opposed directions.

That said, between Kant and the radical essayists of the period preceding the revolutions of 1848 (the period Germans call the *Vormärz*), there was another conjuncture, in which the idea of the "emancipation of humanity," (which is inseparable from the "goals of practical reason" as determined by critical philosophy), was aligned with the idea of a "transformation of the historical conditions" of human existence (including both knowledge and production or action). In this context the word *Praxis* took on these different valences, which are at once "subjective" and "objective," and which expressed their fusion in a new "critical and revolutionary" concept of experience (according to the expression later used by Marx to characterize its dialectic). From this point of view, Marx's writings (especially between 1843 and 1847) appear to be less an "exit" (*Ausgang*) than a culmination of the movement of "classical German philosophy" (Engels, *Ludwig Feuerbach and the Outcome of Classical German Philosophy*).

B. "Theory" and "practice" from Bacon to French positivism

Alongside the German—Kantian and post-Kantian—constitution of the "philosophy of practice," an entirely different formation developed in the French intellectual sphere, one that culminated in the positivist conception of the relations between "theory" and "practice" as systematized by Auguste Comte. Contemporary epistemology, both in its logical empiricist and its historical aspects, is heir to this tradition. To understand its importance and intrinsic connection with the "social status of modern science" (Canguilhem, "Le statut social de la science moderne"), we must go back to the *Encyclopédie*, and most specifically, to the inspiration it drew from the work of Francis Bacon. Bacon had designated *scientia activa* or *operativa* as the terms for a method derived from experience, a method drawn on for the indefinite expansion of the powers of humanity, freed from "fictions" or "idols," and from speculative forms of Scholasticism (but not, for all that, radically anti-Aristotelian: on the contrary, it contained in embryonic form a first great convergence between nature and artifice, between *poiein* and *prattein*). Bacon had in fact employed the Greek *praxis* in a few places in the *Novum organum* (ed. Ellis and Spedding, 1:180, 268, 270, etc.) to show that recourse to experience did not divert study from its object, but constituted the sole means of "augmenting" it or bringing something "new" to it. The French Encyclopedists, who had the advantage over Bacon of coming after the development of a

(Galilean-Newtonian) mathematical physics, and in particular of a mechanics to which some of them made fundamental contributions, constructed on this basis a new epistemology set forth in Jean le Rond d'Alembert's *Discours préliminaire* and in the *Encyclopédie* articles "Application" (by d'Alembert) and "Art" (by Denis Diderot) (RT: Diderot and d'Alembert, *Encyclopédie ou Dictionnaire raisonné des sciences, des arts et des métiers*). These latter reflect for the first time the technological connection (they did not use the term "technology," which was invented in the early nineteenth century) between the science of physicists or chemists and the art of engineers. Military as well as civil technology thus lost the status of an "enterprise" (that is, of an adventure; see ENTREPRENEUR) and acquired that of a "systematic practice" whose principles are formulated by science, but which provides them with the indispensable complement of experience in the field.

In the section on the classification of the sciences in his preface to the *Metaphysical Foundations of Natural Science* (1784), Kant introduced this new dimension of applied knowledge under the name of a "systematic art." But he continued to relegate it to an empirical domain, from which the a priori basis of the pure sciences—that is, mathematics—was definitively detached. It was Auguste Comte, in the second lecture of the *Discours sur l'esprit positif* (1844), to conceptualize the connection, simultaneously reciprocal and dissymmetrical, that mathematization, the experimental method, and technology had established between "theory" and "practice." This connection, conceived as the relation between the abstract and the concrete, is both internal to the classification of the positive sciences, in accord with a progression from the simple to the complex (from mathematics to sociology), and external to their objective, which is properly speculative (a term that in Comte is synonymous with "theoretical") insofar as knowledge of the laws governing phenomena makes it possible to predict (and indeed, in the simplest cases, to calculate) the technical results in the field of "productive operations." From this comes the synthetic formula that, according to Comte, expresses the general relation between science and art (or "industry," a term adopted by Saint-Simon's followers): "from science to prediction; from prediction to action." Comte notes that the "two systems" formed by the "whole of our knowledge of nature" and by the "knowledge of the procedures that we deduce from it in order to modify it" are at once "essentially distinct in themselves" and inseparable. He remarks that although from the "dogmatic" point of view, the simple necessarily precedes the complex and the abstract precedes the concrete, in accord with a deductive relationship, the same is not true from the historical point of view. The problems whose solution can be provided only by theory must first be identified in practice, even when the latter, since the dawn of civilization, had supposedly been accessible only under the veil of a "theological" or magical way of thinking. The more complex the domain of phenomena, the longer it would take to transcend these beginnings and arrive, in the contemporary period, at the domain of sociological phenomena to which political practice is addressed.

It is well known that Marxism and positivism were at odds in their methods and objectives (even if they had a common source in Saint-Simonianism and, through that, the French tradition of the Encyclopedists). *Praxis* and practice thus governed two distinct philosophical paradigms, especially in the French context. However, since such situations in the history of ideas never actually exclude intersections, there were some substantial ones, both on the side of positivism (think of the dialectical ferments that Karl Popper, on his own admission, drew from his intensive reading of Vladimir Lenin's *Materialism and Empirio-Criticism*, 1908) and on the side of Marxism (think of Louis Althusser's conception of the "epistemological break," influenced by Gaston Bachelard's recasting of Comte's positivism).

C. Marxist *praxis*

The "Young Hegelians" who reintroduced the term *praxis* into philosophy (at the junction of philosophy and politics), were of course circumscribed by the limit of the Hegelian system. But they transgressed this limit in reaffirming the primacy of a (revolutionary and creative) subjectivity over and against the apparent objectivism of "the end of history" and the legitimation of state institutions (the latter, as in Hegel, imbued with liberalism). They also assigned fundamental importance to critique, which for them entailed not only the deconstruction of onto-theology, but also a questioning of the established order's values. That is why they turned toward the Kantian heritage radicalized by Johann Gottlieb Fichte and F.W.J. von Schelling. In his *Prolegomena zur Historiosophie* (1838), August von Cieszkowski invented the expression "the philosophy of *praxis*," to which he gave the meaning of an "auto-activity" (*Selbsttätigkeit*) or liberation of action that opens up the historical space of transformation and self-conciousness. In his opuscule of 1841, *Die europäische Triarchie* (The European triarchy), and his 1843 article *Philosophie der Tat* (Philosophy of action), Moses Hess (who was for a few years the closest interlocutor of Marx and Engels) systematized this idea of a free, collective *praxis* that bore the "future" of mankind, and associated it with a socialist credo. Hess also opposed it to another *praxis* that was materialist and "Judaic" in the sense that German Protestantism gave to this term, that is, oriented toward self-interest rather than toward universal emancipation; cf. his opuscule "Uber das Geldwesen" (1843). An ethical and political division thus passes through the heart of *praxis*, separating the world's two movements of appropriation and transformation. For his part, Arnold Ruge (the co-founder with Marx of the *Deutsch-Französische Jahrbücher*, whose single issue was published in Paris in 1844) used *praxis* in the sense of the "philosophy of work." All of these references are not only crucial for understanding the underlying allusions in the *Theses on Feuerbach* (which must in this regard be read as a cryptic formulary); they also shed light on the powerful tension that never ceases to influence Marx's thought and that his use of the word *praxis* encompasses. He is also seeking to open a breach for the future in the enclosure of objective spirit and the institutions of bourgeois society. In this sense, he is in search of a form and a subject for "revolutionary" action (which he later thought he had found in the proletariat and workers' socialism); but for all that, he cannot resign himself to abandoning the perspective of reality. He wants to extract emancipatory auto-activity (or the

realization of freedom) from the element of pure will, thus allowing its activism to become "materially" a transformation of the world. For that to happen, it has to be inserted into the development of social relationships and conflicts, and, in the final analysis, into the development of material life (and its "modes of production"). The Marxist use of the term *praxis* is thus both something inherited from the Young Hegelians and a criticism of their understanding of it. *Praxis* thus has a rather tenuous status in Marx's work as well as in that of the later Marxists.

The concept of *praxis* is central to the *Theses on Feuerbach* (written in 1845, at the same time as *The German Ideology*, and published posthumously in 1888), of which it is clearly the keystone; in return, the *Theses* systematically deploy its different aspects. But Marx had already resorted to the same term, or to the adjective "practical" (*praktisch*), especially in the series of essays written in 1843 and 1844: *On the Jewish Question*, *Correspondence with Ruge*, *Contribution to the Critique of Hegel's Philosophy of Right* (all of which had appeared in the *Deutsch-Französische Jahrbücher*), and *The Holy Family* (written in collaboration with Engels). The "settling of accounts" with the representatives of post-Hegelian liberal philosophy (Bruno Bauer) and anthropological communism (Ludwig Feuerbach) would contribute to reversing the idea of *praxis*. Initially, the idea was still negatively connoted, as shown by the allusion (in *On the Jewish Question*, which is loaded with anti-Semitic stereotypes) to "the practical spirit," that is, to the supposedly self-interested spirit of Judaism. This "practical spirit" was set up in contrast to a Christian idealism whose trace is still found in the first of the theses on Feuerbach. Now, on the contrary, *praxis* becomes irreducible to any single representation; it forms the model of transformative action—of action capable of emancipating humanity—on the condition that it include dialectically, as part of its own determination, what appeared to be its contrary, or what it had to transcend, namely, the "sensible," the real or material being of "social relationships." This real or material being of social relations is the "actual essence" of man (sixth thesis). Marx will insist that its historical development coincides with the activities and productive powers of labor (consciousness of their being a function or expression that is more or less autonomized). There is a certain equivalence, then, between the "proletariat" as a "universal" class or agent of "human revolution" (beyond the simply "political" bourgeois revolution) and *praxis* as a historical development that involves replacing the "weapons of criticism" with the "criticism of weapons."

We have to acknowledge, however, that this equivalence, which had the performative effect of founding a "new materialism" irreducible to the sensualism of the Enlightenment, turned out to be fragile in its original construction; for, Marx, once past a certain stage in his thinking, would abandon the terminology of the argument and, most notably, the reference to *praxis*. We also have to recognize, after the fact, that the shift in terrain that this equivalence proclaimed is on the agenda more than ever. It governs the constant quest (constitutive of the Marxist point of view in philosophy) for an "encounter" between the science of historical material conditions and the insurrectional power of emancipatory movements. It also informs a great deal of contemporary philosophical research dealing with the limits of representation and the philosophical genre itself.

We can discern three reasons, legible in Marx himself, for the introduction of this rupture into philosophy. The first has to do with the fact that "practical activity," that is, thought as the true "differential of history" (instead of consciousness or morality), abolishes the classical distinctions between *praxis* and *poiêsis* that itself governed the possibility of making *theôria* autonomous. As result, the assignment of the bearers of these peculiarly human authorities, agencies, or "powers of acting" to classes or isolated social types, defined once and for all (men of action, producers, intellectuals, or contemplatives), is put back in question.

The second reason, which the second of the *Theses on Feuerbach* formulated with peerless vigor, has to do with the fact that the problematic of truth has now been torn away; not from the element of thought, but from the transcendence of thought with respect to its conditions, (a transcendence constituted on the model of a theological dualism). Marx will bring truth closer to *Diesseitigkeit*, a term that is difficult to translate but that is perfectly legible in its theological provenance. It refers to this world as opposed to the beyond, as well as to what philosophers have called "the world," "experience," "the things themselves," "labor," "the everyday," and so on. To inscribe this orientation, which is both immanent and productive, in the philosophical tradition (a tradition, it is true, that is subterranean rather than dominant), Marx sometimes refers, in the same spirit, to Vico's formula: "*verum esse ipsum factum*" (The truth is what is made).

Finally, the third reason for this philosophical rupture is that practical activity or *praxis* (soldered to the poiëtic, and inclusive of theory) is originally social, or, better, "transindividual." This means that the element of reciprocal action or relation always already forms the condition of its possibility. This opens up, at least in principle, the program of a transcendence of metaphysical oppositions between the singular and the universal or between the subject and the object (initially reduced by Marx to man and nature: *praxis* is the "humanization of nature and the naturalization of man," that is, it is the real history of society—the theme of *The German Ideology*).

III. After Aristotle and Marx: Dilemmas of the Contemporary Philosophy of Action

The history of philosophy does not include modes of thought or languages that ever went out of date. Every conceptual coherence that has once been constituted can be reactivated, which does not mean that it will be reactivated in the same form. One of the causes of this shifting resides in the effect of the irreversibility of translations or re-creations of which certain words bearing a fundamental question have been the object. This is precisely the situation in which we find ourselves with regard to *praxis*. To conclude this genealogical outline, we will indicate two types of terminological difficulty. One concerns, within the Marxist tradition itself or in close association with it, the resurgences of the idea of a "philosophy of *praxis*" in the twentieth century. The other concerns the obstacles that, in other contemporary philosophical trends, stand in the way of using the term *praxis* (including in the form of "returns to Aristotle" or "returns to

Kant") because of its appropriation by Marx (and that testify by that very fact to the power of this appropriation). The exceptions appear all the more significant.

A. Antonio Gramsci and the "philosophy of *praxis*"

The expression "philosophy of *praxis*" is one of the leitmotifs of Gramsci's *Prison Notebooks* (*Quaderni del carcere*), a fragmentary work that many people regard as a "refoundation" of Marxist philosophy, written in Fascist prisons between 1926 and 1937 and published with varying classifications after 1945.

It has to be recognized that in some respects, *praxis* was a coded expression intended to deceive the censors. But "philosophy of action," coined in Italian in a naturalized form (*filosofia della prassi*, which is neither the more usual *pratica* nor a quotation of a foreign expression), sums up well the orientation of the intellectual enterprise undertaken by the martyred communist leader and conceived by him as a radicalization of historicism (*storicismo assoluto*). To understand the importance of that enterprise, we have to situate it in a double context, that of the "critical" recastings of Marxism and that of the Italian Hegelianism characterized by an "actualist" orientation (Giovanni Gentile).

Paradoxically, the most influential of the texts of twentieth-century "critical Marxism" before Gramsci—namely, Georg Lukács's *Geschichte und Klassenbewußtsein* (*History and Class Consciousness*)—is a book that was renounced by its author after it had been condemned by the Third International, and that one might therefore expect to have been forgotten. On the contrary, it inspired the whole development of the Frankfurt School from Adorno and Horkheimer to Habermas, and various dissident philosophical movements within the countries of "real socialism." Here we would mention the "Budapest School" (see *Individuum und Praxis: Positionen der 'Budapester Schule,'* by Georg Lukács, Agnes Heller, and Ferenc Feher [1975], cited in RT: Labica and Bensussan, *Dictionnaire critique du marxisme*, s.v. *Praxis*, 912; the Yugoslavian "Praxis" group (particularly Gajo Petrovic), publishers of a journal of the same name since 1965; not to mention other, non-Marxist philosophies [Martin Heidegger]). Analogous to Gramsci's later elaboration, though pursuing quite different directions, Lukács's early work attests to the resurgence of an antinaturalist point of view (opposed to the interpretation of historical materialism as economic determinism) in Marxism, contemporary with the crisis of imperialism (the First World War), Soviet-style or "councilist" revolutions (not only in Russia, but also in Germany, Hungary, and Italy), and the quest for new forms of alliance between intellectuals and the working masses (a point of view that rapidly lost out within the official communist movement). Lukács's whole enterprise in *History and Class Consciousness* is directed against the reification" (*Verdinglichung*) of thought and action in forms of commercial rationality extended by capitalism to all spheres of life, and the juridical, technological, and scientific objectivism that, according to Lukács, constitute its ideological counterpart. However, confronted by this generalized alienation, which has first to be conceived in its essence, the possibilities of criticism, resistance, and revolutionary overthrow do not reside in pure willpower, but in the constitution of society (particularly its immanent negative

form, its "dissolution," of what Marx called, after Hegel and Schelling, an "identical subject-object" of history, none other than the proletariat itself). The proletariat's "class consciousness," also called "practical consciousness" (that passes immediately from being to action without stopping at the stage of abstract representation), thus figures the obverse and necessary product of capitalist reification. The resort to this sociopolitical category of class consciousness, not found in Marx, demonstrates that in the unity of contraries in the "subject-object," it is the subject that prevails. (This also corresponds to a rupture of the symmetry postulated by Marx in the *Theses on Feuerbach* between the transcendence of pure naturalism and that of pure humanism, to the advantage of the latter.) That is why Lukács always speaks of *praxis* as a "*praxis* of the proletariat," where the proletariat forms the ultimate empirical reference, but also incarnates the mythic movement of universal history and its end in a messianic "actor" that is both singular and omnipresent.

Gramsci's adoption of the expression "*filosofia della prassi*" has a very different genealogy that extends over a longer period. As has been pointed out by André Tosel (who has studied its history in a complete and subtle way), it was first forged by Antonio Labriola in the context of a historicist variant of the Second International's Marxism. This claimed Giambattista Vico as one of its ancestors and emphasized the "morphogenesis" of societies that results from their internal conflict. The most decisive contribution to the Gramscian genealogy was, however, made by Gentile.

■ See Box 3.

The pronounced influence of Gentile's "actualism" on Gramsci's conception of the philosophy of *praxis* is now becoming better known, even if the degree of its impact or the variety of its modalities remain the subject of passionate controversy (especially in Italy). "Actualism," was read by Gramsci as a typical figure of *coincidentia oppositorum*, a tragic mark of the relations between philosophy and politics in the great "European civil war" of the twentieth century. At the time of the revolution of the councils in Turin, Gramsci himself began by practicing a vitalist, activist, and spontaneist Marxism influenced by Georges Sorel's concepts of "proletarian violence" and the general strike (the latter seen as the specific form of the masses' intervention in history). The later notion of *praxis* that Gramsci worked through in the *Prison Notebooks* was much more indebted to his novel reading of Machiavelli. Here, the action of the revolutionary party was compared to that of a "new Prince" seeking to transform the "passive revolutions" of contemporary society prompted by capitalist modernization into a "national-popular will." Gramsci also did a re-reading (to which a very attentive reception of American "pragmatism" also contributed) of the Hegelian organic conception of the state in terms of cultural hegemony and the democratization of culture, where violence and education contribute to a single dialectic. What emerges is the idea of a process that is by definition unfinished and uneven. This process seeks to bring about the conditions for a collective *praxis* or a historical initiative on the part of the masses, manifest as a latent possibility inhering in the power relations of social structure. It essentially takes the form of a tendential transition

"Marx in Italics": Labriola, Gentile, and the *filosofia della prassi*

➤ ATTUALITÀ

In the work of Antonio Labriola, *prassi* designates specifically the fact that the "work of thought" (which includes science and philosophy) is part of the "work of history" (which is itself rooted in the history of the organization of labor). This insistence on work and this effort to generalize its notion unquestionably bear traces of Marx, but Aristotelian accents are not absent from Labriola's formulations when he seeks to express *prassi*'s political and anthropological meaning: "For historical materialism, becoming . . . is reality itself; just as the *prodursi* [self-production] of man, who rises above the immediacy of (animal) life to achieve perfect liberty (which is communism), is real" (cf. *La concezione materialistica della storia* [1896]).

Labriola's texts were the object of a prolonged debate between two great representatives of the Italian idealism shaped by Hegel. Whereas Benedetto Croce, in a spirit that is fundamentally more Kantian than Hegelian, grants priority to *pratica*, Giovanni Gentile, the leader of neo-Hegelianism (and the future official philosopher of fascism) adopts the expression *filosofia della prassi*. Gentile exhumed the *Theses on Feuerbach* and demonstrated their importance, thus making himself the defender of a revolutionary

interpretation of Marxism against both its social-democratic spokesmen (Labriola) and against its liberal critics (Croce). For Gentile, Marxism, even in its specialized economic developments, is a "great" philosophy, not so much of history as precisely of practice, that is, of the transformative action that expresses the intervention in history of a constitutive subjectivity that is simultaneously immanent to becoming and destructive of the continuity of time. It is to this theoretical view of *praxis* in terms of permanent revolution, which he perceives as an "inverted idealism," that Gentile seeks to oppose his own spiritualist conception, to which he was to give the name "actualism" (cf. *Teoria generale dello spirito come atto puro,* a reply to Croce's *Logica come scienza del concetto puro*).

The Hegelianism to which Gentile adheres cannot be constructed without understanding and going beyond Marx's notion of the ontological identity of thinking and acting. In this combination we can once again hear "activist" accents (a radical critique of the idea of "passivity" and thus of any determination of action by its "given" conditions and circumstances) that proceed more from the Fichtean tradition (to which Gentile is also close in his

formalization of the principle in terms of the affirmation of the "I," the *lo assoluto*, the subject of "the pure act"). But ultimately, the objective of actualism, which Gentile was to imagine he could implement in the framework of the "total state" founded by Mussolini, resides in the institution of "society's permanent self-education," which would be the very form of the spirit's concrete becoming, and, in this sense, *praxis* par excellence.

between the passivity that class domination imposes on "subaltern" social groups (what Gramsci calls "the economico-corporative stage") and the "intellectual and moral reform" that is supposed to allow them to become actors in their own history (and in this sense seems to return strictly to the Aristotelian definition of motion: "The fulfillment of what is potential *as* potential"). But here we are concerned not with a "pure act," but rather, according to a correction made by Gramsci himself in the *Prison Notebooks*, with an "impure act," "real in the most profane and mundane sense of the word," that is, inseparable from a matter that imposes its constraints on it. The "optimism of the will" and "pessimism of the intelligence"—the ethical components of an actualized and dialecticized *phronêsis*—also characterize the point of view of Gramscian *praxis* and forbid us to confuse absolute historicism with subjectivism or totalitarianism.

B. Phenomenological problematics

Contemporary, post-Marxist mutations of *praxis* are not limited to the Hegelian tradition. On the contrary, among the most interesting are those that emerge from the encounter with phenomenology (the problematics of Edmund Husserl and Martin Heidegger in particular), and which critique the exclusive orientation toward consciousness or speculative conceptions of existence. The important figure here is obviously Jean-Paul Sartre.

In the two volumes of the *Critique of Dialectical Reason*, of which only the first (*The Theory of Practical Ensembles*, 1960) was completed and published before his death, Sartre combined many sources of philosophical inspiration: not only Husserl, Heidegger, and Marx, but also Hegel, Kierkegaard, and other less obvious ones, Fichte and Bergson, not to mention countless other important figures in historiography and the human sciences. The central notion he elaborates is that of *praxis*: first as an "individual *praxis*," and then as a "historical *praxis*," via the essential mediation of the "group" (in accord with different institutional or spontaneous modalities that may be ephemeral, such as the movement of revolutionary crowds bound together by an "oath" like the Tennis Court Oath of 1789, or enduring, like social class, with its representative organizations). Sartre studies programmatically two movements or transitions: "from individual *praxis* to the practico-inert," and "from the group to history." Here we find again, even if under other names, the problematics we have already encountered (particularly that of reification, which Sartre connects with the original figure of the "seriality" of actions and groups). But Sartre was clearly also working out a new conception.

An essential part of this new conception proceeds from what had preoccupied Sartre in his earliest writings: the necessity of establishing, against the transcendental tradition in which phenomenology was initially situated, a gap

between the structure of consciousness as a field of "views" oriented toward objects (an essentially "immanent" structure that, in his 1937 article *Transcendence of the Ego*, Sartre went so far as to compare to Spinoza's substance, as a production of its own modes) and the structure of the subject-ego, not as a source of consciousness, but as something essentially transcending consciousness, a representative for it. Arguably the *praxis* that occupied him later on, after he had declared that Marxism was the "horizon that cannot be transcended for the philosophy of our time," was a deepening of this gap within subjectivity, and as such a way of positing an immanent intentionality prior to all consciousness, and by that very fact exceeding it. That is why the movement of totalization that, according to Sartre, constitutes the structure of history's intelligibility, and that runs through class struggle and leads to its transcendence, can only be rooted in *praxis*, even if it does so only in a negative or aporetic fashion. That is the other great originality of Sartre's conception of *praxis*: insofar as it must always proceed from individuals, while at the same time aiming at their unification or fusion in a community, it is fundamentally lost, or, as Sartre puts it, "stolen" from its own subjects. In Sartre's radically conflictual and ultimately very Hobbesian model of human history, *praxis* can be realized only by alienating oneself. It seeks the impossible: "to make history" out of the conditions of passivity and dependency, or the dominant institutions themselves. As Marx said, in a passage of the *Eighteenth Brumaire of Louis Bonaparte* that Sartre never tired of interpreting, "Men make their own history, but they do not make it arbitrarily, in conditions they themselves have chosen." *Praxis,*

for Sartre, will never abandon the pursuit of this impossible "liberation" from the inertia or adversity that is inherent in it. *Praxis* is the "despite everything" of the human condition.

- See Box 4.

C. The determinations of Marxism without its "horizon"

One can suppose that the concern to escape Marxist determinations of *praxis* and its horizon accounts for why there is a resistance within a number of contemporary philosophical trends to adopting the terminology of *praxis*, even where it would seem natural to do so. A case in point would be when there is a "return to Aristotle," either from the perspective of an ethics of prudence and judgment, or from that of a regulation of discourses and their public use. We will mention a few examples that are especially interesting because they also bring out problems of translation and idiomatic singularity.

1. Pragmatism without practice

We might wonder why the term "practice" is so little theorized by American "pragmatism," a philosophy founded on the recourse to experience, action, and practice. The term "pragmatism" was invented by Charles Sanders Peirce, adopted by William James and John Dewey, and later modified by Peirce, who, after it came into common use, rejected it in favor of "pragmaticism," as is shown by the following passage in the *Collected Papers*:

> His [the writer's] word "pragmatism" has gained general recognition in a generalized sense that seems to

Althusser: "Practices" versus *praxis*

The influence of Lukács's and Gramsci's theories, and especially the influence of the Sartrean conception of *praxis,* helps us understand why the other great representative of French philosophical Marxism in the 1960s, Louis Althusser, radically rejected the concept. Althusser's conception of Marxist philosophy clearly also proceeds from a critical reading of Hegel, a reading whose program the *Theses on Feuerbach* formulated as "new materialism." It owes to Gramsci and, through him, to Machiavelli a radical conception of the equivalence of theory and politics. But Althusser, who participated in the structuralist adventure and was determined to ferret out in their furthest recesses the germs of subjectivism and historicism that prevented the constitution of a materialist science of revolution, refused to see in *praxis*, and particularly in the "dialectic" of human works and material or institutional inertia, any more than spiritualist dualisms in a new garb. Moreover, Althusser speaks not so much of "practice" as of "practices"

(including "theoretical practice," operating on the generality of concepts). He seeks, it seems, to provide a theoretical account of their analogy (in the sense in which metaphysics spoke of the analogy of being) on the model of a "generalized production," consequently reducing *prattein* to *poiein* (and as we have seen, a certain French positivist-productivist tradition is not alien to this possibility). On closer inspection, however, we see that he does so in a very strange way, leading to a theoretical account that is as original in its own way as that of Sartre, to which it is opposed term for term. Theory is one kind of practice among others. Every practice is internally "overdetermined" by all the others, which it presupposes even as it represses them, in a "totality with a dominant" (*totalité à dominante*) that is subject to constant variations. A practice is "productive" not so much of "objects" or externalized results as of "effects" that are consubstantial with it (a typically structuralist thesis, but in *Capital* Marx had spoken of the "twofold

character of labor" and shown that the effect of the latter is not solely to produce merchandise but also to reproduce social relationships): "effects of knowledge," "effects of society," "effects of subjectivity," even "effects of transference" (in the field of the unconscious), and so on. A practice is essentially a "struggle," on the model of the class struggle (and for Althusser, within its horizon), or a union of contrary tendencies: understanding and misunderstanding, production and exploitation, identification and distancing (in Brecht's sense). It can be maintained that with these paradoxical characteristics, *poiein* has been essentially transformed into a complex form of *prattein*—although as a "process without a subject," if not without an agent (or "agency").

argue power of growth and vitality. The famed psychologist, James, first took it up, seeing that his "radical empiricism" substantially answered to the writer's definition of pragmatism, albeit with a certain difference in the point of view. . . . But at present, the word begins to be met with occasionally in the literary journals, where it gets abused in the merciless way that words have to expect when they fall into literary clutches. . . . So then, the writer feels that it is time to kiss his child good-by and relinquish it to its higher destiny; while to serve the precise purpose of expressing the original definition, he begs to announce the birth of the word "pragmaticism," which is ugly enough to be safe from kidnappers.

(Peirce, *Collected Papers*, 5:414)

The word *praxis* never appears in Peirce, and "practice" is hardly examined, even though it is used quite often in established expressions ("in practice," "the practice of"). The language of pragmatism is rather that of facts (including "facts of consciousness"), experience (including "pure experience"), and behavior ("conduct," notably in Dewey and Mead). Practice is defined only by the recourse to facts, and by the passage to the practice with which theories are confronted, as is shown by typical expressions such as "practical application" and "application to practice" (ibid., 2:7). From an "Aristotelian" point of view, we have here a kind of reversal of *praxis* and *pragmata*. For example:

The value of Facts to it [science], lies only in this, that they belong to Nature; and Nature is something great, and beautiful, and sacred, and eternal, and real. It therein takes an entirely different attitude toward facts from that which Practice takes. For Practice, facts are the arbitrary forces with which it has to reckon and to wrestle. Science . . . regards facts as merely the vehicle of eternal truth, while for Practice they remain the obstacles which it has to turn, the enemy of which it is determined to get the better. Science feeling that there is an arbitrary element in its theories, still continues its studies . . .; but practice requires something to go upon, and it will be no consolation to it to know that it is on the path to objective truth—the actual truth it must have.

(Ibid., 5:589)

The emphatic recourse to Practice here hardly conceals the absence of a problematization of the concept, indeed, its depreciation in relation to true science—a paradox in a philosophy that calls itself "pragmatism," but prefers to think in terms of facts and truth, and not of "practice."

2. Habermas: From *praxis* to "communicative action"

Educated within the Frankfurt School, of which he at first appears to be one of the followers, influenced by American functionalism and by the "linguistic turn" of the 1960s, and politically supportive of Kantian-inspired constitutionalism and cosmopolitanism, Jürgen Habermas began his career by adopting a "critical" opposition between technique and practice. To the former he ascribed, in a way reminiscent of Lukács, *epistêmê* or "objective" science. To the latter, or *praxis*, in the "German" sense of the term, he ascribed both a set of movements affirmative of natural law, and a battle against alienation, commodity fetishism, reification "projected into the public sphere [*Öffentlichkeit*]" where they become the object of debates and declarations, in such a way as to lead to an ideal of community. He then retranslates into Marxist language Max Weber's distinction between action determined by an end (*zweckrationales Handeln*) and reasonable action in relation to values (*wertrationales Handeln*), giving strong preference to the latter. But when Habermas finally finds the specific concept of his philosophy, which expresses the connection between discursive forms and juridical norms in the development of "civil society," while at the same time articulating it with the "lifeworld" (*Lebenswelt*, a concept of Husserlian origin)—that of "communicative action" (*Theory of Communicative Action*, 1981)—he abandons the use of the term *praxis*. No doubt in his view the latter retains connotations too closely connected with decision theory and exclusively associated with the representation of the history of civil society as a development of the capitalist divison of labor and the market; in short, with everything culminating in a valorization of social antagonism detrimental to the production of a social consensus on the fundamental values of democracy.

3. Arendt and "action"

The most important case for our purposes is that of Hannah Arendt, because she directly confronts the anthropological problem of recasting conceptions coming out of Aristotle and Marx. Arendt has a detailed knowledge of Marx's work. She is continually carrying on a critical dialogue with it, especially when she takes up an original position in a "neoclassical" trend of political thought that seeks to reformulate the ideal of *phronêsis* (which she also calls, referring to Kant as much as to Aristotle, "judgment"). Her aim in doing so is to defend the autonomy of political goals against both ideological totalitarianisms and socioeconomic reductionisms (and, a fortiori, against their collusion). The central concept in Arendt's thought, provisionally systematized in *The Human Condition* (1958), is "action."

Arendt's conception of action, which underlies her construction of the relations between the different "spheres" of human existence (intimacy, the private sphere, the public sphere, the sphere of knowledge), and her critique of a modernity that has witnessed the triumph of utilitarian values (those of the *animal laborans* in search of material happiness) over the *vita contemplativa* and the *vita activa* itself, is set forth in another "triad" of which action constitutes the fragile apex: labor-work-action. How is this related to the Aristotelian triads we examined at the outset? And to the Marxist conceptualization of social practice?

These two questions are difficult to treat separately. Arendt has apparently expelled *theôria* from her topics, and split the concept of *poiêsis* in two (drawing a distinction between *technê* and *poiêsis*, corresponding respectively to *labor*, which is supposed to reproduce the conditions of animal life or "well-being" and culminates in the ideal of consumer society, and to *work*, which is supposed to inscribe the mark of humanity on the duration of the world, or to guarantee the primacy of artifice over nature, through technology and especially through art). This new division (corresponding

to the distinction between "arts" and "crafts" in the subtitle of the *Encyclopédie* [RT: Diderot and d'Alembert, *Encyclopédie ou Dictionnaire raisonné des sciences, des arts et des métiers*] and intended to promote them)—makes it possible to situate the Marxist conception of social practice not only outside the field of "action" or *praxis*, but also within the product of art and art itself, in the pure immediacy of making, and thus within the domain of "craft," and the whole tradition stemming from John Locke that makes human labor the measure of value.

Nevertheless, Arendt does not use the term *praxis* to designate the conception of the world held by the ancients, and by Plato and Aristotle in particular, except as an untranslatable "Greek word." Nor does she seek simply to restore the Aristotelian point of view. This has to do not only with her desire to write in ordinary language, but also with her desire to introduce into the concept of "action" an element completely unknown to the ancients: historicity, in the form of the various kinds of uncertainty in human affairs, the constitutive function of representations or appearances in political activity (which affects the workers' movement itself), the creative function of speech acts (pardons, promises, declarations), the loss of traditions that forces people periodically to start their political history over again, and finally, the development of institutions qua necessary conditions of *theôria* (or the *vita contemplativa*). These characteristics of historicity are certainly completely different from those described by Marx; indeed, they are exactly opposite to them. But precisely for that reason, we find ourselves here in the field of a genuine (and interminable) confrontation with Marx (though Arendt's very simplified presentation of him resembles a caricature): one *praxis* versus another, except that the word *praxis* is, for reasons both contextual and symbolic, "crossed out."

4. The originality of Wittgenstein's *Praxis*

Finally, the only one of the great protagonists of the philosophical adventure of the twentieth century in whose work the term *Praxis* plays an important and original role—even if it is not, strictly speaking, thematized— is Wittgenstein. For him it is, of course, a German word, apparently in common use. Only readers who are aware of the history of philosophy and are involved in various ideological disputes will wonder about its relationship to the Aristotelian, Kantian, post-Kantian, and Marxist meanings of the term.

For Wittgenstein, the word refers first of all to the use of language, which in his later philosophy he opposes to the reduction of language to logic carried out in the *Tractatus Logico-Philosophicus*: "*Dies ist leicht zu sehen, wenn Du ansiehst, welche Rolle das Wort im Gebrauche der Sprache spielt, ich meine, in der ganzen Praxis der Sprache*" (You can easily see this if you consider what role the word plays in the use of language, I mean, in the practice of language taken as a whole: *The Brown Book* [*Eine philosophische Betrachtung*], 157). Wittgenstein also constantly refers to "the practice of language games" (*die Praxis des Sprachspiels*). Wittgenstein's later philosophy thus represents a passage from theory to practice (the term *praktisch* is frequently used) through the attention given to playing language games ("*in der täglichen Praxis des Spielens* [in the daily practice of playing]": *Remarks on the*

Foundations of Mathematics), and to actual, "everyday" usage. It is interesting that in the *Brown Book*, which is a kind of English version of *Eine philosophische Betrachtung*, Wittgenstein systematically uses "practice" as an equivalent of the German *Praxis*.

Praxis is thus defined as the context that gives meaning to words: "*Nur in der Praxis einer Sprache kann ein Wort Bedeutung haben*" (Only in practice in a given language can a word have meaning: *Remarks on the Foundations of Mathematics*); "*Die Praxis gibt den Worten ihren Sinn*" (Practice gives words their meaning: *Remarks on Colour*). The nature of this context is what is constantly debated by Wittgensteinians and post-Wittgensteinians: Is it linguistic, or social and institutional (cf. John Searle, Kenneth Jon Barwise)? Sociologists of science (D. Bloor) and ethnomethodologists thus make extensive use of Wittgenstein in their arguments that seek to situate knowledge in social practices.

But it is in Wittgenstein's reflection on the "rule" that the notion of *praxis* plays the most specific role. The idea of *praxis* indicates the repetition inherent in the rule, as in every kind of usage: for Wittgenstein there is no rule that is applied only once: "*Ist, was wir 'einer Regel folgen' nennen, etwas, was nur ein Mensch, nur einmal im Leben, tun könnte?*" (Is what we call "obeying a rule" something that it would be possible for only *one* man to do, and to do only *once* in his life? *Philosophical Investigations*, §199); "*Um das Phänomen der Sprache zu beschreiben, muß man eine Praxis beschreiben, nicht einen einmaligen Vorgang*" (In order to describe the phenomenon of language, one must describe a *Praxis*, not a one-time event: *Remarks on the Foundations of Mathematics*). In the *Philosophical Investigations*, Wittgenstein states that "'obeying a rule' is a practice [*eine Praxis*]" (§202) and "not an interpretation [*eine Deutung*]" (§201). And a little earlier, in §199, he indicates that there are all kinds of practices that involve "obeying a rule [*Regel*]." This does not mean that every practice is governed by rules, but inversely, that the meaning of systems of rules cannot be completely described without referring to the connections established between the different "practices" to which they belong and between these practices and "forms of life" (*Lebensformen*) specific to them, even though they vary indefinitely and can be attributed either to individuals or to groups.

In fact, the word "practice" does not suffice to render the plasticity of this horizon of reality and everyday exercise to which Wittgenstein confines the philosophical aporias of meaning and modality (how can we conceive the contingency of the necessity of rules?). Wittgenstein also has to use the words "action" or "activity" (*Tätigkeit*), and especially "use" or "usage" (*Gebrauch*: "*In der Praxis des Gebrauchs der Sprache,*" *Philosophical Investigations*, §7), in both the sense in which one uses a tool and the sense in which one conforms to a tradition (unless one transgresses it). We do not first "understand a rule" and then, possibly, "apply" it; we make "use" of it. "The use of the word in practice is its meaning" (*The Blue and Brown Book*, 68). Thus *praxis* has not simply descended into the "here and now," it has been disseminated in the multiplicity of common experiences that envelop discursive activity. In the *Tractatus Logico-Philosophicus*, philosophy is defined as activity and not as theory: "*Die Philosophie ist keine Lehre, sondern eine Tätigkeit. Ein philosophisches Werk*

besteht wesentlich aus Erläuterungen" (Philosophy is not a theory but an activity. A philosophical work consists essentially of elucidations: 4.112). Elucidation defines the philosopher's activity, and thereby defines the ethical value of the *Tractatus*— or, as Wittgenstein frequently says, its "therapeutics" of thought, which is pursued in a different way in his later philosophy through the emergence of *Praxis*. Wittgenstein uses the term *praxis* more frequently than "therapy," which appears only once in the whole of his work, or even than "activity" (*Tätigkeit*), which we still find in the writings of the intermediary period ("*Das Denken heißt eine Tätigkeit*" [Thinking is an activity]: *Philosophical Grammar*), but which is later entirely replaced by *Praxis*.

Two final remarks. First, when returned to dependency on the *Praxis* that implements it, the "rule" is no longer subject to the great metaphysical opposition between a descriptive proposition or assertion and an imperative or prescription. The distinction between the normative and the theoretical is qualified, which makes it easier to approach the problematics of "discursive practice," the speech act, or the truth effect. Next, and as a consequence, the most pertinent confrontation, in the end, is not with Aristotle or Marx, but with Kant. In the *Critique of Practical Reason,* Kant wrote: "A practical rule is always a product of reason because it prescribes action [*vorschreibt die Handlung*] as a means to an effect, which is its purpose" (RT: Ak., vol. 5). In Wittgenstein's work, the "rule," before prescribing an action or its goal, must be stated in the context of an action, that is, of a use, of a practice or *praxis*. Otherwise it will have no effect, and consequently no "meaning." There is no doubt here that, despite all the differences, comparisons might be made with other problematics of use (like that of Foucault: "the use of pleasures") or of activity (like that of the "ergologues about whom Yves Schwartz writes). But Wittgenstein is the only one to speak of *praxis* with a sublime unawareness of the historically acquired ambiguity of the notion.

PRÉDICABLE

FRENCH   *prédicable*
GREEK   *katêgoroumenon* [κατηγορούμενον]
LATIN   *praedicabile*

➤ *CATEGORY,* ESSENCE, LOGOS, PARONYM, PREDICATION, PROPERTY, SUBJECT, SUPPOSITION, *THING, TO BE,* TO TI ÊN EINAI, UNIVERSALS

A certain confusion prevails among translators of Aristotle regarding the fundamental terms of onto-logic: *katêgoroumenon* [κατηγορούμενον], *katêgorêma* [κατηγόρημα], and *katêgoria* [κατηγορία]. Although J. Tricot, basing himself on a few actual uncertainties in Aristotle's text, considers them as practically synonyms, it seems preferable to distinguish them in principle in a strict manner, in conformity with a certain medieval usage, reserving "predicable" (Lat. *praedicabile*) for *katêgoroumenon*, "categoreme" (Latin *categorema* [vs. "syncategoreme"]) for *katêgorema*, and "category" or "predicament" (Latin *categoria, praedicamentum* [see *CATEGORY*]), for *katêgoria*. In a sense, this clarification does violence to the texts, because it is obvious that the Greek *katêgoroumenon* means both "predicate" and "predicable." However, modern logic and ontology use Latin (that is, Franco-Latin, Anglo-Latin, Germano-Latin, etc.) more than Greek, and we cannot consider negligible the decisions made by "Latinity" since the sixth century to "enlist" the Aristotelian-Porphyrian technical idiom. The term *praedicabile* was introduced by Boethius in his translation of Porphyry's *Isagoge* to render *katêgoroumenon*, which Marius Victorinus, the first translator of the work, had earlier rendered by *appellativus*. Although it is not always easy to recognize in Aristotle Porphyry's distinction between "predicate" and "predicable" (we will see that some medieval thinkers did not consider it pertinent), it exists in Aristotle and is discussed in the *Categories*. One has to pay attention to this in order to estimate accurately the horizon, foundations, and stakes involved in the debate between nominalism and realism from the Middle Ages to the present—realism presupposing, today as always, the reification of the relations between "predicables" (that is, the "realization" of "Porphyry's Tree"), whereas nominalism presupposes the neutralization of the difference between *praedicamentum* and *praedicabile.*

I. Predicate and Predicable

In *Categories* (1b.10-12), once he has posited the classification of four kinds of beings—secondary substances, primary substances, universal accidents, particular accidents—by permutation of the relations *kath' hupokeimenou legesthai* [καθ' ὑποκειμένου λέγεσθαι] ("to be said of a subject") and *en hupokeimenôi einai* [ἐν ὑποκειμένῳ εἶναι] ("to be in a subject"), which constitutes the complete inventory of the "things that there are," Aristotle formulates a general rule according to which "when something is predicated (*katêgoreitai* [κατηγορεῖται]) of something else as of a subject (*hôs kath' hupokeimenou* [ὡς καθ' ὑποκειμένου]), everything that is said (*legetai* [λέγεται]) of the predicable (*katêgoroumenou* [κατηγορουμένου]) will also be said [ῥηθήσεται] of [this] subject (*hupokeimenou* [ὑποκειμένου])." The expression "be predicated of something as of a subject" does not mean "be attributed to a subject" in the sense in which one says that in a proposition the predicate is attributed to the logical subject by means of a copula ("S is P"), but rather the relation existing between a "predicable" and what is "subjected" to it in the serial order that constitutes a genus—the

very type of relation that was later to be articulated in what is called "Porphyry's Tree." To illustrate this general law, Aristotle takes two examples (1b.12–15): that of "man" predicated of "this man" (a man), and that of "animal," which, according to the rule, is also predicated of the individual man, since the individual man is both a man and an animal. The meaning of the rule is that when one thing—man (a species)—is predicated of another—individual man (a primary substance)—"as of a subject," what is predicated of it—animal (a genus)—is predicated of it and of its subject. To present this rule, Aristotle does not employ the terms "genus" and "species," but that is indeed what he has in mind, as is shown by the definitive formulation in chapter 5 of the *Categories* (3b.2–7), based on the general formula of 1b.10–12: "the definition of the species and that of the genus are applicable to the primary substance." In his *Commentary* on the *Categories* "by question and answer" Porphyry explains the meaning of Aristotle's expression "to be predicated of something as of a subject": it means "to be stated by it as being part of its essence" (see *Isagoge et in Aristotelis categorias commentarium*, ed. A. Busse, 80.5 f.). Thus there is a clear distinction between the "predicate" in the logical sense of the term, the predicative part of a proposition, and "what is predicated" in the sense of the "predicable." In a proposition such as "Socrates is walking," the term "walking" is predicated of the term "Socrates" (which is the logical and grammatical subject of the sentence), but it is not "predicated as of a subject" because it does not express a constituent of its essence. On the other hand, as Porphyry emphasizes, in the statement "Socrates is [a] man," "man" is predicated of "Socrates" as of a subject, for if we ask, "What is Socrates?" the correct answer (that is, the *logos* [λόγος] expressing his being) is this: "He is a man." In "Socrates is a man," "man" is thus both predicate and predicable. What Aristotle has in mind in 1b.10–15 is thus a relation of "predicability" based on another relation, that of "subordination," which means that what is predicated of a predicable Y as of a subject is also predicated of that of which Y is predicated as of an individual subject X. The complete schema of the relation of predicability, corresponding to the vertical relations established on "Porphyry's Tree," is thus:

$$Z \rightarrow Y$$
$$Y \rightarrow X$$
$$Z \rightarrow X$$

(where Z designates a genus, Y a species, X an individual, and → the relation "to be predicated of . . . as of a subject"). This schema articulates entities that are ontologically subordinated to each other within the single genus (X is subordinated to Y, which is subordinated to Z). The same thesis is set forth in *Isagoge* 2.§14: "of everything of which the species is predicated, of that, necessarily, will also be predicated the genus of the species, etc."

Porphyry goes on to define the three "predicables" implied in the relation of subordination:

Genus: Genus signifies what is predicable of several things differing in genus, relative to the question "what is it?"

([τὸ κατὰ πλειόνων καὶ διαφερόντων τῷ εἴδει ἐν τῷ τί ἐστι κατηγορούμενον.])

(Busse, ed., 82.6–7)

Species: Species signifies what is predicable of several things differing in number, relatively to the question: "what is it?"

([τὸ κατὰ πλειόνων καὶ διαφερόντων τῷ ἀριθμῷ ἐν τῷ τί ἐστι κατηγορούμενον.])

(Ibid., 82.10–11)

Difference: A difference is what is predicated of several things differing in species, relative to the question "how is the thing?"

([τὸ κατὰ πλειόνων καὶ διαφερόντων τῷ εἴδει ἐν τῷ ποῖόν τί ἐστι κατηγορούμενον.])

(Ibid., 82.19–20)

On this basis, Porphyry analyzes the relation between essence, animal, and man—the essence is not subordinated to anything, since it is "highest" (there is nothing anterior to it); the animal is a species in relation to the essence and a genus in relation to man; man is a species in relation to the animal and the essence—and then he explains that the relations among the three are determined by the rule that stipulates that what is "higher" is predicated on what is "lower" "synonymously" (*sunônumôs* [συνωνύμως]), a key term in the Aristotelian theory of predication. Next he introduces a distinction between "constitutive" differences (*sustatikai* [συστατικαί]) and "divisive" differences (*diairetikai* [διαιρετικαί]). This set constitutes the foundation of what "Porphyry's Tree" presents for the analysis of the genus "substance" or "essence."

II. The Five Predicables

In addition to what he says in the *Categories*, Aristotle also sets forth the theory of predicables in *Topics*: 1.4, gives their "division"; 1.5 their "definition"; 1.8, the justification for this division; 1.6., 6.1, and 7.5, the analysis of their relations. Aristotle's list of predicables has four entries: definition, property, genus, and accident ([ὁρισμός, ἴδιος, γένος, συμβεβηκός]). Porphyry's, on the other hand, lists five: genus, species, difference, property, and accident ([γένος, εἶδος, διαφορά, ἴδιος, συμβεβηκός]). If we juxtapose Aristotle's and Porphyry's lists, we see that the *Isagoge* refashions Aristotle's division in two ways: (1) by substituting difference for definition; and (2) by adding species to the initial list.

Medieval commentators did not fail to stress this elimination of definition. In his *Summa logicae*, William of Ockham gave it a special chapter at the end of his analysis of "Porphyry's five predicables." He even added three chapters on description, descriptive definition, and the terms "defined" and "described," based on John of Damascus's *Dialectica*. In this way he reconnected, at a distance, with a central element of Neoplatonic exegesis, in which the distinction between *orismos* [ὁρισμός] (definition), *logos* [λόγος] (statement, formula), and *hupographê* [ὑπογραφή] (description), which is not made explicit in the *Isagoge* (although it is used in it),

is the object of careful elaboration (cf. William of Ockham, *Summa logicae*, 1:26–29).

Aristotle himself draws from his list an initial modified list; the final list in the *Topics* is an elaboration of an earlier table with four terms including genus, property, accident, and difference, which Aristotle modified by reducing difference to genus: "the differentia too, applying as it does to a class (or genus) should be ranked together with the genus" (*Topics*, 1.4.101b.18–19); (2) by dividing property into two parts, one of which, signifying "the essential of the essence" (*to ti ên einai* [τὸ τί ἦν εἶναι]), is definition, while the other, not signifying it, is the only one called "property" (*to idion* [τὸ ἴδιον]).

By restoring "difference" to its list of predicables, the *Isagoge* combines Aristotle's two lists, analyzing definition, which is eliminated from the new list, into its two constituents: genus and difference. The introduction of species alongside genus, difference, property, and accident is a change in perspective with regard to the *Topics* that has been criticized by some interpreters. In his book on Aristotle, W. D. Ross severely criticizes Porphyry's revision: "Porphyry later muddled hopelessly [Aristotle's classification of predicables] by reckoning *species* as a fifth predicable" (*Aristotle*, 2nd ed., 57). This modification is easily explained, however; the *Isagoge* is an introduction to the *Categories*, and its function is to explain, within the limits of the *skopos* [σκοπός] (subject) of the *Categories*, the elements of ontology that they contain. As we have seen, the relation genus-species-difference-individual is the backbone of the *Categories*. In choosing species, Porphyry is performing his work as an interpreter: he exchanges the perspective of the *Topics* for that of the *Categories*. In the *Topics*, Aristotle examines only propositions (premises or problems) that have a general term as their subject: species thus does not figure on his list; in the *Isagoge*, on the other hand, Porphyry adds propositions having an individual term as their subject, and thus species necessarily figures on his list. This broadening of the typology of propositions results from an ontological decision: Porphyry Platonizes Aristotle's theory of predicables as it is set forth in the *Topics*. However, this Platonization is consistent with the theoretical content of the *Categories*. Porphyry Platonizes Aristotle only at points where he is still Platonic or, at least, "Platonizable."

Having already mentioned the definitions of genus, species, and difference proposed in the *Commentary* on the *Categories* (Busse, ed., 82), we will cite here from the *Isagoge* only those of property and accident:

Property

Greek: [καὶ γὰρ ὃ μόνῳ τινὶ εἴδει . . . ταῦτα δὲ καὶ κυρίως ἴδιά φασιν, ὅτι καὶ ἀντιστρέφει.]

Boethius: et id quod soli alicui speciei. . . . Haec autem proprie propria perhibent esse, quoniam etiam convertuntur.

([A property is] what belongs to a species alone [. . .] [Properties] are precisely those [traits] which, according to [philosophers] are called properties in the strict sense, because they can be converted.)

(trans. J. Barnes)

Accident

Greek: [συμβεβηκός ἐστιν ὃ ἐνδέχεται τῷ αὐτῷ ὑπάρχειν ἢ μὴ ὑπάρχειν, ἢ ὃ οὔτε γένος ἐστὶν οὔτε διαφορὰ οὔτε εἶδος οὔτε ἴδιον, ἀεὶ δέ ἐστιν ἐν ὑποκειμένῳ ὑφιστάμενον.]

Boethius: Definitur autem sic quoque: accidens est quod contingit eidem esse et non esse, vel quod neque genus neque differentia neque species neque proprium, semper autem est in subiecto subsistens.

(df 1 Accident: An accident is what can belong or not belong to the same thing.

df 2 Accident: or else it is that which is neither genus, nor difference, nor species, nor property, but which always subsists in a subject.)

(trans. J. Barnes)

In Porphyry, definition "df 2 Accident" corresponds to "df 1 Accident" in Aristotle, who also offers, in the *Topics*, two definitions:

Greek: [Συμβεβηκὸς δέ ἐστιν ὃ μηδὲν μὲν τούτων ἐστί, μήτε ὅρος μήτε γένος, ὑπάρχει δὲ τῷ πράγματι· καὶ ὃ ἐνδέχεται ὑπάρχειν ὁτῳοῦν ἑνὶ καὶ τῷ αὐτῷ καὶ μὴ ὑπάρχειν.]

Boethius: Accidens autem est quod nichil horum est, neque diffinitio neque proprium neque genus, inest autem rei et contingit inesse cuilibet uni et eidem et non inesse.

(*Topica*, trans. Boethii in *Aristoteles latinus*, 11.1–2)

df 1 Accident: An accident is something which, though it is none of the foregoing, i.e., neither a definition nor a property nor a genus—yet belongs to the thing.

(*Topics*, 1.5.102b.4–5; trans. J. Barnes)

df 2 Accident: something which may possibly either belong or not belong to any one and the self-same thing.

(*Topics*, 1.5.102b.6–7; trans. J. Barnes)

Porphyry's definition differs from Aristotle's by the addition of *aei de estin en hupokeimenôi huphistamenon* [ἀεὶ δέ ἐστιν ἐν ὑποκειμένῳ ὑφιστάμενον] (but which always subsists in a subject), and this was to pose numerous problems for medieval thinkers.

III. "Predicable" and "Universal"

The distinction between "predicable" and "universal" is difficult to formulate. In one sense, there is no difference between these terms, since both designate the five entities that tradition has also called "five voices" [πέντε φωναί], extrapolated from the heading of one of the chapters in the *Isagoge* about the "common properties of the five voices" (*Peri tês koinônias tôn pente phônôn* [Περὶ τῆς κοινωνίας τῶν πέντε φωνῶν]). These five entities—Apuleius speaks of five *significationes*, while Marius Victorinus speaks of *partes* or *res*,

and Boethius, in the first edition of his commentary on the *Isagoge* also uses the term *res*—being universally predicable, it may seem pointless to distinguish in this case between "predicable" and "universal." The terminist logicians of the thirteenth century, however, made a series of definitions that fully justify, from their realist point of view, a distinction between the two terms. According to them, "predicable" has two meanings: strictly speaking, a "predicable" is what "is predicated on several [things]"; in the broad sense, it is "what is predicated on a thing or of several [things]." Thus "predicable" and "universal" are synonyms, in the strict sense of "predicable." They differ from one another, however, in that the predicable is defined by "being said" (*dici*) whereas the universal is defined by "being [in]" (*esse in*): "differunt in hoc quod praedicabile definitur per dici, universale autem per esse" (Peter of Spain, *Tractatus*, 2.§1.17). In this analysis, the predicable is thus "what is by nature capable of being said of several [things] [*quod aptum natum est dici de pluribus*]." The former is a term, the second a thing or property.

■ See Box 1.

The pair *dici* versus *esse in* is not congruent with the two relations used in the *Categories* to produce the four classes of things: primary and secondary substances, particular and universal accidents. In the *Categories*, the relation *kath' hupokeimenou legesthai* [καθ' ὑποκειμένου λέγεσθαι] (to be said of a subject) is the mark of universality, whereas *en hupokeimenôi einai* [ἐν ὑποκειμένῳ εἶναι] (to be in a subject) is that of accidentality. The meaning of the words *dici* and *esse* in the terminist definition is thus either different from the Aristotelian meaning or it is unsuited to the situation. Moreover, the nominalists rejected, as a categorial error, the use of the notion "to be in" with regard to the universal.

In the fourteenth century the terminist thesis was redefined on the basis of the theory of "supposition" (see SUPPOSITION). "Predicable" and "universal" are both metalogical or meta-linguistic terms that designate other terms, including concepts and signs. In his *Summulae* (in fact a commentary on Peter of Spain's *Tractatus*), Jean Buridan explains that "according to the literal meaning of the words" Peter's thesis is false. One cannot say that the universal and the predicable are the same thing, but only that the terms "universal" and "predicable" are convertible. They differ, however, *secundum rationem*. In his explanation of this difference, Buridan, as a nominalist, erases the distinction initially made by Aristotle and Porphyry between predicate and predicable. "Predicate" (*praedicatum*) and "subject" (*subjectum*) are relative terms. The same goes for "predicable" (*praedicabile*) and "subject-able" (*subicibile*). A term is said to be "predicable" insofar as (*ea ratione*) it is "suited by nature to be predicated of a subject," while it is said to be "subjectable" insofar as (*ea ratione*) it "signifies equally several things and is suited to substitute for several things, without regard to the fact that it functions as a subject or as a predicate." For Buridan, a universal term is thus not defined as such by *esse in*. A universal "is in nothing." The expression *esse in* must be understood in the sense of "to be predicated truly and affirmatively."

The same metalinguistic redefinition of *esse in* as *praedicari vere et affirmative* appears in Ockham. In his commentary on the *Isagoge*, even the passage on the "subsistence" of the

1

Inhaerere/inesse: The ambiguities of the expression of inherence

➤ PREDICATION, Box 3, TERM

The word "inhere" is used to render the two Latin verbs *inhaerere* and *inesse* without attending to the fact that they may have different meanings. In medieval texts *inesse* is used to indicate the fact that an accident is in a substrate, *inhaerere* being usually employed in the logical context of predication to indicate the quality signified by the predicate insofar as it is attributed to the subject, insofar as it is signified as being in the subject. The distinction seems to go back to Boethius, and to the developments of his thought proposed by Abelard. Boethius generally uses the verb *inesse* to describe the inherence of an accident, of a quality, for example, in a subject. The verb can thus signify an accident that inheres (*inest*) in a subject. But Boethius also uses the verb *inhaerere* repeatedly in his *De topicis differentiis* to describe the relations between terms, between the "subject term" and the "predicate term":

> In praedicativa quaestione dubitatur an subiecto termino praedicatus in inhaereat.
>
> (In a predicative question, we ask whether the predicate inheres in the subject term.)
>
> (*De topicis differentiis,* 1177B; trans. E. Stump)

Here the question is how to determine, in a given proposition, which of the four "modes of inherence" is the one in accord with which the predicate term is predicated on the subject term (*quisnam modus sit quattuor inhaerendi*, 1186C), that is, whether the predicate is predicated of the subject qua genus, definition, property, or difference (1179A–B). Although Boethius does use *inhaerere* for relations between terms, this relation seems to depend on a real relation, which he indicates by the verb *inesse*:

> In predicative questions one is asking nothing other than whether the subject inheres (*inhaereat*) in the predicate. If it is in (*inesse*), we must ask whether it is in qua genre, accident, property, or definition. And if it is not in, the question disappears. In fact, what is not in, is not either as an accident, or as a definition, or as a genus, or as a quality. But if it proves to be in, the question remains which of the four modes of inherence (*modus inhaerendi*) is involved.
>
> (*De topicis differentiis*, 1186C; trans. E. Stump)

In his commentary on these passages, Abelard sought to clarify this terminological confusion. As a nominalist, he makes a clear distinction between real relations between things and relations between terms, which constitute the true object of dialectic. Thus he distinguishes between an "inherence of things" (*inhaerentia rerum*) and "inherence of words, of names" (*inhaerentia vocum*), discerning two questions in Boethius's original question as to whether "the predicate term inheres in the subject term." The "inherence of things" concerns the real relations between things: since every predication indicates a "coupling" of things or essences (see in PREDICATION, Box 3), it indicates that what is denoted by the subject term is identical to what is denoted by the predicate term. These real relations are thus not indicated by "being in" (*inesse*) but rather by identity, because "in every predicative affirmation we affirm that something *is* something (ibid.):

> In the questions, "Is Socrates a man?" or "Is Socrates white?" we are asking whether the predicate inheres (*inhaereat*) in the subject.
>
> (*De topicis differentiis* , 275; trans. E. Stump)

Elsewhere, Abelard speaks of the "coherence" of two matters (*cohaerentia*) in the first case, and of the "adjacency" or "adherence" of a form to a matter in the second (*Dialectica*, 329). On the other hand, the "inherence of names" concerns the different modes indicating the relations between the subject and predicate terms, for example relations of identity for property or definition, of superiority for genus, and so forth. In this sense, asking whether the predicate inheres (*inhaereat*) in the subject amounts to inquiring into the mode in which it suits (*conveniat*) the latter. For example, when Boethius explains that "when something is posited as being in (*inesse*) something, it can be superior," it is clear, Abelard says, that the question is not whether the "animal" thing is superior to the "man" thing, since they are really identical, but rather to see if, in saying *homo est animal* the term "animal" is superior to the term "man," which determines that the former is genus in relation to the latter, and the same goes, *mutatis mutandis*, for the three other predicables. In fact, he concludes, in asking this question about the modes of inherence, "Boethius really wanted to speak of the

terms of which the proposition is composed, rather than of the things that they signify" (*Super topica glossae*, 270; cf. *Dialectica*, 165–66, "Edition super porphyrium"). The truth of the proposition "snow is white" depends on real relations between things; to determine whether the accident is in (*inest*) the subject, we have to ask whether one thing (snow) is identical with another thing (this white) and not with this essence (whiteness); but the topical relations depend on relations between terms—and Abelard is here in open opposition to his realist teacher William of Champeaux, who maintained that they concerned real relations between things.

The distinction between these two meanings of the term *inhaerere* is mentioned apropos of other questions. For example, in discussing adverbs of modality, Abelard explains that they cannot qualify real inherence (the modality *de sensu*, later called *de re*), but only verbal inherence: in the proposition "Socrates possibiliter est episcopus" ("Socrates could be a bishop") one cannot speak of the real inherence (or "coherence") of bishop in Socrates (because Socrates is, at the time one speaks, a layperson), which is still clearer in the example "Socratem impossibile est esse lapidem" ("It is impossible that Socrates is a stone"). In opposition to William of Champeaux, who was a partisan of an interpretation of modalities *de dicto*, Abelard maintains that modality acts on the level of *enuntiatio*, and refers to the manner in which the predicate term is joined to the subject term (*Dialectica*, 191–98, *Glossae super peri hermeneias*, 484).

accident in a subject is redefined in this way: according to Ockham, the second definition of "accident" merely elaborates on the first, because in the expression *semper autem est in subjecto subsistens* ("is always also subsisting in the subject"), *subsistere* means *praedicari*. For Ockham, the meaning of the second definition of "accident" in Porphyry is thus purely "logical":

> df 2 Accident: omne praedicabile de multis, quod neque est genus neque species neque differentia neque proprium, et non praedicatur de omnibus sed de aliquibus praedicatur et de aliquibus non, est accidens, hoc est contingenter praedicabile.

> (Everything that is predicable of several subjects and is neither a genus nor a species nor a difference nor a property, and which is not a predicable of all subjects but is predicable of some and not of others, is contingently predicable.)

> (*Expositio in librum Porphyrii de praedicabilibus*, 2:99, 30–34)

The neutralization of the distinction between predicable and universal, to the advantage of the meaning of "predicable" (= a term is universal when it "signifies several things"), is a characteristic of nominalism, whether medieval or modern.

LATIN	*praedicatio*, *praedicare*

➤ ANALOGY, *CATEGORY, CONCEPT* [BEGRIFF, CONCEPTUS], ESSENCE, ESTI, HOMONYM, LOGOS, PARONYM, PRÉDICABLE, PROPOSITION, SUBJECT, TERM, *TO BE,* UNIVERSALS

"Predication" designates the logical form par excellence: the attribution of a predicate to a subject in a proposition is the basic unit of classical logic. The canonical predicative form defining the association of two concepts, subject and predicate, is traditionally presented as the connection of two terms (or "extremes") by means of a copula (lexicalized by the verb "to be"), expressed by the formula "S is P." This analysis is generally traced back to Aristotle—not entirely correctly, however. In fact, the three expressions that appear in his work to designate predication are *huparchein* [ὑπάρχειν] (belong to), *legesthai* [λέγεσθαι] (be said of), and *katêgoreisthai* [κατηγορεῖσθαι] (be predicated of), so that the copula has the function of implementing the imposed/supposed equivalence of *huparchein*, *legesthai*, and *katêgoreisthai*. This assimilation is consummated in all the summae of medieval logic, and the predominance of the tripartite analysis of logical form into "S is P" gives the impression that the distinction "subject"-"predicate," which derives from the *hupokeimenon* [ὑποκείμενον]–*katêgorêma* [κατηγόρημα] pair, is universal.

Thus it was on the basis of the "Aristotelian" conception of predication and its tripartite analysis of propositional form as it was established in the Middle Ages, following Boethius's Latin translations, that the tradition developed and then, starting with G. Frege, threw into crisis—to the advantage of the "function"—the logical theory of predication. The problems encountered by a translator of ancient and medieval texts on logic, which were simply extended in pre-Fregean logic, are thus all concentrated on the avatars of *katêgoreisthai/legesthai*. Here we will discuss only the main difficulties—*praedicatio in quid* versus *praedicatio in quale*; *praedicatio ut de subjecto* versus *praedicatio ut in subjecto*; *praedicatio univoca* versus *praedicatio denominativa*—before returning to the problem of the copula.

I. The "Aristotelian" Conception

Aristotle's three ways of designating predication, *huparchein* [ὑπάρχειν] ("belong to"; Ger. *kommen zu*), *legesthai* [λέγεσθαι] ("be said of"; Ger. *ausgesagt werden*), and *katêgoreisthai* [κατηγορεῖσθαι] ("be predicated of"; Ger. *behauptet werden*), must all be understood on the basis of *huparchein*, at least insofar as predication proper is concerned, occurring in the context of syllogistic reasoning, and thus in that in which the basic unit is the proposition understood as a "premise." In fact, although since the Middle Ages all propositions have commonly been analyzed in the so-called Aristotelian form—"A is B"—Aristotle himself never writes "A *estin* B" (A is B) (except in presenting defective arguments or acknowledging ordinary usage), but only "*to* A *huparchei tôi* B" (the A belongs to B), in series such as "If [the] A belongs to all B, and if [the] B belongs to all C, then [the] A belongs to all C." Naturally, since the same thesis can be expressed using *legesthai*, as Aristotle himself does in the *Prior Analytics*, I.4.25b, 35n.), basing himself on the definition of the *dictum de omne* ("That one term should be included in another as in a whole [*en holôi* (ἐν ὅλῳ)] is the same as for the other to be predicated of all of the first. And we say that one term is predicted of all of another, whenever no instance of the subject can be found of which the other term cannot be asserted") (I.24b, 28.n.; trans. A. J. Jenkinson), the Aristotelian conception of predication on the basis of *huparchein* can easily be reduced to a form that is simpler and easier to handle "in languages": the copula "is" functions to implement the so-called equivalence of *huparchein*, *legesthai*, and *katêgoreisthai*.

This assimilation, which is found in all medieval treatises on logic, is taken further by another assertion in the *Prior Analytics* (I.37, 49a.n.): "The expressions 'this belongs to that' and 'this holds true of that' have to be understood in as many different ways as there are different categories," interpreted as meaning that for Aristotle in various propositions the copula has as many meanings as there are categories (Bochenski, *A History of Formal Logic*). The predominance of the tripartite analysis of the logical form into "S is P" gives the impresssion that the distinction "subject"-"predicate," which arises from the *hupokeimenon* [ὑποκείμενον] – *katêgorêma* [κατηγόρημα] pair (see PRÉDICABLE and SUBJECT), is universal. That is how the Stoic distinction between *ptôsis* [πτῶσις] and *katêgorêma* is understood: the "inflections," that is, the terms or proper nouns (*onomata* [ὀνόματα]) and general terms (*prosêgoriai* [προσηγορίαι]) that, in a statement, designate an object, being transcribed as "subjects," and the *katêgorêmata*, that

is, the terms that attribute a property to these subjects being transcribed as "predicates" (cf. M. Pohlenz, *Die Stoa*). G. Schenk, commenting on Diogenes Laertius (VII.70), thus writes that among the Stoics, "the normal form of the statement/proposition is the case in which the subject is presented in its fundamental form, that is, the one in which the connection is made by means of a nominative" (Als normale Form der Aussage betrachten sie den Fall, wo das Subjekt sich in seiner Grundform aufrecht erhält, d.h. die Verbindung in einem Nominativ vollzogen wird [*Zur Geschichte der logischen Form*, in *Einige Entwicklungstendenzen von der Antike bis zum Ausgang des Mittelalters*, 1:216]; see section V of this entry).

In his translations of Aristotle, Boethius (ca. 480–524/25 CE) uses *praedico* to render *katêgorô* [κατηγορῶ], and *praedicatio* to render *katêgoria* [κατηγορία], which is also rendered by *praedicamentum*. The word *praedicatio* appears, of course, in a great variety of contexts. It raises no particular problem; it is the distinctions that it involves that require explanation in some cases. In the Scholastic vocabulary, *praedicatio* appears in a great variety of contexts in expressions such as *praedicatio essentialis* versus *praedicatio accidentalis*, *praedicatio per essentiam* versus *praedicatio per accidens*, and *praedicatio per se* versus *praedicatio per aliud*, which are so many unproblematic calques of Aristotle's technical language. Other uses of *praedicare* can be easily explained: *in abstracto* versus *concretive*, *in plurali* (or *pluraliter*) versus *in singulari* (or *singulariter*), *negative* versus *positive*, *per prius* versus *per posterius*, *simpliciter* versus *secundum quid*. On the other hand, some uses of *praedicatio/praedicare*, although also of Aristotelian origin, raise genuine problems. For example, *in quid* (or *in eo quod quid*, or *in eo quod quid est*) versus *in quale* (of *in quale quid*, or *ineo quod quale*) or *de ut de subjecto* versus *ut in subjecto* and *de univoce* versus *denominative*. For the first group, the difficulty concerns only the translation, because the conceptual content is clearly accessible; for the second group, it is the notion itself that poses a problem, the translation difficulty disappearing as soon as the content is identified.

II. Predication *In Quid* / Predication *In Quale*

The expression *praedicatio in eo quod quid est* (or *in eo quod quid sit praedicari*) first appears in Marius Victorinus (ca. 280–365), the translator of Porphyry's *Isagoge*, which was later popularized by Boethius's translations of Aristotle's *Organon* and by the *Logica vetus*. That is the case, for example, of the definition of genus in Aristotles' *Topics* (I.5.102a31–32): "Genos esti to kata pleionôn kai diapherontôn tôi eidei en tôi ti esti katêgoroumenon" [Γένος ἐστὶ τὸ κατὰ πλειόνων καὶ διαφερόντων τῷ εἴδει ἐν τῷ τί ἐστι κατηγορούμενον], which Victorinus renders in Latin by "Genus autem est quod de pluribus et differentibus specie in eo quod quid est praedicatur." J. Brunschwig's French translation ("Est genre un attribut qui appartient en leur essence à plusieurs choses spécifiquement différentes" [Genus is an attribute that belongs in its essence to several specifically different things; *Topics*]), as well as J. Tricot's ("Est genre l'attribut essentiel applicable à une pluralité de choses différant entre elles spécifiquement" [Genus is the essential attribute that applies to a plurality of things differentiated among themselves in specific ways; *Topics*]), although very clear, allow us to discern a certain confusion with regard to the basic

formula of essential predication: *en tôi ti esti katêgoreisthai* [ἐν τῷ τί ἐστι κατηγορεῖσθαι]. It is this expression that raises the greatest problems for the translator. The formula "to be predicated" (*en tôi ti esti* [ἐν τῷ τί ἐστι]), introduced by Aristotle and later adopted and established by Porphyry, contains a reference to the idea of a question. What is predicated *en tôi ti esti* is what is predicated to answer the question "What is that thing?" The answer to the question is the *ti esti,* which, insofar as it is expressed in a definition, is the *to ti ên einai* [τὸ τί ἦν εἶναι] (see TO TI ÊN EINAI). The Latin *praedicare in eo quod quid est*, like the Greek *en tôi ti esti katêgoreisthai*, thus means "be predicated as to what is," "be predicated by indicating the 'what it is'"—that is, "be predicated in the rubric 'What is?'" or "be predicated in the relationship of *ti esti*," in short: "to be predicated relative to the question 'What is?'" In the Middle Ages, the Boethian expression was often abbreviated to *praedicari in eo quod quid*, and then to *praiedicari in quid*. The meaning is clear: the reference is to essential predication.

However, if we want to retain the technical aspect of Scholastic language, we find ourselves somewhat perplexed. A first solution is that adopted by medieval thinkers, conveyed by J. Biard in his translation of Ockham's *Summa logicae* (I, chap. 20): "Le genre est ce qui se prédique de plusieurs choses différentes par l'espèce, en en indiquant la quiddité" (Genus is what is predicated of several things differing in species, indicating the quiddity). This makes it possible to avoid using the term "essence," which is in fact better to reserve for *to ti ên einai*—and that is why Biard also uses the Franco-Latin expression *se prédiquer in quid*. Another medieval solution, adopted by O. Boulnois in his translation of Duns Scotus (*Sur la connaissance de Dieu et l'univocité de l'étant*), is *se prédiquer dans-le-quoi*. The same difficulty arises, still more acutely, for the expression *in eo quo quale si praedicari*. This formula is particularly notable in the *Isagoge*, VIII.§5, where Porphyry explains the way in which difference is predicated: "eti to men genos en tôi ti estin, hê de diaphora en tôi poion ti estin, hôs eirêtai, katêgoreitai" [ἔτι τὸ μὲν γένος ἐν τῷ τί ἐστιν, ἡ δὲ διαφορὰ ἐν τῷ ποῖόν τί ἐστιν, ὡς εἴρηται, κατηγορεῖται], which Boethius translates as "amplius genus quidem in eo quod quid est, differentia vero in eo quod quale quiddam est, quemadmodum dictum est, praedicatur." With the most natural translations of *en tôi poion ti estin* (*in eo quod quale sit*) and *en tôi ti estin* being "to be predicated relative to the question 'What is?,'" we can render the passage by "In addition, genus is predicated relative to the question 'What is' and difference, relative to 'How is?'—as has been said." Translating the passage with "to be predicated *in quale*" (to be predicated in what it is) is another possibility. In his French translation of the passage, J. Tricot proposes the following: "Le genre est inhérent à l'essence, tandis que la différence rentre dans la qualité" (Genus is inherent in essence, whereas difference is included in quality). Warren's English translation gives the following: "Further, as has been said, genus is predicated essentially, but difference qualitatively." For the definition of difference ("difference is what is predicated of several things differing in species, relative to the question 'How is the thing?'"), Tricot once again renders *en tôi poion* by "in the category of quality." This seems a poor solution even if it is not basically incorrect. What matters is still to use the vocabulary to make as clear as possible the distinction between the questions "What is X?" (*quid

est?* [which bears on the essence or the essential]) and "How is X?" (*qualis est?* [which bears on the *poion ti*]) incorporated by Aristotle and Porphyry in the definition of the two types of predication, the matrix of the distinction between essential predication and accidental predication, detailed in another form in the following distinctions: "predication as of a subject" versus "as in a subject" and "univocal predication" versus "denominative predication."

III. "Predication as of a Subject" versus "Predication as in a Subject"

The distinction between *praedicatio ut de subjecto* and *praedicatio ut in subjecto* raises no translation problems. However, the meaning of the notions is more difficult to grasp, especially when *praedicatio ut in subjecto* is replaced in the Scholastic language by *praedicatio denominativa* (see PARONYM). We can describe the phenomenon this way: the Aristotelian theory of predication, as it is set forth in the *Categories*, is based on a distinction between "beings that are said of a subject" and "beings that are in a subject." This distinction is often obscured by modern translations. The reason for this is twofold: on the one hand, the confusion of PS "be said of a subject" and Pp "be a predicate in a proposition," and on the other hand the relative homonymy (or only partial synonymy) of PS "be said of a subject" and P*S "to be predicated of a thing as of a subject."

The expression "be said of a subject" appears for the first time in the *Categories* (1a20–21): "Of things themselves some are predicable of a subject, and are never present in a subject" [τῶν ὄντων τὰ μὲν καθ' ὑποκειμένου τινὸς λέγεται, ἐν ὑποκειμένῳ δὲ οὐδενί ἐστιν]. They designate a property (*kath' hupokeimenou legetai*), which, combined with the other (*en hupokeimenôi einai*), makes it possible to distribute beings in four classes. Contrary to what one might expect, "be said of a subject" does not mean "function as a predicate in a proposition" but rather "be applied to a plurality," that is, "be universal," and even, for the same reason, "be capable of functioning as a predicate in a proposition" (in fact, a particular cannot be predicated). Interpreting "be said of a subject" as meaning "be a predicate" is reverse cause and effect: it is because it is applied to a plurality that what is said of a subject is capable of then being a predicate in a proposition. The expression *kath' hupokeimenou legetai* designates the property that makes it possible to distinguish universals from particulars—*en hupokeimenôi einai* designating, for its part, the property that makes it possible to distinguish substances from nonsubstances.

In chapter 2 of the *Categories*, Aristotle thus based on these two relations the classification that allows him, by permutation, to classify, as the commentators (introducing at the same time a distinction between substance and accident that Aristotle had not previously mentioned) were to say, the "four kinds of beings": universal substances, particular nonsubstances, universal nonsubstances, and particular substances—which characterizes each existing substance as not being in a subject (all nonsubstance), being in a subject (all universal), being said of a subject (all particular), and not being said of a subject. This theory of the "four combinations" was made more precise by Porphyry, and then, among the Romans, by Boethius (under the title *quatuor complexiones*),

with a distinction between universal substance, particular substance, universal accident, and particular accident (cf. RT: *PL*, vol. 64, cols. 169–71), which can be represented as follows:

Said of a subject	In a subject	
+	+	universal accident
-	+	particular accident
+	-	universal substance
-	-	particular substance

Although the distinction between PS "be said of a subject" and Pp "be a predicate in a proposition" is not always recognized or correctly rendered by modern translations, what both distinguishes and unites PS "be said of a subject" and P*S "be predicated of a thing as of a subject" is still less clear. The reason is that this distinction is from the outset neither comprehensible nor sharply defined, and moreover it is not uniformly maintained in Aristotle or his commentators. To grasp its import, we have to first see that it operates in the horizon of a distinction between intracategorial predication and transcategorial predication. Then we have to understand that although the theory of predication sought by Aristotle in the *Categories* has as its main goal to explore the first of these two forms of predication, that is, P*S, the meaning of P*S appears on the basis of two rules mentioned in the inverse order of their presupposition: the first in accord with the logical order (notated here as R1), which defines the "synonymy" of predication within the same category, formulated in 2a19–21, whereas the second (R2), which defines its "transitivity," is formulated in 1b10–11. The meaning of P*S thus appears only by combining the stipulations of R1 and R2—that is, once Aristotle's formulas have been put back in their true logical order.

R1 says [φανερὸν δὲ ἐκ τῶν εἰρημένων ὅτι τῶν καθ᾽ ὑποκειμένου λεγομένων ἀναγκαῖον καὶ τοὔνομα καὶ τὸν λόγον κατηγορεῖσθαι τοῦ ὑποκειμένου]. J. Tricot translates this as follows: "Il est clair, d'après ce que nous avons dit, que le prédicat doit être affirmé du sujet aussi bien pour le nom que pour la définition" (It is clear, after what we have said, that the predicate ought to be affirmed by the subject and equally for the noun and the definition). This translation, which omits *tôn kath' hupokeimenou legomenôn*, does not allow us to grasp the function of R1. By giving R1, Aristotle formulates, without saying so explicitly, the first characteristic of intracategorial predication: attribution (*sunônumos* [συνωνύμως]). What R1 means in fact is that in the case in which two entities *x* and *y* belong to the same category and *y* is predicated of *x*, the definition of *y* and "*y*" (that is, the term designating *y*) are both predicated of *x*. The problem for the translator and reader of 2a19–21 is that Aristotle does not make it clear that R1 holds for the entities belonging to the same category. Nonetheless, what R1 defines, namely what 3a33–34 calls "predication by synonymy" is, in Aristotle's view, the fundamental trait of intracategorial predication valid for "synonymous" things, those that have, according to the first chapter of the *Categories*, like an ox and

a man, the same name ("animal") and the same *logos* [λόγος]. The difficulty of 2a19–21 is thus that in R1, "be said of a subject" does not have the same meaning as in PS: *tôn kath' hupokeimenou legomenôn* does not designate all things that are applicable to several things (that is, all universals, whether substances or accidents), but rather a subset of these things, those that apply to other things "according to the name and the definition" (in other words, only secondary substances and differences). Even if this cannot be directly formulated in a translation, in order to understand R1 properly, we must then see that its main expression—the "things said of a subject"—refers to neither Pp nor PS, which, unfortunately, is not possible once P*S has been introduced.

■ See Box 1.

It is in R2 that P*S is introduced. This may explain why Aristotle presents this rule, which is logically posterior to R1, before the latter. R2 has to do with the transitivity of intracategorial predication. There again, Aristotle does not specify this. On the other hand, he uses the expression P*S, which supports his whole theory of predication. The intervention of P*S in 1b10–11 is neutralized by Tricot's translation. The text says, "ὅταν ἕτερον καθ᾽ ἑτέρου κατηγορῆται ὡς καθ᾽ ὑποκειμένου, ὅσα κατὰ τοῦ κατηγορουμένου λέγεται, πάντα καὶ κατὰ τοῦ ὑποκειμένου ῥηθήσεται." Tricot offers this translation: "Quand une chose est attribuée à une autre comme à son sujet, tout ce qui est affirmé du prédicat devra être aussi affirmé du sujet" (When a thing is attributed to another thing as it is to its own subject, everything that is affirmed as belonging to the predicate must also be affirmed as belonging to the subject). The function of R2 is to explain that in the case in which three entities, *x*, *y*, *z*, "belong to the same category," that *x* is predicated of *y* by synonymy and that *y* is predicated of *z* by synonymy, *x* is predicated of *z* by synonymy. The problem raised by this rule is that of correctly interpreting the expression "be predicated of a subject," which assumes that what has been said in R1 has been introduced into it. This necessity is more or less well emphasized in the main translations.

■ See Box 2.

The problem of R2 is not, in fact, the variety of expressions used to render the series *kathêgorêtai/legetai/rhêthêsetai*—namely, for *kathêgorêtai*: *est attribué, praedicatur, è predicata,* "is predicated," "will be said," *gilt*; for *rhêthêsetai*: *devra être affirmé, dicentur, saranno dette,* "will be predicable," "will be said," *gelten* (*muß*), *gelten* (*wird*)—but rather the implicit claim that it conveys, that is, that it is valid only for realities belonging to the same category. The transitivity of predication emphasized by R2 has only an intracategorial validity; it holds only in the context of synonymous predication (defined by R1).

The significance of the system formed by R1 and R2 is thus properly understood only if one grasps the import of the difference between PS and P*S. Even if, in fact, the expressions "be said of *x*" and "be predicated of *x* as of a subject" are often treated as though they were interchangeable, it remains that in the *Categories* the main function of P*S is to explain the predicative relation of secondary substances or of differences to their subjects. This is made explicit in three theses set forth in *Categories* 5.

1

The translations of the First Rule (Aristotle, *Categories*, 2a19–21)

[φανεϱὸν δὲ ἐϰ τῶν εἰϱημένων ὅτι τῶν ϰαθ᾽ ὑποϰειμένων λεγομένων ἀναγϰαῖον ϰαὶ τοὔνομα ϰαὶ τὸν λόγον ϰατηγοϱεῖσθαι τοῦ ὑποϰειμένου].

"Manifestum est autem ex his quae dicta sunt quoniam eorum quae de subjecto dicuntur necesse est et nomen et rationem de subjecto praedicari." (trans. Boethius, *Aristoteles Latinus*)

"È chiaro da quello che si è detto che anche il nome e la definizione delle cose che son dette di un soggetto è necessario che siano predicati del soggetto." (trans. M. Zanatta)

"It is plain from what has been said that both the name and the definition of the predicate must be predicable of the subject." (trans. E. M. Edghill)

"It is clear from what has been said that if something is said of a subject both its name and its definition are necessarily predicated of the subject." (trans. J. L. Ackrill)

"Aus dem Gesagten erhellt, daß bei solchem, was von einem Subjekt ausgesagt wird, der Name und der Begriff gleichmäßig von dem Subjekt ausgesagt werden müssen." (trans. E. Rolfes)

"Aufgrund des Gesagten ist klar, daß bei dem, was von einem Zugrundeliegenden ausgesagt wird, sowohl der Name als auch die Definition von dem zugrundeliegenden prädiziert werden müssen." (trans. K. Oehler)

2

Translations of the Second Rule (Aristotle, *Categories*, 1b10–11)

"ὅταν ἕτεϱον ϰαθ᾽ ἑτέϱου ϰατηγοϱῆται ὡς ϰαθ᾽ ὑποϰειμένου, ὅσα ϰατὰ τοῦ ϰατηγοϱουμένου λέγεται, πάντα ϰαὶ ϰατὰ τοῦ ὑποϰειμένου ῥηθήσεται."

"Quando alterum de altero praedicatur ut de subjecto, quaecumque de eo quod praedicatur dicuntur, omnia etiam de subjecto dicuntur." (trans. Boethius)

"Quando una cosa è predicata di un'altra come di un soggetto, tutte quelle cose che son dette del predicato saranno dette anche del sogetto." (trans. M. Zanatta)

"When one thing is predicated of another, all that which is predicable of the predicate will be predicable also of the subject." (trans. E. M. Edghill)

"Whenever one thing is predicated of another as of a subject, all things said of what is predicated will be said of the subject also." (trans. J. L. Ackrill)

"Wenn etwas von Etwas als seinem Subjekt ausgesagt wird, so muß alles, was von dem Ausgesagten gilt, auch von dem Subjekt gelten." (trans. E. Rolfes)

"Wenn das eine von dem anderen als von einem Zugrundeliegenden ausgesagt wird, wird alles, was von dem Ausgesagten gilt, auch von dem Zugrundeliegenden gelten." (trans. K. Oehler)

Porphyry seems to have been the first philosopher to see the importance of the difference beteen PS and P*S. In his *Commentary* on the *Categories* "by question and answer," he explains clearly the meaning of P*S: "be predicated of a thing 'as of a subject' means 'be stated of a thing as being part of its essence' or as 'constituting its essence'" (trans. S. K. Strange, *On Aristotle's Categories*). As a reader of Porphyry, Boethius transmitted this interpretation to the Romans. That is why in his work essential predication, intracategorial predication, is usually called *praedicatio ut de subjecto* in opposition to accidental, transcategorial predication, which is called *praedicatio ut in subjecto*. Porphyry, rather than Aristotle, seems to have been the origin of this expression. In any case, it is these two varieties of predication that we find expressed in the Middle Ages by the pairs univocal predication / denominative predication and essential/accidental:

There are two kinds of predication: one is univocal, as when we say that Socrates is a man, because man is predicated of Socrates truly and unequivocally [*vere et univoce*]; the other is denominative, as when whiteness is predicated of man, in fact, the man is said to be white and having-whiteness, but he is not said to be whiteness [*dicitur enim homo albus et habens albedinem nec dicitur esse albedo*]. Similarly, if we say that a body is white and that a color is white, the definition of the predicate is not predicated equally of the two subjects.

(Avicenna, *Logica* [Venice, 1508], f. 3vb.)

IV. "Univocal Predication" versus "Denominative Predication"

The reformulation of predication "as of a subject" as "univocal" predication continues Porphyry's *kath' hupokeimenou* interpretation in the form of "essential" predication. On the other hand, the notion of "denominative" predication emphasizes the original Aristotelian notion of accidental attribution. The source of Avicenna's terminology is clear: the passage in the *Topics* (II.2.109b4–8) in which, concerning the attribution of genus to species, Aristotle himself distinguishes predication "by synonymy" from predication in a "paronymic" form—a distinction that J. Brunschwig renders in French by means of the *univoque/dérivée* pair and J. Tricot by *d'une façon synonyme / dans sa forme dérivée*:

[L]'attribution d'un genre à son espèce ne se fait jamais sous une forme dérivée: les genres se prédiquent toujours de manière univoque à leurs espèces, puisque

les espèces admettent à la fois le nom et la définition de leur genre.

(The attribution of a genus to its kind is never done under its derived forms: genus is always predicated in a uniform way to its species, whereas species allow for both the name and the definition of their genus.)

(Fr. trans. J. Brunschwig, *Topiques*)

[L]e prédicat tiré du genre n'est jamais, dans sa forme dérivée, affirmé de l'espèce, mais c'est toujours d'une façon synonyme que les genres sont affirmés de leurs espèces.

(The predicate taken from the genus is never, in its derived form, affirmed in the species, but it is always in a way synonymous.)

(Fr. trans. J. Tricot, *Topiques*)

The distinction between these two kinds of predication, which develops the basic intuition of *Categories*, 5.3b7–9, allows Aristotle to define the attribution of the accident as "paronymic" (or, as Brunschwig translates it, based on *l'utilisation d'une expression dérivée*):

[E]n disant que le blanc est coloré, on ne présente pas l'attribut comme un genre, puisqu'on utilise une expression dérivée [*parônumôs legetai* (παρωνύμως λέγεται)]; on ne le présente pas non plus comme un propre ou comme une définition, puisque *définition* et *propre* n'appartiennent à aucun autre sujet, alors qu'il existe bien d'autres choses colorées que le blanc, par exemple un morceau de bois, une pierre, un homme, un cheval; il est donc clair qu'on le présente comme un accident.

(In saying that white is colored, one does not present the attribute as a genus, since one is using a derived expression [*parônumôs legetai* (παρωνύμως λέγεται)]; nor does one present it as something proper or as a definition, since "definition" and the "proper" belong to no other subject; even though there are many colored things other than white, for example, a piece of wood, a stone, a man, a horse. It is clear that one presents it as an accident.)

(Fr. trans. J. Brunschwig, *Topiques*, II.2.109b8–12)

The expression *parônumôs legetai* appears in the *Categories*, 8.10a27–31, regarding the distinction between *poiotêtes* [ποιότητες] and *poia* [ποιά], qualities and *qualia*: Aristotle explains that a *quale* is "something spoken of paronymically"—that is, about which one speaks "using a paronym"— (when the initial quality has a name) or "in some other way" (when the initial quality does not have a name). An important aspect of the Aristotelian vocabulary is that paronymic attribution, which is characteristic of accidental predication, and designation by derivation, which is characteristic of the formation of a concrete noun, are covered by the same expression, *parônumôs legetai*. This is not perceptible in Tricot's translation (cf. *Catégories* 8.10a27–31):

Sont donc des qualités les déterminations que nous avons énoncées ; quant aux choses qualifiées, ce sont

celles qui sont dénommées d'après ces qualités, ou qui en dépendent de quelque autre façon.—Ainsi dans la plupart des cas, et même presque toujours, le nom de la chose qualifiée est dérivé [de la qualité]: par exemple, blancheur a donné son nom à blanc, grammaire à grammairien, et justice à juste.

(Qualities are thus determinations that we have enunciated: as to qualified things, they are those that have been named after qualities, or that depend on them in some other way. In most cases, almost always in fact, the name of the qualified thing is derived from the quality: for example, whiteness gives a name to white, grammar to the grammarian, and justice to the concept of the just.)

In *Categories*, 8, the examples of morphological derivation provided by Aristotle are whiteness/white, grammar/grammarian, and justice/just. The first already appeared in *Categories*, 5, the second in *Categories*, 1, in the definition of "paronyms" (*parônuma* [παρώνυμα]), the third replacing the courage/courageous pair that is also introduced in *Categories*, 1. In *Categories*, 5, the example of the color white serves to distinguish primary substance, secondary substance, and accident "from the point of view of signification." Primary substance signifies a *tode ti* [τόδε τι]. Substance, or rather secondary essence, seems to signify a *tode ti* because of the "form of its appellation"; in reality, it signifies a *poion ti* [ποιόν τι], because the subject to which it is attributed is multiple and not unique, as in the case of primary substance. In this respect it is comparable to an accident, which also signifies a *poion ti.* There is, however, a difference between them: the accident signifies the *poion* absolutely (*haplôs* [ἁπλῶς]); the species (*eidos* [εἶδος]) and the genus (*genos* [γένος]) do not signify it absolutely, "they delimit the *poion* in relation to the *ousia*," that is, they signify an *ousia* in one way or another. Once again, Aristotle's play on *poion* is not rendered by Tricot, who, interpreting the text on the basis of Boethius's Latin translation, uses the abstract *qualité* and the term *qualification* (cf. *Catégories* 5.3b13–21, 15):

Pour les substances secondes, aussi, on pourrait croire, en raison de la forme même de leur appellation, qu'elles signifient un être déterminé, quand nous disons, par exemple, homme ou animal. Et pourtant ce n'est pas exact: de telles expressions signifient plutôt une qualification, car le sujet n'est pas un comme dans le cas de la substance première ; en réalité, homme est attribué à une multiplicité, et animal également.—Cependant ce n'est pas d'une façon absolue que l'espèce et le genre signifient la qualité, comme le ferait, par exemple, le blanc (car le blanc ne signifie rien d'autre que la qualité), mais ils déterminent la qualité par rapport à la substance : ce qu'ils signifient, c'est une substance de telle qualité.

(For secondary substances, as well, one might assume, by virtue of the form of their appellation, that they signify a determinate being, when we say, for example, man or animal. And yet, that is not quite right: such expressions actually signify a qualification, because the subject is not one, as in the case of the primary substance. In reality, man is attributed to a multiplicity,

and so is animal. Thus there is no absolute way in which species and genus signify a quality, as in the case of the color white (because white means nothing other than a quality); but both determine the quality in relation to substance: what they signify is the substance of a given quality.)

The convergence in *Categories*, 1, 5, and 8, of the level of attribution, that of derivation, and that of signification in a single terminological network is noteworthy. We observe, however, that derivative names and paronyms must not be purely and simply identified. All paronyms are derivative, but all derivatives are not paronyms—since Boethius, Latin has drawn a distinction between *sumpta* and *denominativa* (see PARONYM).

V. The Problem of the Copula

The dominance of the "Aristotelian" analysis of logical form suggests that it is natural to interpret the structure of the proposition on the basis of the verb "to be." This pseudo-naturalness has been strongly denounced in the modern period, in terms that have now become almost scholastic: the confusion between the existential and the predicative senses; the verbal illusion that consists in believing that the verb "to be," detached from the terms that follow it, has the same function in judgments of relation as in predicative judgments, leading to the inevitable reduction of the former to the latter. Some writers have attributed to the "Aristotelianization of the mentality of the countries bordering on the Mediterranean" (cf. L. Rougier, *La métaphysique et le langage*, 105) the responsibility for this major "corruption" of logic (cf. Geach, "History of the Corruptions of Logic," 44–61). Up until Frege's challenge to the formula "S is P," there have been two opposed, dominant models of predication: Aristotle's, based on the attributive proposition, and the Stoic model, often said to have made the most radical challenge to the attributive model of predication. Even overlaid by the language of "subject" and "predicate," the Stoic theory seems in fact to be a complete reversal of the so-called natural schema. For the Stoics, the "subject" has only a complementary value; being both an inflection of the verb and a case of the noun, it is what "completes" the *katêgorêma*, "an [expressible] incomplete *lekton* [*ellipês lekton* (ἐλλιπὴς λεκτόν)] awaiting completion" (cf. P. Aubenque, "Herméneutique et ontologie," 103: "It [the Stoic subject] is a *ptôsis*, a kind of inflection of the verb, whereas in Aristotle, the subject-form is the *onoma* itself, and not a case of the noun"). This devaluation of the attributive sentence is accompanied by an ontological choice: "Stoic ontology is an 'ontology' without Being; it perceives the world as a succession of events in search of subjects, and not as a juxtaposition of stable existents awaiting attributes" (ibid.; cf. P. Hadot, "La notion de cas dans la logique stoïcienne," 109–12; see PARONYM, Box 2, and SIGNIFIER/SIGNIFIED).

Medieval writers' choice of the Aristotelian analysis, which ensured the victory of the attributive proposition, had important consequences:

By introducing the verb to be as the copula, that is, as an explicit operator of synthesis (whereas any verb, Aristotle himself notes, has the power to exercise this synthetic function), Artisotle tips the balance of the proposition toward the subject. The verb "to be," having only a weak meaning, cannot bear the weight of the proposition, which then shifts toward the *hupocheimenon*, which is declared to be the *ousia*, that is, "being-ness" [*étantité*] proper, which its identification with the *sub-jectum*, the substrate, leads it to be translated in Latin correctly as *sub-stantia*, that is, the subsistent and permanent basis perduring under the variability of the attributes. In a parallel manner, the predicate, which in the verbal phrase is the action or event expressed by the verb, is reduced to an attribute, that is, to an accident of the subject, which is "essential" only because it is substantial.

(Ibid., 102–3)

■ See Box 3.

Although it did not take place, for good reason, in the context of a European language, Arabic reflection on the Aristotelian logical schema deserves notice. Averroës, for example, strongly emphasizes that "in Arabic one can form an apophantic statement on the basis of two nouns without a connecting verb, a nominal statement being no less predicative than a statement containing a verb." To do justice to the Aristotelian analysis, he thus resorts to the notion of "potential" interpreted in the sense of "implicit," and presents the tripartite product of the nominal statement as an explicitation/actuation. Of the three notions imported in a predication (Ar. *ḥaml* [الحمل])—the subject (Ar. *mawḍū'* [موضوع]), the predicate (Ar. *maḥmūl* [محمول]), and the relation (Ar. *nisba* [نسبة]), which links the subject and the predicate—two are explicit (the subject and the predicate), while the other (the relation) is implicit. To make the relation explicit, one can resort either to the word *huwa* [هو] (him) or to *mawğūd* [موجود] (existent). In this sense, one will say, "Zayd is just." The copula is thus not a "necessary part" of the premise (which one obtains through analysis), it is in it only potentially, and serves only to make explicit or to lexicalize the connection between subject and predicate, "by compensating for a linguistic defect" (because "in Arabic there is no word designating this kind of connection, whereas it exists in other languages," *Commentary on the "De interpretatione*," §19). The "third element" is thus only an "addition."

In modern logic, essentially starting with Frege, the copula is no longer considered solely as an unnecessary addition but as a useless and misleading one. The analysis of the proposition in two terms, subject and predicate, connected (or separated) by a copula, has been denounced by many modern thinkers as the result of a projection of the linguistic asymmetry of the (grammatical) subject and predicate into ontology or logic themselves (in the Aristotelian manner, I can say "Socrates is a man," not "the/a man is Socrates"). It is generally thought that this deficit is made up starting with Frege (cf. M. Dummett, *Frege's Philosophy of Language*). For Frege, a proposition such as "Two is a prime number" is vitiated by "the inexactitude of its linguistic expression," the use of the copula "making it appear that something is added to the object and to the concept, as if the relation of subsumption were a third element." Without returning to the Stoic schema of incompletion and completion (the verb-predicate

3

Copula in Medieval Logic

➤ PRÉDICABLE, Box 1

It was in the Middle Ages that the notion of the copula was fully worked out, within a system in which there was a problematic connection between the distinction between the existential meaning and the predicative meaning of the verb "to be," in the form of the distinction between *secundum* and *tertium adjacens*; the conflict between the predicative sentence and the verbal sentence; and the distinction between two types of predication: identity and inherence. In order to grasp all the elements in this system and the way in which they are related, we have to go back to a specific passage in the *Peri hermêneias* in which Boethius and, following him, the grammarians and logicians of the eleventh century interpreted these problems, introducing a new terminology.

Although the verb *copulare* is ordinarily used by Boethius as a synonym of *conjungere* or *componere*, in the sense of "conjoin" or "connect," with terms or things as its object, starting at the end of the eleventh century we see it take on a very particular meaning in the analysis of predication. The grammarians and commentators on Priscian's *Institutiones grammaticae*, followed by Abelard a few decades later, introduced the idea that the verb is characterized by a "coupling value" (*vis copulandi*), a property that allowed it to connect the subject and the predicate; this property is clearly inspired by the definition Aristotle gives of the verb in the *Peri hermêneias*, and it led to the introduction of the terms *copula* and *verbum copulativum*. For example, we read the following in an anonymous commentary from the early twelfth century:

> Praedicativa propositio est illa quae alia praedicatum et subjectum, ut "homo est animal," subjectum ut "homo," praedicatum ut "animal," et "est" praedicatum ut "animal," et "est" copula quae copulat ista duo.
>
> (A predicative proposition is a proposition in which there is a predicate and a subject, like "man is an animal," a subject "man," a predicate "animal," and "is," which is the copula coupling the two.)
>
> (Iwakuma, "*Introductiones dialecticae artis secundum magistrum G. Paganellum*")

Similarly, in Abelard:

> Haec est autem proprietas, quod verbum semper est nota, id est copula praedicatorum de altero, id est copulativum est praedicatorum, quae praedicata de altero quam de ipsis verbis copulantibus

necesse est praedicari. Nunquam enim verbum copulativum praedicati subici potest, ut "lego" vel "legis" vel "legit" nunquam alicui potest in propositione subici, sed praedicari, quando scilicet gemina vi fungitur [copulantis] scilicet et praedicati.

> (It is a matter of a property, that the verb is always the mark, that is, the term that couples the predicates with something else [to the other term, the subject], that is, it has the property of coupling the predicates; and these predicates have to be predicated of something other than the verbs that couple themselves. In fact, the coupling verb can never be the subject of the predicate, for example, "I read" or "you read" can never be the subject in a proposition, but always the predicate, when they have a double value, both of coupling and of predicate.)
>
> (*Super Peri hermeneias*)

This passage in Abelard is taken from the grammarians that preceded him: they introduced the idea that every verb has a double value, a value of coupling (*vis copulandi*) and a value of predicate (*vis praedicati*, *vis verbi*) that corresponds to its particular meaning. The same holds for the verb "to be," which has this value of coupling, or substantive value (whence its name of *verbum substantivum*, "substantive verb"), and its own value, which is, depending on the author, an existential or a specifically semantic value (see R. W. Hunt, "The Introductions to the 'Artes' in the Twelfth Century").

This double value was to play a role in the analysis of predication. When the verb "to be" is in *secundum adjacens*, the two values are active, a value of copula and a value of predicate (it couples the thing that it signifies). But the case in which it is in *tertium adjacens*, when there is predication of an accident, such as *Socrates est albus* (Socrates is white), is harder, the question being whether it can have a purely connective function, to the exclusion of its existential value. This elicited divergent interpretations. The grammarians and Abelard considered this kind of proposition to be susceptible of two analyses, even though they disagreed regarding the priority to be attributed to each, and Abelard himself was to modify his position on this point. First, there is a "coupling of essences" (*copulatio essentiae*) signified by the terms "subject" and "predicate": the verb "to be" "signifying all essences *qua* essences, it has property of coupling all essences"; it "couples" the essence or "thing" Socrates with "this white thing," with the meaning "this white thing Socrates is that

white thing"—this initial analysis originates in the "substantive value" of the verb "to be" (*ex vi substantivi*). Second, the quality signified by the predicate *albus*, namely whiteness, *albedo*, is signified as inhering in the subject Socrates—this second analysis has for its cause the nature of the predicate (*ex vi praedicationis*). These two analyses, which we juxtapose here, were to be the origin of two major, and separate, analyses of predication in the Middle Ages: the theory of identity, according to which the predicate is taken in extension, predication amounting to positing an identity between what the subject denotes and what the predicate denotes; and the theory of inherence, according to which the predicate is taken intentionally, predication amounting to positing the inherence of the quality in the subject. It should be noted that this particular usage of the term *copulare* to designate the connection of the "things" denoted by the subject and the predicate originates in the interpretation of an extremely problematic passage in *Peri hermêneias*, 3, which Boethius translates this way:

> Ipsa quidem secundum se dicta verba nomina sunt, et significant aliquid— constituit enim qui dicit intellectum, et qui audit quiescit—sed si est vel non est, nondum significat. Neque enim "esse " signum est rei vel "non esse," nec si hoc ipsum "est " purum dixeris. Ipsum quidem nihil est, consignificat autem quandam compositionem, quam sine compositis non est intelligere.
>
> (In themselves, verbs are in reality nouns, and they signify something—the person who is speaking constitutes in fact an act of understanding, and the one who listens can rest (for the signification is completed, he expects nothing more)—but they do not yet signify that something is or is not. Neither "being" nor "not being" is a sign of a thing, if one says "is" all by itself. It is, in fact, nothing, but it consignifies a composition that cannot be understood without the component terms.)
>
> (Aristotle, *Peri hermêneias* 3.16b20–25, trans. Boethius in *Aristoteles Latinus*)

This passage is of capital importance for the developments regarding the substantive verb (does it mean something or not?) and the notion of "consignification" (see CONNOTATION). Boethius, in opposition to Porphyry, thinks that Aristotle means to say here, not that the verb "to be" has no meaning, but that it does

not yet signify the true and the false. In order to explain why it realizes its signification only in conjunction with the terms it serves to link, Boethius introduces a distinction between two uses, depending on whether it is employed alone or in conjunction with a predicate. It is in this context that, in the first commentary on the *Peri hermêneias*, Boethius uses the term *copulare* to mark the connection of things signified by the subject and the predicate (*duas res copulat atque componit*). In the second commentary, we find the analysis of what was later called the "coupling of essences," both for predications *de secundo adjacente*, like *Socrates est*, which can be glossed as "Socrates is one among those who exist" (*Socrates aliquid eorum est quae sunt*), and in predications *de tertio adjacente*, like *Socrates philosophus est*, which is interpreted as making it possible to conjoin "Socrates" and "philosophy," but also signifies that Socrates participates in philosophy, this second value then being transformed into the signification of an inherence of the quality in the subject. It is in relation to this value of "coupling" or "conjunction" that Aristotle's statement is justified, even when it is in *secundum adjacens*, Boethius explains: the verb "to be" "has a value of conjunction, not of thing [*vim conjunctionis cujusdam obtinet, non rei*]"; here Boethius adopts a formulation of Porphyry's: "it designates no substance" (*nullam substantia monstrat*) (cf. Boethius, *Commentarii in librum Aristotelis Peri hermeneias*).

On the basis of this passage and the commentaries of the grammarians, Abelard made a clear distinction between *copulare* and *praedicare*, which is coherent with his position on universals: since there is no whiteness *qua* essence, but only individual whitenesses and white things, in saying *Socrates est albus* we can only "predicate whiteness in adjacency, and white, or, in other terms, what is affected by whiteness, in an essential way"; whiteness is thus *predicated* in the sense in which one means that whiteness inheres in the subject, but Socrates is *coupled* with this white thing or with this thing that is affected by whiteness. Each term used here has a precise meaning: the adjective *albus* is "conjoined" with the verb, it "predicates" an adjacent form, and "couples" the "foundation of whiteness that it denotes" (*fundamentum quod nominat*); the accidental form is predicated, but it is the substrate in which it is found and which the term "accident" denotes or "names" that is coupled (whence the gloss: Socrates is what is affected by whiteness). It is because of the imperfect nature of the verb "to be," and because it can never be a "pure copula," that this essential or existential value is always present, along with this "coupling of essences" leading to the positing of an identity or an identification of two singular existing things, denoted by the subject and the predicate (Abelard, *Super Peri hermeneias*).

➤ *TIME,* and ASPECT, COMBINATION AND CONCEPTUALIZATION, ENGLISH, ESSENCE, ESTI, HISTORY, MEMORY, MOMENT, *TO BE,* TO TI ÊN EINAI

Is our way of dividing up time into past, present, and future determined by the divisions made in languages, that is, by the different systems of grammatical tenses? Derived from Benveniste, the question can be fully answered only by attentively examining these systems, and in particular the different expressions of aspect. Several approaches open up, however, in the words themselves that express, in different languages, the parts of time and/or grammatical tenses: an archeology of the Greek tripartite division of time, which is anything but obvious on first inspection, will be followed by an examination of the differentiations internal to

modern languages, the twofold past and present in German (*vergangen/gewesen, Gegenwart/ Anwesenheit*), and the twofold future in French (*futur/avenir*).

I. Time and Grammatical Tenses

In English and in French, "past," "present," and "future" designate both grammatical tenses and temporal zones, or, to put it another way, tenses (Lat. *tempora*) within time (Lat. *tempus*), but this is far from being the case in all languages. The tripartite division of time into past, present, and future, which can be traced back as far as Homer only with many qualifications, is found in the verbal systems of the Indo-European languages, even if the future, which issued from an ancient desiderative present, is a late formation (Gr. *opsomai* [ὄψομαι], "I want to see, I am going to see, whence I shall see"; and in addition the Indo-European expresses above all an aspectual value). The constitution of a future tense signals the development in the Greek verb of the expression of time, which had become more important in Greek than in Indo-European in general (cf. Meillet, *Aperçu d'une histoire de la langue grecque*). Linguists have often pointed out how "aberrant" German is in this respect; an expression like "I shall become" is rendered by *Ich werde werden* (on the rather unnatural "clumsiness" of the expression of the future in German, cf. Vendryès, *Langage,* who also notes that "it is a general tendency of language to use the present in relation to the future: an old present serves as a future in Russian, in Welsh, in Scottish Gaelic, and elsewhere").

Here we touch on questions related to the way philosophical speculation is connected with the establishment of grammatical categories. Was Aristotle unconsciously guided by the "categories" of the Greek language, as Benveniste claimed ("Catégories de pensée et catégories de langue," in *Problèmes de linguistique générale*), or did he rediscover something of which his language was the depository, thus ultimately confirming the accuracy of his analyses, as Trendelenburg (*Geschichte der Kategorienlehre*) and then Brentano (*De la diversité des acceptions de l'être d'après Aristote*) had maintained? It is interesting to see that diametrically opposed conclusions could be drawn from a single fortunate coincidence. This problem, which we will have to limit ourselves to mentioning in passing, nonetheless finds expression in the diversity of names given to the parts—grammatical and physical or experienced—of time.

From problems connected with the thematization of time, grammatically and philosophically tripled, we must distinguish those raised by the various appellations relative to the past and the future in particular. What is it that differentiates the German terms *vergangen* and *gewesen*, *Gegenwart* and *Anwesenheit*? Why does French have two words for the future, *futur* and *avenir*?

II. The Tripartite Division of Time

In §168 of his RT: *Syntaxe grecque*, J. Humbert introduces the system of tenses in Greek in the following way:

Grammarians have accustomed us to mentally divide time into three zones: past, present, and future. We have in our minds a very spatial representation of time: it is supposed to be imaged as a line without limits, running

from left to right: the line which, on the left, constitutes the past, is segmented over a certain distance that is our present, and then continues to the right, extending indefinitely into the future. This abstract conception, which makes time something realized, is said to be even more inexact in Greek than in other languages.

While it is not essentially linear, despite the Aristotelian analogy of the line, the tripartite division of time appears very early in the world of ancient Greece. In the *Iliad* (1.5.70), Homer says that the seer Calchas knows "the present, the future, the past" [τά τ' ἐόντα τά τ' ἐσσόμενα πρό τ' ἐόντα]. We note that these times are not listed successively, and that here the reference is less to times than to what they bear, what is conveyed by them. In reality, this verse does not, strictly speaking, distinguish times but rather (intratemporal) existents, and it resorts, remarkably enough, to the same substantivized present participle in the neuter plural (*eonta*) to characterize what P. Mazon's translation renders respectively by *le présent* and *le passé*, whereas Homer refers, more literally, to "what is, what will be, and what is earlier," just as does Hesiod, in whose *Theogony* the same expressions are found in the same order (*Theogony*, 38). In Parmenides's *Poem* (8.5), the "is" is described this way: "it never was nor will be, for it is in the present" [οὐδέ ποτ' ἦν οὐδ' ἔσται, ἐπεὶ νῦν ἔστιν]. All we have to do is identify being with being-present, even if that means splitting the latter between what was and what will be, for time itself to be conceived, Montaigne wrote, as "necessarily divided into two," between "what has not yet come into being" and "what has already ceased to be":

> And as for these words *present, immediate, now,* on which it seems that we chiefly found and support our understanding of time, reason discovering this immediately destroys it; for she at once splits and divides it into future and past, as though wanting to see it necessarily divided in two.
>
> *Essais*, II

■ See Box 1.

In the archaic period, various verbal roots coexisted that did not belong to "this coherent and complete system that we call a conjugation," namely, "a set of themes each expressing a 'time' or a mode of the process and being deduced from each other by simple morphological procedures" (Chantraine, *Morphologie historique du grec,* §175). The aspectual value of the Greek verb in the aorist arises from considerations other than the simple concern to situate action on a temporal axis as past, present, or future. In the *Georgics*, Virgil seems to echo Homer when he speaks of the seer Proteus embracing things "quae sint, quae fuerint, quae mox ventura trahantur" (which are, have been, and will soon occur in the future). The classical discussion of what Plato's *Timaeus* calls the "parts" or "divisions" of time—*merê chronou* [μέρη χρόνου]—saying of "eternal substance" that "it was, it is, and it will be" [ἦν ἔστιν τε καὶ ἔσται] (37e 3–6), is given by Aristotle in the *Physics* (4, chap. 10), where it is the instant (*to nun* [τὸ νῦν]) that discriminates the *parelthon* [παρελθόν]/past from the *mellon* [μέλλον]/future. In late antiquity, finally, Augustine acknowledges the usual tripartite division, even though he sees in it no more than an unfortunate habit that has been only too much used and abused: "Dicatur etiam: tempora sunt tria, praeteritum, praesens et futurum, sicut abutitur consuetudo; dicatur etiam" (Let it be said too, "there be three times, past, present, and to come": in our incorrect way; *Confessions*, 11.20, 26).

Antiquity thus was at first unaware of, and then thematized and investigated, the tripartite division of time into past, present, and future that is familiar to us. To conceive the genesis of this division means, however, going back to the initial lack of obviousness on the basis of which it was forged, even if that means agreeing with Augustine that the effect of obviousness that it seems to have enjoyed since late antiquity is unfortunate.

III. The Two Pasts: *Vergangen* and *Gewesen*

"The past is never dead, it is not even past": this statement of Faulkner's, quoted by Hannah Arendt (*Between Past and Future*), well emphasizes what it is about the past that is irreducible to what is only *passé, dépassé, trépassé* (to use

---

1

The sense of time

In the *Dictionnaire complet d'Homère et des Homérides* published by Napoléon Theil N. and Hippolyte Hallez-D'Arros in 1841, we read:

[ὀπίσω] [*opisô*]: *adv.* 1) with reference to place: behind . . . 2) with reference to time, *lit. what is still behind, what cannot be seen* . . . [ἅμα πρόσσω καὶ ὀπίσσω ὁρᾶν], to see at once the present and the future, *literally* things that are behind, *that is*, which have not yet

reached us and which will come, *that is,* the future; *it is always in this sense that Homer uses* [ὀπίσσως], *the past, he calls* [τὸ ἔμπροθεν] *what has already passed by us; as for* [πρόσω], *they are the things that are before us, which we have so to speak at hand* [τὰ ὑπὸ χεῖρα].

[πρόσω] [*prosô*]: *adv.* 1) *with reference to space*: before, in front of, in advance . . . 2) *with reference to time*: before, in advance, *that is,* the past *and not* the

future, *according to an error that I see shared by people who are nonetheless very competent; this has to do with the fact that the Greeks did not represent time as a river they have gone up; for them, time flowed in the opposite sense; the waters ahead of them were the ones that had passed by them and were, consequently, the past; those they had behind them were the future; many examples from Homer support my view.*

Apollinaire's expression). Whereas Descartes could assert that "when one is too curious about things which were practised in past centuries, one is usually very ignorant about things which are practised in our own time" (*Discourse on Method*), a modern historian—Marc Bloch, for example—would insist not so much on what separates past and present as on what connects them ("The past may very well not dominate the present altogether, but without it the present remains incomprehensible"; *L'Étrange défaite*), or on their interpenetration (*Apologie pour l'histoire*).

What is past, insofar as it no longer exists, corresponds to the German *vergangen*, "past" in the sense of "over." *Vergangen* is the past participle of the verb *vergehen*, "to pass [by or away]," with an idea of decay contained in the prefix *ver-*, "pass" in the sense in which it is said that time passes (*vergeht*). But what is past in the sense in which it has not ceased to be corresponds to the German *gewesen*. The prefix *ge-*, which is used to form the past participle of many verbs, here indicates collection or recollection in a recapitulating presence. Hegel's formula, "Wesen ist, was gewesen ist," does not mean that the "essence" is "what has been." This literally exact translation of Hegel's remark makes no sense, seeing that the last words of the "Doctrine of Being" in the *Science of Logic* determine essence as "being insofar as it is the fact of not being what it is, of being what it is not": an essence is that in which being is collected, but internalized, which, no longer being, has not ceased to be, or to put it in Hegelian terms, "the truth of being." The essence (*Wesen*) is not "l'être [entendu] comme cet être purement-et-simplement intériorisé" that is being "rassemblé avec soi dans sa négation," as P.-J. Labarrière and G. Jarczyk render it on the last page of the "Doctrine of Being" (Hegel, *Science de la logique*). Here the essential is involved in the interpretation given between brackets, which blocks the very movement of "logic" as it animates, from within, Hegel's remark: not being *understood* other than it was earlier, as if the point were merely to vary the meanings of a single term, but instead *promoting itself* to the rank of essence by virtue of its own movement.

Unlike French, German includes in its conjugation of the verb *sein* (to be) both being (*Sein*) and essence (*Wesen* in *gewesen*). Hegel does not fail to insist on this repeatedly in the *Science of Logic*, especially at the very beginning of the "Doctrine of Essence": "The [German] language has preserved in the verb *sein* the *Wesen* [essence] in the past participle *gewesen*; for the essence is past being, *but intemporally past*" (1812 edition; emphasis supplied). At this point, Hegel separates *gewesen* from *vergangen*, that is, from what is purely and simply over, and brings it closer to the *Wesen* that is heard in it, so that the past is thereby detached from its temporal dimension, to express itself, as it were, *sub specie aeternitatis*.

Meditating in his own way on the relationship between *gewesen* and *Wesen*, Schelling regretted that "in the German language the old verb *wesen* [has] gone out of use (it is found only in the past tense—in the form *gewesen*)" (*Schellings Werke*). Heidegger returned to this point as well:

I understand what has been and has not ceased to be [*das Gewesene*] in the following way: just as the mountain range [*das Gebirge*] is the group of mountains, being-having-been is what gathers being in its unfolding.

Second seminar on Kant at Cérisy in 1955

This reflection on the properties of German is accompanied, in many writers, by a meditation on the Greek heritage. To what point is temporality a constitutive dimension of Greek knowledge as essentially retrospective, and to what point is the past far from purely and simply disappearing by slipping into the non-being of what has been and is no more—that is what is shown not only by Platonic anamnesis, and by the emphasis put on a mythical past, but even by the name of knowledge, [οἶδα] ([*Ϝοῖδα]), like "having seen," from the same root as the Latin *video*, the German *wissen*—as Schelling pointed out (*Historical-Critical Introduction to the Philosophy of Mythology*) before Heidegger: "The perfect tense 'I have seen' is the present tense of 'to know'" (*Holzwege*; cf. RT: *Dictionnaire étymologique de la langue grecque*, s.v.). The enigma of the temporal constitution of knowledge, which is traced in a way by the genealogy at the beginning of book A of Aristotle's *Metaphysics*, culminated in the expression Aristotle created, *to ti ên einai* [τὸ τί ἦν εἶναι], Latin *quod quid erat esse*, *quidditas*, "being-what-it-was." For a discussion of what Aristotle designates by this "strange title" and of its supposed prehistory (Antisthenes, Solon), see Aubenque, *Le Problème de l'être chez Aristote* and his claim: "It is . . . idea, so profoundly Greek, according to which every essential view is retrospective, that seems to us to justify the *ên* [ἦν] ("was") of the *to ti ên einai* [τὸ τί ἦν εἶναι]." The vocabulary of Aristotelian ontology is thus illuminated by a tragic source; but we may also think of the grammarians' imperfect of discovery (RT: *Syntaxe grecque* §180, rem.), to which Aubenque also refers (see TO TI ÊN EINAI).

IV. The Two Presents: *Gegenwart* and *Anwesenheit*

Grammatically speaking, the present is not a univocal category in the various European languages. It exists in English in a form called the "present progressive" that considers the process in its unfolding. Descartes's *cogito, ergo sum*, generally translated in English as "I think, therefore I am," should probably be rendered instead as "I am thinking, therefore I am," which has the advantage of bringing out the fact that existence, far from being deduced from thought, is already present in the very act of *cogitatio*: cogito = sum cogitans. The present progressive reinjects the present participle into the indicative.

In French, the term *présent* is as polysemous as the German term *Gegenwart*. The French *présent* indicates (a) the time at which things occur, (b) that in the presence of which we find ourselves (Ger. *Anwesenheit*), (c) that which we witness, indeed that which is present to us, or what we receive, in the sense in which sensibility is thoroughly determined as receptivity to a given (as in Kant), and in the sense in which the phenomenon of phenomenology is what is visible in its being-given (*Gegebenheit*, Husserl).

As for the German term *Gegenwart*, which seems at first to designate the attitude consisting in confronting (*gegen*) in expectation (*-wart*), in resolutely awaiting what will come of the encounter, the RT: *Deutsches Wörterbuch* saw in this an "inconceivable contradiction," that of a presence that

is expressed only by anticipation, a tending toward what it calls for; unless we should discern in it a futurity immanent in every present. Moreover, we should note that the term *Gegenwart* itself presupposes a relationship between past and present that is not one of strict continuity, but rather of opposition. The present is less what follows the past, in a peaceful, continuous flow, than what is strong enough to oppose the past and break away from it, in the promising discontinuity begun by this rupture. In the "genealogy of time" that he proposes in his *Ages of the World* (*Die Weltalter*, 1811–15), Schelling obviously understands *Gegenwart*, in all its antithetical dimension, in relation to *Gegensatz*, *Entgegensetzung* (opposite, opposition): "Der Mensch, der sich seiner Vergangenheit nicht entgegenzusetzen fähig ist, hat keine, oder vielmehr er kommt nie aus ihr heraus, lebt beständig in ihr" (The man who is not capable of opposing his past has none, or rather he never emerges from it, lives constantly in it). The present can thus be conquered only through a living and conflictual relationship of antagonism to the past, beyond any attachment to the past that does not allow the past to be constituted as such. For the present understood in this way, the *avenir* is *à-venir*, *avenant*.

But to the French *présent* and its presence also corresponds the German *Anwesenheit*, which bears the hidden harmony of being and time. How is this German term composed? According to Jean Beaufret, Heidegger noticed "one day"

> that to the Platonic and Aristotelian name of being, *ousia*, which also means, in ordinary language, a peasant's property, directly corresponds, from this point of view, the German *Anwesen*, but on the other hand, nothing is closer to the neuter *Anwesen* than the feminine *Anwesenheit*, in which the ending *-heit* brings to language, making it shine, so to speak, that which in *Anwesen* still remains opaque. Thus *Anwesenheit* says: the pure brilliance of *Anwesen*. But on the other hand *Anwesenheit* is synonymous with *Gegenwart*, and thereby also says that what shines, when the Greek name of being (*ousia*, as the *apheresis* of *parousia*) resounds, is essentially of the present.
>
> *Dialogue avec Heidegger*

The interference, given in the word itself, between the present defined in opposition to the past or to the future, on the one hand, and the present in its presence by opposition to absence, on the other hand, was to lead Heidegger, notably in *Being and Time*, to emphasize a concordance of times in the heart of the present, such that it subverts the traditional relation of the subordination of time (and of the *nunc fluens* [the now that flows away]) to eternity (as *nunc stans* [the now that remains]). So that "past and future meet or rather correspond to each other in an entirely different way than the adverb 'successively' indicates." Beaufret continues: "Present, past, and future, far from following one another, are *ek-statically* contemporary within a world in which the present is not the passing instant but extends as far as a future corresponds to a past."

The German *Gegenwart*, to designate the present, shows a futurity immanent in the present. The present is thus drawn toward the future, which illumines it in return. The being of the human being cannot be said in the present because it is illuminated on the basis of the being-mortal of the person who says "I am." "I am," *ich bin*, which is however no longer the German translation of the Cartesian *ego sum* (= *ich bin vorhanden*, I am occurrent, as is also this bit of wax that you see there), but corresponds instead to the Latin *sum moribundus* (*Heidegger Gesamtausgabe*). Thus in Heidegger, it is on the basis of the future that time is, or rather matures, ages.

■ See Box 2.

V. *Futur* and *Avenir*

Etymologically, the French word *futur*, from the Latin *futurus* (fated to be), is related to *fus* ([*je*] *fus*), Latin *fui*, and thereby to the Indo-European root **bhu-* (to grow), whence the Greek *phuô* [φύω], "to cause to be born, to cause to grow" (whence *phusis* [φύσις]; see NATURE; cf. Aristotle, *Metaphysics*, D.4.1014b 16–17), German *bin*, English "be" (cf. RT: *Dictionnaire étymologique du français*). As an autonomous grammatical category, the future is, as we have seen, a relatively late development. In some languages (German, Russian), the future is more apt to be expressed by a near future with a desiderative value: "I am going to go" or "I want to go," rather than "I shall go." In modern Greek, the future is formed by adding [θὰ] before the present indicative, the abbreviation of [θέ λω νὰ], "I want" (RT: *Aperçu d'une histoire de la langue grecque*). In English, which has no future paradigm in its verbal morphology, a modal distinction persists in the distinction between the two auxiliaries "shall" and "will." In French, the personal morphemes of the future are derived from the present tense indicative of the verb *avoir*: modern French *chanterai* (I shall sing) comes from Vulgar Latin *cantaraio* and Classical Latin *cantare habeo*, "I have the prospect of singing" (RT: *Grammaire de l'ancien français*). According to D. Maingueneau (RT: *Précis de grammaire*), in language there is a "fundamental dyssemmetry between the past and the future: the future is a projection on the basis of the present, and is radically modal . . . , whereas the past, that which is over and done, gives priority to the aspectual dimension. The future is always supported by the wills, hopes, fears, etc. of subjects." So much so, in fact, that in Old French the verb *voloir* (to will or desire) is sometimes used in the future instead of the present, which highlights its modal function because of its perspective *sémantèse*, as in the *Prose Tristan*, 216, 15: "Et li rois . . . quant il entent cest parole, il descent et s'en vet a la fosse, car il voudra veoir qui cil est qui dedenz gist [qui donc est celui qui repose là-dedans]" (cf. RT: *Grammaire de l'ancien français*). Let us add that today, grammarians see the future as including the form previously called "the conditional" in the form of a "future II," belonging to the same "tiroir." Ultimately, the future does not exist as an original grammatical form.

French *avenir* corresponds to German *Zukunft* (and to Dan. *tilkommende*): the *avenir* is *à venir* (to come) and *Zu-kunft* is derived from *kommen* (to come). But French has two terms, *futur* and *avenir*, whereas the German *Futurum* refers only to the grammatical category of verb tenses. *Futur* and *avenir* are not synonyms, but opposites in terms of modality: *futur* indicates only what will be, while *avenir* indicates what might be. In this sense, the *futur* is thus the suspension of the *avenir*,

2

Præsentisk/nuværende: Presence in Kierkegaard's Danish

Præsentisk is a neologism in Danish that was apparently coined by Kierkegaard, the usual terms being *nuværende* (being now) and *nœrvœrende* (being near, before the eyes, current). It refers to presence (*Nærværelse*) to oneself: *sig selv præsentisk* (*Either/Or*), as opposed to absence (*Fravœrelse*). Total self-presence is defined as "being today," as the exclusion of unhappiness: the "blessed God who eternally says 'today'" [*idag*] (*The Lily of the Fields and the Bird of the Sky*). Whereas the absence of the past and the future signifies perfection, presence (*praesentes dii*) is that of a "powerful support" (*kraftige Bistand*) (*The Concept of Fear*). In *The Most Unhappy* (*Den Ulykkeligste*, 1843), the pseudonymous author tells a story (similar to Kafka's *The Hunter Gracchus*) that extends, under the sign of lived temporality, Hegel's analysis of the unhappy consciousness. Hegel's *Phenomenology of Spirit* describes the unhappiness of the divided (*entzweit*) consciousness, which is absent from itself because it lives separately, without the horizon of union, marked by a doubling (*Verdoppelung*) that cannot be unified. It is the consciousness animated by pious fervor (*Andacht*), nostalgia (*Sehnsucht*), and a hope that is never fulfilled, without presence (*ohne Erfüllung und Gegenwart*). To explore concretely the forms of absence from oneself (*sig selv fravœrende*), Kierkegaard analyzes in terms of temporality this consciousness, which, according to Hegel, has its essence, the content of its own life, outside itself. That is what leads him to oppose to the present of the past and the present of the future the pluperfect (*plus quam perfectum*) and the future anterior (*futurum exactum*), in which there is nothing present. Whence the portrait of individualities that memory or hope makes unhappy. Nonetheless, the man of hope's absence from himself includes "a happier deception" than that of the man deceived by memories. For the former, the future, the infinite of the possible, remains, whereas the latter turns toward a past that was not the presence of anything. But "the most unhappy man" is the one who experiences both misfortunes. Since the two passions oppose each other, he is the theater of the powerlessness that consists in "not having time at all" (*slet ingen Tid*).

To this is opposed "repetition, the serious aspect of reality and existence," a repetition that is "the interest of metaphysics, and at the same time the interest against which metaphysics fails" (*Repetition*). The privilege of the present signifies that true life is in the instant and not in the state. Whatever the forms of life, the existential stages, might be, it is in each instant that their meaning is given, in the event itself through which it is contracted (*pådrage*). This holds for joy as well as for despair, for fear and for serenity, "each instant (*ethvert Øjeblik*) being "real" (*virkelig*) only in the "present time" (*nærværende Tid*) of a "relationship to oneself" (*Forholdet til sig selv*) (*The Sickness unto Death*). As is shown by a passage in Kierkegaard's *Journal* for 1847–48 (*Papirer*, VIII A 305), this *præsentisk* moment involves freedom, and thus tends toward the future (see EVIGHED).

given that it conceives the latter only as what proceeds anticipatively from the present and not what comes to the present in an unanticipated way. Thus the *avenir* differs from the *futur* as the possible differs from the real.

Fundamentally, it may be that the understanding of the verbal system on the basis of the tripartite division past-present-future was outdated, grammarians now tending to consider as aspectual values that used to be considered, wrongly, strictly temporal.

From this brief survey we can conclude that there is a certain homogeneity in the verbal system of Indo-European languages (even if the future infinitive, for example, is hardly found outside ancient Greek), but also a remarkable heterogeneity in the diverse expressions of times and tenses (Ger. *Zeiten* and *Tempora*) in the few languages examined here. In each case a certain division of reality is made, but this division (to which, moreover, both the French term *temps* and the German *Zeit* are etymologically related [see *TIME*]) is rarely the same.

Contemporary phenomenology has sought to rethink the unitary focal point prior to the tripartite division we have studied, while at the same time acknowledging the latter, and even trying to provide it with a rigorous foundation: either, following Husserl, in the ego-pole radiating from its "living present" and its retentions and protentions, or, following Heidegger, in the contemporary character of ekstases. This seems to be what led Sartre to see in the tripartite classification past-present-future a kind of triple profusion or triple attachment, even when it does not present itself as such, whether in the triple synthesis of the "Transcendental Deduction" in Kant's *Critique of Pure Reason* (apprehension, reproduction, recognition) or in Nietzsche's division of history into antiquarian, monumental, and critical.

PRINCIPLE, SOURCE, FOUNDATION

FRENCH   *principe*
GERMAN   *Satz, Grundsatz, Prinzip, Principium, Anfangsgrund, Grund*
GREEK   *archê* [ἀρχή], *aitia* [αἰτία]
LATIN   *principium*

➤ LAW, MACHT, NATURE, PROPOSITION, *REASON,* SACHVERHALT, SENSE, SOLLEN, *THING, WORLD*

The principle, *archê* [ἀρχή], *principium*, is what begins and dominates, the two meanings being connected in both Greek and Latin. It is a generating element of being and/or a point of departure for knowledge. The Aristotelian distinctions are determining: principles and causes (*archai kai aitiai* [ἀρχαὶ καὶ αἰτίαι]), principles and axioms or hypotheses (*axiômata* [ἀξιώματα], *hupotheseis* [ὑποθέσεις]); but they do not pose any translation problem. In German, however, the paradigm of the beginning (*Prinzip*) is reduplicated in that of the foundation (*Grund*). The Kantian distinctions overthrew the Aristotelian nomenclature by introducing a sharp distinction between the logical and analytical domain, on the one hand, and the transcendental on the other hand. The logical meaning, which proceeds from the *Posterior Analytics*, was shaken up by

the various axiomatics that emerged between the end of the nineteenth century and the beginning of the twentieth: *Grundsatz* was then used in the sense of the initial laws of a formal system on the basis of which a certain number of theorems, propositions, *Sätze*, can be derived.

I. *Archai* and *Archê*

A. The ambiguity of *archê* and *telos*, *principium* and *finis*

Archê [ἀρχή] derives from the verb *archô* [ἄρχω], which in Homer means both "begin" (to take the lead or initiative: *êrche hodon* [ἦρχε ὁδόν], "he showed the way," *Odyssey*, 8.107; *archein polemoio* [ἄρχειν πολέμοιο], "begin the fighting," *Iliad*, 4.335) and "command" (*Iliad* 16.65); then it was used especially in the middle voice, *archesthai* [ἄρχεσθαι]; we can easily understand how the latter meaning emerged from the former, either because the leader was the first to act (cf. its uses in religion, music, and dance) or because he walked in front (RT: *Dictionnaire étymologique de la langue grecque*). *Archê* thus signifies both the beginning (principle, point of departure, for example, *euthus ex archês* [εὐθὺς ἐξ ἀρχῆς], from the beginning) and command (responsibility, authority, power, magistracy, for example, *archên archein* [ἀρχὴν ἄρχειν], exercise a responsibility). From "archaism" to "archetype" or "architecture" its numerous combined forms emphasize one and/or the other of these two meanings. A philosophy of the origin may thus be based on the way in which the beginning is decisive in Greek.

The Latin *principium*, from *princeps* (a combination of *primum* and *capio*, literally, "he who takes first," "he who occupies the first place"), has the same ambiguity (the *principium*, like the *archê*, of a discourse is its exordium; cf. RT: *Handbuch der literarischen Rhetorik*); the plural, *principia*, which designates the front lines of an army, is used, like the Greek *archai*, to signify both the parts from which a whole is formed (*principia rerum*), and natural impulses (*principia naturae*; Cicero, *De officiis*, 1.50) or the foundations of law (Cicero, *De legibus*, 1.18; cf. Gaffiot, s.v.).

The corresponding antonyms are no less ambiguous. Greek *telos* [τέλος] signifies achievement, in the sense of achieving an end (in the sense of goal or purpose); it is seconded by *teleutê* [τελευτή], which belongs to the same family, to signify the end in the sense of cessation or conclusion (in particular, death). The Latin *finis* covers the whole of this semantic field, and we still see this in English "end" and French *fin*: it signifies first limit, boundary, frontier, like the Greek *horos* [ὅρος] (which RT: *Dictionnaire étymologique de la langue grecque* relates to the Homeric *ouron* [οὖρον], furrow), which, in its abstract or logical meaning, is rendered precisely by "de-finition"; and then "cessation, the end" (*res finem invenit* [the thing is finished]) no less than "goal" (*domus finis est usus* [the goal of a house is to be used]; Cicero, *De officiis*, 1.138, renders exactly the final cause, the *hou heneka* [οὗ ἕνεκα], Aristotle's "that for which") and the culmination (*fines bonorum et malorum* [the supreme degree of goods and evils], Cicero, *De finibus*, 1.55). Cicero, precisely in *De finibus*, comments on the richness of the Latin term:

Sentis me, quod τέλος Graeci dicunt, id dicere tum extremum, tum ultimum, tum summum ; licebit etiam finem pro extremo aut ultimo dicere.

(You see, what the Greeks call *telos*, I sometimes call extremity, sometimes ultimate degree, and sometimes culmination; but I could say end instead of extremity and ultimate degree.)

3.26

B. *Archai* and *aitia* (principles and causes) / *archê* et *protasis*, *thesis*, *hupothesis*, *axiôma*, *aitêma*, *horismos* (principle and premise, thesis, hypothesis, axiom, postulate, definition)

It is common, then, to all beginnings to be the first point from which a thing either is or comes to be or is known.

to prôton einai hothen ê estin ê gignetai ê gignôsketai [τὸ πρῶτον εἶναι ὅθεν ἢ ἔστιν ἢ γίγνεται ἢ γιγνώσκεται].

Aristotle, *Metaphysics*, D.1.1013a 17–19

A distinction is traditionally drawn between the principles of being (*principia essendi*, *principia realia*) and principles of knowledge (*principia cognoscendi*): Bonitz (RT: *Index aristotelicus*, s.v. *Arkhê*), for example, setting aside the univocal meanings of *initium* (used chiefly in meteorological or biological texts) and *imperium* (used chiefly in rhetoric and politics), arranges the occurrences of the term in Aristotle under these two rubrics.

Principia realia are the Pre-Socratics' *archai*, which Aristotle classifies, in book A of the *Metaphysics*, thereby providing the matrix of later doxographies, and even for an initial history of philosophy. The *archêgos* [ἀρχηγός], or "founder," of this kind of theory, for whom water was the sole *archê* of all things (A.3.983b 19–22): this type of *archê*, whether single or multiple, belongs to the order of the *stoicheion* [στοιχεῖον], of the "element" (b 11), that is, of the material cause. Aristotle reinterprets these principles to show how they prefigure and confirm his own systematics of causes: Anaxagoras's *nous* [Νοῦς], Empedocles's Love and Hate, as efficient causes (*archê kinêseôs* [ἀρχὴ κινήσεως]; 7.988a 33), the Platonic Ideas as embryonic formal causes, the One and the Good as final causes. These *archai* are *aitiai*, and in this case there is no difference between principles and causes (988b 16–21) or, more precisely, as chapter Δ of the *Metaphysics* explains, "all causes are beginnings" (5.1013a 17).

The *principia cognoscendi*, "principles of knowledge," are one of the three constitutive elements of any demonstrative science, namely: "(1) that which it posits; the subject genus whose essential attributes it examines; (2) the so-called axioms, which are primary premises of its demonstration; (3) the attributes, the meaning of which it assumes" (*Posterior Analytics*, 1.10.76b 11–16). Principle and cause are clearly connected in scientific knowledge because to know something is to know its cause:

We suppose ourselves to possess unqualified scientific knowledge of a thing [ἐπίστασθαι ἕναστο] . . . when we think that we know the cause on which the fact depends [τήν δ᾽ αἰτίαν . . . δι᾽ ἣν τὸ πρᾶγμά ἐστιν], as the cause of that fact and of no other [ὅτι ἐκείνου αἰτία ἐστί], and, further that the fact could not be other than it is [καὶ μὴ ἐνδέχεσθαι τοῦτ᾽ ἄλλως ἔχειν].

Posterior Analytics, 1.2.71b 9–12

The causes of the fact are thus the premises (*protaseis* [προτάσεις], from *pro-teinô* [προ-τείνω], "tend toward") of the demonstration, that is, the causes of the conclusion, and constitute the "specific principles" (*hai archai oikeai* [αἱ ἀρχαὶ οἰκεῖαι], 71b 23) of the knowledge of the fact: "a 'basic truth' in a demonstration is an immediate proposition" (*protasis amesos* [πρότασις ἄμεσος]), (72a 7–8), that is, a proposition (*apophansis* [ἀπόφανσις]) that is affirmative, *apophasis* [ἀπόφασις], or negative, *kataphasis* [κατάφασις]; see PROPOSITION), and is not preceded by any other.

However, the *Posterior Analytics* makes very precise distinctions among the different kinds of principles (book 1, chaps. 2 and 10): the protasis is a "thesis" (*thesis* [θέσις], from *tithêmi* [τίθημι], "to set or posit") when it is not necessary to have it in order to learn something; in the contrary case, it is an "axiom" (*axiôma* [ἀξίωμα], from *axioô* [ἀξιόω], "evaluate, believe to be right or true"). The thesis thus has a limited validity, while the axiom has a general validity. When a thesis rules on the existence of its object, it is a "hypothesis" (*hupothesis* [ὑπόθεσις], from *hupo-tithêmi* [ὑποτίθημι], "put on top of, suppose"; see SUBJECT), and if the hypothesis is contrary to what the student thinks (or if the student has no opinion about it), then it is a "postulate" (*aitêma* [αἴτημα], from *aiteô* [αἰτέω], "to ask, demand") (10.76b 30–31); when a proposition does not rule on the existence of its object, it is a simple "definition" (*horismos* [ὁρισμός], from *horizô* [ὁρίζω], "limit") (2.72a 20–24).

However, the common denominator of all these kinds of principles remains: "there will be no scientific knowledge of the primary premises" (*Posterior Analytics*, 2.19.100b 10–11); the principles are undemonstrable primary truths: "Whereas the rest can be demonstrated by the principles, the principles cannot be demonstrated by something else" (*Topics*, 8.3.158b 2–4). In this sense, there are two kinds of truths: secondary truths, established syllogistically—these are conclusions obtained thanks to the presence of a middle term (*to meson* [τὸ μέσον]) in two premises, a middle term that established the proportion between them and thus makes it possible to produce a third proposition—and primary truths, which are the only ones called "principles."

C. The question of the first principle

To understand what an *archê*, in the singular, really is, however, we must determine what resists this convenient classification enabling us to situate the physical (the principles of being) on the one hand, and the organon (the principles of knowing) on the other, but leaves room between the two for metaphysics in its relation to the scientific nature of knowledge (Aubenque, *Le problème de l'être chez Aristote*). All the complexity or hesitation constitutive of Aristotelian onto-theology can be expressed in terms of *archê*: is the knowledge sought, which deals with the *prôtê archê* [πρῶτη ἀρχή], the theology of book Λ of the *Metaphysics*, according to which "on such a principle [viz. God], then, depend the heavens (*ek toiautês . . . archês êrtêtai ho ouranos* [ἐκ τοιαυτῆς . . . ἀρχῆς ἤρτηται ὁ οὐρανὸς]) and the world of nature" (Λ, 7.1072b 14)? Or is the knowledge of being qua being described in book Γ of the *Metaphysics*, according to which the principle that "is the most certain of all" (*bebaiotatê . . . pason* [βεβαιοτάτη . . . πασῶν], is also the best known, *gnôrimôtatê* [γνωριμωτάτη], and it is *anupotheton* [ἀνυπόθε τον], not depending on any

previous postulate), the one that has passed on to posterity under the name of the principle of non-contradiction, which is formulated as follows: 'it is impossible for any one to believe the same thing to be and not to be'" (*Metaphysics*, Γ, 3.1005b 19–20)? A science that is universal because it is primary, and deals with the *ousia prôtê*, primary substance, insofar as it is a first principle, or a science, first because general, which deals with the whole of being and first principles?

In any case, God and non-contradiction are both simultaneously principles of being and principles of intelligibility, ontological. Non-contradiction is clearly a logical law because it defines the truth condition of a demonstrative construction (arguments, syllogisms) and of a terminological construction (propositions), and, still more crucially, because it requires us to signify something when we speak (univocality and definition; see HOMONYM); it is also, as Heidegger emphasizes, a law of being that affirms "nothing less than this: the essence of the existent consists in the constant absence of contradiction" (*Nietzsche*). The Leibnizian principle of reason is also expressed, very explicitly, in the *Monadology*, for instance, as a principle of being and as a principle of discourse ("no fact can be real or existent, no statement true, unless there be a sufficient reason why it is so and not otherwise"; §32).

The principle is at once the cause and the reason for first truths as the middle term is both cause (the Scholastics' *principium essendi*, Kant's *Realgrund*) and reason (the Scholastics' *principium cognoscendi*, Kant's *Idealgrund*) of the syllogism ("A cause in the realm of things corresponds to a reason in the realm of truths"; Leibniz, *Nouveaux essais*, book 4, chap. 17).

■ See Box 1.

II. *Principia*, Laws, Common Notions

While recognizing that the notion of principle has several meanings, Descartes refused to grant an exclusive privilege to the principle of non-contradiction; he tries to justify his use of the plural in the title of his *Principia philosophiae*:

It is one thing to seek a common notion that is so clear and so general that it can serve as a principle for proving the existence of all Beings, all *Entia*, which we will discover later on; and another to seek a Being whose existence is better known to us than any other, so that it can serve as a principle for knowing them.

Letter to Clerselier, June or July 1646

As an example of the first sense of "principle," Descartes gives the example of the principle of non-contradiction, which he formulates as follows: "impossibile est idem simul esse et non esse" (it is impossible for the same thing to be and not to be at the same time). But he refuses to reduce every kind of principle to this one because this principle does not produce true knowledge; it merely confirms truths we already know: "For it may happen that there is no principle in the world to which all things can be reduced; and the way in which other propositions are reduced to this one: *impossibile est idem simul esse et non esse*, is superfluous and useless." That is why in order to know we must turn to other principles: "in the other sense, the first principle is that our mind exists, because there is nothing whose existence is better known to us."

The *Principia philosophiae* date from 1644; they give us useful, not superfluous principles; they are "first causes" and include both "the principles of human knowledge" (the first part) and "the principles of material things" (the three other parts). These two types of principles are both clear and distinct, but the former are called "principles" *stricto sensu*; the latter relate to "what is most general in physics" and are called "laws of nature" or "rules" in accord with which changes in nature take place, as well as the other laws of nature formulated in articles 37–40 of the second part of the *Principia*. These laws "established in nature" are "imprinted upon our minds" in the form of "common notions" (Descartes, *Discours*, V). What is required of the principle is that it not promote an enterprise of reducing truths to a first notion. In reality, there are several innate common

---

1

Petitio principii

In Greek, to "beg the question" is *aiteisthai to en archêi* [αἰτεῖσθαι τὸ ἐν ἀρχῇ] (Aristotle, *Metaphysics*, Γ.4.1006a 15–16), "to ask what is in the principle." Every first principle as such is necessarily undemonstrable. To demand (*aitein* [αἰτεῖν]) that it be demonstrated is a sign of the lack of education, *apiaideusia* [ἀπαιδευσία], characteristic of the Sophists—"for not to know of what things one should demand demonstration, and of what one should not, argues want of education (*esti gar apideusia* [ἔστι γὰρ ἀπαιδευσία])" (*Metaphysics*, 4.1006a 6–8). Thus Aristotle does not propose a "demonstration" (*apodeixis* [ἀπόδειξις]) of the principle of non-contradiction, but rather a "negative demonstration" or refutation

(*elegchos* [ἔλεγχος]; 1006a 18), so that the adversary of the principle bears all the responsibility for the demand: it is he who will be allowed to speak first so that by stating his rejection, he says something that is significant for himself and for others and thus always already obeys the principle that he claims to deny (1006a 18–27) (cf. Cassin and Narcy, *La Décision du sens*; see HOMONYM).

Principle and *petitio principii* refer to the problem of the ultimate foundation. The necessity of a stopping point (*anagkê stenai* [ἀνάγκη στῆναι]) has the force of a postulation. That is why Heidegger can see in the *petitio principii* not a logical error but a founding act.

Petere principium, in other words, tending toward the foundation and its foundation, is the single and unique step taken by philosophy, the step that moves beyond, ahead, and opens up the only domain within which a science can be established.

Heidegger, "Ce qu'est et comment se détermine la *phusis*"

BIBLIOGRAPHY

Cassin, Barbara, and Michel Narcy. *La Décision du sens*. Paris: Vrin, 1989.

Heidegger, Martin. "Ce qu'est et comment se détermine la *phusis*." French translation by F. Fédier: *Questions II*. Paris: Gallimard / La Pléiade, 1968.

notions (Euclid's *koinai ennoiai* [κοιναὶ ἔννοιαι]) whose use is so constant that it is no longer governed by systematic discernment on our part; principles in the sense of common notion-axioms are then in our minds as it were virtually or implicitly, in the manner of "the propositions suppressed in enthymemes, which are omitted not only outside our thought but also within it" (Leibniz, *Nouveaux essais*, book 1, §4). The principle fulfills its function when, on the one hand, it is so obvious that it cannot be denied, and on the other hand, it allows us to recognize the deductions that depend on it, in other words, the laws. Let us emphasize that this vocabulary is not always used: Descartes sometimes calls the three laws of movement "principles" (*Principia*, II, §36); similarly, Leibniz gives the name of "law" to the principle of the conservation of energy (*Discours de métaphysique*, §17). Along with Newton's *Principia*, we have here an effort to systematize natural philosophy; in Newton's work, principles are everything that allows us to account for the "first and last sums and ratios of nascent and evanescent quantities" (*Philosophiae naturalis principia mathematica* [1687]), which includes not only the "definitions" and "axioms or laws of movement" that Newton places before the first book, but also the lemmas and theorems of the three books of the *Principia*.

III. "Principle," "Foundation," "Source," "Original": Principles and the Connection of Ideas

Locke takes up the notion of principle in arguing against the theory of innate ideas. At the beginning of the *Essay Concerning Human Understanding*, he notes that "it is an established opinion amongst some men, that there are in the understanding certain *innate principles*: of primary notions, *koinai ennoiai*" (book I, chap. 2, §1). His refutation bears on both speculative and practical principles, taking the ironic form of a critique of the argument from authority: the schoolmasters and teachers maintaining the thesis that there are innate ideas postulate as "the principle of principles ... *that principles must not be questioned*" (I, 4, 24). The obviousness of some general propositions and the general consent to which they give rise do not, however, transform these general propositions into innate propositions. Moreover, the most general propositions, such as "what is, is" or "it is impossible for a thing to be and not to be" do not by themselves advance knowledge; on the one hand, the ideas of which they are composed—the ideas of identity and impossibility—are far from clear to everyone; on the other hand, in the best of cases they have only an argumentative value and serve to "stop the mouths of wranglers" (IV, 7, 11). In the transformation of general maxims into principles Locke discerns a survival of the dialectical method that consists in starting from the *endoxa* [ἔνδοξα], from generally accepted propositions, in disputes. But accepting such maxims does not imply that knowledge has to recognize them as principles:

> And then these Maxims, getting the name of Principles, beyond which men in dispute could not retreat, were by mistake taken to be the Originals and the Sources, from whence all knowledge began, and the Foundations whereon the sciences were built.
>
> IV, 7, 11

Locke prefers to use the terms "source" and "foundations" when discussing what seems to him to be the starting points for human knowledge: "perhaps we should make greater progress in the discovery of rational and contemplative knowledge, if we sought it in the fountain, *in the consideration of the things themselves*" (I, 4, 23). This "fountain" consists in simple ideas: sensation and reflection. The advance of knowledge is measured, then, by the agreement or disagreement of our ideas, and not by the status of principle that we confer on general propositions of the type "what is, is."

Hume, having recognized the difficulty of finding principles, emphasizes that we must substitute for conjectures imposed on nature or the mind a knowledge of the principles that would enable us to connect phenomena with each other in a regular way: such a project involves the analysis of the origin of our ideas (*An Enquiry Concerning Human Understanding*, §2) and knowledge of their derivation. Hume's analysis is not limited to a morphology of our ideas that divides them into ideas of reflection and ideas of sensation. He radicalizes Locke on the question of principles by questioning not only the source of knowledge but also its origin. His analysis is thus more genetic, and accords to the notion of origin, and to its corollary, the notion of derivation, such importance that this general maxim can be formulated:

> That all our simple ideas, in their first appearance, are derived from simple impressions, which are correspondent to them, and which they exactly represent.
>
> *A Treatise of Human Nature*, book 1, chap. 1, §1

IV. *Principium, Grundsatz, Prinzip, Satz, Grundgesetz*

A. Kantianism and post-Kantianism

In the French translation of Kant, *principe* may render six German words that the philosopher frequently uses and sometimes distinguishes: *Satz, Grundsatz, Prinzip, Principium, Anfangsgrund, Grund.* This translation is perfectly legitimate in some instances: it would be pointless, pedantic, and erroneous to render *Satz des Widerspruchs* as *proposition de contradiction*. But the impoverishment of the Kantian vocabulary has sometimes corresponded to an absence of conceptual distinctions that results in major lacunae and even interpretive confusions.

Within Kantianism, the terminology just described is used in the following contexts:

1. The *principium* retains the meaning of "principle" as beginning and command. It is a specification of the "principle" (*Prinzip*) to which Kant denies, in its generality, any value as a foundation for knowledge: "The term 'principle' [*Prinzip*] is ambiguous, and commonly signifies any knowledge which can be used as a principle [*Prinzip*], although in itself, and as regards its proper origin, it is no principle [*Prinzipium*]" (*Critique of Pure Reason*, B 356). On the other hand, the *Prinzipium* is valid in the legislative order (*Gesetzgebung*) because in this case we are in fact the authors, the source itself (*die Ursache*) of the laws, which are "entirely our own work" (B 358).

2. Principles in the sense of *Grundsätze* (sing. *Grundsatz*) are used by Kant in two ways:

a. First, they are the formal "fundamental propositions [*Grundsätze*] of the sensible world" (1770 Dissertation, §14 and 15), or space and time: they indicate the impossibility of the Leibnizian reduction of principles to the principle of identity and to the "great principle" (reciprocally related to the latter) according to which the predicate is in a subject (*praedicatum inest subjecto*; letter from Leibniz to Arnaud, 14 July 1686).

b. Second, the fundamental a priori propositions (*Grundsätze*) of the understanding found the possibility of knowledge and are in this sense "rules for the objective employment of the former [the categories]" (*Critique of Pure Reason*, A 161/B 200). They are foundational and take the form of "axioms of intuition," "anticipations of perception," "analogies of experience," and "postulates of empirical thought in general." They are demonstrable and their formulation is followed by a proof. Their theoretical role is to found the possibility of knowledge, their critical role is to break with the assimilation of "first principles" to "first causes": we cannot arrive at the notion of cause through a simple concept. "If the reader will go back to our proof of the principle of causality . . . he will observe that we were able to prove it only of objects of possible experience" (B 289).

The post-Kantian and anti-Kantian traditions both radicalize this point of view, especially in matters of logic; not only are first principles no longer first causes, but they are not necessarily connected with intuition to found knowledge. The question is: how can a subjective principle like intuition found objectivity, how can it realize the necessity that only a judgment can contain? B. Bolzano indicates that necessity is related first to the judgment, where concepts and, indirectly, our intuitions and representations, are connected with each other. In the *Beyträge zur einer begründeteren Darstellung der Mathematik* (partial French translation in J. Laz, *Bolzano critique de Kant*), Bolzano notes his reservations regarding Kant's foundation of synthetic judgments on intuitions, even if they are a priori:

It is well known that some people have been shocked by these a priori intuitions of critical philosophy. For my own part, I willingly concede that there must be a certain reason (*Grund*) completely different from the principle of contradiction, for which the understanding joins, in a synthetic judgment, the predicate to the concept of subject. But that this reason might be, and be called, an intuition, and what is more, a pure intuition in the case of judgments a priori—that I do not find clear.

3. The principles (*Prinzipien*) of reason have a regulative value through which reason is "interested" in the constitutive use of the fundamental propositions (*Grundsätze*) of the understanding. This interest gives them a subjective character that leads Kant to consider them as "maxims" (*Maximen*) instead. Their role is to give a "systematic or rational unity" to knowledge, and in

this sense they are "logical." Kant distinguishes three of them: (1) "a principle [*Prinzip*] of the *homogeneity* of the manifold under higher genera"; (2) "a principle [*Grundsatz*] of the *variety* of the homogeneous under lower species"; and (3) "the *affinity* of the concepts—a law [*Gesetz*] which prescribes that we proceed from each species to every other by gradual increase of the diversity" (*Critique of Pure Reason*, A 657/B 685).

We see here that the Kantian nomenclature, which is recapitulated in terms of "principles" (*Prinzipien*) of homogeneity, specification, and continuity, blurs for the translator and the French interpreter the initial distinction between *Grundsatz* and *Prinzip* (*Principium*). This is because the concepts of "fundamental proposition" (*Grundsatz*) and "principle" (*Prinzip*) are given different meanings depending on whether the context in which they are used is formal logic or transcendental logic. In the transcendental register, only the understanding has fundamental propositions (of which, as the "faculty of rules," it is the origin), whereas only reason has these (unconditioned) principles of which it is the source. In formal logic, *Grundsatz* designates a proposition to which we have gone back, and which, *a parte ante*, is thus not founded on an anterior proposition, whereas *Prinzip* designates the ability to derive, *a parte post*, other propositions. For traditional logical principles such as the principle of identity and the principle of contradiction, Kant uses the term *Sätze* (*Satz*, proposition) to indicate that these principles do not have foundational value, and that they are therefore only "criteria" of truth: "*The principle of contradiction* must therefore be recognized as being the universal and completely sufficient *principle of all analytic knowledge*; but beyond the sphere of analytic knowledge it has, as a *sufficient* criterion of truth, no authority and no field of application" (A 151/B 191). Mathematical philosophers of the nineteenth century like Bolzano retained the same terminology in speaking of the principles of identity and contradiction—*Satz der Einerleiheit* and *Satz des Widerspruches*—but far from being simple criteria of truth, these principle-propositions were considered as the universal source of all analytical judgments. On the other hand, the principle of reason (*Satz vom Grunde*) is for Kant a synthetic proposition that accounts for judgments. This principle assumes the intuition of time and yet, as Bolzano once more points out, "it is also valid where there is no time" (§8), namely, when the existence of noumena has to be justified.

From both the logical and transcendental points of view, the distinction between *Satz*, *Grundsatz*, and *Prinzip* is thus not merely reasonable: on the one hand, if a proposition can play the role of principle, a principle, since it can be founded on a superior proposition, is not necessarily a fundamental proposition; on the other hand, transcendental fundamental propositions have their source in the understanding, while principles have theirs in reason. Here we see the root of a possible confusion. In a logical sense, the understanding has principles and reason has fundamental propositions, which in a transcendental sense would be contradictory; if the logical sense is taken for the transcendental sense, the critical nomenclature and the architectonics that underlie it will be upset: reason will already be involved in the "Analytic of

the Understanding," but that would destroy the enterprise of Criticism, if it is true that, according to a Kantian leitmotif, its systematicity is the foundation of its scientific character.

In the strictly practical (moral) domain, the vocabulary used in the *Critique of Practical Reason* is explicitly mathematical: "definition," "theorem," "axiom," "postulate," "law" (*Gesetz*), and this may seem surprising, coming from a thinker highly critical of the mathematical method in philosophy, and all the more so because this mathematical usage is adopted for an essential term in the Kantian vocabulary, that of "formula" (*Formel*), which is substituted for "principle" in referring to morality:

> A reviewer who wanted to find some fault with this work [*The Foundation of the Metaphysics of Morals*] has hit the truth better, perhaps, than he thought, when he says that no new principle of morality is set forth in it, but only a new formula [*kein neues Prinzip der Moralität, sondern nur eine neue Formel*].... But whoever knows of what importance to a mathematician a formula is, which defines accurately what is to be done to work on a problem, will not think that a formula is insignificant and useless which does the same for all duty in general.
>
> *Critique of Practical Reason*

It is possible to grasp the reasons for this change: on the one hand, it is only a matter of setting forth the doctrine, an exposition that has to be dogmatic; hence the formulas expressing the objective principles of knowledge constitute the fundamental propositions of transcendental philosophy. The latter thus produces a formulaic representation of the principles of knowledge: a system of statements which, through successive transformations, must return to the initial statements, those of the doctrinal empirical sites (letter to Markus Hertz, 26 May 1789). On the other hand, Kant maintains even in this lexicon a distinction between mathematics and philosophy since he reserves *Definitionen* for the former and *Erklärungen* for the latter.

Thus Kant, seeking to conceive a genuinely philosophical revolution that resembles only by analogy the revolution in physics, nonetheless found himself led back to a dangerous proximity to mathematics. In this return, to which the terms "principle" and "formula" testify, we can see the sign of how difficult it is to conceive a specifically philosophical demonstration. This difficulty is the constitutive knot that modern philosophical reflection seeks to undo when it inquires into its status as truth.

■ See Box 2.

B. Frege: *Grundgesetz, Grundsatz, Axiom, Definition*

The term *Grundgesetz*, commonly used by Frege, can be translated as "basic law." This translation unfortunately preserves only one aspect of the German term *Grund*, which means both "basis" and "reason." In the preface to his *Begriffschrift* ("Concept Notation," 1879), Frege divides all truths that require a foundation (*Begründung*) into two kinds: those whose proof is entirely logical and those that are based on the facts of experience. The notion of basis or foundation is thus intimately connected, in German, with those of reason and proof: the basic laws are "the deepest reasons" (*die tiefsten Gründe*)

that constitute the justification (*Berechtigung*) for our assent" (*The Foundations of Arithmetic*, §3). In the domain of logic, the basic laws are general (*allgemein*) and "neither lend themselves to nor require a proof (*Beweis*)." Here Frege is directly borrowing one of Leibniz's formulas, though he does not cite him (*Nouveaux essais*, book IV, chap. 9, §3). The fact that *Grundgesetze* cannot be proven is connected with their "obvious" (*selbstverständlich*) character (*Basic Laws of Arithmetic*, vol. 2, §60; Frege apparently uses the adjective *einleuchtend* in the same sense: cf. *The Foundations of Arithmetic*, §90). Finally, the basic laws are often described as *Urwahrheiten* (first truths): cf. *The Foundations of Arithmetic*, §3.

In Frege, the notion of basic law is opposed to those of definition (*Definition*), axiom (*Axiom*), and theorem (*Lehrsatz*). In "Logic in Mathematics" (1914), Frege states that definitions, although important from a psychological point of view, are not essential to logic: they are simple abbreviations. A basic law is thus not a definition that bears on the signs used. Despite the fact that Frege often treats them as propositions (*Sätze*), basic laws, axioms, and theorems are not linguistic in nature. In his mature writings, Frege clearly indicates that they are thoughts (*Gedanken*) independent of the mind and of language. The notion of basic law also differs from that of axiom, but in a more subtle way. Every axiom is a basic law, and thus a primary truth, but the reciprocal statement is not true. A law is an axiom when it is used as the point of departure for a system of inferences. On the basis of axioms and rules of inference, one can derive a set of theorems (*Lehrsätze*). A primary truth considered as an axiom in one system can be considered a theorem in another, and vice versa ("Logic in Mathematics").

In relation to the Kantian tradition, the originality of Frege's notion of basic laws is twofold. First, Frege thinks that the comprehension of axioms does not depend on intuition but on inference, that is, on the ability to derive theorems from axioms in accord with the order of proof, and also on the correlative ability to go back from the theorems to the axioms. No source of intuitive knowledge, spatiotemporal or other, is required to grasp the obvious character of the axioms. Second, while Frege thinks that logical laws are purely general, he believes he can derive from them the existence of numbers considered as "objects," whereas Kant thought that only sense intuition can present objects to the understanding (*Critique of Pure Reason*, A 51/B 75).

In his introduction to the *Foundations of Arithmetic* (*Die Grundlagen der Arithmetik*, 1884), Frege states three principles (*Grundsätze*) that guide his inquiry. The first advocates separating "the psychological from the logical, the subjective from the objective." The second is that "we must find out what words mean (*bedeuten*) not in isolation but taken in their context." This is what we now call the Fregean principle of contextuality. Finally, the third principle prescribes that we "never lose sight of the difference between concept and object." These methodological principles must not be confused with the laws of Fregean conceptual notation. For example, the distinction between object and concept cannot be formulated within the logical system; it only "shows itself" in the correct use of the symbolism, which does not allow the denotation of a concept by means of an expression suited to an object.

2

Principle of reason, *Satz vom Grund*

In 1955–56, Heidegger gave, under the title *Der Satz vom Grund*, a series of lectures at the University of Freiburg that took as their theme the "great" Leibnizian principle, the *principium magnum, grande et nobilissimum*: the *principium (sufficientis) rationis*, the one that answers the fundamental question (*Grundfrage*) formulated notably in the *Principes de la nature et de la grâce fondés en raison* (§7):‴ Why is there something rather than nothing?'... assuming that things must exist, we must be able to account for *why they must exist this way*, and not otherwise." Starting from the standard formulation of the principle *nihil est sine ratione*, Heidegger highlights the most rigorous statement of the *principium rationis* as *principium reddendae rationis*: what requires that this be accounted for? To whom? By whom? The lectures as a whole are thus presented as a long variation on a theme: that of the translation of *principium rationis—Satz vom Grund*; a variation with repetition, transposition, change in accentuation, "alternation of tones," so as to hear, in accord with all its harmonies, echoes, and resonances (*Anklänge*) what is said by the "principle": *Grundsatz*, fundamental proposition, or rather "ground proposition," since it—as a thesis or positing of the ground—is the ultimate presupposition of language and truth understood as propriety of judgment. The *principium rationis—Satz vom Grund*, understood as *Grundsatz*—is thus what makes the ground of every proposition: *der Satz vom Grund als Grund des Satzes*. The whole procedure of the lecture is then, by playing on accentuation (*Tonart*), to retranslate or reinterpret, in accord with other possibilities of the language, the *Satz* as a "leap" (*Sprung*) and as a "movement" in the musical sense of the term, and *ratio*, reason/*Grund*, as *Grund*, ground, abyssal ground (*Grund—Abgrund*). The powerful motif of play (*Spiel*) runs like a leitmotif from one end to the other of the lectures, which conclude with this surprising transposition of fragment 52 of Heraclitus (see also AIÔN, I.A):

[αἰὼν παῖς ἐστι παίζων] . . .

(*Seinsgeschick, ein Kind ist es, spielend . . .*)

(The fateful sending of being is a child who plays . . .)

Der Satz vom Grund

The text can thus be presented explicitly as a play on words (*Wortspielerei*) laboriously woven and intended to reinvest the principle in an ultimate paratactic reformulation:

Sein und Grund : das Selbe ./ Sein: der Ab-grund.

(Being and ground: the Same. / Being: the abyss.)

To play the game, or to accompany the movements of this game (*Sätze dieses Spiels*), is also, regressing from German to Greek, to understand Being/Ground as *logos* [λόγος], or to emphasize the abyss between the *rationem reddere* characteristic of the *principium* and the *logon didonai* [λόγον διδόναι] that is heard "with Greek ears" (!):

etwas Anwesendes in seinem so und so Anwesen und Vorliegen darbieten, nämlich dem versammelnden Vernehmen.

(offer what enters in presence in its unfolding in presence so or so—and offer it to the grasp that collects)

In an essay entitled "Der Gedanke" ("Thought," 1918), Frege asserts that logic must seek to discover the laws of being true (*Gesetze des Wahrseins*). However, he adds that the word "law" is ambiguous. People speak of moral or political laws in a normative or prescriptive sense, whereas the laws of being true are primarily descriptive; they refer to an ontological domain independent of natural processes and psychological representations. We can nonetheless draw from them "prescriptions (*Vorschriften*) for opinion, thought, judgment, reasoning." In this sense, the laws of logic, or of being true, are also laws of thought (*Denkgesetze*).

PROBABILITY

"Probable" is related to proof (*probare*, "try out, test") and approbation (*probus*, "solid, upright, honest"). Thus it operates in several registers, epistemological, logical, and rhetorical, and it opens out onto ontology as well as aesthetics and ethics.

I. Proof and Probability

1. The vocabulary of proof and demonstration is examined under EPISTEMOLOGY, IMPLICATION, and PRINCIPLE. Also see TRUTH.

2. More precisely, "probability" and its calculation are discussed on the basis of the English term "chance," in contradistinction to "probability"; see CHANCE.

3. The expression of the probable, which is connected with the possible and the contingent as a distinct modality of the necessary, is attached to one of the senses of "owe/ought": see DUTY; cf. SOLLEN, WILLKÜR. See also, regarding linguistic expression, ASPECT.

4. The probable then merges with the possible, by contrast with the actual: see *ACT, POWER.*

5. Finally, the probable is related to dialectical demonstrations. See DOXA, II.C especially.

II. Probability and Verisimilitude

1. In rhetoric, the probable (Greek *eikos* [εἴκος]) is connected with what appears, and it belongs first of all to the vocabulary of the image and the imagination: see EIDÔLON, Box 1; cf. *APPEARANCE* [DOXA], *IMAGE, IMAGINATION* [FANCY, PHANTASIA], TRUTH.

2. It is attached in a privileged way to commonplaces. See COMMONPLACE; cf. COMPARISON and supra, I.4.

3. It is connected with aesthetic imitation: see MIMÊSIS concerning the relation between the true and the verisimilar in theories of art; cf. ART, PLASTICITY. On the discursive modalities then put in operation, see DICHTUNG, ERZÄHLEN, *FICTION,* HISTORY.

4. It implies faith and belief. See *CROYANCE* [BELIEF, GLAUBE].

➤ *DIALECTIC, FALSE, LIE*

PROGRESS

Derived from the Latin *progressus* (walking forward), the word "progress" designates an improvement related to time, and it may refer to the individual and/or to history.

I. Progress and Self-Improvement

The reader will find under PERFECTIBILITY a study of the passage, in various traditions, from "improvement" (*perfectionnement, Vervollkommnung*) and progress.

See also BILDUNG, *CULTURE,* MENSCHHEIT, VIRTÙ.

II. Progress and History

On the interpretation that can be given to a history oriented toward a goal or determined in its course by an origin that governs its development, see HISTORIA UNIVERSALIS; see also CIVILIZATION, CORSO, NEUZEIT, SECULARIZATION.

III. Ethics, Economics, and Politics

On the boundary between the individual and the collective, see BERUF, ENTREPRENEUR, and OIKONOMIA. See also, in the aesthetic domain, WORK, Box 1 especially.

➤ *DESTINY,* GEISTESWISSENSCHAFTEN, HISTORY, *TIME*

PROPERTY

FRENCH	*propriété, propre*
GERMAN	*Eigenschaft, Eigentum, eigen*
GREEK	*idiotês* [ἰδιότης], *to idion* [τὸ ἴδιον], *idios* [ἴδιος]
LATIN	*proprietas, proprius*

➤ COMPARISON, EREIGNIS, I/ME/MYSELF, OIKEIÔSIS, PRÉDICABLE, PREDICATION, *SELF,* TRUTH, UNIVERSALS

The term "property," in the abstract sense of a thing's mode of being, has a twofold origin, theological and juridical, which can still be discerned in the French expressions *amour propre* or *biens propres* (private property).

This twofold origin goes back to the general meaning of "proper" as the unsoiled, the intimate. This Latin genealogy (calqued by the French *propre* and the English "proper") is reduplicated by a Germanic genealogy that derives from *Eigenschaft* (property), from *eigen* (own), from *Eigentum* (property [in the sense of what one owns]). The connection between "proper" and "property" thus seems to be more than an accident in a single language; it seems to be a constant.

The Latin etymology traces *proprius* to *pro privo* (privately, RT: *Dictionnaire étymologique de la langue latine*, 540). *Proprius* is equivalent to *perpetuus* (ibid., 539): what is proper to an individual is a permanent characteristic of that individual. *Proprietas* is a relatively late derivative from *proprius*, with the twofold sense of possession and characteristic: it is a "calque of *idiotês*" which is found in Cicero (ibid., 540). The Greek *idios* [ἴδιος] is related to what is private, proper to someone, whether it be a good or a mode of being, by contrast with what is public (*koinos* [κοινός]). *Idiotês* [ἰδιότης] designates property, the proper character of something, and *idiôtês* [ἰδιώτης], for which there is no Latin calque,

designates both the private citizen as opposed to the public man, and the nontechnician, the "idiot" in contrast to the specialist (cf. RT: *Le Vocabulaire des institutions européennes*, 1:328 ; see ART, and LANGUAGE, II.B.1). *Idios* is based on the Indo-European root **swe-d*, from which is derived *suus* (his); **swe* (which appears not only in **swe-d* but also in *swe-t*, connected with *étes* [Fr., *allié*], and in **swe-dh*, connected with *ethos* [ἔθος]), on the one hand "implies membership in a group of 'one's own,' and on the other it specializes the 'self' as individuality" (ibid., 1:332). The logical sense of *idion* [ἴδιον], "the proper, own" is strictly determined in Aristotle: "A 'property' [*idion*] is a predicate which does not indicate the essence of a thing [*to ti ên einai*, (τὸ τί ἦν εἶναι)], but yet belongs to that thing alone, and is predicated convertibly of it [*monôi d'huparchei kai antikatêgoreitai tou pragmatos* (μόνῳ δ' ὑπάρχει καὶ ἀντικατηγορεῖται τοῦ πράγματος)]" (*Topics*, 1.5.102a.18–19; trans. W. A. Packard-Cambridge in *Basic Works of Aristotle*). Along with genus, definition, and accident, property is one of the predicables (ibid., 1.5; see PRÉDICABLE and TO TI ÊN EINAI). J. Brunschwig comments, "When a property is attributed to a subject, the name (of the subject) is attributed to everything to which the formula (of the property) is attributed, and the formula (of the property) is attributed to everything to which the name (of the subject) is attributed" (Brunschwig, Introduction to *Topiques*, by Aristotle, 122).

In English, "property" is derived from "proper." A proper name is one that is proper to the individual (the French *nom propre* appears in 1549 as a modernization of the Old French *propre nuns*, which appears around 1155 [RT: DHLF]). The proper name is the one that is appropriate[d] to the individual. In this sense, "God" is an archetypal proper name: it is perfectly appropriate[d]. In French, *propre* has two meanings, the second a late development (1842, RT: DHLF) that is attributed to a person who bathes frequently and includes two derivatives with distinct senses: A: *propriété*, and B: *propreté* (in Walloon French it has been appropriated for "cleaning"). Sense A is present in the expression *le propre de X*, meaning "the essence of X"—for example, "le propre de la puissance est de protéger" (Pascal). Sense B is the origin of a general sense of "good order" and came to designate hygiene only later on—in the seventeenth century, a dinner or a garden could be said to be *propre* in the sense of appropriate for a situation or use, suitable: "Personne ne l'embarrasse, tout le monde lui convient, tout lui est propre" (La Bruyère). What sense A and B have in common is the idea of suitability (Greek *prepon* [πρέπον]; see MIMÊSIS, Box 6).

German distinguishes among *Eigenschaft, Eigentum, and Eigenheit* ("peculiarity"): an *Eigenschaft* is shared by several individuals (for example, "being red"), whereas an *Eigenheit* is possessed by a single individual (for example, "being myself"). In the seventeenth century, *Eigenschaft* appeared as a translation of *qualitas* and *attributum*, and was part of the vocabulary of technical philosophy established by Wolff in particular: "That which is uniquely and solely founded in the essence of a thing will be called a property [*Eigenschaft*]." Medieval and later mysticism in the Rhineland and in Flanders exploited the semantic affinity of the derivatives of *eigen*: it is just as much a matter of renouncing possessions as of

transcending both general and individual qualities (Suso's noble man is literally a "man without qualities" (*Eigenschaften*). In this sense Musil's "Man without Qualities" descends from the "noble man" of Meister Eckhart and Suso. In this context, the juridical term *Aneignung* (a German translation of *appropriatio*) designates much more than taking material possession, the acquisition of an egoity (self-hood) or even an ipseity; and the ascetic and then mystical path is identified with disappropriation (syn.: detachment, abnegation, deprivation), which means renouncing what we have of our own, whether it be properties or possessions: "The monk must not only renounce ownership of material things, but also that of his own will [*proprietati propriae voluntatis*]" (quoted in RT: *Historisches Wörterbuch der Philosophie*, 335–36), but also "the doctrine of the cynical philosophers which was the spirit of disappropriation" (Voltaire). In the contemporary period, Heidegger reappropriated the proper, *Eigentlichkeit* (genuineness, authenticity) and *Ereignis* (propriation, event; see EREIGNIS). The abstract philosophical concepts *Eigenschaft*, property, and *propriété* thus have not only a juridical origin but also an ascetic origin.

GERMAN	*Satz, Rede, Aussage*
GREEK	*protasis* [πρότασις], *logos* [λόγος], *phasis* [φάσις], *apophasis* [ἀπόφασις], *apophansis* [ἀπόφανσις], *logos apophantikos* [λόγος ἀποφαντικός], *thesis* [θέσις], *axiôma* [ἀξίωμα]
LATIN	*propositio, praemissa, oratio, oratio enuntiativa, sententia, elocutio, enuntiatio, sermo*

➤ DICTUM, *ÉNONCÉ*, INTENTION, LOGOS, PREDICATION, PRINCIPLE, SACHVERHALT, SENSE, SIGN, SIGNIFIER/SIGNIFIED, SPEECH ACT, SUPPOSITION, TERM, TROPE, TRUTH, WORD

The term "proposition" designates a complex unit intermediary, in the analysis of language, between the "word" or the "term" on the one hand, and "discourse" on the other. The "word" is the minimal unit endowed with meaning; combined with other words, it constitutes the sentence (see WORD, which itself can be analyzed as a SIGNIFIER/SIGNIFIED; see also HOMONYM). The "term" is more precisely the product of the decomposition of the proposition (see TERM). "Discourse" is the signifying totality constituted notably by propositions (see LOGOS and LANGUAGE).

A basic unit of logical syntax, the proposition is also the crossroads of philosophical semantics. The analysis of its constituents,

subject and predicate (or more classically, subject, copula, and attribute; see PREDICATION), governs the semantics of terms, meaning and reference being originally approached as expressions of the "subject" function (see SUPPOSITION and SUBJECT). The question of the meaning or of the signified of the proposition opens in turn onto the notion of the "stateable" (see DICTUM), and onto all the problems of reference (see SENSE), deriving from the relation among intention (see INTENTION), objectivity, or state of affairs (see GEGENSTAND and SACHVERHALT) and truth-value (see TRUTH).

The "proposition" remains an enigmatic and even contested entity, however. Is it a matter of a thing or a matter of a word? That is the whole problem. Those who reject the existence of propositions and those who accept it are not talking about the same thing, the former thinking of the entities signified and the latter of the signifying forms. The semantic definition of the proposition as a subject ("bearer") of "true" or "false" predicates is rejected by all who believe that it is sentences in a given language that are true or false. Focusing on the meaning of the word "proposition" in modern philosophical texts involves confronting a network formed by the moving triad "proposition"-"statement"-"sentence" in its relations with the notions of "fact" or "state of affairs." If this is the case, it is the status itself of the set of these distinctions as it has been handed down by tradition in languages that has to be clarified.

Two kinds of ambiguity are connected with "proposition." The first has to do with the fact that in languages such as French, German, and English, the respective semantic fields of French *proposition*, German *Satz*, and English "proposition" are not completely congruent and refer to distinct terminological complexes. This leads to certain disparities that stubbornly confuse the reader of texts on logic, like the twofold meaning of the German *Satz*—"proposition" (*Satz* comes from *setzen*, "to pose") and "principle"—to which testify, for example, the use of the formula *Der Satz vom Grund* to render *principe de raison* (*principium reddendae rationis*), or the translation of the Aristotelian title *Peri hermêneias* [Περὶ ἑρμηνείας] by *Lehre vom Satz* (theory of the proposition; see PRINCIPLE and TO TRANSLATE). The confusion is at its height when the French term *proposition* is used to render Gottlob Frege's *Satz,* as opposed to its content, *Sinn* or *Gedanke*, which is rendered in English by "proposition."

The second ambiguity is connected with the difficulties specific to the Greek and Latin philosophical languages: *propositio* is in fact a Latin term that is ambiguous from the start, because it means both a statement (*oratio*) signifying the true and the false, and a statement serving as a premise for a demonstration. Latin-speaking logicians derived *propositio* from *pro alio positio*, an etymology according to which the proposition ultimately appears as a statement calling for another—the conclusion to be drawn (*pro alio, id est pro conclusione habenda*). Thus they exploited the possibility offered by Latin of expressing what was already contained in the Greek *protasis* [πρότασις], whose Aristotelian technical sense (the major premise in both an argument and a proposition) remains imbued with the idea of a question proposed (and thus to be established or verified), but also common, nonphilosophical senses corresponding to a spectrum ranging from "set in advance" (a period of time) to "place someone in the first rank" (in order to speak in the name of a group or to protect someone).

The two sorts of ambiguity are difficult to distinguish, and there is a tendency to impute to the "genius of the language" what in fact has to do with the history of idiolects: in any case, we have to take into account the effects of ancient terminologies on the technical languages of logic and the modern philosophy of language. There are two keys to this exploration: make an inventory, starting with Greek and Latin, of the concurrent words belonging to other registers of analysis (grammar, rhetoric, dialectic) and conveying other pairs of theoretical and doctrinal oppositions; and look into the recurrent questioning—found in modern philosophy, but pertinent very early, as is shown by fourteenth-century debates about "propositions composed of things" or "real propositions"—bearing on an archetypal problem: namely, whether it is propositions or statements that are primarily the bearers of the true and false—"one of the most important subjects that future philosophy of language will have to discuss" (Bar-Hillel, "Universal Semantics and Philosophy of Language," 17).

I. What Is a *Propositio*?

A. Greek retroversions:
The ambiguity of Aristotle's *protasis* and the Stoics' *axiôma*

In the course of a translation from Greek, many terms are rendered by "proposition." For example, there is a first group of words around *phasis* [φάσις] (from *phêmi* [φημί], "to say"), which means "saying, speech, sentence"; but when *phasis*, neither entirely the same nor entirely different, is understood as connected with *phainô* [φαίνω] (make luminous, bring to light; and, in the middle voice, be luminous, be shown [as]), it means "denunciation, accusation," or "appearance of a star, phase of the moon." *Apophasis* [ἀπόφασις], when the prefix before *phainô* indicates its provenance, means "declaration, explanation, response, report, judicial decision, inventory" (to limit ourselves to Bailly's Greek dictionary, RT: *Dictionnaire grec français*); but, when *apo* denotes distance, *apophasis*, which is then supposed to come from *apophêmi* [ἀπόφημι], means "negation." *Apophansis* [ἀπόφανσις], which is clearly derived from *phainô*, means "explanation, declaration," and it designates, for example, a "property inventory." Another candidate is *protasis* [πρότασις] (throw ahead), which refers to the question proposed, the proposition, the premise. Yet another is *thesis* [θέσις], from *tithêmi* [τίθημι] (set or lay), which refers to the action of instituting, or to convention, affirmation, or positing. Still another is *axiôma* [ἀξίωμα], from *axioô* [ἀξιόω] (evaluate, assess, believe to be right or true), which signifies price, consideration, resolution, principle, proposition. To these words we must still add *logos* [λόγος], one of the best candidates for any translation in the discursive and logical domain, which founds what modern logic can see only as the matrix of the greatest confusions (see LOGOS).

But the major fact crucial for the comprehension of the history and semantics of "proposition" is the conjunction of *protasis*, in the technical sense of the "premise" of a syllogism, with *apophansis* (or its developed expression, *logos apophantikos* [λόγος ἀποφαντικός]), "declarative statement," starting with the Latin translations of Aristotle; this is the point that determines the meaning of *propositio* and founds the ambiguity of "proposition." We can assume that this Latin confusion was made possible, or favored, by Aristotle's broad use of *protasis*: by itself, as it is explained in the *Analytics*, *protasis* has almost the same sense as *propositio*. The term is in fact defined in the first lines of the *Prior Analytics* (1.1, 24a16–17) as a *logos kataphatikos ê apophatikos tinos kata*

tinos [λόγος καταφατινὸς ἢ ἀποφατινός τινος κατά τινος] (a sentence affirming or denying one thing of another). At the same time, all kinds of *protases* (universal, particular, or indefinite, dialectical or demonstrative) are qualified as "syllogistic" (24a28): the *protases* or "premises" are "that on the basis of which there is a syllogism," "that of which it is made" (cf. 1.25, 42a32: every syllogistic conclusion "follows from [*ek*] two premises and not from more than two"). The commentators gloss the etymology of *protasis*, "that which one holds out and proposes first" (cf. Bonitz, RT: *Index aristotelicus*, citing Ammonius, s.v.), from which emerges the *apodosis*, "given," deduced, from them. And the syllogistic premise will be "demonstrative" (*apodeiktikê* [ἀποδεικτική], the object of the *Analytics*) "if it is true" (*ean alêthês êi* [ἐὰν ἀληθὴς ᾖ], 24a30): since in *De interpretatione*, the true and the false are characteristics of the *logos apophantikos* as the affirmative or negative connection between a noun and a verb (17a2–3 and 8–10), we see that the superimposition is carried out without further question.

We will limit ourselves to locating a few sets of problems.

1. The *phasis-apophasis-apophansis* complex by itself leads to certain difficulties in the Aristotelian terminology that interpreters are not always able to monitor.

■ See Box 1.

2. The development of the vocabulary from Plato and Aristotle to the Stoics ended up settling on *axiôma* as the best candidate for a term to be translated as "proposition" in the corpus of the grammarians and logicians. The Aristotelian *axiôma* is a "principle on the basis of which a demonstration is conducted," and thus that others are asked to accept (that is the definition given by Bonitz [RT: *Index aristotelicus*], who refers to *Posterior Analytics* 2.72a17; see PRINCIPLE, I.B), and it can be rendered precisely by modern "axiom." On the other hand, the Stoics' *axiôma* is defined, in a way very similar to the way *logos apophantikos* is defined in *De interpretatione*, as "what is true or false" ("*axiôma de estin ho estin alêthes ê pseudos* [ἀξίωμα δέ ἐστιν ὅ ἐστιν ἀληθὲς ἢ ψεῦδος]," Diogenes Laertius 7.65; cf. RT: Long and Sedley, *The Hellenistic Philosophers* 34A, 1:202 and 2:204). "The 'complete sayable'" ("*lekton autotelês* [λεκτὸν αὐτοτελές]": Sextus Empiricus, *Adversus mathematicos* 8.74 = RT: Long and Sedley 34B, 205; see SIGNIFIER/SIGNIFIED, II) is, as Long and Sedley say, the "basic material of Stoic logic" (ibid.; on the difference between Aristotle's logic and that of the Stoics, see in particular SIGN). The meaning of "judgment," "demand"—indeed, of "requirement" or "claim" (see CLAIM), which is discernible in the verb *axioô*—is emphasized by Diogenes Laertius, but English and French translations elect to use "propose" and "proposition": "Someone who says 'it is light' seems to be proposing that it is light [*axioun dokei to hêmeran einai* (ἀξιοῦν δοκεῖ τὸ ἡμέραν εἶναι)]. Then, if it is light, the proposition put forward [*to prokeimenon axiôma* (τὸ προκειμένον ἀξίωμα)] proves to be true, and if not, it is revealed to be false" (7.75 = RT: Long and Sedley 34E). Latin translators give *effatum* (Seneca, *Letters to Lucilius* 117.13 = RT: Long and Sedley 33E; Cicero, *Academica* 2.96 = RT: Long and Sedley 37H; Cicero also gives *enuntiatum* and *enuntiatio*, see RT: Long and Sedley

33E), but the translation by "'proposition' is much the least misleading," Long and Sedley assert (205). In fact, according to them, once the characteristics that belong to the linguistic act have been eliminated from *axiôma*, "no serious confusion need arise in attributing to the Stoics a doctrine of propositions" (206), a theory that anticipates significant characteristics of contemporary theories, and in particular the paradoxes of reference according to Bertrand Russell (207–8; see below, III; and see SENSE, SPEECH ACT, and IMPLICATION).

B. *Propositio*, or the seizure (*arraisonnement*) of the apophantic by the syllogism

In the "Summas" of thirteenth-century terminist logic, the definition of the *propositio* always contains two formulas: (1) "*propositio est oratio verum vel falsum significans*" (A proposition is a statement signifying the true or the false), and (2) "*propositio est oratio secundum quod ponitur in praemissis ad aliquid probandum*" (A proposition is a statement insofar as it is formulated in premises to prove something). The writers of logical summas thus put under the same term what Boethius called *oratio enuntiativa* or *enuntiatio*, namely Aristotle's *logos apophantikos*, and what Aristotle generally calls *protasis* in the *Prior Analytics*.

1. *Propositio-praemissa*

Let us begin with the second meaning, which is backed in both Latin and Greek by an etymology: "proposition" is used in the sense of "positing in order / with a view to the conclusion to be drawn [*dicitur propositio quasi pro alio positio, idest pro conclusione habenda*]" (cf. Nicholas of Paris, *Summa Metenses*, in De Rijk, ed., *Logica modernorum* 2.1, p. 452). We should note that in some texts, such as the *Posterior Analytics* (1.2, 71b20–22), Aristotle defines scientific demonstration without mentioning *protasis*. This silence is maintained in James of Venice's Latin translation (*Aristoteles Latinus*, 4.1–4, ed. Minio-Paluello and Dod, 7.16–18), which gives: "*Si igitur est scire ut posuimus, necesse est et demonstrativam scientiam ex verisque esse et primis et inmediatis et notorioribus et prioribus et causis conclusionis*" ("*anagkê kai tên apodeiktikên epistêmên ex alêthôn t' einai kai prôtôn kai amesôn kai gnôrimôterôn kai proterôn kai aitiôn tou sumperasmatos* [ἀνάγκη καὶ τὴν ἀποδεικτικὴν ἐπιστήμην ἐξ ἀληθῶν τ' εἶναι καὶ πρώτων καὶ ἀμέσων καὶ γνωριμωτέρων καὶ προτέρων καὶ αἰτίων τοῦ συμπεράσματος]"). However, it is broken in modern translations. Jules Tricot (in *Organon*, 8) renders this as "*Si donc la connaissance scientifique consiste bien en ce que nous avons posé, il est nécessaire aussi que la science démonstrative parte de prémisses qui soient vraies, premières, immédiates, plus connues que la conclusion, antérieures à elle, et dont elles sont les causes.*" Seidl (*Aristoteles: Zweite Analytiken*) gives: "*Wenn nun das wissenschaftliche Verstehen solcher Art ist, wie wir ansetzen, dann erfolgt notwendig die beweisende Wissenschaft aus [Prämissen], die wahre, erste, unmittelbare, bekanntere, frühere und ursächliche sind in Bezug auf die Konklusion.*" Other, more rigorous translators use the term "things," as does Barnes (*Aristotle's Posterior Analytics*, 3): "If, then, understanding is as we posited, it is necessary for demonstrative understanding in particular to depend on things which are true and primitive and immediate and more familiar than and prior to and explanatory of the conclusion." "Premises"? Or "things"? Or,

1

Phasis, apophasis, apophansis, kataphasis: Problems of Aristotelian terminology

➤ LIGHT, Box 1

In his *Organon*, Aristotle establishes the technical vocabulary of classical logic relative to words and terms, sentences and propositions, arguments and syllogisms (see LOGOS, SENSE, TERM, WORD). This contribution, which was decisively precise, nonetheless included a certain number of ambiguities, due especially to the subsistence of nonterminological uses. Two main difficulties concern the intermediate level.

1. *Apophasis/apophansis* and *apophasis/kataphasis*

A first difficulty has to do with the possible confusion of two signifieds of a single signifier that are dangerously close because they belong to the same semantic field: *apophasis* can mean either "declaration" or "negative statement." Whether there was originally a single root (as Chantraine seems to think, RT: *Dictionnaire étymologique de la langue grecque*, s.v. *phainô*) or two roots that are phonetically distinct and semantically convergent (*pha-* [φα-] / *phê-* [φη-], which designates above all the expression of thought, the assertion of an opinion in speech; and *fan*, which means, depending on the diathesis, "to be luminous" or "to make luminous," the latter being specified in certain compounds with the sense of "to manifest through language, to declare"), we seek in it the source of the confusion. Related to *apophanein*, *apophasis* means, in Demosthenes, for example (47.45), the "sentence uttered," and in Aristotle, "assertion," "declaration" (*Rhetoric* 1.8, 1365b27: "*kuria estin ê tou kuriou apophasis*," "Sovereign is the declaration of the sovereign body," which varies depending on the object; and, in the greatest proximity to the *gnômê* or *doxa* [see DOXA], *Metaphysics* Δ.8, 1073a16: "*memnêsthai dei tas tôn allôn apophaseis*," "We must recall the declarations made by others"). Related to *apophaskô* (Sophocles, *Oedipus Rex* 485) and *apophêmi* (Sophocles, *Oedipus at Colonus* 317), *apophasis* takes on the sense of "negative statement," in contradistinction to *kataphasis*, the "affirmative statement" with which it is already associated in Plato's *Sophist* (263e). The two meanings do coexist in Aristotle, but the danger is less serious than it seems. Aristotle, in accord with his linguistic policy of "de-homonymization" (see HOMONYM), largely wards off the danger by establishing *apophansis* (with its derivative, *apophantikos*) as the stable technical designation of "assertion" in the sense of "predicative statement" in general, and by reserving *apophasis* for negation or the negative statement, as

opposed to *kataphasis*, "affirmation, affirmative statement," both constituting an *antiphasis* or "contradiction." Thus in chapter 6 (17a23–26) of the *Peri hermêneias*, we find the following:

> Esti d'hê men haplê *apophansis* phônê sêmantikê peri tou ei huparchei ti ê mê huparchei, hôs hoi chronoi diêirêntai. *Kataphasis* de estin *apophansis* tinos kata tinos, *apophasis* de estin *apophansis* tinos apo tinos.

To be perfectly clear, this statement is nonetheless difficult to translate, as is shown by Tricot's version, whose internal incoherences are easy to emphasize:

> La *proposition* [*apophansis*] simple est une émission de voix possédant une signification concernant la présence ou l'absence d'un attribut dans un sujet, suivant les divisions du temps. Une *affirmation* [*apophasis*] est la *déclaration* [*apophansis*] qu'une chose se rapporte à une autre chose; une *négation* [*kataphasis*] est la *déclaration* [*apophansis*] qu'une chose est séparée d'une autre chose.

The simple *proposition* [*apophansis*] is a vocal utterance possessing a meaning related to the presence or absence of an attribute in a subject, according to divisions in time. An *affirmation* [*apophasis*] is the *declaration* [*apophansis*] that one thing is related to another thing; a *negation* [*kataphasis*] is the *declaration* [*apophansis*] that one thing is separated from another thing.

No doubt it would be more judicious to always render *apophansis* by *énoncé* (statement: *Categories and On Interpretation*, trans. Ackrill, 46–47), but translators always abandon the attempt to make the reader hear the connection, explicit in Aristotle and heavily emphasized by Heidegger, between *apophansis* and *apophainesthai*, "to show on the basis of" ("*epei de esti kai to huparchon apophainesthai hôs mê huparchon*," "But since it is also possible to make appear not to belong what belongs"). The text of *Peri hermêneias* (17a26–28) seeks, following these remarks, to make explicit the definition of the true and the false characteristic of the apophantic register (see below, and TRUTH).

2. The meanings of *phasis*

The astronomical sense of *phasis* (cf. *phainesthai*) appears once in Aristotle's *Meteorology* (1.6, 324b34). In all other occurrences—more

than fifty, chiefly in the *Organon* and the *Metaphysics*—*phasis* (cf. *phanai*) has the following meanings, in decreasing order of frequency:

a. It is used as a synonym of *kataphasis* opposed to *apophasis*; thus in *Metaphysics* Γ.4, 1008a9–10: "*peri tas allas phaseis kai apophaseis homoiotropôs*" (And all other assertions and negations are similarly compatible). (This text then proceeds with the presentation, three times in a row, of the verbal pair *phêsai kai apophêsai*, "affirm and deny"; see also *Prior Analytics* 37a12, 51b20, 33, etc.; *Sophistical Refutations* 180a26, b30; *De anima* 430b26; *Topics* 136a5–6 [with the very unusual play on *phasis* and *tês phaseôs idion*], 163a15, etc.).

b. It is used as a generic synonym of *apophansis*, except that it has more to do with propositional than apophantic logic, as in the recurrent expression "*hai antikeimenai phaseis*"—for example, *Metaphysics* Γ.6, 1011b13–14: "*bebeiotatê doxa pasôn to mê alêteis hama tas antikeimenai phaseis*" (The firmest opinion of all is that the opposed statements are not simultaneously true). In the same vein, see *Peri hermêneias* 12.21b17–18.

c. Finally, *phasis* is used twice in the *Peri hermêneias* to designate the semiotic status of a "separate part of the *logos*," a noun or verb "isolated" (*kechôrismenon*) from its phrastic context. "A sentence is a significant portion of speech, some parts of which have an independent meaning, that is to say, as an utterance [*hôs phasis*; Ackrill renders this as 'expression'], though not as the expression of any positive judgment [*all' ouch' hôs kataphasis*]. Let me explain. The word 'human' has meaning, but does not constitute a proposition, either positive or negative. It is only when other words are added that the whole will form an affirmation or denial" (4.16b27–30). Aristotle thus proposes to call the noun and the verb "an expression [*phasis*] only" ("*to men oun onoma kai to rhêma phasis estô monon*," 5.17a17–18). Instead of following Bonitz in seeing this as the *princeps* use, to which Aristotle does not limit himself (RT: *Index aristotelicus*, s.v. *phasis*), the simplest thing to do is probably just to say that when he characterizes the type of signification of a phrastic constituent that, detached from a construct that may be either a *kataphasis* or an *apo-phasis*, loses thereby all assertive capacity, Aristotle falls back,

in order to designate what remains of meaning, on what remains of *kataphasis-apophasis* when the verbal prefixes that make them a species of assertive statement have been removed, namely, *phasis*. For example, to signify *hôs phasis* when we say "[the] man" or "is in good health" is thus to present the listener with a signifier bearing a lexical signified that he recognizes, but that provides him with no information regarding what is or is not. We might render *phasis* here by "mention," but we would at the same time be abandoning the relationship to the family of terms.

perhaps, "principles"? The word is used by translators immediately following the passage above (71b22–23): "*sic enim erunt et principia propria ei quod demonstratur*" (James of Venice); "*c'est à ces conditions, en effet, que les principes de ce qui est démontré seront aussi appropriés à la conclusion*" (Tricot); "for in this way the principles will also be appropriate to what is being proved" (Barnes). The choice between "premises," "things," and "principles" hardly matters. Here it suffices to see that the French and German resort to "premise," *Prämisse*, rather than "proposition" or *Satz*. Then it is "premise," a calque of the Scholastic Latin *praemissa* (a neuter plural considered as a feminine singular, from *praemitto*, "to send on ahead"), that relieves *propositio* of its ambiguity.

2. *Propositio—oratio enuntiativa*

The first meaning finds its starting point in a quite different corpus, that of the *Peri hermêneias* (4.16b33–17a4):

> Esti de logos hapas men sêmantikos . . . apophantikos de ou pas, all' en hôi to alêtheuein ê pseudesthai huparchein. Ouk en hapasi de huparchei, hoion hê euchê logos men, all' out' alêthês oute pseudês. [Ἔστι δὲ λόγος ἅπας μὲν σημαντικός . . . ἀποφαντικὸς δέ οὔ πᾶς, ἀλλ' ἐν ᾧ τὸ ἀληθεύειν ἢ ψεύδεσθαι ὑπάρχειν. Οὐκ ἐν ἅπασι δὲ ὑπάρχει, οἷον ἡ εὐχὴ λόγος μέν, ἀλλ' οὔτ' ἀληθὴς οὔτε ψευδής.]

When one reads this passage in Tricot's French translation, it provides a definition of the proposition that every reader will consider to be of cardinal significance:

> Tout discours n'est pas une proposition, mais seulement le discours dans lequel réside le vrai ou le faux, ce qui n'arrive pas dans tous les cas: ainsi la prière est un discours, mais elle n'est ni vraie ni fausse.

> Not every discourse is a proposition—only that in which truth or falsehood dwell, and this is not universally the case. Prayer, for instance, is a form of discourse, but it is neither true nor false.

When Boethius translates it, he gives *oratio enuntiativa*: "*enuntiativa vero non omnis [oratio], sed in qua verum vel falsum inest; non autem in omnibus, ut deprecatio oratio quidem est, sed neque vera neque falsa*" (*Aristoteles latinus*, 2.1–2, ed. Minio-Paluello, 8.8–10). The lexicon of propositionality thus includes not only what has to do with the elements of the syllogism, with the syllogistic *protasis*, but also what has to do with the possibility of saying the true and the false. Depending on the author, this double register refers to a simple "distinction of reason": the same *oratio* is called *enuntiatio* when it is considered "alone and absolutely" ("*quando per se sumitur et absolute*"), and *propositio* when it is related to the conclusion to be proved or inferred

("*quando ordinatur ad aliquam conclusionem probandam vel inferendam*": William of Sherwood, *Introductiones*, ed. Lohr, 222). For some writers, it is the whole system that is based on such a distinction of reason. As Lambert of Auxerre put it (*Logica*, ed. Alessio, 12):

> Ista nomina: enunciatio, dictio, [as]sumptio, quaestio, conclusio, propositio, idem sunt realiter, nam una et eadem oratio secundum rem et secundum substantiam potest nominari hiis nominibus realiter, unde solum differunt secundum rationem.

> These names—"utterance," "word," "[hypo]thesis," "question," "conclusion," "proposition"—are the same thing, really, for it is one and the same thing, regarding substance, namely discourse [or: the utterance], which can really receive all these names. All that differs only in reason.

The *logos apophantikos* is approached in various ways by modern translations. Participating in the "reduction of the apophantic to the predicative" emphasized by Heidegger (*Sein und Zeit*, §44; see TERM), Tricot translates, as we have seen, by duplicating the substantive: "*Tout discours n'est pas une proposition, mais seulement le discours dans lequel réside le vrai ou le faux.*" Rolfes, who starts from *Rede* (discourse), proposes, elliptically, a verbal formation, *aussagen* (state), corresponding to the noun *Aussage* (statement, French *énonciation*, Italian *enunciazione*):

> Dagegen sagt nicht jede [Rede] etwas aus, sondern nur die, in der es Wahrheit oder Irrtum gibt. Das ist aber nicht überall der Fall. So ist die Bitte zwar eine Rede, aber weder wahr noch falsch.

> On the other hand, not every [discourse] states something, but only the one that includes in itself truth or falsity. But this is not always the case. A request [a prayer] is a discourse, but is neither true nor false.

(Aristoteles, *Kategorien: Lehre vom Satz*, German trans. Rolfes, 97–98)

Similarly Zanatta: "*Ma non ogni [discorso] è enunciativo, bensì quello nel quale sussiste il dire il vero o il dire il falso. E non in tutti quanti i discorsi sussiste: per esempio, la preghiera è sì un discorso, ma non è né vera né falsa*" (*Della interpretazione*, 85). Ackrill, on the other hand, opposes "sentence" and "statement-making sentence": "Every sentence is significant . . ., but not every sentence is a statement-making sentence, but only those in which there is truth or falsity. There is not truth or falsity in all sentences: a prayer is a sentence but is neither true or false. [The present investigation deals with the statement-making sentence]" (*Aristotle's Categories and De interpretatione*, trans. Ackrill, 45–46).

In choosing to use two nouns (*discours, proposition*), Tricot thus removes from the *logos apophantikos* the apophantic dimension preserved (only in appearance, if we follow Heidegger) as *enonciation* by other translations (note that he even directly translates *apophansis* by *proposition* in the first lines of *De interpretatione* [16a22]; Ackrill renders it by "statement").

Logos	Apophansis	Logos apophantikos
Oratio	*Enuntiatio*	*Oratio enuntiativa*
Discours	*Énonciation*	*Proposition*
Sentence	Statement	Statement-making sentence
Rede	*Aussage*	*Satz, indikative Rede*
Discorso	*Enunciazione*	*Discorso enunciativo*

Up to a certain point, contemporary controversies over the truth-value bearer are programmed in the wake of equivalencies noted in the table here. The polysemy of the term *logos*, which includes the notions of "sentence" and "statement"—crucial in the modern debate—among its many meanings, is not the only thing involved; more profoundly, the logical *arraisonnement* of the *logos*, which claims that the *enuntiatio*, or *oratio* (= *logos*) qua "bearer of truth-values," is fundamentally "ordered to the syllogism [*ordinata ad sillogizandum*]" and not only "apt to be ordered in a syllogistic argument [*ordinata in sillogizando*]"—a theme that flows from the "ordering" of Aristotle's logical corpus, and results from the recursive reading of the *Organon*, from the "scientific" syllogism (*Posterior Analytics*), the more complex, to the simplest, the *oratio* and its ingredients, the noun and the verb (*De interpretatione*).

The difficulties of the European logical vocabulary also depend, however, on the idiolects specific to each philosophical tradition ("continental" or "analytical"), and even to each philosophy. The recent English translation of an important sixteenth-century work, the *De significato propositionis* by the Oxford philosopher Richard Brinkley, under the title *Theory of Sentential Reference*, expresses the philosophical point of view of the translator, M. J. Fitzgerald, who reserves, for theoretical reasons, the English term "proposition" for what is "expressed" in a sentence. In this case, it is the whole theoretical apparatus stipulating that "two sentences that express the same proposition have the same truth-value," or that "sentences have their truth-values in virtue of the proposition they express," which is present in the background, that poses a problem—a philosophical problem, not a problem of comprehension or translation. In the case of *De significato propositionis*, the translator's choice, once it is made fully explicit, amounts to reserving the word "proposition" for the signified of what the Latin expresses by *propositio*, and what he expresses by "sentence." The same goes for principles such as "nonsynonymous sentences express distinct propositions": the problem is how to know to what the word "proposition" refers—for example, an abstract entity, Frege's "sense" (*Sinn*)—and to determine on that basis the nature of the difference between "sentence" and "proposition" that is supposed by every user

of this principle. Using such principles in a philosophical commentary on a medieval work, as many English-speaking interpreters of Brinkley and his contemporaries do, involves attributing to the ancients distinctions that are themselves far from being unanimously accepted in modern philosophy.

II. How Should Linguistic Units of Reference Be Defined?

A. The "sentence" in Latin antiquity

Propositio is not the only way of designating in Latin a complex unit endowed with meaning. In classical Latin the term belongs, in accord with the influence of the syllogism, to the rhetorical and dialectical registers rather than to the grammatical register. In nontechnical works, there are numerous terms that can be applied to a linguistic unit of the phrastic type: in particular, *sententia*, which derives from *sentire*, "to feel, to experience a sensation or feeling," designates in general an opinion, a way of seeing, a view that one expresses, an idea and, by extension, the form that this idea takes, which means that *sententia* can correspond contextually to what is called a sentence (but often signifies, more particularly, a maxim or aphorism, and thus the "twist" or witticism that concludes the sentence; see SENSE and ARGUTEZZA). As for *oratio*, which derives from *orare*, "to utter a ritual formula, a prayer, a plea," it is applied to language, and more specifically to prepared language, to eloquence, style, and particularly to prose, but also to more limited achievements—discourses, oral expositions—and hence, but very rarely in these nontechnical works, to still more limited wholes that may coincide with units of the phrastic type. These are only coincidental effects.

Alongside these general uses, technical texts in which language is analyzed present linguistic units whose classification depends on precise theoretical choices. Three domains are concerned: rhetoric, dialectic, and grammar. (Metrics, which we may consider in the Latin domain as a subset of grammar, has to do with preoccupations that are too particular to be taken into account here.)

1. The rhetorical "period"

The standard linguistic unit is the "period," *periodos* [περίοδος] in Greek, literally a "path that goes around" (perimeter wall, revolution of the stars, etc.), which Aristotle defines in his *Rhetoric* as a "sentence [*lexis* (λέξις); see SIGNIFIER/SIGNIFIED and WORD] that has a beginning and an end by itself and an extent that can be taken in at a single glance [*megethos eusunopton* (μέγεθος εὐσύνοπτον)]" (3.9, 1409a36–38). The Latins rendered it by the loan word *periodus* or by the calques *ambitus* and *circuitus*, or again by various adaptations, such as *circumscriptio*, *comprehensio*, and *continuatio*, which mark the unit and the whole thus "circumscribed" or "embraced," or the continuity of the whole formed. This period may be constituted by subsets: the member (*membrum*) and the phrase (*incisum* or *incisio*), which have no absolute definition, but only a definition relative to the whole of which they are the constituents. In general, a period forms a sentence (but not necessarily: a succession of questions and responses can form a period). However that may be, the criteria determining the period clearly distinguish it from the sentence:

> first, because of the context in which it appears, that of the oratorical discourse: the period has no application outside this context and is absolutely inseparable from it;

second, because of its dimension, which is necessarily developed—the simple combination of the elements that are indispensable but sufficient to constitute a sentence would never suffice to form a period ("A period has a minimum of two parts [*habet periodus membra minimum duo*]," Quintilian says);

finally, because of the reference to rhythm, both in the consideration of the relative volume of the various parts of the period (whence an ascending, descending, or staccato rhythm, etc.), and in the fundamental importance attributed to the combination of the syllabic quantities at the end of the period, that is, the clausula: the presence of a clausula is part of the definition of the period.

Another unit, the *propositio*, appears in the context of rhetoric, but in uses that are shared with dialectic, and that we therefore have an interest in examining here in the framework of this other discipline.

2. Dialectical terminology

The standard linguistic unit in the domain of dialectical terminology is what the Greeks, and in particular the Stoic tradition (cf. I.A above), call *axiôma*, the assertion, a linguistic unit that can be true or false. The Romans resorted to various translations to render this unit: Varro, in the first century BCE, cites *profatum*, a proposal that was not adopted, and *proloquium* (which had already been used a generation earlier by Aelius Stilon, and was known to Cicero, but which did not persist either). For his part, Cicero cites *pronuntiatum* (later abandoned), *enuntiatum* (which we find in Seneca in the first century CE and in Apuleius in the second century CE), and *enuntiatio* (still present in the fourth and sixth centuries in Donatus and Boethius). Varro (cf. Aulus Gellus, *Attic Nights* 16.8) defines the *proloquium* as "an assertion or a sentence in which there is nothing lacking [*sententia in qua nihil desideratur*]," but this criterion of completeness is isolated: the criterion of determination cited is generally the ability to be true or false (even if the point is debated regarding assertions in the future tense). In opposition to this sense of *axiôma* as the true-or-false assertion, Martianus Capella (fourth century), in his book on dialectic, creates the term *eloquium*, as opposed to *proloquium*, to designate utterances that are neither true nor false (orders, questions, etc.). These other types of utterance are usually related to the term *oratio* (*oratio imperativa, interrogativa*, etc.), whose generality lends itself to all kinds of specification.

The term *propositio* represents what is "posed," what is "advanced," the "thesis." In the syllogism, where three structural elements (major, minor, conclusion) are distinguished, the *propositio* is thus the major (strictly speaking, what is "posed" or "posited"). The criterion is unity of content: the *propositio* is a proposition in the sense in which it is a statement that sets forth a single idea ("*x* killed *y*"). As a result, when a single statement implies that "*x* killed *y* and wounded *z*," Quintilian speaks, in the plural, of *propositiones*. This plural shows that the *propositio* cannot be confused with the sentence.

3. Grammatical analysis

Grammatical analysis is constructed on the basis of a hierarchy of units: *littera, syllaba, dictio* or *pars orationis, oratio* (or its rare variant, *elocutio*). Each level results from the combination of units from a lower level and itself constitutes an element of the unit at a higher level. In this perspective, the categories of words are *partes orationis* ("parties du discours," to use the French calque). This means only that words are an inferior unit in relation to *oratio*, which results, in most cases, from a combination of words. The *oratio* has as its sole specificity in relation to the word its ability to be "complete": in accord with the Stoic problematic, the *oratio* is complete or incomplete. That being the case, the nature of this completion, syntactical or semantic, or even pragmatic, remains open, and is not analyzed, except to a certain extent by Priscian at the very end of classical antiquity. The *oratio plena* is thus a construct that incontestably coincides with the sentence (or, when only a reply is involved, with a phrasoid expression), but before Priscian, nothing is said about the nature of this construct, except that it is complete. In short, whereas the sentence is opposed to the proposition, one forming an independent construct, the other a virtually dependent construct, the completion of the *oratio* is opposed to its "incompletion." What is incomplete utterance? Originally, among the Stoics, it was a predicate when it is alone, without a point of application (that is, without a subject), but later on it was more generally any utterance in which something is lacking. Some grammarians even added intermediate levels. Thus Servius speaks, regarding an utterance including a pronoun (subject) and a verb, of a "semi-complete" utterance: it lacks something, which in this case is of the order of reference (a determinate referent for the pronoun and an object of the predicate verb). In fact, according to the progressive schema in which it is situated, the *oratio* is understood in a problematic of part and whole: there are "parts of the *oratio*" (categories of words), and the *oratio* itself, composed of these parts, is incomplete or complete. Whereas the sentence is understood in a problematic of independence with regard to dependence, the *oratio* is understood in a problematic of the achieved in relation to the unachieved. (Medieval posterity sought to specify the nature and modalities of this completeness.)

More vague than *oratio*, among the grammarians (e.g., Diomedes or Charisius) *sermo* sometimes designates a linguistic sequence that can constitute what we call a sentence, but these are either general uses, with the meaning "remark," or very specialized uses, probably in the Stoic perspective of the predicate as a propositional kernel, with *sermo* ending up being equivalent to the verb alone. Here we find again the difference in point of view that opposes the ancients to the moderns on this point: whereas the notion of the sentence advanced in early modern grammar sought to discover where the construct examined stops (and thus what the framework and conditions of its independence are), the ancients sought to discover where this construct began (from which comes the problematics of incompletion, that is, of the "not yet" in relation to the complete utterance).

B. The medieval criteria for defining *oratio*: *Congruitas/perfectio*

The definition of the sentence, *oratio* (but "sentence" is, as we have seen, only one of the possible equivalents of *oratio*; see also LOGOS, III.A), took place in the Middle Ages on the basis of various criteria inherited from both Aristotle and Priscian, but profoundly rethought to take into account the

formal, semantic, and pragmatic aspects of the utterance, which are not always mutually compatible.

1. The principle of composition

Consider Aristotle's and Boethius's definition (*De interpretatione* 4.16b26): "*Logos esti phônê sêmantikê hês tôn merôn ti sêmantikon esti kechôrismenon, hôs phasis all' ouch hôs kataphasis* [Λόγος ἐστὶ φωνὴ σημαντικὴ ἧς τῶν μερῶν τι σημαντικόν ἐστι κεχωρισμένον, ὡς φάσις ἀλλ' οὐχ ὡς κατάφασις]"; "*Oratio est vox significativa, cuius partium aliquid significativum est separatum (ut dictio, non ut adfirmatio)*"; "A sentence is a significant spoken sound some part of which is significant in separation, as an expression not as an affirmation" (Ackrill); "*Le discours est un son vocal [possédant une signification conventionnelle] et dont chaque partie prise séparément présente une signification comme énonciation et non pas comme affirmation [ou négation]*" (Tricot). The distortion of the equivalences shows quite clearly the general weakness of the linguistic vocabulary. The essential criterion is composition. Various problems arise: (1) How can we distinguish the sentence from the compound noun (for instance, the noun *republica*)? Usually we distinguish, in the first place, the simple noun (*domus*), which is composed of parts that can themselves be significant (*do* = I give; *mus* = mouse), but whose meaning does not contribute to that of the whole; in the second place, the compound noun, composed of parts that contribute to the meaning of the whole, but lose their meaning in the whole, so that the meaning is simple—Boethius says that in the compound, the parts "consignify"; and in the third place, the *oratio*, composed of parts that retain, in the compound, their full meaning. (2) This definition is often associated with a principle of compositionality, which posits that the meaning of the whole must be constructed on the basis of that of its parts. This raises a problem in the case of utterances that are figurative or include metaphorical uses. In such cases—as, for example, in the expression *prata rident* (The prairies are flowering)—it is inversely on the basis of the meaning of the whole that we can understand that *ridere* does not have its ordinary meaning of "laugh," but rather the transferred meaning of *florere*. Some authors maintain that in cases of this sort, we must understand the meaning in an overall way, without bringing in the principle of compositionality. They go so far as to conclude that figurative utterances are "instituted," whereas institution was generally reserved for simple units alone (a position held notably by Abelard).

2. The criterion of semantic completeness (producing an intellection)

The criterion of semantic completeness was forged on the basis of the *Peri hermêneias* (*On Interpretation*) 3.16b19–22: "*auta men oun kath' hauta legomena ta rhêmata onomata esti kai sêmainei ti, histêsi gar ho leêgôn tên dianoian, kai ho akousas êremêsen, all' ei estin ê mê oupô sêmainei* [αὐτὰ μὲν οὖν καθ' αὑτὰ λεγόμενα τὰ ῥήματα ὀνόματά ἐστι καὶ σημαίνει τι, ἵστησι γὰρ ὁ λέγων τὴν διάνοιαν, καὶ ὁ ἀκούσας ἠρέμησεν, ἀλλ' εἰ ἔστιν ἢ μὴ οὔπω σημαίνει]"; "*ipsa quidem secundum se dicta uerba nomina sunt et significant aliquid—constituit enim qui dicit intellectum, et qui audit quiescit—sed si est vel non est nondum significat*"; "*En eux-mêmes et par eux-mêmes ce qu'on appelle les verbes sont donc en réalité des noms, et ils possèdent une signification déterminée (car en les prononçant on fixe la pensée de l'auditeur, lequel aussitôt la tient en repos), mais ils ne signifient pas encore qu'une chose est ou n'est pas*" (Tricot); "When uttered just by itself a verb is a name and signifies something—the speaker arrests his thought and the listener pauses—but it does not yet signify whether it is or not" (see TERM, Box 1).

Boethius and medieval thinkers draw from this the idea that it is the "constitution of an intellection" that is the criterion of the utterance—or of the complete utterance. This may be interpreted as a semantic completeness: if the utterance produces an intellection, then it is "completed" (*perfectus*: we will see later the consequences of this interpretation, which makes it possible to transgress the criterion of formal completeness). In addition, a principle of compositionality is constructed at the same time: as Boethius says, if one hears a noun, the moment it is spoken an intellection is constituted, but our mind is still in suspense; if then we hear the verb, at the moment when the last syllable is pronounced, then our intellect can rest easy. The principle of the constitution of meaning is parallel on the level of the sentence and on the level of the word: it is only when the final syllable of *imperritus* (who is without fear) is pronounced that the mind can rest, so far as simple intellection is concerned. The listener's mind progresses in a linear way as the syllables are pronounced (cf. Boethius, *In Peri hermêneias* 2). Some twelfth-century authors try to determine the precise moment when the meaning of the utterance is produced, with the paradox that if it is when all the parts have been pronounced, then it signifies when it no longer exists. Others maintain that the utterance signifies while it is being uttered, the meaning being realized at the last moment of the pronunciation ("*in ultimo puncto illius prolationis*"), which is the first instant in which it produces a complete intellection. We find a comparable position in the discussions of the theologians as to the moment when the meaning of the utterance of the Eucharistic conversion is produced, and therefore when the conversion itself is produced (see SPEECH ACT). Once pronounced, the parts no longer exist qua vocal form, but only in their genus, which is quantity. Abelard proposes a solution rather analogous to the one that we find later in Duns Scotus: we constitute the intellection of the utterance by remembering that of its parts. To say that a sentence signifies thus means simply that the mind of someone forms an intellection of it by a process of assembling the partial intellections (*recollectio*; see de Libera and Rosier, "Les enjeux logico-linguistiques").

■ See Box 2.

Medieval texts hesitate to give priority to one or the other of these two criteria, formal completeness or semantic completeness. A formalist approach like that of the thirteenth-century Modists privileges the former: formal completeness entails semantic completeness, or in other terms, grammaticality automatically implies semanticity. *Congruitas* indicates a construction's degree of correctness, *perfectio* an utterance's degree of completeness (requiring the presence of a *suppositio* and an *appositio*); the Modists excluded *proprietas*, or semantic compatibility: the compatibility (*convenientia*) or noncompatibility (*repugnantia*) of the signifieds does not have to be taken into account by grammar. By expelling from their domain non-sense, illustrated by examples such as "capa categorica" ("a categorical—or

2

The definition of *oratio* according to Priscian

Priscian gives the following definition of the statement: "*Oratio est ordinatio dictionum congrua, sententiam perfectam demonstrans*" (The statement is a correct combination of words indicating a complete meaning: *Institutiones grammaticae*, in RT: Keil, *Grammatici latini*, 2:53.28–29). Thus labeled, this definition describes *oratio* first of all as a correct combination, which for Priscian implies that it includes a noun and a verb and that, in addition, the rules of agreement are respected. The semantic characteristic comes in only secondarily: the statement must indicate a complete meaning. The difficulty was to arise from the juxtaposition of the two criteria, formal and semantic. But according to another reading of the text, the definition goes this way: "*ordinatio, congruam perfectamque sententiam demonstrans.*" The combination that characterizes the statement is not qualified, whereas the meaning it conveys is: it must be complete and finished. This is a less frequent variant, but one that is nonetheless based on the Greek text of the scholia on the *Technê grammatikê*, and that may go back to Apollonius (*Grammatici graeci*, ed. Hilgard, vol. 1, fasc. 3, p. 214.5). The question is whether the adjective *congrua* is related to the combination of words (a reading supported by other passages in Priscian; RT: Keil, *Grammatici latini*, 3:201.1 or 208.25: "*est enim oratio comprehensio dictionum aptissime ordinatarum*" [The statement is in fact a group of words ordered in a completely suitable way]), or to the meaning. In the latter case, it is the criterion of formal semantic completeness that is primary. According to Priscian, this implies that we must find on the formal level principles that account for this completeness, even if they are not ordinary rules, as in the case of figurative or elliptical statements. Thus even a simple word like *honestas* can be considered complete and thus acceptable as a reply to the question "*Quid est summum bonum in vita?*" (What is the supreme good in life?). Hence it is intelligibility that governs grammaticality (Baratin, *La naissance de la syntaxe à Rome*). The copyists' hesitations regarding the choice of the variant *congrua* or *congruam* testify here to the difficulty of choosing between the formal criterion and the semantic criterion in defining the *oratio*.

affirmative—hat," an incongruous association of a metalinguistic adjective with a nonmetalinguistic substantive), the Modists thus tried, as Noam Chomsky did, famously, by means of the exemplary phrase "colorless green ideas sleep furiously," to found a syntax that dispenses with any reference to the lexical meaning of the units. Other attempts to articulate formal and semantic criteria resulted in accounts that favor the pragmatic dimension of language—as in the works of the intentionalist grammarians of the thirteenth century, who were inspired by both Priscian ("Every construction must be related to the intellection of the expression," *Institutiones grammaticae* 17.187) and Aristotle (the principle of the "constitution of intellection" that satisfies the listener): an utterance must be judged acceptable if it corresponds to the speaker's deep intention, and if it can be interpreted and recognized as such by the listener, whether it is grammatical or not. Thus a substantive such as *aqua*, uttered alone, is not an *oratio perfecta*; but if water has to be sought when a house is on fire (a particular intonation would be required), then it acquires the status of *oratio perfecta*, corresponding adequately, by its elliptical form, to the speaker's state of panic. Inversely, a grammatically correct utterance that does not correspond to the speaker's intention will accordingly be rejected (see *actus exercitus* in SPEECH ACT).

C. Correctness / completeness / truth

The connection of these different criteria with the notion of truth is carried out mainly in the context of logic. In the philosophical tradition that concerns us, cases of ill-formed utterances give rise to the problem of how to determine whether such utterances (*orationes*) thereby lose the status of a proposition (*propositio*), that is, if an ill-formed sequence is automatically deprived of truth-value: such malformations include grammatical incorrectness (such as "*homo est alba*" ["man is white" or "a white woman," where a masculine noun is connected with a feminine adjective]), semantic redundancy, and the semantic incompatibility of the constituents composing the subject or predicate groups, the impossibility of assigning a reference (e.g., "*omnis Socrates,*" which violates the rule according to which a distributive sign can be applied only to a common term whose extension is greater than two; or, again, "*omnis phoenix*" [all phoenix]—the phoenix existing, by definition, as a unique entity at a certain moment in time, like "*omnis sol*" [all sun]); or cases of empty reference, such as "*Asinus rationalis currit*" (A rational ass runs; cf. Ebbesen, "The Present King of France"; de Libera, *La référence vide*). This last case can be analyzed in various ways: a proposition such as "*Asinus est rationalis*" (The ass is rational) is generally considered false; but "*Asinus rationalis currit*" may be analyzed as incorrect (*incongrua*); or as correct but asemantic or *impropria* (incapable of producing an intellection); or as nonreferential (*rationalis* not being able to perform its function of determining the substantive, and thus preventing the group from "supposing" something); or, sometimes, as false. The "implication of a possible falsehood" ("*Homo qui est albus currit* [The man who is white runs]," if there is no white man: the fact that there are white men, implied here, is possible, even if that is not the case) is distinguished from the "implication of an impossible falsehood" ("*Asinus qui est rationalis*" [The ass that is rational]," the distinction having consequences that are analyzed in diverse ways, in terms of correctness or of truth; see IMPLICATION). The question of empty reference was the subject of lively debate in the thirteenth century: Can one say, "Homo est animal, nullo homine existente" (Man is an animal, no man existing)? Is this sentence false or ill-formed, because it cannot give rise to an intellection, the subject itself not being able to give rise to an intellection and/or to have a denotation (cf. de Libera, "Roger Bacon et la référence vide," and *La référence vide*)? This case, where it is impossible to assign a reference to one of the terms because of the state of the world and of

the moment of predication, is often compared with the cases previously described in which "empty reference" occurs because of the incompatibility of a proposition's constituents (as in *asinus rationalis*). The notion of *congruitas/incongruitas* is always clearly distinguished from that of *veritas/falsitas*: if we consider that a proposition cannot be true unless it is well formed, it is obvious that there are well-formed propositions that are not true, and that one cannot say of all ill-formed propositions that they are false (since some of them cannot have truth-value).

■ See Box 3.

Medieval thinkers' reflections on the construction, correctness, completeness, and proper formation of utterances (*orationes*) thus brings into play the great possible options in the analysis of language, since we can take an interest in the utterance itself (with its formal or semantic properties), or in its production (taking into account the speaker's intention), or in its interpretation (considerations on the freedom of the interpreter), the problem then always being to determine whether an ill-formed or uninterpretable utterance is still an utterance, and if only well-formed utterances can be true or false.

III. From "Proposition" to "Utterance": The Competition of Idiolects

Friedrich Ludwig Gottlob Frege played a key role in the constitution of what might be called the modern system of the proposition. At the beginning of his monograph *La norme du vrai* (The norm of truth) on the philosophy of logic, Pascal Engel describes this system as follows: (1) The proposition is what can be true or false, and has a truth-value: truth-bearer. (2) The proposition is the meaning of a sentence, and is clearly distinguished from the latter. A sentence is a series of signs, a proposition is what a sentence expresses. (3) The proposition is the content of what is said or conveyed by a certain speech act, what the sentence "does." (4) The proposition is the content of a certain psychological state.

How can so many different senses of the word "proposition" coexist?

A. Frege and his translations—*Satz/Gedanke*: *Proposition/pensée* (French) or "sentence"/"proposition" (English)?

In his articles "Über Sinn und Bedeutung" (Sense and reference) and "Der Gedanke" (Thought), Frege, after defining the sense and reference of proper names, inquires into "the sense and reference of a whole declarative sentence [*Behauptungssatz*]." Such a sentence, he tells us, "has a thought as its content":

> Wir fragen nun nach Sinn und Bedeutung eines ganzen Behauptungssatzes. Ein solcher Satz enthält einen Gedanken.

("Über Sinn und Bedeutung," 32)

Here Frege clearly distinguishes the *Satz*, the "sentence," from the content or thought (*Gedanke*) expressed by this *Satz* (see SENSE, BELIEF). The content or *Gedanke* turns out, later in the text, to be the sense (*Sinn*) of the sentence. Frege emphasizes the objectivity of thought and thus of sense, which can, he says in a famous note, be common properties of several subjects and are thus clearly distinct from the psychological content, like Bernard Bolzano's "proposition in itself" (*Satz an sich*: *Wissenschaftslehre*, 1.19).

> Ich verstehe unter Gedanken nicht das subjektive Tun des Denkens, sondern dessen objektiven Inhalt, der fähig ist, gemeinsames Eigentum von vielen zu sein.

> By a thought I understand not the subjective performance of thinking but its objective content, which is capable of being the common property of several thinkers.

("Thought," in *The Frege Reader*, 156n)

3

Congruitas

➤ TRUTH

The word *congruitas* can be rendered rather well by "correctness," "congruence," "proper formation," and *congruus* by "correct, congruent"; we also find Latin (*in*) *competens*. In grammar, *incongruitas* refers essentially to the rules of proper formation, which imply formal marks (agreement) or syntactical characteristics (modes of signifying); in logic, it refers exclusively, or in addition to these first rules of proper formation, to the rules of proper formation that make use of the semantic traits of the constituents. The terms "proper formation" and "well/ill formed" render the two meanings fairly well. Let us note that *constructio congrua* can mean either the correct process of construction, or the result of the process (and, in that case,

constructio can be equivalent to *oratio*). Writers discuss the conformity (*conformitas*) or the nonconformity (*discrepantia*) of accidents and modes of signification; of the compatibility (*convenientia*) or incompatibility (*repugnantia*) of semantic traits; *proprietas* is given a privileged place on the semantic level: an expression is said to be *impropria* if, for example, it includes a term taken in a figurative or inadequate sense (it is not taken in the literal or "proper" sense). *Nugatio* (a term that may have no modern equivalent) refers to improper formation on the semantic level; in its strict sense, it covers pointless semantic redundancies (e.g., *homo animal* [man animal], *homo rationalis* [man endowed with reason], *corvus niger* [black

crow], *homo v*the incompatibilities of the semantic traits of the constituents (e.g., *spero dolorem* [I hope pain], *homo irrationalis* [man without reason]). The term *perfectus* is difficult to translate; the notion of *perfectio*, defined in the twelfth century on the basis of Aristotle's *Metaphysics* Δ.16, 1021b21–25, in Averroës's reading, is well summed up in the adage "*perfectum est cui nihil deest quod ei sit necessarium*" (The perfect is that in which nothing of what is necessary to it is lacking); it covers both completeness and "perfection" (cf. the *perfective* in grammar) in the sense of the English adjective "achieved" (see ASPECT). This double meaning can be rendered by the term "completeness," but not by the corresponding adjective "complete."

In conformity with the philosophical tradition, Claude Imbert, in her translation of Frege's "Über Sinn und Bedeutung," chooses to render *Satz* in French as "proposition." If we compare this translation with English ones, we encounter an interesting problem. In Frege, the *Sinn*, as the objective content of the sentence, is clearly distinguished from the sentence itself. But in the first translations and adoptions in English of the Fregean distinction, it is the objective content of the sentence, the *Gedanke* or *Sinn*, not the sentence (*Satz*) itself but what it signifies, that is rendered by "proposition." Simply translating *Satz* into French as *proposition* can create a difficulty, but translating *Gedanke* into English by "proposition," as is done in this case, raises other, still more serious problems. The translation choices made in the first half of the twentieth century, starting with the spread of the philosophy of language (of which Frege is the founding father), have several consequences for the status of propositions:

1. Propositions are "detached" from sentences as a result of the twofold translation of *Satz*: *Satz* as a sentence (for example, systematically in Rudolf Carnap, first in the English translation of *Logische Syntax der Sprache* [*The Logical Syntax of Language*], and then in *Meaning and Necessity*), and *Satz* as "proposition," understood as the meaning of the sentence or as expressed by the sentence.
2. Propositions are closely connected with meaning (*Sinn*) and thoughts (*Gedanken*), and become abstract, objective entities. These entities are then considered not only as "what is signified," but also as "what is named" by sentences.

The first English translation of the passage from Frege previously cited thus reads: We are now going to inquire into the sense and the nominatum of a whole declarative sentence. Such a sentence [*Satz*] contains a proposition [*Gedanke*].

> (Feigl and Sellars, *Readings in Philosophical Analysis*, 89)

The *Satz*/*Gedanke* pair, which in French becomes *proposition*/*pensée*, is here translated by "sentence"/"proposition," not without incoherence and difficulty, because in the subsequent sentence we find:

> Is this thought [*Gedanke*] to be regarded as the sense [*Sinn*] or the nominatum [*Bedeutung*] of the sentence?

Whereas the note concerning the objectivity of thought is, with a certain lack of appropriateness, translated as:

> By proposition [*Gedanke*] I do not refer to the subjective activity of thinking [*Tun des Denkens*], but rather to its objective content.

It is clear that what caught the attention of the translators and philosophers who introduced Frege's thought to the United States in the 1940s was the objective, desubjectivized character of the Fregean *Gedanke*. This led to their reluctance to translate this term by "thought," which it seems impossible to objectivize in this way. But this is perhaps to underestimate the theoretical impact Frege achieved, especially in the

note, by affirming the existence of a thought independent of its bearer and not psychological. The English translation of *Gedanke* by "proposition" might at first seem to jump to conclusions; but far from being audacious, it draws back before the idea of a thought that is not "thought by someone." The shared form of the noun ("thought") and the participle ("it is thought"), which is more obvious in English than in other languages, may play a role here—and it may also be that English-language philosophy finds it especially difficult to integrate an anti-psychologizing mode of thought.

B. *Gedanke,* "proposition" (English), *phrase* (French)

The transposition of *Gedanke* as the English "proposition" allows us to clearly differentiate the proposition both from the mental or psychological act of thinking, and from the sentence, of which the proposition becomes the content or the objective meaning, common not only to different thinkers, but also to different languages. We find a very clear exposition of this double view in Alonzo Church: the proposition (1) is not the particular declarative sentence, but rather the content of meaning that is common to the sentence and its translation into another language, and (2) is not the particular judgment, but the objective content of the judgment, which can be the common property of several people.

The proposition thus turns out to be an abstract proposition, the object designated by the sentence. It will be noted that Bolzano arrived at a similar theoretical result by using a single term, distinguishing between "proposition" (*Satz*) and "proposition in itself" (*Satz an sich*), which does seem to cover the transition from particular sentences to propositions. In such a perspective, the sentence/proposition relation also emerges in the type/token distinction, the proposition being a type of which the different sentences expressing it are occurrences or tokens. That is what seems to be shown by the example, frequently used in this context, of a sentence and its translation (Time flies / *Tempus fugit*) as expressions of a single proposition.

■ See Box 4.

We can see how the notion of proposition, established in such a context, would later be exposed to all of the criticisms aroused by the idea of translation. The passage into a foreign language is in fact crucial in Church's argument regarding propositional attitudes (*Introduction to Mathematical Logic*): if the object of a belief was a sentence, for example, the utterance of a propositional attitude "I believe he is here" would be equivalent to "I believe the sentence 'he is here.'" To translate such statements correctly, we have to consider that it is the proposition qua abstract object, and not the sentence, that is the object of belief or of any other propositional attitude or act; thus there is a radical difference between the token sentence and the abstract proposition.

In "standard" analytical philosophy, beginning in the 1940s, we thus find a basic unit of expression, the sentence, which, when it is endowed with a meaning, expresses a complete thought, and is then defined as a declarative sentence—in which we find the Aristotelian and medieval problematic of the *logos apophantikos* and of completeness. Sentences are conceived (in a reformulation of Frege's theory) as names. This may seem rather unnatural, Church says, insofar as the

4

"Type"/"token" (English), *type/occurrence* (French)

➤ SIGN, SPECIES

The distinction between "type" and "token," invented by the American philosopher C. S. Peirce, plays an essential role in linguistics and in the philosophy of language. A "token" of a sign is a particular, physical occurrence of this sign, whereas its "type" is, depending on the point of view, the class of the actual or possible occurrences of this sign. The token is a specific utterance of a given linguistic expression, itself considered as a type. The expressions themselves can be considered as tokens of a proposition or of a meaning "type," at least according to a certain approach to signification.

The basic text is found in Peirce's *Collected Papers*. Peirce notes that on a page printed in English, one can find "about twenty *the*'s on a page." There are in one sense twenty "the's," and in another sense a single word "the": "There is but one word 'the' in the English language; and it is impossible that this word should lie visibly on a page, for the reason that it is not a Single thing or Single event." It is "such a definitely significant Form" that Peirce defines as a "Type." The individual object or event (a given word, a given line on a page) will be a "Token." The token is thus a "Sign of the Type" and "hence of the object that the Type signifies." The token is an "instance" of the type. There are twenty instances of the type "the" on a page (see Peirce, *Collected Papers*, 4:537 [article written for *The Monist*, 1906]).

Peirce's distinction had a remarkable influence on later developments. In a review of Wittgenstein's *Tractatus logico-philosophicus*, F. P. Ramsey noted that the use of *Satz* in the *Tractatus* has an ambiguity that Russell's concept, for example, is lacking, and that could have been avoided by using the type/token distinction (review of the *Tractatus logico-philosophicus*, in *Mind* 32 [1924]: 464–78). The distinction is also adopted in a fertile way in Ogden and Richards's influential book *The Meaning of Meaning* (1923) (see SPEECH ACT, in particular IV.B).

On the linguistic level, we can note that linguistic "types" and "tokens" have different statuses: types belong to "competence," whereas tokens belong to "performance" (see SPEECH ACT).

One of the most interesting extensions of the distinction is found in semantics. The sentence itself (disregarding the debate concerning the proposition) can be considered a type or a token: each time someone utters the sentence "The cat is on the mat," we have a new instance of this type-sentence.

Peirce's distinction also has fertile uses in the philosophy of mind (see SOUL). A distinction is drawn between types and instances of mental states, and this distinction founds "token physicalism"—translated into French by Récanati and Rastier as *physicalisme occasionnel*—a materialist theory according to which the identification of mental states with cerebral states can be established only at the level of instances. "Every instance of a mental state is an instance of a cerebral state, but (according to *physicalisme occasionnel*) that does not mean that a type of mental state can be reduced to a type of cerebral state" (F. Récanati, in RT: *Vocabulaire des sciences cognitives*, s.v. "Type/token").

use of sentences is not in principle to "name something," but to "make an assertion" (ibid., 24). Thus we must distinguish an assertive use and a nonassertive use of sentences. Considering sentences as names, we can inquire into their denotation and meaning. Their denotation is an abstract object, namely, their truth-value (true or false); their meaning is "that which is grasped when we understand the sentence, or . . . that which two sentences in different languages must have in common in order to be correct translations each of the other" (ibid., 25). We can grasp the meaning of a sentence without knowing its denotation (truth-value), but knowing (thanks to its meaning) that it has a truth-value. Then we have this new version of Frege (ibid., 26):

Any concept of truth-value, provided that *being a truth-value* is contained in the concept, and whether or not it is the sense of some actually available sentence in a particular language under consideration, we shall call a proposition, translating thus Frege's *Gedanke*.

We arrive at a radical theory of the proposition as abstraction, entirely detached from the linguistic entity that is the sentence. Church recognizes, lucidly, that this is a characteristic of English, where in nontechnical usage "proposition" has long signified the meaning, not the sentence (ibid.):

This is the happy result of a process which, historically, must have been due in part to sheer confusion between the sentence itself and the *meaning* of the sentence. It provides in English a distinction not easily expressed in other languages, and makes possible a translation of Frege's *Gedanke* which is less misleading than the word "thought."

C. "Proposition-statement" (*Satz*) versus *Tatsache*, *propositions* versus *faits*

Bertrand Russell uses the word "proposition" in an entirely different sense, far removed from Church's translation of Frege's *Gedanke*, to designate the description of a state of affairs (see SACH-VERHALT). A sentence is associated not only with a meaning, but also with a fact: it is not solely expressive, but also indicative. The denotation of the proposition is seen as a state of affairs, and not a truth-value: its truth-value will be determined by its relation to a state of affairs. In "On Denoting" (1905), Russell rejects the Fregean conception of meaning in order to assert that the only important dimension of a proposition is its "denotation" (see SENSE). He distinguishes between a "verbal expression" and a "proposition" (as a logically structured unit composed of elements). A proposition, just like a verbal expression, has no meaning, only (in certain cases) a denotation that depends on its "denoting phrases" and its logical structure.

Real propositions and states of affairs: The current relevance of the medieval debate

Some realist logicians of the fourteenth century acknowledged the existence of "propositions of things" or "real propositions" (*propositio in re*). This theory shifts into reality itself the question of the relation between proposition and reality. In so doing, it anticipates certain modern reflections on the state of things as the denotation of the proposition. In the thirteenth century, the text of Aristotle's *Categories* 14b21–22 was paraphrased as "*res est causa veritatis orationis*" (The *res* is the true cause of the statement), which poses the problem of how to interpret *res*: as an individual thing or as a state of things (see SACHVERHALT). The notion of a "proposition composed of things" seems to have been invented by Gauthier Burley, William of Ockham's main adversary. For Burley, the "ultimate signified" of mental propositions must be something real. Since this can be neither the individual thing supposed by the subject and the predicate, nor—on pain of infinite regress—a "complex of concepts," it can be only a "complex of things"—and it is this composite that he calls a "real proposition": "*Ergo in rebus est aliquod compositum cuius subiectum est res et praedicatum similiter, quod dicitur propositio in re.*" Contrary to the nominalists and almost all of his contemporaries, Burley thus distinguished not three but four kinds of proposition: the written proposition (*in scripto*), the oral proposition (*in voce*), the mental proposition (*in mente*)—also called "conceptual" (*in conceptu*)—and the real proposition (*in re*). The point of departure for the theory of the real proposition is Aristotelian: the goal is to determine "what corresponds" in reality to "complex truth," that is, to the "intellectual" combination and separation Aristotle mentions when he defines the true in the logical sense of the term by positing that "he who thinks the separated to be separated and the combined to be combined has the truth" (*Metaphysics* Θ.10, 1051b3–4), or when, in the *Categories* 14b21–22, as translated by Boethius, he posits that "*ex eo quod res est vel non est oratio dicitur esse vera vel falsa*" (From this it follows that whether a proposition is true or not depends on whether the thing is true or not). Burley's originality is to have taken this as a basis for seeking a "truthmaker" in a "reality" seized and rationalized as a "real proposition composed of things." The argument in favor of the real proposition is founded on a principle common to many medieval theories of truth as correspondence: in order for a proposition *in mente*, *in prolatione*, or *in scripto* to be true, "it must really be so, as in the proposition that signifies it [*oportet quod sit in re sicut propositio significat*]." This assertion presupposes another: that *there is something*, in reality, that is such that the proposition signifies it. This "something" is the real proposition, also called a "complex thing" (*res complexa*), a "connected being" (*ens copulatum*), or, more simply, a "composite" (*compositum*). Burley's main theoretical justification is given in his *Middle Commentary* of ca.1310 on the *De interpretatione*: "*Res significata per istam 'homo est animal' non dependet ab intellectu nec etiam veritas istius rei; immo ista esset vera etsi nullus intellectus consideraret. Et ista similiter 'Chimaera est Chimaera' esset vera, etsi numquam aliquis intellectus consideraret.*" If neither the signified nor the truth of a proposition depend on the intellect, that is because what is signified by the proposition is the truthmaker of the proposition, and this signified is a complex reality independent of our activity of thought: a state of things, a fact, or a complex object.

A new concept of the *Satz* emerges in Wittgenstein's *Tractatus logico-philosophicus*, which is generally translated into English and French by "proposition": the *Satz* is indissolubly the expression-demonstration of a meaning (and in that way, Fregean) and a depiction (*Abbildung*; see BILD and DESCRIPTION) of a state of affairs (and in that way, Russellian). It is defined as a "perceptible expression of thought":

4.3.1. Im Satz drückt sich der Gedanke sinnlich wahrnehmbar aus.

In a proposition a thought finds an expression that can be perceived by the senses.

We see that Wittgenstein rejects the interpretation of the proposition as an abstract entity, and makes the *Satz* a propositional sign "that can be perceived by the senses [*sinnlich wahrnehmbar*]." He also rejects the idea that a proposition's denotation is a truth-value, without abandoning the connection Frege established between *Gedanke* and *Satz*. The notion of the meaning of the proposition turns out to be central in the *Tractatus*. For Wittgenstein as for Russell, the proposition is a function of components, that is, of expressions (*Ausdrücke*). But for Wittgenstein (and here he differs from Russell), the proposition does not refer to a complex object; it has a meaning (whereas names have only a denotation), which is what we know when we understand a proposition, the state of affairs it depicts. It is in fact a state of affairs (*Sachverhalt*) and not an object that has here the absolute independence that defines logical atomism (Russell). The proposition thus acquires a logical and ontological priority. The *Tractatus* connects sense (*Sinn*) and reference or denotation (*Bedeutung*) in a different way from Frege, by defining the proposition (*Satz*) both by thought (*Gedanke*) and by fact (*Tatsache*).

4.021. Der Satz ist ein Bild der Wirklichkeit: denn ich kenne die von ihm dargestellte Sachlage, wenn ich den Satz verstehe.

A proposition is a picture of reality: for if I understand a proposition, I know the situation that it represents.

4.022. Der Satz zeigt seinen Sinn. Der Satz zeigt, wie es sich verhält, wenn er wahr ist.

A proposition shows its sense. A proposition shows how things stand if it is true.

4.024. Einen Satz verstehen, heisst, wissen was der Fall ist, wenn er wahr ist.

To understand a proposition means to know what is the case if it is true.

D. "Proposition" / "statement" / "sentence"

Understood in this way, the proposition (*Satz*) raises in a new way the question of the relationship to facts, as is shown by the way English translators of *Satz* hesitate between "proposition," "sentence," and "statement." The deployment of the different translations of *Satz* results in a complex table of the "meanings" that the word "proposition" can take in French and English. The proposition (*Satz*) understood as a depiction of a state of affairs, or "saying that," does not name a fact, it *states* it. The proposition should then be called (as it is by J. L. Austin) a statement. A proposition expresses a meaning, it states . . . what? A fact. It is this idea of fact as what is asserted, stated, that can determine, in a minimalist way, truth as correspondence, as is shown by the expression "It is a fact that . . ." A fact, from this point of view, is defined as a true statement (as is shown, according to Austin, by the parallel "to be a truth" / "to be a fact"). Thus a statement is, extending the *Satz*, a problematic notion, falling between the sentence and the fact.

Such a theorization of the statements/facts pair is found in diverse forms in Russell and G. E. Moore. We can, however, inquire into the status of these facts, which are not simple situations, but are also "objective," and ask if they are not subject to certain criticisms formulated with regard to propositions/thoughts understood in Frege's sense. To assert a fact is to make an assertion. To state a proposition is to make an assertion. F. P. Ramsey was one of the first to criticize, in "Facts and Propositions," what he called the "linguistic muddle," which is connected with the idea of truth, but which is also associated with the idea both of the proposition and of fact. To say that a proposition is true, or that it corresponds to the facts, is simply to state that proposition, to make that assertion. Thus there is no need for facts, or propositions, or truth. This "redundancy theory" of Ramsey's (see TRUTH, V.B) has been subjected to a number of criticisms, but its radicality has continued to make it interesting.

It was probably Quine who struck the fatal blow to propositions, and thus to facts. The thesis of the indeterminacy of translation (see TO TRANSLATE, Box 4) already constituted a challenge to the Fregean *Gedanke*, and even to the very notion of meaning itself: there is no entity intermediary between two linguistic expressions that are translated from each other, and that express each other. There are always several possible translations, and indeterminacy. This criticism could be formulated in Quine, as in Ramsey, on the basis of the question of truth, in a passage in the *Philosophy of Logic* that draws attention to a new configuration of the terms "statement," "sentence," "utterance," and "proposition":

When someone speaks truly, what makes his statement true? We tend to think that there are two factors: meaning and fact.

Quand quelqu'un dit vrai, qu'est-ce qui fait que son assertion est vraie? Nous avons tendance à croire que deux facteurs sont en jeu: la signification et le fait.

(Quine, *Philosophy of Logic*, 1)

It is this tendency that Quine criticizes. If a German utters the declarative sentence "*Der Schnee ist weiss,*" we are tempted to say that his sentence is true by virtue of its meaning (the meaning of the German sentence is that snow is white) and the fact (that snow is white), because "the fact of the matter is that snow is white." But here there is a redundancy or, as Quine puts it, a "philosophical extravagance": Why resort to two elements that are not only identical (they both state that snow is white), but also useless? We have the declarative sentence, and snow is white; why appeal to "intangible intervening elements"? This is a "hollow mockery." Quine's violent objection to propositions (a tendency that, according to him, "cannot be excused") is motivated by the indeterminate status of meanings and the impossibility of establishing and defining a relation of synonymy between sentences.

Meanings of sentences are exalted as abstract entities in their own right, under the names of propositions. These, not the sentences themselves, are seen as the things that are true or false. These are the things that are known or believed.

(Ibid., 2)

Quine's critique of propositions and facts is accompanied by a linguistic analysis and a justification of his constant choice to speak of sentences and not propositions. French translators of Quine often render "sentence" by *énoncé*, following a well-established usage in French translation of contemporary texts on the philosophy of logic.

Philosophers' tolerance toward propositions has been encouraged partly by ambiguity in the term "proposition." The term often is used simply for the sentences themselves, declarative sentences. . . . Some philosophers . . . have taken refuge in the term "statement."

(Ibid.)

Or, still more systematically, in a recent translation of a passage that sums up the whole problematic:

What are true or false, it will be widely agreed, are propositions. But it would not be so widely agreed were it not for the ambiguity of "proposition." Some understand the word as referring to sentences meeting certain specifications. Others understand it as referring rather to the meanings of such sentences. What looked like wide agreement thus resolves into two schools of thought: for the first school the vehicles of truth and falsity are the sentences, and for the second they are the meanings of the sentences. . . . It seems perverse to bypass the visible or audible sentences and to center upon sentence meanings.

(Quine, *Pursuit of Truth*, 77)

It is amusing to note that the French translation, by rendering "sentence" as *énoncé*, makes, by also seeking consensus, the same error as the one pointed out by Quine in the passage itself regarding the consensus choice of "proposition." In French, *énoncé* also introduces an ambiguity, being a kind of intermediary between "sentence" and "statement"

(cf. *énoncer que...*). But the use of "statement," as Quine clearly saw, is an "evasive use": "statement" means something different from "sentence," and designates, since coming into use by the Oxford philosophers, an act.

> I gave up the word [statement] in the face of the growing tendency at Oxford to use the word for acts that we perform in uttering declarative sentences. Now by appealing to statements in such a sense, instead of to propositions, certainly no clarity is gained.
>
> (Quine, *Philosophy of Logic*, 2)

Thus we must once again examine the new vocabulary targeted here by Quine, which, according to him, perpetuates the mythology of propositions. In reality, we could also maintain that the introduction of the new terms "statement" and "utterance" takes a further step in the critical task (begun by Ramsey and Quine) of abandoning propositions in favor of sentences. The relation of the proposition-type to the sentences-tokens that, according to the traditional doctrine, express it could be set in parallel with the relation of the sentence to its real occurrences (utterances). For ordinary language philosophers, the primary objection to propositions is that a sentence-type can have different truth-values, and of course different meanings, in its different concrete occurrences. It is clear that the theory of performatives and speech acts developed by Austin and later generalized by John Searle poses a radical challenge to these concepts of truth and meaning (see SENSE, SPEECH ACT, TRUTH). We will limit ourselves to a few remarks on the vocabulary designating linguistic units, which becomes more complex here. The proposition/sentence pair, a development of the German *Satz*, becomes a system, sentence-statement-utterance, whose terms are combined in various ways. We have to recognize (cf. Quine's critique) that the notion of "statement" (like that of "utterance"), initially proposed as a minimal term (like French *énoncé*), rapidly acquired, through the theory of speech acts that made use of it, an inevitable theoretical importance. The two terms have been used to indicate the dimension of doing involved first in certain utterances (performatives), and then in all utterances. Of course, this can be seen not as a performative dimension of all utterances, but, trivially, as the action implied in the very fact of making an utterance: the difficulty remains, as we see, to find the term that is as neutral and minimal as possible, and that is what, at least initially, was sought in "statement," "utterance," and *énoncé*. We can see some of these difficulties at the beginning of *How to Do Things with Words*. Austin begins with "statement" to criticize the idea that assertions are always descriptive, and thus the equivalence of statement and proposition:

> It was for too long the assumption of philosophers that the business of a "statement" can only be to "describe" some state of affairs, or to "state some fact.". . .Not all "sentences" are (used in making) statements.
>
> (*How to Do Things with Words*, 1)

"Statement" is difficult to translate into French. In French it tends to be translated as *affirmation*, which is a

problem, just as is *assertion*, because the expression "state a fact" is more natural than *affirmer un fait*, and *a fortiori* is more natural than *asserter un fait*. We can also note the equivalence between "state a fact" and "make a statement," which institutes the connection between statement and fact, but also defines the statement as an action (unlike "sentence" and "proposition"). In a note, Austin adds:

> It is, of course, not really correct that a sentence ever *is* a statement: rather, it is *used* in *making a statement*, and the statement itself is a "logical construction" out of the makings of statements.
>
> (Ibid.)

The difficulty of translating the "makings of statements" indicates the problem: an assertion, like a proposition, is supposed to be an abstraction elaborated on the basis of the tokens constituted by acts of making statements. Moreover, there are utterances (the French translations usually give *énonciations*, which better renders the oral character of the utterance than does *énoncé*; German translates this by *Äußerung*) that are not statements; "many utterances look like statements" but "do not state a fact." These "pseudo-statements" refer and are comparable to the *Scheinsätze* defined by Carnap. The basic unit that includes all the others is thus said to be the utterance.

> We shall take, then, for our first examples some utterances which can fall into no hitherto recognized *grammatical* category save that of "statement."
>
> (Ibid., 4)

The utterances that interest Austin are such that to utter the sentence is not to describe or state, it is to *do* (see SPEECH ACT, IV). This is what defines the "performative," which is short for "performative [or performatory] utterance [or sentence]." Here is established the relation, rather close in Austin, between "utterance" and "sentence." Utterances include sentences, without the difference between them being clearly marked, which attenuates their immediately spoken character (the "speech act"): "What are we to call a sentence or an utterance of this type?" (ibid., 6). "Utter a sentence" and "make [or issue] an utterance" are not very different. "Utterance" makes it possible to play on the verb "to utter" and on constructions like "uttering" and "utterer" (cf. Grice, *Utterer's Meaning*). It is with Austin's definition of the utterance that the idea of the proposition as an entity disappears. There is no longer an object separate from the utterance, so to speak, no type of which it would be the token: what is said is absorbed into the saying, what is said does not exist independent of its occurrence and its utterance.

French has the good fortune of having a basic terminology for this vocabulary, established by Austin himself in the paper he presented at Royaumont in 1958, "Performatif-constatif," which he had written himself in French (the English version, "Performative-Constative," published after his death, was translated by Geoffrey Warnock and is less colorful than the original). Austin uses *énoncé* for "utterance," *assertion* for "statement," and *effectuer* for "perform." We could take our inspiration from these

choices, even if *assertion* lacks part of the factual dimension of "statement," and *énoncé* lacks the physical dimension of "utterance." Similarly, Austin himself translated "speech act" into French as *acte de discours*, which seems in fact more adequate than *acte de langage*, which has since been generally adopted.

There are numerous philosophical meanings of the term "proposition" that have been sedimented in various contemporary uses. Defined semantically in terms of true or false, a proposition no longer has any apparent relationship with the *logos-apophansis-logos apophantikos* complex inherited from Aristotle. It is an extra- or translinguistic entity: a sentence is French or Turkish; a proposition is not and cannot be either. An *énoncé*, like a sentence, is always in a language. The French *proposition* (German *Satz*, English "proposition") seeks to transcend this linguistic difference, to define a content of language or an independent thought. This semantic definition of the proposition is rejected by everyone who thinks that it is the sentences of a given language that are true or false—"It is what human beings *say* that is true and false" (Wittgenstein, *Philosophical Investigations*, §241). Others purely and simply reject "propositions," seen as mythical beings subsisting independent of thoughts and sentences (as Russell puts it, "a proposition is only a symbol," "propositions are only sentences in the indicative," "propositions are shadows, they are nothing"). Focusing on the meaning of the word "proposition" (*Satz*, etc.) in modern philosophical texts means being confronted, as we can see, with theories rather than with linguistic fluctuations, and sometimes with a departure from usage. But the constant passage from one language to another allows us to bring out the polysemies and to eliminate the ambiguity from words in languages, as when *protasis* becomes *praemissa* and *propositio*, or *Satz* becomes simultaneously "statement," "utterance," and "sentence."

PROPOSITIONAL CONTENT

This is one of the possible translations of the German *Sachverhalt*, which in everyday language designates the "facts of the case." But this translation emphasizes the propositional formulation of the object of judgment at the expense of the properties of the objects of experience. The other, no less frequent translation as "state of affairs" suffers from the inverse defect. See SACHVERHALT.

Here we are dealing with a logical terminology connected with the greatest questions (the relation thing-word-mind and the definition of truth), which makes the transition from a medieval Latin term (DICTUM) that emerged from Stoicism in its competition with Aristotelianism (see *lekton* [λεκτόν] under SIGNIFIER/SIGNIFIED, II) to the German of the late nineteenth century and early twentieth century, which

opens onto contemporary English and American analytic philosophy, and for which French produces descriptive translations that make the problem obvious.

See, on the one hand, DICTUM, INTENTION, PROPOSITION, SENSE; on the other hand, ERSCHEINUNG, *FACT,* GEGENSTAND, *IL Y A,* MATTER OF FACT, OBJECT, TATSACHE, *THING* [RES], *TO BE*; finally, TRUTH.

➤ *STATE OF AFFAIRS*

PRUDENCE

"Prudence" derives from the Latin *prudentia*, in which Cicero still heard *providentia*, the "foresight" that characterizes "providence." The Latin word, which was connected with a civilization based on law (*jurisprudentia*; see LEX, II.B), seeks to render the Greek *phronêsis* [φρόνησις], which designates practical wisdom, both intellectual (*phronein* [φρονεῖν], "to think," *phrenes* [φρένες], "lungs"; cf. SOUL, Box 3 and cf. *HEART*) and moral: see PHRONÊSIS for an exploration of the interpretations and translations of this key term in the various linguistic systems (in particular, German *Klugheit*). See MORALS, *VIRTUE, WISDOM*. Cf. LOGOS, MÊTIS, UNDERSTANDING.

The term has been reinvested in contemporary English, with prudential ethics connected to economics: see PRUDENTIAL; cf. MORAL SENSE, RIGHT/JUST/GOOD, UTILITY.

➤ DUTY, ECONOMY, GLÜCK, INGENIUM, *SENS COMMUN, VALUE*

PRUDENTIAL / PRUDENCE

FRENCH	*prudentiel, prudence*
GERMAN	*Klugheit*
GREEK	*phronêsis* [φρόνησις]
LATIN	*prudentia*

➤ *PRUDENCE* [PHRONÊSIS], *WISDOM,* and ECONOMY, FAIR, OIKONOMIA, PLEASURE, PRAXIS, UTILITY, VIRTÙ, WUNSCH

The adjective "prudential" does not present any genuine translation problem. But in relation to the introduction into contemporary philosophical language of this technical term borrowed from economics, it is interesting to inquire into the connection between this term and its philosophical ancestors. What contemporary exponents (mainly English speaking) of rational choice theory understand by "prudential" too easily assumes that the dilemmas regarding the nature of practical reason have been resolved, in the sense in which the great classical conceptions of *phronêsis* and *prudentia*, from Aristotle and Cicero to Kant and Sidgwick, tried to understand it. These dilemmas are still being debated by writers who, even when they draw on both traditions, try, like James Griffin, to reevaluate the relations between prudential virtues and ethics or to derive all of ethics from prudential reason, like David Gauthier or John Rawls in his early work.

I. From the Reason for Acting to Self-Interest and Anticipation

Philosophers used to understand the notion of prudence in three dimensions. In the first place, it was understood as providing reasons for acting that, while not necessarily being moral in the sense of the categorical imperative of duty, are nonetheless good reasons. Here, "good" means what enables us to realize maximally our essence (Kant) or our happiness (the utilitarians). Prudence, Kant writes, is "skill in the choice of means to one's own highest welfare" (*Foundations of the Metaphysics of Morals*, §2). Because of this relationship to happiness, prudential reason is distinguished from instrumental reason or technics, whose end, in the Kantian vocabulary, is not real but only possible (the imperative of prudence, *Klugheit*, is an assertive hypothetical and not a problematic one). In a second sense, the domain peculiar to prudence is limited to self-interest. The whole difficulty proceeds from how this limit is interpreted: is it selfishness or self-esteem that takes the Other equally into consideration? Sidgwick asks whether the imperatives of prudence are compatible with the utilitarian maxim of rational good will or with the axiom of justice or equity, and this indicates that the question is far from being resolved (*Methods of Ethics*). The third characteristic of the notion resides in its relation to temporality. Prudence is the contrary of the kind of short-term, irrational thinking that Mill calls "expediency" (*Utilitarianism*). It presupposes a capacity for rational anticipation, complex modes of reasoning to evaluate one decision in relation to another—for example, an immediate advantage in relation to one that is greater but more distant. We must not forget that the Latin *prudentia* comes from *providentia*, that is, "foresight."

II. The Rational Agent's Interests

In the technical sense conveyed by the term "prudential," we see shifts taking place in the three directions we have indicated. First, we as ideal rational agents on whom economic theories are based are interested solely in maximizing our utility, that is, our expressed preferences, and not our happiness, a notion that has been abandoned on the grounds that it is too "normative." The conception of the growth of a pleasant state of mind is replaced by the economics of welfare; pleasure or happiness is replaced by the satisfaction of desires or preferences, even if we do not always desire what makes us happy. Second, in accord with methodological individualism, we as rational agents are interested only in our own satisfaction; the Other is taken into account only in estimating the chances of succeeding in negotiating or threatening. We are in an individualist, conflictual model in which cooperation is chosen only because it will maximize our chances (the prisoner's dilemma). The self-contradictions of self-love and self-esteem are eliminated. Finally, as Jean-Pierre Dupuy ("Prudence et rationalité") rightly points out, the economic model's conception of temporality reverses the flow of time in the sense that arguments are made on the basis of what would have happened if decision X had been made earlier, leading to a result that will never occur, because in the meantime we will have taken care to make a more advantageous decision.

QUALE, QUALIA

FRENCH	*quale, qualia*
GERMAN	*Quale, Qualia*
LATIN	*quale, qualia*

➤ CONSCIOUSNESS, ERLEBEN, PERCEPTION, PROPERTY, REPRÉSENTATION, SOUL, SUBJECT

The term "quale" (plural "qualia") refers to the qualitative properties of experience insofar as they elicit in the subject the experience of a distinctive impression. This blue that I perceive, this pain felt, this coffee fragrance, are "qualia."

Since the middle of the twentieth century several words have been competing as designations of these properties: they have been called "subjective qualities" or "sensuous qualities," "phenomenal properties" or "phenomenological properties," or even immediate impressions ("raw feels"; see Herbert Feigl's 1967 book *The Mental and the Physical*). The Latin word prevailed in English-language philosophy, and has been adopted in German and French translations, probably because of the symmetry with the *quantum/ quanta* pair, one representing a qualitative differential, the other a quantitative differential.

In many uses of the term, "qualia" refers to singular events, such as the manifestation of a pain at a given moment (Casati, "Qualia") or to instantiated (that is, nonrepeatable) singular properties (this way of suffering here and now being necessarily different from all others). Other uses of "qualia" refer to general properties of such events (for example, the intensity or the type of pain). In this use, the concept of "quale" does not coincide with the notion of secondary quality: the term can be applied to primary qualities such as forms as well as to secondary qualities such as colors, because, for example, one can have an objective experience of "seeing" a square form (different from the experience of "touching" a square surface).

The word "quale" cannot be used interchangeably with the term "sensation" insofar as, unlike a sensation, a quale cannot be treated in a quantitative or relational manner. Moreover, the word can be applied to data that are not strictly sensorial, such as the impression of knowing or that of imagining: some philosophers maintain that mental states of the propositional type (such as believing that P or desiring that Q) also give rise to qualia that are at the origin of the subject's understanding of what the mental state in question is.

It seems indisputable, at least at first sight, that some of our mental states have qualia in the sense that they give rise to a distinctive qualitative impression. It is often thought that conceding this point amounts to recognizing that there are facts to which subjects have a privileged epistemic access, and which they can know in an infallible way, or at least with an exclusive authority. But how can we explain the privileged status of the access enjoyed by subject of the experience relative to the knowledge of corresponding objective properties such as temperature, form, and length, which is in each case eminently subject to error?

One of the ways of responding to this difficulty consists in treating qualia as a domain that cannot be reduced to any physicalist approach (Chalmers, *The Conscious Mind*). The quale thus becomes a weapon in a dualist argumentative apparatus. The other way consists in maintaining, inversely, that the existence of qualia does not threaten the monist materialist conception of the world, while at the same time recognizing that a functionalist explanation (that is, an analysis based on the causal relations between an object giving rise to qualia and the subject's dispositions to believe or to act) cannot be given for qualia. It is, in fact, emphasized that qualia are by nature "intrinsic" properties that cannot be explained by a differential and relational approach. One of the ways of showing this is to imagine that a subject has a deviant experience of color in which the colors of the spectrum are reversed. Given that language learning is not affected by the intrinsic characteristics of experience, the anomaly of this subject's qualia could not be discerned by someone else, or detected by a relational analysis of the functionalist type (Block and Fodor, "What Psychological States Are Not"). Similarly, no one could discover the anomaly of a subject who was totally deprived of qualia but who gave the same verbal and behavioral responses as a subject capable of qualitative experience.

A final argument draws from the discovery of qualia the proof of functionalism's incompleteness as a theory of the mental. Let us imagine that a subject named Mary has lived in a black-and-white world but has learned everything one can know about the perception of colors. Let us further suppose that one day Mary emerges from this colorless world and sees a red object: it seems indisputable that Mary thus discovers a new fact. We must therefore conclude that the functionalist analysis does not offer a complete explanation of mental events (Jackson, "What Mary Did Not Know").

These arguments led adversaries of dualism to make numerous attempts to show either that a nonfunctionalist explanation of qualia is possible (for example, by studying the properties of the neurons that implement them), or that qualia are the object of practical knowledge and not of conceptual knowledge; or, finally, that qualia are a myth of which science must rid itself (Dennett, "Quining Qualia"; Tye, *The Imagery Debate*).

QUIDDITY

"Quiddity" is a technical termed modeled on the Scholastic Latin *quidditas* (*quiditas*) and translating the Aristotelian *to ti ên einai* [τὸ τί ἦν εἶναι] (we also find a Latin calque, which is purely descriptive and grammatically ill formed: *quod quid erat esse*): see TO TI ÊN EINAI and ESTI, SEIN, *TO BE*. The term *quidditas* was introduced by Latin translations of Avicenna's *Metaphysics.* It was later overdetermined as a response to the question *quid sit* (what is?), as opposed to the question *an sit* (is it?), which is said to have produced *anitas*, a word that soon disappeared. While quiddity refers to the essence as it is articulated in the definition, the *anitas* refers to existence, or rather to the *quod est*, "what it is." See ESSENCE, OMNITUDO REALITATIS, and cf. PREDICATION, REALITY, RES.

➤ *ACT, IL Y A*, SPECIES

REALITY

FRENCH	*réalité*
GERMAN	*Realität, Wirklichkeit, Wesenheit, Sachheit*
ITALIAN	*realtà, realtà effettiva, effettualità*
LATIN	*realitas, actualitas, forma, formalitas, entitas, entitas quidditativa*
SPANISH	*realidad, efectividad*

➤ *ACT*, ATTUALITÀ, ERSCHEINUNG, ESSENCE, *FICTION*, GEGENSTAND, OBJECT, SACHVERHALT, TATSACHE, *THING* [RES], *TO BE*, TO TI ÊN EINAI, TRUTH

The term *realitas*, a neologism coined by Duns Scotus, does not pose translation problems as such, and it was easily transcribed into European languages. On the other hand, the conceptual identity that it posits between "reality," "formality," "quiddity," and "internal possibility" leads—over the long term, even after Kant—to a complete redistribution of the ontological vocabulary; thus we find, depending on the traditions, which sometimes overlap in the same author, the equivalence of reality and the quidditive content (*Sachheit*) and also the association of reality with factuality, or even of reality with actuality. Thus German academic metaphysics, faithful to Duns Scotus's and Suárez's reforms, retranslated the vocabulary of actuality (*actualitas*, *esse in actu*) into the register of objective reality (*Wirklichkeit*) to the point of creating a pseudo-doublet: *Realität/Wirklichkeit*.

Whereas in most European languages, even if to very different degrees, the term "reality" is characterized by an apparently irreducible ambiguity between essence and existence. The few historical itineraries proposed here allow us to illuminate some inflections and to avoid some misinterpretations produced by a retrospective reading.

I. Duns Scotus's Inventions of *Realitas*

In its first, Scholastic meaning, the term *realitas* was not associated with the adjective *realis* or the expression *esse reale*, in the sense of what exists as posited outside its causes, but instead with *res*, understood in its broadest sense. Thus it was a technical term and an abstract notion that designated precisely the essence, or rather the essentiality, of the *res* as such in abstraction from existence. It was, it seems, starting with Henry of Ghent and especially Duns Scotus that the term *realitas* appeared in the Scotist tradition. Its meaning was initially defined in the context of the doctrine of formalities, that is, of the traits or "notes" constitutive of a determinate essence. Although *formalitas* is not itself a *res*, it nonetheless corresponds to a reality; that is, to a unitary and consistent determination that can be objectively apprehended by the mind (the *entitas quidditativa* that classical German philosophy rendered by *Wesenheit*, "essence," or rather, "essentiality"), thus helping to make explicit an essence or a quiddity (Duns Scotus, *Ordinatio* 3, dist. 22, n. 5,

in *Opera omnia*; see TO TI ÊN EINAI). Of course, the *realitates* or *formalitates* have no separate existence and thus no defined ontological status; they subsist only in and through the *res* (thus *realitates* are always *realitates rei*), from which, however, they are distinguished formally *a parte rei*. Thus they provide the foundation for a "real" distinction (i.e., of one thing in relation to another); in other words, for a distinction that is neither actual nor potential, but only virtual or merely formal.

■ See Box 1.

In the Scotist tradition, *realitas* is thus a term broader than *res* and has an indifferent ontological status with respect to objective reality. Reality or formality is in fact independent of the intellect:

> Et ideo potest concedi quod ante omnem actum intellectus est realitas essentiae qua est communicabilis, et realitas suppositi qua suppositum est incommunicabile; et ante actum intellectus haec realitas formaliter non est illa.

> (And we can thus grant that anterior to any act of intellect there is the reality of the essence, through which it is communicable, and the reality of the subject through which the subject is non-communicable; and that anterior to the act of intellect, this latter reality is not formally the former [reality].)

> (Duns Scotus, *Ordinatio* 1, dist. 2, pt. 2, qu. 1–4, n. 403, in *Opera omnia*, 2:357)

Understood in this way, reality is radically separated from the *fictum*, or the rational entity, and far from being purely and simply conflated with the *res*, it is composed of formal notes (*formalitates*) or reasons (*rationes*) that distinctly constitute the complete essence of the *res*, considered as such, in the multiplicity of its aspects or its intelligible determinations:

> Quodlibet commune et tamen determinabile, adhuc potest distingui, quantumcumque sit una res, in plures realitates formaliter distinctas, quarum haec non est illa.

> (Everything that is common and yet determinable can, however, be distinguished, insofar as it is a thing, into several formally distinct realities, one of which is not the other.)

> (Duns Scotus, *Ordinatio* 2, dist. 3, qu. 6, n. 15, in *Opera omnia*)

The *res positiva* thus is initially not the individual and singular reality posited *extra intellectum* (outside the intellect, in the nature of things), but rather what is presented to the mind as a *realitas*; that is, as a mental content (*Sachbestand*)

1

Res essentialis vs. *realitas actualis*: The reformulation of the distinction between essence and existence in Petrus Aureolus

The use of *realitas* as a synonym of *entitas* or *formalitas* is much more doctrinal (in conformity with Scotist hyperrealism) than lexical, and this is shown especially by an author like Petrus Aureolus, who was often close to Duns Scotus but did not hesitate to criticize him severely. When, in his *Commentary on the Sentences* (*Scriptum*, dist. 8, qu. 21), he takes up the question whether there is a real distinction between essence and existence—a question whose classical formulation had been established by Giles of Rome—Petrus Aureolus can propose the apparently Scotist thesis that "no thing really differs from its reality. If it did differ, it would already be another reality, and thus not its own" (nulla res differt realiter a sua realitate. Si enim differt, jam est alia realitas, et per consequens non sua; *Scriptum*, dist. 8, qu. 21, n. 60); the term *realitas*, which can be understood in the sense of *realitas essentiae* or *res essentialis*, actually has a quite different meaning, quite close to what we would now call "objective reality" (*realitas actualis*). In a long and complex argument, initially intended to show negatively that it is not possible to distinguish between being and essence, Petrus Aureolus illustrates his thesis ("esse lapidis est sua realitas" [he being of a stone is its reality]), drawing on a demonstration *ad absurdum* from which the ambiguity inherent in the neologism *realitas* clearly emerges: on the one hand, the formality constitutive of an essence or a nature, which can be grasped in its indifference with respect to existence, or rather in comparison with

haecceitas (*Ordinatio* 2, dist. 3, pt. 1, qu. 5–6, n. 187, in Duns Scotus, *Opera omnia*, 7:483), and on the other hand, the objective existence of an actual "reality":

> Et si dicatur quod res sumitur dupliciter, uno modo pro re essentiali — et sic non est verum quod esse lapidis sit sua realitas—, vel pro realitate actuali, et sic est verum ; unde in lapide actualiter existente sunt duae realitates, una quidem essentialis puta lapiditas, et alia accidentalis puta actualitas; siquidem hoc non valet, quoniam realitas essentialis lapidis aut habet quod sit realitas ex ipso esse, aut habet seipsa et sine esse. Si habet sine esse quod sit realitas extra nihil et in rerum natura, ergo res sine esse potest esse extra nihil et in rerum natura ; quod est contradictio. Si vero habet quod sit realitas non a se sed per esse, aut esse imprimit suam realitatem et ita erit efficiens et imprimens, quod est impossibile; aut non imprimit suam realitatem sed eandem communicat, et tunc habetur propositum quod esse est realitas essentiae, indifferens ab ea.

> (And if it is said that the term "thing" is taken in two senses: on the one hand, in the sense of an essential thing—and then it is not true that the being of a stone is its reality—, and on the other hand, in the sense of actual reality, then it is true; it follows that in the stone actually existing, there are two realities, one essential, namely stoniness, and the other accidental, namely actuality;

yet the inference is not valid because either the essential reality of the stone is such that it is reality on the basis of the being itself, or it is reality in itself and independently of being. If it is possible that independently of being, it is a reality, outside of nothing and [posited] in the nature of things, then the thing will be able to be outside of nothing and in the nature of things, independently of being, which implies a contradiction. But if it is such that it is reality not by itself, but thanks to being, then either being shapes its reality and will be an efficient and shaping cause, which is impossible, or it does not shape its reality, but communicates it, and in this case we arrive at the thesis sought, namely that being is the reality of essence, and not different from the latter.)

(*Scriptum*, dist. 3, §14, n. 31–32)

Given the difficulty of such a passage and its translation, we can easily gauge the importance of the conceptual re-elaboration that affects the terms "reality," "being," and "actuality" here, which are likely to shift to the side of essence or of existence that will be qualified precisely as "actual."

BIBLIOGRAPHY

Aureolus, Petrus. *Scriptum super primum Sententiarum*. Edited by Elgius M. Buytaert. St. Bonaventure, NY: Franciscan Institute, 1956.

Duns Scotus, John. *Opera omnia*. Vatican City: Typis Polyglottis Vaticanis, 1950–.

whose own content and internal rigor suffice to distinguish it essentially from the *res ficta*, or chimera. This elaboration of the Scotist doctrine of the *realitas* was doubtless carried out through Henry of Ghent's analysis of the *ens ratum* (*Quodlibet* 9, qu. 3, in corp., in *Opera omnia*) and led to a new determination of *ratitudo* (*Ordinatio* 1, dist. 36, qu. 1, n. 48, in *Opera omnia*, 6:290). (See RES, Box 3.)

The *res* understood *a ratitudine* thus designates a quidditative reality (*realitas quidditativa*) heir to Avicenna's essence or common nature ("equinitas est equinitas tantum" [equineness is nothing other than equineness]; *Metaphysics*, vol. 5, chap. 1) and distinct from both fiction and objective, or actual, reality (*realitas actualis existentiae*)—the reality that is already defined, before Kant, as posited. Thus Duns Scotus, by apprehending reality as formality, seeks to move beyond the negative determination, which is too broad, that Henry of Ghent gave of it, simply by opposing it to the *purum nihil*:

Sciendum quod omnium communissimum omnia continens in quodam ambitu analogo est res sive aliquid sic consideratum ut nihil sit ei oppositum, nisi purum nihil, quod nec est, nec natum est esse in re extra intellectum, neque etiam in conceptu alicujus intellectus, quia nihil est natum movere intellectum nisi habens rationem alicujus realitatis.

(It must be known that what is most common, including everything in itself, in accord with an analogous circle, is the thing or the some-thing, considered in such a way that nothing is opposed to it except pure and simple nothingness, which is not and cannot be outside the intellect, in the nature of things, and which is not in the concept of some understanding, either, because nothing is apt to set the understanding in movement except what has the reason of some reality.)

(Duns Scotus, *Quodlibet* 7, 1, in *Opera omnia*)

According to this same Scotist logic, the *entitas individuans*, or even the *proprietas individui*, which constitutes the *haecceitas* (the "thisness") of every singular being, will ultimately be defined as *realitas*, and even as *ultima realitas entis*.

II. The Influence of Duns Scotus on the Classical Age

Down to Bolzano and Peirce, the influence of this Scotist usage was considerable: we find a very clear testimony to this in the seventeenth century, in Micraelius's *Lexicon philosophicum terminorum philosophis usitatorum* (col. 1203–5):

> Realitas est aliquid in re. Ideoque in unaquaque re possunt multas realitates poni. . . . Realitates interim distinguendae sunt a re, in qua sunt. Sic in homine est realitas rationalitatis, animalitatis, substantialitatis.

> (Reality is something in the thing. So that in each thing several realities may be posited. . . . The realities must be distinguished from the thing in which they are. Thus the reality of rationality, animality, and substantiality is present in man.)

Thus, in a tradition that was still very much alive in the seventeenth century, but which our retrospective overestimation of the Cartesian "break" too often obscures, *realitas*, *aliquitas*, *essentia*, and *quidditas* remained almost synonymous notions (*Ordinatio* 1, dist. 3, qu. 1, n. 302, in *Opera omnia*, 3:184). Outside the Scotist tradition, Godfrey of Fontaines (in 1285 a professor of philosophy in Paris, where he continued to teach until 1304), seeking to define in turn the creature's eternal mode of being in the divine understanding, spoke of *realitas*, the latter now being determined as *realitas objectiva* (objective reality), that is, a reality that could be considered, prior to any existential positing, in its *esse objective* (objective being), that is, as something confronting the intellect and being capable of being an object for it:

> . . . . sicut ipsa realitas et essentia vel quidditas creaturae ab aeterno etiam non solum est essentia et quidditas realis in potentia et in esse cognito, sed in actu secundum esse essentiae reale et quidditativum. . . . Quare oportuit eas importare aliquam realitatem, quae esset obiectum verum et reale intellectus divini realiter differens a suo exemplari. . . .

> (Reality and the essence or the quiddity of the creature is from eternity not only a real essence and quiddity with the potential of being cognized, but an actual existing being of essence, according to the real and the quidditative. And so it was necessary to introduce some reality, which really would be the real and true object of the divine intellect differing from a copy.)

> (Godfrey of Fontaines, *Les quodlibet* 9, qu. 2)

All these propositions remain rigorously unintelligible if we understand by them, in the sense that now seems obvious, the terms "reality," "real," "object."

With the Scotist notion of reality, we are in fact not merely very distant from, but actually at, the antipodes of the modern notion of existence or objective reality (*Wirklichkeit*). From this point of view, even the *ultima realitas*, that is, the last characteristic trait that makes an *entitas quidditative* (quidditative entity) an *entitas ut haec* (an entity distinct from all others and ultimately characterized by its *haecceitas*) and that thus contributes to individuation, is still of a conceptual nature and does not include within itself the *essere existere* (being of existing or what existing is). Étienne Chauvin, in his *Lexicon rationale seu thesaurus philosophicus* (1692), perfectly summarized the Scotist use of the term—still defended by his late disciples (J. Poncius [J. Punch], 1603–1673; B. Mastrius, 1602–1673; B. Bellutius, 1600–1670) and also transmitted to academic metaphysics, notably by Suárez—by defining it in these terms:

> Realitas est diminutivum dictum a re. Et a Scotistis, qui primi vocis hujus inventores fuere, distinguitur a re: quod res sit id quod per se potest existere et non sit pars rei: realitas autem sit aliquid minus re. Et ideo ponunt in unaquaque re plures realitates, quas alio nomine appellant formalitates: in homine v.g. plures realitates ex Scotistarum sententia, puta esse substantiae, esse viventis, animalitas, et ultima denique realitas, per quam constituitur esse hominis, tanquam per differentiam ultimam, et ea est rationalitas.

> ("Reality" is a term derived from *res* ["thing"]. "Reality" is distinguished by the Scotists, who were the first to invent this term, from the *res*, because the *res* is what can exist by itself and is not part of something else; whereas a reality is something less than the thing. That is why they posit in each thing several realities that they also call by another name: "formalities." In man, for example, according to Scotist doctrine, there are several realities, for example the being of substance, the being of the living, animality, and finally the ultimate reality through which the being of man is constituted, as by an ultimate difference, and that is rationality.)

III. Descartes and the "Objective Reality" of the Idea

If one wants to understand and assess the decisions, both doctrinal and terminological, made by the great authors of the seventeenth century (Descartes, Spinoza, Leibniz, Malebranche, et al.), one has to always keep in mind this backdrop constituted by the then-prevalent Scotist usage, because it is in relation to it that deviations that have become invisible for us are defined. In Descartes, the term *realitas* is always associated with a determining adjective (formal reality, objective reality, subjective reality) and connected with the problematics of the idea. Descartes's first use of the formula *realitas objectiva* regarding the idea is found in the Third Meditation (*Œuvres*, 7:40.15 and 41.4), and it immediately called for explanations that were repeated in his correspondence and in the replies to queries. The formula itself is not new, but it is the meaning Descartes gives it that causes the difficulty, or rather it is the Cartesian context in which it appears. Let us summarize very briefly an extremely well-known line of argument: *Sum res cogitans*, "I am a thing that thinks," and the *modi cogitandi* are in me as in a subject. I have abandoned, as hyperbolic doubt forces me to do, the hypothesis—that is, the positing of *res extra me*—from which ideas are supposed to proceed and which they are supposed to resemble. The path that Descartes is trying to blaze is very narrow: "*alia via mihi occurrit*"—

But there is yet another method of inquiring whether any of the objects of which I have ideas within me exist outside of me. If ideas are taken as certain modes of thought [*cogitandi modi*], I recognize amongst them no difference or inequality, and all appear to proceed from me in the same manner; but when we consider them as images [*tanquam rerum imagines*], one representing one thing and the other another, it is clear that they are very different one from the other.

(*Meditations*, in *Œuvres*, 7:40.5)

How can these ideas be distinguished? Here a new, internal principle has to be found, a principle of diversification or unequalization among ideas, and this implies considering the idea as a representative form, essentially referred to an immanent content. Thus for Descartes the idea is always something mental, but it nonetheless presents itself at first as representative, which amounts to saying that, within the hypothesis of hyperbolic doubt, it is then or first of all representative of nothing (*nihil, nulla res*, in any case in the sense of the *res extra animam*). Such a use of the term "idea" to designate the content of human thought was completely unprecedented and must therefore have led to numerous misunderstandings. Thomistic Scholasticism usually reserved the term "idea" for the eternal archetypes in which God thinks things. According to the most common Scholastic doctrine, in fact, God knows things by conceiving his own essence as imitable; thus he has a representative and purely intelligible knowledge of them.

For Descartes, in contrast, the idea is a thing thought (*res cogitata*) that includes, as such, a double reality: on the one hand as *modus cogitandi* (and in the sense that all ideas are to be put on the same level), and on the other hand as a representative form that apprehends a determinate content and an intelligible reality that is sui generis:

Per realitatem objectivam ideae intelligo entitatem rei repraesentae per ideam, quatenus est in idea.

(By the objective reality of the idea, I mean that in respect of which the thing represented in the idea is an entity, in so far as that exists in the idea.)

(*Œuvres*, 7:161.4–6)

The reality of the idea is precisely the entity that is in turn a positive "thing"; even if it is an *ens deminitum* (a diminished being), yet it is not nothing, but something to which the principle of causality, taken in all its universality, can still be applied (*Meditations, Reply to Second Objections*, *Axioma* 3, *Œuvres*, 7:165.7–9). And if it is also true (*Axioma* 4) that "whatever reality or perfection exists in a thing [*realitas sive perfectio in aliqua re*], exists formally or else eminently in its first and adequate cause," then it appears that the *realitas objectiva* of our ideas cannot escape this general principle until the discovery of the idea of "a being supremely perfect" that "possesses so much objective reality (that is to say participates by representation in so many degrees of being and perfection)" that it necessarily requires an absolutely perfect cause (*Œuvres*, 7:41.24–29). Thus, thanks to the Cartesian transposition of the Scotist doctrine of the production of things in God in accord with their *esse intelligibile*, the idea considered

in its objective reality is neither a *fictum quid* nor an *ens rationis*, but indeed a *reale aliquid, quod distincte concipitur* (neither something fictive nor a rational entity, but indeed something that is real and conceived distinctly [ibid., 7:103.10–13]).

IV. Spinoza, Leibniz: Perfection and the Requirement of Existence

In the *Principia philosophiae cartesianae*, in which he faithfully sets forth the Cartesian doctrine of the *realitas ideae*, Spinoza stresses the hierarchized differentiation of the objectively represented content of the idea as soon as the latter is considered in its *realitas objectiva*: "[I]llam scilicet [ideam], quae objective continet esse et perfectionem substantiae, longe perfectiorem esse, quam illam, quae tantum objectivam perfectionem alicujus accidentis continet" (This idea that contains objectively the being and perfection of substance is far more perfect than that which contains only the objective perfection of any accident whatever; *Opera*, 1:153.29–154.2). Thus Spinoza, like Descartes, and following Duns Scotus, also explains *realitas* as *entitas* (ibid., 1:154.27–31), and even in the *Ethics*, *realitas* is still associated with *perfectio* (*Ethics*, in *Opera*, vol. 2, def. 6). For Leibniz as well, the ancient meaning of *realitas*, in conformity with the Scotist tradition in the broad sense, remains guiding and determining: reality does not primarily characterize the worldly object exterior to consciousness, but rather the content or tenor of what it apprehends as quiddity, or essence, or of what is objectively present in it. We see this especially in Leibniz's definitions of perfection, which always bring in the concept itself of *realitas*:

Ego definire malim perfectionem esse gradum seu quantitatem realitatis seu essentiae.

(I prefer to define perfection as the degree or quantity of reality or essence.)

(*Die philosophische Schriften*, 1:366)

Perfectio est essentiae gradus seu quod quid plus habet essentiae vel realitatis, eo est perfectius.

(Perfection is the degree of essence, that is, what has more essence or reality is thereby more perfect.)

(Quoted in Bodemann, *Die Leibniz-Handschriften*, 124)

Perfectio est gradus [seu quantitas] realitatis.

(Perfection is the degree [or quantity] of reality.)

(*Textes inédits*, 1.11)

Thus the reality does define something positive (*aliquid positivum et absolutum*), in proportion to the essence, even if this reality, precisely insofar as it pretends or aspires to existence in accord with its degree of perfection, requires a really—or, better, an actually—existing foundation: "[F]or if there is a reality in essences or possibilities, or in eternal truths, this reality must be founded on something existing and actual, and consequently in the existence of the necessary being" (*Monadology*, §44; cf. *Theodicy*, §184).

But what does "reality" mean in such a remarkable passage? It is not opposed to the possible as the actual is to the virtual: instead, it is the reality of the possible in the divine understanding;

that is, the reality of its substance, its peculiar tenor or determinateness. The reality is from the outset conceived as *essentia* or *realitas possibilis*, and it is as such that it appears as *exigentia existentiae*. Thus the reality, far from being opposed to the possible as a category of modality, constitutes its very being or the "lesser being."

> Omnia possibilia, seu essentiam vel realitatem possibilem exprimentia, pari jure ad existentiam tendere pro quantitate essentiae seu realitatis, vel pro gradu perfectionis quam involvunt.

> (All possibles, that is, everything that expresses an essence or a possible reality, tend, by the same right, toward existence, in function of the quantity of essence or reality, or the degree of perfection that they include.)

> (*De rerum originatione radicali*, in *Die philosophische Schriften*, 7:10)

Thus when Leibniz identifies *realitas* and *cogitabilitas*, or even reduces the former to the latter ("nihil aliud realitas quam cogitabilitas" [reality is nothing other than cogitability]; *Die philosophische Schriften*, 1:271), he is only drawing the ultimate conclusions from the movement that leads by stages from the essence or real perfection through Suárez's *essentia realis* to the possible defined as noncontradictory, thinkable (*cogitabile in universum quatenus tale est*; Leibniz, *Opuscules et fragments inédits*).

V. *Realitas*—"Reality"

However, we also find in Leibniz certain uses of the term *realitas*, or still more clearly, uses of the adjective *realis*, that anticipate the post-Kantian meaning of the word. For instance, distinguishing real phenomena from imaginary ones, Leibniz wonders, in his correspondence with Clark, about the reality of space and time; space and time cannot in fact be reduced to the *ordo possibilium existentiarum*, because neither one nor the other contain any *realitas* when abstracted from the divine immensity or eternity:

> Spatium, quemadmodum et tempus, nihil aliud sunt quam ordo possibilium existentiarum, in spatio simul, in tempore successive, realitasque eorum per se nulla est, extra divinam immensitatem atque aeternitatem.

> (Space and in a certain way also time are nothing other than the order of possible existences, simultaneously in space, successively in time, and their reality in themselves is null, outside the divine immensity and eternity.)

> (*Leibnizens mathematische Schriften* , 7:242)

> Sciendum est ante omnia, Vim quidem esse quiddam prorsus reale, in substantiis etiam creatis; at spatium, tempus et motum habere aliquid de ente rationis, nec per se, sed quatenus divina attributa, immensitatem, aeternitatem, operationem aut substantiarum creatarum vim involvunt, vera et realia esse.

> (It must be known first of all that force is something completely real, even in created substances; whereas space, time, and movement have something of the

rational entity, and are not by themselves real and true things, but only insofar as they include divine attributes, immensity, eternity, the operation or the force of created substances.)

> (*Specimen dynamicum*, in *Leibnizens mathematische Schriften*, 6:247)

Thus reality comes to designate, by opposition to the rational entity or the purely apparent, phenomenal being, what truly or actually exists, independent of the knowledge that a conscious subject may have of it. Perhaps we may see in this a distant anticipation of the new meaning of the term *realitas* that gradually established itself in English philosophy of the seventeenth and eighteenth centuries, when the term "reality" became a synonym of "existence," even if we still frequently encounter, especially in Berkeley, the classical expressions "reality of ideas," "reality of notions"—which can be interpreted in the direct line of the Scholastic tradition— to emphasize the truth or validity of ideas. However, the latter already refers to the reality of things that corresponds to the modern use of the term, taken as a synonym of "objectivity" (*Principles of Human Knowledge*, §33–36, in *Works of George Berkeley*; Locke, *An Essay*, bk. 2, chap. 22:30–32; bk. 4, chap. 4).

Whereas David Hume, in his *A Treatise of Human Nature* ("Of the Ideas of Space and Time," bk. 1, pt. 2), clearly opposes "reality" and "possibility": "the reality, or at least possibility, of the idea of a vacuum, may be proved by the following reasoning. . . ." Here reality is distinguished, as a modality, from possibility, whereas in the German academic tradition (so-called *Schulmetaphysik*), *Realität* (*realitas*) is always on the side of possibility. Let us also note that in Hume, to limit ourselves to him, the term "reality" appears most often in an adverbial form to indicate what is "in fact and reality," just as the adjective "real" is associated with the words "positive" and "existent" ("thing real and positive"; "something real and existent").

VI. The Kantian Heritage: Reality / Objective Reality, *Realität/Wirklichkeit*

Kant succeeds in keeping together two entirely heterogeneous meanings of "reality": one referrring, as a category of quality, to the Scholastic, and ultimately Scotist, use of the term; the other gesturing, as *objektive Realität* or *objektive Gültigkeit* (objective reality, objective validity), not backward toward a completely atypical Cartesian usage, but rather forward, toward the idea, obvious for us today, of objectivity. However, the first authors of the post-Kant period quickly put an end to this difficult tension: either, with Fichte and Schelling, by making the term "reality" (*Realität*) bear all the weight of positivity and positing, to the point of lending it the lexically completely unexpected meaning of unconditionality (*Unbedingheit* vs. *Ding*) or activity/actuality; or, with Hegel, by substituting for it, in this reference to actuality or to "energy," the term *Wirklichkeit*, "objective reality," whose emphatic use, not very much in accord with common usage, must then be justified.

A. The plurality of Kantian meanings

Kant's work certainly constitutes a decisive turning point in the history of the meanings of the term "reality" (*Realität*),

for if it still bears witness to the Scholastic meaning, shaped essentially by Scotism, of the Latin term *realitas*, on which the loan-word *Realität* is modeled, it introduced at the same time, through the notions of "objective reality" and "realization" (*Realisierung*), the modern meaning of the term as it later came to be used almost uncritically. For Kant, reality is a category of quality (*Critique of Pure Reason*, A 80/B 106), and not of modality, according to a usage that goes back, beyond Wolff, to Suárez and ultimately to Duns Scotus, since it designates the determination or qualitative determinacy of a *res* (its content-as-a-thing, *Sachverhalt*). The Latin term, which figures again in the *Critique of Pure Reason* (B 602 ff.), has as its equivalent strict *Sachheit* (which we will take care not to translate into French by *choséité*) in the sense of an external, physical thing (*Ding*).

But Kant is also the thinker who, thanks to complementary adjectival determinations (objective reality, empirical reality, subjective reality, etc.), is at the origin of the meaning that is now the most common: the real, in the dominant sense of the term "reality," is what is autonomous, independent of subjective conditions and of the process of knowledge—in short, external to the knowing subject and therefore endowed with an extramental being. Kant is, finally, the thinker who inaugurated, no doubt indirectly, an essential distinction that is peculiar to Germanic languages between *Realität* and *Wirklichkeit*.

After Kant, the problem of reality bears most often on the being-in-itself of things, in abstraction from knowing, in the tradition of Cartesian doubt relative to the reality of the external world. In truth, Descartes spoke of existence and never of reality in the sense of objective reality (*Meditationes*, Meditation 6: "De rerum materialium existentia et reali mentis a corpore distinctione" [The existence of material things, and the real distinction between mind and body]), whereas in the Kantian attempt at a "demonstration of the reality of the external world" (*Critique of Pure Reason*, B 274 ff.), it is always a matter, through the refutation of idealism, of demonstrating the *Wirklichkeit*, the "objective reality" of things outside oneself and independent of the inner sense. It is with the expression *objektive Realität* that we rediscover the common problematics of what is objectively given in sense experience:

Wenn eine Erkenntnis objektive Realität haben, d.i. sich auf einen Gegenstand beziehen, und in demselben Bedeutung und Sinn haben soll, so muß der Gegenstand auf irgend eine Art gegeben werden können.

(If knowledge is to have objective reality, that is, to relate to an object, and is to acquire meaning and significance in respect to it, the object must be capable of being in some manner given.)

(Kant, *Critique of Pure Reason*, A 155 /B 194)

Thus only perception (*Wahrnehmung*) is capable of providing the matter (*Stoff*) of our concepts, and it is also perception that is the "sole mark of actuality" (*Wirklichkeit*) (ibid., A 225/B 273). Knowledge therefore cannot have objective reality, that is, relate its concepts to objects insofar as an object is given through the senses. If the object is given, "the *possibility of experience* is, then, what gives objective reality to all our *a priori* modes of knowledge" (ibid., A 156 /B 195). There is therefore

objective reality (*objektive Realität*) only insofar as the relation of our concepts to an object (*Gegenstand, Objekt*) is provided or attested. What makes the objective reality of a concept is surely its relation to the object given in a possible experience, but, as Heidegger in particular emphasized, the concept itself, considered in its real content (*Sachgehalt*), includes within itself, in a latent or implicit manner, this reference to actuality and existence (*Phenomenological Interpretation*). With regard to space or time, empirical reality is opposed to "absolute reality" (Kant, *Critique of Pure Reason*, A 35/B 52) and defines their "objective validity" (*objektive Gültigkeit*) with respect to all the objects that can ever be given to our senses (ibid.). To say of time, for instance, that its reality is subjective thus means that if we abstract from the subjective conditions of empirical intuition, it is no longer anything: its reality is subjective, that is, directly related to inner experience. Although as a general rule, and particularly when he associates reality, substantiality, and causality, Kant denies these concepts any meaning capable of determining an object outside their use in possible experience (ibid., A 677 /B 705, A 679/B 707); he also sometimes defines the reality of ideal concepts by distinguishing them from rational entities or pure chimeras.

B. Fichte and Schelling: The fundamental ontological distinctions of the German language

In the *Grundlage der gesamten Wissenschaftslehre* (*Foundations of the Entire Science of Knowledge*, 1794), Fichte notes, in a not very Kantian way:

The Ego can determine itself only as reality [*Realität*], because it is posited purely and simply as reality . . . and no negation is posited in it . . . every reality [*Realität*] is posited in the Ego, but the non-Ego is opposed to the Ego. . . . Every non-Ego is negation [*Negation*], and it thus has no reality in itself [*es hat gar keine Realität in sich*].

(*Science of Knowledge*, pt. 1, §2)

And it is no doubt echoing Fichte that Schelling uses the term *Realität* in *Vom Ich als Prinzip der Philosophie oder über das Unbedingte im menschlichen Wissen* (*Of the I as the Principle of Philosophy or, On the Unconditional in Human Knowledge*; 1795): here, "reality" designates not the "thing" (*Ding*), but the unconditioned (*das Unbedingte*):

The philosophical formation of languages, whose major traits remain perceptible especially in the original languages, is a genuine marvel produced by the mechanism of the human mind. Thus our German word *bedingen* ("to condition"), along with its derivatives . . . is in fact an excellent term, of which it might almost be said that it includes the whole treasury of philosophical wisdom. *Bedingen* designates the action by which any thing becomes a *Ding* ("thing"), whence it follows at the same time that by itself nothing can be posited as a *Ding*, in other words, that an unconditioned thing [*ein unbedingtes Ding*] is a contradiction in terms. The unconditioned is in fact what cannot be transformed into a thing, can never become a thing [*zum Ding werden, zum Ding gemacht sein*].

(*Of the I*, §3)

The subtitle of *Of the I* is *On the Unconditional in Human Knowledge*, and its initial purpose was defined in these terms: "etwas zu finden, das schlechterdings nicht als Ding gedacht werden kann" (to find something that simply cannot be conceived as a thing), that is, what provides human knowledge with its "reality" (*Realität*). A little later in the same work (§15, n. 3), Schelling comes back to the privilege of language—the German language—when it is a matter of ontological distinctions as fundamental as those that concern being, existing, reality, and objective reality:

It is striking to observe that most languages have the advantage of being able to distinguish absolute being [*das absolute Sein*] from all conditioned existing [*bedingtes Existiren*]. Such a differentiation, which is found in all primitive languages, refers back to an originary ground which, as soon as language is first elaborated, has already determined this differentiation, without people even being aware of it. But it is no less striking to observe that most philosophers still do not make use of this asset offered by their language. Almost all of them use the words "be," "be there," "existence," "actuality" [*Sein, Dasein, Existenz, Wirklichkeit*] almost as if they were synonymous. However, the word "be" obviously expresses pure, absolute being-posited [*das reine, absolute Gesetzt-sein*], whereas existence [*Dasein*] already designates etymologically a posited being that is conditioned, limited [*ein bedingtes, eingeschränktes Gesetztsein*]. And yet people commonly talk, for example, about the existence of God [*Dasein Gottes*], as if God could actually be there, that is, in a conditioned, empirical way . . . . Someone who can say of the absolute Ego: "It is actual" [*wirklich*] knows nothing about it. *Sein* expresses being posited as absolute whereas *Dasein* expresses a being posited as conditioned in general, whereas *Wirklichkeit* expresses a being posited as conditioned in a determinate way, by a determined condition.

A lexical consideration that is extended in the *Briefe über Dogmatismus und Kritizismus* (*Letters on Dogmatism and Criticism*):

It is nonetheless striking to note that the German language already makes such a precise distinction between the actual [*das Wirklichkeit*] (what is given in sensation or has an effect on me, and on which I have a retroactive effect [*auf mich wirkt und worauf ich zurückwirke*]), the being-there [*das Daseiende*] (what is there in general, that is, in space and time), and being (what is purely and simply by itself, independently of any temporal condition).

(Sixth Letter, n. 1, in *Historisch-Kritische Ausgabe*, ser. 1, 3:77–78)

C. Reality as a positive ontological category

After Kant, it was the distribution of *Realität* and *Wirklichkeit* in the framework of the categories of quality and modality, respectively, that gradually tended to become blurred. In this process, Kant's critique of the ontological argument and his determination of being as positing (*Setzung, Position*) must certainly have played a crucial role: if Fichte, for example, in the *Grundlage der gesamten Wissenschaftslehre* (1794), continued to oppose reality and negation directly by associating reality, identity, possibility, and essentiality, he quickly emphasized as well that reality, which has its ultimate source in the Ego, must, like the latter, be defined in terms of activity and positing:

If we abstract from all judging as determined acting, and if we consider solely the mode of the human mind's action given through this form, we obtain the category of reality [*die Kategorie der Realität*]. Everything to which the proposition A = A can be applied has reality [*Realität hat*] precisely insofar as this form is applied. What is posited by the simple positing of anything (posited in the Ego) is reality [*Realität*] in it, is its essence [*Wesen*].

(*Grundlage*, 2:261)

These quotations from Fichte and Schelling show how on the one hand Kant's usage (reality vs. negation) is faithfully maintained, and on the other, how a new theoretical and conceptual proximity is established: that between reality and activity (*Aktuosität*, Leibniz would have said) that no doubt constitutes an indispensable historical mediation here. Thus Fichte notes (ibid.): "Aller Realität Quelle ist das Ich. Erst durch und mit dem Ich ist der Begriff der Realität gegeben" (The Ego is the source of all reality. It is only through and with the Ego that the concept of reality is given). If the Ego is understood as activity (*Thätigkeit*), self-positing (*Sich-setzen*), the conclusion is inevitable: "Alle Realität ist thätig; und alles thätige ist Realität. Thätigkeit ist positive Realität" (All reality is active; and everything that is active is reality. Activity is positive reality).

In his *System des transcendentalen Idealismus* (1800), Schelling also associates reality, egoity, and self-positing activity: "Das Ich ist Prinzip der Realität, das Objekt hat abgeleitete Realität . . . es gibt einen höheren Begriff als den des Dinges, nämlich den des Handelns, der Tätigkeit" (The Ego is the principle of reality, the object has a derivative reality . . . there is a higher concept than that of the thing, namely action, activity; *Historisch-Kritische Ausgabe*, vol. 9, bk. 1). Hegel, in his *Science of Logic*, also adopts Kant's distinction only to subvert it by reintroducing the moment of negation into the very heart of reality as a category of quality as soon as the latter is determined.

D. Actual reality, *Wirklichkeit*

Hegel's famous formula in the preface to the *Elements of the Philosophy of Right* (*Grundlinien der Philosophie des Rechts*, 821): "[W]hat is real [*wirklich*] is rational [*vernunftig*], and what is rational [*vernunftig*] is real" is no more obvious in German than in its English translation, as is amply shown by the criticisms to which it was soon subjected (Von Thaden, Haym, et al.) and especially by Hegel's repeated clarifications. This clearly indicates that the Hegelian meaning of the term *Wirklichkeit*, even if it draws on the same resources of the German language and the paronymic series *Werk, wirken, Wirkung, wirklich, Wirklichkeit, Verwirklichung* . . . , was initially constructed theoretically. In the addition to section 142 of the *Encyclopedia of the Philosophical Sciences* (1817–30, in *Werke*,

vols. 8–10), Hegel denounces the trivial opposition between "idea," "correctness," "truth," and "actuality," taken in the sense of "sensible external existence":

> Ideas are not simply lodged in our heads, and the idea in general is not something so powerless that its realization [*Realisierung*] depends on our good will to be achieved [*bewerkstelligen*] or not achieved, but it is instead what is at the same time absolutely efficient and also actual [*das schlechthin Wirkende zugleich und auch Wirkliche*].

Thus actuality will not be confused with reality, nor the actual with the real, first of all because we must distinguish the actual from simple appearance, *Erscheinung* (*Science of Logic*), and second because, according to the proper use of the language, "we hesitate to recognize as a poet or statesman someone who cannot accomplish anything substantial and rational, like a true poet [*wirklicher Dichter*] or a genuine statesman [*wirklicher Staatsmann*]" (*Encyclopedia*, addition to §142). Philosophy, in contrast to common sense, will thus not oppose the idea or ideality to actual reality but will recognize in the Idea only what is "true" and will consider it as *energeia* [ἐνέργεια], as "the interior which is absolutely outside [*das Innere, welches schlechthin heraus ist*], and consequently as the unity of the inside and the outside, or like actuality, in the emphatic sense of the word, the one to which we refer here" (ibid.). Returning once again to the formula in the preface to the *Elements of the Philosophy of Right*, in the introduction to the second version of the *Encyclopedia* (§6), Hegel explains that it is important to distinguish in existence (*Dasein*) what is mere appearance (*Erscheinung*) from what is only partly *Wirklichkeit*. Here again, we must distinguish "the aspect of things that does not deserve the emphatic name of actuality," the contingent, the possible, being-there, the existence of actuality. Regarding the emphatic sense of "actuality," we can rely on the economical formulation in the *Encyclopedia*:

> Actuality is the unity, which has become immediate, of essence and existence, or of the inside and the outside. The exteriorization of the actual is the actual itself [*die Äusserung des Wirklichen ist das Wirkliche selbst*], so that in it there also remains an essential element [*ebenso Wesentliches bleibt*], and it is an essential element only insofar as it is in an immediate external existence [*in einer unmittelbarer äußerlicher Existenz*].
>
> (*Encyclopedia*, 1817, §91)

That is, for Hegel, the true reconciliation or rather the transcendence of the opposition between Plato and Aristotle: the Idea (*idea*, [ἰδέα, εἶδος]) become actual (*energeia* [ἐνέργεια]). And Hegel clarifies the thesis, repeated in the *Science of Logic*:

> Earlier, being [*Sein*] and existence [*Existenz*] were presented as forms of the immediate; being is in a general way immediacy and not reflected, and passage [*Übergang*] into the Other. Existence is immediate unity of being and reflection; that is why it is appearance [*Erscheinung*], it proceeds from the ground and returns to it [*kommt aus dem Grunde und geht zu Grunde*]. The actual is the being-posited of this unity, Relationship [*Verhältnis*] become

identical itself; it is consequently exempt from the passage [into the Other], and its exteriority [*Äußerlichkeit*] is its energy [*Energie*]; it is reflected in the latter in itself; its being-there is only the manifestation of itself [*die Manifestation seiner selbst*], not of an Other.

This commentary, which is rather dense, provides the essential clues that allow us to understand in what way the "emphatic" Hegelian thematization of *Wirklichkeit* in a sense merely extends the terminological use established by Christian Wolff and so-called German academic philosophy, and it thereby also reconnects with one of the classical motifs of existence understood as *ex sistere, poni extra causas*, but it also and especially constitutes Hegel's genuine newness. It is the newness of a beyond-phenomenology that is not limited to appearance (*Erscheinung*) in its indefinite movement of coming into existence and perishing, but attempts to apprehend exteriority itself as "energy" (*Wirksamkeit*): actuality is manifest and manifestation, manifestation of nothing other than oneself, and manifestation in oneself; that is, it is also "reflection." The *Science of Logic* (*Wissenschaft der Logik*) explains that

> [w]hat is actual can act [*was wirklich ist, kann wirken*]; its actuality makes something known by what it brings forth [*seine Wirklichkeit gibt etwas kund durch das, was es hervorbringt*]; its being-in-relation to the Other is the manifestation of itself [*die Manifestation seiner*].

The reader will have recognized here the highest Hegelian figure of the mind, the one that makes it possible to conclude the *Encyclopedia*'s "philosophy of mind" in its last chapter ("Absolute Spirit") with a long quotation from Aristotle's *Metaphysics* (50.7.1072b 18–30).

REASON

The English word "reason" and the French word *raison* are both formed on the basis of *reor* (to count or calculate), whence "think, believe." The Latin verb translates the Greek *legein* [λέγειν], two of whose principal meanings it retains, but only two: "count" and "think." The third principal meaning of the Greek term, "speak, discourse," which designates a third type of putting into relation and proportion, is rendered by other Latin series (*dicere*, *loquor*, *orationem*, or *sermonem habere*), so that ultimately the Greek word *logos* [λόγος] is approached by Latin philosophers by means of a syntagm, *ratio et oratio* (reason and discourse). Each vernacular fragments the meaning of *logos* into a greater or lesser

plurality of meanings, each represented by one or more specific words. The first question, from the point of view of the difference of languages, is thus that of the breadth of the meaning of "reason" or its equivalents, and of the systems diffracting the meanings of *logos* and then of *ratio*. A presentation of this will be found under LOGOS (see also LANGUAGE, PROPOSITION, WORD).

But another complex of problems immediately arises. The Latin *ratio* absorbs the meanings of other Greek terms, such as *nous* [νοῦς] (mind) and *dianoia* [διάνοια] (intelligence), which are also translated in other, more technical ways, such as *intellectus*; so that "reason," in the sense of "rationality," is a comprehensive term, whereas "reason" in the sense of "intellect" or "understanding" is a singular and differentiated faculty. However, none of the comprehensive terms or systems of opposition coincides with those of another language, which are moreover changing. Under INTELLECTUS one will find a way of conceiving these divergences on the basis of the polysemy of *intellectus* and of the Latin pair *intellectus/ratio* (cf. INTELLECTUS, Box 2), which is related to the Greek *nous/dianoia*, and opens onto other theoretically marked systems such as the Kantian pair *Verstand/Vernunft*. This should be complemented by the entries for INTELLECT and UNDERSTANDING.

I. Reason and Rationality

A. Man, animal, god

Since Aristotle's definition of man as an "animal endowed with *logos*," which Latin writers rendered by *animal rationale*—omitting the discursive dimension—reason, or the *logos*, is a specific difference that defines man by his difference from other living beings and/or his participation in a divine or cosmic nature: see LOGOS and ANIMAL, *DISCOURSE,* SPEECH ACT; cf. GOD, *HUMANITY,* NATURE, *WORLD*. On the discursive dimension properly so called, see also *ÉNONCÉ,* INTENTION, LANGUAGE, SENSE, SIGN, SIGNIFIER/SIGNIFIED, TO TRANSLATE, WORD.

See also POLIS, and BILDUNG, *CONSENSUS,* POLITICS concerning the other Aristotelian definition of man as a "political animal."

B. Reason and madness

Reason is opposed to madness understood as "dementia." On the privative vocabulary that is one of the possible ways of describing madness, see MADNESS; cf. *MALAISE.*

More broadly, reason is conceived in terms of difference from what does not belong to its domain and falls outside its immediate law, but which man may, in certain ways, share with other animals, such as sensation, passion, imagination, and possibly memory: see PERCEPTION, *IMAGINATION* [BILD, FANCY, PHANTASIA], MEMORY, PATHOS, *TO SENSE* [FEELING, GEFÜHL].

See also discussions on the way in which psychoanalysis conceives and names these relations: DRIVE, ENTSTELLUNG, ES, UNCONSCIOUS, VERNEINUNG, *WITTICISM,* WUNSCH.

C. Rationality and the principle of intelligibility

Rationality, defined by the *logos*, is connected with logic as the art of speaking and thinking, and with its founding principles. Under PRINCIPLE, the principle of noncontradiction

(see also HOMONYM) is explored, as well as that of the principle of reason (*principium reddendae rationis*, *Satz vom Grund*). More broadly, see PREDICATION, SUBJECT, *TO BE*, TRUTH; cf. ABSTRACTION, *ABSURD, THING*, UNIVERSALS.

Finally, rationality functions as a principle of the intelligibility of the world and history, particularly in Hegel: see ATTUALITÀ, AUFHEBEN, CLAIM, GERMAN, HISTORIA UNIVERSALIS, LIGHT, PERFECTIBILITY, PLASTICITY, *RUSE,* SECULARIZATION; cf. II.C of this entry.

II. The Partitions of Reason

A. Semantic diffractions

Although there is no language that retains under a single word all the meanings of *logos* (except by bringing *logos* into the language in question), the distribution of these meanings is more or less close to Latin. For the classical French word *raison*, which maintains almost all the Latin meanings (including the mathematical sense of proportion: *raison d'une série*, *raison inverse*), a contemporary French-German dictionary proposes the following terms: *Vernunft, Verstand* (rational faculty; see UNDERSTANDING and also II.B of this entry), *Billigkeit* (acceptability; cf. CLAIM), *Recht* (law, right), *Recht haben* (to be right; see LEX, RULE OF LAW; cf. DUTY, MACHT), *Grund* (ground, foundation), *Satz vom Grund* (principle of reason; see PRINCIPLE), *Ursache* (cause; cf. DASEIN, GEGENSTAND, RES, *THING*), *Anlass* (motive), *Erklärung* (explanation; see GERMAN, TO TRANSLATE, UNDERSTANDING), *Rechenschaft* (calculation, account), *Genugtuung* (satisfaction; see PLEASURE), *Firma* (firm; cf. ENTREPRENEUR), *Proportion*, *Verhältnis* (proportion, relation) (*Hand-Wörterbuch*, F-D, D-F, Weis-Mattutat, Klett-Bordas, 1968). This example shows that the whole of the vocabulary is thus mobilized.

B. Reason and faculties

We can distinguish between two interfering systems: the first designates reason, identified with thought in general, in its relationship to a bodily and/or mental instance; the second situates reason in a hierarchy of faculties whose organization it determines.

Regarding the first system, as it is expressed in various languages, see SOUL (where one will find studies of the main distortions, especially around English "mind," German *Geist*, and French *esprit*, along with the main metaphors that serve to express the mental in ancient Greek, Latin, and Hebrew), CONSCIOUSNESS, *HEART*. We will emphasize especially the ways of designating reason and mind that appear to be the most irreducible from one language to another: thus Greek LOGOS, MÊTIS, Latin INGENIUM, Basque GOGO, and German GEMÜT; cf. Italian CONCETTO, and GENIUS; see also FRENCH and GERMAN.

Regarding the second system, and the partitions that do not coincide, see UNDERSTANDING (under which the Kantian vocabulary is set forth, and in particular the distinction *Verstand/Vernunft*), and INTELLECT, INTELLECTUS, *INTUITION*, REPRÉSENTATION, SENSUS COMMUNIS.

C. Speculative reason, practical reason

From Plato and Aristotle to Kant and beyond, two great domains of rationality have been distinguished: theory, or speculative reason, and practice.

Regarding the former, see especially II.B of this entry; cf. AESTHETICS, EPISTEMOLOGY, GEISTESWISSENSCHAFTEN.

Regarding the latter, see ART, DUTY, GLÜCK, *LIBERTY*, MORALS, PHRONÊSIS, PRAXIS, WILL, *WISDOM*; cf. *ACT*, and I.C of this entry.

➤ *CROYANCE*, UTILITY

| RÉCIT

The French word *récit*, from Latin *recitare*, which means "to read out loud (a law, a document, a letter), give a public reading" (*citare* means first of all "set in motion," whence "lift one's voice in song"), is one of the ways of designating narrative. Under ERZÄHLEN the reader will find a comparison of the French and German terminological systems. See also ROMANTIC.

In addition, *récit* is one of the possible translations of a certain number of Greek words, in particular *muthos* [μῦθος], which, when distinguished from *logos* [λόγος] (rational language), can also be rendered in French by *mythe*; when distinguished from *ergon* [ἔργον] (act), by *parole*; when distinguished from *diêgêsis* [διήγησις] (simple narration), by *récit dialogué*; when distinguished from *êthos* [ἦθος] (character), by *fable*; when distinguished from *historia* [ἱστορία] (narrative of facts), by *fiction*: see HISTORY, LOGOS, MIMÊSIS. See also DESCRIPTION (on the various ways of "showing" and the vocabulary of *ekphrasis* [ἔκφρασις], see DESCRIPTION, Box 1), DICHTUNG, *FICTION* (and on the vocabulary of the "plastic," see ART, PLASTICITY), *STYLE*.

➤ *PHÉNOMÈNE*, REALITY, SPEECH ACT, *THING*, TRUTH

| REFERENCE

"Reference" (from the Lat. *referre*, "to report, relate") is, along with "denotation," one of the accepted translations of the German *Bedeutung* as distinguished from *Sinn*: see especially SENSE, V. On the relationship to the referent, particularly in regard to the medieval semantics of *suppositio*, see SENSE, III.B, and SUPPOSITION; cf. INTENTION, SACHVERHALT, SIGN.

➤ *AUTHORITY*, OBJECT, REALITY, *RÉCIT*, SIGNIFIER/SIGNIFIED, WORD

| RELIGIO (LATIN)

ENGLISH	religion
FRENCH	*religion, culte, crainte*

➤ *RELIGION*, and *CROYANCE* [BELIEF, GLAUBE], *DESTINY*, *DROIT*, *FAITH*, GOD, LEX, PIETAS, SIGN, THEMIS, *WORLD*

It is on the basis of the use of the term *religio* in Latin philosophers that we can understand the extension given the word in the Christian West. In Classical Latin, the meanings of *religio* never exactly coincided with those attested for the term "religion" in English and French, which designates both a set of practices of worship and the

beliefs on which the latter are based. It was Christianity that unified the distinct uses of the word *religio* and defined it in relation to an object of belief, as it is expressed by the use of the objective genitive *religio veri Dei* (the religion of the true God). But if Christianity's original contribution consisted in giving a doctrinal content to the term, it was the Roman philosophers of the first century BCE (Cicero and Lucretius) who changed the word's spheres of use, and it was their polemics that established in the Latin language the oppositions that were taken up again by their Christian readers, Lactantius, Arnobius, and Augustine.

I. From Reading Signs to Worshiping the Gods

In its most frequent uses, *religio* designates the scrupulous attention given to signs, whether these are manifestations external to the individual or, on the contrary, modifications on the psychological level, such as fear, doubt, or apprehension, which prescribe decisions or prevent us from making them. Used in this way, the term *religio* does not apply exclusively to the sphere of relations with the gods; on the other hand, it is not the same as respect for codes or prescriptions. These codes are in fact not rigorously fixed and the possibilities of error are great, to judge by the numerous anecdotes related by Roman historians (see Scheid, *Religion et piété à Rome*). The evaluation of what should be done thus remains subjective, and flows from an estimate that may be mistaken, and never excludes fear.

When *religio* covers the whole of the practices of worship, as is shown by Cicero's definition, "religio, id est cultus deorum" (religion, that is, the worship of the gods) (*De natura deorum*, 2.8), we can assert that this synthetic use of the term is the consequence of taking a philosophical position. This emerges clearly from the whole of the text from which this definition is drawn. It is a Stoic who is speaking, and who wants to prove—against his Epicurean and Neo-Academic interlocutors—that the Stoic doctrine is the only one capable of coinciding with Roman practices, or rather, of making them intelligible: with this in mind, he seeks to grasp the unification of the meanings of *religio* by using the term in six distinct ways:

> Caelius tells us how Flaminius met his death at Lake Thrasimene because he neglected the signs (*religione neglecta*) and caused great damage to the state.... Those who have obeyed the injunctions that were signified to them (*qui religionibus paruissent*) have made the state prosper. If we compare our institutions with those of foreign peoples, we will discover that we are equal or even inferior in every other respect, but for religion, that is, the worship of the gods, we are far superior. And in truth, respect for the rites exercised such power (*tanta religionis vis*) over our ancestors that some generals fulfilled the vows they had made to the gods on behalf of the state—their heads veiled and uttering the set words—by committing suicide.... Gracchus, who had nonetheless held the elections and realized that the affair was going to arouse fears among the citizens as a whole (*in religionem populo venisse*), reported the results to the Senate.... Thus this man who was above all others in wisdom preferred to admit a mistake that he could well have concealed rather than associate the state with any impiety (*haerere in re publica religionem*);

the consuls immediately gave up their powers rather than keep them a moment longer in defiance of religious prescriptions (*contra religionem*).

> (Cicero, *De natura deorum*, 2.8–11)

II. The *Religio/Superstitio* Opposition

This unification of the diverse uses of *religio*—which authorizes the uniqueness of the term—is also realized by means of the opposition between *religio* and *superstitio*. The distinction between the two terms, which resulted from efforts to define it made by philosophers and not by the guardians of the rites, made it possible to give a positive content to *religio* at a time when Lucretius, on the contrary, was using *religio* exclusively to designate the fearful observation of uncomprehended rites that is generally translated by "superstition": *turpis religio* (2.660), *antiquae religiones* (6.62). It was in opposition to this sense given to *religio* by Lucretius that we must assess the definition Cicero offers in *De divinatione*:

> It is not true that in suppressing superstition we are also suppressing religion. On the one hand, we act wisely when we maintain the ancestors' institutions by preserving rites and festivals, and on the other hand, the beauty of the world and the order of the heavenly phenomena force us to recognize that there is a superior and eternal nature that the human race must honor with its veneration.

> (Nec vero superstitione tollenda religio tollitur. Nam et majorum instituta tueri sacris caerimoniisque retinendis sapientis est, et esse praestantem aliquam aeternamque naturam, et eam suspiciendam admirandamque hominum generi pulchritudo mundi ordoque rerum caelestium cogit confiteri.)

> (*De divinatione*, 2.148)

The content given to *religio* associates the respectful preservation of the rites—because they were instituted by the ancestors—with the principal cause, according to the Greek philosophical tradition, of the formation of the belief in the divine, namely, admiration for the order and beauty of the world.

It is on the basis of this definition that we can understand the way Christian writers developed the word *religio*, even though they did not use the same criterion for distinguishing between religion and superstition: it is not how the gods are honored but which gods are honored that is crucial: "Religion is the worship of the true, superstition is the worship of the false" (religio veri cultus est, superstitio falsi). What matters is what one worships (*quid colas*), and not the way in which one does it (*quemadmodum colas*) (Lactantius, *Divine Institutions*, 4.28).

When attempts were made to show through etymology how *religio* could designate both a practice and what qualifies it in contrast to superstition, the transformation of the Latin word came into play. In the dialogue in the *Nature of the Gods*, the Stoic proposed in fact this twofold etymology: "those who, for days on end, prayed and sacrificed so that their children might survive (*superstites essent*), have been called superstitious (*superstitiosi*) ... but those who examined carefully and, so to speak, gathered together (*tamquam relegerent*)

everything that is related to the worship of the gods were called religious (*religiosi*), from the word *relegere*." This etymology emphasizes that which, in *religio*, refers to the scrupulous observation of the rites and associates their practice with the knowledge of its foundations: *relegere* means to gather together and reread to understand, as Varro did at the same time in his *Antiquitates rerum humanarum et divinarum*.

III. *Religio, Pietas, Sanctitas, Fides*

Another etymology was proposed by Lactantius, who emphasized instead the "bond":

> Hoc vinculo pietatis obstricti Deo et religati sumus: unde ipsa religio nomen accepit, non, ut Cicero interpretatus est, a relegendo. . . . Diximus nomen religionis a vinculo pietatis esse deductum quod hominem sibi Deus religaverit et pietate constrinxerit, quia servire nos ei ut domino et obsequi ut patri necesse est.

> (It is by this bond of piety that we are attached and bound to God. It is from this that religion has received its name, and not, as Cicero claimed, from the word *relegere*. . . . We have said that the word "religion" was deduced from the bond of piety, because God binds man to him and attaches him by piety, since we must necessarily serve him as a master and obey him as a father.)

> (*Divine Institutions*, 4.28.3–12)

Although Lactantius's etymology seems less well founded than that of the Stoics (see RT: *Le Vocabulaire des institutions indo-européennes*), it allows us in any case to understand the critical moment when the term *religio* included all the relations with the gods, in a synthesis of the juridical and moral links that entered into the definition of the word in the classical period.

By using the vocabulary of the bond, *vinculum-religare-constringere*, Lactantius emphasized the importance of *pietas*. In Classical Latin, *pietas* designates a type of relation that assumes that one performs the duties connected with the recognition of a juridical (and not natural) link, that of a son to his father, in particular. Thence proceeded the definition "pietas est justitia adversus deos" (piety is justice toward the gods) (*The Nature of the Gods*, 1.116). It was also the legal relationship that prevailed in *sanctitas*, covering everything that is protected by the sanction of the laws (*sanctire*). In addition to *pietas* and *sanctitas*, *fides* clearly defines the juridical sphere in which the relations of *religio* are defined: *fides* designates, on the basis of the protection that the victor owes to the vanquished, the guarantee provided by the state or by the gods who are implored "pro fidem deum." It was these three terms, associated in fluid semantic configurations, that allowed the elaboration of the definition proposed by Lactantius.

The inflection undergone by these three terms took place on the basis of a transfer of human relations to relations with the gods. In the particular case of *fides*, the inflection consisted in exploiting another field, that of rhetorical persuasion: to elicit the audience's confidence (*fides*), to obtain its assent (*fides*). The transition from persuasion to belief passed through the vocabulary of knowledge: "fides est firma opinio" (Cicero, *Partitiones oratoriae*, 9). Thus *opiniones* can designate all the kinds of knowledge the ancestors had

of the gods, and these kinds of knowledge, as such, were just as immutable as the rites instituted: "I shall defend the beliefs that our ancestors transmitted to us regarding the immortal gods, the rites and the practices of worship" (opinions quas a majoribus accepimus de dis immortalibus, sacra, caerimonias religionesque) (*De natura deorum*, 3.5).

On the other hand, in classical usage we find no equivalent of a "belief in something." "The gods exist (or not)" is a proposition that is attached to a declarative verb, indicates a decision (*placet* [*De natura deorum,* 1.62]) or, finally, develops, in the Epicureans and Stoics, the content of a "pre-notion" (see ibid., 1.44–45; 2.13). As the object of an affirmation or negation, the proposition "the gods exist" cannot be governed by *credere*, whose epistemological value is too weak in Classical Latin. The closest approximation for an element of belief is the verb *suspicari* (to suspect, conjecture): "You blamed those who . . . , seeing the world . . . , suspected the existence of an excellent and eminent nature . . . [suspicati essent aliquam excellentem esse praestantem naturam)]. But you, what masterpiece can you show us that makes you conjecture the existence of the gods [ex quo esse deos suspicere]?" (ibid., 1.100).

RELIGION

"Religion" is borrowed from the Latin *religio* (scrupulous attention), which is sometimes connected with the notion of "bond," from *religare* (bind), and sometimes with that of "collection, collect," from *relegere* (recollect), and includes a set of ritualized relations with the gods, but also relations of a juridical and moral order. Regarding the Latin word and its crucial Christian inflection, see RELIGIO and PIETAS; cf. LEX.

More generally, see the following:

1. On the relation between humans and the god(s), and on the representation of the sacred, see *ALLIANCE*, BOGOČELOVEČESTVO, *DEMON* [DAIMÔN, DUENDE], DEVIL, GOD; cf. *DESTINY, HUMANITY*.
2. On the relation between humans, the god(s), and the world, and on the mediation of the church, see also BERUF, SECULARIZATION, SOBORNOST' (and on Orthodox Christianity, *CONCILIARITY*); cf. *WORLD* [SVET, WELT].
3. On the vocabulary of belief, and on the relation between faith and reason, see *CROYANCE* [BELIEF, GLAUBE], REPRÉSENTATION.

REPRÉSENTATION (FRENCH)

ENGLISH   representation
GERMAN   *Vorstellung, Repräsentierung, Vertretung*
LATIN   *repraesentatio*

➤ BEGRIFF, CONSCIOUSNESS, DRIVE, ERSCHEINUNG, INTENTION, MIMÊSIS, PERCEPTION, PHANTASIA, *REASON*, SACHVERHALT, SENSE, SOUL, TRUTH, WILL

The term *représentation* can designate a relation, an action, or a vehicle of representation. The German terms *Repräsentierung* and *Vertretung* are used mainly to designate the action or relationship of representation. In Kant a *Vorstellung* implies a relation of representation, but it also has the characteristics of a vehicle. According to Frege, a *Vorstellung* is a secondary vehicle that has no intrinsic representative value. Moreover, he uses the term *Vertretung* in a different sense, to designate a logical relation between a concept and the object that "takes its place." The English term "representation," like the corresponding French term, has often been opposed to "presentation" (*présentation*). We also speak of mental or internal representations, by opposition to linguistic and iconic representations.

I. The Open Texture of the Term *Représentation*

The open texture of the term *représentation* is the main problem involved in using it to translate a philosopheme in a foreign language: the concept that it expresses is only partially determined and has optional marks (in the sense of Frege's *Merkmale*, that is, characteristics that every object that is subsumed under a concept has to have; see MERKMAL) that are sometimes mutually incompatible. The use of this term thus raises questions that the philosopher and translator have to answer if they intend to use it in a coherent way. It is useful to distinguish two groups of pertinent questions, even though this list is not exhaustive.

A. *Représentation*: A relationship, an action, or a vehicle?

The first question concerns the ontological status of representation. The term *représentation* can be considered the nominalization of the verb "to represent." In that case it designates either a simple relationship or the (relational) action of being represented. In general, a representation is a representation *of* something. The notion of representation thus typically includes the idea of a relationship. Since Brentano this notion has been associated with that of intentionality, understood here as a representation's property of referring to something other than itself (or simply to itself, in the borderline case of a self-reflexive representation such as: "The present sentence is false"). The simplest logical form of a representation is a dyadic relationship: "*x* represents *y*" or "*x* represents *y* to itself." In the first case, *x* is the vehicle of the representation (which may be a proposition, a mental state, an image, or a picture), and *y* is what is represented (a thing or a state of affairs). In the second case, *x* is the subject of the representation, and no independent vehicle is mentioned. We can combine these two schemas in a single form that figures representation as a triadic relationship: "*x* represents *y* for *z*," where *x* is the vehicle of representation, *y* is what is represented, and *z* is an interpreter, or, in Peirce's theory, an "interpretant," that is, an additional sign produced in the mind of the interpreter (cf. Peirce, *Elements of Logic*, §208; see SIGN, IV.A).

The term *représentation* can also be used to designate, not the relationship of representation, but one of the possible terms of this relationship, namely its vehicle. Then we speak of a representation as an entity (proposition, mental state, picture, etc.) that represents something, possibly for someone. In this sense a portrait, for example, not only implies a relation of representation with its model, but "is" itself a representation. This use, which is very common, may lead to confusion. In general, the vehicle of a representation is an entity external to the relationship of representation, in the sense in which the vehicle can be characterized independently of the fact that it enters into a relationship of representation. Thus we can identify a picture, for example, by its material properties (size, shape, colors), independently of the fact that it represents something. In other cases this condition of exteriority is not fulfilled, which leads to an abusive reification of the representation: the latter becomes the postulated term of a relation of representation without its being possible to characterize it otherwise.

B. The meaning of "re-"

Another set of questions concerns the indirect or mediate character of representation. The term *représentation* suggests, because of the prefix "re-," that what is represented is also capable of being simply "presented," that is, that the representation of something is based on the assumption that it is at least possible to present it as well. The distinction between presentation and representation can be understood in a temporal sense if, for example, we emphasize the fact that a representation must be caused by a presentation. But the repetition can also be understood in a logical sense. For example, it is sometimes thought that the representation involves a predicative or quasi-predicative articulation: *x* is represented as an *F* (as a man, as a table), where *F* is a predicate that characterizes or "typifies" what is represented. The representation itself is supposed to be "ante-predicative," that is, anterior to the distinction between what is represented and the way in which it is represented.

II. The Kantian Paradigm: *Vorstellung, Repräsentierung, Vertretung*

The German terms *Vorstellung*, *Vertretung*, and *Repräsentierung* are all often translated by *représentation*. If the translation of Kant's writings did not inaugurate the translation of *Vorstellung* (from *vor-stellen*, literally, "place before") by *représentation*, it at least established it. In fact, Kant defines the technical concept of *Vorstellung* by means of the ordinary verb *vertreten*, which suggests "moving in front of something" (*vor etwas treten*), and of which the corresponding noun is *Vertretung*: the *Vorstellung* is a "determination (*Bestimmung*) in us that we relate to something else (which it represents [*vertritt*], so to speak, in us)" (letter to Beck, 4 December 1792, Ak. 11: 395, cf. Freuler, *Kant*, 46). Moreover, Kant frequently uses instead of *Vorstellung* the Latin term *repraesentatio*, from which *Repräsentierung* directly issued. Kant distinguished two main types of conscious representation: the singular representation or intuition (*repraesentatio singularis*, *Anschauung*), and the general representation or concept (*repraesentatio generalis*, *Begriff*) (See ANSCHAULICHKEIT, BEGRIFF).

Kant's usage of the term *Vorstellung* is not only compatible with the semantic profile of the English term "representation" but responds explicitly to the main questions left open by the latter. First, every representation is intrinsically directed toward an object: "All representations have, as representations, their object" (*Critique of Pure Reason*, A 108). The *Vorstellung* is an element in an intentional relationship of representation. Second, the *Vorstellung* is "in us," that is, it is intrinsically subjective or psychological. Finally, the *Vorstellung* presupposes a certain distinction between the object represented and the way it is represented, which Kant calls the "content" (*Materie* or *Inhalt*) of the representation.

Nonetheless, the association of the first two marks of the Kantian concept of representation can give rise to a certain intellectual tension. Whereas Kant uses the terms *Vertretung* and *Repräsentierung* especially to designate the action or relation of representation, he uses the term *Vorstellung* to designate a mental state, a determination in us that has the value of representation. But how can something be both "in us" and imply a relation to an object represented "outside us"? Either Kant's *Vorstellung* has an intrinsic value of representation, in which case it would be wrong to reify it, or it is only a vehicle of the representation and can be characterized independently, though evidently Kant does not do so. About two hundred years later, Frege was to resolve this tension in an admirably rigorous way.

III. Frege Twists *Vorstellung*

Frege often twists Kant's vocabulary. In a note to the *Foundations of Arithmetic* (cf. §26, note 2), he criticizes Kant for having associated the term *Vorstellung* with two very distinct meanings. In the subjective sense a representation is sensible in nature and is like a mental image. In the objective sense it has nothing to do with the sensible and is logical in nature. To avoid confusion Frege reserves *Vorstellung* for the designation of the subjective representation.

Later on, in *The Thought: A Logical Investigation* (*Der Gedanke: Eine logische Untersuchung*, 1918), Frege gives the term *Vorstellung* a more general meaning. In this essay Frege recognizes three ontological domains—three "worlds" or "realms" (*Reiche*) of entities having different modes of existence. The first world is the external world (*Außenwelt*), which contains among other things all natural and thus objective entities. The second world, which is internal (*Innenwelt*), is that of psychological entities, which Frege divides into *Vorstellungen* and *Entschlüsse* (volitions). Representations include sense impressions, the creations of the imagination, sensations, emotions, sentiments, states of mind, inclinations, and desires. Finally, the third world is that of thoughts (*Gedanken*), whose constituents are the "senses" (*Sinne*) of linguistic expressions. Frege explains that *Vorstellungen*, like thoughts, are not accessible to sense perception, but that, unlike thoughts, they belong to the content of consciousness and necessarily have a "bearer" (*Träger*, that is, the subject of the representations).

No doubt the translation of *Vorstellung* by *représentation* is inevitable here, but it presents a difficulty: Frege's *Vorstellungen* do not have the property of intentionality, which seems to be the obligatory mark of our term *représentation*. Sense impressions, for example, are incapable of opening us to the outside world. The sensation of redness is a representation of redness only in the sense in which one speaks of the dancing of a waltz: just as dancing a waltz does not consist in putting oneself in relation to the object "waltz," having an impression of redness does not put the subject in relation with the quality "redness." Only thoughts (*Gedanken*), which do not belong to the content of consciousness, are capable of breaking the circle of our internal representations. But thought does not need *Vorstellungen* to be conveyed: the main vehicle of thought is public language—linguistic representations. Frege's English translators have preferred to translate *Vorstellung* by "idea" rather than "representation," but the difficulty just mentioned does not thereby disappear: an idea is still the idea "of" something that is in principle distinct from the idea itself.

A possible solution to this difficulty consists in interpreting Frege's *Vorstellung* as a secondary vehicle of thought, and thus as a term independent of certain relations of conceptual representation. The *Vorstellung* fulfills the condition that we set for an entity to be considered as a vehicle: it can be characterized independently of its value of representation, that is, as an element of consciousness accessible to introspection. Consequently, a sense impression, or a mental image, can represent an object only with the support of an appropriate conceptual background:

> The predicate "true" is not properly attributed to the representation itself, but rather to the thought that this representation depicts a certain object.
>
> (Daraus ist zu entnehmen, dass eigentlich nicht der Vorstellung selbst das Prädikat *wahr* zuerkannt wird, sondern dem Gedanken, dass sie einen gewissen Gegenstand abbilde.)
>
> (Frege, *Nachgelassene Schriften*, 142)

This interpretation, to which Dummett (*Origins of Analytical Philosophy*) drew attention, certainly does not diminish the essential differences between Kant's and Frege's notions of the *Vorstellung*, but it does justify to a certain extent the translation of Frege's *Vorstellung* by *représentation*.

IV. Frege and the Paradoxes of *Vertretung*

Frege uses the verb *vertreten* in a sense very different from that of *vorstellen*. In "On Concept and Object," Frege formulates the following famous paradox: although the city of Berlin is a city and the volcano Vesuvius is a volcano, the concept "horse" is not a concept. In Frege's view the expression "the concept 'horse' " can designate only an object, because it occupies the grammatical position of subject. An object is a complete entity, closed in upon itself, whereas a concept is by nature essentially incomplete or predicative. It follows that it is impossible to designate a concept directly, that is, by means of a singular expression, for the latter would necessarily lack the incomplete character of the concept. Frege then suggests that the singular expression "the concept 'horse' " designates a special object that "represents" or "takes the place of" (*vertretet*) the concept that one vainly sought to designate directly. In the *Basic Laws of Arithmetic* (1893–1903), Frege explains that this object is none other than the extension of the concept, or more precisely what

Frege calls its "truth-value range." As Philippe de Rouilhan has pointed out (*Frege*, 60), the extension is the *représentant* (*Vertreter*) of the concept in the category of objects. (Note the still more marked legal connotation in the English translation of Frege's book, where *vertreten* is rendered as "to go proxy for.")

Even if *vertreten* has been translated here as "represent" (de Rouilhan himself speaks of the "paradoxes of representation"), we must keep in mind the rigorous distinction that Frege makes between *vertreten* and *vorstellen*. He uses the verb *vertreten* principally to designate a purely logical relation that owes nothing to the psychological world. The noun *Vertretung* must thus be understood as being merely the nominalization of the verb *vertreten*. On the other hand, the expression *(sich) vorstellen* signifies "to have representations," where the latter are (as we have seen) essentially psychological entities.

V. "Presentation," "Representation," and "Mental Representation"

The English term "representation," like the French *représentation* and the German *Repräsentierung*, sometimes connotes an absence of immediacy. Thus, we can understand the contrast, to which Husserl draws attention in *Ding und Raum* (1907, 13–15), between the object of perception, which is there in the present and, as it were, in person (*als leibhafter*), on the one hand, and the object of imagination or belief, which is only "represented" (*vorgestellt*). Jacques Bouveresse (*Langage, perception*, 1: 54) has asked (but cf. Pacherie, "Théories représentationnelles") whether a model of perception, seen as constructing "internal representations" of the environment could really do justice to this observation by Husserl. Perception does indeed have an intentional object, but the latter seems to be intended directly, without being mediated by an internal representation.

The critique of the notion of internal representation is not peculiar to phenomenology. In the cognitive sciences an important school of thought has since the 1980s opposed the "cognitivist" paradigm incarnated by Fodor's "Representational Theory of Mind." According to this theory, our cognitive access to reality is mediated by "mental representations" that Fodor conceives as essentially symbolic—this is the hypothesis of the "language of thought." Fodor's detractors have criticized the "intellectualist" character of the representational theory of mind, which multiplies mental representations, arguing that essentially practical or nonrepresentational capacities provide a better account of an organism's intelligent interaction with its environment (cf. Cantwell-Smith, "Situatedness/Embeddedness"; Von Eckardt, "Mental Representations").

On the purely lexical level, however, the terms "presentation" and "representation" are not always seen as contraries. For example, John Searle considers presentations as kinds of representations. According to Searle, most if not all intentional states are representations of states of affairs. Presentations are thus representations that are characterized by their "direct," "immediate," and "involuntary" character. Visual experience, for instance, is better described as a presentation than as a representation, even though in reality it is both at once:

> The visual experience . . . does not just represent the state of affairs perceived; rather, when satisfied, it gives us direct access to it, and in that sense it is a presentation of that state of affairs.

(Searle, *Intentionality*, 46)

According to Searle's taxonomy, memory and propositional attitudes such as belief, desire, and previous intention are only simple representations, whereas perceptive experience and intention in action are also presentations.

Searle observes that it is not "natural" to describe perceptive experience as a representation because "if we talk that way it is almost bound to lead to the representative theory of perception" (ibid.). According to this theory, the perceiving subject does not perceive a physical object directly, but indirectly; his immediate perception is mediated by a "sense-datum" that can only represent the object.

Generally speaking, the critique of internal (or mental) representation can take several forms. For example, one can ask what the cognitive status of internal representations is, and especially whether the subject's cognitive access to what is represented has to pass by way of a cognitive access to the representation itself. If our only cognitive access to reality is representational in nature, an affirmative answer to this question seems to lead to an infinite regress (cf. Judge, *Thinking about Things*).

A very different criticism, which is independent of the preceding one, concerns the thesis that what we call "representation" necessarily involves a propositional articulation, whereas perception is "ante-predicative" (Husserl, *Erfahrung und Urteil*). Once again, this thesis presupposes a semantic choice. From a strictly lexical point of view, there is no objection to considering perception, no matter how immediate, as a "representation" (*représentation*, *Repräsentierung*) of its object.

RES, ENS (LATIN)

ARABIC	*šayʾ* [شيء], *maʿnā* [المعنى]
ENGLISH	thing, something
FRENCH	*chose, quelque chose*
GERMAN	*Ding, Sache, etwas*
GREEK	*chrêma* [χρῆμα], *pragma* [πρᾶγμα], *ti* [τι], *ousia* [οὐσία], *on* [ὄν], *onta* [ὄντα]
ITALIAN	*cosa, qualcosa*
SPANISH	*cosa, algo*

➤ *THING* and ESSENCE, GEGENSTAND, HOMONYM, INTENTION, LOGOS, *NEGATION, NOTHING*, OBJECT, REALITY, SACHVERHALT, SEIN, SENSE, SIGN, SIGNIFIER/ SIGNIFIED, *TO BE*, WORD

Perhaps nothing fated the Latin word *res* to have such a long philosophical career—extending from Cicero to Franz Brentano's "reism" by way of Latin Scholasticism and German academic metaphysics of the seventeenth and eighteenth centuries—except its remarkable indeterminacy. This career allowed it, in passing through rhetoric and the fields of economics, law, logic, and finally metaphysics, to position itself not only as a possible equivalent of the Greek term considered the most common, *to on* [τὸ ὄν], "being" or "the existent," but also to overflow, so to speak, in the direction of the opposition between *aliquid* and *nihil*, "something" and "nothing," to the point of erecting itself into an absolutely primary or supertranscendental term. In another aspect of its semantics, the derivatives *realis* and *realitas* opened up the field of formality and possibility.

I. The Stoics and Aristotelian Semantics: *Pragma*, from the Thing Itself to the Incorporeal

The philosophical history of the word *res* doubtless parallels rather closely that of the Greek term *pragma* [πρᾶγμα], whose meaning was initially legal and rhetorical (Aristotle, *Topics* 1.18, 108a21; *Rhetoric* 3.14, 1415b4). *Pragma* designates the fact or affair that must be discussed, debated, and judged in a trial ("*die Streitsache, um die es vor Gericht geht*"; Wieland, *Die aristotelische Physik*, 170), and not only the material and individual reality given or immediately present. That is why this same term can also characterize what is indicated by a word or proposition, the meaning or state of affairs in question. That is certainly how Plato uses it in letter 7.341c: *to pragma auto* [τὸ πρᾶγμα αὐτό] does not signify the thing in itself, but rather the matter at issue, the "problems" debated, or the "subject" in dispute (as rendered in Joseph Souilhé's translation of Plato's letters). And it is legitimate to see in this passage of Plato the final anchoring point of the phenomenological maxim—as Husserlian as it is Heideggerian: "*Zur Sache selbst.*" The Latin translators, from Boethius to William of Moerbeke, did not find it difficult to render these different meanings by using the expression *res ipsa.*

Thanks in particular to Boethius's translations of the *Peri hermêneias*, the opposition *logos/pragma* [λόγος/πρᾶγμα] passed quite naturally into Latin, the term *res* not designating exclusively a singular material reality that is external and transcendent with respect to discourse. Let us also recall that in the famous opening of the *Peri hermêneias*, where Aristotle distinguishes between *pragmata* [πρᾶγματα] and *pathêmata tês psuchês* [παθήματα τῆς ψυχῆς], the affections of the mind that reflect them and whose vocal forms (*phônai* [φωναί]) are symbols or signs, the term *pragmata* refers more to states of affairs than to material and singular things (see SIGN)—cf. Aristotle, *Metaphysics* Δ.29: it is proposed here that "the diagonal of a square is commensurate with the side" (*to tên diametron einai summetron* [τὸ τὴν διάμετρον εἶναι σύμμετρον]), or that "you are sitting" (*to se kathêsthai* [τὸ σὲ καθῆσθαι], 1024b19–20), as examples of statements of a state of affairs (*pragma*), of a "being such and such," always false, or sometimes true, sometimes false (see De Rijk, "*Logos* and *Pragma* in Plato and Aristotle").

This also allows us to correct the too-frequent interpretation of the famous passage in Aristotle's *Sophistical Refutations* (165a6–16) where he points out that we cannot bring into the discussion "the things themselves that are being debated" and that we must instead "use words as symbols" ("*epei gar ouk estin auta ta pragmata dialegesthai pherontas, alla tois onomasin anti tôn pragmatôn chrômetha hôs sumbolois* [ἐπεὶ γὰρ οὐκ ἔστιν αὐτὰ τὰ πράγματα διαλέγεσθαι φέροντας, ἀλλὰ τοῖς ὀνόμασιν ἀντὶ τῶν πραγμάτων χρώμεθα ὡς συμβόλοις]"). The expression "the things themselves" does not refer primarily to an extra-mental and a-semantic reality—a stone, an ox, or an ass (which in fact it would often be difficult to bring into the discussion)—but to the affair at issue ("*die Sache, um die es in der Aussage geht; . . . etwas, worum es in der Rede geht*," Wieland, *Die aristotelische Physik*, 159–60). (Against this view, see HOMONYM, II.B.3).

1

Ways of saying "thing" in Greek

➤ LAW, Box 1; PRAXIS; SEX, Box 1; VORHANDEN

If we start with the ways of saying "thing" in vernacular languages—for example, French *chose*—the most common retroversion is obviously the neuter, and particularly the neuter of nominalized participles, which is rendered, more or less, by adding *chose* or *objet* (see, for example, *aisthêton*, in SENSE, Box 1, on the article *to*; cf. I/ME/MYSELF, Box 2, on *auto*), or again the neuter of the relative pronouns and demonstratives (Ildefonse and Lallot innovate by proposing for the relatives at the beginning of Aristotle's *Categories*: "On dit homonymes les *items* [*hôn* (ὧν)] qui n'ont de commun qu'un nom"). But these are merely expletive "things," by default and by projection (see OBJECT). The same can be said of the indefinite *ti* [τι], which functions, when accented, like an interrogative (What? Which?): it has no equivalent other than "something" (*kalon ti* [καλόν τι], "something beautiful"), even when it designates, in the Stoic doctrine, that strange and remarkable supreme genre, "the something" (*to ti* [τὸ τι]), *quid*: Seneca, letter 58.24; *res*, Cicero also says: see here, III), which includes both the bodies and the incorporeals and which Plotinus considers "incomprehensible" (*Enneads* 6.1.25.6–10).

In Greek, however, there are direct, "semanticized" ways of designating what French designates by *chose* in the full sense, *via* the Latin senses of *res* and *causa*, even if there is, as we shall see, no equivalence between them. Two words were in competition, *pragma* [πρᾶγμα] and *chrêma* [χρῆμα].

Pragma derives from *prassô* [πράσσω]. In Homer it is used only intransitively, in the sense of "go all the way, go all over," but in general it is transitive: "to achieve, accomplish, work on, deal with a matter, practice" (RT: Chantraine, *Dictionnaire étymologique de la langue grecque*, s.v.). More concrete than *praxis* [πρᾶξις], whose primary meaning is "activity" (see PRAXIS), *pragma* designates the motive or result of this activity: the thing as related to an action, the task, the affair, the concrete reality, the object. In the singular, it indicates both the subject matter (what is at issue), and what is actual and real, what is the case—in both senses, the thing itself (*auto to pragma* [αὐτὸ τὸ πρᾶγμα]) is involved, and it is very close to what *res* means in its primary senses, from the juridico-economic to the object of thought. But the plural, *ta pragmata*, is clearly more concrete: it designates "the realities" of the external world in which we act, namely the things that have occurred, "the facts," and the things we deal with, "affairs," whether public or private. It is the most common philosophical term for the objects in the

world, including natural realities, insofar as living and knowing human beings are implied ("If external things [*ta pragmata*] are numerous and in movement toward each other," Melissus, 30A5; RT: DK 1:260, 974a25, for example). Moreover, that is why one cannot endorse Pierre Hadot's previously mentioned interpretation of the opening of Aristotle's *Sophistical Refutations*: if in this passage Aristotle regards homonymy as the radical illness of language, that is because there are more "things" than words, more concrete realities with which we have to deal than words at our disposal in natural language (cf. Cassin, *L'effet sophistique*, 344–47, and 386–87 n. 8). We can compare this "reality" connected with practice to *Wirklichkeit*, which is also connected with a *Wirken*, with the actuality of an implementation (see REALITY, VI), on at least one point: *pragmata* and *Wirklichkeit* are both distinguished by a pure, simple, ontologically immediate "given," that of the *phainomena* [φαινόμενα], the *onta* [ὄντα], "phenomena," "beings," the "things" that emerge on their own, appear and remain there, without reference to any operation at all (see ERSCHEINUNG, ESTI, and LIGHT, Box 1).

The other term, *chrêma*, implies human beings still more strictly. It is connected with a very large family derived from *chrê* [χρή], "it is necessary," in the sense of "there is need," and is centered on *chraomai* [χράομαι], "seek the use of something," "resort to for one's own use." Often seen as connected with *cheir* [χείρ], "hand" (and linked, by Heidegger himself, with *vorhanden*; see VORHANDEN), but also often connected with *chairô* [χαίρω] "enjoy" (RT: Chantraine, *Dictionnaire étymologique de la langue grecque*, s.v. *chraomai*, 1275), *chraomai* means "make use of," whether it is a matter of borrowing from a neighbor or questioning the god by consulting an oracle (*chrêsmos* [χρησμός] designates the reply), with the earlier sense of "lack, desire," and the later sense of "have a relationship with someone, become addicted to, undergo." Let us note, as testimony to the breadth of the theme, the adverb *parachrêma* [παραχρῆμα], "immediately" (literally, "ready for use"), and alongside the noun of action *chrêsis* [χρῆσις], the substantive *chreia* [χρεία], "use," which designates both a service or function (military "service") and a grammatical and rhetorical use (the *chreia* is the exploitation of commonplaces in an oratorical exercise). We see that *chrêma* names the thing insofar as it is used and counts (the poet, Plato says—*Ion* 534b—is "a light thing [*chrêma*], winged and sacred"): it is because he is part of a chain that leads from the god and

the muse to the rhapsode and the listener, in which he constitutes a particularly noteworthy functional link); in the plural, *ta chrêmata* [τὰ χρήματα] usually signifies "wealth, resources" (in modern Greek, *chrêma* means "money"): *chrêma* is, Gernet notes, "the very type of the economic notion" (*Droit et institutions*, 11 and n. 32). This definition of the "thing" by its use and function, like that of wealth by expenditure, is very frequent in the texts, from Antiphon (the miser who steals the *chrêmata*, riches, buried under a tree, and must console himself this way: "When it was yours, you didn't make use of it either" [*oud'* . . . *echrô* (οὐδ' . . . ἐχρῶ)], RT: 87B54 DK; cf. Cassin, *L'effet sophistique*, 325–26) to Aristotle: "The use of riches [*chrêsis . . . chrêmatôn* (χρῆσις . . . χρημάτων)] seems indeed to be spending them and giving them away [*dapanê kai dosis* (δαπάνη καὶ δόσις)]" (*Nicomachean Ethics* 3.4, 1120a4–9).

Chrêmata is thus the word that, in Anaxagoras's famous fragment "*homou panta chrêmata ên* [ὁμοῦ πάντα χρήματα ἦν]" ("All things were together," RT: 59B1 DK, 2:32, 11), and in Protagoras's equally famous fragment "*pantôn chrêmatôn metron estin anthrôpos* [πάντων χρημάτων μέτρον ἐστὶν ἄνθρωπος]" ("Man is the measure of all things," RT: 80B1 DK, 2:263, 3–4), is always rendered by "things" (*alle Dinge*, RT: DK). We see that a certain precaution is called for. In particular, it cannot be taken for granted that the reference is to phenomena and beings, according to the equivalences proposed by Sextus Empiricus (*Outlines of Pyrrhonism* 1.216) and endorsed by Heidegger, the better to make Anaxagoras and Protagoras Parmenidean pre-Socratics, Protagoras simply giving a fine moderation to the unveiling of *alêtheia* [ἀλήθεια] (cf. Cassin, *L'effet sophistique*, 108–10 and 225–36). It seems more accurate to say that the man of *chrêmata*, taken in a general economy of flux and expenditure, seeks to determine *pragmata*, to delimit them by his activity, to stabilize them into a world. In any case, this is to take seriously the clues that words and their use in the texts persist in giving us.

In the singular, from *pragma* to *res*, the consequence is good, even if the inventive sequel of history belongs only to *res*. But in the plural we have to distinguish, without counting the "items," at least two series of "things" in Greek: those that are given, and belong to the domain of the phenomenon of and phenomenology; and those that are acted, and are connected with the implication of human

(continued)

(*continued*)

beings as practitioners and users. The latter, which are called *pragmata* and *chrêmata*, lie outside the history of ontology.

Sextus Empiricus. *Outlines of Pyrrhonism*. Translated by R. G. Bury. Loeb Classical Library. London: W. Heinemann, 1933.

For their part, the Stoics, according to Sextus Empiricus (*Adversus mathematicos* 8.11–12; RT: *SVF* 2:166; RT: Long and Sedley, *The Hellenistic Philosophers*, 33B, 2:191), distinguished among the signifier (*to sêmainon* [τὸ σημαίνον]), that is, the vocal form or utterance (*phônê* [φωνὴ]), the signification (*to sêmainomenon* [τὸ σημαινόμενον]), which is the *pragma*, the conceptual content or the intentional object indicated by the voice ("*auto to pragma to hup' autês <phônês> dêloumenon* [αὐτὸ τὸ πρᾶγμα τὸ ὑπ' αὐτῆς <φωνῆς> δηλούμενον]"), "the actual state of affairs revealed by an utterance," the "intension" (De Rijk, "*Logos* and *Pragma* in Plato and Aristotle"), and its extralinguistic correlate: the external substrate, *to ektos hupokeimenon* [τὸ ἐκτὸς ὑποκείμενον], namely, the event, *to tugchanon* [τὸ τυγχάνον] (on the referent, see De Rijk, "*Logos* and *Pragma* in Plato and Aristotle"; on the name-bearer, see RT: Long and Sedley, *The Hellenistic Philosophers*, 1:197; see also SIGNIFIER/SIGNIFIED). Max Pohlenz pointed out that according to Hellenistic usage, *ta tunchanonta* [τὰ τυγχάνοντα] should be understood as an abbreviation of *ha tugchanei onta* [ἃ τυγχάνει ὄντα], "that which is," "which is met with" (Pohlenz, *Die Stoa*, 2:22; see Hadot, "Sur les divers sens du mot *pragma* dans la tradition philosophique grecque," in *Études de philosophie ancienne*, 61–76). See also Box 1.

II. The Latin Legal and Economic Heritage: *Res/Bona, Res/Causa, Res/Verba*

If there is a specifically Latin and prephilosophical history of the term *res*, it probably concerns the sphere of goods (*bona*), possession, wealth, or interest, as we see in Roman comedy (Plautus, *Pseudologus* 338: "It is not in your interest [*ex tua re non est*]"), or in common expressions such as *rem augere* (increase one's fortune) or *in rem esse alicui* (to be in someone's interest). This latter meaning is probably in conformity with the etymology, if it is true that the term is related to Sanskrit *revan* (wealth), as Ernout and Meillet claim (RT: *Dictionnaire étymologique de la langue latine*, s.v. *res*). This legal-economic meaning is presupposed by numerous compound expressions: *res sua, aliena, privata, publica, venalis, extra commercium, mobilis, immobilis, in patrimonio, extra patrimonium*, and even *res corporalis*, to designate a material, sensible, tangible thing by opposition to incorporeal *res*, such as the right to property (Gaius, *Institutiones* 2.12–14). In the juridical domain, we can distinguish between the *res* (the affair in general, the facts) and the *causa* (the charges or indictment, with regard to which the guilt or innocence of the accused has to be determined): *de re et causa iudicare*: Cicero, *Partitiones oratoriae* 9.30; *De finibus* 1.5.15, 2.2.5, 2.2.6).

In the general context of Latin rhetoric, the term *res* designates in an indeterminate way the subject matter of a discourse (*res de qua agitur*), so that it is the orator's peculiar task to set forth a question or a subject (*rem exponere, rem narrare*). If it fails to understand the subject or the *status quaestionis* (the *res subiectae*: Quintilian, *De institutione oratoria* 2.21.4), rhetoric risks falling into mere rambling about everything and nothing (Cicero, *De oratore* 1.6.20: "*Oratio . . . nisi subest res ab oratore percepta et cognita, inanem quandam habet elocutionem et paene puerilem*" (A speech, if it is not supported by a fund of precise knowledge, will be no more than a vain and frivolous display of words). But the word *res* (just like the Greek *pragma*) can also refer to thoughts, as in this description of the *oratio* given by Quintilian: "*Orationem . . . omnem constare rebus et verbis*," to which correspond respectively *inventio*, when it is a matter of *res* = thoughts, and *dispositio*, when it is a matter of discourse properly so called. Thus judicial rhetoric classically distinguishes between the "affair" that is to be judged and the *circumstantiae rei*—the examination of the circumstances being clarified in turn through questions that refer to the Aristotelian categories, *quid? quale? quantum? ad aliquid?*—whereas the rhetorical tradition also classifies the *loci* in relation to the opposition between *res* and *persona* (Quintilian, *De institutione oratoria* 5.10.23; Cicero, *De inventione* 1.24.34).

III. *Res* and *Corpus*

Despite a few passages in Tertullian that connect being a thing with corporeality, it does not seem that the *res* was understood from the outset as *solida* or associated with the body. In fact, Tertullian's use of the word *substantia* (*substantia corporis*) and the definition that he gives of it—"*cum ipsa substantia corpus sit rei cuiusque*"—militates rather in favor of the essential indeterminacy of the *res*, after it has concealed its original economic connotation (cf. Moingt, *Théologie trinitaire*, which includes a valuable index and lexicographic repertory). It was probably the indeterminacy of the term that made possible such a deliberate attempt to transpose or explain the Greek *ousia* [οὐσία]: "*Quomodo dicetur* οὐσία—*res necessaria, natura continens fundamentum omnium?*" Seneca asked in his famous letter 58, which begins by deploring the poverty of the Latin vocabulary when one seeks to set forth Plato's philosophy: "*Quanta verborum nobis paupertas, immo egestas sit, numquam magis quam hodierno die intellexi*" (How poor our vocabulary is, in fact, poverty-stricken. Never have I understood this as I have today).

In his *Topics*, Cicero also plays on the generality of a term that can designate both things that are ("*earum rerum quae sunt*"), like *fundum, penus, aedis, parietem, pecudem*, and so on, and intelligible things ("*earum quae intelleguntur*") without any *substantia corporis*, such as *ususcapio, tutela, agnatio*:

unum earum rerum quae sunt, alterum earum quae intelleguntur. Esse ea dico quae cerni tangive possunt, ut fundum aedis, parietem stillicidium, mancipium pecudem, supellectilem penus cetera; quo ex genere quaedam interdum vobis definienda sunt . . . Non esse rursus ea dico quae tangi demonstrarive non possunt, cerni tamen animo atque intellegi possunt, ut si usus capionem, si tutelam, si gentem, si agnationem definias; qualium rerum nullum subest quasi corpus . . .

(One group includes things that are, the other those that are intelligible. I say that the former are things that can be seen and touched, such as land, a house, a wall, a gutter, a slave, and large livestock, small livestock, furniture, provisions, etc.; in this group some elements remain to be defined. On the other hand, I say that these realities are not things that cannot be touched or pointed to, but are things that can nonetheless be seen and understood by the mind, such as property rights, trusteeship, clan, consanguinity, and anything else that lacks any bodily substrate.)

(Cicero, *Topics* 26–27)

Lohmann emphasizes that when Cicero translated the Stoic doctrine, presenting it as self-evident and making the *ti* its most general concept, he naturally used the term *res*: the *res* could easily be divided into things that are (*quae sunt*) and those that are intelligible (*quae intelliguntur*); it is legitimate to say that the latter do not exist ("Vom ursprünglichen Sinn der aristotelischen Syllogistik," in *Lexis*, 1:205–36). However, the opposition between the two languages, on which Lohmann based his argument, must be at least qualified, if we consider, for instance, this passage from Dionysius Thrax's *Ars grammatica* (*Grammatici Graeci* 1.1, ed. Uhlig, 24.3): "The noun is a part of speech that can be declined, signifying a body [*sôma*] or an incorporeal entity [*pragma*]: a body like 'stone' or an incorporeal like 'education'" (quoted in Pierre Hadot, *Études de philosophie ancienne*). "We may regret being obliged to translate *pragma* by 'incorporeal' [*incorporel*], a term that is obviously unrelated to the etymology of *pragma*, but any other translation seems completely impossible," Hadot concluded. But another translation is not in fact entirely impossible if we consider Donatus's Latin translation (RT: Keil, ed., *Grammatici Latini*, 4:355.5), which Hadot himself quoted in a note: "*Pars orationis cum casu corpus aut rem proprie communiterve significans*" (The part of speech that, when declined, signifies literally or in a general way the body or the incorporeal [*res*]).This generality and indeterminacy also explain why the term *res*, in the plural, was able rather naturally to translate the Greek *onta* [ὄντα], and why it acquired a clearly differentiated meaning only through the determinants that accompanied it or secondary oppositions that came into play only against the background of a neutral primary meaning. Thus it became possible to use the expression *res gestae* to designate the events related by a historian, and a more precise meaning could be defined using an adjective that assumes the whole semantic burden ("*res publica, res divina, res familiaris, res militaris, res navalis, res rustica, res naturalis, res adversae, res secundae*"), or again one could distinguish, by opposition, between *res* and *sermo, res* and *verbum*

(on this canonical opposition, see especially Cicero, *De natura deorum* 1.16, ed. Pease, 1:168 and note). The Augustinian version (*De doctrina christiana*, 2.1–4) of this latter opposition remained classical throughout the Middle Ages, but it was already found in Cicero, Quintilian, and Boethius.

IV. From Augustine to Abelard: *Res/Signa* and *Res/Verba*

The Augustinian distinction is remarkable in that it is based on a general primary meaning of *res*: all things, apprehended in a way that remains completely undetermined, without any distinction of region, status, or mode of being. Thus it is the poorest and most extended term, which can be at first grasped only negatively: "*Proprie autem nunc res appelavi, quae non sunt ad significandum aliquid adhibentur, sicuti est lignum, . . . pecus, atque huiusmodi cetera*" (I have just called "things" that which is not used to signify something, for example, wood, stone, livestock, and other realities of the same kind: *De doctrina christiana* 1.2.2). In other words, it is a question here of apprehending things that are only things, and not also "signs," like "the wood that Moses cast into the bitter waters."

Everything that can be taught can in turn be divided up in relation to this primary opposition between *res* and *signa*, or between *res* and *verba*, since a word is first defined by its transitive function of signification (*De magistro* 4.7), and it is part of the nature of the sign that it refers to something other than itself, that is, ultimately, to an external reality: "*res autem ipsa, quae iam verbum non est, neque in mente conceptio*" ("The thing itself, which is not already a word or a mental conception"), according to the (pseudo-Augustinian) *Principia dialecticae* (chap. 5).

To be sure, the sign itself is always a thing-sign ("*ita res sunt, ut aliarum etiam signa sint rerum*"), and it must always have a certain concrete reality (*vox, dictio, intellectus*), precisely in order to fulfill its signifying and transitive function, namely, referring to something else, in function of a polarity that no doubt plays a determining role: the polarity of the inside and the outside, pursuing the relationship in language between the thing (signified)—*res*—and the linguistic sign. Certainly, from the Augustinian point of view, signs cannot be reduced to the linguistic sign, in its phonic or mental reality, but must also include both natural signs and the *signum sacrum* constituted by the *sacramentum*, in its secondary and overdetermined opposition to the *res*.

In the plural, and when associated with *natura, ordo,* or *proprietas*, the word *res* designates the totality of created things (humans, animals, material realities), as in John Scotus Erigena, who uses the expression *universitas rerum*. But the meaning of the term can be further broadened to designate something in general (*aliquid*)—"*solemus enim usu dicere rem, quidquid aliquo modo dicimus esse aliquid*" (We are accustomed, through usage, to call "thing" what we say is in some way something: Anselm, *Epistula de incarnatione verbi* 2, p. 12.5–6, ed. Schmitt)—or an abstract "reality."

Also in Anselm, the distinction between *enuntiatio* and *res enuntiata* testifies to this general meaning of *res* as designating a state of affairs. Particularly in *De veritate*, Anselm examines what constitutes the truth of an utterance, even when the utterance denies that something is; but in this case, the utterance can still be said to be true, since "*etiam quando*

negat esse quod non est. . . , sic enuntiat quemadmodum res est" (Even when it denies being to that which is not . . . it says that the thing is; ed. Schmitt, 2.177.17).

When Peter Abelard wonders, particularly in his *Dialectica*, about the meaning of the proposition (his *dictum*; see DICTUM), he determines the objective content of the act of thought as a *quasi res* that can itself refer, through various intellections and the corresponding *dictiones* (for example, *cursus, currit*), to the same "thing," without the latter being a singular external *res*. Jolivet, in his valuable *Notes de lexicographie abélardienne*, has examined in detail several passages in the *Logica ingredientibus* in which we see how the word *res* changes meaning and is thus modified by a remarkable ambiguity, since it can designate, in a "nonrealist" way, not only the singular, subsistent "thing," but also the signified of a proposition or of universal terms: in fact, the *res propositionis* may not correspond to any *res subiecta* (Jolivet, "Éléments pour une étude," in *Aspects de la pensée médiévale*, 203–32).

V. Avicenna and the Translations of Avicenna: *Wuǧūd*

But in addition to the analyses by Augustine, Anselm, and Abelard, one of the major events in the history of the word *res* in the Latin West was certainly the production of direct or indirect translations of the *Šifā'* [الشفاء] of the *Metaphysics* of Ibn Sina, or, as he is more commonly known in the West, Avicenna. In book 1, chapter 5, and in book 5, chapter 1, Avicenna set out to define the existent (*al-Wuǧūd* [وجود], *ens*; see VORHANDEN, Box 1) and the thing (*al-šay'* [الشيء], *res*), as well as their primary divisions. These are "the ideas that are inscribed in the mind by a first impression," "the things most capable of being represented by themselves." The existent and the thing (*ens* and *res*) are at the origin of all representation, and thus attention can be drawn to them, they can be highlighted, but they cannot be known in the strict sense, since the names and signs that would be used to do so would be secondary and more obscure than they are. Referring more particularly to the "thing," we can describe it as "that about which something is said" ("*res est de quo potest aliquid vere enuntiari*," *Liber de philosophia prima*, 1.33.37–38).

Such a thing does not necessarily exist among concrete subjects, however; it suffices that it be intended or posited in the mind ("*potest res habere esse in intellectu, et non in exterioribus*"). What defines it, in fact, is first of all the "*certitudo qua est id quod est*," the certainty (*ḥaqīqa* [حقيقة]) that provides it with an *esse proprium* (*Liber de philosophia prima*, 1.34.55–56, 35.58). Thus the concept of the thing differs from that of the existent (*ens*) or the actual: the thing (*res*) is defined in each case by its own *certitudo*: the *quidditas* (*māhiyya* [ماهية]) through which the thing is what it is. Chapter 1 of book 5, which deals with "general things and their mode of being" ("*de rebus communibus et quomodo est esse earum*"), confirms this analysis by highlighting the original status of the signified as such (for example, the famous *equinitas tantum*, which is neither universal nor singular but is indifferent with regard to ulterior specifications, that is, without condition of being general, particular, and so on.

Definitio enim equinitatis est praeter definitionem universalitatis nec universalitas continetur in definitione equinitatis. Equinitas etenim habet definitionem

quae non eget universalitate, sed est cui accidit universalitas. Unde ipsa equinitas non est aliquid nisi equinitas tantum; ipsa enim in se nec est multa nec unum, nec est existens in his sensibilibus nec in anima, nec est aliquid horum potentia vel effectu, ita ut hoc contineatur intra essentiam equinitatis, sed ex hoc quod est equinitas tantum.

(For the definition of equineness is not the definition of universality and universality does not enter into the definition of equineness. In fact, equineness has a definition that does not need the definition of universality, but universality comes to it. In itself, it is neither one nor several, existing neither in reality nor in the mind, nor in one of these potential or actual things, in the sense that that would enter into equineness, but only insofar as it is equineness.)

(*Liber de philosophia prima*, 5.1.29–36, ed. Van Riet, 228)

(N.B. On all of this, see de Libera, *La querelle des universaux*, particularly 201–2; see also, regarding the doctrine accepted in the Latin Middle Ages as that of the nondifferentiation of essence, de Libera, *L'art des généralités*, 576ff.)

Avicenna posits (1.5.34–35) that "for every thing there is a nature by which it is what it is." Thus a triangle, for instance, has a "certitude by which it is a triangle, just as whiteness has one by which it is whiteness." The essence therefore includes a proper being distinct from existence as it is affirmed in a judgment. Avicenna's thesis thus posits the following equivalence: own certitude (*ḥaqīqa*), proper being, quiddity (*māhiyya*), to which is opposed being, or rather existence (*al-wuǧūd*) in the sense of affirmation (*intentio esse affirmativi*) (cf. Goichon, *La distinction*, 31–35). In Latin, the series becomes *certitudo propria—esse proprium—quidditas*, and that is what makes possible the doctrine of an *esse essentiae*, a proper being of the essence capable of being apprehended beyond being or nonbeing ("outside being"; *außerseiend*, to borrow Meinong's vocabulary; see SEIN). Thus it is possible to consider the animal in itself, to consider its essence per se, in abstraction from everything that is accidental to it: taken itself, the essence is, as we have seen, neither general, nor universal, nor particular, nor singular; neither is it (and this is no doubt the central point) in the mind or outside the mind. By the being that is proper to it, the animal is "neither individual, nor one, nor multiple," but only animal ("*ex hoc esse animal tantum*"—"*equinitas est tantum equinitas*"). This is a thesis whose influence—even if it was based on a misunderstanding, as de Libera suggests (*L'art des généralités*, 588)—was entirely remarkable starting in the second half of the thirteenth century, when everyone was discussing the well-foundedness and import of the difference between *esse essentiae* (*esse essentiale, habituale, quidditativum*) and *essen existentiae* or *esse actuale* (Thomas Aquinas, Henry of Ghent, Duns Scotus, and others).

■ See Box 2.

VI. The Scholastic Distinctions: *Res a Reor, Res Rata*

But let us now return to the Latin thirteenth century: medieval thinkers tried to reduce the dangerous polysemy of the

2

Šayʾ, "thing," and *šayʾiyya*, "reality"

Jolivet has shown in a very convincing manner ("Aux origines") that the Arabic terms *šayʾ* and *šayʾiyya* [الشيئية] (thingness, or rather, reality) had their own history, quite independent of the Aristotelian *pragma* [πρᾶγμα] and connected with the debates in Islamic theology regarding the nonexistent, of which we still find an echo, after Avicenna, in Šahrastānī ("L'inexistant est-il une chose ou non?"), but whose more distant background goes back to al-Kindi and al-Fārābī and to the positions of the Muslim practice of theological debate known as *kalam*, for which the "thing" is what is known and everything nonexistent is a "thing."

It is from this "formal ontology" centered on the "thing," as it is elaborated on the basis of al-Fārābī and Ibn Sīnā, that algebra developed, outside Aristotelian epistemological frameworks, as a science common to arithmetic and geometry, bringing in the "thing," *res* (al-*šayʾ*), as something unknown that can designate either a number or a geometrical magnitude (Rashed, "Mathématiques et Philosophie"). Thus are sketched the outlines of a new ontology in which one can speak of an object without definite characteristics, and even know it, but not represent it exactly. In the Latin translations of Arabic works on algebra that began to appear at the beginning of the thirteenth century, the term that was finally adopted to designate the unknown was thus *res* (*res ignota*), whereas in books on mathematics written in Italian, the word *cosa* appeared in the following centuries (cf. G. Crapulli, "Res e cosa (cossa)," and C. Costable and P. Redondi, "Sémantèse de res / cosa / cossa," in Fattori and Bianchi, *Res*).

term *res* by proposing a three-part division that became traditional in a history that continued down to the seventeenth century among representatives of what has been incorrectly called "late" or even "belated" Scholasticism, because of a powerful retrospective illusion that insists that we adopt, without any critical distance, the thesis that there was a Cartesian break and a new *Instauratio magna*, forgetting that the seventeenth century could legitimately be described as the golden age of Scotism.

Bonaventure, in his *Commentary on the Sentences* (1250–52), thus proposes a three-part classification of the meanings of *res* that remained classical for all Scholasticism:

Dicendum quod res accipitur communiter et proprie et magis proprie.—Res, secundum quod communiter dicitur, dicitur a reor, reris; et sic comprehendit omne illud, quod cadit in cognitione, sive sit res exterius, sive in sola opinione.—Proprie vero dicitur res a ratus, rata, ratum, secundum quod ratum dicitur esse illud quod non tantummodo est in cognitione, immo est in rerum natura, sive sit ens in se, sive in alio; et hoc modo res convertitur cum ente.—Tertio modo dicitur res magis proprie, secundum quod dicitur a ratus, rata, ratum, prout ratum dicitur illud quod est ens per se et fixum; et sic res dicitur solum de creaturis et substantiis per se entibus.

(We shall say that the term *res* can be understood in the general sense, in the strict [*proprie*] sense, and in the most strict [*magis proprie*] sense.—The term *Res* said in general is said on the basis of *reor, reris* [reckon, calculate, think, believe], and thus includes everything that comes to knowledge, whether it be an external thing or a thing present only in thought [the equivalent of the Aristotelian *doxaston* (δοξαστόν) contradistinguished from the *epistêton* (ἐπιστητόν), *Posterior Analytics* 2.33, 88b30–31].—But the strict sense of *res* is *a ratus, rata, ratum*, on the basis of what is confirmed and established, since we call *ratum* [ratified] what is not only in knowledge but in the nature of real things, whether we speak of the existent in itself or in another; and in this sense the term *res* is convertible with the term *ens.*—Thirdly, and in the strictest sense, *res* is related to *ratus, rata, ratum*, when what is called *ratum* is what is existent by itself and fixed; and thus *res* is said only of creatures and of existents subsisting by themselves.)

(In *Opera omnia*, 2, dist. 37, dub. 1, p. 2:876a)

It is a remarkable passage, but also one that presents a challenge for translation because of its fantastic etymologies and its repetition of the same term with a different accentuation: *ratum/ratum.* The most surprising part of all this is that although the etymology of the word *res* is more or less clear (it goes back to Indo-Iranian), the verb *reor, reri, ratus sum, reri* has no known etymology and is in any case not related to *res*. From *pro rata parte*, a common expression in classical Latin, the jurists drew the term *ratihabitio*, the ratification that is involved in dividing up a heritage, for example; and the expression *ratum facere aliquid* became established in the sense of "ratify," "approve" (RT: Ernout and Meillet, *Dictionnaire étymologique de la langue latine*). Thus we can understand why *ratum* could be taken in the sense of what is confirmed or ratified by the mind. The shift in meaning must have seemed natural, if we consider that on the other hand, *ratio*, in the sense of "reckoning" and "calculation," is connected with *reor, reris*, even in the common expressions *rationem reddere* and *rationem habere.* But counting up one's wealth (*res*) is clearly different from ratifying through thought. The *magis proprie* meaning, that of accentuated *ratum*, can then be seen as characteristic of what is fixed and firm (*ratum et firmum*), actually or "really" ratified.

The influence of the three-part classification indicated here was to be all the more remarkable because Bonaventure is no doubt also the writer who introduced or coined the term *ratitudo* to clarify the third meaning:

> Res dicitur a reor, reris, quod dicit actum a parte animae; et alio modo res venit ab hoc quod est ratus, quod dicit stabilitatem a parte naturae; et sic res dicit stabilitatem sive ratitudinem ex parte entitatis.

> (*Res* is related to *reor, reris*, when it refers to an act on the part of the mind; and on the other hand, *res* is related to what is *ratus* [ratified], which refers to stability on the part of nature; and thus *res* refers to stability or ratification on the part of the entity.)

> (Bonaventure, *Opera omnia*, 1, dist. 25, dub. 3, p. 446b)

■ See Box 3.

Henry of Ghent (d. 1293) distinguishes the *res secundum opinionem*, which is purely mental, from the *res secundum veritatem*, which is characterized by its internal certitude and thus moves from the contingent to the necessary, from the psychological to the metaphysical. This is again a *res a ratitudine* corresponding to an extra-mental reality (*aliquid extra intellectum*) that possesses the certitude by which it is a certain thing (cf. Paulus, *Henri de Gand*, 23–25).

The major distinction established by Henry of Ghent can thus be formulated as follows:

> Res primo modo est res secundum opinionem tantum, et dicitur a reor, reris, quod idem est quod opinor, opinaris, quae tantum res est secundum opinionem, quoad modum quo ab intellectu concipitur, scilicet in ratione totius, ut est mons aureus, vel hircocervus, habens medietatem cervi et medietatem hirci.

> (The *res* in the first sense is a *res* only according to opinion, and it is related to *reor, reris*, which is the same thing as *opinor, opinaris*, and it is only a thing according to opinion, according to the way in which it is conceived by the intellect, namely according to the reason of a (composite) whole, like a golden mountain or a goat-stag, which is half goat and half stag.)

> (Henry of Ghent, *Quodlibeta*, 5.2, fol. 154D; 7.1, fol. 258B)

Duns Scotus (1265–1308), who also sought to reduce the ambiguity of the term *res*, presented first a tripartite classification in the *Quodlibeta* (q. 3, n. 2), but he later distinguished, in opposition to Henry of Ghent, a twofold figure of *ratitudo*, which thus took over for the *certitudo* that Avicenna attributed to quiddities: "*Unaquaeque enim res habet certitudinem qua est id quod est*" (*Ordinatio*, 1.3.2, Vatican ed., 3:184.14–17). The neologism *ratitudo* had a prodigious career down to Francisco Suárez's *Disputationes metaphysicae* (4.2 n. 2). Some writers, like Petrus Aureolus (d. 1322), tried to reduce the series of distinctions to a fundamental polarity between essence and existence:

> Res sumitur dupliciter, uno modo pro re essentiali—et sic non est verum quod esse lapidis sit sua realitas—, vel pro realitate actuali, et sic est verum; unde in lapide actualiter existente sunt duae realitates, una quidem essentialis, puta lapiditas, et alia accidentalis, puta actualitas.

> (*Res* is taken in two senses, on the one hand for the essential *res* [synonym of *essentia*], and then it is not true that the being of a stone is its reality—, and on the other for the actual reality, and in this case, it is true; consequently, in the stone that actually exists, there are two realities, namely "stoniness" and another, accidental reality, namely, actuality.)

> (*Scriptum super primum Sententiarum*, 1.1.21 n. 60)

Other authors, on the contrary, multiplied the subdivisions in order to make place for rational entities or chimeras.

We find an echo of this as late as a "Cartesian" Dutch writer, Johannes Clauberg (1622–60), in his *Exercitationes et epistolae varii argumenti*:

> Mens quando rem eandem considerat, ut est extra notionem in seipsa, et ut est in notione repraesentata, videt hoc aliquid esse fundamentale, notionem autem suam aliquid umbratile et intentionale. Unde res etiam seu ens absolutum rectissime dividitur, quod sit vel fundamentale, quod specialiter et *kat' exochên* [κατ' ἐξοχήν] reale dici solet, quod primo et propriissime est et producit aliquid, etc., vel intentionale, quod non est nec facit aliquid solide et proprie sicut reale (fundamentale) et est tamen quasi umbra et similitudo illius, quae nos illud facit cognoscere, unde communiter notio vel idea appellatur.

> (The mind, when it considers one and the same thing, whether as it is in itself and outside the concept, or as it is represented in the concept, sees clearly that in the first case this something is fundamental, whereas its concept is something obscure and intentional. That is why the thing, or if one prefers, the existent taken absolutely, is most properly divided in the following manner: either it is fundamental, and is usually called real in the specific and quintessential sense, that is, what is firstly and most properly, which produces something, etc.; or else it is called intentional, insofar as it is not and does not make anything solid and proper, as does what is real (fundamental), and yet it is like shadow and a resemblance of the latter, and this allows us to know it, and that is why it is commonly called a concept or idea of the thing.)

> (Clauberg, *Exercitationes*, 16, in *Opera omnia philosophica*, 621)

However, in the same work, Clauberg also proposed a four-part classification:

> *Res* primo sumitur latissime pro omni cogitabili, nam quicquid sub cogitationem nostram cadit, sive verum sive fictum, sive possibile sive impossibile, sive actuale sit, interdum rei nomine appellatur. Nec dubitatur, quin accidens hoc significatu latissimo res dici queat.—Secundo res accipitur minus late pro omni eo quod est aliquid, non nihil, et sic reale ens opponitur enti rationis, . . . nempe ubi Authores sub illa (reali) modalem quoque distinctionem complectuntur . . . —Tertio stricte sumitur

3

Res rata, res a reor, ratitudo, Ding a denken

Medieval thought understands *res* as a supplementary transcendental, another name of being. Thomas Aquinas explains the doublet *ens* (being) and *res* (thing) on the basis of the two concepts of essence and existence: "The name *res* is derived from the quiddity," but since the essence can have a singular being outside the mind or a being apprehended in the mind, the name of "*res* is related to both of them: to what is in the mind, insofar as the *res* is based on *reor, reris*, and to what is outside the mind, insofar as the *res* signifies a being whose nature is solid (*ratum*) and firm" (*Sentences*, 1, d. 25, q. 1, a. 4, ed. Mandonnet, 3:612). Thus "being" refers directly to that which has the act of being (*esse*), but *res* refers to the quiddity both insofar as it is thought (*res a reor*, *reris*) and insofar as it exists (*res rata*). The *res* can be either the thing thought or the existing thing, but it is not what bears the full weight of Thomist metaphysics, which is oriented toward the being's act of being.

With Henry of Ghent, on the contrary, it is the *res* that is primary. For Henry, the definition of the *res* covers the double determination of the possible: that which is simply conceivable, that is, logically noncontradictory, or that which has a certain solidity in its possibility, that is, that which is real insofar as it has an essence. The first sense covers everything that is not pure nothingness, every object of opinion, including chimeras, fictions, possible worlds that will never be realized. The second sense designates what has an essence, that is, what has an idea, a positive model in divine thought. The two meanings of *res* must be opposed: the *res a reor, reris* ("think, believe, consider, imagine"), namely, the *res* in the etymological sense, which designates every object of opinion, whether it is endowed with an essence or not, and the *res ratitudine* (*ratitudo* is a medieval neologism designating solidity), namely, the *res* that has a certain solidity and designates the essence whose model is in God.

> The intention of every created thing [*res*] insofar as it is so called on the basis of "I think, you think" [*reor, reris*] must be distinguished from the being of essence, which is appropriate to it insofar as it is a nature and an essence, and a thing [*res*]

so called on the basis of its solidity [*a ratitudine*].

> (Henry of Ghent, *Summa quaestionum ordinariarum*, art. 21, q. 4 response; 1.127, O)

This ambiguity of *res* conceals a hesitation regarding the interpretation of the nature of metaphysics: should being be conceived simply as the correlate of our representation that is the most primordial because it is the most universal, or as possible because it imitates a divine model and through it participates in its essence? Is it simply the representation of the logically possible (noncontradictory), including fiction, chimeras, secondary intentions, and so on, or the representation of the real possible (founded in a relation to divine nature)? This fundamental hesitation between a logic of representation and a metaphysics of participation, which we also find in the theory of analogy peculiar to Henry of Ghent, was ended by Duns Scotus. For him, the *res* endowed with a real possibility does not draw the latter from a relation to God, but from the solidity specific to quiddity, which is open to essence or existence. What is it that founds the intelligibility of the real? What kind of being should be assigned to the intelligible? Not pure fiction, forged by imagination or opinion, but genuine possibility, which has a being that is *ratum*, solid (*res a ratitudo*), and not purely thought (*res a reor*). It is a "being that is from the outset distinct from fictions, that is, from what is open to the being of essence or the being of existence" (Duns Scotus, *Ordinatio*, 1.36.48, Vatican ed., 6:290). Being is truly *ratum* only by its own solidity—because this being is of one kind and that being is of another kind: it is formal coherence that founds noncontradiction, and not the other way around; relayed by divine omnipotence, it opens out onto a production in existence.

Suárez presupposes this analysis of the two senses of *res* when he writes:

> The *res* is predicated quiddatively, because it signifies a true and solid [*rata*] quiddity that is taken absolutely, and that is not coordinated with existence [*esse*].

> (*Disputationes metaphysicae*, 2.4.2, in *Opera omnia*, 88)

The most proper name of being is precisely *res*, that is, the order of quiddities, that which is open to being. "*Res* indicates only the quiddity of the thing taken formally, and the solid [*rata*] or real essence of the being" (*Disputationes metaphysicae*, 3.2.1, in *Opera omnia*, 107). Here, reality means not actual existence, but a formal perfection of essence.

Still more audacious, Clauberg, in his *Ontosophia* (§§7–8), combines the etymologies, harmonizing Greek, Latin, and German to the point of identifying the *res* with the pure representable:

> Aio *omne ens posse dici*, hoc est, nominari, voce viva vel scripta enuntiari. Hinc, *Sache*—res—a sagen, dicere. . . . Ipsum: res, si non a reor, est a ῥέω, loquor. . . . Praetera, *omne ens potest cogitari* seu intelligi, ideoque *cogitabile et intelligibile* appellatur. . . . *Ding*,—res—et *denken*—cogitare—eiusdem sunt originis.

> (*Metaphysica de ente, quae rectius ontosophia*, quoted in Courtine, *Suárez et le système de la métaphysique*, 261)

This fantastic study in comparative etymology is obviously untranslatable.

res pro substantia, atque ita res opponitur modo, distinctio realis opponitur modali proprie dictae. . . . —Quarto strictius adhuc reale opponitur intentionali, quo sensu etiam res et signa rerum distinguuntur, nec interim negatur intentionale ens esse aliquid, prout signa etiam non sunt nihil. Hanc vocis illius acceptionem si respiciamus, dicere possumus, dari nonnulla accidentia, quae non sint realia, sed intentionalia, dari alia plurima, quae realia sint.

(The *res* is taken first in the broadest sense, for everything that can be thought, for everything that falls under our thought, whether it be true or fictitious, possible or impossible, or actual, nonetheless receives the name of thing. There is no doubt that in this broadest possible signification the accident can also be called a "thing."—In a second sense, *res* is understood less broadly as referring to everything that is something, not nothing, and thus the real being is opposed to the rational entity, as is still the case in authors who subsume the modal distinction into the first (real one). . . .—In a third sense, *res* is taken as substance, and thus it is opposed to mode, whereas real distinction is opposed to modal distinction properly so called. . . .—In a fourth sense, and in a still stricter way, the "real" is opposed to the intentional, and in this sense things are distinguished from signs of things, without, however, denying that intentional being is something, insofar as signs are also not nothing. Considering this latter meaning of the term, we can say that there are a few accidents that are not real, but intentional, and that there are many others that are real.)

(Clauberg, *Exercitationes*,
43, in *Opera omnia philosophica*, 665)

There are many writers, however, who, in spite or because of these multiplying distinctions, maintain as the fundamental meaning of *res* the concrete object existing outside the mind as a singular individual. Such is the *res secundum esse*: the *res posita*, that is, the *res singularis* (William of Ockham, *Sentences*, 1, dist. 2, q. 7): "*Omnis res positiva extra animam eo ipso est singularis*" (Every positive reality [existing] outside the mind is by that very fact singular).

VII. *Res* as a Transcendental and Supertranscendental Term

The broadening of the term *res* and its extension beyond even the meaning of *ens* defined as *ens ratum* (firm, stable, and ontologically ratified) tend to make it a transcendental term, and even the first among transcendental terms. In any case, *res* is counted among the transcendental terms starting with Gerard of Cremona. Thomas Aquinas sometimes assimilates *res* and *ens* (*Summa theologica*, 1a, q. 48, a. 2), even if in his thematic exposition of the transcendentals he carefully distinguishes between the two terms (*De veritate*, q. 1, a. 1). In his *Disputationes dialecticae*, Lorenzo Valla seeks to reduce the six transcendentals to *res* as the first and principal of them all: "*Ex his sex, quae nunc quasi de regno contendunt non aliter res erit rex, quam Darius.*" In fact, *aliquid* can be analyzed or explained as "*alia res,*" *unum* as "*una res,*" and so on. In this

transcendental meaning that dominates all other convertible properties, nothing is any longer opposed to *res*, except precisely nothing or nothingness: "*nihil habet repugnans nisi ipsum nihil*" (*Disputationes dialecticae*, book 1, in *Opera*, 646–48).

Even if they explicitly criticize Valla's anti-Aristotelian thesis, many writers, such as Fonseca (1528–99) and Suárez, unhesitatingly make *res* a transcendental term on the same footing as *ens*, or even a complete synonym of the latter: "*Sex porro transcendentia esse dicuntur, Ens, Unum, Verum, Bonum, Aliquid, Res*" (Fonseca, *Institutionum dialecticarum libri octo*, book 1, chap. 28, ed. Ferreira Gomes). Suárez, having cited the common thesis of the five transcendentals or passions convertible with being, nonetheless adds: "Many writers think that *res* is a more essential predicate [*magis essentiale praedicatum*] than being itself" (*Disputationes metaphysicae*, 3.2.1), without, however, expressing deep disagreement with this thesis, since, as he himself says, "*solum dicit de formali rei quidditatem, et ratam seu realem essentiam entis*" (The *res* simply and formally designates the quiddity of the thing, that is, its real and ratified essence).

On the other hand, Chrysostome Javelli, in his *Tractatus de transcendentibus*, part of a *Totius philosophiae compendium* published in Lyon in 1563 (1:460, col. 1), maintains a more Thomistic distinction: "*Ens sumitur ab esse, Res autem a essentia*" ("The participle 'being' is taken from the verb 'to be,' the thing [is taken] from the essence"). Whence he concludes, rather oddly, that *ens* can be said of both *ente reali* and *ente rationis*, whereas on the other hand, the *res* is said only of *entia realia*, that is, those that "have essence of quiddity." Thus the *res* can be identified with being (*ens*) only if the latter is understood (and this was to be the basis for Suárez's thesis against Thomas Cajetan) in the nominal sense, in the sense of "*ens nominaliter sumptum.*" In the *Disputationes*, Suárez drew all the consequences of the distinction between the two meanings of "being": the *ens* taken as a participle and *ens* taken as a noun—a distinction, let us note, that is no more discernible in Latin than it is in French or English (at least so far as the present participle of the verb "to be" is concerned, whereas French has distinguished, at least since Claude Favre de Vaugelas, between the participle as an invariable form and as a qualifying or verbal adjective: *différant/différent, excellant/excellent, divaguant/divagant*, and so on).

Ens (being), insofar as it derives directly from the verb *sum*, is understood as a participle that names the *actus essendi* or the act of existing: to be and to exist are the same. ("*Quae opinio fundata est in significatione vocis ens; derivatur enim a verbo sum, estque participium eius; verbum autem sum, absolute dictum, significat actum essendi, seu existendi: esse enim et existere idem sunt,*" Suárez, *Disputationes metaphysicae*, 2.4.1).

Of course, the same term (*ens*) can also be explained as "*ens nominaliter suptum*" (*ens ut nomen*), if we note that this time it signifies properly and adequately "*id quod est,*" "that which is." But "*id quod est*" can in turn be understood as that which has, or rather exercises, the act of being or existing—in other words, that which is being in the sense of existing: what is *actu* (in actuality) or what is *potentia* (potentially), that which is being because it can be, because it is already the possible subject of a true predication, as when one says of man in general that he is an animal, leaving aside the

question whether he is or is not *actu*, whether he exists, whether he is being ("*significat ergo adaequate 'ens,' id quod est . . . , id est, quod habet actum essendi seu existendi, ut idem sit ens, quod existens; dicit ergo ens de formali esse seu existentiam, quae est extra rerum quidditatem*"). However, Suárez rejects the thesis (here attributed to Domingo de Soto) according to which being cannot be predicated quidditatively or essentially (*in quid*) on everything, because it always implies a reference to being as disposition or way of holding oneself ("*habitudo ad esse*"), understood this time as an "act of being" ("*actus essendi*") that can be participialized ("*être participé*") by the created existent, while remaining external to its essence:

> dicit ens semper esse participium verbi *sum* sicut existens, verbi *existo*, et de formali significare esse, de materiali vero, quod habet esse postea vero declarat, ens non solum significare quod actu est, sicut existens, sed quod est actu vel potentia, quia de homine non existente vere dicitur esse ens, sicut esse animal vel substantiam, et nihilominus concludit ens non dici quidditative de rebus, praesertim creatis, quia dicit habitudinem ad esse, quod est extra essentiam creaturae.
